Our news editors obtained a quote from the research from China Agricultural University, "Therefore, the aim of this study is to investigate in vitro innate immune responses implicated by P. zopfii. Bovine mammary epithelial cells (bMECs) were infected with 5.0 x 10 (4) cells/ml P. zopfii genotypes I and II independently, and the mRNA expression of TLR-2, TLR-4, TNF-alpha, IL-1 beta, IL-8, NOD-1, NOD-2 and beta-defensin-5 was determined by real-time polymerase chain reaction (RT-PCR) over a time course of 1, 3, 6, 12 and 24 h. The detection of the NF-kappa B p65 protein in nucleus and cytoplasm of infected bMECs over the same time course was evaluated. P. zopfii genotype II has ability to up-regulate the expression of TLR-2, TLR-4, TNF-alpha, IL-1 beta, IL-8, NOD-1, NOD-2 and beta-defensin-5 more strongly than genotype I. Western blot results showed that when bMECs were challenged by P. zopfii genotype II, the expression of NF-kappa B p65 protein in the nucleus was up-regulated, while in cytoplasm it appeared to be repressed, which indicated that bMECs partly regulate the innate immune responses and inflammation by the NF-kappa B signaling pathway while being infected by P. zopfii genotype II."

According to the news editors, the research concluded: "It was concluded that adhesion of genotype II was stronger than genotype I, and therefore the genotype II regulatory ability is more robust than that of the genotype I, which causes inflammation of bovine mammary tissue."

For more information on this research see: An Investigation of the Innate Immune Response in Bovine Mammary Epithelial Cells Challenged by Prototheca zopfii. Mycopathologia, 2016;181(11-12):823-832. Cyclohexanes
Findings from China Medical University and Hospital Yields New Findings on Cyclohexanes (Changes in hippocampal AMPA receptors and cognitive impairments in chronic ketamine addiction models: another understanding of ketamine CNS toxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cyclohexanes. According to news reporting originating from Shenyang, People's Republic of China, by NewsRx correspondents, research stated, "Ketamine has been reported to impair human cognitive function as a recreational drug of abuse. However, chronic effects of ketamine on central nervous system need to be further explored."

Our news editors obtained a quote from the research from China Medical University and Hospital, "We set out to establish chronic ketamine addiction models by giving mice a three or six month course of daily intraperitoneal injections of ketamine, then examined whether long-term ketamine administration induced cognition deficits and changed hippocampal post-synaptic protein expression in adult mice. Behavior tests results showed that mice exhibited dose-and time-dependent learning and memory deficits after long-term ketamine administration. Western blot results showed levels of GluA1, p-S845 and p-S831 proteins demonstrated significant decline with ketamine 60 mg/kg until six months administration paradigm. But levels of p-S845 and p-S831 proteins exhibited obvious increase with ketamine 60 mg/kg three months administration paradigm. NR1 protein levels significantly decrease with ketamine 60 mg/kg three and six months administration paradigm. Our results indicate that reduced expression levels and decreased phosphorylation levels of hippocampal post-synaptic membrane GluA1-containing AMPA receptors maybe involved in cognition impairment after long-term ketamine administration."

According to the news editors, the research concluded: "These findings provide further evidence for the cognitive damage of chronic ketamine addiction as a recreational drug."

For more information on this research see: Changes in hippocampal AMPA receptors and cognitive impairments in chronic ketamine addiction models: another understanding of ketamine CNS toxicity. *Scientific Reports*, 2016;6():1-11. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Findings from China Medical University and Hospital in the Area of Prostate Cancer Reported (BAP18 coactivates androgen receptor action and promotes prostate cancer progression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting originating in Liaoning, People's Republic of China, by NewsRx journalists, research stated, "BPTF associated protein of 18 kDa (BAP18) has been reported as a component of MLL1-WDR5 complex. However, BAP18 is an uncharacterized protein."

The news reporters obtained a quote from the research from China Medical University and Hospital, "The detailed biological functions of BAP18 and underlying mechanisms have not been defined. Androgen receptor (AR), a member of transcription factor, plays an essential role in prostate cancer (PCa) and castration-resistant prostate cancer (CRPC) progression. Here, we demonstrate that BAP18 is identified as a coactivator of AR in Drosophilar experimental system and mammalian cells. BAP18 facilitates the recruitment of MLL1 subcomplex and AR to androgen-response element (ARE) of AR target genes, subsequently increasing histone H3K4 trimethylation and H4K16 acetylation. Knockdown of BAP18 attenuates cell growth and proliferation of PCa cells. Moreover, BAP18 depletion results in inhibition of xenograft tumor growth in mice even under androgen-depletion conditions. In addition, our data show that BAP18 expression in clinical PCa samples is higher than that in benign prostatic hyperplasia (BPH)."

According to the news reporters, the research concluded: "Our data suggest that BAP18 as an epigenetic modifier regulates AR-induced transactivation and the function of BAP18 might be targeted in human PCa to promote tumor growth and progression to castration-resistance."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/nar/gkw472. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from Chinese Academy of Medical Sciences Provide New Insights into Lung Cancer (A Matched Comparison Study of Uniportal Versus Triportal Thoracoscopic Lobectomy and Sublobectomy for Early-stage Nonsmall Cell Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Lung Cancer are presented in a new report. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Both uniportal and triportal thoracoscopic lobectomy and sublobectomy are feasible for early-stage non-small cell lung cancer (NSCLC). The aim of this study was to compare the perioperative outcomes of uniportal and triportal thoracoscopic lobectomy and sublobectomy for early-stage NSCLC."

The news reporters obtained a quote from the research from the Chinese Academy of Medical Sciences, "A total of 405 patients with lung lesions underwent thoracoscopic lobectomy or sublobectomy through a uniportal or triportal procedure in approximately 7-month period (From November 2014 to May 2015). A propensity-matched analysis, incorporating preoperative variables, was used to compare the short-term outcomes of patients who received uniportal or triportal thoracoscopic lobectomy and sublobectomy. Fifty-eight patients underwent uniportal and 347 patients underwent triportal pulmonary resection. The conversion rate for uniportal and triportal procedure was 3.4% (2/58) and 2.3% (8/347), respectively. The complication rate for uniportal and triportal procedure was 10.3% and 9.5%, respectively. There was no perioperative death in either group. Most patients had early-stage NSCLC in both groups (uniportal: 45/47, 96%; triportal: 313/343, 91%). Propensity score-matching analysis demonstrated no significant differences in operation time, intraoperative blood loss, numbers of dissected lymph nodes, number of stations of lymph node dissected, duration of chest tube, and complication rate between uniportal and triportal group for early-stage NSCLC. However, the duration of postoperative hospitalization was longer in the uniportal group (6.83 ± 4.17 vs. 5.42 ± 1.86 d, p=0.036) compared with the triportal group. Uniportal thoracoscopic lobectomy and sublobectomy is safe and feasible, with comparable short-term outcomes with triportal thoracoscopic pulmonary resection."

According to the news reporters, the research concluded: "Uniportal lobectomy and sublobectomy lead to similar cure rate as triportal lobectomy and sublobectomy for early NSCLC."

Our news correspondents report that additional information may be obtained by contacting J. He, Dept. of Thoracic Surgery, Cancer Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing 100021, People's Republic of China. Findings from Chinese Academy of Sciences Update Knowledge of Chemistry (Toward High-Efficient Red Emissive Carbon Dots: Facile Preparation, Unique Properties, and Applications as Multifunctional Theranostic Agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Chemistry. According to news reporting originating in Zhejiang, People's Republic of China, by NewsRx journalists, research stated, "The achievement of high-efficient pure red emissive carbon dots (CDs) is still a great challenge as well as one of the most critical issues that hinders widespread applications of CDs. Herein, a facile approach for the preparation of high-efficient red emissive CDs (R-CDs) is reported, and they exhibit numerous unique features including pure red emission (λmax approximate to 640 nm), respectable quantum yield (22.9%), low cytotoxicity, two-photon excited fluorescence (TPEF), and high photothermal conversion efficiency (43.9% under irradiation of 671 nm laser)."

Funders for this research include Ningbo Municipal Bureau of Science and Technology, National Natural Science Foundation of China, Natural Science Foundation of Zhejiang Province.

The news reporters obtained a quote from the research from the Chinese Academy of Sciences, "Moreover, the chemical composition and photophysical properties of the R-CDs are detailed characterized and analyzed, and from which their photoluminescence mechanism is proposed. Interestingly, the R-CDs are found to particularly light up RNA-rich nucleolus both in one-photon and two-photon modes as well as show excellent counterstain compatibilities with other classical subcellular dyes. The localization of the R-CDs in nucleolus is supported by ribonuclease digestion testing, and the stronger emission is further verified to be due to an accumulation process. In addition, the R-CDs are confirmed to be facilely conjugated with fluorescein isothiocyanate (FITC) and then bring it into living cells, which reveals their potentials to perform as carriers for delivery of drugs that cannot (or hardly) enter into living cells directly. Finally, the R-CDs are shown to be excellent in photothermal cancer therapy in vitro due to their high photothermal conversion efficiency."

According to the news reporters, the research concluded: "This study represents not only a facile method for the preparation of high-efficient R-CDs, but also opens many possibilities for applications, such as in biomedicine (multifunctional theranostic agents) and emitting/display devices, thanks to their unique and superior properties."

For more information on this research see: Toward High-Efficient Red Emissive Carbon Dots: Facile Preparation, Unique Properties, and Applications as Multifunctional
Chemistry

Findings from Chinese Academy of Sciences Yields New Findings on Chemistry [Near-Infrared (NIR)-Absorbing Conjugated Polymer Dots as Highly Effective Photothermal Materials for In Vivo Cancer Therapy]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Chemistry. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Photothermal therapy (PTT) holds great promise for noninvasive cancer treatment. To fulfill this goal, highly effective and low-risk photothermal agents have been intensively explored."

Financial supporters for this research include National Natural Science Foundation of China, Chinese Academy of Sciences.

Our news journalists obtained a quote from the research from the Chinese Academy of Sciences, "Here, we present a new PTT material based on conjugated polymer dots (Pdots) that exhibit strong near-infrared (NIR) absorption and high photostability. The Pdots result in a thermal response upon illumination with a NIR laser, leading to a high photothermal conversion efficiency of 65%. Thus, the photothermal ablation of cancer cells using the Pdots both in vitro and in vivo can be achieved, highlighting the potential of Pdots as a nanoplatform for clinical therapy."

According to the news editors, the research concluded: "They also open up a new avenue to develop new photothermal therapeutic materials."

For more information on this research see: Near-Infrared (NIR)-Absorbing Conjugated Polymer Dots as Highly Effective Photothermal Materials for In Vivo Cancer Therapy. Chemistry of Materials, 2016;28(23):8669-8675. Chemistry of Materials can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA.

Oncology - Acute Myeloid Leukemia

Findings from Chinese People's Liberation Army General Hospital Provides New Data on Acute Myeloid Leukemia (Overexpression of ATP1B1 predicts an adverse prognosis in cytogenetically normal acute myeloid leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Acute Myeloid Leukemia is now available. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "ATP1B1 encodes the Na,K-ATPase b subunit, a key regulator of the Na+ and K+ electrochemical gradients across the plasma membrane and an essential regulator of cellular activity. We used several microarray datasets to test the prognostic efficacy of ATP1B1 expression in cytogenetically normal acute myeloid leukemia (CN-AML)."

Our news editors obtained a quote from the research from Chinese People's Liberation Army General Hospital, "Within the primary cohort (n=157), high ATP1B1 expression (ATP1B1(high)) was associated with shorter overall survival (OS) and event-free survival (EFS) (p=0.0068, p=0.0039, respectively). Similar results were also obtained in the European Leukemia Net (ELN) Intermediate-I genetic category (OS: p=0.0035, EFS: p=0.0007). Multivariable analyses confirmed ATP1B1(high) is an independent predictor of shorter OS (p=0.042) and EFS (p=0.035). Analysis of another CN-AML cohort confirmed that ATP1B1(high) is associated with shorter OS (p=0.0046, n=162). In addition, up-regulation of oncogenes/onco-microRNAs such as MYCN, CCND2, CDK6, KIT and miR-155, among others, was associated with ATP1B1(high), which may be indicative of ATP1B1's leukemogenicity."

According to the news editors, the research concluded: "Our results may improve risk stratification and indicate new therapeutic targets for CN-AML."

For more information on this research see: Overexpression of ATP1B1 predicts an adverse prognosis in cytogenetically normal acute myeloid leukemia. Oncotarget, 2016;7(3):2585-95.

The news editors report that additional information may be obtained by contacting J.L. Shi, Medical Engineering Support Center, Chinese PLA General Hospital, Beijing, People's Republic of China. Additional authors for this research include L. Fu, Q. Ang, G.J. Wang, J. Zhu and W.D Wang.

Findings from Chinese University of Hong Kong Reveals New Findings on Plasma (Cell-free DNA in maternal plasma and serum: A comparison of quantity, quality and tissue origin using genomic and epigenomic approaches)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematology - Plasma. According to news reporting originating from Hong Kong, People's Republic of China, by NewsRx correspondents, research stated, "The objectives of this study were to compare the concentrations, size profiles and major tissue contributors of cell-free DNA (cfDNA) in plasma and in serum. Thirteen pregnant women in the third trimester were recruited for this study."

Financial support for this research came from Hong Kong Research Grants Council Theme-Based Research Scheme.

Our news editors obtained a quote from the research from the Chinese University of Hong Kong, "We collected EDTA-plasma and serum samples using various collection tubes. We determined their cfDNA concentrations and fetal cfDNA fractions using a zinc-finger X (ZFX)/zinc-finger Y (ZFY) droplet digital polymerase chain reaction (ZFX/ZFY ddPCR) assay. We used paired-end massively parallel sequencing (MPS) to measure plasma and serum cfDNA sizes at single-base resolution. We deconvoluted the genome-wide bisulfite sequencing data with reference to the methylation profiles of different tissues. The concentrations of cfDNA collected in Sarstedt Serum Z tubes were found to be significantly higher than those in Greiner Bio-One Vacuette ® Z Serum Separator Clot Activator tubes or Vacuette ® Z Serum Clot Activator tubes. The concentrations of fetal cfDNA were significantly reduced in samples collected in the Vacuette serum collection tubes. Fetal cfDNA fractions were significantly reduced in all sera compared to plasma. MPS of serum cfDNA revealed a right shift of the size distributions compared to plasma. Methylation-based tissue mapping of serum cfDNA revealed an increase of cfDNA from neutrophils and B cells but not T cells. The use of different serum collection tubes has a significant impact on serum cfDNA concentrations."

According to the news editors, the research concluded: "This effect is likely mediated through the combined effect of genomic DNA release from white blood cells and DNA degradation or removal."

The news editors report that additional information may be obtained by contacting F.C.K. Wong, Chinese University of Hong Kong, Prince of Wales Hospital, Dept. of Chem Pathol, Shatin, Hong Kong, People's Republic of China. Additional authors for this research

Women's Health - Obstetrics and Gynecology

Findings from Chinese University of Hong Kong in the Area of Obstetrics and Gynecology Described (Noninvasive prenatal testing beyond genomic analysis: what the future holds)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Women's Health - Obstetrics and Gynecology have been presented. According to news reporting originating in Hong Kong, People's Republic of China, by NewsRx journalists, research stated, "The discovery of cell-free fetal DNA in maternal blood enabled the development of DNA-based noninvasive prenatal testing. Noninvasive prenatal testing for chromosomal aneuploidy detection was first applied for clinical use a few years ago, resulting in a paradigm shift in prenatal testing."

The news reporters obtained a quote from the research from the Chinese University of Hong Kong, "Apart from the use of cell-free fetal nucleic acids for the detection of fetal genetic or chromosomal diseases, we predict that the analysis of cell-free placental RNA and DNA methylation signatures would allow the noninvasive monitoring of placental function. These developments would potentially allow the screening and identification of a range of pregnancy-associated diseases, providing a holistic approach to prenatal management. This article covers the advancement of techniques in measuring cell-free fetal RNA and fetal-specific methylation patterns in maternal blood. Recently, genome-wide fetal transcriptome and methylome can be obtained from maternal plasma, which allow the identification of novel biomarkers and the elucidation of the pathogenesis of maternal and fetal diseases. In fact, some studies demonstrated the feasibility of applying the RNA and DNA methylation analysis techniques for prenatal disease assessment."

According to the news reporters, the research concluded: "This study reviews the evidence that demonstrates the potential utilities of cell-free fetal transcriptomic and methylomic analysis for the future assessment of pregnancy-associated disorders."

For more information on this research see: Noninvasive prenatal testing beyond genomic analysis: what the future holds. Current Opinion In Obstetrics & Gynecology, 2016;28 (2):105-10. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Obstetrics & Gynecology - journals.lww.com/co-obgyn/pages/default.aspx)

Findings from Chongqing Medical University Broaden Understanding of Gliomas (Downregulation of Nitrogen Permease Regulator Like-2 Activates PDk1-AkT1 and Contributes to the Malignant Growth of Glioma Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Gliomas. According to news reporting from Chongqing, People's Republic of China, by NewsRx journalists, research stated, "Nitrogen permease regulator like-2(NPRL2) is a candidate tumor suppressor gene(TSG) located on chromosome 3p21.3 and deletions frequently occur in this region, leading to canceration. Recently, molecular pathologic researches have provided valuable insights into the downregulation of NPRL2 in carcinogenesis in some types of cancers."

The news correspondents obtained a quote from the research from Chongqing Medical University, "However, very little is known about genetic changes of NPRL2 involved in glioma. Here, for the first time, we aimed to understand the expression levels, functions and mechanisms of NPRL2 for progression of glioma. We clearly demonstrated that NPRL2 expression was decreased in glioma and was negatively correlated with the histologic grade. The upregulation of NPRL2 expression in glioma cells inhibited proliferation by inducing G0/G1 cell cycle arrest in vitro and suppressed the growth of xenotransplanted tumors. In contrast, siRNA-mediated knockdown of NPRL2 promoted glioma growth. The anti-cancer effects of NPRL2 were involved in dephosphorylation of PDK1(Tyr9) and downstream AKT1(Thr308) resulting in inactivation of the PDK1-AKT1 signaling pathway, this ultimately increased the expression of p21 and p27, and inactivated CDK2 and CDK4. Our data confirmed NPRL2 was downregulated in gliomas. More importantly, NPRL2 was able to inhibit cell proliferation in vitro and repress tumorigenicity in vivo, suggesting its role as a tumor suppressor."

According to the news reporters, the research concluded: "Our data provide a basis for the further development of a promising therapeutic target for glioma."

Keywords for this news article include: Chongqing, People's Republic of China, Asia, Tumor Suppression, Oncology, Nitrogen, Genetics, Gliomas, Chongqing Medical
Enzymes and Coenzymes - Phosphotransferases…

Findings from Chung Ang University in the Area of Phosphotransferases (Alcohol Group Acceptor) Reported (Y-27632, a Rho-Associated Protein Kinase Inhibitor, Inhibits Voltage-Dependent K plus Channels in Rabbit Coronary Arterial Smooth Muscle ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - Phosphotransferases (Alcohol Group Acceptor). According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "We examined the effects of the Rho-associated protein kinase (ROCK) inhibitor Y-27632 on voltage-dependent K+ (Kv) channels in rabbit coronary arterial smooth muscle cells using the whole-cell patch clamp technique. Y-27632 reduced the amplitude of the Kv current in a concentration-dependent manner, with an IC50 of 0.87 +/- 0.06 mu mol/l and a Hill coefficient of 1.48 +/- 0.06."

Our news journalists obtained a quote from the research from Chung Ang University, "Y-27632 did not affect the steady-state activation or inactivation curves, suggesting that the drug does not affect the voltage sensitivity of Kv channels. Another ROCK inhibitor, H-1152, did not affect the Kv current and had no significant effect on the Y-27632-induced inhibition of Kv channels, indicating that the inhibitory effect of Y-27632 on the Kv current is independent of ROCK signaling."

According to the news editors, the research concluded: "From these results, we conclude that Y-27632 inhibits the Kv channel current in a dose-dependent and ROCK signaling-independent manner."

Our news journalists report that additional information may be obtained by contacting H. Bang, Chung Ang University, Dept. of Physiol, Coll Med, Seoul 06974, South Korea. Additional authors for this research include S.E. Shin, H.W. Kim, H.S. Kim, W.K. Jung, K.S. Ha, E.T. Han, S.H. Hong, I.W. Choi, Y.M. Bae, A.L. Firth, H. Bang and W.S. Park.

Findings from Cleveland Clinic Broadens Understanding of Lactic Acidosis [Sigmoid volvulus in a patient with mitochondrial encephalomyopathy, lactic acidosis and stroke-like episodes (MELAS): a rare occurrence]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Lactic Acidosis is now available. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "Mitochondrial diseases are rare and devastating, with a wide spectrum of clinical presentations and systemic symptoms. The majority of the published literature focuses on the neuromuscular manifestations and genetic components of this mitochondrial cytopathy, however, cardiac, renal, endocrine and gastrointestinal manifestations may also be present."

The news reporters obtained a quote from the research from Cleveland Clinic, "The authors report a case detailing a 56-year-old woman's final hospitalisation from the gastrointestinal sequelae of mitochondrial encephalomyopathy, lactic acidosis and stroke-like episodes (MELAS) (Co Q10 deficiency variant). She presented with abdominal pain and distension associated with lactic acidosis, and was shown on imaging to have a colon perforation. This resulted in emergent surgery at which a necrotic colon secondary to a sigmoid colon was identified. Following four subsequent operations, and the development of multiorgan failure, care was eventually withdrawn."

According to the news reporters, the research concluded: "Practitioners of patients with MELAS should be cognisant of the rare but devastating gastrointestinal consequences of mitochondrial diseases."

For more information on this research see: Sigmoid volvulus in a patient with mitochondrial encephalomyopathy, lactic acidosis and stroke-like episodes (MELAS): a rare occurrence. Bmj Case Reports, 2016;2016():. (BMJ Publishing Group - group.bmj.com/; Bmj Case Reports - casereports.bmj.com/)

Our news correspondents report that additional information may be obtained by contacting A. Hallac, Dept. of General Surgery, Cleveland Clinic Foundation, Cleveland, Ohio, United States. Additional authors for this research include H.B. Keshava, G. Morris-Stiff and S. Ibrahim.

Findings from College of Nursing in Ebstein Anomaly Reported (Restoration of Tricuspid Valve Mechanism at the Level of Displaced Septal and Posterior Leaflets in Ebstein's Anomaly)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Ebstein Anomaly have been presented. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Surgical techniques currently used for the repair of Ebstein's anomaly comprise reconstruction of the tricuspid valve mechanism at the level of the true annulus with or without plication of the atrialized right ventricle. However, performing this procedure for patients with a dysmorphic anterior leaflet (i.e., insufficient leaflet tissue and decreased mobility due to tethering) may necessitate technical modifications."

Our news journalists obtained a quote from the research from the College of Nursing, "A retrospective review was performed of 31 patients (seven males and 24 females, median age at operation 31 years) with Ebstein's anomaly, who underwent tricuspid valve repair between March 2002 and December 2014. The original Hetzer technique (annulus to annulus approximation) was employed for six patients with a well-formed anterior leaflet. In 25 patients, the tricuspid valve mechanism was restored at the displaced septal leaflet by approximating the anterior leaflet attachment in the true annulus to the displaced septal leaflet attachment in the mid-septum. A bidirectional superior cavopulmonary anastomosis was added in 27 of 31 (87%) patients. No early or late death occurred during the median follow-up of 66 months (1-138 months). Immediate postoperative tricuspid regurgitation was trivial in 22 patients, and the median preoperative, immediate postoperative, and last follow-up tricuspid regurgitation jet areas in 21 adult patients were 23.3 cm2, 10.4 cm2, and 7.0 cm2, respectively. Two patients underwent reoperation at 81 and 119 months postoperatively. Five-year freedom from severe tricuspid regurgitation or reoperation was 93.2%. Restoration of the tricuspid valve mechanism at the level of displaced septal leaflet leads to excellent long-term outcomes."

According to the news editors, the research concluded: "The addition of the bidirectional superior cavopulmonary anastomosis has contributed to the success of this technique."

The news correspondents report that additional information may be obtained from Y.M. Im, Seoul Women's College of Nursing, Seoul, South Korea. Additional authors for this research include C.S. Park, J.J. Park and T.J Yun.

Enzymes and Coenzymes - Carboxylic Ester...

Findings from College of Pharmacy Provides New Data about Carboxylic Ester Hydrolases (Phospholipase A2 Isoforms as Novel Targets for Prevention and Treatment of Inflammatory and Oncologic Diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Enzymes and Coenzymes - Carboxylic Ester Hydrolases is now available. According to news reporting originating from Miami, Florida, by NewsRx correspondents, research stated, "Phospholipase A2s (PLA2s) are group of enzymes, which cleave phospholipids specifically at sn-2 position to liberate free fatty acid, mostly arachidonic acid (AA) and lysophospholipids (LPLs). Inhibition of PLA2 prevents the liberation of AA and LPLs."

Our news editors obtained a quote from the research from the College of Pharmacy, "Hence, researchers have been considering PLA2s could be a better therapeutic target than the downstream enzymes cyclooxygenase and lipoxygenase. Several isoforms of PLA2s exist; they are mainly divided into secretory PLA2s (sPLA2), cytosolic PLA2s (cPLA2), and calcium independent PLA2s (iPLA2), platelet activating factor-acyl hydrolase (PAF-AH), lysosomal PLA2 (LPLA2), adipose-specific PLA2 (Ad-PLA). Each isoform of PLA2s is different in its chemical structure and physiological functions. sPLA2s (Groups IIA, V and X) are well characterized as proinflammatory mediating enzymes but their role in cancer is controversial. Groups IVA, IVB and IVC cPLA2s are present in humans but only Group IVA cPLA2 plays key role in pathophysiology of various cancers and inflammation. The role of iPLA2 in inflammation and cancer is limited. Lipoprotein associated PLA2 (Group VIa PLA2), a PAF-AH isoform, has key role in atherosclerosis. Several isoform specific PLA2 inhibitors have been developed and some of the PLA2s inhibitors are currently under clinical trials for various inflammatory and oncologic diseases."

According to the news editors, the research concluded: "This review focuses on the recent experimental evidences to support the notion that PLA2s are causally implicated in the pathobiology of cancer and inflammatory related disorders and discuss the potential utility of isoform specific PLA2 inhibitors as preventive and/or therapeutic agents."

The news editors report that additional information may be obtained by contacting A. Bishayee, Dept. of Pharmaceutical Sciences, College of Pharmacy, Larkin Health Sciences Institute, Miami, Florida 33169, United States. Additional authors for this research include A. Bishayee, L. Vadlakonda, R. Chintala, G.R. Duddukuri, P. Reddanna and K.S Dowluru.

Mycobacterium Infections - Tuberculosis

Findings from Colorado State University Broaden Understanding of Tuberculosis (Therapeutic Potential of the Mycobacterium tuberculosis Mycolic Acid Transporter, MmpL3)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mycobacterium Infections - Tuberculosis are presented in a new report. According to news reporting out of Fort Collins, Colorado, by NewsRx editors, research stated, "In recent years, whole-cell-based screens for novel small molecule inhibitors active against Mycobacterium tuberculosis in culture followed by the whole-genome sequencing of spontaneous resistant mutants have identified multiple chemical scaffolds thought to kill the bacterium through the inactivation of the mycolic acid transporter, MmpL3. Consistent with the fact that MmpL3 is required for the formation of the mycobacterial outer membrane, we have conclusively shown in this study, using conditionally regulated knockdown mutants, that mmpL3 is required for the replication and viability of M. tuberculosis, both under standard laboratory growth conditions and during the acute and chronic phases of infection in mice."

Funders for this research include Global Alliance for TB Drug Development, Potts Memorial Foundation, American Lebanese Syrian Associated Charities, HHS | National Institutes of Health (NIH), Bill and Melinda Gates Foundation.

Our news journalists obtained a quote from the research from Colorado State University, "Speaking for the vulnerability of this target, silencing mmpL3 had a rapid bactericidal effect on actively replicating cells in vitro and reduced by 3 to 5 logs in less than 4 weeks the bacterial loads of acutely and chronically infected mouse lungs, respectively. Depletion of MmpL3 further rendered M. tuberculosis hypersusceptible to MmpL3 inhibitors."

According to the news editors, the research concluded: "The exquisite vulnerability of MmpL3 at all stages of the infection establishes this transporter as an attractive new target with the potential to improve and shorten current drug-susceptible and drug-resistant tuberculosis chemotherapies."

For more information on this research see: Therapeutic Potential of the Mycobacterium tuberculosis Mycolic Acid Transporter, MmpL3. Antimicrobial Agents and Chemotherapy, 2016;60(9):5198-5207. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Hyperplasia

Findings from Columbia University Update Understanding of Hyperplasia (Targeting of Ras-mediated FGF signaling suppresses Pten-deficient skin tumor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hyperplasia have been published. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Deficiency in PTEN (phosphatase and tensin homolog deleted on chromosome 10) is the underlying cause of PTEN hamartoma tumor syndrome and a wide variety of human cancers. In skin epidermis, we have previously identified an autocrine FGF signaling induced by loss of Pten in keratinocytes."

Financial support for this research came from HHS | NIH | National Eye Institute (NEI).

Our news journalists obtained a quote from the research from Columbia University, "In this study, we demonstrate that skin hyperplasia requires FGF receptor adaptor protein Frs2 alpha and tyrosine phosphatase Shp2, two upstream regulators of Ras signaling. Although the PI3-kinase regulatory sub-units p85 alpha and p85 beta are dispensable, the PI3-kinase catalytic subunit p110 alpha requires interaction with Ras to promote hyperplasia in Pten-deficient skin, thus demonstrating an important crosstalk between Ras and PI3K pathways. Furthermore, genetic and pharmacological inhibition of Ras-MAPK pathway impeded epidermal hyperplasia in Pten animals."

According to the news editors, the research concluded: "These results reveal a positive feedback loop connecting Pten and Ras pathways and suggest that FGF-activated Ras-MAPK pathway is an effective therapeutic target for preventing skin tumor induced by aberrant Pten signaling."

Our news journalists report that additional information may be obtained by contacting X. Zhang, Columbia University, Dept. of Pathol & Cell Biol, New York, NY 10032,
United States. Additional authors for this research include A. Hannan, K. Hertzler-Schaefer, F. Wang, G.S. Feng, J. Zhong, J.J. Zhao, J. Downward and X. Zhang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1073/pnas.1604450113. This DOI is a link to an online electronic document that is either free or for purchase.

**DNA Research**

**Findings from Commonwealth Scientific and Industrial Research Organisation (CSIRO) Has Provided New Data on DNA Research (Co-localized genomic regulation of miRNA and mRNA via DNA methylation affects survival in multiple tumor types)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on DNA Research have been published. According to news reporting originating in Herston, Australia, by NewsRx journalists, research stated, "Aberrant gene expression in cancer is due in part to irregular patterns of DNA methylation and miRNA target gene down regulation. Using data from The Cancer Genome Atlas (TGCA), we investigated co-localized mRNA, miRNA and DNA methylation data across 15 cancer types, focusing on cases where evidence for direct regulation was strong."

The news reporters obtained a quote from the research from Commonwealth Scientific and Industrial Research Organisation (CSIRO), "Restricting attention to regions where miRNA markers co-localize within a corresponding mRNA transcript, we checked expression data from 2839 samples for 354 mRNAs, 389 miRNAs and 13,809 DNA methylation probes for correlations greater than an absolute 0.6. We identified 32 genes, 34 miRNAs and 143 DNA methylation site probes comprising 180 'triplet combinations' that together provide evidence of co-localized genomic regulation in cancer. The five triplet combinations showing the highest prevalence across tissue types were found in four genes, HOXC5, PDE2A, SH3TC2 and TP63. Of the total 32 genes, eight among two tumor types (Kidney Renal Clear Cell Carcinoma (KIRC, 4) and Low Grade Glioma (LGG, 4)) were significantly associated with survival time (p < 0.002)."

According to the news reporters, the research concluded: "Together, the data presented in this paper provide evidence toward our primary hypothesis, that both genes and miRNAs strongly correlated with methylation level are more likely to be associated with cancer outcomes."

Our news correspondents report that additional information may be obtained by contacting J.D. Doecke, CSIRO, Royal Brisbane & Womens Hospital, Hlth & Biosecur
Autoimmune Diseases and Conditions - Multiple

Findings from Complutense University Yields New Data on Multiple Sclerosis (Analysis of the Relationship between the Month of Birth and Risk of Multiple Sclerosis in a Spanish Population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Autoimmune Diseases and Conditions - Multiple Sclerosis is now available. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "Some studies have suggested an association between the month of birth and risk of multiple sclerosis (MS), related to environmental factors, mainly sun exposure and maternal vitamin D levels. Few studies have been conducted in Southern Europe countries."

The news reporters obtained a quote from the research from Complutense University, "Madrid has a continental climate with considerable variation of sun hours between winter and summer, so it may be relevant to study this relationship. MS patients, born between 1932 and 2003, 1,335 of them from our database between 2004 and 2015, were analysed. The weighted average number of births per month in Madrid from 1996 and 2012 (n = 1,098,774) was considered the control population. The month and season of birth were analysed using chi-square, Hewitt's and Roberson's seasonality tests. Birth rate increased in June, July, and September, and decreased in November, January, and February. Births were 29% more frequent in summer (July-September) than in winter (January-March), with a ratio of 0.79. Hewitt's test for seasonality gave a rank sum of 53 between May and October (p = 0.12). Rogerson's variation was applied to 3-, 4-, and 5- month periods. Substantial differences were noted in the 5- month periods (k = 5), although the largest rank sum (June-October) was not significant (p = 0.09)."

According to the news reporters, the research concluded: "Our analysis seemed to suggest that pre-natal sun exposure may have an influence on the incidence of MS, most likely in combination with other environmental or genetic factors."

Our news correspondents report that additional information may be obtained by contacting R.N. Villar-Quiles, Complutense University Madrid, Dept. of Neurol, Inst Neurosci, Hosp Clin San CarlosSan Carlos Inst Hlth Res IdI, Madrid, Spain. Additional authors for this research include J.A. Matias-Guiu, G. Ortega, I. Gonzalez-Suarez, C. Oreja-Guevara and J.
Matias-Guiu.

**Liver Diseases and Conditions - Hepatitis**

**Findings from Croix Rousse Hospital Update Understanding of Hepatitis (Efficiency and Safety of an Early Dose Adjustment of Ribavirin in Patients Infected With Hepatitis C Underexposed to the Drug and Treated With Peginterferon Ribavirin)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Liver Diseases and Conditions - Hepatitis is the subject of a report. According to news reporting originating in Lyon, France, by NewsRx journalists, research stated, "Ribavirin exposure after the first dose (D(0)AUC(0-4h)) >1755 mcg.h(-1).L-1 is predictive of sustained virological response (SVR) in patients with hepatitis C treated with peginterferon and ribavirin. The aim of this study was to test the benefit of ribavirin early dose adjustment based on this target in naive patients infected with genotype 1. A multicenter randomized controlled trial with two parallel groups; fixed-dose (FD) group: standard of care in 2010-2011, ie, peginterferon-alpha 2a 180 mcg.wk(-1) and weight-based ribavirin 1000-1200 mg/d during 48 weeks; adapted-dose (AD) group: increase of ribavirin dose if D(0)AUC(0-4h),1755 mcg.h(-1).L-1."

The news reporters obtained a quote from the research from Croix Rousse Hospital, "A total of 221 patients were included, 110 in the AD group and 111 in the FD group with similar baseline characteristics. In the perprotocol analysis, SVR was higher in the AD group (55.1% versus 40.4%; P = 0.042), especially in patients with D(0)AUC(0-4h),1755 mcg.h(-1).L-1 (54.3% versus 31.9%; P = 0.029). In the intention-to-treat analysis, the difference was not significant (50% versus 41%; P = 0.197). Ribavirin trough concentrations (C0s) at week 4 of treatment (intention-to-treat analysis) were higher in patients achieving SVR (2.06 versus 1.72 mg/L, P = 0.003). In the subgroup of patients with AUC(0-4h),1755 mcg.h(-1).L-1, 46% of patients with AD achieved a C0.2.0 mg/L versus 22% of patients with FD (P = 0.013). Grade 1 anemia (but not other grades) was more frequent in the AD group (70% versus 48%, P = 0.001). The number of dose reductions or discontinuation of ribavirin was similar in both groups. Early ribavirin dose adjustment increases SVR in patients underexposed to ribavirin without increasing grade II-IV anemia."

According to the news reporters, the research concluded: "Such a strategy could be useful in patients with no access to new antiviral drugs."

Findings from Curtin University Update Knowledge of Botany
(Differential effector gene expression underpins epistasis in a plant fungal disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Botany have been published. According to news reporting originating in Bentley, Australia, by NewsRx journalists, research stated, "Fungal effector-host sensitivity gene interactions play a key role in determining the outcome of septoria nodorum blotch disease (SNB) caused by Parastagonospora nodorum on wheat. The pathosystem is complex and mediated by interaction of multiple fungal necrotrophic effector-host sensitivity gene systems."

Funders for this research include Centre for Crop and Disease Management (CCDM), University of Adelaide, Australian Research Council.

The news reporters obtained a quote from the research from Curtin University, "Three effector sensitivity gene systems are well characterized in this pathosystem; SnToxA-Tsn1, SnTox1-Snn1 and SnTox3-Snn3. We tested a wheat mapping population that segregated for Snn1 and Snn3 with SN15, an aggressive P. nodorum isolate that produces SnToxA, SnTox1 and SnTox3, to study the inheritance of sensitivity to SnTox1 and SnTox3 and disease susceptibility. Interval quantitative trait locus (QTL) mapping showed that the SnTox1-Snn1 interaction was paramount in SNB development on both seedlings and adult plants. No effect of the SnTox3-Snn3 interaction was observed under SN15 infection. The SnTox3-Snn3 interaction was however, detected in a strain of SN15 in which SnTox1 had been deleted (tox1-6). Gene expression analysis indicates increased SnTox3 expression in tox1-6 compared with SN15. This indicates that the failure to detect the SnTox3-Snn3 interaction in SN15 is due - at least in part - to suppressed expression of SnTox3 mediated by SnTox1. Furthermore, infection of the mapping population with a strain deleted in SnToxA, SnTox1 and SnTox3 (toxa13) unmasked a significant SNB QTL on 2DS where the SnTox2 effector sensitivity gene, Snn2, is located. This QTL was not observed in SN15 and tox1-6 infections and thus suggesting that SnToxA and/or
SnTox3 were epistatic."

According to the news reporters, the research concluded: "Additional QTLs responding to SNB and effectors sensitivity were detected on 2AS1 and 3AL."

Our news correspondents report that additional information may be obtained by contacting R.P. Oliver, Curtin University, Dept. of Environm & Agr, Center Crop & Dis Management, Bentley, WA 6102, Australia. Additional authors for this research include K. Rybak, E. Furuki, S. Breen, P.S. Solomon, R.P. Oliver and K.C. Tan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/tpj.13203. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Neuroblastomas**

*Findings from D. Di Paolo and Co-Authors Broaden Understanding of Neuroblastomas (New therapeutic strategies in neuroblastoma: combined targeting of a novel tyrosine kinase inhibitor and liposomal siRNAs against ALK)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Neuroblastomas are presented in a new report. According to news reporting originating from Genoa, Italy, by NewsRx correspondents, research stated, "Many different aberrations in the Anaplastic Lymphoma Kinase (ALK) were found to be oncogenic drivers in several cancers including neuroblastoma (NB), therefore ALK is now considered a critical player in NB oncogenesis and a promising therapeutic target. The ALK-inhibitor crizotinib has a limited activity against the various ALK mutations identified in NB patients."

Our news editors obtained a quote from the research, "We tested: the activity of the novel ALK-inhibitor X-396 administered alone or in combination with Targeted Liposomes carrying ALK-siRNAs (TL[ALK-siRNA]) that are active irrespective of ALK gene mutational status; the pharmacokinetic profiles and the biodistribution of X-396; the efficacy of X-396 versus crizotinib treatment in NB xenografts; whether the combination of X-396 with the TL [ALK-siRNA] could promote long-term survival in NB mouse models. X-396 revealed good bioavailability, moderate half-life, high mean plasma and tumor concentrations. X-396 was more effective than crizotinib in inhibiting in vitro cell proliferation of NB cells and in reducing tumor volume in subcutaneous NB models in a dose-dependent manner. In orthotopic NB xenografts, X-396 significantly increased life span independently of the ALK mutation status. In combination studies, all effects were significantly improved in the mice treated with TL[ALK-siRNA] and X-396 compared to mice receiving the single agents."
According to the news editors, the research concluded: "Our findings provide a rational basis to design innovative molecular-based treatment combinations for clinical application in ALK-driven NB tumors."

For more information on this research see: New therapeutic strategies in neuroblastoma: combined targeting of a novel tyrosine kinase inhibitor and liposomal siRNAs against ALK. *Oncotarget*, 2015;6(30):28774-89.

The news editors report that additional information may be obtained by contacting D. Di Paolo, Laboratorio di Oncologia, Istituto G Gaslini, Genoa, Italy. Additional authors for this research include D. Yang, F. Pastorino, L. Emionite, M. Cilli, A. Daga, E. Destafanis, A. Di Fiore, F. Piaggio, C. Brignole, X. Xu, C. Liang, J. Gibbons, M. Ponzoni and P. Perri.

Keywords for this news article include: Biotechnology, Genoa, Italy, siRNA, Europe, Therapy, Genetics, Oncology, Proteins, Liposomes, Hematology, Proteomics, Xenografts, Neuroblastomas, Tyrosine Kinase, Xenotransplantation, Aromatic Amino Acids, Enzymes and Coenzymes, Small Interference RNAs.

Skin Diseases and Conditions - Psoriasis

**Findings from D. Gabriel and Colleagues Update Understanding of Psoriasis (Improved topical delivery of tacrolimus: A novel composite hydrogel formulation for the treatment of psoriasis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Skin Diseases and Conditions - Psoriasis is now available. According to news reporting out of Geneva, Switzerland, by NewsRx editors, research stated, "We have developed a composite hydrogel for improved topical delivery of the poorly soluble drug Tacrolimus (TAC) to psoriasis lesions. TAC is efficiently solubilized in methoxy poly-(ethylene glycol) hexyl substituted poly-(lactic acid) (mPEGhexPLA) based nanocarriers."

Our news journalists obtained a quote from the research, "For convenient and patient-friendly topical administration, TAC loaded polymeric nanocarriers were incorporated in a Carbopol ® based hydrogel, to yield a composite hydrogel formulation (TAC composite hydrogel). TAC composite hydrogel was designed to have superior pharmaceutical formulation properties, delivery efficiency and local bioavailability, compared to currently available paraffin-based TAC ointments. Composite hydrogel formulations had good local tolerance and showed no signs of immediate toxicity after repeated topical administration in healthy mice. Skin delivery of TAC composite hydrogel in an imiquimod-induced psoriasis mouse model was found to be twice as high as for the commercial formulation Protopic ™, used as benchmark."

According to the news editors, the research concluded: "TAC composite hydrogel showed significant improvement in the in vivo and histopathological features of the imiquimod-induced psoriasis model."

Oncology - Lung Cancer

Findings from D.M. Jiao and Colleagues Update Understanding of Lung Cancer (Curcumin inhibited HGF-induced EMT and angiogenesis through regulating c-Met dependent PI3K/Akt/mTOR signaling pathways in lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news reporting from Zhejiang, People's Republic of China, by NewsRx journalists, research stated, "The epithelial-mesenchymal transition (EMT) and angiogenesis have emerged as two pivotal events in cancer progression. Curcumin has been extensively studied in preclinical models and clinical trials of cancer prevention due to its favorable toxicity profile."

The news correspondents obtained a quote from the research, "However, the possible involvement of curcumin in the EMT and angiogenesis in lung cancer remains unclear. This study found that curcumin inhibited hepatocyte growth factor (HGF)-induced migration and EMT-related morphological changes in A549 and PC-9 cells. Moreover, pretreatment with curcumin blocked HGF-induced c-Met phosphorylation and downstream activation of Akt, mTOR, and S6. These effects mimicked that of c-Met inhibitor SU11274 or PI3 kinase inhibitor LY294002 or mTOR inhibitor rapamycin treatment. c-Met gene overexpression analysis further demonstrated that curcumin suppressed lung cancer cell EMT by inhibiting c-Met/Akt/mTOR signaling pathways. In human umbilical vein endothelial cells (HUVECs), we found that curcumin also significantly inhibited PI3K/Akt/mTOR signaling and induced apoptosis and reduced migration and tube formation of HGF-treated HUVEC. Finally, in the experimental mouse model, we showed that curcumin inhibited HGF-stimulated tumor growth and induced an increase in E-cadherin expression and a decrease in vimentin, CD34, and vascular endothelial growth factor (VEGF) expression."

According to the news reporters, the research concluded: "Collectively, these findings indicated that curcumin could inhibit HGF-promoted EMT and angiogenesis by targeting c-Met and blocking PI3K/Akt/mTOR pathways."
For more information on this research see: Curcumin inhibited HGF-induced EMT and angiogenesis through regulating c-Met dependent PI3K/Akt/mTOR signaling pathways in lung cancer. Molecular Therapy-Oncolytics, 2016;3():1-12. Molecular Therapy-Oncolytics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

Our news journalists report that additional information may be obtained by contacting Q.Y. Chen, 117th Hosp PLA, Dept. of Resp Dis, Zhejiang, People's Republic of China. Additional authors for this research include J. Wang, W. Lu, X.L. Tang, J. Chen, H. Mou and Q.Y. Chen.

Keywords for this news article include: Zhejiang, People's Republic of China, Asia, Intercellular Signaling Peptides and Proteins, Hepatocyte Growth Factor, Organic Chemicals, Diarylheptanoids, Lung Neoplasms, Angiogenesis, Hydrocarbons, Lung Cancer, Catechols, Oncology, Curcumin, Alkanes.

Cardiovascular Research

Findings from Dalhousie University Broaden Understanding of Cardiovascular Research (Quality of Care for Percutaneous Coronary Intervention: Development of Canadian Cardiovascular Society Quality Indicators)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Research are discussed in a new report. According to news reporting originating from Halifax, Canada, by NewsRx correspondents, research stated, "Currently there are more than 40 centres in Canada that perform more than 65,000 percutaneous coronary interventions (PCIs) in a year. Considering the high volume of procedures and number of operators, the potential for variation in processes of care is high, and might lead to variation in the quality of care."

Our news editors obtained a quote from the research from Dalhousie University, "As part of its quality initiative, the Canadian Cardiovascular Society convened a working group to develop a set of PCI Quality Indicators (QIs) that would be relevant, scientifically acceptable, and feasible to measure and report. The working group was comprised of clinical experts from across Canada and members of provincial and federal organizations involved in promoting the quality of health care. Using the Canadian Cardiovascular Society 'Best Practices for Developing Cardiovascular Quality Indicators' methodology, a total of 23 QIs were proposed. Subsequent ranking and discussion led to the selection of 8 QIs. The selection and ranking of QIs were on the basis of clinical importance and relevance, scientific acceptability, and feasibility of their operationalization at a national level. The data definitions and technical notes of the QIs were refined after feasibility testing and Web consultation."

According to the news editors, the research concluded: "Feasibility testing indicated that standardization and enhancements of knowledge infrastructure are essential to provide the comprehensive patient data necessary to evaluate the quality of PCI across Canada."

For more information on this research see: Quality of Care for Percutaneous Coronary Intervention: Development of Canadian Cardiovascular Society Quality Indicators. Canadian Journal of Cardiology, 2016;32(12):1570-1573. Canadian Journal of Cardiology
Findings from Dalhousie University Broaden Understanding of Ovarian Cancer (Contribution of reactive oxygen species to ovarian cancer cell growth arrest and killing by the anti-malarial drug artesunate)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Ovarian Cancer is the subject of a report. According to news reporting originating in Halifax, Canada, by NewsRx journalists, research stated, "Ovarian cancer is a leading cause of cancer-related death in women and the most lethal gynecological malignancy in the developed world. The morbidity and mortality of ovarian cancer underscore the need for novel treatment options."

The news reporters obtained a quote from the research from Dalhousie University, "Artesunate (ART) is a well-tolerated anti-malarial drug that also has anti-cancer activity. In this study, we show that ART inhibited the in vitro growth of a panel of ovarian cancer cell lines, as well as the growth of ovarian cancer cells isolated from patients. Moreover, ART decreased tumor growth in vivo in a mouse model of ovarian cancer. ART-treated ovarian cancer cells showed a strong induction of reactive oxygen species (ROS) and reduced proliferation. ROS-dependent cell cycle arrest occurred in the G2/M phase whereas ROS-independent cell cycle arrest occurred in the G1 phase, depending on the concentration of ART to which ovarian cancer cells were exposed. The anti-proliferative effect of ART was associated with altered expression of several key cell cycle regulatory proteins, including cyclin D3, E2F-1, and p21, as well as inhibition of mechanistic target of rapamycin signaling. Exposure of ovarian cancer cells to higher concentrations of ART resulted in ROS-dependent DNA damage and cell death. Pretreatment of ovarian cancer cells with a pan-caspase inhibitor or ferroptosis inhibitor decreased but did not completely eliminate ART-mediated cytotoxicity, suggesting the involvement of both caspase-dependent and caspase-independent pathways of killing."

According to the news reporters, the research concluded: "These data show that ART has potent anti-proliferative and cytotoxic effects on ovarian cancer cells, and may therefore be useful in the treatment of ovarian cancer."

**Immunization - Vaccines**

**Findings from Dalhousie University Broaden Understanding of Vaccines**

(Respiratory macrophages regulate CD4 T memory responses to mucosal immunization with recombinant adenovirus-based vaccines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immunization - Vaccines is now available. According to news reporting originating from Halifax, Canada, by NewsRx correspondents, research stated, "Respiratory immunization is an attractive way to generate systemic and mucosal protective memory responses that are required for preventing mucosally transmitted infections. However, the molecular and cellular mechanisms for controlling memory T cell responses remain incompletely understood."

Financial supporters for this research include IWK Health Centre, NSHRF, CIHR, CFI.

Our news editors obtained a quote from the research from Dalhousie University, "In this study, we investigated the role of respiratory macrophage (M Phi) in regulating CD4 T cell responses to recombinant adenovirus-based (rAd) vaccines. We demonstrated that rAd intranasal (i.n.) vaccination induced migration and accumulation of respiratory M Phi and circulatory monocytes in the mediastinal lymph nodes and lung parenchyma. Under the influence of respiratory M Phi CD4 T cells exhibited slow proliferation kinetics and an increased tendency of generating central memory, as opposed to effector memory, CD4 T cell responses in vitro and in vivo. Correspondingly, depletion of M Phi using clodronate-containing liposome prior to i.n. immunization significantly enhanced CD4 T cell proliferation and increased the frequency of CD4 memory T cells in the airway lumen, demonstrating that M Phi initially serve as a negative regulator in limiting generation of mucosal tissue-resident memory CD4 T cells. However, clodronate-containing liposome delivery following i.n. immunization markedly reduced the frequencies of memory CD4 T cells in the airway lumen and spleen, indicating that respiratory M Phi and potentially circulating monocytes are critically required for maintaining long-term memory CD4 T cells."

According to the news editors, the research concluded: "Collectively, our data demonstrate that rAd-induced mucosal CD4 T memory responses are regulated by respiratory M
Phi and/or monocytes at multiple stages."

For more information on this research see: Respiratory macrophages regulate CD4 T memory responses to mucosal immunization with recombinant adenovirus-based vaccines. *Cellular Immunology*, 2016;310():53-62. *Cellular Immunology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Neurodegenerative Diseases and Conditions -...**

**Findings from Dalhousie University Update Knowledge of Alzheimer Disease (Reduced fibrillar beta-amyloid in subcortical structures in a butyrylcholinesterase-knockout Alzheimer disease mouse model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news originating from Halifax, Canada, by NewsRx correspondents, research stated, "The serine hydrolase, butyrylcholinesterase (BChE) is known to have a variety of enzymatic and nonenzymatic functions. In the brain, BChE is expressed mainly in glia, white matter and in distinct populations of neurons in areas important in cognition."

Our news journalists obtained a quote from the research from Dalhousie University, "In Alzheimer's disease (AD), many beta-amyloid (Ab) plaques become associated with BChE activity, the significance of which is unclear. A mouse model of AD containing five familial AD genes (5XFAD) also exhibits Ab plaques associated with BChE. We developed a comparable strain (5XFAD/BChE-KO) that is unable to synthesize BChE and reported diminished fibrillar Ab deposits in the cerebral cortex of 5XFAD/BChE-KO mice, compared to 5XFAD counterparts at the same age. This effect was most significant in male mice. The present study extends comparison of the two strains with a detailed examination of fibrillar Ab plaque burden in other regions of the brain that typically accumulate pathology and exhibit neurodegeneration. This work demonstrates that, as in the cerebral cortex, the absence of BChE leads to diminished fibrillar Ab deposition in amygdala, hippocampal formation, thalamus and basal ganglia."

According to the news editors, the research concluded: "This reduction is statistically
significant in males, with a trend towards such reduction in female mice."

For more information on this research see: Reduced fibrillar beta-amyloid in subcortical structures in a butyrylcholinesterase-knockout Alzheimer disease mouse model. *Chemico-Biological Interactions*, 2016;259():307-312. *Chemico-Biological Interactions* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Oncology - Carcinomas**

**Findings from Dalian Medical University Has Provided New Data on Carcinomas (The expression and significance of WT1 in xenotransplanted ovarian carcinoma treated by paclitaxel)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Carcinomas. According to news reporting out of Dalian, People's Republic of China, by NewsRx editors, research stated, "In this study, the authors investigated the expression and significance of WT1 in xenotransplanted ovarian carcinoma cell SKOV3 of nude mice treated with paclitaxel. Xenotransplanted ovarian carcinoma was established in nude mice using the SKOV3 cell line."

Our news journalists obtained a quote from the research from Dalian Medical University, "The mice were randomized into the treatment group with paclitaxel and control group with normal sodium. The sizes of the xenotransplanted tumors were measured and the tumor specimens were confirmed by routine hemotoxyl-eosin (H&E) staining. The apoptosis index was then assayed using flow cytometry. WT1 and bcl-2 expression were detected with immunohistochemistry, and WT1 mRNA expression was determined by reverse transcriptase polymerase chain reaction (RT-PCR). The authors found that the growth of the xenotransplanted tumor was inhibited by paclitaxel therapy. Compared to the control group, the apoptosis rate was significantly increased in the treatment group (p < 0.05). At the same time, the expression of WT1, bcl-2 and WT1, mRNA were significantly decreased in the paclitaxel therapy group (p < 0.05)."

According to the news editors, the research concluded: "The authors conclude that the WT1 gene may play an important role during apoptosis of ovarian carcinoma and the mechanism may be closely related to bcl-2."

Phenethylamines

Findings from Dalian Medical University Update Understanding of Phenethylamines (Effects of P-glycoprotein on the intestine and blood-brain barrier transport of YZG-331, a promising sedative-hypnotic compound)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Phenethylamines. According to news reporting originating from Dalian, People's Republic of China, by NewsRx correspondents, research stated, "YZG-331 is a synthetic adenosine analogue which exhibits the sedative and hypnotic effects by binding to the adenosine receptor. The present study was designed to investigate the effects of P-glycoprotein (P-gp) on the intestine and brain distribution of YZG-331 in vitro and in vivo as well as related binding mechanisms."

Funders for this research include National Natural Science Foundation of China, National Science and Technology Major Project for “Major New Drugs Innovation and Development”, Public Science and Technology Research Funds Projects.

Our news editors obtained a quote from the research from Dalian Medical University, "The activity of P-gp ATPase was both induced by YZG-331 and verapamil, a typical P-gp inhibitor, but affinity of YZG-331 for P-gp was lower than that of verapamil. The docking analyses further elucidated the binding relationship of YZG-331 and P-gp. The directional transport of YZG-331 was disappeared in Caco-2 and MDCK-MDRI cells when the P-gp activity was blocked. However, the penetration of digoxin, a P-gp known substrate, was not change in MDCK-MDR1 cells along with YZG-331. In the everted intestinal sac model, the influx of YZG-331 was significantly reduced in the presence of verapamil in all the segments except for the colon. In the in situ and in vivo study, the brain exposure of YZG-331 was promoted after co-administered of verapamil. Furthermore, the Kp value changed from 0.03 to 0.05 after drug combination. Taken together, these results indicated that YZG-331 is a substrate but may not an inhibitor of P-gp. The intestine and brain permeability of YZG-331 can be restricted, at least in part, by P-gp."

According to the news editors, the research concluded: "The drug interactions should be awarded when YZG-331 and other P-gp-related drugs used together."

For more information on this research see: Effects of P-glycoprotein on the intestine and blood-brain barrier transport of YZG-331, a promising sedative-hypnotic compound. European Journal of Pharmacology, 2016;791():339-347. European Journal of Pharmacology
Amyotrophic Lateral Sclerosis

Findings from Dana-Farber Cancer Institute Provide New Insights into Amyotrophic Lateral Sclerosis (Two familial ALS proteins function in prevention/repair of transcription-associated DNA damage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Amyotrophic Lateral Sclerosis have been published. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Amyotrophic lateral sclerosis (ALS) is a progressive motor neuron dysfunction disease that leads to paralysis and death. There is currently no established molecular pathogenesis pathway."

Financial supporters for this research include Target ALS, NIH, ALS Therapy Alliance, Harvard NeuroDiscovery Center Neurodegenerative Disease Pilot Study Grant, Murray Winston Foundation, DOD BCRP, NIH NCI.

The news reporters obtained a quote from the research from Dana-Farber Cancer Institute, "Multiple proteins involved in RNA processing are linked to ALS, including FUS and TDP43, and we propose a disease mechanism in which loss of function of at least one of these proteins leads to an accumulation of transcription-associated DNA damage contributing to motor neuron cell death and progressive neurological symptoms. In support of this hypothesis, we find that FUS or TDP43 depletion leads to increased sensitivity to a transcription-arresting agent due to increased DNA damage. Thus, these proteins normally contribute to the prevention or repair of transcription-associated DNA damage. In addition, both FUS and TDP43 colocalize with active RNA polymerase II at sites of DNA damage along with the DNA damage repair protein, BRCA1, and FUS and TDP43 participate in the prevention or repair of R loop-associated DNA damage, a manifestation of aberrant transcription and/or RNA processing."

According to the news reporters, the research concluded: "Gaining a better
understanding of the role(s) that FUS and TDP43 play in transcription-associated DNA damage could shed light on the mechanisms underlying ALS pathogenesis."

Our news correspondents report that additional information may be obtained by contacting S.J. Hill, Dana Farber Canc Inst, Dept. of Canc Biol, Boston, MA 02215, United States. Additional authors for this research include D.A. Mordes, L.A. Cameron, D.S. Neuberg, S. Landini, K. Eggan and D.M. Livingston.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1073/pnas.1611673113. This DOI is a link to an online electronic document that is either free or for purchase.

**Hematologic Diseases and Conditions --**

**Findings from Dana-Farber Cancer Institute in the Area of Thrombocytopenia Described (Aminocaproic acid use in hospitalized patients with hematological malignancy: a case series)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematologic Diseases and Conditions - Thrombocytopenia have been published. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "The antifibrinolytic aminocaproic acid is widely used in surgical settings to prevent blood loss and decrease transfusion requirements, and small observational studies have suggested that aminocaproic acid may be useful in the setting of malignancy-related bleeding. At our institution, aminocaproic acid is sometimes prescribed to patients with hematological malignancy who experience refractory thrombocytopenia with or without bleeding."

The news correspondents obtained a quote from the research from Dana-Farber Cancer Institute, "We performed a 5-year retrospective review of 54 adult patients with 13 types of hematological malignancy who received aminocaproic acid at our institution. Indications for use included 31 (57.4%) for refractory thrombocytopenia with bleeding, 16 (29.6%) for refractory thrombocytopenia without bleeding, and 7 (13%) for bleeding alone. Patients received both oral and intravenous formulations. Administered doses ranged broadly and median duration of use was 6 days. Three patients (5.7%) developed deep venous thrombosis but none of the thrombotic events were clearly related to administration of aminocaproic acid. We conclude that
aminocaproic acid may be a relatively safe and cost-effective adjunct treatment in the setting of bleeding related to the diagnosis and treatment of hematological malignancy."

According to the news reporters, the research concluded: "Prospective trials as well as formalized protocols for the use of aminocaproic acid may be indicated."

Our news journalists report that additional information may be obtained by contacting A. Marshall, Dana Farber Canc Inst, Boston, MA 02215, United States. Additional authors for this research include A. Li, A. Drucker and W. Dzik.

Keywords for this news article include: Boston, Massachusetts, United States, North and Central America, Hematologic Diseases and Conditions, Blood Platelet Disorders, Aminocaproic Acids, Thrombocytopenia, Amino Acids, Hematology, Caproates, Dana-Farber Cancer Institute.

DNA Research

Findings from Dankook University College of Medicine in DNA Research Reported (Early Prediction of Hypertensive Disorders of Pregnancy Using Cell-Free Fetal DNA, Cell-Free Total DNA, and Biochemical Markers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on DNA Research are presented in a new report. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "To evaluate the predictive value of separate and combined tests using cell-free fetal DNA (cffDNA), cell-free total DNA (cfDNA), and biochemical markers for the early detection of pregnancies with hypertensive disorders. A nested case-control study was conducted with 135 singleton pregnancies including 17 gestational hypertension cases, 34 preeclampsia (PE) cases, and 84 controls."

The news correspondents obtained a quote from the research from the Dankook University College of Medicine, "We performed real-time quantitative PCR to measure levels of DSCR3 and RASSF1A as cffDNA markers and HYP2 as a cfDNA marker in the first and early second trimesters. Levels of pregnancy-associated plasma protein A (PAPP-A), a-fetoprotein, b-human chorionic gonadotropin, unconjugated estriol, and inhibin A were also determined. Compared with controls, the median levels and multiples of the median (MoM) values of HYP2 were significantly higher in the PE and hypertensive disorders of pregnancy (HDP) groups at 6-14 and 15-23 weeks. First-trimester PAPP-A MoM was significantly lower in PE and HDP than in controls. For PE and HDP, the best model included the first-trimester DSCR3, HYP2, and PAPP-A MoM values achieving detection rates of 67 and 58% at a fixed 10% false-positive rate, respectively [area under the receiver operating characteristic curve 0.832 (95% CI 0.689-0.928) for PE; 0.751 (0.607-0.863) for HDP]."

According to the news reporters, the research concluded: "The study demonstrates
the potential utility of combined first-trimester cffDNA, cfDNA, and PAPP-A for the early prediction of PE."

Our news journalists report that additional information may be obtained by contacting S.Y. Kim, Laboratory of Medical Genetics, Medical Research Institute, Cheil General Hospital and Women's Healthcare Center, Dankook University College of Medicine, Seoul, South Korea. Heart Disorders and Diseases - Heart Attack

**Findings from Department of Cardiology Broaden Understanding of Heart Attack (Association of ADAMTS-7 Levels with Cardiac Function in a Rat Model of Acute Myocardial Infarction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Attack are presented in a new report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "High ADAMTS-7 levels are associated with acute myocardial infarction (AMI), although its involvement in ventricular remodeling is unclear. In this study, we investigated the association between ADAMTS-7 expression and cardiac function in a rat AMI model."

Our news journalists obtained a quote from the research from the Department of Cardiology, "Sprague-Dawley rats were randomized into AMI (n=40) and sham (n=20) groups. The left anterior descending artery was sutured to model AMI. Before surgery and 7, 14, 28, and 42 days post-surgery, ADAMTS-7 and brain natriuretic peptide (BNP), and cartilage oligomeric matrix protein (COMP) were assessed by ELISA, western blot, real-time RT-PCR, and/or immunohistochemistry. Cardiac functional and structural parameters were assessed by M-mode echocardiography. After AMI, plasma ADAMTS-7 levels increased, peaking on day 28 (AMI: 13.2 ± 6.3 vs. sham: 3.4 ± 1.3 ng/ml, p<0.05). Compared with the sham group, ADAMTS-7 expression was higher in the infarct zone at day 28. COMP present in normal myocardium was degraded by day 28 post-AMI. Plasma ADAMTS-7 correlated positively with BNP (r=0.642, p=0.025), left ventricular end-diastolic diameter (r=0.695, p=0.041), left ventricular end-systolic diameter (r=0.710, p=0.039), left ventricular ejection fraction (r=0.695, p=0.036), and left ventricular short-axis fractional shortening (r=0.721, p=0.024)."

According to the news editors, the research concluded: "ADAMTS-7 levels may
reflect the degree of ventricular remodeling after AMI."

The news correspondents report that additional information may be obtained from W. Wu, Dept. of Cardiology, China-Japan Friendship Hospital, Beijing, Beijing, People's Republic of China. Additional authors for this research include H. Wang, C. Yu, J. Li, Y. Gao, Y. Ke, Y. Wang, Y. Zhou and J. Zheng.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000443047. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Asia, Beijing, Surgery, Cardiology, Heart Attack, Heart Disease, Myocardial Ischemia, Myocardial Infarction, People's Republic of China, Heart Disorders and Diseases, Vascular Diseases and Conditions.

**Oncology - Thyroid Cancer**

**Findings from Department of Endocrinology Broaden Understanding of Thyroid Cancer (Time course of Graves' orbitopathy after total thyroidectomy and radioiodine therapy for thyroid cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Thyroid Cancer have been presented. According to news reporting originating in Clermont Ferrand, France, by NewsRx journalists, research stated, "The risk of cancer is relatively higher in Graves' patients presenting simultaneously with thyroid nodules. Radioiodine (RAI) therapy recommended in high-risk differentiated thyroid carcinoma may be associated with worsening of a pre-existing Graves' orbitopathy (GO) or developing a new onset."

The news reporters obtained a quote from the research from the Department of Endocrinology, "The impact of RAI therapy in patients with differentiated thyroid cancer on the course of a pre-existing GO has not been specifically investigated. The aim of this study is to assess the influence of RAI treatment administered for differentiated thyroid cancer on the course of a pre-existing GO. This is a retrospective multicenter study including 35 patients from the University Hospital of Clermont-Ferrand (7 patients) and Lyon-Est (6 patients) in France and from a literature review published as case reports or studies (22 patients). Seven patients exhibited a worsened pre-existing GO after total thyroidectomy followed by RAI treatment for thyroid cancer. Older men, those who initially presented with a lower clinical score of GO before RAI therapy, received higher doses of I-131 especially when prepared with recombinant thyroid-stimulating hormone, and/or not prepared with glucocorticoids during RAI are at a higher risk to worsen their GO. This study is the first and complete study collection."

According to the news reporters, the research concluded: "We describe worsening of GO in 20% of patients after RAI treatment for thyroid cancer and determine a pool of predictive factors."
For more information on this research see: Time course of Graves' orbitopathy after total thyroidectomy and radiiodine therapy for thyroid cancer. *Medicine*, 2016;95(48):137-143. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Our news correspondents report that additional information may be obtained by contacting C. Louvet, CHU Clermont Ferrand, Dept. of Endocrinol, F-63000 Clermont Ferrand, France. Additional authors for this research include A. De Bellis, B. Pereira, C. Bournaud, A. Kelly, S. Maqdasy, B. Roche, F. Desbiez, F. Borson-Chazot, I. Tauveron and M. Batisse-Lignier.

Keywords for this news article include: Clermont Ferrand, France, Europe, Therapy, Risk and Prevention, Thyroid Neoplasms, Thyroid Cancer, Thyroidectomy, Oncology, Surgery, Department of Endocrinology.

Our news editors obtained a quote from the research from the Department of Gastroenterology, "However, the outcomes of non-curative ESD are not known in detail. We analyzed the outcomes of 165 EGCs in 165 patients after non-curative ESD, as well as the clinical course. Of these patients, 109 underwent additional surgical resection (group S) and 56 patients were followed up without additional surgery (group F). The complete resection rate was 90.7% (39/43) for intramucosal cancer (M), 97.3% (36/37) for minimally submucosal invasive cancer (SM1), and 74.1% (63/85) for deep submucosal invasive cancer (SM2). The lymph node metastasis rate was 0% for M, 5.4% for SM1, and 10.6% for SM2 cancers. Regarding long-term survival, although the number of patients who died of another disease was significantly higher in group F than in group S, there was no significant difference in overall survival between the groups. The resectability of ESD for EGCs with an invasion depth of M to SM1 after non-curative ESD was excellent, and lesions without lymphovascular invasion did not metastasize or recur, resulting in a favorable prognosis. Our data may help in deciding whether additional surgery should be performed for borderline lesions after non-curative ESD."

According to the news editors, the research concluded: "Furthermore, we suggest the possibility of further expanding the indications for ESD."

For more information on this research see: Clinicopathological Outcomes of Patients...

The news editors report that additional information may be obtained by contacting S. Hoteya, Dept. of Gastroenterology, Toranomon Hospital, Tokyo, Japan. **Oncology - Gastric Cancer**

**Findings from Department of General Surgery in the Area of Gastric Cancer Described (TRIM25 blockade by RNA interference inhibited migration and invasion of gastric cancer cells through TGF-b signaling)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Tripartite Motif Containing 25 (TRIM25), a member of TRIM proteins, has been found abnormally expressed in cancers of female reproductive system. Here, TRIM25 was conspicuously expressed in human gastric cancer (GC) tissues in which its higher expression generally correlated with the poor prognosis of patients."

Our news journalists obtained a quote from the research from the Department of General Surgery, "Small interfering RNA (siRNA)-mediated knockdown of TRIM25 expression in MGC-803 and AGS cells had no effects on cell proliferation, whereas reduced cell migration and invasion. Gene set enrichment analysis on The Cancer Genome Atlas stomach adenocarcinoma (STAD) dataset revealed that several signaling pathways, including the migration, E-cadherin and transforming growth factor-b (TGF-b) pathways, were enriched in TRIM25 higher expression patients. Moreover, ectopic expression of TRIM25 in a GC cell line with lower expression of TRIM25 significantly promoted the migration and invasion. Further experiments with TGF-b inhibitor suggested that TRIM25 may exert its function through TGF-b pathway."

According to the news editors, the research concluded: "In summary, our results indicate that TRIM25 acts as an oncogene in GC and thus presents a novel target for the detection and treatment of GC."

For more information on this research see: TRIM25 blockade by RNA interference inhibited migration and invasion of gastric cancer cells through TGF-b signaling. *Scientific Reports*, 2016;6():19070. (Nature Publishing Group - www.nature.com; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from Z. Zhu, Dept. of General Surgery, Shanghai Pudong District People's Hospital, Shanghai 201299,
Findings from Department of Medical Genetics Has Provided New Data on Lymphoid Tissue (Spleen hypoplasia leads to abnormal stress hematopoiesis in mice with loss of Pbx homeoproteins in splenic mesenchyme)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lymphoid Tissue are discussed in a new report. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "The spleen plays critical roles in immunity and also provides a permissive microenvironment for hematopoiesis. Previous studies have reported that the TALE-class homeodomain transcription factor Pbx1 is essential in hematopoietic stem and progenitor cells (HSPCs) for stem cell maintenance and progenitor expansion."

Financial support for this research came from National Institutes of Health.

The news correspondents obtained a quote from the research from the Department of Medical Genetics, "However, the role of Pbx1 in the hematopoietic niche has not been investigated. Here we explored the effects that genetic perturbation of the splenic mesenchymal niche has on hematopoiesis upon loss of members of the Pbx family of homeoproteins. Splenic mesenchyme-specific inactivation of Pbx1 (SKO) on a Pbx2-or Pbx3-deficient genetic background (DKO) resulted in abnormal development of the spleen, which is dysmorphic and severely hypoplastic. This phenotype, in turn, affected the number of HSPCs in the fetal and adult spleen at steady state, as well as markedly impairing the kinetics of hematopoietic regeneration in adult mice after sublethal and lethal myelosuppressive irradiation. Spleens of mice with compound Pyx deficiency 8 days following sublethal irradiation displayed significant downregulation of multiple cytokine-encoding genes, including KitL/SCF, Cxcl12/SDF-1, IL-3, IL-4, GM-CSF/Csf2 IL-10, and Igf-1, compared with controls. KitL/SCF and Cxcl12/SDF-1 were recently shown to play key roles in the splenic niche in response to various haematopoietic stresses such as myeloablation, blood loss, or pregnancy. Our results demonstrate that, in addition to their intrinsic roles in HSPCs, non-cell autonomous functions of Pbx factors within the splenic niche contribute to the regulation of hematopoiesis, at least in part via the control of KitL/SCF and Cxcl12/SDF-1."

According to the news reporters, the research concluded: "Furthermore, our study establishes that abnormal spleen development and hypoplasia have deleterious effects on the efficiency of hematopoietic recovery after bone marrow injury."

For more information on this research see: Spleen hypoplasia leads to abnormal stress hematopoiesis in mice with loss of Pbx homeoproteins in splenic mesenchyme. Journal
Drugs and Therapies - Flumazenil Therapy

Findings from Department of Neurology Update Knowledge of Flumazenil Therapy (Flumazenil for the Treatment of Refractory Hypersomnolence: Clinical Experience with 153 Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Flumazenil Therapy have been presented. According to news originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "Patients with central disorders of hypersomnolence sometimes do not achieve satisfactory symptom control with currently available wake-promoting medications. Based on the finding that the cerebrospinal fluid from some patients with hypersomnolence demonstrates potentiation of gamma-aminobutyric acid (GABA)-A receptors in excess of that of controls, a finding that reverses with flumazenil, we initiated prescribing compounded flumazenil to carefully selected, treatment-refractory hypersomnolent patients."

Our news journalists obtained a quote from the research from the Department of Neurology, "This retrospective chart review evaluated the first 153 consecutive patients treated with transdermal and/or sublingual flumazenil by physicians at our center from 2013 through January 2015. Patients were 35.5 y old (+/- 14.4) and 92 (60.1%) were women. Mean Epworth Sleepiness Scale scores prior to flumazenil were 15.1 (+/- 4.5) despite prior or current treatment with traditional wake-promoting therapies. Symptomatic benefit was noted by 96 patients (62.8%), with a mean reduction in Epworth Sleepiness Scale score of 4.7 points (+/- 4.7) among responders. Of these, 59 remained on flumazenil chronically, for a mean of 7.8 mo (+/- 6.9 mo). Female sex and presence of reported sleep inertia differentiated flumazenil responders from nonresponders. Adverse events were common, but often did not result in treatment discontinuation. Serious adverse events included a transient ischemic attack and a lupus vasculopathy, although whether these events occurred because of flumazenil administration is unknown. This chart review demonstrates that sublingual and transdermal flumazenil provided sustained clinical benefit to 39% of patients with treatment-refractory hypersomnolence."

According to the news editors, the research concluded: "Prospective, controlled studies of this GABA-A receptor antagonist for the treatment of hypersomnolence are needed."
For more information on this research see: Flumazenil for the Treatment of Refractory Hypersomnolence: Clinical Experience with 153 Patients. *Journal of Clinical Sleep Medicine*, 2016;12(10):1389-1394. *Journal of Clinical Sleep Medicine* can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

**Hemorrhage**

**Findings from Department of Neurology Yields New Data on Hemorrhage (Temporal kinetics of organ damage in copper toxicity: A histopathological correlation in rat model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hemorrhage are presented in a new report. According to news originating from Uttar Pradesh, India, by NewsRx correspondents, research stated, "Excess of copper is toxic to different organs. We aim to study the histopathological changes of liver, kidney, and brain following oral CuSO4 exposure for different duration and doses in rat model."

Our news journalists obtained a quote from the research from the Department of Neurology, "Fifty-four males Wistar rats (205 +/- 10 g) were included and divided into control (group-I) and experimental (group-II and III) arms. An oral dose of 100 and 200 mg/kgBWt/Day CuSO4 was given to group-II and III respectively and group-I received normal saline by gavage. Six rats from each group were sacrificed on days 30, 60 and 90 for biochemical and histopathological examinations. The histopathological changes were graded on 1-5 scores and correlated with respective laboratory parameters. The organ functions were worsened in experimental group with increasing dose and time. Histopathological study revealed edema, hemorrhage, necrosis and fibrosis/gliosis in experimental group. The worst histopathological severity score ranged from 4 to 5(median 5) in liver, 3-5(median 4) in kidney and 4-5(median 5) in brain. The edema and hemorrhage were more marked at 30 days and fibrosis/gliosis at 90 days."

According to the news editors, the research concluded: "High-dose Cu toxicity results in structural damage to liver, kidney, and brain that correlates with organ dysfunction, Cu, GSH, TAC, and MDA concentrations. Liver damage is more severe and occurs earlier than other organs."

For more information on this research see: Temporal kinetics of organ damage in copper toxicity: A histopathological correlation in rat model. *Regulatory Toxicology and Pharmacology*, 2016;81():372-380. *Regulatory Toxicology and Pharmacology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495,
Central Nervous System Diseases and Conditions -…

Findings from Department of Neurosurgery Yields New Findings on Subdural Hematoma (Optimal perioperative management of antithrombotic agents in patients with chronic subdural hematoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Subdural Hematoma. According to news originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "The use of antithrombotic agents such as anticoagulants and antiplatelet agents is widespread, and the opportunities to treat patients with chronic subdural hematoma (CSDH) under antithrombotic therapy are growing. However, whether antithrombotic therapy contributes to postoperative complications and recurrences of CSDH and how these agents should be managed in the surgical treatment of CSDH remains unclear.”

Our news journalists obtained a quote from the research from the Department of Neurosurgery, "We retrospectively analyzed 150 consecutive patients with CSDH who underwent neurosurgical interventions at Kyushu Rosai Hospital from 2011 to 2015 and followed them for more than 3 months. Of the 150 study patients, 44 received antithrombotic therapy. All anticoagulants and 76% of the antiplatelet agents were discontinued before surgical treatment of CSDH and resumed within 1 week except in 4 patients whose treatment was terminated and 7 patients who developed postoperative complications or underwent reoperations before resumption of these agents. Postoperative hemorrhagic complications associated with surgical treatment of CSDH occurred in 8 patients (5.3%), and there was no significant difference in the incidence of these complications between patients with and without antithrombotic therapy (6.8% vs. 4.7%, respectively; p = 0.90). Postoperative thromboembolic complications occurred in 5 patients (5.4%), including 4 patients with antithrombotic therapy; these complications developed before resumption of antithrombotic agents in 2 patients. There was a significant difference in the incidence of postoperative thromboembolic complications between patients with and without antithrombotic therapy (9.1% vs. 0.9%, respectively; p = 0.04). There were no significant differences in the incidence of radiographic deterioration or reoperation of ipsilateral or contralateral hematomas between patients with and without antithrombotic therapy after surgical treatment of unilateral CSDH. A history of antithrombotic therapy was significantly correlated with the incidence of postoperative thromboembolic..."
complications in patients with CSDH.”

According to the news editors, the research concluded: "Antithrombotic agents should be resumed as soon as possible when no hemorrhagic complication is confirmed after neurosurgical intervention for CSDH.”

The news correspondents report that additional information may be obtained from T. Amano, Kyushu Rosai Hosp, Dept. of Neurosurg, Fukuoka, Japan. Additional authors for this research include K. Takahara, N. Maehara, T. Shimogawa, N. Mukae, T. Sayama, S. Arihiro, S. Arakawa, T. Morioka and S. Haga.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.clineuro.2016.10.002. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Fukuoka, Japan, Asia, Central Nervous System Diseases and Conditions, Subdural Hematoma, Antithrombotic, Neurosurgery, Angiology, Therapy, Department of Neurosurgery.

**Oncology - Acute Myeloid Leukemia**

**Findings from Department of Pathology in the Area of Acute Myeloid Leukemia Reported (Improved Minimal Residual Disease Detection by Targeted Quantitative Polymerase Chain Reaction in Nucleophosmin 1 Type a Mutated Acute Myeloid Leukemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Acute Myeloid Leukemia. According to news reporting originating in Halmstad, Sweden, by NewsRx journalists, research stated, "Multicolor flow cytometry (MFC) and real-time quantitative PCR (RQ-PCR) are important independent techniques to determine minimal residual disease (MRD) in acute myeloid leukemia (AML). MFC is the standard method, but may be unreliable.”

The news reporters obtained a quote from the research from the Department of Pathology, "Therefore, MFC-based determination of MRD with an RQ-PCR-based approach targeting the nucleophosmin 1 (NPM1) type A mutation was set out to compare. Since most current NPM1 RQ-PCR MRD protocols suffer from clear definitions of quantifiability, we sought to define quantifiability in a reproducible and standardized manner. The limit of quantifiability of our RQ-PCR protocol for the NPM1 type A mutation varied between 0.002% and 0.04% residual leukemic cells depending on the features of the standard curve for each PCR experiment. The limit of detection was close to 0.001% leukemic cells. The limit of detection by MFC ranged from 0.01% to 1% depending on the phenotype of the leukemic cells as compared with non-leukemic bone marrow cells. Forty-five MRD samples from 15 patients using both NPM1 mutation specific RQ-PCR and MFC were analyzed. In 32 of the 45 samples (71%), an
MRD-signal could be detected with RQ-PCR. A quantifiable NPM1 mutation signal was found in 15 samples (33%) (range 0.003%-2.6% leukemic cells). By contrast, only two follow-up samples (4%) showed residual leukemic cells (0.04% and 0.3%, respectively) by MFC."

According to the news reporters, the research concluded: "Thus, RQ-PCR of the NPM1 type A mutation was more sensitive and reliable than MFC for determination of MRD, which might have clinical implications."

For more information on this research see: Improved Minimal Residual Disease Detection by Targeted Quantitative Polymerase Chain Reaction in Nucleophosmin 1 Type a Mutated Acute Myeloid Leukemia. *Genes Chromosomes & Cancer*, 2016;55(10):750-766. *Genes Chromosomes & Cancer* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news correspondents report that additional information may be obtained by contacting L. Pettersson, Halland Hosp Halmstad, Dept. of Pathol, Halmstad, Sweden. Additional authors for this research include P. Leveen, O. Axler, D. Dvorakova, G. Juliusson and M. Ehinger.

**Drugs and Therapies - Cell Therapy**

**Findings from Department of Pediatrics Reveals New Findings on Cell Therapy (Toxicity and management in CAR T-cell therapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Cell Therapy are discussed in a new report. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "T cells can be genetically modified to target tumors through the expression of a chimeric antigen receptor (CAR). Most notably, CAR T cells have demonstrated clinical efficacy in hematologic malignancies with more modest responses when targeting solid tumors."

Our news editors obtained a quote from the research from the Department of Pediatrics, "However, CAR T cells also have the capacity to elicit expected and unexpected toxicities including: cytokine release syndrome, neurologic toxicity, 'on target/off tumor' recognition, and anaphylaxis. Theoretical toxicities including clonal expansion secondary to insertional oncogenesis, graft versus host disease, and off-target antigen recognition have not been clinically evident. Abrogating toxicity has become a critical step in the successful application of this emerging technology."

According to the news editors, the research concluded: "To this end, we review the reported and theoretical toxicities of CAR T cells and their management."

For more information on this research see: Toxicity and management in CAR T-cell therapy. *Molecular Therapy-Oncolytics*, 2016;3():1-7. *Molecular Therapy-Oncolytics* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

Salicylic Acids

Findings from Department of Pharmacology Yields New Data on Salicylic Acids (Aspirin prevents bone loss with little mechanical improvement in high-fat-fed ovariectomized rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Salicylic Acids have been presented. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Obesity and osteoporosis are often concurrently happened in the menopausal women. Obesity in menopausal women is not only related to a high risk of cardiovascular disease, but also results in a detrimental effect on bone health."

The news reporters obtained a quote from the research from the Department of Pharmacology, "This study aimed to investigate the effects of aspirin, a popular anti thrombosis drug, on bone quantity and quality in the high-fat-fed animal model. Adult female rats were subjected to either sham operations or ovariectomized operations. The ovariectomized rats were orally administered with deionized water or standardized high fat emulsion with or without aspirin. All rats were injected with calcine before killed for the purpose of double in vivo labeling. Biochemistry, histo-morphometry, micro-computed tomography analysis, mechanical test, and component analysis were performed after 12 weeks. In vitro cell culture was also performed to observe the effect of aspirin in osteogenesis. We found that high fat remarkably impaired bone formation and bone biomechanics. Aspirin treatment significantly prevented bone loss by increasing bone formation. In vitro studies also validated the enhancement of osteogenic differentiation. However, aspirin presented no significant improvement in bone mechanical properties. Component analysis shown aspirin could significantly increase the content of mineral, but had limited effect on the content of collagen."

According to the news reporters, the research concluded: "Aspirin is beneficial for the prevention of bone loss; meanwhile, it may cause an imbalance in the components of bone which may weaken the mechanical properties. The current study provided further evidence that aspirin might not be powerful for the prevention of fracture in osteoporotic patients."

Our news correspondents report that additional information may be obtained by contacting L. Cui, Guangdong Med Univ, Guangdong Key Lab Res & Dev Nat Drugs, Dept. of
Hematologic Diseases and Conditions - Sickle Cell...

Findings from Department of Pharmacology Yields New Findings on Sickle Cell Anemia (Neonates with sickle cell disease are vulnerable to blue light phototherapy-induced oxidative stress and proinflammatory cytokine elevations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hematologic Diseases and Conditions - Sickle Cell Anemia have been presented. According to news originating from Maharashtra, India, by NewsRx correspondents, research stated, "Sickle cell disease is a frequent genetic anomaly characterized by altered molecular structure of hemoglobin resulting into crescent-like deformation of the red blood corpuscles. Neonatal jaundice is a frequent co-morbidity in sickle cell disease."

Financial support for this research came from R. C. Patel Institute of Pharmaceutical Education and Research.

Our news journalists obtained a quote from the research from the Department of Pharmacology, "Phototherapy induces isomerization of bilirubin rendering it extractable through urine and hence it is used as a routine treatment of neonatal jaundice. An exposure to light phototherapy as a treatment of neonatal jaundice induces oxidative stress. It is hypothesized that such exposure of neonates with sickle cell disease to the blue light phototherapy as a treatment of neonatal jaundice induces severe oxidative stress and increases the levels of proinflammatory cytokines. This hypothesis is supported with two case studies of sickle cell disease suffering neonates who were exposed to blue light phototherapy to treat jaundice. In both these cases, exposure to phototherapy induced oxidative stress (increased lipid peroxidation and superoxide dismutase, slight change in activity of catalase and GSH) and elevated the levels of proinflammatory cytokine (TNF alpha IL-1, and IL-6) in the sickle cell disease suffering neonates."

According to the news editors, the research concluded: "These observations warrant further investigations to determine the consequences and clinical significance of the blue phototherapy-induced oxidative and proinflammatory stress in Sickle cell disease suffering neonates exposed to phototherapy as a treatment of jaundice."

For more information on this research see: Neonates with sickle cell disease are

Health and Medicine - Urology

**Findings from Department of Urology Provide New Insights into Urology (Bladder Preservation Therapy: A Review of the Literature and Future Directions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Health and Medicine - Urology is the subject of a report. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Trimodal bladder preservation therapy (ie, transurethral resection followed by chemoradiotherapy) may be an acceptable treatment alternative to radical cystectomy with urinary diversion in the carefully selected patient with muscle invasive bladder cancer."

Our news editors obtained a quote from the research from the Department of Urology, "Although no head-to-head randomized controlled trials have been performed, large retrospective cohort reviews and observational data analyses suggest comparable oncologic outcomes in select patients with the additional benefit of maximizing quality of life and maintaining the patient's native bladder."

According to the news editors, the research concluded: "In this review, we discuss the evolution and clinical outcomes of bladder preservation therapy, highlighting its role in the contemporary management of muscle invasive bladder cancer."

The news editors report that additional information may be obtained by contacting D.B. Cahn, Einstein Healthcare Network, Dept. of Urol, Philadelphia, PA 19141, United States. Additional authors for this research include B.T. Ristau, E.M. Ghiraldi, T.M. Churilla, D.M.
Findings from Diabetes Center Provides New Data on Type 2 Diabetes (How much is too much? Outcomes in patients using high-dose insulin glargine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are presented in a new report. According to news reporting out of Janesville, Wisconsin, by NewsRx editors, research stated, "Many patients with type 2 diabetes mellitus (T2DM) do not achieve glycaemic control targets on basal insulin regimens. This analysis investigated characteristics, clinical outcomes and impact of concomitant oral antidiabetes drugs (OADs) in patients with T2DM treated with high-dose insulin glargine."

Our news journalists obtained a quote from the research from Diabetes Center, "Patient-level data were pooled from 15 randomised, treat-to-target trials in patients with T2DM treated with insulin glargine ? OADs for (>=) 24 weeks. Data were stratified according to whether patients exceeded three insulin dose cut-off levels (>0.5, >0.7 and >1.0 IU/kg). End-points included glycated haemoglobin A1c (A1C), fasting plasma glucose, body weight, and overall, nocturnal and severe hypoglycaemia. Data from 2837 insulin-na?ve patients were analysed. Patients with insulin titrated beyond the three doses investigated had significantly higher baseline A1C levels and were younger, with shorter diabetes duration than those at/below cut-offs (p <0.05 for all cut-offs); they also had greater weight gain (p <0.001 for the >0.5 and >0.7 IU/kg cut-offs) than those who did not exceed the cut-offs, regardless of concomitant OAD. Patients on concomitant metformin alone had higher insulin doses at Week 24, but achieved greater reductions in A1C, less weight gain and lower hypoglycaemia rates than patients on a concomitant sulfonylurea or metformin plus a sulfonylurea, regardless of whether cut-offs were exceeded."

According to the news editors, the research concluded: "In patients with T2DM, increasing basal insulin doses above 0.5 IU/kg may not improve glycaemic control; treatment strategies targeting postprandial glucose control should be considered for such patients."

Our news journalists report that additional information may be obtained by contacting T. Reid, Mercy Diabetes Center, Janesville, WI, United States. Additional authors for
this research include L. Gao, J. Gill, A. Stuhr, L. Traylor, A. Vlajnic and A. Rhinehart.

Liver Diseases and Conditions - Fatty Liver

Findings from Diabetes Institute Yields New Data on Fatty Liver (Serum uric acid is independently and linearly associated with risk of nonalcoholic fatty liver disease in obese Chinese adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Fatty Liver. According to news reporting from Xiamen, People's Republic of China, by NewsRx journalists, research stated, "The present study aimed to explore the independent association and potential pathways between serum uric acid (SUA) and nonalcoholic fatty liver disease (NAFLD). 1365 community-living obese Chinese adults who received hepatic ultrasonography scanning were included. The prevalence rates of NAFLD were 71.5% for men and 53.8% for women."

The news correspondents obtained a quote from the research from Diabetes Institute, "Compared with controls, NAFLD subjects showed significantly increased SUA levels (333.3 +/- 84.9 vs. 383.4 +/- 93.7 mu mol/L) and prevalence rate of hyperuricemia (HUA) (25.7% v.s. 47.3%, p < 0.001). After adjustment for insulin resistance (IR), components of metabolic syndrome (MetS) and other potential confounders, elevated SUA is independently associated with increased risk of NAFLD, with the adjusted OR of 1.528-2.031 (p < 0.001). By using multivariable fractional polynomial (MFP) modeling, the best FP transformation model shows that SUA was independently and linearly associated with risk of NAFLD. The one-pathway model by using structural equation modeling (SEM) about the relationships among SUA, IR, components of metabolic syndrome and NAFLD fits well (chi(2) = 57.367, p< 0.001; CFI = 0.998; TLI = 0.992; and RMSEA = 0.048) and shows SUA might increase the risk of NAFLD directly besides of the indirect effects through increasing fasting insulin, blood pressure, triglyceride and decreasing HDL-C levels."

According to the news reporters, the research concluded: "Our results imply that elevated SUA may play an important role in NAFLD pathogenesis."

For more information on this research see: Serum uric acid is independently and linearly associated with risk of nonalcoholic fatty liver disease in obese Chinese adults. Scientific Reports, 2016;6():18-27. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Stem Cell Research

Findings from Dongguk University Ilsan Hospital in Stem Cell Research Reported (Endogenous Cartilage Repair by Recruitment of Stem Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Stem Cell Research is now available. According to news reporting originating from Goyang, South Korea, by NewsRx editors, the research stated, "Articular cartilage has a very limited capacity for repair after injury. The adult body has a pool of stem cells that are mobilized during injury or disease."

Our news editors obtained a quote from the research from Dongguk University Ilsan Hospital, "These cells exist inside niches in bone marrow, muscle, adipose tissue, synovium, and other connective tissues. A method that mobilizes this endogenous pool of stem cells will provide a less costly and less invasive alternative if these cells successfully regenerate defective cartilage. Traditional microfracture procedures employ the concept of bone marrow stimulation to regenerate cartilage. However, the regenerated tissue usually is fibrous cartilage, which has very poor mechanical properties compared to those of normal hyaline cartilage. A method that directs the migration of a large number of autologous mesenchymal stem cells toward injury sites, retains these cells around the defects, and induces chondrogenic differentiation that would enhance success of endogenous cartilage repair."

According to the news editors, the research concluded: "This review briefly summarizes chemokines and growth factors that induce recruitment, proliferation, and differentiation of endogenous progenitor cells, endogenous cell sources for regenerating cartilage, scaffolds for delivery of bioactive factors, and bioadhesive materials that are necessary to bring about endogenous cartilage repair."

The news editors report that additional information may be obtained by contacting G.I. Im, Dept. of Orthopedics, Dongguk University Ilsan Hospital, Goyang, South Korea.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1089/ten.teb.2015.0438. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from Dongyang University in the Area of Heart Attack Reported
(Plant-based foods containing cell wall polysaccharides rich in specific active monosaccharides protect against myocardial injury in rat myocardial infarction models)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Attack is the subject of a report. According to news reporting originating from Gyeongbuk, South Korea, by NewsRx correspondents, research stated, "Many cohort studies have shown that consumption of diets containing a higher composition of foods derived from plants reduces mortality from coronary heart disease (CHD). Here, we examined the active components of a plant-based diet and the underlying mechanisms that reduce the risk of CHD using three rat models and a quantitative proteomics approach."

Our news editors obtained a quote from the research from Dongyang University, "In a short-term myocardial infarction (MI) model, intake of wheat extract (WE), the representative cardioprotectant identified by screening approximately 4,000 samples, reduced myocardial injury by inhibiting apoptosis, enhancing ATP production, and maintaining protein homeostasis. In long-term post-MI models, this myocardial protection resulted in ameliorating adverse left-ventricular remodelling, which is a predictor of heart failure. Among the wheat components, arabinose and xylose were identified as active components responsible for the observed efficacy of WE, which was administered via ingestion and tail-vein injections. Finally, the food components of plant-based diets that contained cell wall polysaccharides rich in arabinose, xylose, and possibly fucose were found to confer protection against myocardial injury."

According to the news editors, the research concluded: "These results show for the first time that specific monosaccharides found in the cell wall polysaccharides in plant-based diets can act as active ingredients that reduce CHD by inhibiting postocclusion steps, including MI and heart failure."

For more information on this research see: Plant-based foods containing cell wall polysaccharides rich in specific active monosaccharides protect against myocardial injury in rat myocardial infarction models. Scientific Reports, 2016;6():1-15. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Findings from Dow Chemical in the Area of Agrochemicals Described
[Tiered application of the neutral red release and EpiOcular (TM) assays for evaluating the eye irritation potential of agrochemical formulations]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Agrochemicals is now available. According to news reporting originating from Midland, Michigan, by NewsRx correspondents, research stated, "Agrochemical formulations have been underrepresented in validation efforts for implementing alternative eye irritation approaches but represent a significant opportunity to reduce animal testing. This study assesses the utility of the neutral red release assay (NRR) and EpiOcular™ assay (EO) for predicting the eye irritation potential of 64 agrochemical formulations relative to Draize data."

Our news editors obtained a quote from the research from Dow Chemical, "In the NRR, formulations with an NRR50 value <= 50 mg/mL were categorized as UN GHS Cat 1 and those >250 mg/mL were classified as UN GHS Non Classified (NC). The accuracy, sensitivity, and specificity were 78, 85 and 76% and 73, 85 and 61% for identifying UN GHS 1 and NC formulations, respectively. Specificity was poor for formulations with NRR50 > 50 to <= 250 mg/mL. The EO (ET-40 method) was explored to differentiate formulations that were UN GHS 1/2 and UN GHS NC. The EO resulted in accuracy, sensitivity, and specificity of 65%, 58% and 75% for identifying UN GHS NC formulations."

According to the news editors, the research concluded: "To improve the overall performance, the assays were implemented using a tiered-approach where the NRR was run as a first-tier followed by the Ea The tiered-approach resulted in improved accuracy (75%) and balanced sensitivity (73%) and specificity (77%) for distinguishing between irritating and non-irritating agrochemical formulations."

For more information on this research see: Tiered application of the neutral red release and EpiOcular™ assays for evaluating the eye irritation potential of agrochemical formulations. Regulatory Toxicology and Pharmacology, 2016;81():407-420. Findings from Drexel University Provide New Insights into Sickle Cell Anemia (Sickle cell disease: Its molecular mechanism and the one drug that treats it)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematologic Diseases and Conditions - Sickle Cell Anemia are discussed in a new report. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx editors, the research stated, "Sickle cell disease is probably the first known assembly disease, and its mechanism has been extensively studied. It arises because of the expression of a mutant hemoglobin that can polymerize, and which does so by a double nucleation mechanism that is now seen to operate in other diseases."

Our news editors obtained a quote from the research from Drexel University, "The polymers so formed lead to circulatory obstruction in the microcirculation. The accuracy of the description that has been developed is sufficient to describe precisely the impact of molecules that cannot join polymers but that still crowd the solution, including fetal hemoglobin. The one approved drug, hydroxyurea, is thought to achieve its benefit by enhancing the production of fetal hemoglobin, but the effects of the drug on polymerization exceed what the added fetal hemoglobin can accomplish."

According to the news editors, the research concluded: "While some possible answers to this mystery are suggested, no mechanism has been conclusively established for the remarkably efficacy of the one drug available to treat this disease."

The news editors report that additional information may be obtained by contacting F.A. Ferrone, Drexel University, Dept. of Phys, Philadelphia, PA 19104, United States.

Nursing - Oncology Nursing

Findings from Duke Cancer Institute Broaden Understanding of Oncology Nursing (Radon Exposure: Using the Spectrum of Prevention Framework to Increase Healthcare Provider Awareness)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nursing - Oncology Nursing is the subject of a report. According to news originating from Raleigh, North Carolina, by NewsRx correspondents, research stated, "The radioactive properties of radon have been known for decades, but the risks of exposure have been understated in most professional healthcare curriculums. Healthcare providers in areas with low levels of radon exposure may not consider radon to be a main source of concern in the development of lung and other cancers."

Our news journalists obtained a quote from the research from Duke Cancer Institute, "Just as nurses counsel patients to avoid tobacco exposure, they should advocate that patients have their homes tested for radon. This article aims to increase radon awareness and address opportunities for providers to work toward various objectives to reduce radon exposure. At a Glance  Radon is the second leading cause of lung cancer in the United States and worldwide. Prevention activities are needed to increase awareness of the risks of radon exposure and promote mitigation. Healthcare providers are trusted sources of information for patients and consumers and should recommend home radon testing, even after a diagnosis of lung cancer. Jane Worrell, MSN, RN, OCN®, is an oncology nurse navigator at Duke Cancer Institute in Raleigh, NC; Phillip Gibson, BA, MS, is a radon program coordinator at the North Carolina Department of Health and Human Services in Candler; and Deborah 'Hutch' Allen, PhD, RN, CNS, FNP-BC, AOCNP®, is an advanced practice RN at Duke Cancer Institute. The authors take full responsibility for the content of the article. The authors did not receive honoraria for this work."

According to the news editors, the research concluded: "No financial relationships relevant to the content of this article have been disclosed by the authors or editorial staff."

For more information on this research see: Radon Exposure: Using the Spectrum of Prevention Framework to Increase Healthcare Provider Awareness. Clinical Journal of Oncology Nursing, 2016;20(6):664-666. Clinical Journal of Oncology Nursing can be contacted at: Oncology Nursing Soc, 125 Enterprise Dr, Pittsburgh, PA 15275, USA.

Findings from Duke Clinical Research Institute Update Understanding of Atrial Fibrillation (Off-Label Dosing of Non-Vitamin K Antagonist Oral Anticoagulants and Adverse Outcomes The ORBIT-AF II Registry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Atrial Fibrillation are presented in a new report. According to news originating from Durham, North Carolina, by NewsRx correspondents, research stated, "Although non-vitamin K antagonist oral anticoagulants (NOACs) do not require frequent laboratory monitoring, each compound requires dose adjustments on the basis of certain clinical criteria. This study assessed the frequency of off-label NOAC doses among AF patients and the associations between off-label dose therapy and clinical outcomes in community practice."

Our news journalists obtained a quote from the research from Duke Clinical Research Institute, "We evaluated 5,738 patients treated with a NOAC at 242 ORBIT-AF II (Outcomes Registry for Better Informed Treatment of Atrial Fibrillation phase II) sites. NOAC doses were classified as either underdosed or overdosed, consistent with Food and Drug Administration labeling. Longitudinal outcomes (median follow-up: 0.99 years) included stroke or systemic embolism, myocardial infarction, major bleeding (International Society of Thrombosis and Haemostasis criteria), cause-specific hospitalization, and all-cause mortality. Overall, 541 NOAC-treated patients (9.4%) were underdosed, 197 were overdosed (3.4%), and 5,000 were dosed according to U.S. labeling (87%). Compared with patients receiving the recommended dose, those who were receiving off-label doses were older (median: 79 and 80 years of age vs. 70 years of age, respectively; p< 0.0001), more likely female (48% and 67% vs. 40%, respectively; p< 0.0001), less likely to be treated by an electrophysiologist (18% and 19% vs. 27%, respectively; p< 0.0001), and had higher CHA(2)DS(2)-VASc scores (96% and 97% > = 2 vs. 86%, respectively; p< 0.0001) and higher ORBIT bleeding scores (25% and 31% >4 vs. 11%, respectively; p< 0.0001). After dose adjustment, NOAC overdosing was associated with increased all-cause mortality compared with recommended doses (adjusted hazard ratio: 1.91; 95% confidence interval [CI]: 1.02 to 3.60; p = 0.04). Underdosing was associated with increased cardiovascular hospitalization (adjusted hazard ratio: 1.26; 95% CI: 1.07 to 1.50; p = 0.007). A significant minority (almost 1 in 8) of U.S. patients in the community received NOAC doses inconsistent with labeling."

According to the news editors, the research concluded: "NOAC over-and underdosing are associated with increased risk for adverse events."

For more information on this research see: Off-Label Dosing of Non-Vitamin K Antagonist Oral Anticoagulants and Adverse Outcomes The ORBIT-AF II Registry. *Journal of the American College of Cardiology*, 2016;68(24):2597-2604. *Journal of the American College of Cardiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.

Findings from Duke University Broaden Understanding of Infectious Diseases and Conditions (Surgical Site Infections An Update)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Infectious Diseases and Conditions is the subject of a report. According to news originating from Durham, North Carolina, by NewsRx correspondents, research stated, "Surgical site infections (SSTs) lead to adverse patient outcomes, including prolonged hospitalization and death."

Our news journalists obtained a quote from the research from Duke University, "Wound contamination occurs with each incision, but proven strategies exist to decrease the risk of SSI. In particular, improved adherence to evidence-based preventative measures related to appropriate antimicrobial prophylaxis can decrease the rate of SSI."

According to the news editors, the research concluded: "Aggressive surgical debridement and effective antimicrobial therapy are needed to optimize the treatment of SSI."

The news correspondents report that additional information may be obtained from D.J. Anderson, Duke University, Medical Center, Div Infect Dis, Durham, NC, United States.

Findings from Duke University Provides New Data about Coagulation (Discontinuation and management of direct-acting anticoagulants for emergency procedures)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Coagulation have been presented. According to news reporting from Durham, North Carolina, by NewsRx editors, the research stated, "Patients taking direct oral anticoagulants (DOACs) who then need an emergency invasive procedure require specialized management strategies. Appropriate patient evaluation includes assessment of the current anticoagulation state, including timing of the last dose."

The news correspondents obtained a quote from the research from Duke University,
"DOACs require particular coagulation assays to measure anticoagulation levels accurately, although standard coagulation screening tests may provide qualitative guidance. Specialty societies have endorsed general recommendations for patient management to promote hemostasis in anticoagulated patients requiring surgery or other invasive procedures. These include general stopping rules (such as >= 24 hours for low-risk procedures and >= 48 hours for high-risk surgery with normal renal function) for elective procedures. Bridging therapy when oral anticoagulant treatment is interrupted has recently been questioned, depending on the clinical scenario. Novel agents for the reversal of DOAC-induced anticoagulation have recently been developed. Idarucizumab, a humanized monoclonal antibody fragment that selectively binds dabigatran, was recently approved for clinical use in patients with life-threatening or uncontrolled bleeding, and for patients requiring emergency interventions. Idarucizumab can streamline the pre- and periprocedural anticoagulation management of dabigatran-treated patients, as it provides fast, complete, and sustainable reversibility. Andexanet alfa is an inactive, decoy factor Xa (FXa) molecule that binds FXa inhibitors, and ciraparantag is a synthetic molecule designed to bind fractionated and unfractionated heparins, and each of the currently approved DOACs."

According to the news reporters, the research concluded: "As clinical development of the additional anti-FXa-specific anticoagulant reversal agents proceeds, the respective role of each in the management of emergency bleeding events and invasive procedures will be better defined, and it is hoped they will make important contributions to patient care."

Our news journalists report that additional information may be obtained by contacting J.H. Levy, Duke University, Sch Med, Dept. of Anesthesiol, Cardiothorac ICU, Durham, NC, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajem.2016.09.048. This DOI is a link to an online electronic document that is either free or for purchase.

Gender and Health

Findings from Duke University Update Knowledge of Gender and Health (Statin Adherence: Does Gender Matter?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gender and Health. According to news reporting from Durham, North Carolina, by NewsRx journalists, research stated, "Purpose of Review Cardiovascular disease (CVD) continues to be the leading cause of death for men and women in the USA. Statins have contributed significantly to noted declines in cardiovascular-
related mortality in the last decade; however, the benefit of statins is inequitable across genders."

The news correspondents obtained a quote from the research from Duke University, "Women continue to be less likely to take statins and to meet target LDL goals than men. As a possible contributing factor to this disparity, we explore the evidence for gender-based differences in provision of, and adherence to statins. Compared with men, women are less likely to adhere to statins. Potential reasons for this gender difference in use of statins can be observed across all phases of adherence including both intentional and unintentional non-adherence. Notable gender-specific contributing factors for statin non-adherence include decreased provider and patient awareness of CVD risk among women, higher risk of statin intolerance among women, and competing demands associated with family caregiving responsibilities. Similar to limitations in the broader CVD literature, there is inadequate inclusion of gender-specific analyses in statin-related trials. Gender-based disparities in statin adherence can be linked to both provider level, psychosocial, and medication intolerance factors."

According to the news reporters, the research concluded: "Interventions designed to improve statin adherence should take gender-specific challenges into consideration such as women being older at the time of increased CVD risk, higher rates of statin intolerance, and potentially greater caregiving responsibilities."

Our news journalists report that additional information may be obtained by contacting K.M. Goldstein, Duke University, Div Gen Internal Med, Durham, NC 27708, United States. Additional authors for this research include L.L. Zullig, L.A. Bastian and H.B. Bosworth.

DNA Research

Findings from Duke University in the Area of DNA Research Reported (Global analysis of genomic instability caused by DNA replication stress in Saccharomyces cerevisiae)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on DNA Research have been presented. According to news reporting originating from Durham, North Carolina, by NewsRx correspondents, research stated, "DNA replication stress (DRS)-induced genomic instability is an important factor driving cancer development. To understand the mechanisms of DRS-associated genomic instability, we measured the rates of genomic alterations throughout the genome in a yeast strain with lowered expression of the replicative DNA polymerase delta."
Our news editors obtained a quote from the research from Duke University, "By a genetic test, we showed that most recombinogenic DNA lesions were introduced during S or G (2\) phase, presumably as a consequence of broken replication forks. We observed a high rate of chromosome loss, likely reflecting a reduced capacity of the low-polymerase strains to repair double-stranded DNA breaks (DSBs). We also observed a high frequency of deletion events within tandemly repeated genes such as the ribosomal RNA genes. By whole-genome sequencing, we found that low levels of DNA polymerase d elevated mutation rates, both single-base mutations and small insertions/deletions. Finally, we showed that cells with low levels of DNA polymerase d tended to accumulate small promoter mutations that increased the expression of this polymerase."

According to the news editors, the research concluded: "These deletions conferred a selective growth advantage to cells, demonstrating that DRS can be one factor driving phenotypic evolution."

The news editors report that additional information may be obtained by contacting T.D. Petes, Duke University, Sch Med, Dept. of Mol Genet & Microbiol, Durham, NC 27710, United States. Additional authors for this research include K. Zhang, X.C. Wu, P.A. Mieczkowski and T.D. Petes.

Keywords for this news article include: Durham, North Carolina, United States, North and Central America, Saccharomyces cerevisiae, Enzymes and Coenzymes, Saccharomycetaceae, Saccharomycetales, Life Sciences, DNA Research, Polymerase, Genetics, Duke University.

**Lung Diseases and Conditions - Asthma**

**Findings from Durban University of Technology Broaden Understanding of Asthma [Tumour necrosis factor alpha polymorphism (TNF-308 alpha G/A) in association with asthma related phenotypes and air pollutants among children in KwaZulu-Natal]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Asthma. According to news reporting out of Durban, South Africa, by NewsRx editors, research stated, "The study of gene-environment interactions enables us to further understand the pathogenesis of asthma and inflammation. The TNF-alpha gene has been associated with airway pathology in asthma but there is limited information in relation to pollutant exposure and the TNF-alpha 308G/A polymorphism."

Our news journalists obtained a quote from the research from the Durban University of Technology, "To determine the risk conferred by the TNF-alpha 308(G/A) polymorphism on
respiratory outcome and to evaluate whether the association between exposure to ambient air pollutants such as SO2, NO2, NO, and PM10 and variation in lung function measures is modified by genotype. The sample comprised 129 African children (between 9-11 years old). A questionnaire based on guidelines from the British Medical Research Council and the American Thoracic Society was administered to all caregivers to evaluate the prevalence of respiratory symptoms. Atopy was evaluated by skin prick testing. Bihourly measures of lung function (spirometry) were collected at school five days per week over three week periods in each of four seasons (2004-2005) using digital hand-held devices. During each of the four intensive 3-week phases, gaseous air pollutant concentrations were monitored continuously. Polymerase Chain Reaction-Restriction Fragment Length Polymorphism (PCR-PFLP) analysis was used to detect the TNF-alpha 308 genotype and plasma TNF-alpha levels were measured using the human TNF-alpha Max Standard Enzyme-linked immuno-absorbent assay (ELISA) kit. The TNF-alpha variant A allele was common among this sample of African children (40% with an allelic frequency of 0.24). There was no significant association with the TNF-alpha G/A polymorphism and any respiratory linked phenotype, nor cytokine levels. However, when exposure to pollutants were analyzed with genotypic and phenotypic data, we found relatively modest interaction effects for the TNF-alpha 308 genotype. GEE models showed that children with the TNF-alpha 308 A allele had increased deterioration of lung function post pollution exposure to SO2 \((\beta=2.62, CI:0.51-4.71, p=0.02 \text{ and } p(\text{int}) =0.03)\) and NO \([\beta=3.28, CI:0.68-5.89, p=0.01, p(\text{int})=0.03]\). The TNF-alpha 308 (G/A) polymorphism may be associated with increased pollutant-associated effects on FEV1 intraday variability for both SO2 and NO."

According to the news editors, the research concluded: "The A allele may increase susceptibility to the adverse effects of air pollutants."

Our news journalists report that additional information may be obtained by contacting P. Reddy, Durban Univ Technol, Dept. of Community Hlth Studies, ZA-4000 Durban, South Africa. Additional authors for this research include P. Reddy, A. Chuturgoon, R.N. Naidoo, G. Mentz, S. Batterman and T.G. Robins.

Keywords for this news article include: Durban, South Africa, Africa, Respiratory Tract Diseases and Conditions, Obstructive Lung Diseases and Conditions, Bronchial Diseases and Conditions, Respiratory Hypersensitivity, Asthma, Immunology, Genetics, Durban University of Technology.

Prothrombin

Findings from E. Bernardi et al Update Understanding of Prothrombin (Management Strategies for Vitamin K Antagonists Reversal in Patients With Major Bleeding: A Survey of Italian Emergency Departments)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Prothrombin have been published. According to
news reporting originating from Conegliano, Italy, by NewsRx correspondents, research stated, "Emergency physicians frequently deal with patients on vitamin K antagonists (VKAs) suffering major bleeding events, and rapid reversal of anticoagulation in this setting is of paramount importance. In Italy, given the absence of specific national guidelines, local policies are likely to differ, possibly impacting on clinical outcomes."

Our news editors obtained a quote from the research, "We decided to perform a telephone survey among Italian emergency physicians to evaluate management strategies for VKAs reversal in patients with major bleeding. We conducted a computer-assisted, 10-minute telephone survey of 15 questions, focusing on the local prevalence, assessment, and management strategies of major and intracranial hemorrhage (ICH) occurring in patients on VKAs. We planned to interview a sample of 320 Italian emergency physicians. Institutions from all geographic areas of Italy were to participate in the survey. Of the 320 physicians contacted, 150 (47%) completed the survey, 95% being employed in public hospitals. Focusing on ICH, only 29% of the responders stated they would reverse anticoagulation irrespective of the international normalized ratio value, and only 27% would use prothrombin-complex concentrate as first-line agent. In patients needing urgent neurosurgical operation, less than 50% would administer prothrombin-complex concentrate before surgery. The average knowledge of management strategies for reversal of anticoagulation displayed by Italian emergency physicians appears to be unsatisfactory."

According to the news editors, the research concluded: "The need for an extensive educational program and for the implementation of specific guidelines, possibly endorsed by Scientific Societies, cannot be underemphasized."

The news editors report that additional information may be obtained by contacting E. Bernardi, ULSS7 Pieve Soligo, Pronto Soccorso, Conegliano, Italy. Additional authors for this research include D. Imberti and A. Ferrari.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/1076029615598219. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Conegliano, Italy, Europe, Prothrombin, Hematology.

Oncology - Acute Myeloid Leukemia

Findings from E. Ma and Co-Authors Update Knowledge of Acute Myeloid Leukemia (An Evaluation of Treatment Patterns and Outcomes in Elderly Patients Newly Diagnosed With Acute Myeloid Leukemia: A Retrospective Analysis of Electronic Medical ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Acute Myeloid Leukemia have been
published. According to news originating from Montreal, Canada, by NewsRx correspondents, research stated, "This retrospective observational study of data from the US community oncology setting evaluates real-world treatment patterns and outcomes for newly diagnosed, elderly patients with acute myeloid leukemia. The analysis focuses on those patients who did not receive standard induction therapy (3 + 7-type regimens)."

Our news journalists obtained a quote from the research, "Many elderly patients with acute myeloid leukemia (AML) are considered ineligible for standard intensive induction therapy due to performance status and comorbidities. We analyzed treatment patterns and outcomes among elderly patients newly diagnosed with AML in the US community oncology setting. A retrospective observational study was conducted using patient-level data from a network of US community oncology practices provided by Altos Solutions. Patients aged >= 60 years, diagnosed with AML between November 2005 and February 2014, with >= 1 recorded visit and >= 6 months between diagnosis and data cutoff, were included. Only patients who received active treatment or best supportive care (BSC) per National Comprehensive Cancer Network (NCCN) AML Guidelines were analyzed. Of 1139 patients meeting the inclusion criteria, 922 (median age 76 years) received NCCN-recommended treatments: standard induction (n = 5), low-intensity therapy (n = 425), BSC with hydroxyurea (HU) (n = 36), or BSC without HU (n = 455). For the low-intensity therapy cohort, median time from diagnosis to treatment initiation was 17 days; median duration of therapy was 5.1 months. Median overall survival (OS) from diagnosis in the low-intensity, BSC with HU, and BSC without HU groups was 12.3, 7.0, and 49.4 months, respectively. Median time to next therapy/death was 10.1 months in patients receiving low-intensity therapy. A higher proportion of patients receiving low-intensity therapy required transfusion or other supportive care versus those receiving BSC. As expected, OS in patients receiving low-intensity therapy or BSC with HU is poor for elderly patients with AML."

According to the news editors, the research concluded: "Remarkably, intensive induction strategies are rarely used for older patients in community oncology practice."

For more information on this research see: An Evaluation of Treatment Patterns and Outcomes in Elderly Patients Newly Diagnosed With Acute Myeloid Leukemia: A Retrospective Analysis of Electronic Medical Records From US Community Oncology Practices. Clinical Lymphoma Myeloma & Leukemia, 2016;16(11):625-636. Clinical Lymphoma Myeloma & Leukemia can be contacted at: Cig Media Group, Lp, 3500 Maple Avenue, Ste 750, Dallas, TX 75219-3931, USA.

Enzymes and Coenzymes

**Findings from East China University of Science and Technology Provides New Data about Enzymes and Coenzymes (Highly Selective Fluorescent Turn-On Probe for Protein Thiols in Biotin Receptor-Positive Cancer Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Sulfhydryl-containing proteins play critical roles in various physiological and biological processes, and the activities of those proteins have been reported to be susceptible to thiol oxidation. Therefore, the development of protein thiol target fluorescent probe is highly desirable."

Financial supporters for this research include Natural Science Foundation of Shanghai, National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the East China University of Science and Technology, "In the present work, a biotinylated coumarin fluorescence 'off-on' probe SQ for selectively detecting protein thiols in biotin receptor-positive cancer cells was designed with a 2,4-dinitrobenzenesulfonyl as the thiol receptor. The probe exhibited dramatic fluorescence responses toward sulphydryl-containing proteins (ovalbumin (OVA), bovine serum albumin (BSA)): up to 170-fold fluorescence enhancement with 70 nm blue-shift was observed with the addition of OVA. However, low molecular weight thiols (Cys, glutathione (GSH), Hcy) caused negligible fluorescence changes of SQ. In addition, biotin receptor-positive Hela cells displayed strong red and green fluorescence after incubation of SQ for 1 h; neither red nor green fluorescence signal could be visualized in biotin-negative normal lung Wi38 cells."

According to the news editors, the research concluded: "These results imply that the probe has potential application in fluorescent imaging protein thiols on the surface of Hela cells."

Our news journalists report that additional information may be obtained by contacting Q. Sun, Shanghai Key Laboratory of Functional Materials Chemistry, School of Chemistry and Molecular Engineering, East China University of Science and Technology , Shanghai, 200237, People's Republic of China. Additional authors for this research include D. Sun, L. Song, Z. Chen, Z. Chen, W. Zhang and J. Qian.

Findings from Eberhard-Karls University in Coagulation Reported (Safety of transesophageal echocardiography during extracorporeal life support)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Coagulation have been presented. According to news reporting from Tubingen, Germany, by NewsRx journalists, research stated, "Use of extracorporeal life support (ECLS) has significantly increased in critically ill patients refractory to medical management. ECLS requires systemic anticoagulation to avoid thromboembolic complications and superimposed coagulopathies are common."

The news correspondents obtained a quote from the research from Eberhard-Karls University, "Transesophageal echocardiography (TEE) is frequently employed to assess cannula position and cardiac function during extracorporeal therapy. The goal of this study was to assess whether TEE probe insertion and removal in systemically anticoagulated ECLS patients was safe compared to patients without ECLS and normal coagulation studies. Eighty-seven separate TEE examinations in 53 adult ECLS patients were analyzed. Detailed complication profiles were logged for each patient from initiation through discontinuation of ECLS. Routine coagulation testing was recorded within two hours prior to the TEE exams. Controls consisted of age- and gender-matched patients undergoing perioperative TEE without ECLS and normal coagulation (N=87). Overall TEE-associated morbidity in ECLS patients was 2.3% and consisted of minor oropharyngeal bleeding (2/87 TEE exams) exclusively. The patients presenting with oropharyngeal bleeding received heparin for anticoagulation and had two or more abnormal coagulation studies at the time of TEE. Seventy-nine percent of ECLS patients received intravenous heparin infusions, 6.8% argatroban and 3.4% epoprostenol. Ten-point-eight percent of patients were not anticoagulated at the time of TEE because of pre-existing bleeding complications and/or deranged plasmatic coagulation profiles. No major complications (e.g., esophageal perforation, gastrointestinal bleeding, accidental extubation) were recorded in either group. TEE remained safe in critically ill patients under ECLS, despite systemic anticoagulation, during probe insertion, manipulation and removal."

According to the news reporters, the research concluded: "TEE-related complications pertained solely to oropharyngeal bleeding amenable to conservative management."

Oncology - Bladder Cancer

Findings from Eberhard-Karls University in the Area of Bladder Cancer
Reported (Ten Years of Complete Remission of Pulmonary Metastasis after Post-Cystectomy Palliative Cisplatin-Gemcitabine Chemotherapy with Gefitinib for Muscle Invasive ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Bladder Cancer are presented in a new report. According to news reporting originating in Tubingen, Germany, by NewsRx journalists, research stated, "Muscle-invasive bladder cancer (MIBC) is considered one of the most lethal malignancies with high metastatic potential. Usually, metastatic bladder cancer carries worse prognosis with a median survival rate of approximately 6 months, which can be prolonged for up to 14 months with palliative systemic chemotherapy."

The news reporters obtained a quote from the research from Eberhard-Karls University, "We present the case of a 61-year-old male patient diagnosed with localized MIBC 10 years ago. He underwent nerve-sparing radical cystectomy with ileal neobladder, but developed pulmonary metastatic disease 7 months postoperatively. Six cycles of gemcitabine/cisplatin combination chemotherapy with an addition of gefitinib as daily oral medication were administered within a randomized phase II clinical trial; this resulted in complete remission of the pulmonary metastases. Until now, the patient is still on gefitinib daily without any side effects."

According to the news reporters, the research concluded: "Although, the addition of gefitinib to standard systemic chemotherapy has not been shown to improve the survival in metastatic urothelial cancer, this case represents a very pleasant albeit uncommon long-term outcome."

Our news correspondents report that additional information may be obtained by contacting G. Gakis, Eberhard Karls Univ Tubingen, Dept. of Urol, Tubingen, Germany. Additional authors for this research include M. Scharpf, T. Schubert, S. Feyerabend, A. Stenzl, C. Schwentner, F. Fend and G. Gakis.

Gram-Positive Bacterial Infections - Listeria Infections

Findings from Ehime University Reveals New Findings on Listeria Infections [Menin Plays a Critical Role in the Regulation of the Antigen-Specific CD8(+) T Cell Response upon Listeria Infection]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Positive Bacterial Infections - Listeria Infections is now available. According to news reporting originating from Ehime, Japan, by NewsRx correspondents, research stated, "Menin, a tumor suppressor protein, is encoded by the MEN1 gene in humans. Certain germinal mutations of MEN1 induce an autosomal-dominant syndrome that is characterized by concurrent parathyroid adenomas and several other tumor types."

Our news editors obtained a quote from the research from Ehime University, "Although menin is also expressed in hematopoietic lineages, its role in CD8(+) T cells remains unclear. We generated Menin(flox/flox) CD4-Cre (Menin-KO) mice by crossing Menin (flox/flox) mice with CD4-Cre transgenic (Tg) mice to determine the role of menin in CD8(+) T cells. Wild-type (WT) and Menin-KO mice were infected with Listeria monocytogenes expressing OVA to analyze the immune response of Ag-specific CD8(+) T cells. Menin deficiency resulted in an impaired primary immune response by CD8+ T cells. On day 7, there were fewer Menin-KO OVA-specific CD8(+) T cells compared with WT cells. Next, we adoptively transferred WT and Menin-KO OT-1 Tg CD8(+) T cells into congenic recipient mice and infected them with L. monocytogenes expressing OVA to determine the CD8(+) T cell-intrinsic effect. Menin-KO OT-1 Tg CD8(+) T cells were outcompeted by the WT cells upon infection. Increased expression of Blimp-1 and T-bet, cell cycle inhibitors, and proapoptotic genes was observed in the Menin-KO OT-1 Tg CD8(+) T cells upon infection. These data suggest that menin inhibits differentiation into terminal effectors and positively controls proliferation and survival of Ag-specific CD8(+) T cells that are activated upon infection."

According to the news editors, the research concluded: "Collectively, our study uncovered an important role for menin in the immune response of CD8(+) T cells to infection."

For more information on this research see: Menin Plays a Critical Role in the Regulation of the Antigen-Specific CD8(+) T Cell Response upon Listeria Infection. Journal of Immunology, 2016;197(10):4079-4089. Journal of Immunology can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Drugs and Therapies - Pharmacy and... 

Findings from Eli Lilly Provides New Data on Pharmacy and Pharmaceutical Sciences (Evaluation and Optimization of Blood Micro-Sampling Methods: Serial Sampling in a Cross-Over Design from an Individual Mouse)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Pharmacy and Pharmaceutical Sciences is now available. According to news reporting from Indianapolis, Indiana, by NewsRx journalists, research stated, "Current practices applied to mouse pharmacokinetic (PK) studies often use large numbers of animals with sporadic or composite sampling that inadequately describe PK profiles. The purpose of this work was to evaluate and optimize blood microsampling techniques coupled with dried blood spot (DBS) and LC-MS/MS analysis to generate reliable PK data in mice."

The news correspondents obtained a quote from the research from Eli Lilly, "In addition, the feasibility of cross-over designs was assessed and recommendations are presented. The work describes a comprehensive evaluation of five blood microsampling techniques (tail clip, tail vein with needle hub, submandibular, retro-orbital, and saphenous bleeding) in CD-1 mice. The feasibility of blood sampling was evaluated based on animal observations, ease of bleeding, and ability to collect serial samples. Methotrexate, gemfibrozil and glipizide were used as test compounds and were dosed either orally or intravenously, followed by DBS collection and LC-MS/MS analysis to compare PK with various bleeding methods. Submandibular and retro-orbital methods that required non-serial blood collections did not allow for inter-animal variability assessments and resulted in poorly described absorption and distribution kinetics. The submandibular and tail vein with needle-hub methods were the least favorable from a technical feasibility perspective. Serial bleeding was possible with cannulated animals or saphenous bleeding in non-cannulated animals. Of the methods that allowed serial sampling, the saphenous method when executed as described in this report, was most practical, reproducible and provided for assessment of inter-animal variability. It enabled the collection of complete exposure profiles from a single mouse and the conduct of an intravenous/oral cross-over study design."

According to the news reporters, the research concluded: "This methodology can be used routinely, it promotes the 3Rs principles by achieving reductions in the number of animals used, decreased restraints and animal stress, and improved the quality of data obtained in mouse PK studies."

Our news journalists report that additional information may be obtained by contacting N.J. Patel, Eli Lilly & Co, Drug Disposit, Indianapolis, IN 46285, United States. Additional authors for this research include E. Wickremsinhe, Y.H. Hui, A. Barr, N. Masterson, K. Ruterbories, J. Weller, J. Hanes, T. Kern and E. Perkins.

Findings from Eli Lilly Yields New Findings on Multiple Sclerosis (Pharmacological Characterization of a Potent Inhibitor of Autotaxin in Animal Models of Inflammatory Bowel Disease and Multiple Sclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autoimmune Diseases and Conditions - Multiple Sclerosis have been presented. According to news reporting originating in Indianapolis, Indiana, by NewsRx journalists, research stated, "Autotaxin is a secreted enzyme that catalyzes the conversion of lysophosphatidyl choline into the bioactive lipid mediator lysophosphatidic acid (LPA). It is the primary enzyme responsible for LPA production in plasma."

The news reporters obtained a quote from the research from Eli Lilly, "It is upregulated in inflammatory conditions and inhibition of autotaxin may have anti-inflammatory activity in a variety of inflammatory diseases. To determine the role of autotaxin and LPA in the pathophysiology of inflammatory disease states, we used a potent and orally bio-available inhibitor of autotaxin that we have recently identified, and characterized it in mouse models of inflammation, inflammatory bowel disease (IBD), multiple sclerosis (MS), and visceral pain. Compound-1, a potent inhibitor of autotaxin with an IC50 of similar to 2 nM, has good oral pharmacokinetic properties in mice and results in a substantial inhibition of plasma LPA that correlates with drug exposure levels. Treatment with the inhibitor resulted in significant anti-inflammatory and analgesic effects in the carrageenan-induced paw inflammation and acetic acid-induced visceral pain tests, respectively. Compound-1 also significantly inhibited disease activity score in the dextran sodium sulfate-induced model of IBD, and in the experimental autoimmune encephalomyelitis model of MS."

According to the news reporters, the research concluded: "The present study demonstrates the anti-inflammatory and analgesic properties of a novel inhibitor of autotaxin that may serve as a therapeutic option for IBD, MS, and pain associated with inflammatory states."

Our news correspondents report that additional information may be obtained by contacting K. Thirunavukkarasu, Eli Lilly & Co, Lilly Res Lab, Indianapolis, IN 46285, United States. Additional authors for this research include B.L. Tan, C.A. Swearingen, G. Rocha, H.H. Bui, D.J. McCann, S.B. Jones, B.H. Norman, L.A. Pfeifer and J.K. Saha.

Biological Factors - Metalloporphyrins

Findings from Emory University Broaden Understanding of Metalloporphyrins [Oxygen and Bis(3',5')-cyclic Dimeric Guanosine Monophosphate Binding Control Oligomerization State Equilibria of Diguanylate Cyclase-Containing Globin Coupled Sensors]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biological Factors - Metalloporphyrins have been published. According to news reporting originating in Atlanta, Georgia, by NewsRx journalists, research stated, "Bacteria sense their environment to alter phenotypes, including biofilm formation, to survive changing conditions. Heme proteins play important roles in sensing the bacterial gaseous environment and controlling the switch between motile and sessile (biofilm) states."

The news reporters obtained a quote from the research from Emory University, "Globin coupled sensors (GCS), a family of heme proteins consisting of a globin domain linked by a central domain to an output domain, are often found with diguanylate cyclase output domains that synthesize c-di-GMP, a major regulator of biofilm formation. Characterization of diguanylate cyclase-containing GCS proteins from Bordetella pertussis and Pectobacterium carotovorum demonstrated that cyclase activity is controlled by ligand binding to the heme within the globin domain. Both O-2 binding to the heme within the globin domain and c-di-GMP binding to a product-binding inhibitory site (I-site) within the cyclase domain control oligomerization states of the enzymes. Changes in oligomerization state caused by c-di-GMP binding to the I-site also affect O-2 kinetics within the globin domain, suggesting that shifting the oligomer equilibrium leads to broad rearrangements throughout the protein. In addition, mutations within the I-site that eliminate product inhibition result in changes to the accessible oligomerization states and decreased catalytic activity."

According to the news reporters, the research concluded: "These studies provide insight into the mechanism by which ligand binding to the heme and I-site controls activity of GCS proteins and suggests a role for oligomerization-dependent activity in vivo."

For more information on this research see: Oxygen and Bis(3',5')-cyclic Dimeric Guanosine Monophosphate Binding Control Oligomerization State Equilibria of Diguanylate Cyclase-Containing Globin Coupled Sensors. *Biochemistry*, 2016;55(48):6642-6651. *Biochemistry* can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. Drugs and Therapies - Antiretrovirals

Findings from Emory University Provides New Data on Antiretrovirals [CD8(+)] Lymphocytes Are Required for Maintaining Viral Suppression in SIV-Infected Macaques Treated with Short-Term Antiretroviral Therapy]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antiretrovirals. According to news reporting out of Atlanta, Georgia, by NewsRx editors, research stated, "Infection with HIV persists despite suppressive anti-retroviral therapy (ART), and treatment interruption results in rapid viral rebound. Antibody-mediated CD8(+) lymphocyte depletion in simian immunodeficiency virus (SIV)-infected rhesus macaques (RMs) shows that these cells contribute to viral control in untreated animals."

Our news journalists obtained a quote from the research from Emory University, "However, the contribution of CD8(+) lymphocytes to maintaining viral suppression under ART remains unknown. Here, we have shown that in SIV-infected RMs treated with short-term (i.e., 8-32 week) ART, depletion of CD8(+) lymphocytes resulted in increased plasma viremia in all animals and that repopulation of CD8(+) T cells was associated with prompt reestablishment of virus control. Although the number of SIV-DNA-positive cells remained unchanged after CD8 depletion and reconstitution, the frequency of SIV-infected CD4(+) T cells before depletion positively correlated with both the peak and area under the curve of viremia after depletion."

According to the news editors, the research concluded: "These results suggest a role for CD8(+) T cells in controlling viral production during ART, thus providing a rationale for exploring immunotherapeutic approaches in ART-treated HIV-infected individuals."

For more information on this research see: CD8(+) Lymphocytes Are Required for Maintaining Viral Suppression in SIV-Infected Macaques Treated with Short-Term Antiretroviral Therapy. Immunity, 2016;45(3):656-668. Immunity can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. Cardiovascular Research

Findings from Erasmus University Medical Center Provide New Insights into Cardiovascular Research (Reasons to Participate or not to Participate in Cardiovascular Health Checks: A Review of the Literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Research. According to news reporting originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "Cardiovascular health checks test risk factors for cardiovascular disease (CVD). They are offered to improve health: in case of an increased risk, participants receive lifestyle advice and medication."

Our news editors obtained a quote from the research from Erasmus University Medical Center, "With this review, we investigate what is known about the reasons why people do or do not test for CVD risk factors. To what extent do these reasons relate to health monitoring and/or improvement? And do reasons differ in different contexts in which health checks are offered? We conducted a literature search and included 22 papers in which we identified a broad range of motives. We conclude that (i) people have reasons to test related to health improvement and reasons other than health improvement, (ii) practical reasons related to the way health checks are offered (facilitators and barriers) play an important role and (iii) motives should be understood in the context of the situation in which health checks are offered. Our results are relevant for public health officials and providers of health checks: first, if people undergo testing for reasons unrelated to health, this could explain why participation in health checks does not necessarily lead to health improvement."

According to the news editors, the research concluded: "Second, efforts to improve uptake not necessarily serve justice and may hamper informed consent."

The news editors report that additional information may be obtained by contacting Y.H. Stol, Erasmus MC, Dept. of Med Eth & Philosophy, Rotterdam, Netherlands. Additional authors for this research include E.C.A. Asscher and M.H.N. Schermer.

Keywords for this news article include: Rotterdam, Netherlands, Europe, Cardiovascular Research, Cardiovascular Diseases and Conditions, Risk and Prevention, Article Review, Cardiology, Erasmus University Medical Center.
Bone Research

Findings from Eunice Kennedy Shriver National Institute of Child Health and Human Development Provides New Data about Bone Research [Bone Abnormalities in Mice with Protein Kinase A (PKA) Defects Reveal a Role of Cyclic AMP Signaling in Bone ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Bone Research. According to news reporting originating in Bethesda, Maryland, by NewsRx journalists, research stated, "Protein kinase A (PKA) is an important enzyme for all eukaryotic cells. PKA phosphorylates other proteins, thus, it is essential for the regulation of many diverse cellular functions, including cytoplasmic trafficking and signaling, organelle structure and mitochondrial oxidation, nuclear gene expression, the cell cycle, and cellular division."

The news reporters obtained a quote from the research from the Eunice Kennedy Shriver National Institute of Child Health and Human Development, "The PKA holoenzyme is composed of 2 regulatory and 2 catalytic subunits. Four regulatory (R1 alpha, R1 beta, R2 alpha, and R2 beta) and 4 catalytic subunits (C alpha, C beta, C gamma, and Prkx) have been identified, giving rise to mainly PKA-I (when the 2 regulatory subunits are either R1 alpha or R1 beta), or PKA-II (when the 2 regulatory subunits are either R2 alpha or R2 beta). Mutations in the PKA subunits can lead to altered total PKA activity or abnormal PKA-I to PKA-II ratio, leading to various abnormalities in both humans and mice. These effects can be tissue-specific. We studied the effect of PKA subunit defects on PKA activity and bone morphology of mice that were single or double heterozygous for null alleles of the various PKA subunit genes. Bone lesions including fibrous dysplasia, myxomas, osteosarcomas, -chondromas and -chondrosarcomas were found in these mice. Observational and molecular studies showed that these lesions were derived from bone stromal cells (BSCs). We conclude that haploinsufficiency for different PKA subunit genes affected bone lesion formation, new bone generation, organization, and mineralization in variable ways."

According to the news reporters, the research concluded: "This work identified a PKA subunit-and activity-dependent pathway of bone lesion formation from BSCs with important implications for understanding how cyclic AMP affects the skeleton and its tumorigenesis."

For more information on this research see: Bone Abnormalities in Mice with Protein Kinase A (PKA) Defects Reveal a Role of Cyclic AMP Signaling in Bone Stromal Cell-Dependent Tumor Development. *Hormone and Metabolic Research*, 2016;48(11):714-725. *Hormone and Metabolic Research* can be contacted at: Georg Thieme Verlag Kg, Ruderstr 14, D-70469 Stuttgart, Germany. Findings from Eunice Kennedy Shriver National Institute of Child Health and Human Development Yields New Data on Osteogenesis Imperfecta [Osteoblast Malfunction Caused by Cell Stress Response to Procollagen Misfolding in alpha 2(I)-G610C Mouse ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Musculoskeletal Diseases and Conditions - Osteogenesis Imperfecta. According to news reporting out of Bethesda, Maryland, by NewsRx editors, research stated, "Glycine (Gly) substitutions in collagen Gly-X-Y repeats disrupt folding of type I procollagen triple helix and cause severe bone fragility and malformations (osteogenesis imperfecta [OI]). However, these mutations do not elicit the expected endoplasmic reticulum (ER) stress response, in contrast to other protein-folding diseases."

Our news journalists obtained a quote from the research from the Eunice Kennedy Shriver National Institute of Child Health and Human Development, "Thus, it has remained unclear whether cell stress and osteoblast malfunction contribute to the bone pathology caused by Gly substitutions. Here we used a mouse with a Gly610 to cysteine (Cys) substitution in the procollagen alpha 2(I) chain to show that misfolded procollagen accumulation in the ER leads to an unusual form of cell stress, which is neither a conventional unfolded protein response (UPR) nor ER overload. Despite pronounced ER dilation, there is no upregulation of binding immunoglobulin protein (BIP) expected in the UPR and no activation of NF-kappa B signaling expected in the ER overload. Altered expression of ER chaperones alpha B crystalline and HSP47, phosphorylation of eIF2 alpha, activation of autophagy, upregulation of general stress response protein CHOP, and osteoblast malfunction reveal some other adaptive response to the ER disruption. We show how this response alters differentiation and function of osteoblasts in culture and in vivo."

According to the news editors, the research concluded: "We demonstrate that bone matrix deposition by cultured osteoblasts is rescued by activation of misfolded procollagen autophagy, suggesting a new therapeutic strategy for OI."

Our news journalists report that additional information may be obtained by contacting S. Leikin, Eunice Kennedy Shriver Natl Inst Child Hlth & Hum, Sect Phys Biochem, National Institutes of Health, Bethesda, MD, United States. Additional authors for this research include E. **Oncology - Peripheral T-Cell Lymphoma**

**Findings from European Institute of Oncology Broaden Understanding of Peripheral T-Cell Lymphoma (Molecular investigation of coexistent chronic myeloid leukaemia and peripheral T-cell lymphoma - a case report)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Peripheral T-Cell Lymphoma have been published. According to news reporting from Milan, Italy, by NewsRx journalists, research stated, "Chronic myeloid leukemia (CML) is a myeloproliferative neoplasm underlain by the formation of BCR-ABL1 -an aberrant tyrosine kinase -in the leukaemic blasts. Long-term survival rates in CML prior to the advent of tyrosine kinase inhibitors (TKIs) were dismal, albeit the incidence of secondary malignancies was higher than that of age-matched population."

The news correspondents obtained a quote from the research from the European Institute of Oncology, "Current figures confirm the safety of TKIs with conflicting data concerning the increased risk of secondary tumours. We postulate that care has to be taken when distinguishing between coexisting, secondary-to-treatment and second in sequence, but independent tumourigenic events, in order to achieve an unbiased picture of the adverse effects of novel treatments."

According to the news reporters, the research concluded: "To illustrate this point, we present a case of a patient in which CML and peripheral T-cell lymphoma (PTCL) coexisted, although the clinical presentation of the latter followed the achievement of major molecular response of CML to TKIs."

For more information on this research see: Molecular investigation of coexistent chronic myeloid leukaemia and peripheral T-cell lymphoma - a case report. *Scientific Reports*, 2015;5():14829. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Nosocomial Diseases and Conditions - Ventilator-…**

**Findings from F. Sbrana and Colleagues Update Understanding of Ventilator-Associated Pneumonia (Risk factors for ventilator associated pneumonia due to carbapenemase-producing Klebsiella pneumonae in mechanically ventilated patients with …)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nosocomial Diseases and Conditions - Ventilator-Associated Pneumonia have been presented. According to news reporting originating from Pisa, Italy, by NewsRx correspondents, research stated, "The aim of this study was to identify the risk factors for ventilator associated pneumonia (VAP) due to Klebsiella pneumonae carbapenemase-producing K (KPC-Kp) development in ICU patients with documented rectal and tracheal colonization.. We performed a retrospective, matched case-control study in a medical-surgical ICU (January 2011-December 2013) comparing 30 patients who developed KPC-Kp VAP during the ICU stay to 60 colonized patients not developing KPC-Kp VAP."

Our news editors obtained a quote from the research, "Analysed risk factors included: age, sex, SAPS II and SOFA scores, comorbidities, type and length of antibiotic therapy, previous non KPC-Kp infections, time between admission to rectal and tracheal colonization. Several risk factors were more frequent among patients who developed KPC-Kp pneumonia versus matched colonized controls: previous infection not related to KPC-Kp (P <0.001), duration of previous antibiotic therapy before (P <0.001) and after (P=0.002) KPC-Kp colonization. Amoxicillin/clavulanic acid prophylaxis was administered in 17% of VAP patients versus 73% of patients not developing VAP (P <0.001). Multivariate conditional logistic regression analysis identified several significant independent risk factors favoring KPC-Kp VAP in patients colonized at multiple sites: previous non KPC-Kp infections (OR: 2.046), duration of previous antibiotic therapy before (OR: 1.309) and after (OR: 1.122) KPC-Kp colonization; antibiotic therapy with amoxicillin/clavulanic acid prophylaxis (<48 hours) was associated with reduced risk of KPC-Kp VAP (OR: 0.987). In rectal and tracheal KPC-Kp colonized patients, prolonged antibiotic therapy administered for non KPC-Kp infection predisposes patients to subsequent KPC-Kp VAP."

According to the news editors, the research concluded: "Short prophylaxis of early pneumonia with amoxicillin/clavulanic acid, reducing the need for subsequent antibiotic use, may be associated with reduced risk for KPC-Kp VAP."

The news editors report that additional information may be obtained by contacting F. Sbrana, Fdn Toscana Gabriele Monasterio, UO Lipidoaferesi, Pisa, Italy. Additional authors for this research include P. Malacarne, M. Bassetti, C. Tascini, L. Vegnuti, P. Della Siega, A.
Oncology - Cancer Care

Findings from F.M. van Nuenen et al Has Provided New Information about Cancer Care (Feasibility of implementing the 'Screening for Distress and Referral Need' process in 23 Dutch hospitals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Care. According to news reporting originating in Utrecht, Netherlands, by NewsRx journalists, research stated, "In the Netherlands, the three-step process 'Screening for Distress and Referral Need' (SDRN) was developed for helping identifying, and referring cancer patients suffering from clinically relevant distress or needing a referral. This process includes (1) instrument completion, (2) patient-care provider discussion of the responses, and (3) referral based on 1 and 2. The Netherlands Comprehensive Cancer Organisation, location Groningen (IKNL-G), initiated the implementation of SDRN and developed an implementation roadmap, including procedure and materials."

The news reporters obtained a quote from the research, "This exploratory study examines the feasibility of SDRN implementation in hospitals, seen from healthcare providers' perspective, responsible for implementation, and those executing SDRN. Healthcare providers, from 22 hospitals and from 5 oncology departments of the University Medical Center Groningen (=25 % of Dutch hospitals), evaluated their experiences by responding to a 26-item internet survey. Twenty-five participants (response = 93 %) completed the survey. SDRN was implemented in 21 hospitals (implementation = 91 %), in two thirds of these hospitals in more than one patient group. Adoption of IKNL-G's roadmap elements varied between 84 and 100 %. Participants' average satisfaction score with SDRN was 6.5 (possible range = 0-10, range found = 5-8). Significant positive relationships were found between this satisfaction and participants' satisfaction with frequency of SDRN (p = 0.02), and keeping logistical agreements (p = 0.04). Participants were dissatisfied with SDRN's limited current availability to only select patient groups and only certain disease phases. The implementation of SDRN in daily practice, supported by a pre-developed implementation roadmap, is highly feasible."

According to the news reporters, the research concluded: "Continuous attention to SDRN execution, broadening implementation to all forms of cancer, and during the total disease trajectory seems vital to improve healthcare providers' satisfaction."

For more information on this research see: Feasibility of implementing the 'Screening for Distress and Referral Need' process in 23 Dutch hospitals. Supportive Care in
Findings from Faculty of Medicine Update Knowledge of Medical Genetics (Associated anomalies in cases with anotia and microtia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics - Medical Genetics is now available. According to news originating from Strasbourg, France, by NewsRx correspondents, research stated, "Infants with anotia and microtia (AM) often have other non-AM associated congenital anomalies. The purpose of this investigation was to assess the prevalence and the types of these associated anomalies in a defined population."

Our news journalists obtained a quote from the research from the Faculty of Medicine, "The associated anomalies in infants with AM were collected in all livebirths, stillbirths and terminations of pregnancy during 29 years in 387,067 consecutive births in the area covered by our population-based registry of congenital malformations. Of the 146 cases with AM registered during this period, representing a prevalence of 3.77 per 10,000, 49.3% had associated anomalies. There were 14 (9.6%) cases with chromosomal abnormalities including 5 trisomies 18, and 18 (12.3%) nonchromosomal recognized dysmorphic conditions including 6 cases with oculo-auriculo-vertebral spectrum. However, numerous other recognized dysmorphic conditions were registered. Forty (27.4%) of the cases had multiple congenital anomalies (MCA). Anomalies especially in the cardiovascular, the musculoskeletal, the urogenital, the central nervous, and the digestive systems, and facial clefts were the most common other anomalies. This study included special strengths: each affected child was examined by a geneticist, all elective terminations were ascertained, and the surveillance for anomalies was continued until 2 years of age. In conclusion the overall prevalence of associated anomalies, which was one in every two cases, emphasizes the need for a thorough investigation of cases with AM."

According to the news editors, the research concluded: "A routine screening for other anomalies may be considered in infants and in fetuses with AM."

For more information on this research see: Associated anomalies in cases with anotia and microtia. European Journal of Medical Genetics, 2016;59(12):607-614. Oncology - Cancer Epidemiology

Findings from Faculty of Medicine Yields New Findings on Cancer
Epidemiology (The burden of oesophageal cancer in Central and South
America)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Oncology - Cancer Epidemiology are discussed in a
new report. According to news originating from Montevideo, Uruguay, by NewsRx
 correspondents, research stated, "Rationale and objective: Oesophageal cancer shows marked
geographic variations and is one of the leading causes of cancer death worldwide. We described
the burden of this malignancy in Central and South America."

Our news journalists obtained a quote from the research from the Faculty of
Medicine, "Regional and national level incidence data were obtained from 48 population-based
cancer registries in 13 countries. Mortality data were obtained from the WHO mortality
database. Incidence of oesophageal cancer by histological subtype were available from high-
quality population-based cancer registries. Males had higher incidence and mortality rates than
females (male-to-female ratios: 2-6:1 and 2-5:1). In 2003-2007, the highest rates were in Brazil,
Uruguay, Argentina and Chile. Mortality rates followed the incidence patterns. Incidence of
oesophageal squamous cell carcinoma (SCC) was higher than adenocarcinoma (AC), except in
females from Cuenca (Ecuador). SCC and AC incidence were higher in males than females,
except in the Region of Antofagasta and Valdivia (Chile), Manizales (Colombia) and Cuenca
(Ecuador). Incidence and mortality rates tended to decline in Argentina, Chile, Brazil
(incidence) and Costa Rica from 1997 to 2008. The geographic variation and sex disparity in
oesophageal cancer across Central and South America may reflect differences in the prevalence
of tobacco smoking and alcohol consumption which highlights the need to implement and/or
strengthen tobacco and alcohol control policies. Mate consumption, obesity, diet and
Helicobacter pylori infection may also explain the variation in oesophageal cancer rates but
these relationships should be evaluated."

According to the news editors, the research concluded: "Continuous monitoring of
oesophageal cancer rates is necessary to provide the basis for cancer prevention and control in
the region."

For more information on this research see: The burden of oesophageal cancer in
Central and South America. Cancer Epidemiology, 2016;44():S53-S61. Cancer Epidemiology

The news correspondents report that additional information may be obtained from E.
Findings from Faculty of Medicine in Head and Neck Cancer Reported (Quality of life impairment in patients with head and neck cancer and their caregivers: a comparative study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Head and Neck Cancer is the subject of a report. According to news originating from Santo Andre, Brazil, by NewsRx correspondents, research stated, "Head and neck cancer represents 3% of all the types of malignant neoplasms and squamous cell carcinoma (SCC) is responsible for 90% of these cases. There have been some studies evaluating the quality of life of these patients, but little is known about the physical and emotional effects on their caregivers."

Our news journalists obtained a quote from the research from the Faculty of Medicine, "To evaluate the quality of life of patients with head and neck cancer and their caregivers by applying validated questionnaires. Thirty patients with advanced tumors (SCC stage III or IV) and their 30 caregivers were included. Specific questionnaires (Coop/Wonca, EORTC QLQ-C30, EORTC HEN35, Coop/Wonca, and Caregiver Strain Index-CSI) were applied during routine medical consultations. Of the 30 patients, 28 were males and 25 had stage IV tumors, with mean age of 56.6 years. 36.7% had the primary tumor in the oropharynx and 70% reported pain. The functional cognitive, physical, and emotional scales were the most affected. Pain, fatigue, and sleep disorders were the most prevalent symptoms. Of the 30 caregivers, 23 were females and 70% were the primary caregivers. 36.7% of the caregivers had high levels of stress, mainly related to the feeling of incapacity. The comparison between patients and caregivers demonstrated that the two groups had similar quality of life impairment: physical fitness (p = 0.487), mental health (p=0.615), daily activities (p=0.793), social activities (p=0.301), changes in health (p =0.649), and overall health (p=0.168). Quality of life impairment is similar between patients and 'their caregivers."

According to the news editors, the research concluded: "This result demonstrates that not only the patients show quality of life impairment, but their caregivers also have it and at similar proportions."

The news correspondents report that additional information may be obtained from L.
Rigoni, Fac Med ABC, Santo Andre, SP, Brazil. Additional authors for this research include R.F. Bruhn, R. De Cicco, J.L. Kanda and L.L. Matos.

Oncology - Prostate Cancer

Findings from Federal University Provides New Data on Prostate Cancer [A decade (2004-2014) of FTIR prostate cancer spectroscopy studies: An overview of recent advancements]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Prostate Cancer are discussed in a new report. According to news reporting from Natal, Brazil, by NewsRx journalists, research stated, "This paper presents a retrospective study from 2004 to 2014 of FTIR prostate cancer spectroscopy related to tissues and cell biology."

The news correspondents obtained a quote from the research from Federal University, "Since vibrational spectroscopy is delicately sensitive to the biochemical composition of the sample and variations therein, it is possible to monitor metabolic processes in tissue and cells, and to construct spectral maps based on thousands of collected IR spectra. These reveal information on tissue structure, distribution of cellular components, metabolic activity and the health condition of cells and tissues."

According to the news reporters, the research concluded: "In addition, rapid collection, reliable data, a powerful ability to structure elucidation about IR spectroscopy, and the need for a rapid diagnosis of traditional biopsy (subject to sampling and inter-observer) have potentiated infrared as a way for a new type of analysis based on optical examination and being more objective than conventional colour methods."

Keywords for this news article include: Natal, Brazil, South America, Prostatic Neoplasms, Prostate Cancer, Oncology, Federal University.

Findings from Federal University Update Understanding of Cancer Therapy (Roles of OCT4 in tumorigenesis, cancer therapy resistance and prognosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Cancer Therapy are discussed in a new report. According to news reporting out of Porto Alegre, Brazil, by NewsRx editors, research stated, "OCT4 (POU5F1) is a major regulator of cell pluripotency and plays an important role not only during embryogenesis but also in tumorigenesis. It has been studied in various types of cancers, since stemness is an important factor for cancer growth and therapy."

Financial supporters for this research include CAPES, CNPq.

Our news journalists obtained a quote from the research from Federal University, "Here we present basic information about the OCT4 gene, its isoforms and pseudogenes besides discussing the current literature in which OCT4 is linked to cancer, emphasizing its roles in tumorigenesis and therapy. The majority of studies indicated a negative correlation between the expression of OCT4 and prognosis, and only in testicular germ cell tumor this correlation was positive. Using The Cancer Genome Atlas database we showed that OCT4 expression correlated negatively with patient survival in pancreatic cancer."

According to the news editors, the research concluded: "All those different impacts of OCT4 on cancer indicate the biological complexity of this transcription factor in biology and, therefore, also in cancer."

Our news journalists report that additional information may be obtained by contacting E.S. Villodre, Univ Fed Rio Grande do Sul, Dept. of Biophys, BR-91501970 Porto Alegre, RS, Brazil. Additional authors for this research include F.C. Kipper, M.B. Pereira and G. Lenz.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j ctrv.2016.10.003. This DOI is a link to an online electronic document that is either free or for purchase.

Peptide Proteins - Proinsulin

Findings from Federal University Yields New Findings on Proinsulin (L-Arginine supplementation improves insulin sensitivity and beta cell function in the offspring of diabetic rats through AKT and PDX-1 activation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Peptide Proteins - Proinsulin is now available. According to news reporting out of Sao Paulo, Brazil, by NewsRx editors, research stated, "Maternal hyperglycemia can result in defects in glucose metabolism and pancreatic beta-cell function in offspring. The purpose of this study was to evaluate the impact of maternal diabetes mellitus on pancreatic islets, muscle and adipose tissue of the offspring, with or without oral L-Arginine supplementation."

Financial support for this research came from The State of Sao Paulo Research Foundation.

Our news journalists obtained a quote from the research from Federal University, "The induction of diabetes was performed using streptozotocin (60 mg/kg). Animals were studied at 3 months of age and treatment (sucrose or L-Arginine) was administered from weaning. We observed that L-Arg improved insulin sensitivity in the offspring of diabetic mothers (DA), reflected by higher insulin-induced phosphorylation of Akt in muscle and adipose tissue. Insulin resistance is associated with increased oxidative stress and the NADPH oxidase enzyme plays an important role. Our results showed that the augmented interaction of p47(PHOX) with gp91(PHOX) subunits of the enzyme in skeletal muscle tissue in the offspring of diabetic rats (DV) was abolished after L-Arg treatment in DA rats. Maternal diabetes caused alterations in the islet functionality of the offspring leading to increased insulin secretion at both low (2.8 mM) and high (16.7 mM) concentrations of glucose. L-Arg reverses this effect, suggesting that it may be an important modulator in the insulin secretory process. In addition it is possible that L-Arg exerts its effects directly onto essential molecules for the maintenance and survival of pancreatic islets, decreasing protein expression of p47(PHOX) while increasing Akt phosphorylation and PDX-1 expression."

According to the news editors, the research concluded: "The mechanism by which L-Arg exerts its beneficial effects may involve nitric oxide bioavailability since treatment restored NO levels in the pancreas."

For more information on this research see: L-Arginine supplementation improves insulin sensitivity and beta cell function in the offspring of diabetic rats through AKT and PDX-1 activation. European Journal of Pharmacology, 2016;791():780-787. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Musculoskeletal Diseases and Conditions - …

Findings from Federal University in the Area of Osteopetrosis Described (Bone Mineral Density and Microarchitecture in Patients With Autosomal Dominant Osteopetrosis: A Report of Two Cases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Osteopetrosis have been published. According to news reporting from Rio de Janeiro, Brazil, by NewsRx journalists, research stated, "The aim of this case study is to describe changes in areal bone mineral density (aBMD) by dual-energy X-ray absorptiometry (DXA) scan, as well as volumetric bone density and microarchitecture by high-resolution peripheral quantitative computed tomography (HR-pQCT) in two patients with autosomal dominant osteopetrosis (ADO) and compare with 20 healthy subjects. We describe a 44-year-old male patient with six low-impact fractures since he was age 16 years, and a 32-year-old female patient with four low-impact fractures on her past history."

The news correspondents obtained a quote from the research from Federal University, "Radiographic changes were typical of ADO. Consistent with the much higher aBMD, total volumetric BMD (average bone density of the whole bone, including trabecular and cortical compartments) at distal radius and tibia (HR-pQCT) was more than twice the mean values found in healthy subjects in both patients. Trabecular number and thickness were higher, leading to an evident increase in trabecular bone volume to tissue volume. Also, an enormous increase in cortical thickness was found. Most important, a great heterogeneity in bone microstructure of the affected patients was evident on HR-pQCT images: islets of very dense bone were interposed with areas with apparent normal density. The increase in aBMD, volumetric BMD, and most indices of trabecular and cortical bone, associated with the great heterogeneity on bone tridimensional microarchitecture, reflect the accumulation of old and fragile bone randomly distributed along the skeleton."

According to the news reporters, the research concluded: "These alterations in bone microstructure probably compromise bone quality, which might justify the high prevalence of low-impact fractures in patients with ADO, despite abnormally elevated BMD."

Our news journalists report that additional information may be obtained by contacting M. Arruda, Dept. of Internal Medicine and Endocrinology Section, Medical School and Hospital Universitario Clementino Fraga Filho, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil. Additional authors for this research include M.C. Coelho, A.B. Moraes,

Oncology - Colon Cancer

Findings from First Affiliated Hospital in the Area of Colon Cancer Reported (5-Fluorouracil induces apoptosis of colorectal cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Colon Cancer are presented in a new report. According to news reporting originating in Changchun, People's Republic of China, by NewsRx journalists, research stated, "5-Fluorouracil (5-FU) is widely used in chemotherapy for treatment of colorectal cancer. Leucine-rich repeat-containing G protein-coupled receptor (LGR) is known to participate in the occurrence and development of breast cancer by regulating the rebirth of tumor vessels."

The news reporters obtained a quote from the research from First Affiliated Hospital, "This study aimed to explore the proliferation and apoptosis of HCT116 colorectal cancer cells treated with 5-FU and related molecular mechanisms. 5-FU (20 mg/mL) was used to treat cultured HCT116 cells. An MTT test, flow cytometry, and colony formation assays were used to examine the proliferation and apoptosis of HCT116 cells. Western blotting was applied to detect the expression of the LGR4 protein in HCT116 cells. Small interference RNA or over-expression techniques were used to manipulate LGR4 expression in HCT116 cells and describe the proliferation and apoptosis of HCT116 treated with 5-FU. A dosage of 20 mg/mL 5-FU resulted in a significant decrease in the proliferation and apoptosis of HCT116 cells and significantly decreased expression levels of LGR4."

According to the news reporters, the research concluded: "The specific gene silence or over-expression of LGR4 in HCT116 cells increased and decreased the levels of apoptosis in HCT116, respectively. 5-FU induces apoptosis of colorectal cancer cells and inhibits proliferation by suppressing LGR4 proteins."

For more information on this research see: 5-Fluorouracil induces apoptosis of colorectal cancer cells. Genetics and Molecular Research [electronic Resource], 2016;15 (1):15017326.

Our news correspondents report that additional information may be obtained by contacting J.T. Findings from First Hospital Provide New Insights into Breast Cancer (Juglone loaded poloxamer 188/phospholipid mixed micelles evaluated in vitro and in vivo in breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating from Suqian, People's Republic of China, by NewsRx correspondents, research stated, "Investigating the effects of juglone loaded P188/phospholipid mixed micelles (J-MM) in breast cancer. In vitro cytotoxicity, apoptotic effects, in vivo therapeutic efficacy and toxicity were used to assess its antitumour effect."

Funders for this research include National Natural Science Foundation of China, 333 project of Jiangsu Province and the Science and Technology Support Project of Suqian.

Our news editors obtained a quote from the research from First Hospital, "Uptake and imaging were used to evaluate the effect on the uptake and passive targeting. Mixed micelle carrier enhanced the targeting and uptake by MB-231 cells. The tumour inhibition rates in tumour xenograft models for paclitaxel, juglone, J-MM (10 mg/kg) and J-MM (40 mg/kg) were 46%, 27%, 39% and 53%, respectively. J-MM (10 mg/kg) exhibited lower toxicity compared with that by free juglone or high dose J-MM."

According to the news editors, the research concluded: "J-MM exhibited low toxicity, improved cellular uptake, passive targeting and anti-cancer effects in breast cancer model."

The news editors report that additional information may be obtained by contacting X. Jin, First Hosp Suqian, Dept. of Hosp Pharm, Suqian 223800, People's Republic of China. Additional authors for this research include Y.W. Zhang, Z.H. Zhang, D.B. Che and H.X. Lv.

Liver Diseases and Conditions - Hepatitis B Virus

Findings from First Hospital of Jilin University Provide New Insights into Hepatitis B Virus (Association between hepatitis B virus infection and risk of multiple myeloma: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Hepatitis B Virus. According to news reporting out of Changchun, People's Republic of China, by NewsRx editors, research stated, "Hepatitis B virus (HBV) infection is a major global public health concern. Although recent findings suggest an inverse relationship between HBV infection and multiple myeloma (MM), the true relationship between these two conditions remains unclear."

Our news journalists obtained a quote from the research from the First Hospital of Jilin University, "The primary aim of this meta-analysis was to evaluate the association between HBV infection, defined as hepatitis B surface antigen positivity, and the incidence of MM. We searched the PubMed/Medline, Cochrane Library and EMBASE databases from January 1975 to July 2014 and reviewed the reference lists of all retrieved articles. Odds ratios (OR) and 95% confidence intervals (CI) were calculated using fixed-and random-effects models. We identified nine case-control studies involving 30,646 patients with MM and 379,837 controls. HBV infection was not significantly associated with the development of MM (OR=1.3; 95% CI: 0.92-1.82; p=0.14). A similar risk of developing MM was present in different HBV-prevalent countries. However, significant heterogeneity was observed among studies (p=0.01). A statistically significant relationship between HBV infection and increased MM risk was detected in sub-analyses evaluating high-quality studies and those with hospital-based controls (p <0.05). HBV infection may be associated with an increased risk of MM."

According to the news editors, the research concluded: "However, confirmation of this relationship and the specific molecular mechanisms involved in the association between HBV infection and the development of MM require further exploration."

Our news journalists report that additional information may be obtained by contacting Y. Li, Cancer Center, First Hospital of Jilin University, Changchun, Jilin Province, People's Republic of China. Additional authors for this research include O. Bai, C. Liu, Z. Du, X. Wang, G. Wang and W. Li.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/imj.12981. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antivirals

Findings from Florida State University in Antivirals Provides New Insights (Differential Binding of Rimantadine Enantiomers to Influenza A M2 Proton Channel)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antivirals have been published. According to news reporting originating from Tallahassee, Florida, by NewsRx correspondents, research stated, "Rimantadine hydrochloride (α-methyl-1-adamantane-methalamine hydrochloride) is a chiral compound which exerts antiviral activity against the influenza A virus by inhibiting proton conductance of the M2 ion channel. In complex with M2, rimantadine has always been characterized as a racemic mixture."

Financial supporters for this research include Division of Chemistry, National Institute of Allergy and Infectious Diseases.

Our news editors obtained a quote from the research from Florida State University, "Here, we report the novel enantioselective synthesis of deuterium-labeled α- and (S)-rimantadine and the characterization of their protein-ligand interactions using solid-state NMR. Isotropic chemical shift changes strongly support differential binding of the enantiomers to the proton channel. Position restrained simulations satisfying distance restraints from (13)C-(2)H rotational-echo double-resonance NMR show marked differences in the hydrogen-bonding pattern of the two enantiomers at the binding site."

According to the news editors, the research concluded: "Together these results suggest a complex set of interactions between α-rimantadine and the M2 proton channel, leading to a higher stability for this enantiomer of the drug in the channel pore."

The news editors report that additional information may be obtained by contacting A.K. Wright, National High Magnetic Field Laboratory, Florida State University, Tallahassee, Florida 32310, United States. Additional authors for this research include P. Batsomboon, J. Dai, I. Hung, H.X. Zhou, G.B. Dudley and T.A. Cross.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/jacs.5b13129. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from Fourth Military Medical University in the Area of Hormones Reported (Snapshot: implications for melatonin in endoplasmic reticulum homeostasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hormones is now available. According to news reporting out of Xi'an, People's Republic of China, by NewsRx editors, research stated, "The endoplasmic reticulum (ER) is an important intracellular membranous organelle. Previous studies have demonstrated that the ER is responsible for protein folding and trafficking, lipid synthesis and the maintenance of calcium homeostasis."

Our news journalists obtained a quote from the research from Fourth Military Medical University, "Interestingly, the morphology and structure of the ER were recently found to be important. Melatonin is a hormone that anticipates the daily onset of darkness in mammals, and it is well known that melatonin acts as an antioxidant by scavenging free radicals and increasing the activity of antioxidant enzymes in the body. Notably, the existing evidence demonstrates that melatonin is involved in ER homeostasis, particularly in the morphology of the ER, indicating a potential protective role of melatonin."

According to the news editors, the research concluded: "This review discusses the existing knowledge regarding the implications for the involvement of melatonin in ER homeostasis."

Our news journalists report that additional information may be obtained by contacting Y. Yang, Fourth Military Medical University, Dept. of Biomed Engn, Xian, People's Republic of China. Additional authors for this research include Z.Q. Ma, S.Y. Di, S. Jiang, Y. Li, C.X. Fan, Y. Yang and D.J. Wang.

Keywords for this news article include: Xi'an, People's Republic of China, Asia, Hormones, Article Review, Melatonin, Fourth Military Medical University.

Findings from French National Institute of Health and Medical Research (INSERM) Broaden Understanding of Inflammation (Western diet induces a shift in microbiota composition enhancing susceptibility to Adherent-Invasive E. coli infection and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Inflammation have been published. According to news reporting from Clermont Ferrand, France, by NewsRx journalists, research stated, "Recent
advances have shown that the abnormal inflammatory response observed in CD involves an interplay among intestinal microbiota, host genetics and environmental factors. The escalating consumption of fat and sugar in Western countries parallels an increased incidence of CD during the latter 20(th) century."

The news correspondents obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "The impact of a HF/HS diet in mice was evaluated for the gut micro-inflammation, intestinal microbiota composition, function and selection of an *E. coli* population. The HF/HS diet created a specific inflammatory environment in the gut, correlated with intestinal mucosa dysbiosis characterized by an overgrowth of pro-inflammatory Proteobacteria such as *E. coli*, a decrease in protective bacteria, and a significantly decreased of SCFA concentrations. The expression of GPR43, a SCFA receptor was reduced in mice treated with a HF/HS diet and reduced in CD patients compared with controls. Interestingly, mice treated with an agonist of GPR43 were protected against DSS-induced colitis. Finally, the transplantation of feces from HF/HS treated mice to GF mice increased susceptibility to AIEC infection."

According to the news reporters, the research concluded: "Together, our results demonstrate that a Western diet could aggravate the inflammatory process and that the activation of the GPR43 receptor pathway could be used as a new strategy to treat CD patients."

For more information on this research see: Western diet induces a shift in microbiota composition enhancing susceptibility to Adherent-Invasive *E. coli* infection and intestinal inflammation. *Scientific Reports*, 2016;6():19032. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

dexamethasone intravitreal implant (DEX implant) in the treatment of macular edema secondary to branch or central retinal vein occlusion (BRVO, CRVO) in French clinical practice. A 24-month, prospective, multicenter, longitudinal, observational study (LOUVRE) conducted at 48 randomly selected sites in metropolitan France enrolled consecutive adult patients with macular edema following retinal vein occlusion (RVO) who were treated with DEX implant at baseline."

Financial support for this research came from Allergan plc.

The news correspondents obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "Re-treatment with DEX implant and use of other RVO treatments was at the physician's discretion. The primary endpoint was the change in best-corrected visual acuity (BCVA) from baseline to month 6. Secondary endpoints included change in BCVA, intraocular pressure (IOP), adverse events, and RVO treatments administered through month 24. The analysis population of 375 patients (53.9 % BRVO, 46.1 % CRVO) received a mean of 2.6 DEX implant injections over 2 years; mean time between injections was 6.6 months. Mean (SD) change in BCVA from baseline was 5.1 (19.0) letters at month 6 (p < 0.001) and 4.6 (22.3) letters at month 24 (p < 0.001). During the study, 208 patients (55.5 %) received treatment other than DEX implant for RVO, usually laser or ranibizumab therapy, with first use of other therapy occurring at a mean of 8.7 months. Mean change from baseline BCVA at month 6 was 5.5 letters (p < 0.001, N = 254) in patients who had received only DEX implant and 4.2 letters (p = 0.006, N = 121) in patients who had received additional other RVO treatment during the first 6 months. At month 24, mean change from baseline BCVA was +20.7 letters in patients treated with a single DEX implant only (p < 0.001), +4.9 letters in patients treated with aeyen2 DEX implants only (p = 0.029), and +2.3 letters in patients treated with DEX implant and other RVO treatment (p = 0.143). The most common adverse events (incidence) were cataract progression (39.7 %) and increased IOP (34.4 %). No glaucoma incisional surgeries were required. Efficacy and safety of DEX implant in the treatment of RVO-associated macular edema were demonstrated in the French clinical setting. Patients who switched from DEX implant to other RVO treatments did not have improved outcomes."

According to the news reporters, the research concluded: "The study is registered at ClinicalTrials.gov with the identifier NCT01618266."

For more information on this research see: Two-year, prospective, multicenter study of the use of dexamethasone intravitreal implant for treatment of macular edema secondary to retinal vein occlusion in the clinical setting in France. Drugs and Therapies - Antiretrovirals

Findings from French National Institute of Health and Medical Research (INSERM) in Antiretrovirals Reported (Efficacy and safety of a switch to rilpivirine-based regimens in treatment-experienced HIV-1-infected patients: a cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antiretrovirals. According to news originating from Paris, France, by NewsRx correspondents, research stated, "Rilpivirine (RPV) is a second-generation once-daily non-nucleoside reverse transcriptase inhibitor (NNRTI) which has shown non-inferior antiviral activity to efavirenz in treatment-naïve patients. Data in treatment-experienced patients are more limited."

Our news journalists obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "We wished to assess the efficacy and safety of a switch to RPV-based regimens in well-suppressed treatment-experienced patients. Between September 2012 and June 2013, all antiretroviral therapy (ART)-experienced HIV-1-infected patients with a plasma HIV RNA level < 50 copies/ml, and switching to an RPV-based regimen, were analysed in this retrospective observational monocentric cohort study. The primary end point was the proportion of patients with virological success defined as a plasma HIV RNA level < 50 copies/ml at 12 months using the FDA snapshot algorithm. A total of 281 participants were studied and 97% received a combination of RPV/tenofovir disoproxil fumarate/emtricitabine. At month 12, the rate of virological success was 59% and increased to 72% using available data beyond month 12. Sixteen (6%) patients experienced virological failure, which was associated with the presence of the M184V/I resistance mutation in prior genotypes (P= 0.02) and the use of a non-NNRTI as third agent before the switch (P= 0.03). RPV-based regimens were overall well tolerated and only 23 (8%) patients discontinued ART because of adverse events, mostly neuropsychiatric adverse events. Switching to RPV was associated with significant but modest improvement of the lipid profile."

According to the news editors, the research concluded: "In patients fully suppressed on ART, a switch to an RPV-based regimen should only be considered in the absence of prior virological failure or resistance mutations to nucleoside reverse transcriptase inhibitors and NNRTIs to avoid virological failures."

The news correspondents report that additional information may be obtained from J.M. Molina, INSERM UMR 941, Paris, France. Additional authors for this research include M. Resche-Rigon, C. Gatey, C. Yang, B. Denis, J. Fonsart, K. Desseaux, M. Guionie, W. Rozenbaum, C. Delaugerre and J.M. Molina.

Drugs and Therapies - Fundamental and Clinical...

Findings from French National Institute of Health and Medical Research (INSERM) in the Area of Fundamental and Clinical Pharmacology Described (Illicit drugs or medicines taken by parachuting)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Fundamental and Clinical Pharmacology have been presented. According to news originating from Bordeaux, France, by NewsRx correspondents, research stated, "Parachuting (also called bombing) is a method of drug delivery where illicit drugs or medicines are ingested after wrapping the substance. There are little data describing parachuting in the literature."

Our news journalists obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "To provide a description of this practice, all cases of parachuting reported to the national addictovigilance network up to 31 December 2014 were identified from spontaneous reports and specific surveillance programs. Cases were described according to the type of substance used, patient age and gender, type of complications, context of use and year of the event. Forty-five cases of parachute use were identified and most (n=43) occurred after 2011. Patients were mostly men (60%), and mean age was 28.9 years. The context of use, known in 19 cases, was mostly recreational. Complications were present in 24 cases, of which eight were serious. The substance was supposed to be 3,4-methylenedioxyamphetamine (MDMA) in the majority of cases (64.4%); research chemicals were more involved in the most recent years. The physical form was mainly granular (51.6%). The wrappers were a cigarette paper (nine cases) and in one case plastic package; in the other cases, the term of parachute was used without further details. The reason for use was not explained in the majority of cases; two patients indicated using a parachute for faster effect than with a methadone capsule."

According to the news editors, the research concluded: "Clinicians should be aware of this delivery form as the results suggest that it is common and can involve a great variability of drugs."

The news correspondents report that additional information may be obtained from A. Daveluy, Centre d'Addictovigilance, Service de Pharmacologie Medicale, CHU de Bordeaux, INSERM, U657, Bordeaux, F-33000, France. Additional authors for this research include H. Geniaux, C. Eiden, A. Boucher, C. Chenaf, S. Deheul, M. Spadari, M. Gerardin, G. Miremont-Salame and F. Haramburu.

Transplant Medicine - Liver Transplants

Findings from French National Institute of Health and Medical Research (INSERM) in the Area of Liver Transplants Reported (A high performance liquid chromatography tandem mass spectrometry for the quantification of tacrolimus in human bile in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Liver Transplants is now available. According to news reporting originating in Rennes, France, by NewsRx journalists, research stated, "Tacrolimus whole-blood concentrations imperfectly reflect concentrations at the effect site. Tacrolimus concentrations in the transplanted organ could be more relevant to predict rejection events."

Financial support for this research came from COmite de la REcherche Clinique Translationnelle.

The news reporters obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "Because liver biopsy cannot be repeatedly performed after liver transplantation, we suggested measuring tacrolimus in the bile to have a cost-effective and clinically implementable surrogate marker of intra-hepatic tacrolimus concentration. We developed and fully validated a liquid chromatography-tandem mass spectrometry method for the determination of tacrolimus in human bile. Sample purification was achieved using protein precipitation and liquid-liquid extraction with ethylacetate. Gradient elution was performed using a C18 analytical column with a 5 min run-time. The method was linear from 0.5 ng/mL to 20 ng/mL. In this concentration range, within-day and between-day precisions as well as overall bias were within 15%. Matrix effect was fully corrected by the internal standard (ascomycin). The assay was optimized to achieve good selectivity in this complex biological matrix. Tacrolimus was found to be stable in bile stored 6 months at -80 degrees C, after 3 freeze and thaw cycles, 20 h at room temperature and 24 h in extracts kept at 15 degrees C in the auto-sampler. The method was applied to quantify tacrolimus in bile from liver transplant recipients. It allowed getting preliminary data about tacrolimus excretion profile in bile and showed the lack of correlation between tacrolimus whole blood concentration and tacrolimus liver exposition."

According to the news reporters, the research concluded: "This alternative and innovative analytical approach of tacrolimus bio-analysis appears suitable for further studies evaluating relevance of biliary tacrolimus concentration as a new pharmacological marker of immunosuppressive activity."

For more information on this research see: A high performance liquid chromatography tandem mass spectrometry for the quantification of tacrolimus in human bile in liver transplant recipients. Journal of Chromatography A, 2016;1475():55-63. Journal of
Oncology - Gastric Cancer

Findings from Fudan University Update Understanding of Gastric Cancer (Glycoprotein 130 is associated with adverse postoperative clinical outcomes of patients with late-stage non-metastatic gastric cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Gastric Cancer are discussed in a new report. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "The interaction of glycoprotein 130 (gp130) with the cytokines of Interleukin-6 (IL-6) family has proved to play a crucial part in several cancers. Our current study is designed to discover the clinical prognostic significance of gp130 in non-metastatic gastric cancer."

The news correspondents obtained a quote from the research from Fudan University, "We examined intratumoral gp130 expression in retrospectively enrolled 370 gastric cancer patients who underwent radical gastrectomy with standard D2 lymphadenectomy at Zhongshan Hospital of Fudan University during 2007 and 2008 by immunohistochemical staining. The expression of gp130 was significantly correlated with T classification, N classification and TNM stage (P = 0.003, P < 0.001 and P < 0.001, respectively; T, N, TNM refers to Tumor Invasion, Regional lymph node metastasis and Tumor Node Metastasis, respectively). Elevated intratumoral gp130 expression implied unfavourable overall survival (OS) (P < 0.001) and disease-free survival (DFS) (P < 0.001), respectively. Furthermore, among TNM II and III gp130-high patients, those who were treated with 5-fluorouracil (5-FU) based adjuvant chemotherapy had better OS (P < 0.001). The generated nomogram performed well in predicting the 3- and 5-year OS of gastric cancer patients. The incorporation of gp130 into contemporary TNM staging system would be of great significance to improve the current individual risk stratification."

According to the news reporters, the research concluded: "These findings contribute
to better clinical management for those patients who would benefit from adjuvant chemotherapy."

For more information on this research see: Glycoprotein 130 is associated with adverse postoperative clinical outcomes of patients with late-stage non-metastatic gastric cancer. Scientific Reports, 2016;6():1-10. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Cardiovascular Diseases and Conditions - Aneurysm

Findings from Fudan University in Aneurysm Reported (Assessment of intracranial aneurysm rupture based on morphology parameters and anatomical locations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Aneurysm have been published. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "The aim of the present study was to identify image-based morphological parameters and anatomical locations associated with intracranial aneurysm (IA) rupture. Nine morphological parameters and aneurysm location were evaluated in 150 patients with saccular IAs (82 unruptured, 68 ruptured) using three-dimensional geometry."

The news reporters obtained a quote from the research from Fudan University, "Aneurysm location and morphological parameters including size, aspect ratio, size ratio, height-width ratio, flow angle, aneurysm inclination angle, parent artery angle, vessel angle, and aneurysm shape were explored to identify a correlation with aneurysm rupture. These factors were analyzed using a two-tailed independent Student t test or the chi test for significance. Significant factors were further examined using logistic regression analysis. Additionally, receiver operating characteristic (ROC) analysis was performed to evaluate each parameter. Statistically significant differences were observed in ruptured and unruptured groups for aspect ratio, size ratio, height-width ratio, flow angle, aneurysm inclination angle, vessel angle, aneurysm shape, and aneurysm location. Logistic regression analysis further revealed that size ratio (OR 1.66; 95% CI 1.05 to 2.64), height-width ratio (OR 14.22; 95% CI 2.67 to 75.88), aneurysm inclination angle (OR 1.04; 95% CI 1.01 to 1.07), aneurysm shape (OR 4.68; 95% CI 2.44 to 8.98), and aneurysm location (OR 1.60; 95% CI 1.15 to 2.23) had the strongest independent correlation with ruptured IA. The ROC analysis showed that the size ratio and flow angle had the highest area under the curve, with values of 0.735 and 0.730, respectively. Size ratio, height-width ratio, aneurysm inclination angle, aneurysm shape, and aneurysm location
might be important for discriminating between ruptured and unruptured aneurysms."

According to the news reporters, the research concluded: "Further investigation will determine whether these morphological parameters and anatomical locations will be reliable predictors of aneurysm rupture."

Our news correspondents report that additional information may be obtained by contacting B. Leng, Fudan University, Shanghai Med College, Huashan Hosp, Dept. of Neurosurg, Shanghai 200040, People's Republic of China. Additional authors for this research include F. Xu, J.M. Ren, Q. Xu, Y.J. Liu, Y.L. Tian and B. Leng.

Oncology - Carcinomas

**Findings from Fudan University in the Area of Carcinomas Reported**

(Depletion of the triggering receptor expressed on myeloid cells 2 inhibits progression of renal cell carcinoma via regulating related protein expression and PTEN-PI3K/Akt pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Carcinomas are discussed in a new report. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "The triggering receptor expressed on myeloid cells 2 (TREM-2) is suggested to be involved in the development of certain human malignancies. However, the functions of TREM-2 in renal cell carcinoma (RCC) are still less known."

Our news journalists obtained a quote from the research from Fudan University, "To reveal the effects of TREM-2 on the RCC progression, we examined the TREM-2 expression in RCC tumor tissues. Then, we analyzed the cell proliferation, cell apoptosis, cell cycle and expression of the relative factors in two selected RCC cell lines post RNA interference. We also analyzed the functions of TREM-2 in an in vivo nude mouse model. We found that, the expression of TREM-2 was abnormally elevated in RCC tumor tissues. Silencing TREM-2 inhibited cell growth, induced G1 phase arrest of cell cycle and cell apoptosis in RCC cells. In vivo, the results showed that depletion of TREM-2 significantly inhibited the ACHN tumor growth in the nude mouse model. The analysis of relative protein factors suggested that silencing TREM-2 downregulated the expression levels of Bcl2 and PCNA, and upregulated the
expression levels of Bax and caspase-3 in RCC cell lines. Depletion of TREM-2 inactivated PI3K/Akt pathway through increasing the expression of PTEN.

According to the news editors, the research concluded: "Taken together, TREM-2 acts as an oncogene in the development of RCC and can be considered as a novel therapeutic factor in the treatment of RCC."

Our news journalists report that additional information may be obtained by contacting W.Q. Qian, Fudan University, Huadong Hosp, Dept. of Urol, Shanghai 200040, People's Republic of China. Additional authors for this research include L. Sheng, J. Tao, R. Chen, Y. Li, Z.Q. Sun and W.Q. Qian.

Keywords for this news article include: Shanghai, People's Republic of China, Asia, Protein Expression, Myeloid Cells, Proteomics, Nephrology, Carcinomas, Oncology, Genetics, Kidney, Fudan University.

**Heart Disorders and Diseases - Atrial Fibrillation**

**Findings from Fukuoka University in the Area of Atrial Fibrillation Described (Circadian variations in laboratory measurements of coagulation assays after administration of rivaroxaban or warfarin in patients with nonvalvular atrial fibrillation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "Although rivaroxaban has a relatively shorter half-life and peak and trough plasma concentrations throughout the day than warfarin, rivaroxaban has been found to be non-inferior to warfarin in preventing thromboembolic events in patients with nonvalvular atrial fibrillation (NVAF). We measured circadian variations in laboratory measurements of coagulation assays for chronic treatment with rivaroxaban or warfarin in patients with NVAF."

Our news editors obtained a quote from the research from Fukuoka University, "We included 28 consecutive patients with NVAF who were treated with rivaroxaban (n = 13) or warfarin (n = 15). Blood samples were collected at 6 AM, 11 AM, and 3 PM on the same day and on the next morning at 6 AM. Prothrombin time (PT), international normalized ratio of the PT (PT-INR), activated partial thromboplastin time (APTT), prothrombin fragment 1 + 2 (F1 + 2), and protein C level/activity were measured in each patient. PT and PT-INR were significantly and consistently lower, and the F1 + 2 and protein C level/activity were significantly and consistently higher throughout the day in rivaroxaban-treated patients than in warfarin-treated patients. Significant increases in PT and PT-INR were observed 3 h after oral administration in the patients taking rivaroxaban in the morning, whereas, significant increases in the protein C level/activity were observed 3 h after oral administration in the patients taking..."
warfarin in the morning. The protein C level/activity was significantly and consistently higher in the rivaroxaban-treated patients than in the warfarin-treated patients throughout the day, which was in contrast to the findings for other coagulation assays."

According to the news editors, the research concluded: "These findings may partly explain the specific persistent anticoagulant effects of rivaroxaban even during the trough phase of the plasma concentration."

For more information on this research see: Circadian variations in laboratory measurements of coagulation assays after administration of rivaroxaban or warfarin in patients with nonvalvular atrial fibrillation. *Journal of Cardiology*, 2016;68(5-6):529-535. *Journal of Cardiology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Oncology - Esophageal Cancer**

**Findings from G. Lin et al in Esophageal Cancer Reported (Increasing the interval between neoadjuvant chemoradiotherapy and surgery in esophageal cancer: a meta-analysis of published studies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Esophageal Cancer is now available. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "The aim of this meta-analysis was to clarify whether a longer interval between the end of neoadjuvant chemoradiotherapy (nCRT) and surgery is associated with better outcomes in esophageal cancer. nCRT followed by surgery is the most common approach for patients with resectable esophageal cancer. Operations are performed within 2-8 weeks after nCRT; however, the optimal interval between nCRT and surgery for esophageal cancer is unknown."

The news reporters obtained a quote from the research, "We performed a systematic literature search in MEDLINE, EMBASE, the Cochrane Central Register of Controlled Trials, and the Clinical Trials database for studies published between January 2000 and December 2014. Eligible studies were prospective or retrospective studies of esophageal cancer that assessed the effects of intervals longer or shorter than 7-8 weeks between the end of nCRT and surgery. The primary end-points were the overall survival (OS) and pathologic complete
A meta-analysis was performed to estimate odds ratios (ORs) using fixed-effect and random-effect models, with Review Manager 5.2. The five studies that met the eligibility requirements included 1,016 patients: 520 in the shorter interval group (7-8 weeks) and 496 in the longer interval group (>7-8 weeks). The results of our meta-analysis indicate that a longer interval between nCRT and surgery may be disadvantageous for 2-year OS (OR = 1.40, 95% confidence interval [CI]: 1.09-1.80, P = 0.010) and R0 resection rate (OR = 1.71, 95% CI: 1.14-2.22, P = 0.009). The pCR, anastomotic leak rate, and postoperative morbidity were similar in the two groups. A longer interval (more than the standard 7-8 weeks) from the end of preoperative nCRT to surgery did not increase the rate of pCR in esophageal cancer, and the different intervals had similar effects on anastomotic leak rate and postoperative mortality rates. However, the longer interval between nCRT and surgery may be disadvantageous for long-term OS."

According to the news reporters, the research concluded: "These results should be validated prospectively in a randomized trial."

Financial support for this research came from France AgriMer (National Agency of Agricultural and Maritime Products).

Our news correspondents report that additional information may be obtained by contacting Y.P. Xu, Zhejiang Key Lab Diag & Treatment Technol Thorac, Hangzhou 310022, Zhejiang, People's Republic of China. Additional authors for this research include S.Y. Han, Y.P. Xu and W.M. Mao.

Gram-Negative Bacteria - Escherichia coli

Findings from G. Mourand et al in Escherichia coli Reported (Rare Spontaneous Loss of Multiresistance Gene Carrying IncI/ST12 Plasmid in Escherichia coli in Pig Microbiota)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Escherichia coli have been presented. According to news originating from Ploufragan, France, by NewsRx correspondents, research stated, "Resistance to extended-spectrum cephalosporins (ESCs) is a matter of considerable concern for public health. Here, we studied the spontaneous loss of an extended-spectrum beta-lactamase (ESBL)-encoding plasmid from a rifampin-resistant Escherichia coli isolate orally inoculated into pigs under controlled conditions."

Financial support for this research came from France AgriMer (National Agency of Agricultural and Maritime Products).

Our news journalists obtained a quote from the research, "Fecal samples were collected and cultured on rifampin-supplemented medium, and the resistance of the E. coli
isolates to ESCs was studied by phenotypic tests, PCR detection of plasmid genes, and complete sequencing. The results showed that only 3 out of 353 rifampin-resistant E. coli isolates were ESC susceptible, and PCR and bioinformatics analysis confirmed the loss of the plasmid."

According to the news editors, the research concluded: "These in vivo experiments indicate that the loss of an ESBL-encoding plasmid seems a rare event in gut microbiota."

For more information on this research see: Rare Spontaneous Loss of Multiresistance Gene Carrying IncI/ST12 Plasmid in Escherichia coli in Pig Microbiota. Antimicrobial Agents and Chemotherapy, 2016;60(10):6046-6049. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news correspondents report that additional information may be obtained from I. Kempf, Univ Bretagne Loire, Agence Natl Securite Sanitaire Anses, Lab Ploufragan Plouzane, Ploufragan, France. Additional authors for this research include F. Touzain, E. Jouy, M.A. Fleury, E. Denamur and I. Kempf.

Heart Disorders and Diseases - Arrhythmogenic...

Findings from G.D. Aquaro and Colleagues Provides New Insights into Arrhythmogenic Right Ventricular Dysplasia (Usefulness of Combined Functional Assessment by Cardiac Magnetic Resonance and Tissue Characterization Versus Task Force Criteria ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Arrhythmogenic Right Ventricular Dysplasia is the subject of a report. According to news reporting originating in Pisa, Italy, by NewsRx journalists, research stated, "Current task force criteria (TFC) of cardiac magnetic resonance (CMR) for the diagnosis of arrhythmogenic right ventricular cardiomyopathy (ARVC/D) were generated by comparing probands (mean age of 44 years) to healthy participants of the multi-ethnic study of atherosclerosis (mean age of 60 years). These age differences may be a selection bias because right ventricular end-diastolic volume index decreases 4.6% per decade."

The news reporters obtained a quote from the research, "Moreover, fat infiltration and late gadolinium enhancement were not included. We evaluated the diagnostic accuracy of TFC using the same methodology used by the task force but comparing probands and age- and gender-matched healthy controls and considering also other morphofunctional and tissue abnormalities detected by CMR. Forty-seven probands with previous diagnosis of ARVC/D (excluding probands if CMR was used for diagnosis) were compared with 216 age- and gender-matched healthy controls. TFC had optimal specificity (100%) but poor sensitivity (20% for
major and 13% for minor criteria). The presence of any pre- and post-contrast signal abnormalities had 100% specificity and 81% sensitivity. The best diagnostic accuracy (98%) was achieved by the combined evaluation of any right ventricular wall motion abnormality (excluding hypokinesia) with any signal abnormality (including left ventricular fat infiltration and late gadolinium enhancement) yielding a 100% specificity and 96% sensitivity. Left ventricular was involved in 45% of the probands. Current TFC for CMR presented optimal specificity but poor sensitivity to identify patient with ARVC/D."

According to the news reporters, the research concluded: "Signal and wall motion parameters of CMR should be considered together to achieve the best diagnostic accuracy for the diagnosis of ARVC/D."

Our news correspondents report that additional information may be obtained by contacting G.D. Aquaro, G Monasterio CNR Tuscany Fdn, UOC Risonanza Magnet, Pisa, Italy. Additional authors for this research include A. Barison, G. Todiere, C. Grigoratos, L.A. Ali, G. Di Bella, M. Emdin and P. Festa.

Hydrocarbons

Findings from G.M. Rusch and Co-Authors Broaden Understanding of Hydrocarbons (An approach for the development of emergency response levels for halogenated hydrocarbons)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hydrocarbons have been presented. According to news reporting from Sarasota, Florida, by NewsRx editors, the research stated, "Emergency exposure guidance levels have been developed for many halogenated hydrocarbons. These can be employed in the event of accidental releases or terrorist actions."

Financial support for this research came from Honeywell International.

The news correspondents obtained a quote from the research, "However, for a chemical release involving a substance without existing guidance levels, there is a need to be able to develop one rapidly. Two data sources are available, the Acute Exposure Guideline Levels (AEGL) and Emergency Response Guideline Levels (ERPG). The subset of halogenated
hydrocarbons and related substances included in these data sources represent 30 chemicals and 41 risk assessments. The ratios for serious toxicity/annoyance level and for potential lethality/serious toxicity were calculated. On reviewing the results, the geometric means provided the best basis for extrapolation. When the geometric means of the ratios of ERPG-3/ERPG-2 and AEGL-3/AEGL-2 were calculated their combined mean was 4.40. The geometric standard deviation for the combined data set was 2.00 suggesting the data were homogeneous. Likewise, calculation of the geometric means for ERPG-2/1 and AEGL-2/1 the combined ratio was 3.93. The geometric standard deviation for the combined set was 1.46, again suggesting homogeneity of the data.

According to the news reporters, the research concluded: "The review described in this paper confirmed that the time default 'n' values of 3 and 1 (ten Berge et al., 1986) are appropriate for extrapolation to shorter and longer exposure times, respectively."

Our news journalists report that additional information may be obtained by contacting G.M. Rusch, Risk Assessment & Toxicol Serv, Sarasota, FL 34241, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.yrtph.2016.06.021. This DOI is a link to an online electronic document that is either free or for purchase.

**Nutritional and Metabolic Diseases and Conditions -…**

**Findings from GNS Science Yields New Findings on Morbid Obesity (Morbid Obesity in Disasters: Bringing the "Conspicuously Invisible" into Focus)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Morbid Obesity are presented in a new report. According to news reporting originating in Wellington, New Zealand, by NewsRx journalists, research stated, "It is a frightening reality for some people to be caught up in the midst of a disaster, alone and vulnerable due to their relative size, shape or weight. A literature search failed to find any empirical reports of data specific to body mass index (BMI) in disaster situations."

The news reporters obtained a quote from the research from GNS Science, "A handful of largely anecdotal reports described situations in which people categorised as morbidly obese were negatively impacted in disasters because of their size and/or weight. While a small number of toolkits and training resources were found, there remains a paucity of research in relation to obesity and emergency planning or disaster risk reduction. This is somewhat surprising, considering the concern about increasing levels of obesity globally."

---

**Findings from GNS Science Yields New Findings on Morbid Obesity (Morbid Obesity in Disasters: Bringing the "Conspicuously Invisible" into Focus)**
According to the news reporters, the research concluded: "Research is urgently needed to prioritise and address the specific considerations of people with morbid obesity and how communities plan, prepare, respond, and recover from disasters and public health emergencies."

Our news correspondents report that additional information may be obtained by contacting L. Gray, GNS Sci, Wellington 6021, New Zealand.

Digestive System Diseases and Conditions - …

**Findings from Gachon University Yields New Findings on Inflammatory Bowel Disease (MicroRNA-132 and microRNA-223 control positive feedback circuit by regulating FOXO3a in inflammatory bowel disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Inflammatory Bowel Disease. According to news reporting from Inchon, South Korea, by NewsRx journalists, research stated, "Although many progresses have been achieved for inflammatory bowel disease (IBD), it is still remained as idiopathic disease to be completely controlled. MicroRNAs (miRNAs) have been identified as key players in many human diseases through degradation or translational inhibition of target genes."

The news correspondents obtained a quote from the research from Gachon University, "Because role of miRNAs in IBD is not completely understood yet, we need to identify miRNAs as novel targets for treatment of IBD. Microarray analysis for miRNAs was performed using dextran sulfate sodium-induced colitis samples and selected differentially regulated miRNAs. Candidate genes were validated using in vitro system and IBD patient samples. Molecular mechanism for regulation of inflammatory signaling was identified using gene modulation system of miRNAs. We selected 14 upregulated and 15 downregulated miRNAs through microarray analysis. Among candidate miRNAs, significant upregulation of miR-132 and miR-223 was confirmed in inflamed mouse tissues as well as human IBD patient tissues. Through bioinformatics analysis, we identified FOXO3a as direct target of miRNAs and confirmed regulatory mechanism using luciferase assay. Expression of miRNAs clearly suppressed the level of I kappa B alpha through downregulation of FOXO3a, leading to enhanced NF-kappa B signaling to promote the production of pro-inflammatory cytokines. The downregulation of FOXO3a concurrent with upregulation of cytokines was significantly reversed by sequestration of miRNAs with miRNA sponges."

According to the news reporters, the research concluded: "Our findings provided the evidences that miR-132 and 223 are critical mediators in positive circuit for pathogenesis of
IBD by negatively regulating FOXO3a to enhance the expression of inflammatory cytokines and can be a good therapeutic target for IBD treatment.

Our news journalists report that additional information may be obtained by contacting S. Hong, Gachon Univ, Lee Gil Ya Canc & Diabet Inst, Dept. of Molecular Med, Inchon, South Korea. Additional authors for this research include H.Y. Kwon, H.T.H. Thi, H.J. Lee, G. Il Kim, K.B. Hahm and S. Hong.

Keywords for this news article include: Inchon, South Korea, Asia, Digestive System Diseases and Conditions, Gastrointestinal Diseases and Conditions, Bowel Diseases and Conditions, Inflammatory Bowel Disease, Gastroenteritis, Cytokines, Genetics, Gachon University.

**Oncology - Leukemia**

**Findings from General Hospital Provides New Data about Leukemia (Sulforaphane-induced apoptosis in human leukemia HL-60 cells through extrinsic and intrinsic signal pathways and altering associated genes expression assayed by cDNA microarray)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Leukemia have been presented. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "Sulforaphane (SFN), one of the isothiocyanates, is a biologically active compound extracted from cruciferous vegetables, and has been shown to induce cytotoxic effects on many human cancer cells including human leukemia cells. However, the exact molecular mechanism and altered gene expression associated with apoptosis is unclear."

Financial support for this research came from China Medical University, Taichung, Taiwan.

The news reporters obtained a quote from the research from General Hospital, "In this study, we investigated SFN-induced cytotoxic effects and whether or not they went through cell-cycle arrest and induction of apoptosis and further examined molecular mechanism and altered gene expression in human leukemia HL-60 cells. Cell viability, cell-cycle distribution, sub-G1 (apoptosis), reactive oxygen species (ROS) and Ca production, levels of mitochondrial membrane potential (DPS), and caspase-3, -8, and -9 activities were assayed by flow cytometry. Apoptosis-associated proteins levels and gene expressions were examined by Western blotting and cDNA microarray assays, respectively. Results indicated that SFN decreased viable cells, induced G2/M phase arrest and apoptosis based on sub-G1 phase development. Furthermore, SFN increased ROS and Ca production and decreased the levels of DPS and activated caspase-3, -8, and -9 activities in HL-60 cells. SFN significantly upregulated the expression of BAX, Bid, Fas, Fas-L, caspase-8, Endo G, AIF, and cytochrome c, and inhibited the antiapoptotic
proteins such as Bcl-x and XIAP, that is associated with apoptosis. We also used cDNA microarray to confirm several gene expressions such as caspase -8, -3, -4, -6, and -7 that are affected by SFN."

According to the news reporters, the research concluded: "Those results indicated that SFN induced apoptosis in HL-60 cells via Fas-and mitochondria-dependent pathways. 2016 Wiley Periodicals, Inc. Environ Toxicol 32:311-328."

Our news correspondents report that additional information may be obtained by contacting H.S. Shang, Dept. of Pathology, National Defense Medical Center, Division of Clinical Pathology, Tri-Service General Hospital, Taipei, Taiwan. Additional authors for this research include Y.L. Shih, C.H. Lee, S.C. Hsueh, J.Y. Liu, N.C. Liao, Y.L. Chen, Y.P. Huang, H.F. Lu and J.G Chung.

Transplant Medicine - Organ Transplants

Findings from Georges Pompidou European Hospital in the Area of Organ Transplants Reported (Early Identification of Patients With Out-of-Hospital Cardiac Arrest With No Chance of Survival and Consideration for Organ Donation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Organ Transplants. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "In patients with out-of-hospital cardiac arrest (OHCA), care requirements can conflict with the need to promptly focus efforts on organ donation in patients who are pronounced dead. To evaluate objective criteria for identifying patients with OHCA with no chance of survival during the first minutes of cardiopulmonary resuscitation to enable prompt orientation toward organ donation."

The news reporters obtained a quote from the research from Georges Pompidou European Hospital, "Retrospective assessment using OHCA data from 2 registries and 1 trial. France (Paris Sudden Death Expertise Center [SDEC] prospective cohort [2011 to 2014] and PRESENCE multicenter cluster randomized trial [ClinicalTrials.gov: NCT01009606] [2009 to 2011]) and the United States (King County, Washington, prospective cohort [2006 to 2011]). 1771 patients from the Paris SDEC 1-year cohort (2011 to 2012) and 5192 from the validation cohorts. Evaluation of 3 objective criteria (OHCA not witnessed by emergency medical services..."
personnel, nonshockable initial cardiac rhythm, and no return of spontaneous circulation before receipt of a third 1-mg dose of epinephrine), survival rate at hospital discharge among patients meeting these criteria, performance of the criteria, and number of patients eligible for organ donation. In the Paris SDEC 1-year cohort, the survival rate among the 772 patients with OHCA who met the objective criteria was 0% (95% CI, 0.0% to 0.5%), with a specificity of 100% (CI, 97% to 100%) and a positive predictive value of 100% (CI, 99% to 100%). These results were verified in the validation cohorts. Ninety-five (12%) patients in the Paris SDEC 1-year cohort may have been eligible for organ donation. Limitation: Several patients had unknown outcomes.

According to the news reporters, the research concluded: "Three objective criteria enable the early identification of patients with OHCA with essentially no chance of survival and may help in decision making about the organ donation process."

For more information on this research see: Early Identification of Patients With Out-of-Hospital Cardiac Arrest With No Chance of Survival and Consideration for Organ Donation. Annals of Internal Medicine, 2016;165(11):770-778,146-150. Hematology - Plasma

Findings from Georgetown University Has Provided New Data on Plasma (The enigma of continual plasma volume expansion in pregnancy: critical role of the renin-angiotensin-aldosterone system)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematology - Plasma have been published. According to news reporting originating from Washington, District of Columbia, by NewsRx correspondents, research stated, "Pregnancy is characterized by avid renal sodium retention and plasma volume expansion in the presence of decreased blood pressure. Decreased maternal blood pressure is a consequence of reduced systemic vascular tone, which results from an increased production of vasodilators [nitric oxide (NO), prostaglandins, and relaxin] and decreased vascular responsiveness to the potent vasoconstrictor (angiotensin II)."

Our news editors obtained a quote from the research from Georgetown University,
"The kidneys participate in this vasodilatory response, resulting in marked increases in renal plasma flow and glomerular filtration rate (GFR) during pregnancy. In women, sodium retention drives plasma volume expansion (similar to 40%) and is necessary for perfusion of the growing uterus and fetus. For there to be avid sodium retention in the presence of the potent natriuretic influences of increased NO and elevated GFR, there must be modifications of the tubules to prevent salt wasting."

According to the news editors, the research concluded: "The purpose of this review is to summarize these adaptations."

The news editors report that additional information may be obtained by contacting C.A. West, Georgetown University, Dept. of Med, Washington, DC, United States. Additional authors for this research include J.M. Sasser and C. Baylis.

Mosquito-Borne Diseases - Malaria

Findings from Georgetown University Reveals New Findings on Malaria (Endoperoxide Drug Cross-Resistance Patterns for Plasmodium falciparum Exhibiting an Artemisinin Delayed-Clearance Phenotype)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mosquito-Borne Diseases - Malaria. According to news reporting originating from Washington, District of Columbia, by NewsRx correspondents, research stated, "The ring-stage susceptibility assay was modified to quantify the susceptibilities of multiple strains of control and delayed-clearance phenotype (DCP) Plasmodium falciparum strains to seven endoperoxide antimalarial drugs."

Financial support for this research came from HHS | National Institutes of Health (NIH).

Our news editors obtained a quote from the research from Georgetown University, "The susceptibility of all of the DCP lines to six of the drugs was lower than that of the controls. In contrast, DCP parasites did not show reduced susceptibility to the synthetic endoperoxide drug OZ439."

According to the news editors, the research concluded: "These data show that it is possible to circumvent emerging artemisinin resistance with a modified endoperoxide drug."

For more information on this research see: Endoperoxide Drug Cross-Resistance Patterns for Plasmodium falciparum Exhibiting an Artemisinin Delayed-Clearance Phenotype. Antimicrobial Agents and Chemotherapy, 2016;60(11):6952-6956. Antimicrobial Agents and
Inflammation

Findings from Georgetown University in the Area of Inflammation Described (Rac1-Mediated DNA Damage and Inflammation Promote Nf2 Tumorigenesis but Also Limit Cell-Cycle Progression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Inflammation. According to news reporting from Washington, District of Columbia, by NewsRx journalists, research stated, "Merlin encoded by the Nf2 gene is a bona fide tumor suppressor that has been implicated in regulation of both the Hippo-Yap and Rac1-Pak1 pathways."

Funders for this research include NIH, V Foundation, Advocure NF2 Foundation, Georgetown Undergraduate Research Opportunities Program, Cancer Center Support.

The news correspondents obtained a quote from the research from Georgetown University, "Using genetically engineered murine liver models, we show that co-deletion of Rac1 with Nf2 blocks tumor initiation but paradoxically exacerbates hepatomegaly induced by Nf2 loss, which can be suppressed either by treatment with pro-oxidants or by co-deletion of Yap. Our results suggest that while Yap acts as the central driver of proliferation during Nf2 tumorigenesis, Rac1 primarily functions as an inflammation switch by inducing reactive oxygen species that, on one hand, induce nuclear factor kappa B signaling and expression of inflammatory cytokines, and on the other activate p53 checkpoint and senescence programs dampening the cyclin D1-pRb-E2F1 pathway."

According to the news reporters, the research concluded: "Interestingly, senescence markers are associated with benign NF2 tumors but not with malignant NF2 mutant mesotheliomas, suggesting that senescence may underlie the benign nature of most NF2 tumors."

For more information on this research see: Rac1-Mediated DNA Damage and Inflammation Promote Nf2 Tumorigenesis but Also Limit Cell-Cycle Progression. Developmental Cell, 2016;39(4):452-465. Developmental Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. Findings from Georgia Institute of Technology Yields New Data on CD Antigens [Local Cellular and Cytokine Cues in the Spleen Regulate In Situ T Cell Receptor Affinity, Function, and Fate of CD8(+) T Cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - CD Antigens. According to news reporting out of Atlanta, Georgia, by NewsRx editors, research stated, "T cells rapidly undergo contraction upon viral clearance, but how T cell function and fate are determined during this phase is unclear. During the contraction phase of an acute infection with lymphocytic choriomeningitis virus, we found that virus-specific CD8(+) T cells within the splenic red pulp (RP) had higher two-dimensional (2D) effective affinity than those within the white pulp (WP)."

Our news journalists obtained a quote from the research from the Georgia Institute of Technology, "This increased antigen recognition of RP-derived CD8(+) T cells correlated with more efficient target cell killing and improved control of viremia. FoxP3(+) regulatory T cells and cytokine TGF-beta limited the 2D-affinity in the WP during the contraction phase. Anatomical location drove gene expression patterns in CD8(+) T cells that led to preferential differentiation of memory precursor WP T cells into long-term memory cells."

According to the news editors, the research concluded: "These results highlight that intricate regulation of T cell function and fate is determined by anatomic compartmentalization during the early immune contraction phase."

For more information on this research see: Local Cellular and Cytokine Cues in the Spleen Regulate In Situ T Cell Receptor Affinity, Function, and Fate of CD8(+) T Cells. *Immunity*, 2016;45(5):988-998. *Immunity* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Immunity - www.journals.elsevier.com/immunity/)

Our news journalists report that additional information may be obtained by contacting C. Zhu, Georgia Inst Technol, Wallace H Coulter Dept. of Biomed Engn, Atlanta, GA 30332, United States. Additional authors for this research include P. Jothikumar, M.S. Suthar, C. Zhu and A. Grakoui.

Findings from Ghent University Has Provided New Data on Antihyperuricemic Agents (Sampling on ice will not yield reliable uric acid monitoring in rasburicase-treated patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antihyperuricemic Agents have been published. According to news reporting from Ghent, Belgium, by NewsRx journalists, research stated, "Rasburicase is administered to prevent hyperuricemia and counteract the consequences of tumour lysis syndrome (TLS). The benefit of monitoring uric acid (UA) concentrations in rasburicase-treated patients is questionable as spuriously low values are most frequently encountered."

The news correspondents obtained a quote from the research from Ghent University, "The manufacturer recommends a cold sample handling procedure to arrest ex vivo uricolysis. Contrariwise, it was recently considered that the temperature does not significantly affects rasburicase uricolysis. We here present a thorough investigation on rasburicase kinetics in clinical samples. UA was spiked in sera from rasburicase-treated patients at varying concentrations, divided in three fractions for incubation at 4 degrees C, 22 degrees C or 37 degrees C and measured at fix time points. The Michaelis-Menten constant (K-m) and activation energy (E-act) were estimated by linear regression and the Arrhenius equation, respectively. Additionally, UA concentrations retrieved in sera of rasburicase-treated patients were retrospectively studied (3.5 years period). Although uricolysis increased at a higher temperature, incubation at 4 degrees C did not arrest uricolysis entirely. The yielded K-m of 128 mu mol/L highlights that maximum uricolytic activity is reached at UA concentrations lower than those observed for TLS patients."

According to the news reporters, the research concluded: "Furthermore, the E-act of 27 kJ/mol corresponds to only a modest logarithmic decrease of the uricolytic capacity by 4-5% per -1 degrees C. In routine practise, 'negative' UA concentrations were observed during 88.5% of the rasburicase therapy episodes, even when samples were stored at 4 degrees C. In contrast to manufacturer's guidelines, simple cooling of the sample will not arrest the temperature-dependent uricolysis provoked by rasburicase and therefore not yield reliable UA monitoring."

For more information on this research see: Sampling on ice will not yield reliable uric acid monitoring in rasburicase-treated patients. Clinical Biochemistry, 2016;49(18):1390-1395. Clinical Biochemistry can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. (Elsevier - www.elsevier.com; Clinical Biochemistry - www.journals.elsevier.com/clinical-biochemistry/)

Our news journalists report that additional information may be obtained by contacting J. Delanghe, University of Ghent, Dept. of Clin Chem Microbiol & Immunol, Ghent, Belgium. Additional authors for this research include V. Stove and J. Delanghe.

Cardiovascular Diseases and Conditions - Venous...

Findings from Gil Medical Center Broaden Understanding of Venous Thrombosis (Living Donor Liver Transplantation in a Patient With Extensive Portomesenteric Venous Thrombosis: Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Venous Thrombosis have been presented. According to news originating from Inchon, South Korea, by NewsRx correspondents, research stated, "Extensive portomesenteric venous thrombus preventing restoration of adequate portal venous flow used to be considered a contraindication to liver transplantation."

Our news journalists obtained a quote from the research from Gil Medical Center, "The subject was a 49-year-old male with hepatitis B cirrhosis and extensive thrombosis of portal, splenic, and superior mesenteric veins, and two large collateral vessels; one dilated and tortuous inferior to the pancreaticoduodenal vein and relevant to splanchnic venous return and the other a dilated coronary vein relevant to splenic venous return. During operation, the portal vein was anastomosed to these large collateral vessels using cryopreserved iliac vein."

According to the news editors, the research concluded: "Portal reconstruction with large collateral vessels in living-donor liver transplantation could be used selectively for patients with extensive portomesenteric venous thrombosis."

The news correspondents report that additional information may be obtained from S. Choi, Gachon Med & Sci, Gil Med Center, Dept. of Surg, Inchon, South Korea. Additional authors for this research include K.K. Kim, W.S. Lee, J.M. Kang and Y.H. Park.

Liver Diseases and Conditions - Hepatitis C Virus

Findings from Gilead Sciences Inc. Update Understanding of Hepatitis C Virus [Clinical Resistance to Velpatasvir (GS-5816), a Novel Pan-Genotypic Inhibitor of the Hepatitis C Virus NS5A Protein]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Hepatitis C Virus have been presented. According to news reporting originating from Foster City, California, by NewsRx correspondents, research stated, "Velpatasvir (VEL, GS-5816) is a novel pan-genotypic hepatitis C virus (HCV) nonstructural protein 5A (NS5A) inhibitor with activity against genotype 1 (GT1) to GT6 HCV replicons. In a phase 1b 3-day monotherapy study, patients treated with a 150-mg dose of GS-5816 had a mean maximal HCV RNA decline of >= 3.3 log (10) IU/ml in GT1a, -1b, -2, -3, and -4."

Our news editors obtained a quote from the research from Gilead Sciences Inc., "This report characterizes virologic resistance to VEL in these patients. NS5A resistance-associated substitutions (RASs) were detected by deep sequencing (1% cutoff) pretreatment in 22/70 patients, i.e., 10/35 (29%) patients with GT1a, 1/8 (13%) with GT1b, 4/8 (50.0%) with GT2, 5/17 (29.4%) with GT3, and 2/2 (100.0%) with GT4. In GT1a and GT3 patients, pretreatment RASs were associated with a slightly reduced HCV RNA response compared to that of patients without pretreatment RASs; among patients with GT1b, GT2, and GT4, no significant difference in response was observed in those with or without pretreatment RASs. Following treatment, the pattern of emergent RASs was more complex for GT1a than for the other genotypes. In GT1a, substitutions emerged at positions M28, Q30, L31, P32, H58, E92, and Y93, with the most prevalent substitutions at positions Y93, M28, and L31. RASs were observed at two positions in GT1b and GT2 (Y93 and L31), three positions in GT3 (Y93, L31, and E92), and four positions in GT4 (L28, M31, P32L, and Y93)."

According to the news editors, the research concluded: "RASs that were present pretreatment persisted through the 48-week follow-up period; however, RASs emerging during treatment were more likely to decline both in prevalence and in frequency within the viral population during follow-up."

For more information on this research see: Clinical Resistance to Velpatasvir (GS-5816), a Novel Pan-Genotypic Inhibitor of the Hepatitis C Virus NS5A Protein. Antimicrobial Agents and Chemotherapy, 2016;60(9):5368-5378. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news editors report that additional information may be obtained by contacting H. Dvory-Sobol, Gilead Sci, Foster City, CA 94404, United States. Additional authors for this research include H. Dvory-Sobol, B.P. Doehle, A.S. Worth, J. McNally, D.M. Brainard, J.O. Link, M.D. Miller and H.M. Mo.

Findings from GlaxoSmithKline Reveals New Findings on Pharmacology (Apneic events - A proposed new target for respiratory safety pharmacology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pharmacology have been published. According to news reporting from King of Prussia, Pennsylvania, by NewsRx editors, the research stated, "Current practice in respiratory safety pharmacology generally follows the regulatory guidance provided by the ICH document S7A and focuses on measures of pulmonary ventilation. What these measures do not account for is the ability of drugs to cause ventilatory instability or interruptions in ventilatory rhythm."

The news correspondents obtained a quote from the research from GlaxoSmithKline, "Ventilatory instability can be identified by the presence of prolonged end-expiratory pauses or apneic periods. An apneic event has been defined as an apneic period of sufficient duration to cause hypoxia (i.e., decrease in hemoglobin oxygen saturation >= 3%). Repeated apneic events are often referred to as intermittent hypoxia. Characterizing ventilatory instability is important since (1) occurrence of apneic events in humans can lead to serious adverse outcomes such as systemic and pulmonary hypertension, cardiac arrhythmia, stroke, CNS dysfunction, metabolic disorders, enhanced tumor growth and death, (2) drugs are known to cause or exacerbate apneic events in humans, and (3) there is a preexisting condition of ventilatory instability referred to as sleep apnea that is prevalent in the human population."

According to the news reporters, the research concluded: "Evaluating this new target in respiratory safety pharmacology studies is needed to ensure that the potential for new drugs to cause or exacerbate apneic events can be identified and the impact on patient safety characterized."

For more information on this research see: Apneic events - A proposed new target for respiratory safety pharmacology. Regulatory Toxicology and Pharmacology, 2016;81():194-200. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Stem Cell Research - Hematopoietic Stem Cells

Findings from Goethe-University in Hematopoietic Stem Cells Provides New Insights (DNA-damage response gene GADD45A induces differentiation in hematopoietic stem cells without inhibiting cell cycle or survival)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stem Cell Research - Hematopoietic Stem Cells. According to news reporting from Frankfurt, Germany, by NewsRx journalists, research stated, "Hematopoietic stem cells (HSCs) maintain blood cell production life-long by their unique abilities of self-renewal and differentiation into all blood cell lineages. Growth arrest and DNA-damage-inducible 45 alpha (GADD45A) is induced by genotoxic stress in HSCs."

Financial support for this research came from The LOEWE Center for Cell and Gene Therapy.

The news correspondents obtained a quote from the research from Goethe-University, "GADD45A has been implicated in cell cycle control, cell death and senescence, as well as in DNA-damage repair. In general, GADD45A provides cellular stability by either arresting the cell cycle progression until DNA damage is repaired or, in cases of fatal damage, by inducing apoptosis. However, the function of GADD45A in hematopoiesis remains controversial. We revealed the changes in murine HSC fate control orchestrated by the expression of GADD45A at single cell resolution. In contrast to other cellular systems, GADD45A expression did not cause a cell cycle arrest or an alteration in the decision between cell survival and apoptosis in HSCs. Strikingly, GADD45A strongly induced and accelerated the differentiation program in HSCs. Continuous tracking of individual HSCs and their progeny via time-lapse microscopy elucidated that once GADD45A was expressed, HSCs differentiate into committed progenitors within 29 hours. GADD45A-expressing HSCs failed to long-term reconstitute the blood of recipients by inducing multilineage differentiation in vivo. Importantly, g-irradiation of HSCs induced their differentiation by upregulating endogenous GADD45A. The differentiation induction by GADD45A was transmitted by activating p38 Mitogen-activated protein kinase (MAPK) signaling and allowed the generation of megakaryocytic-erythroid, myeloid, and lymphoid lineages."

According to the news reporters, the research concluded: "These data indicate that genotoxic stress-induced GADD45A expression in HSCs prevents their fatal transformation by directing them into differentiation and thereby clearing them from the system."

Our news journalists report that additional information may be obtained by contacting S. Wingert, LOEWE Center for Cell and Gene Therapy and Dept. of Medicine, Hematology, Oncology, Goethe University Frankfurt, Frankfurt am Main, Germany. Additional authors for this research include F.B. Thalheimer, N. Haetscher, M. Rehage, T. Schroeder and M.A Rieger.

Oncology - Cancer Risk

Findings from Government Medical College Update Understanding of Cancer Risk (Cytochrome P450 1A1 genetic polymorphisms as cancer biomarkers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cancer Risk. According to news reporting out of Uttarakhand, India, by NewsRx editors, research stated, "Phase I metabolic enzyme CYP1A1 plays an important role in xenobiotics metabolism and has been extensively studied as a cancer risk biomarker. CYP1A1 is polymorphic and its four variants, e.g., CYP1A1* 2 A, CYP1A1* 2C, CYP1A1* 3 and CYP1A1* 4 with trivial names m1, m2, m3, and m4 respectively, are most commonly studied for cancer link."

Our news journalists obtained a quote from the research from Government Medical College, "Gene-gene interaction studies combining polymorphisms of this enzyme with those of phase II detoxifying enzymes, especially glutathione S-transferases (GSTs) revealed greater risk for cancer susceptibility. Variants of CYP1A1 have also been found to be associated with chemotherapeutic adverse-effects. Results of these studies, however, remained largely contradictory mainly because of lack of statistical power due to involvement of small sample size."

According to the news editors, the research concluded: "Strongly powered experimental designs involving gene-gene, gene-environment interactions are required in order to validate CYP1A1 as reliable cancer-biomarker."

For more information on this research see: Cytochrome P450 1A1 genetic polymorphisms as cancer biomarkers. Indian Journal of Cancer, 2015;52(4):479-89.

Our news journalists report that additional information may be obtained by contacting A. Bag, Dept. of Biochemistry, Government Medical College, Haldwani, Uttarakhand, India. Additional authors for this research include N.S. Jyala and N. Bag.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0019-509X.178380. This DOI is a link to an online electronic document that is either free or for purchase.

Reactive Oxygen Species
Findings from Grigore T. Popa University of Medicine and Pharmacy Has Provided New Data on Reactive Oxygen Species (In vitro Evaluation of Morphological Integrity of Dental Enamel Exposed to Carbamide Peroxide-based Bleaching Agent)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Reactive Oxygen Species are presented in a new report. According to news reporting originating in Iasi, Romania, by NewsRx journalists, research stated, "This article presents the effect of the bleaching above the enamel of the teeth using three fundamental approaches for bleaching non vital teeth. Our purpose is to assess the effects of the carbamide peroxide on the structure of the tooth enamel at different concentrations and to check if the destructive effects are important at low concentrations."

The news reporters obtained a quote from the research from the Grigore T. Popa University of Medicine and Pharmacy, "In order to assess the morphological and topographical modifications of the whitening treatment, the three samples (incisor, premolar, molar) were analyzed with a Scanning Electron Microscope, type Quanta 200 (FEI Company). More detailed morphological aspects of the samples before and after the whitening treatment were analysed using a Scanning Probe Microscope (Solver PRO-M, NTMDT, Russia) and various tridimensional statistical parameters were calculated from the AFM measurements."

According to the news reporters, the research concluded: "Significantly higher 3D roughness parameters indicate that the surfaces were more irregular, because the demineralization process of the enamel, exhibiting numerous and deeper peaks and valleys."

For more information on this research see: In vitro Evaluation of Morphological Integrity of Dental Enamel Exposed to Carbamide Peroxide-based Bleaching Agent. Revista De Chimie, 2016;67(10):2103-2105. Revista De Chimie can be contacted at: Chiminform Data S A, Calea Plevnei Nr 139, Sector 6, Bucharest R-77131, Romania.

Our news correspondents report that additional information may be obtained by contacting R. Vasluianu, Grigore T Popa Univ Med & Pharm, Fac Med Dental, Iasi 700115, Romania. Additional authors for this research include R. Vasluianu, L. Matricala, I. Stoica and N.C. Forna.

Drugs and Therapies - Adenosine Therapy
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Adenosine Therapy is the subject of a report. According to news originating from Bergamo, Italy, by NewsRx correspondents, research stated, "Intravenous adenosine is a short-acting blocker of the atrioventricular node that has been used to unmask subtle or latent preexcitation, and also to enable catheter ablation in selected patients with absent or intermittent preexcitation."

Our news journalists obtained a quote from the research, "Depending on the accessory pathway characteristics, intravenous adenosine may produce specific electrocardiographic changes highly suggestive of the preexcitation variant. Herein, we view different ECG responses to this pharmacological test in various preexcitation patterns that were confirmed by electrophysiological studies."

According to the news editors, the research concluded: "Careful analysis of electrocardiographic changes during adenosine test, with emphasis on P-delta interval, preexcitation degree, and atrioventricular block, can be helpful to diagnose the preexcitation variant/pattern."

The news correspondents report that additional information may be obtained from H. Ali, Humanitas Gavazzeni, Arrhythmia & Electrophysiol Unit 2, Bergamo, Lombardy, Italy. Additional authors for this research include P. Lupo, S. Foresti, G. De Ambroggi, G. Epicoco, A. Fundaliotis and R. Cappato.

Keywords for this news article include: Bergamo, Italy, Europe, Cardiac Stressing Agents, Antiarrhythmic Agents, Cardiovascular Agents, Drugs and Therapies, Radiologic Adjuncts, Radiologic Agents, Adenosine Therapy, Pharmaceuticals.

Nutritional and Metabolic Diseases and Conditions - …

Findings from H. Naik and Co-Researchers in the Area of Type 2 Diabetes Described (Application of pharmacometric approaches to evaluate effect of weight and renal function on pharmacokinetics of alogliptin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is now available. According to news reporting out of Deerfield, Illinois, by NewsRx editors, research stated, "The aims of the study were to characterize the pharmacokinetics (PK) of alogliptin in healthy and type 2 diabetes mellitus (T2DM) subjects using a population PK approach and to assess the influence of various covariates on alogliptin exposure. Plasma concentration data collected from two phase 1 studies and one phase 3 study following administration of alogliptin (12.5-400 mg) were used for the PK model development."

Our news journalists obtained a quote from the research, "One-and two-compartment
models were evaluated as base structural PK models. The impact of selected covariates was assessed using stepwise forward selection and backward elimination procedures. The predictability and robustness of the final model was evaluated using visual predictive check and bootstrap analyses. The final model was used to perform simulations and guide appropriate dose adjustments. A two-compartment model with first-order absorption and elimination best described the alogliptin concentration vs. time profiles. Creatinine clearance and weight had a statistically significant effect on the oral clearance (CL/F) of alogliptin. The model predicted a lower CL/F (17%, 35%, 80%) and a higher systemic exposure (56%, 89%, 339%) for subjects with mild, moderate and severe renal impairment, respectively, compared with healthy subjects. Effect of weight on CL/F was not considered clinically relevant. Simulations at different doses of alogliptin support the approved doses of 12.5 mg and 6.25 mg for patients with moderate and severe renal impairment, respectively. The PK of alogliptin was well characterized by the model."

According to the news editors, the research concluded: "The analysis suggested an alogliptin dose adjustment for subjects with moderate-to-severe renal impairment and no dose adjustments based on weight."

Our news journalists report that additional information may be obtained by contacting H. Naik, Takeda Global Research & Development Center, Inc, One Takeda Parkway, Deerfield, IL, 60015, United States. Additional authors for this research include R. Czerniak and M. Vakilynejad.

Stem Cell Research

Findings from H. Patel et al Update Understanding of Stem Cell Research (Testicular Stem Cells Express Follicle-Stimulating Hormone Receptors and Are Directly Modulated by FSH)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stem Cell Research. According to news reporting from Maharashtra, India, by NewsRx journalists, research stated, "Testicular spermatogonial stem cells (SSCs) are a heterogeneous population of stem cells, and definitive marker for the most primitive subset that undergoes asymmetric cell division remains to be identified. A novel subpopulation of pluripotent, very small embryonic-like stem cells (VSELs)
has been reported in both human and mouse testes."

The news correspondents obtained a quote from the research, "Follicle-stimulating hormone (FSH) receptors (FSHRs) are expressed on Sertoli cells in testis and on granulosa cells in ovary, but recently FSHRs are reported on VSELs in ovaries, bone marrow, and cord blood. The present study was aimed to investigate whether FSHRs are also expressed on testicular stem cells (VSELs and SSCs) and their possible modulation by FSH using intact and chemoablated (25 mg/kg busulfan) mice. Chemoablated testis was a better model to study stem cell biology since quiescent stem cells survive along with the Sertoli cells in the tubules. Proliferating cell nuclear antigen-positive, small-sized cells presumed to be VSELs were clearly visualized, and flow cytometry analysis revealed an increase in LIN-/CD45(-)/SCA-1(+) VSELs from 0.045 +/- 0.008% to 0.1 +/- 0.03% of total cells in chemoablated testis after FSH treatment. Very small embryonic-like stem cells expressing nuclear octamer-binding transcription factor 4 (OCT-4) and SSCs with cytoplasmic OCT-4 were detected. Very small embryonic-like stem cells (Oct-4A, Sca-1, Nanog), SSCs (Oct-4), and proliferation (Pcna) specific transcripts were upregulated on FSH treatment. Stem cells expressed FSHR and were stimulated by FSH, and Fshr3 was the predominant transcript maximally modulated by FSH."

According to the news reporters, the research concluded: "Nuclear OCT-4 and SCA-1 (stem cell antigen 1) positive VSELs are the most primitive stem cells in testis, and FSH stimulates them to undergo asymmetric cell division including self-renewal and give rise to SSCs, which in turn proliferate rapidly and undergo clonal expansion and further differentiation."

For more information on this research see: Testicular Stem Cells Express Follicle-Stimulating Hormone Receptors and Are Directly Modified by FSH. Reproductive Sciences, 2016;23(11):1493-1508. Reproductive Sciences can be contacted at: Sage Publications Inc, 2455 Teller Rd, Thousand Oaks, CA 91320, USA. (Sage Publications - www.sagepub.com; Reproductive Sciences - rsx.sagepub.com)

Oncology - Liver Cancer

Findings from H.G. Lu et al in Liver Cancer Reported (Novel substituted aminothiazoles as potent and selective anti-hepatocellular carcinoma agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Liver Cancer is the subject of a report. According to news reporting originating in Doylestown, Pennsylvania, by NewsRx journalists,
research stated, "Based on our previous identification of a disubstituted aminothiazole termed HBF-0079 with promising selective toxicity for HCC-derived cell lines versus non-HCC liver lines, a series of tri-substituted aminothiazole derivatives were prepared and evaluated."

Financial support for this research came from CURE.

The news reporters obtained a quote from the research, "This work resulted in the discovery of isopropyl 4-(pyrazin-2-yl)-2-(pyrimidin-2-ylamino) thiazole-5-carboxylate, 14, which displayed EC50 value of 0.11 \(\mu\) M and more than 450 times of selectivity, and its methyl carbonate prodrug 24 with improved solubility in organic solvents."

According to the news reporters, the research concluded: "Furthermore, 14, was shown to reduce the proliferation of several liver cancer cells derived directly from patients."

Our news correspondents report that additional information may be obtained by contacting A. Cuconati, Baruch S Blumberg Inst, Doylestown, PA 18902, United States. Additional authors for this research include J. Rogowskyj, W.Q. Yu, A. Venkatesh, N. Khan, S. Nakagawa, N. Goossens, A.P. Koh, T. Higashi, G. Gunasekaran, M.E. Schwarz, S.P. Hiotis, X.D. Xu, W. Kinney, Y.J. Hoshida, T. Block, A. Cuconati and Y.M. Du.

Lung Diseases and Conditions - Pulmonary...

**Findings from H.J. Patel and Co-Researchers Advance Knowledge in Pulmonary Hypertension (Aortic Valve Replacement in the Moderately Elevated Risk Patient: A Population-Based Analysis of Outcomes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Pulmonary Hypertension. According to news reporting originating in Ann Arbor, Michigan, by NewsRx journalists, research stated, "As transcatheter aortic valve replacement (TAVR) therapy transitions from inoperable or high-risk patients to those considered moderate risk, a contemporary evaluation of AVR in this latter group is warranted. Using the Michigan Cardiothoracic Surgical Quality Collaborative Database, we analyzed outcomes and identified predictors of a composite end point (30-day death, stroke, and dialysis) for 2,979 patients (2007 to 2015) undergoing AVR (n = 1,196) or AVR and coronary artery bypass grafting (n = 1,783) with a preoperative The Society of Thoracic Surgeons predicted risk of mortality (PROM) of 4% to 8% (mean, 5.5%; interquartile range, 4.5% to 6.3%)."

The news reporters obtained a quote from the research, "The 30-day mortality was
3.9%. Independent predictors of death included stage 4 chronic kidney disease and the presence of pulmonary hypertension (both p < 0.05), but not year of procedure, despite a significant trend in decreased PROM during the study period (p = 0.003). Morbidity included stroke in 2.3%, and renal failure, defined as Acute Kidney Injury Network stage 1 to 3, in 43.7%, although only 5.4% required dialysis. Prolonged ventilator support was required by 21.0%. After a mean length of stay of 10 days (interquartile range 6 to 11 days), 36.4% were discharged to extended care facilities. Independent predictors of the composite outcome included the Society of Thoracic Surgeons PROM (p < 0.001 for trend) and pulmonary hypertension (p < 0.001). Compared with those presenting with pure aortic stenosis, mixed aortic stenosis and aortic insufficiency was independently protective of the composite outcome (odds ratio, 0.58; p < 0.001), whereas pure aortic insufficiency was not (odds ratio, 0.87; p = 0.58). The composite end point frequency was not significantly different in the 17 hospitals developing TAVR programs (TAVR 9.6% vs nonTAVR 9.6%, p = 0.98). This population-based contemporary assessment suggests moderate-risk patients undergoing AVR experience favorable outcomes.

According to the news reporters, the research concluded: "Although increasing PROM is important in preoperative evaluation of risk, preexisting pulmonary hypertension and indication for operation are among other factors that should be considered as TAVR expands into this group of patients."

Our news correspondents report that additional information may be obtained by contacting H.J. Patel, Michigan Soc Thorac & Cardiovasc Surg Qual Collab, Ann Arbor, MI, United States. Additional authors for this research include D.S. Likosky, A.L. Pruitt, E.T. Murphy, P.F. Theurer and R.L. Prager.

Oncology - Breast Cancer

Findings from Harbin Medical University Provides New Data on Breast Cancer [Initial experience of automated breast volume scanning (ABVS) and ultrasound elastography in predicting breast cancer subtypes and staging]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published.
According to news reporting originating from Harbin, People's Republic of China, by NewsRx correspondents, research stated, "Breast cancer is a heterogeneous disease consisting of distinct histopathological subtypes with different clinical outcomes. In this article, we identified the automated breast volume scanning (ABVS) and shear wave velocity (SWV) characteristics of different pathological types of breast carcinoma."

Our news editors obtained a quote from the research from Harbin Medical University, "A retrospective review of both ABVS and SWV imaging of 118 consecutive breast masses was performed. The imaging features of both techniques were assessed with reference to histopathological results. Echo heterogeneity with a smooth and lobulated margin was a significant feature more frequently found in mucinous carcinoma groups (100%, $P < 0.05$). Between different stages of ductal carcinoma, echo homogeneity was more likely in high-grade ductal carcinomas ($P < 0.05$). SWV differences existed between inside tumor areas and either tumor boundary or tissues outside the tumors ($P < 0.05$), and values differed between different breast carcinoma stages. The central and tumor margin areas of ductal carcinomas were much harder than in tubular carcinoma and micro-carcinoma, respectively ($P < 0.05$). SWV ROC curve analyses yielded a cut-off value of 3.015 m/s between ductal carcinoma in situ (DCIS) and invasive ductal carcinoma in the central part of lesions, with 83.5% sensitivity and 80% specificity for TO vs T1-3 staging."

According to the news editors, the research concluded: "Since some features were associated with different breast carcinoma types and stages, ABVS and SWV imaging has the potential to give clues about breast carcinoma differentiation in a non-invasive manner."

For more information on this research see: Initial experience of automated breast volume scanning (ABVS) and ultrasound elastography in predicting breast cancer subtypes and staging. *Breast*, 2016;30():130-135. *Breast* can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. **Biological Factors - Metalloporphyrins**

**Findings from Harbin Medical University Update Understanding of Metalloporphyrins (Enhancement of DEN-induced liver tumorigenesis in heme oxygenase-1 G143H mutant transgenic mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
According to news originating from Harbin, People's Republic of China, by NewsRx correspondents, research stated, "Heme oxygenase (HO) is the rate-limiting enzyme in heme metabolism. HO-1 exhibits anti-oxidative and anti-inflammatory function via the actions of its metabolite, respectively."

Our news journalists obtained a quote from the research from Harbin Medical University, "A growing body of evidence demonstrates that HO-1 is implicated in the pathogenesis and progression of several types of cancer. However, whether HO-1 takes part in healthy-premalignant-malignant transformation is still undefined. In this study, we took advantage of transgenic mice which over-expressed HO-1 dominant negative mutant (HO-1 G143H) and observed its susceptibility to DEN-induced hepatocarcinogenesis. Our results indicate that HO-1 G143H mutant accelerates the progression of tumorigenesis and tumor growth. The mechanism is closely related to enhancement of ROS production which induce more hepatocytes death and secretion of inflammatory cytokines, proliferation of surviving hepatocytes. Our result provides the direct evidence that HO-1 plays an important protective role in liver carcinogenesis."

According to the news editors, the research concluded: "Alternatively, we suggest the possible explanation on effect of HO-1 promoter polymorphism which involved in tumorigenesis."

For more information on this research see: http://dx.doi.org/10.1016/j.bbrc.2016.10.148. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Harbin, People's Republic of China, Asia, Enzymes and Coenzymes, Biological Factors, Metalloporphyrins, Gastroenterology, Oxidoreductases, Oxygenases, Genetics, Heme, Harbin Medical University.
to news reporting originating in Heilongjiang, People's Republic of China, by NewsRx journalists, research stated, "Acetylated H3 lysine 23 (H3K23ac) is a specific histone post-translational modification recognized by oncoprotein TRIM24. However, it is not clear whether H3K23ac levels are correlated with TRIM24 expression and what role H3K23ac may have in cancer."

Financial supporters for this research include National Natural Science Foundation of China, Natural Science Foundation of Heilongjiang Province.

The news reporters obtained a quote from the research from Harbin Medical University, "In this study, we collected breast carcinoma samples from 121 patients and conducted immunohistochemistry to determine the levels of TRIM24 and H3K23ac in breast cancer. Our results demonstrated that TRIM24 expression is positively correlated with H3K23ac levels, and high levels of both TRIM24 and H3K23ac predict shorter overall survival of breast cancer patients. We also showed that both TRIM24 and H3K23ac are higher in HER2-positive patients, and their levels were positively correlated with HER2 levels in breast cancer. Moreover, TRIM24 expression is associated with estrogen receptor (ER) and progesterone receptor (PR) statuses in both our cohort and The Cancer Genome Atlas (TCGA) breast carcinoma."

According to the news reporters, the research concluded: "In summary, our results revealed an important role of TRIM24 and H3K23ac in breast cancer and provided further evidence that TRIM24 small-molecule inhibitors may benefit ER-and PR-negative or HER2-positive breast cancer patients."

For more information on this research see: Histone H3 lysine 23 acetylation is associated with oncogene TRIM24 expression and a poor prognosis in breast cancer. RNA Viruses - Influenza A Virus

Findings from Harbin Veterinary Research Institute Broaden Understanding of Influenza A Virus (Human antibody 3E1 targets the HA stem region of H1N1 and H5N6 influenza A viruses)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in RNA Viruses - Influenza A Virus. According to news reporting out of Harbin, People's Republic of China, by NewsRx editors, research stated, "As influenza A viruses remain a major threat to human health worldwide, the discovery of broadly neutralizing monoclonal antibodies that recognize conserved epitopes would facilitate the development of antibody-based therapeutic strategies."

Our news journalists obtained a quote from the research from Harbin Veterinary Research Institute, "Here we report that a V(H)4-4- encoded human mAb named 3E1 could neutralize H1 and H5 subtype viruses in vitro and protect mice against the H1N1 and H5N6 viruses by inhibiting the low pH-induced conformational rearrangement of haemagglutinin (HA), hence blocking membrane fusion."

According to the news editors, the research concluded: "The crystal structures of 3E1 Fab in complex with HA of two H1N1 strains reveal that 3E1, with both heavy and light chains, binds to a conserved epitope of the HA stem region, comprising parts of the fusion peptide, the F subdomain and the outermost beta-strand preceding helix A. Altogether, these data suggest the potential of 3E1 as a therapeutic drug against H1 and H5 subtype viruses."

For more information on this research see: Human antibody 3E1 targets the HA stem region of H1N1 and H5N6 influenza A viruses. *Nature Communications*, 2016;7():1-12. *Nature Communications* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Stem Cell Research - Hematopoietic Stem Cells

**Findings from Harvard School of Medicine Provides New Data about Hematopoietic Stem Cells (Epigenetic Memory Underlies Cell-Autonomous Heterogeneous Behavior of Hematopoietic Stem Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Stem Cell Research - Hematopoietic Stem Cells have been presented. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Stem cells determine homeostasis and repair of many tissues and are increasingly recognized as functionally heterogeneous. To define the extent of-and molecular basis for-heterogeneity, we overlaid functional, transcriptional, and epigenetic attributes of hematopoietic stem cells (HSCs) at a clonal level using endogenous fluorescent tagging."

Funders for this research include NIH, Gerald and Darlene Jordan Chair, Ellison
The news correspondents obtained a quote from the research from the Harvard School of Medicine, "Endogenous HSC had clone-specific functional attributes over time in vivo. The intra-clonal behaviors were highly stereotypic, conserved under the stress of transplantation, inflammation, and genotoxic injury, and associated with distinctive transcriptional, DNA methylation, and chromatin accessibility patterns. Further, HSC function corresponded to epigenetic configuration but not always to transcriptional state. Therefore, hematopoiesis under homeostatic and stress conditions represents the integrated action of highly heterogeneous clones of HSC with epigenetically scripted behaviors."

According to the news reporters, the research concluded: "This high degree of epigenetically driven cell autonomy among HSCs implies that refinement of the concepts of stem cell plasticity and of the stem cell niche is warranted."

For more information on this research see: Epigenetic Memory Underlies Cell-Autonomous Heterogeneous Behavior of Hematopoietic Stem Cells. Cell, 2016;167(5):1310-1322,327-342. Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell - www.journals.elsevier.com/cell/)

Cardiovascular Diseases and Conditions - Aneurysm

Findings from Harvard School of Medicine Provides New Data on Aneurysm (Pipeline Embolization Device for small paraophthalmic artery aneurysms with an emphasis on the anatomical relationship of ophthalmic artery origin and aneurysm)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Aneurysm are discussed in a new report. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Contemporary treatment for paraophthalmic artery aneurysms includes flow diversion utilizing the Pipeline Embolization Device (PED). Little is known, however, about the potential implications of the anatomical relationship of the ophthalmic artery (OA) origin and aneurysm, especially in smaller aneurysms."

The news reporters obtained a quote from the research from the Harvard School of Medicine.
Medicine, "Four major academic institutions in the United States provided data on small parapaphthalmic aneurysms (<= 7 mm) that were treated with PED between 2009 and 2015. The anatomical relationship of OA origin and aneurysm, radiographic outcomes of aneurysm occlusion, and patency of the OA were assessed using digital subtraction angiography. OA origin was classified as follows: Type 1, OA separate from the aneurysm; Type 2, OA from the aneurysm neck; and Type 3, OA from the aneurysm dome. Clinical outcome was assessed using the modified Rankin Scale, and visual deficits were categorized as transient or permanent. The cumulative number of small parapaphthalmic aneurysms treated with PED between 2009 and 2015 at the 4 participating institutions was 69 in 52 patients (54.1 +/- 13.7 years of age) with a male-to-female ratio of 1:12. The distribution of OA origin was 72.5% for Type 1, 17.4% for Type 2, and 10.1% for Type 3. Radiographic outcome at the last follow-up (median 11.5 months) was available for 54 aneurysms (78.3%) with complete, near-complete, and incomplete occlusion rates of 81.5%, 5.6%, and 12.9%, respectively. Two aneurysms (3%) resulted in transient visual deficits, and no patient experienced a permanent visual deficit. At the last follow-up, the OA was patent in 96.8% of treated aneurysms. Type 3 OA origin was associated with a lower rate of complete aneurysm occlusion (p = 0.0297), demonstrating a trend toward visual deficits (p = 0.0797) and a lower rate of OA patency (p = 0.0783). Pipeline embolization treatment of small parapaphthalmic aneurysms is safe and effective."

According to the news reporters, the research concluded: "An aneurysm where the OA arises from the aneurysm dome may be associated with lower rates of aneurysm occlusion, OA patency, and higher rates of transient visual deficits."

For more information on this research see: Pipeline Embolization Device for small parapaphthalmic artery aneurysms with an emphasis on the anatomical relationship of ophthalmic artery origin and aneurysm. *Journal of Neurosurgery*, 2016;125(6):1352-1359. *Journal of Neurosurgery* can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mycobacterium Infections - Tuberculosis is the subject of a report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Fluoroquinolones (FQs) are effective second-line drugs for treating antibiotic-resistant tuberculosis (TB) and are being considered for use as first-line agents. Because FQs are used to treat a range of infections, in a setting of undiagnosed TB, there is potential to select for drug-resistant Mycobacterium tuberculosis mutants during FQ-based treatment of other infections, including pneumonia."

Financial supporters for this research include National Science Council of Taiwan, Pershing Square Foundation, Broad Institute Tuberculosis Donor Group, HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID), HHS | NIH | National Human Genome Research Institute (NHGRI), Natural Science Foundation of Fujian Province (Fujian Provincial Natural Science Foundation), Doris Duke Charitable Foundation (DDCF).

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Here we present a detailed characterization of ofloxacin-resistant M. tuberculosis samples isolated directly from patients in Taiwan, which demonstrates that selection for FQ resistance can occur within patients who have not received FQs for the treatment of TB. Several of these samples showed no mutations in gyrA or gyrB based on PCR-based molecular assays, but genome-wide next-generation sequencing (NGS) revealed minority populations of gyrA and/or gyrB mutants. In other samples with PCR-detectable gyrA mutations, NGS revealed subpopulations containing alternative resistance-associated genotypes. Isolation of individual clones from these apparently heterogeneous samples confirmed the presence of the minority drug-resistant variants suggested by the NGS data. Further NGS of these purified clones established evolutionary links between FQ-sensitive and-resistant clones derived from the same patient, suggesting de novo emergence of FQ-resistant TB. Importantly, most of these samples were isolated from patients without a history of FQ treatment for TB."

According to the news editors, the research concluded: "Thus, selective pressure applied by FQ monotherapy in the setting of undiagnosed TB infection appears to be able to drive the full or partial emergence of FQ-resistant M. tuberculosis, which has the potential to confound diagnostic tests for antibiotic susceptibility and limit the effectiveness of FQs in TB treatment."

For more information on this research see: Genomic Analysis of the Evolution of Fluoroquinolone Resistance in Mycobacterium tuberculosis Prior to Tuberculosis Diagnosis. Antimicrobial Agents and Chemotherapy, 2016;60(11):6600-6608. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Heart Disorders and Diseases - Tachycardia

Findings from Harvard School of Medicine Reveals New Findings on Tachycardia (Evaluation of a novel high-resolution mapping technology for ablation of recurrent scar-related atrial tachycardias)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Tachycardia are discussed in a new report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Rhythmia is a new technology capable of rapid and high-resolution mapping. However, its potential advantage over existing technologies in mapping complex scar-related atrial tachycardias (ATs) has not yet been evaluated."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "The purpose of this study was to examine the utility of Rhythmia for mapping scar-related ATs in patients who had failed previous ablation procedure(s). This multicenter study included 20 patients with recurrent ATs within 2 years after a previous ablation procedure (1.8 +/- 0.7 per patient). In all cases, the ATs could not be adequately mapped during the index procedure because of scar with fractionated electrograms, precluding accurate time annotation, frequent change in the tachycardia in response to pacing, and/or degeneration into atrial fibrillation. These patients underwent repeat mapping and ablation procedure with Rhythmia. From a total of 28 inducible ATs, 24 were successfully mapped. Eighteen ATs (75%) terminated during radiofrequency ablation and 4 (16.6%) with catheter pressure or entrainment from the site of origin or isthmus. Two ATs that were mapped to the interatrial septum slowed but did not terminate with ablation. In 21 of 24 ATs the mechanism was macroreentry, while in 3 of 24 the mechanism was focal. Interestingly, in 5 patients with previously failed ablation of an allegedly 'focal' tachycardia, high-resolution mapping demonstrated macroreentrant arrhythmia. The mean mapping time was 28.6 +/- 17 minutes, and the mean radiofrequency ablation time to arrhythmia termination was 3.2 +/- 2.6 minutes. During a mean follow-up of 7.5 +/- 3.1 months, 15 of 20 patients (75%) were free of AT recurrences."

According to the news editors, the research concluded: "The Rhythmia mapping system may be advantageous for mapping complex scar-related ATs."

For more information on this research see: Evaluation of a novel high-resolution mapping technology for ablation of recurrent scar-related atrial tachycardias. Heart Rhythm, 2016;13(10):2048-2055. Heart Rhythm can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Heart Rhythm - www.journals.elsevier.com/heart-rhythm/)

The news correspondents report that additional information may be obtained from E. Anter, Harvard Med Sch, Beth Israel Deaconess Med Center, Harvard Thorndike Electrophysiol Inst, Dept. of MedCardiovasc Div, Boston, MA 02215, United States. Additional authors for this research include T.H. Mc Elderry, F.M. Contreras-Valdes, J.Q. Li, P. Tung, E. Leshem, C.I. Haffajee, H. Nakagawa and M.E. Josephson.

Findings from Harvard School of Medicine Update Knowledge of Glioblastomas (Demonstration of DCE-MRI as an early pharmacodynamic biomarker of response to VEGF Trap in glioblastoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Glioblastomas are discussed in a new report. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Glioblastoma (GBM) is an incurable brain tumor characterized by the expression of pro-angiogenic cytokines. A recent phase II clinical trial studied VEGF Trap in adult patients with temozolomide-resistant GBM."

The news reporters obtained a quote from the research from the Harvard School of Medicine, "We sought to explore changes in [F-18]Fluorodeoxyglucose positron emission tomography (FDG-PET) or magnetic resonance imaging (MRI) in trial participants correlating these changes with disease response. FDG-PET and MRI images obtained before and after the first dose of VEGF Trap were spatially co-registered. Regions of interest on each image slice were combined to produce a volume of interest representative of the entire tumor. Percent and absolute changes in maximum FDG-avidity, mean apparent diffusion coefficient (ADC), K-trans, and Ve were calculated per lesion. Among the 12 participants that underwent dynamic contrast enhanced MRI (DCE-MRI), there were large, statistically significant reductions in K-trans and Ve (median difference = -41.8 %, p< 0.02 and -42.6 %, p< 0.04, respectively). In contrast, there were no significant reductions in ADC or FDG-PET SUVmax values. DCE-MRI is a useful measure of early pharmacodynamic effects of VEGF Trap on tumor vasculature. The absence of significant changes in FDG-PET and DW-MRI suggest that the early pharmacodynamic effects are specific to tumor perfusion and/or permeability and do not directly inhibit metabolism or induce cell death. DCE-MRI in conjunction with standard imaging may be promising for the identification of anti-angiogenic effects in this patient population with this therapeutic target."

According to the news reporters, the research concluded: "Further studies are needed to evaluate the relationship between DCE-MRI response and clinical outcome."

For more information on this research see: Demonstration of DCE-MRI as an early pharmacodynamic biomarker of response to VEGF Trap in glioblastoma. *Journal of Neuro-Oncology*, 2016;130(3):495-503. *Journal of Neuro-Oncology* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Oncology - Carcinomas**

**Findings from Harvard School of Medicine Update Understanding of Carcinomas (Targeting PD-1/PD-L1 in the treatment of metastatic renal cell carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Carcinomas. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Immunostimulatory therapies have been a cornerstone of treatment for metastatic renal cell carcinoma (RCC) since the 1990s. However, the use of traditional immunotherapeutic approaches for RCC, such as high-dose interleukin-2 and interferon-a, has been limited by significant systemic toxicities and the need to deliver these therapies at centers of expertise."

The news reporters obtained a quote from the research from the Harvard School of Medicine, "Furthermore, in spite of the success of these immunostimulatory therapies for some patients with RCC, it is clear that most patients fail to respond to cytokine therapy. More effective immune therapy for RCC has therefore been necessary. The interaction between programmed death-1 (PD-1, present on T cells), and one of its ligands (PD-L1, present on antigen-presenting cells and tumor cells) constitutes an immune checkpoint through which tumors can induce T-cell tolerance and avoid immune destruction. Monoclonal antibodies that disrupt the PD-1/PD-L1 interaction serve as inhibitors of this immune checkpoint, and have demonstrated favorable activity in RCC as monotherapy and in combination with other active agents."

According to the news reporters, the research concluded: "This review summarizes the current landscape of anti-PD-1/PD-L1 therapy for RCC, and highlights challenges for the future development of this promising approach."

Our news correspondents report that additional information may be obtained by contacting M. Weinstock, Beth Israel Deaconess Medical Center, Dana-Farber, Harvard Cancer Center, Harvard Medical School, Boston, MA, United States.

The direct object identifier (DOI) for that additional information is:
Findings from Harvard School of Medicine Update Understanding of Cytokines (Aire Inhibits the Generation of a Perinatal Population of Interleukin-17A-Producing gamma delta T Cells to Promote Immunologic Tolerance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Intercellular Signaling Peptides and Proteins - Cytokines is the subject of a report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Aire's primary mechanism of action is to regulate transcription of a battery of genes in medullary thymic epithelial cells (mTECs) and, consequently, negative selection of effector T cells and positive selection of regulatory T cells. We found that Aire-deficient mice had expanded thymic and peripheral populations of perinatally generated IL-17A(+)V gamma 6(+) V delta 1(+)T cells, considered to be 'early responders' to tissue stress and drivers of inflammatory reactions."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Aire-dependent control of Iil7 expression in mTECs regulated the size of thymic IL-17A(+)V gamma 6(+) V delta 1(+)T compartments. In mice lacking Aire and gd T cells, certain tissues typically targeted in the "Aire-less" disease, notably the retina, were only minimally infiltrated. IL-17A(+)V gamma 6(+) V delta 1(+)T cells were present in the retina of wild-type mice and expanded very early in Aire-deficient mice. A putatively parallel population of IL-17A(+)V gamma 6(+) V delta 1(+)T cells was increased in humans lacking Aire."

According to the news editors, the research concluded: "Thus, Aire exerts multifaceted autoimmune control that extends to a population of innate-like T cells."

For more information on this research see: Aire Inhibits the Generation of a Perinatal Population of Interleukin-17A-Producing gamma delta T Cells to Promote Immunologic Tolerance. *Immunity*, 2016;45(5):999-1012. *Immunity* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Immunity - www.journals.elsevier.com/immunity/)

Findings from Haukeland Hospital in Autoimmune Diseases and Conditions Reported (AIRE-mutations and autoimmune disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autoimmune Diseases and Conditions have been presented. According to news originating from Bergen, Norway, by NewsRx correspondents, research stated, "The gene causing the severe organ-specific autoimmune disease autoimmune polyendocrine syndrome type-1 (APS-1) was identified in 1997 and named autoimmune regulator (AIRE). AIRE plays a key role in shaping central immunological tolerance by facilitating negative selection of T cells in the thymus, building the thymic microarchitecture, and inducing a specific subset of regulatory T cells."

Our news journalists obtained a quote from the research from Haukeland Hospital, "So far, about 100 mutations have been identified. Recent advances suggest that certain mutations located in the SAND and PHD1 domains exert a dominant negative effect on wild type AIRE resulting in milder seemingly common forms of autoimmune diseases, including pernicious anemia, vitiligo and autoimmune thyroid disease."

According to the news editors, the research concluded: "These findings indicate that AIRE also contribute to autoimmunity in more common organ-specific autoimmune disorders."

For more information on this research see: AIRE-mutations and autoimmune disease. Current Opinion in Immunology, 2016;43():8-15. Current Opinion in Immunology can be contacted at: Current Biology Ltd, 84 Theobalds Rd, London WC1X 8RR, England. (Elsevier - www.elsevier.com; Current Opinion in Immunology - www.journals.elsevier.com/current-opinion-in-immunology/)

The news correspondents report that additional information may be obtained from E.S. Husebye, Haukeland Hosp, Dept. of Med, N-5021 Bergen, Norway. Additional authors for this research include B.E. Oftedal, A.B. Wolff and E.S. Husebye.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Ovarian Cancer. According to news reporting from Istanbul, Turkey, by NewsRx journalists, research stated, "To investigate the predictive value of the Risk of Malignancy Index (RMI), CA-125, and inflammatory markers in discriminating ovarian cancers (OCs). The postmenopausal (PM) women (n=139) with adnexal masses who underwent surgery were included."

The news correspondents obtained a quote from the research from Haydarpasa Numune Education and Research Hospital, "The predictive value of CA-125, RMI (1, 2, 3, and 4) and inflammatory markers [neutrophil lymphocyte ratio (NLR), platelet lymphocyte ratio (PLR)] were calculated in geriatric (G) and non-geriatric women. OCs had significantly increased NLR and PLR. RMI models were highly reliable in PM (Kappa: 0.642-0.715; AUC: 0.907-0.934). CA-125 measurement alone had good accuracy and moderate reliability in PM (kappa: 0.507-0.587), excellent accuracy and moderate reliability in G, NLR, and PLR predicting OCs, showed fair agreement in the PM, while PLR had a moderate agreement with G. RMI algorithms were the best models for malignancy prediction."

According to the news reporters, the research concluded: "However, the rise of PLR and CA-125 levels in a G population may be used as referring adnexal masses to gynecologic oncologists."

For more information on this research see: The ovarian cancers in geriatric population: the validity of inflammatory markers, malignancy risk indices 1, 2, 3, 4, and CA-125 levels in malignancy discrimination of adnexal masses. European Journal of Gynaecological Oncology, 2016;37(6):846-851. Heart Disorders and Diseases - Heart Attack

Findings from Heart of England NHS Foundation Trust in the Area of Heart Attack Reported (Characteristics of patients who are not resuscitated in out of hospital cardiac arrests and opportunities to improve community response to cardiac arrest)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Attack have been presented. According to news reporting out of Birmingham, United Kingdom, by NewsRx editors, research stated, "This study explores why resuscitation is withheld when emergency medical staff arrive at the scene of a cardiac arrest and identifies modifiable factors associated with this decision. This is a secondary analysis of unselected patients who sustained an out of
hospital cardiac arrest attended by ambulance vehicles participating in a randomized controlled trial of a mechanical chest compression device (PARAMEDIC trial)."

Our news journalists obtained a quote from the research from the Heart of England NHS Foundation Trust, 'Patients were categorized as 'non-resuscitation' patients if there was a do-not-attempt-cardiopulmonary-resuscitation (DNACPR) order, signs unequivocally associated with death or resuscitation was deemed futile (15 min had elapsed since collapse with no bystander-CPR and asystole recorded on EMS arrival). Emergency Medical Services attended 11,451 cardiac arrests. Resuscitation was attempted or continued by Emergency Medical Service staff in 4805 (42%) of cases. Resuscitation was withheld in 6646 cases (58%). 711 (6.2%) had a do not attempt resuscitation decision, 4439 (38.8%) had signs unequivocally associated with death and in 1496 cases (13.1%) CPR was considered futile. Those where resuscitation was withheld due to futility were characterised by low bystander CPR rates (7.2%) and by being female. Resuscitation was withheld by ambulance staff in over one in ten (13.1%) victims of out of hospital cardiac arrest on the basis of futility. These cases were associated with a very low rate of bystander CPR."

According to the news editors, the research concluded: "Future studies should explore strengthening the 'Chain of Survival' to increase the community bystander CPR response and evaluate the effect on the numbers of survivors from out of hospital cardiac arrest."

For more information on this research see: Characteristics of patients who are not resuscitated in out of hospital cardiac arrests and opportunities to improve community response to cardiac arrest. Resuscitation, 2016;109():110-115. Resuscitation can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Intracellular Space**

**Findings from Hebrew University Broaden Understanding of Intracellular Space (Emulating proton-induced conformational changes in the vesicular monoamine transporter VMAT2 by mutagenesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Intracellular Space have been published. According to news originating from Jerusalem, Israel, by NewsRx correspondents, research stated, "Neurotransporters located in synaptic vesicles are essential for communication between
nerve cells in a process mediated by neurotransmitters. Vesicular monoamine transporter (VMAT), a member of the largest superfamily of transporters, mediates transport of monoamines to synaptic vesicles and storage organelles in a process that involves exchange of two H+ per substrate.

Financial supporters for this research include HHS | NIH | National Institute of Neurological Disorders and Stroke (NINDS), United States-Israel Binational Science Foundation (BSF).

Our news journalists obtained a quote from the research from Hebrew University, "VMAT transport is inhibited by the competitive inhibitor reserpine, a second-line agent to treat hypertension, and by the noncompetitive inhibitor tetrabenazine, presently in use for symptomatic treatment of hyperkinetic disorders. During the transport cycle, VMAT is expected to occupy at least three different conformations: cytoplasm-facing, occluded, and lumen-facing. The lumen-to-cytoplasm-facing transition, facilitated by protonation of at least one of the essential membrane-embedded carboxyls, generates a binding site for reserpine. Here we have identified residues in the cytoplasmic gate and show that mutations that disrupt the interactions in this gate also shift the equilibrium toward the cytoplasm-facing conformation, emulating the effect of protonation."

According to the news editors, the research concluded: "These experiments provide significant insight into the role of proton translocation in the conformational dynamics of a mammalian H+-coupled antiporter, and also identify key aspects of the mode of action and binding of two potent inhibitors of VMAT2: reserpine binds the cytoplasm-facing conformation, and tetrabenazine binds the lumen-facing conformation."

The news correspondents report that additional information may be obtained from S. Schuldiner, Hebrew University of Jerusalem, Alexander Silberman Inst Life Sci, Dept. of Biol Chem, IL-91904 Jerusalem, Israel. Additional authors for this research include A. Vergara-Jaque, L.R. Forrest and S. Schuldiner.

Liver Diseases and Conditions - Hepatitis C Virus

Findings from Henan University Provides New Data on Hepatitis C Virus
(Hepatitis C virus promotes hepatocellular carcinogenesis by targeting TIPE2, a new regulator of DNA damage response)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Hepatitis C Virus have been published. According to news reporting out of Kaifeng, People's Republic of China, by NewsRx editors, research stated, "Infection of hepatitis C virus (HCV) is associated with primary hepatocellular carcinoma (HCC). However, its underlying molecular mechanisms remain enigmatic."

Financial support for this research came from NSFC.

Our news journalists obtained a quote from the research from Henan University, "Tumor necrosis factor-a-induced protein 8-like 2 (TIPE2), a new negative regulator of immunity, plays significant roles in modulating inflammation and tumorigenesis. We hypothesized that TIPE2 might be involved in the development of HCV-induced HCC. To test this hypothesis, the expression of TIPE2 was determined by Western blot in the tumor and pericarcinomatous tissues collected from ten HCV-positive HCC patients; the interaction between TIPE2 and HCV-encoded non-structural proteins was analyzed by immunoprecipitation and immunofluorescence assays, and tumorigenesis and its mechanisms were studied in cell models and nude mice. Our results demonstrated that the expression of TIPE2 was significantly reduced in HCC tissues compared to that in the paracarcinoma tissues. HCV-encoded non-structural protein NS5A could specifically interact with TIPE2 and induce its degradation. Downregulation of TIPE2 by shRNA in cell lines increased genomic DNA damage and promoted cell colony formation in vitro and tumorigenesis in nude mice. In contrast, overexpression of TIPE2 had an opposite effect. Downregulation of TIPE2 by NS5A is associated with genomic DNA instability and HCV-induced HCC development."

According to the news editors, the research concluded: "Thus, TIPE2 may be a new therapeutic target for the treatment of HCV-associated HCC."

For more information on this research see: Hepatitis C virus promotes hepatocellular carcinogenesis by targeting TIPE2, a new regulator of DNA damage response. Tumor Biology, 2016;37(11):15265-15274. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Findings from Henri Mondor Hospital Provide New Insights into Kidney Research (Repression of CMIP transcription by WT1 is relevant to podocyte health)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nephrology - Kidney Research have been presented. According to news reporting originating from Creteil, France, by NewsRx correspondents, research stated, "The WT1 (Wilm's tumor suppressor) gene is expressed throughout life in podocytes and is essential for the functional integrity of the glomerular filtration barrier. We have previously shown that CMIP (C-Maf inducing protein) is overproduced in podocyte diseases and alters intracellular signaling."

Our news editors obtained a quote from the research from Henri Mondor Hospital, "Here we isolated the proximal region of the human CMIP promoter and showed by chromatin immunoprecipitation assays and electrophoretic-mobility shift that Wilm's tumor protein (WT1) bound to 2 WT1 response elements, located at positions -290/-274 and -57/-41 relative to transcription start site. Unlike the human CMIP gene, only one Wt1 response element was identified in the mouse Cmip proximal promoter located at position -217/-206. Luciferase reporter assays indicated that WT1 dose-dependently inhibited the transcriptional induction of the CMIP promoter. Transfection of decoy oligonucleotides mimicking the WT1 response elements prevented the inhibition of WT1 on CMIP promoter activity. Furthermore, WT1 silencing promoted Cmip expression. In line with these findings, the abundance of Cmip was early and significantly increased at the transcript and protein level in podocytes displaying a primary defect in Wt1, including Denys-Drash syndrome and Frasier syndrome."

According to the news editors, the research concluded: "Thus, WT1 is a major repressor of the CMIP gene in physiological situations, while conditional deletion of CMIP in the developing kidney did not affect the development of mature glomeruli."

The news editors report that additional information may be obtained by contacting D. Sahali, Henri Mondor Hosp, Inst Francilien Rech Nephrol & Transplantat, Creteil, France. Additional authors for this research include S.Y. Zhang, P. Vachin, V. Ory, C. Henique, V. Audard, C. Rucker-Martin, E. Gouadon, M. Eccles, A. Schedl, L. Heidet, M. Ollero, D. Sahali and A. Pawlak.

Oncology - Squamous Cell Carcinoma

Findings from Hiroshima University in the Area of Squamous Cell Carcinoma Reported (Ability of Fluorine-18 Fluorodeoxyglucose Positron Emission Tomography to Predict Outcomes of Neoadjuvant Chemoradiotherapy Followed by Surgical Treatment for ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Squamous Cell Carcinoma. According to news reporting from Hiroshima, Japan, by NewsRx journalists, research stated, "Responses of esophageal cancer to neoadjuvant therapy and patient prognosis are difficult to predict preoperatively. This study aimed to determine the ability of fluorine-18 fluorodeoxyglucose ((18)FDG) positron emission tomography (FDG-PET) to predict outcomes of trimodal therapy on esophageal squamous cell carcinoma (ESCC)."

The news correspondents obtained a quote from the research from Hiroshima University, "The responses of 111 patients with ESCC were monitored using FDG-PET before and after neoadjuvant chemoradiotherapy (nCRT) followed by surgical treatment. Associations between the maximum standardized uptake value (SUVmax) and pathologic responses (PRs) and prognosis were analyzed. Responses were significantly associated with SUVmax after nCRT (post-SUVmax) and with the rate of decreases in the SUVmax (% Delta SUVmax) of the primary tumor. The optimal cutoffs for post-SUVmax and % Delta SUVmax determined from receiver operating characteristic (ROC) curves were 2.7 (area under the curve [AUC], 0.68; 95% confidence interval [CI], 0.58-0.78; p = 0.001) and 75 (AUC, 0.64; 95% CI, 0.54-0.75; p = 0.01) for predicting a pathologic complete response (pCR) and 3.7 (AUC, 0.76; 95% CI, 0.63-0.89; p < 0.001) and 70 (AUC, 0.65; 95% CI, 0.52-0.78; p = 0.02) for predicting a good response according to Japan Esophageal Society response criteria. These values reliably separated patients into groups with and without pCR and with and without a good response. Multivariate analysis showed that %Delta SUVmax (<= 70 and > 70) was an independent prognostic factor for disease-specific survival (hazard ratio [HR], 0.45; 95% CI, 0.21-0.98; p = 0.04)."

According to the news reporters, the research concluded: "SUVmax is a valuable preoperative predictor of tumor response and survival among patients who undergo trimodal therapy for ESCC."

Our news journalists report that additional information may be obtained by contacting J. Hihara, Hiroshima University, Dept. of Surg Oncol, Hiroshima, Japan. Additional authors for this research include J. Hihara, M. Emi, T. Furukawa, I. Yamakita, T. Kurokawa and M. Okada.

The direct object identifier (DOI) for that additional information is:

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Drug Delivery Systems are presented in a new report. According to news reporting originating from Hokkaido, Japan, by NewsRx correspondents, research stated, "The ultimate goal in the area of drug-delivery systems is the development of a nanoparticle that can penetrate the endothelial cell monolayer for the targeting of tissue parenchyma. In the present study, we identify a transcytosis-targeting peptide (TTP) that permits polyethyleneglycol (PEG)-modified liposomes (PEG-LPs) to penetrate through monolayers of brain-derived endothelial cells."

Financial supporters for this research include Next Generation World-Leading Researchers, Japan Science and Technology Corporation.

Our news editors obtained a quote from the research from Hokkaido University, "These endothelial cells were layered on a gelatin nanofiber sheet, a nanofiber meshwork that allows the evaluation of transcellular transport of nanosized particles (ca. 100 nm). Systematic modification of the sequences results in the identification of the consensus sequence of TTP as L(R/K)QZZZL, where Z denotes hydrophilic amino acids (R/K/S and partially D). The TTP-modified liposomes are bound on the heparin sulfate proteoglycan, and are then taken up via lipid raft-mediated endocytosis. Subsequent intracellular imaging of the particles reveals a unique intracellular sorting of TTP-modified PEG liposomes (TTP-PEG-LPs); namely the TTP-LPs are not localized with the lysosomes, whereas this co-localization is dominant in the unmodified PEG liposomes (PEG-LPs). The in vivo endothelial penetration of liposomes in adipose tissue is conferred by the dual modification of the particles with TTP and tissue-targeting ligands."

According to the news editors, the research concluded: "This technology promises innovations in intravenously available delivery system to tissue parenchyma."

The news editors report that additional information may be obtained by contacting H. Akita, Faculty of Pharmaceutical Sciences, Hokkaido University, Kita12 Nishi6, Kita-ku, Sapporo City, Hokkaido, 060-0812, Japan. Additional authors for this research include T. Fujiwara, S. Santiwarangkool, N. Hossen, K. Kajimoto, A. El-Sayed, Y. Tabata and H. Harashima.

Diet and Nutrition

Findings from Hong Kong Polytechnic University Yields New Data on Diet and Nutrition (Association between dietary fibre intake with cancer and all-cause mortality among 15 740 adults: the National Health and Nutrition Examination Survey III)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Diet and Nutrition. According to news reporting out of Hong Kong, People's Republic of China, by NewsRx editors, research stated, "Few prospective studies have examined the longitudinal associations of total dietary fibre intake and water insoluble and soluble fibres with cancer and all-cause mortality. The present study aimed to examine these associations."

Our news journalists obtained a quote from the research from Hong Kong Polytechnic University, "We studied the effects of total dietary fibre intake and water insoluble and soluble fibres on cancer and all-cause mortality, using data from 15 740 adult participants [mean (SD) age: 44.53 (19.22) years, 46.60% male] in the National Health and Nutrition Examination Survey (NHANES) III, 1988-1994, who had completed a 24-h dietary recall. Death certificate data were obtained up to 2006. Participants had been followed for 13.74 years on average. Cox regression was used to estimate the hazard ratios (HRs) of total dietary, insoluble and soluble fibres on cancer and all-cause mortality, with the first quartile as the reference group, adjusted for demographics, lifestyle and dietary factors. Relative to those in the first quartile of total fibre intake, only the third quartile was associated with all-cause mortality, with an adjusted HR of 0.87 [95% confidence interval (CI) = 0.79, 0.97, P = 0.021], and cancer mortality, with an adjusted HR of 0.77 (95% CI = 0.61, 0.99, P = 0.05). The third quartile of insoluble fibre intake was associated with cancer mortality, with an adjusted HR of 0.76 (95% CI = 0.60, 0.96, P = 0.023), and colorectal-rectal cancer mortality (in grouped data as provided for public use), with an adjusted HR of 0.42 (95% CI = 0.19, 0.91, P = 0.03). Dietary fibre showed protective benefits in terms of mortality risk."

According to the news editors, the research concluded: "Investigating the mechanisms and components of dietary fibres underlying the different protective benefits remains an important consideration for research on fibre-mortality risk."

Our news journalists report that additional information may be obtained by contacting C.W. Chan, Hong Kong Polytechnic University, Sch Nursing, Kowloon, Hong Kong, People's Republic of China.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jhn.12389. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Oral Squamous Cell Carcinoma

Findings from Hong Kong University of Science and Technology Has Provided New Data on Oral Squamous Cell Carcinoma (Long non-coding RNA UCA1 contributes to the progression of oral squamous cell carcinoma by regulating the WNT/beta-catenin ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Oral Squamous Cell Carcinoma. According to news reporting originating in Shenzhen, People's Republic of China, by NewsRx journalists, research stated, "With the development of functional genomics studies, a mass of long non-coding RNAs (LncRNA) were discovered from the human genome. Long non-coding RNAs serve as pivotal regulators of genes that are able to generate LncRNA-binding protein complexes to modulate a great number of genes."

The news reporters obtained a quote from the research from the Hong Kong University of Science and Technology, "Recently, the LncRNA urothelial carcinoma-associated 1 (UCA1) has been revealed to be dysregulated, which plays a critical role in the development of a few cancers. However, the role of the biology and clinical significance of UCA1 in the tumorigenesis of oral squamous cell carcinoma (OSCC) remain unknown. We found that UCA1 expression levels were upregulated aberrantly in tongue squamous cell carcinoma tissues and associated with lymph node metastasis and TNM stage. We explored the expression, function, and molecular mechanism of LncRNA UCA1 in OSCC. In the present work, we revealed that UCA1 silencing suppressed proliferation and metastasis and induced apoptosis of OSCC cell lines in vitro and in vivo, which might be related to the activation level of the WNT/beta-catenin signaling pathway."

According to the news reporters, the research concluded: "Our research results emphasize the pivotal role of UCA1 in the oncogenesis of OSCC and reveal a novel LncRNA UCA1--catenin-WNT signaling pathway regulatory network that could contribute to our understanding in the pathogenesis of OSCC and assist in the discovery of a viable LncRNA-directed diagnostic and therapeutic strategy for this fatal disease."

Our news correspondents report that additional information may be obtained by contacting W. Zhang, Hong Kong University of Science & Technology, Shenzhen Peking Univ, Medical Center, Biomed Res Inst, Shenzhen 518036, People's Republic of China. Additional authors for this research include Y.F. Wang, J.Y. Lai, S.Y. Shen, F. Wang, J. Kong, W. Zhang and H.Y. Yang.

Keywords for this news article include: Shenzhen, People's Republic of China, Asia, Oral Squamous Cell Carcinoma, Armadillo Domain Proteins, Transcription Factors, beta Catenin, Carcinomas, Catenins, Oncology, Genetics, Hong Kong University of Science and Technology.

**Transplant Medicine - Kidney Transplants**

**Findings from Hospital Clinic Reveals New Findings on Kidney Transplants (Bortezomib for refractory acute antibody-mediated rejection in kidney transplant recipients: A single-centre case series)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Kidney Transplants have been published. According to news originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Acute antibody-mediated rejection (ABMR) after kidney transplantation (KT) is associated with poor allograft survival. Current therapies for ABMR are able to deplete B-lymphocytes but do not target plasma cells."

Our news journalists obtained a quote from the research from Hospital Clinic, "Bortezomib is a proteasome inhibitor that can eliminate plasma cells and has demonstrated utility in the treatment of ABMR. A retrospective study was carried out from 2010 to 2014, including all patients with ABMR refractory to conventional treatment who received bortezomib. Bortezomib (1.3 mg/m(2)) was administered intravenously on days 1, 4, 8, and 11. Renal function, graft survival, follow-up biopsies, and donor-specific antibodies (DSA) were recorded. We identified seven patients. Of these, high immunological risk was found in 6 of 7, preformed DSA were found in 5 of 7, flow cytometry cross-match was positive in 4 of 7, and desensitization before KTx was provided in 6 of 7 patients. ABMR was diagnosed at a median of 90 days (8-167) post-KT. After bortezomib therapy, renal function improved or stabilized in 5 of 7 patients and progressively deteriorated in 2 of 7, leading to haemodialysis after 7 and 11 months, respectively. Follow-up kidney biopsies showed persistence of ABMR in 2 of 7, chronic active ABMR 3 of 7 and inactive chronic lesions in 2 of 7. DSA titres significantly decreased after treatment (P = 0.028). All patients experienced mild adverse events. After a follow-up of 22 +/- 18 months, three grafts were lost (42%) and four remained functioning. Bortezomib could be useful as an adjuvant therapy for ABMR refractory to conventional treatment with acceptable mid-term outcomes in these severe cases."

According to the news editors, the research concluded: "More research is needed to develop strategies to better preserve graft function after refractory ABMR."

For more information on this research see: Bortezomib for refractory acute antibody-mediated rejection in kidney transplant recipients: A single-centre case series. *Nephrology*, 2016;21(8):700-704. *Nephrology* can be contacted at: Wiley-Blackwell, 111 River St,
Findings from Hospital Clinic in Acute Myeloid Leukemia Provides New Insights (The lincRNA HOTAIRM1, located in the HOXA genomic region, is expressed in acute myeloid leukemia, impacts prognosis in patients in the intermediate-risk cytogenetic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Acute Myeloid Leukemia are presented in a new report. According to news reporting from Barcelona, Spain, by NewsRx journalists, research stated, "Long non-coding RNAs (lncRNAs) are deregulated in several tumors, although their role in acute myeloid leukemia (AML) is mostly unknown. We have examined the expression of the lncRNA HOX antisense intergenic RNA myeloid 1 (HOTAIRM1) in 241 AML patients. We have correlated HOTAIRM1 expression with a miRNA expression profile."

The news correspondents obtained a quote from the research from Hospital Clinic, "We have also analyzed the prognostic value of HOTAIRM1 expression in 215 intermediate-risk AML (IR-AML) patients. The lowest expression level was observed in acute promyelocytic leukemia (p <0.001) and the highest in t(6;9) AML (p=0.005). In 215 IR-AML patients, high HOTAIRM1 expression was independently associated with shorter overall survival (OR:2.04; p=0.001), shorter leukemia-free survival (OR:2.56; p<0.001) and a higher cumulative incidence of relapse (OR:1.67; p=0.046). Moreover, HOTAIRM1 maintained its independent prognostic value within the favorable molecular subgroup (OR: 3.43; p=0.009). Interestingly, HOTAIRM1 was overexpressed in NPM1-mutated AML (p <0.001) and within this group retained its prognostic value (OR: 2.21; p=0.01). Moreover, HOTAIRM1 expression was associated with a specific 33-microRNA signature that included miR-196b (p <0.001). miR-196b is located in the HOX genomic region and has previously been reported to have an independent prognostic value in AML. miR-196b and HOTAIRM1 in combination as a prognostic factor can classify patients as high-, intermediate-, or low-risk (5-year OS: 24% vs 42% vs 70%; p=0.004). Determination of HOTAIRM1 level at diagnosis provided relevant prognostic information in IR-AML and allowed refinement of risk stratification based on common molecular markers. The prognostic information provided by HOTAIRM1 was strengthened when combined with miR-196b expression."

According to the news reporters, the research concluded: "Furthermore, HOTAIRM1
correlated with a 33-miRNA signature."

For more information on this research see: The lincRNA HOTAIR-1M, located in the HOXA genomic region, is expressed in acute myeloid leukemia, impacts prognosis in patients in the intermediate-risk cytogenetic category, and is associated with a distinctive microRNA signature. *Oncotarget*, 2015;6(31):31613-27.

**Heart Disorders and Diseases - Heart Attack**

**Findings from Hospital Clinico Universitario Broadens Understanding of Heart Attack (Inhomogeneity of collagen organization within the fibrotic scar after myocardial infarction: results in a swine model and in human samples)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting originating in Valencia, Spain, by NewsRx journalists, research stated, "We aimed to characterize the organization of collagen within a fibrotic scar in swine and human samples from patients with chronic infarctions. Swine were subjected to occlusion of the left anterior descending artery followed by reperfusion 1 week (acute myocardial infarction group) or 1 month (chronic myocardial infarction group) after infarction."

Financial supporters for this research include Instituto de Salud Carlos III and FEDER, Generalitat Valenciana.

The news reporters obtained a quote from the research from Hospital Clinico Universitario, "The organization of the collagen fibers (Fast Fourier Transform of samples after picrosirius staining; higher values indicate more disorganization) was studied in 100 swine and 95 human samples. No differences in collagen organization were found between the acute and chronic groups in the core area of the scar in the experimental model. In the chronic group, the endocardium [0.90 (0.84-0.94); median (interquartile range)], epicardium [0.84 (0.79-0.91)] and peripheral area [0.73 (0.63-0.83)] displayed a much more disorganized pattern than the core area of the fibrotic scar [0.56 (0.45-0.64)]. Similarly, in human samples, the collagen fibers were more disorganized in all of the outer areas than in the core of the fibrotic scar (P <0.0001). Both in a highly controlled experimental model and in patient samples, collagen fibers exhibited an organized pattern in the core of the infarction, whereas the outer areas displayed a high level
of inhomogeneity."

According to the news reporters, the research concluded: "This finding contributes pathophysiological information regarding the healing process and may lead to a clearer understanding of the genesis and invasive treatment of arrhythmias after acute myocardial infarction."

Our news correspondents report that additional information may be obtained by contacting A. Hervas, Cardiology Department, Hospital Clinico Universitario, INCLIVA, University of Valencia, Valencia, Spain. Additional authors for this research include A. Ruiz-Sauri, E. de Dios, M.J. Forteza, G. Minana, J. Nunez, C. Gomez, C. Bonanad, N. Perez-Sole, J. Gavara, F.J. Chorro and V. Bodi.

Nutritional and Metabolic Diseases and Conditions - Findings from Hospital for Special Surgery Provides New Data on Malnutrition (Malnutrition Increases With Obesity and Is a Stronger Independent Risk Factor for Postoperative Complications: A Propensity-Adjusted Analysis of Total Hip ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Malnutrition have been published. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Obesity is frequently associated with complications after total hip arthroplasty (THA) and is often concomitant with malnutrition. The purpose of this study was to investigate the independent morbidity risk of malnutrition relative to obesity."

Our news journalists obtained a quote from the research from Hospital for Special Surgery, "The National Surgical Quality Improvement Program from 2005 to 2013 was queried for elective primary THA cases. Malnutrition was defined as albumin <3.5 g/dL. Propensity scores for having preoperative albumin data were determined from demographics, body mass index, and overall comorbidity burden. Patients were classified as nonobese (body mass index 18.5-29.9), obese I (30-34.9), obese II (35-39.9), or obese III (>= 40). Complications were compared across nutritional and obesity classes. Multivariable propensity-adjusted logistic regressions were used to examine associations between obesity and malnutrition with 30-day outcomes. A total of 40,653 THA cases were identified, of which 20,210 (49.7%) had preoperative albumin measurements. Propensity score adjustment successfully reduced potential..."
selection bias, with P> .05 for differences between those with and without albumin data. Malnutrition incidence increased from 2.8% in obese I to 5.7% in obese III patients. With multivariable propensity-adjusted logistic regression, malnutrition was a more robust predictor than any obesity class for any postoperative complication(s) (odds ratio [OR] 1.61, 95% confidence interval [CI] 1.25-2.08), major complications (OR 1.63, 95% CI 1.21-2.19), respiratory complications (OR 2.35, 95% CI 1.27-4.37), blood transfusions (OR 1.71, 95% CI 1.44-2.03), and extended length of stay (OR 1.35, 95% CI 1.14-1.59).

According to the news editors, the research concluded: "Malnutrition incidence increased significantly from obese I to obese III patients and was a stronger and more consistent predictor than obesity of complications after THA."

Our news journalists report that additional information may be obtained by contacting M.C. Fu, Hospital for Special Surgery, Adult Reconstruct & Joint Replacement Serv, New York, NY 10021, United States. Additional authors for this research include C. D'Ambrosia, A.S. McLawhorn, W.W. Schairer, D.E. Padgett and M.B. Cross.

Cardiology

Findings from Howard Hughes Medical Institute Broaden Understanding of Cardiology (Single-Cell Resolution of Temporal Gene Expression during Heart Development)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiology have been presented. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Activation of complex molecular programs in specific cell lineages governs mammalian heart development, from a primordial linear tube to a four-chamber organ. To characterize lineage-specific, spatiotemporal developmental programs, we performed single-cell RNA sequencing of >1,200 murine cells isolated at seven time points spanning embryonic day 9.5 (primordial heart tube) to postnatal day 21 (mature heart)."

Funders for this research include NIGMS, Harvard Medical School, NHLBI, Howard
Hughes Medical Institute, NIMH, NIH, Foundation for Anesthesia Education and Research.

Our news journalists obtained a quote from the research from Howard Hughes Medical Institute, "Using unbiased transcriptional data, we classified cardiomyocytes, endothelial cells, and fibroblast-enriched cells, thus identifying markers for temporal and chamber-specific developmental programs. By harnessing these datasets, we defined developmental ages of human and mouse pluripotent stem-cell-derived cardiomyocytes and characterized lineage-specific maturation defects in hearts of mice with heterozygous mutations in Nkx2.5 that cause human heart malformations."

According to the news editors, the research concluded: "This spatiotemporal transcriptome analysis of heart development reveals lineage-specific gene programs underlying normal cardiac development and congenital heart disease."

The news correspondents report that additional information may be obtained from C.E. Seidman, Brigham & Women's Hospital, Div Cardiovasc, Howard Hughes Med Inst, Boston, MA 02115, United States. Additional authors for this research include A.G. Bick, H. Wakimoto, D. McKean, J.M. Gorham, I.S. Kathiriya, J.T. Hinson, J. Homsy, J. Gray, W. Pu, B.G. Bruneau, J.G. Seidman and C.E. Seidman.

Drugs and Therapies - Antineoplastics

Findings from Huaiyin Institute of Technology Yields New Data on Antineoplastics (Novel morphology change of Au-Methotrexate conjugates: From nanochains to discrete nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antineoplastics have been presented. According to news reporting from Huaiyan, People's Republic of China, by NewsRx journalists, research stated, "A novel morphology change of Au-methotrexate (Au-MTX) conjugates that could transform from nanochains to discrete nanoparticles was achieved by a simple, one-pot, and hydrothermal growth method. Herein, MTX was used efficiently as a complex-forming agent, reducing agent, capping agent, and importantly a targeting anticancer drug."

Financial supporters for this research include National Natural Science Foundation of China, Foundation of Key Laboratory for Palygorskite Science and Applied Technology of Jiangsu Province, Fund of Priority Academic Program Development of Jiangsu Higher
Education Institutions, Jiangsu Collaborative Innovation Center of Biomedical Functional Materials.

The news correspondents obtained a quote from the research from the Huaiyin Institute of Technology, "The formation mechanism suggested a similarity with the molecular imprinting technology. The Au-MTX complex induced the MTX molecules to selectively adsorb on different crystal facets of gold nanoparticles (AuNPs) and then formed gold nanospheres. Moreover, the abundantly binding MTX molecules promoted directional alignment of these gold nanospheres to further form nanochains. More interestingly, the linear structures gradually changed into discrete nanoparticles by adding different amount of ethylene diamine tetra (methylene phosphonic acid) (EDTMPA) into the initial reaction solution, which likely arose from the strong electrostatic effect of the negatively charged phosphonic acid groups."

According to the news reporters, the research concluded: "Compared with the as-prepared nanochains, the resultant discrete nanoparticles showed almost equal drug loading capacity but with higher drug release control, colloidal stability, and in vitro anticancer activity."

Our news journalists report that additional information may be obtained by contacting S.P. Li, Huaiyin Inst Technol, Jiangsu Prov Key Lab Palygorskite Sci & Appl Technical, Huaiian 223003, People's Republic of China. Additional authors for this research include X.F. Zhao, X.H. Ju, Y. Wang, L. Wang, S.P. Li and X.D. Li.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.022. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Breast Cancer

Findings from Huazhong University of Science and Technology Provide New Insights into Breast Cancer (Addition of the p110 alpha inhibitor BYL719 overcomes targeted therapy resistance in cells from Her2-positive-PTEN-loss breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting originating from Wuhan, People's Republic of China, by NewsRx correspondents, research stated, "Breast cancer is one of the leading causes of death for women
worldwide. Among various subtypes of breast cancer, human epidermal growth factor receptor 2 (HER2)-positive and phosphatase and tensin homolog (PTEN) loss breast cancer is a cause of great concern in terms of its resistance to HER2-targeted therapies and its poor prognosis.

Our news editors obtained a quote from the research from the Huazhong University of Science and Technology, "Phosphatidylinositol 3-kinase (PI3K)/AKT hyperphosphorylation is considered one of key mechanisms leading to this resistance, thus combination therapy of PI3K inhibitors and HER2 antibodies is promising for overcoming this problem, and more specific regimens should be designed in this age of precision medicine. In this study, we established an HER2-positive and PTEN loss cell line and confirmed it by western blot analysis. This cell line and its orthotopic xenograft models were exposed to p110 alpha-specific inhibitor BYL719, p110 beta-specific inhibitor AZD6482, or pan-PI3K inhibitor BKM120, respectively, and the results showed sensitivity to both BYL719 and BKM120 but not AZD6482, which indicated a p110 alpha-reliance for HER2-positive-PTEN-loss breast cancer. Then, the addition of BYL719 to HER2 antibody greatly reduced tumor growth both in vitro and in vivo, accompanied by inhibited PI3K effector phosphorylation."

According to the news editors, the research concluded: "Therefore, our findings suggest that the combination of p110 alpha-selective inhibitor BYL719 with HER2 antibody could be a potential strategy for more personalized treatment of HER2-positive-PTEN-loss breast cancer; and in addition, the optimal schedule of this combination therapy needs to be further explored."

For more information on this research see: Addition of the p110 alpha-selective inhibitor BYL719 overcomes targeted therapy resistance in cells from Her2-positive-PTEN-loss breast cancer. Tumor Biology, 2016;37(11):14831-14839. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. The news reporters obtained a quote from the research from Hyogo Cancer Center, "164 intentional extended segmentectomies were compared with 73 lobectomies subcategorized by consolidation to maximum tumor diameter ratio (C/T) measured by computed tomographies. Preoperative characteristics were propensity score matched to evaluate local-regional recurrence-free survival using the log-rank test. Preoperative factors and surgical procedure were analyzed with the Cox proportional hazards regression model to identify independent predictor of local-regional recurrence. Local-regional recurrence per segment were assessed by Kaplan-Meier estimates between both groups. No recurrences were observed for 46 C/T <= 0.5 segmentectomies. In 59 C/T >0.5 propensity scorematched pairs, 5-year local-regional recurrence-free survival rates of segmentectomies were 76.3%, versus 91.5% for lobectomies (p = 0.082). Multivariate analysis confirmed segmentectomies to be the only independent risk factor for local-regional recurrence-free probability (p = 0.020). Subset analysis reveals superior segmentectomies have significantly less local-regional recurrence (p = 0.029) than other segments and comparable prognosis to lower lobectomies. Left upper lobe segmentectomies also showed comparable prognosis to lobectomies. Segmentectomies in the right upper lobe and of basal segments showed significantly higher local recurrence (p = 0.001) than other segments. Basal segmentectomies showed significantly poor prognosis versus lower lobectomies (p = 0.005). For radiographically invasive right upper lobe or basal segment clinical T1a NSCLC, strict inclusion criteria is necessary for intentional segmentectomy."

According to the news reporters, the research concluded: "For superior and left upper lobe segments, however, segmentectomies may be preferred with prognosis comparable to lobectomies."

Our news correspondents report that additional information may be obtained by contacting W. Nishio, Hyogo Canc Center, Dept. of Chest Surg, Akashi, Hyogo 6738558, Japan. Additional authors for this research include M. Yoshimura, Y. Maniwa, Y. Kitamura, K. Tane, D. Takenaka and S. Adachi.

Liver Diseases and Conditions - Hepatitis C Virus

Findings from IDIBAPS Provide New Insights into Hepatitis C Virus (Boceprevir plus pegylated interferon/ribavirin to re-treat hepatitis C virus genotype 1 in HIV-HCV co-infected patients: final results of the Spanish BOC HIV-HCV Study)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Hepatitis C Virus. According to news reporting out of Barcelona, Spain, by NewsRx editors, research stated, "Boceprevir (BOC) was one of the first oral inhibitors of hepatitis C virus (HCV) NS3 protease to be developed. This study assessed the safety and efficacy of BOC + pegylated interferon-alpha 2a/ribavirin (PEG-IFN/RBV) in the retreatment of HIV-HCV co-infected patients with HCV genotype 1. This was a phase III prospective trial."

Our news journalists obtained a quote from the research from IDIBAPS, "HIV-HCV (genotype 1) co-infected patients from 16 hospitals in Spain were included. These patients received 4 weeks of PEG-IFN/RBV (lead-in), followed by response-guided therapy with PEG-IFN/RBV plus BOC (a fixed 44 weeks was indicated in the case of cirrhosis). The primary endpoint was the sustained virological response (SVR) rate at 24 weeks post-treatment. Efficacy and safety were evaluated in all patients who received at least one dose of the study drug. From June 2013 to April 2014, 102 patients were enrolled, 98 of whom received at least one treatment dose. Seventy-three percent were male, 34% were cirrhotic, 23% had IL28b CC, 65% had genotype 1a, and 41% were previous null responders. The overall SVR rate was 67%. Previous null-responders and cirrhotic patients had lower SVR rates (57% and 51%, respectively). Seventy-six patients (78%) completed the therapy scheme; the most common reasons for discontinuation were lack of response at week 12 (12 patients) and adverse events (six patients). Response-guided therapy with BOC in combination with PEG-IFN/RBV led to an overall SVR rate of 67%, but an SVR rate of only 51% in patients with cirrhosis. The therapy was generally well tolerated."

According to the news editors, the research concluded: "Although the current standards of care do not include BOC + PEG-IFN/RBV, the authors believe that this combination can be beneficial in situations where new HCV direct antiviral agent interferonfree therapies are not available yet."

Findings from IUPUI Provide New Insights into HIV/AIDS [Reasons People Give for Using (or Not Using) Condoms]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immune System Diseases and Conditions - HIV/AIDS are discussed in a new report. According to news reporting from Indianapolis, Indiana, by NewsRx journalists, research stated, "Study participants (N = 348) were asked about 46 reasons that have been suggested for why people use or do not use condoms. Participants were asked which of these reasons motivated them when they were deciding whether to use condoms in 503 sexual relationships."

Financial support for this research came from Eunice K Shriver National Institute of Child Health and Human Development.

The news correspondents obtained a quote from the research from IUPUI, "Participants were classified into one of three roles based on their HIV status and the status of each sexual partner: HIV+ people with HIV- partners; HIV- people with HIV+ partners; and HIV- people with HIV- partners. Motivations were looked at in the context of each of these roles. Of the 46 reasons, only 15 were selected by at least 1/3 of the participants, and only seven were selected by at least half. Frequently reported reasons primarily concern protecting self and partner from STDs including HIV. Less frequently reported reasons involved social norms, effects of condoms on sex, and concern for the relationship."

According to the news reporters, the research concluded: "These findings have implications for clinical interventions."

For more information on this research see: Reasons People Give for Using (or Not Using) Condoms. AIDS and Behavior, 2016;20(12):2850-2862. AIDS and Behavior can be contacted at: Springer, Plenum Publishers, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; AIDS and Behavior - www.springerlink.com/content/1090-7165/)

Findings from Illinois State University in the Area of Central Nervous System Agents Reported (Modafinil Activates Phasic Dopamine Signaling in Dorsal and Ventral Striata)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Central Nervous System Agents are discussed in a new report. According to news reporting from Normal, Illinois, by NewsRx journalists, research stated, "Modafinil (MOD) exhibits therapeutic efficacy for treating sleep and psychiatric disorders; however, its mechanism is not completely understood. Compared with other psychostimulants inhibiting dopamine (DA) uptake, MOD weakly interacts with the dopamine transporter (DAT) and modestly elevates striatal dialysate DA, suggesting additional targets besides DAT."

The news correspondents obtained a quote from the research from Illinois State University, "However, the ability of MOD to induce wakefulness is abolished with DAT knockout, conversely suggesting that DAT is necessary for MOD action. Another psychostimulant target, but one not established for MOD, is activation of phasic DA signaling. This communication mode during which burst firing of DA neurons generates rapid changes in extracellular DA, the so-called DA transients, is critically implicated in reward learning. Here, we investigate MOD effects on phasic DA signaling in the striatum of urethane-anesthetized rats with fast-scan cyclic voltammetry. We found that MOD(30-300 mg/kg i.p.) robustly increases the amplitude of electrically evoked phasic-like DA signals in a time- and dose-dependent fashion, with greater effects in dorsal versus ventral striata. MOD-induced enhancement of these electrically evoked amplitudes was mediated preferentially by increased DA release compared with decreased DA uptake. Principal component regression of nonelectrically evoked recordings revealed negligible changes in basal DA with high-dose MOD (300 mg/kg i.p.). Finally, in the presence of the D2 DA antagonist, raclopride, lowdoseMOD( 30 mg/kg i.p.) robustly elicited DA transients in dorsal and ventral striata."

According to the news reporters, the research concluded: "Taken together, these results suggest that activation of phasic DA signaling is an important mechanism underlying the clinical efficacy of MOD."

For more information on this research see: Modafinil Activates Phasic Dopamine Signaling in Dorsal and Ventral Striata. Journal of Pharmacology and Experimental Therapeutics, 2016;359(3):460-470. Journal of Pharmacology and Experimental Therapeutics can be contacted at: Amer Soc Pharmacology Experimental Therapeutics, 9650 Rockville Pike, Bethesda, MD 20814-3995, USA.

DNA Research

Findings from Imperial College Provides New Data on DNA Research (Single-Molecule Studies of Unlabeled Full-Length p53 Protein Binding to DNA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in DNA Research. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "p53 is an antitumor protein that plays an important role in apoptosis, preserving genomic stability and preventing angiogenesis, and it has been implicated in a large number of human cancers. For this reason it is an interesting target for both fundamental studies, such as the mechanism of interaction with DNA, and applications in biosensing."

Our news editors obtained a quote from the research from Imperial College, "Here, we report a comprehensive study of label-free, full length p53 (flp53) and its interaction with engineered double-stranded DNA in vitro, at the single-molecule level, using atomic force microscopy (AFM) imaging and solid-state nanopore sensing. AFM data show that dimeric and tetrameric p53 bind to the DNA in a sequence-specific manner, confirming previously reported relative binding affinities. The statistical significance is tested using both the Grubbs test and stochastic simulations. For the first time, ultralow noise solid-state nanopore sensors are employed for the successful differentiation between bare DNA and p53/DNA complexes. Furthermore, translocation statistics reflect the binding affinities of different DNA sequences, in accordance with AFM data."

According to the news editors, the research concluded: "Our results thus highlight the potential of solid-state nanopore sensors for single-molecule biosensing, especially when labeling is either not possible or at least not a viable option."

The news editors report that additional information may be obtained by contacting P. Nuttall, Imperial College London, Dept. of Chemistry, Exhibition Road, London SW7 2AZ, UK. Additional authors for this research include K. Lee, P. Ciccarella, M. Carminati, G. Ferrari, K.B. Kim and T. Albrecht.

Findings from Imperial College Provides New Data on Sulfur Amino Acids (The Salmonella Effector SpvD Is a Cysteine Hydrolase with a Serovar-specific Polymorphism Influencing Catalytic Activity, Suppression of Immune Responses, and Bacterial ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Sulfur Amino Acids is the subject of a report. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Many bacterial pathogens secrete virulence (effector) proteins that interfere with immune signaling in their host. SpvD is a Salmonella enterica effector protein that we previously demonstrated to negatively regulate the NF-kappa B signaling pathway and promote virulence of S. enterica serovar Typhimurium in mice."

Our news editors obtained a quote from the research from Imperial College, "To shed light on the mechanistic basis for these observations, we determined the crystal structure of SpvD and show that it adopts a papa-in-like fold with a characteristic cysteine-histidine-aspartate catalytic triad comprising Cys-73, His-162, and Asp-182. SpvD possessed an in vitro deconjugative activity on aminoluciferin-linked peptide and protein substrates in vitro. A C73A mutation abolished SpvD activity, demonstrating that an intact catalytic triad is required for its function. Taken together, these results strongly suggest that SpvD is a cysteine protease. The amino acid sequence of SpvD is highly conserved across different S. enterica serovars, but residue 161, located close to the catalytic triad, is variable, with serovar Typhimurium SpvD having an arginine and serovar Enteritidis a glycine at this position. This variation affected hydrolytic activity of the enzyme on artificial substrates and can be explained by substrate accessibility to the active site. Interestingly, the SpvD(G161) variant more potently inhibited NF-kappa B-mediated immune responses in cells in vitro and increased virulence of serovar Typhimurium in mice."

According to the news editors, the research concluded: "In summary, our results explain the biochemical basis for the effect of virulence protein SpvD and demonstrate that a single amino acid polymorphism can affect the overall virulence of a bacterial pathogen in its host."

The news editors report that additional information may be obtained by contacting D.W. Holden, Imperial Coll London, Microbiol Sect, London SW7 2AZ, United Kingdom. Additional authors for this research include Y. Zhang, M. Przydacz, N. Rolhion, Y. Yang, J.N. Pruneda, D. Komander, D.W. Holden and S.A. Hare.

**Drugs and Therapies - Pharmaceutical Research**

**Findings from Imperial College in Pharmaceutical Research Reported**

*(ATR-FTIR spectroscopic imaging to study the drying and dissolution of pharmaceutical polymer-based films)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Pharmaceutical Research have been published. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "Pharmaceutical film dosage forms have recently become of interest to pharmaceutical formulation development, particularly for patients who experience difficulty in swallowing tablets or capsules. Furthermore, formulation scientists require a reliable analytical approach to reveal vital insight and investigate the drying process of these films to consolidate suitable quality control."

Our news journalists obtained a quote from the research from Imperial College, "Since most of the polymer-based films containing a drug are produced via solution or dispersion states, an estimation of the physicochemical properties of drugs during drying and dissolution is critical to design novel formulations with the consideration to control drug release, i.e. safety and efficacy to patients. This work presents the novel application of attenuated total reflection-Fourier transform infrared (ATR-FTIR) spectroscopic imaging to study the drying process and dissolution behaviour of polymer-based films. Two types of the ibuprofen containing films, hydroxypropyl methylcellulose (HPMC) based films for immediate release and polyvinylpyrrolidone (PVP) based films for extended release, were studied in modified pH environments and changing hydrophobicity. ATR-FTIR imaging has revealed important information on water ingress into the films and the presence, distribution, and physicochemical state of the drug."

According to the news editors, the research concluded: "ATR-FTIR imaging is a powerful technique to investigate and to deeply understand physicochemical processes for pharmaceutical polymer-based films."

For more information on this research see: ATR-FTIR spectroscopic imaging to study the drying and dissolution of pharmaceutical polymer-based films. *International Journal of Pharmaceutics*, 2016;515(1-2):57-68. *International Journal of Pharmaceutics* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Findings from Indian Institute of Science Provides New Data about Antibiotics (High Antibacterial Activity of Functionalized Chemically Exfoliated MoS2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news reporting from Bangalore, India, by NewsRx journalists, research stated, "In view of the implications of inherent resistance of pathogenic bacteria, especially ESKAPE pathogens toward most of the commercially available antibiotics and the importance of these bacteria-induced biofilm formation leading to chronic infection, it is important to develop new generation synthetic materials with greater efficacy toward antibacterial property. In addressing this issue, this paper reports a proof-of-principle study to evaluate the potential of functionalized two-dimensional chemically exfoliated MoS2 (ce-MoS2) toward inhibitory and bactericidal property against two representative ESKAPE pathogenic strain a Gram-positive Staphylococcus aureus (MRSA) and a Gram-negative Pseudomonas aeruginosa."

Financial supporters for this research include Council of Scientific and Industrial Research, Department of Biotechnology, Ministry of Science and Technology, Department of Science and Technology, Ministry of Science and Technology.

The news correspondents obtained a quote from the research from the Indian Institute of Science, "More significantly, the mechanistic study establishes a different extent of oxidative stress together with rapid membrane depolarization in contact with ce-MoS2 having ligands of varied charge and hydrophobicity. The implication of our results is discussed in the light of the lack of survivability of planktonic bacteria and biofilm destruction in vitro."

According to the news reporters, the research concluded: "A comparison with widely used small molecules and other nanomaterial-based therapeutics conclusively establishes a better efficacy of 2D ce-MoS2 as a new class of antibiotics."

Our news journalists report that additional information may be obtained by contacting M. De, Indian Inst Sci, Dept. of Organ Chem, Bangalore 560012, Karnataka, India. Additional authors for this research include S. Karunakaran, S.K. Boda, B. Basu and M. De.

Emergency Treatment

Findings from Indiana University in Emergency Treatment Reported (Being There: Inpatients' Perceptions Of Family Presence During Resuscitation And Invasive Cardiac Procedures)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Emergency Treatment have been published. According to news reporting from Muncie, Indiana, by NewsRx journalists, research stated, "Although patients' families want to be invited to the bedside of hospitalized loved ones during crisis events, little is known about patients' perceptions of family presence. To explore adult inpatients' perceptions of family presence during resuscitation, near-resuscitation, and unplanned invasive cardiac procedures shortly after the life-threatening event."

The news correspondents obtained a quote from the research from Indiana University, "In this qualitative study, data were collected by interviews at least 13 hours after a crisis event and before hospital discharge. Data were audio recorded, transcribed, and analyzed for themes. From the bedside interviews (N = 48), the over-arching theme of 'being there' was explained more specifically as 'being there is beneficial,' 'being there is hard,' 'families in the way,' and 'desire for control.' Most participants preferred family presence, although preferences varied with types of crisis events, patients' predictions of family members' responses, and the nature of family relationships. New perspectives emerged about patients' decision making related to family presence. This study extends existing knowledge about factors that influence the decision-making processes of hospitalized patients regarding family presence during a crisis event."

According to the news reporters, the research concluded: "Health care professionals can provide support as patients ponder difficult decisions about who to have present and can reduce patients' fears that families might interfere with the life-saving efforts."

For more information on this research see: Being There: Inpatients' Perceptions Of Family Presence During Resuscitation And Invasive Cardiac Procedures. American Journal of Critical Care, 2015;24(6):E108-E115. American Journal of Critical Care can be contacted at: Amer Assoc Critical Care Nurses, 101 Columbia, Aliso Viejo, CA 92656, USA.

Findings from Inonu University Provide New Insights into Glottic Cancer (Dosimetric comparison of helical tomotherapy, intensity-modulated radiation therapy, volumetric-modulated arc therapy, and 3-dimensional conformal therapy for the ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Glottic Cancer. According to news reporting originating in Malatya, Turkey, by NewsRx journalists, research stated, "Various radiotherapy planning methods for T1N0 laryngeal cancer have been proposed to decrease normal tissue toxicity. We compare helical tomotherapy (HT), linac-based intensity-modulated radiation therapy (IMRT), volumetric-modulated arc therapy (VMAT), and 3-D conformal radiotherapy (3D-CRT) techniques for T1N0 laryngeal cancer."

The news reporters obtained a quote from the research from Inonu University, "Overall, 10 patients with T1N0 laryngeal cancer were selected and evaluated. Furthermore, 10 radiotherapy treatment plans have been created for all 10 patients, including HT, IMRT, VMAT, and 3D-CRT. IMRT, VMAT, and HT plans vs 3D-CRT plans consistently provided superior planning target volume (PTV) coverage. Similar target coverage was observed between the 3 IMRT modalities. Compared with 3D-CRT, IMRT, HT, and VMAT significantly reduced the mean dose to the carotid arteries. VMAT resulted in the lowest mean dose to the submandibular and thyroid glands. Compared with 3D-CRT, IMRT, HT, and VMAT significantly increased the maximum dose to the spinal cord. It was observed that the 3 IMRT modalities studied showed superior target coverage with less variation between each plan in comparison with 3D-CRT. The 3D-CRT plans performed better at the Dmax of the spinal cord."

According to the news reporters, the research concluded: "Clinical investigation is warranted to determine if these treatment approaches would translate into a reduction in radiation therapy-induced toxicities."

For more information on this research see: Dosimetric comparison of helical tomotherapy, intensity-modulated radiation therapy, volumetric-modulated arc therapy, and 3-dimensional conformal therapy for the treatment of T1N0 glottic cancer. Medical Dosimetry, 2016;41(4):329-333. Medical Dosimetry can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Findings from Inova Fairfax Hospital Provide New Insights into Heart Transplants (Long-term outcomes of heart transplant recipients with hepatitis C positivity: the data from the US transplant registry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Transplant Medicine - Heart Transplants. According to news originating from Falls Church, Virginia, by NewsRx correspondents, research stated, "Chronic HCV infection is often considered a contraindication for receiving a heart transplantation. From the Scientific Registry of Transplant Recipients, we selected all adults with and without HCV infection who underwent a single-organ heart transplantation in 1995-2013; the mortality status was updated in September 2015."

Our news journalists obtained a quote from the research from Inova Fairfax Hospital, "A total of 32,812 heart transplant recipients were included; N=756 (2.30%) HCV positive. Post-transplant patients were discharged alive at similar rates regardless of their HCV status (P=.10). Despite this, mortality in HCV+ heart transplant recipients was consistently higher throughout post-discharge follow-up (P <.002). In multivariate survival analysis, being HCV+ was independently associated with a higher post-transplant mortality: adjusted hazard ratio 1.35 (1.16-1.56), P<.0001. Other predictors of lower post-transplant survival included being obese at transplant and pre-transplant history of comorbidities (type 2 diabetes, COPD, hypertension) (all P<.05). No association of HCV infection with graft loss rates or time to graft loss was found (all P>.23). Chronic hepatitis C infection is associated with a significantly increased post-transplant mortality in heart transplant recipients."

According to the news editors, the research concluded: "The introduction of new direct-acting antiviral agents may provide a treatment option for HCV pre-or post-heart transplantation which could have a positive impact on patients' survival."

The news correspondents report that additional information may be obtained from Z.M. Younossi, Inova Fairfax Hosp, Center Liver Dis, Dept. of Med, Falls Church, VA, United States. Additional authors for this research include T. Locklear, N. Rafiq, A. Mishra, C. Venkatesan and Z.M. Younossi.

Immunology - Mononuclear Phagocyte System

Findings from Insmed Inc. Update Knowledge of Mononuclear Phagocyte System (Pulmonary Deposition and Elimination of Liposomal Amikacin for Inhalation and Effect on Macrophage Function after Administration in Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immunology - Mononuclear Phagocyte System are discussed in a new report. According to news reporting out of Bridgewater, New Jersey, by NewsRx editors, research stated, "Pulmonary nontuberculous mycobacterial (PNTM) infections represent a treatment challenge. Liposomal amikacin for inhalation (LAI) is a novel formulation currently in development for the treatment of PNTM infections."

Our news journalists obtained a quote from the research from Insmed Inc., "The pulmonary deposition and elimination of LAI and its effect on macrophage function were evaluated in a series of preclinical studies in healthy rats. The pulmonary deposition of LAI was evaluated in female rats (n = 76) treated with LAI by nebulizer at 10 mg/kg of body weight per day or 90 mg/kg per day for 27 days, followed by dosing of dually labeled LAI (LAI with a lipid label plus an amikacin label) on day 28 with subsequent lung histological and amikacin analyses. In a separate study for assessment of alveolar macrophage function, rats (n = 180) received daily treatment with LAI at 90 mg/kg per day or 1.5% saline over three 30-day treatment periods followed by 30-day recovery periods; phagocytic and Saccharomyces cerevisiae (yeast) killing capabilities and inflammatory mediator release were assessed at the end of each period. LAI demonstrated equal dose-dependent deposition across all lung lobes and regions. Lipid and amikacin labels showed diffuse extracellular colocalization, followed by macrophage uptake and gradual amikacin elimination. Macrophages demonstrated accumulation of amikacin during treatment periods and nearly complete elimination during recovery periods. No evidence of an inflammatory response was seen. No differences in microsphere uptake or yeast killing were seen between LAI-treated and control macrophages. Neither LAI-treated nor control macrophages demonstrated constitutive inflammatory mediator release; however, both showed normal mediator release on lipopolysaccharide stimulation."

According to the news editors, the research concluded: "LAI is readily taken up by macrophages in healthy rats without compromising macrophage function."

For more information on this research see: Pulmonary Deposition and Elimination of Liposomal Amikacin for Inhalation and Effect on Macrophage Function after Administration in Rats. Antimicrobial Agents and Chemotherapy, 2016;60(11):6540-6549. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Findings from Institute Butantan Provide New Insights into Escherichia coli (Characterization of the universal stress protein F from atypical enteropathogenic Escherichia coli and its prevalence in Enterobacteriaceae)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gram-Negative Bacteria - Escherichia coli. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "Atypical enteropathogenic Escherichia coli (aEPEC) are heterogeneous strains in terms of serotypes, adherence patterns and the presence of novel virulence factors. This heterogeneity is intriguing, promoting studies trying to characterize these novel proteins and to better comprehend this pathotype group."

Our news journalists obtained a quote from the research from Institute Butantan, "In a previous study analyzing low-molecular mass proteomes of four representative aEPEC strains of three different adhesion phenotypes, we classified proteins according to their annotated function, with most of them being involved in metabolism and transport; while some of them were classified as hypothetical proteins. The majority of the hypothetical proteins were homologue products of genes identified in the genome of enterohemorrhagic E. coli. One of the hypothetical proteins was annotated as Z2335, with orthologue in EPEC, and by bioinformatics analysis, this protein was revealed to be the universal stress protein F (UspF). Thus, herein we successfully obtained a recombinant UspF protein from aEPEC, which is a alpha/beta, ATP-binding protein involved in stress response, with comparable protein production among the four studied strains, but showing noteworthy differences when cultivated in different stress conditions, also present in other enterobacterial species, such as Shigella sonnei and Citrobacter freundii."

According to the news editors, the research concluded: "Furthermore, our results confirm that the Usp protein superfamily encompasses a conserved group of proteins involved in stress resistance in aEPEC and other Enterobacteriaceae."

The news correspondents report that additional information may be obtained from R.M.F. Piazza, Inst Butantan, Lab Bacteriol, BR-05503900 Sao Paulo, SP, Brazil. Additional authors for this research include A.G. Torres, A. Caravelli, A. Silva, J.M. Polatto and R.M.F. Piazza.

Findings from Institute for Biochemistry Update Knowledge of Obesity
[Cardiac-Specific Down-Regulation of Carnitine Palmitoyltransferase-1b (CPT-1b) Prevents Cardiac Remodeling in Obese Mice]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "To determine whether inhibiting cardiac carnitine palmitoyltransferase-1b (CPT-1b) improves obesity-related cardiomyopathy. Four-week-old male C57BL/6J mice were fed with high-fat diet (HFD) for 12 weeks to induce obesity."

The news correspondents obtained a quote from the research from Institute for Biochemistry, "At 6 weeks of age, mice were subjected to intramyocardial injection with lentivirus to down-regulate the expression of either cardiac CPT-1b or green fluorescent protein. Morphological, biochemical, functional, histological, and ultrastructural profiles were assessed at 16 weeks of age. HFD administration elicited obesity, cardiac hypertrophy, and systolic dysfunction accompanied with altered biochemical parameters. In addition, HFD consumption promoted lipid accumulation and reactive oxygen species generation in cardiomyocytes and damaged myocardial ultrastructure. Cardiac CPT-1b silencing protected against HFD-induced cardiac remodeling by decreasing heart weight/tibial length ratio and increasing left ventricular ejection fraction and fractional shortening, as well as normalizing left ventricular diameter. Meanwhile, CPT-1b inhibition mitigated the changes in biochemical parameters, aggravated myocardial lipid accumulation, reduced intramyocardial reactive oxygen species production, and partly amended myocardial ultrastructural alterations in obese mice. Cardiac CPT-1b suppression protects against the aggravation of cardiac morphology and function associated with HFD feeding."

According to the news reporters, the research concluded: "CPT-1b represents a potential therapeutic target for the treatment of cardiac dysfunction related to metabolic diseases such as obesity and diabetes."

For more information on this research see: Cardiac-Specific Down-Regulation of Carnitine Palmitoyltransferase-1b (CPT-1b) Prevents Cardiac Remodeling in Obese Mice. Obesity, 2016;24(12):2533-2543. **Blood Diseases and Conditions - Sepsis**

**Findings from Institute for Cancer Research and Treatment (IRCCS) Broaden Understanding of Sepsis (Cardiac dysfunction and circulating cardiac markers during sepsis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Blood Diseases and Conditions - Sepsis are presented in a new report. According to news reporting out of Milan, Italy, by NewsRx editors, research stated, "Among several alterations affecting the cardiovascular system during severe sepsis or septic shock, myocardial depression has been pointed out with increasing attention over the last 30 years as a frequent and often misdiagnosed clinical condition. As expected, patients with cardiac dysfunction during sepsis have a worse prognosis than those without."

Our news journalists obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "In the present review, we will first discuss the etiology, pathophysiology, monitoring and clinical manifestations of cardiac dysfunction in patients with severe sepsis or septic shock. Thereafter, we will briefly present the evidence on the role of circulating biomarkers of cardiac function in the management of sepsis. Circulating cardiac biomarkers are becoming increasingly popular in cardiovascular diseases, as they are a simple and cost-effective tool for triage, diagnosis and prognosis. Their importance during sepsis is related to the development of complications due to an aging population with frequent co-morbidities and a scarce functional reserve. We will focus on two specific markers of cardiac origin: troponins, which reveal cardiac myocytes injury, and natriuretic peptides, as indicators of cardiac chambers wall stress and fluid homeostasis. The bulk of evidences accumulated so far on cardiac markers support their role as prognostic indicators, with marginal improvement in terms of accuracy, as compared to widely employed clinical scores."

According to the news editors, the research concluded: "Their potential to satisfy unmet needs in the daily care of septic patients is more appealing, in particular for monitoring the cardiovascular system during support therapy."

For more information on this research see: Cardiac dysfunction and circulating cardiac markers during sepsis. *Minerva Anestesiologica*, 2016;82(6):697-710. *Minerva Anestesiologica* can be contacted at: Edizioni Minerva Medica, Corso Bramante 83-85 Int Journals Dept., 10126 Turin, Italy.

**Clinical Research - Clinical Trials and Studies**

**Findings from Institute for Cancer Research and Treatment (IRCCS) Provides New Data about Clinical Trials and Studies (Brain and cognitive functions in two groups of naive HIV patients selected for a different plan of antiretroviral therapy: A ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news originating from Rome, Italy, by NewsRx correspondents, research stated, "Cortical sources of electroencephalographic (EEG) rhythms were investigated in two sub-populations of naive HIV subjects, grouped based on clinical criteria to receive different combination anti-retroviral therapies (cARTs). These EEG sources were hypothesized to reflect beneficial effects of both regimes."

Financial supporters for this research include Tosinvest Sanita, Fondazione SDN of Naples, Viiv Healthcare.

Our news journalists obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Eyes-closed resting state EEG data were collected in 19 (Group A) and 39 (Group B) naive HIV subjects at baseline (i.e. pre-treatment; T0) and after 5 months of cART (T5). Compared with the Group A, the Group B was characterized by slightly worse serological parameters and higher cardiovascular risk. At T0, mean viral load (VL) and CD4 count were 87,694 copies/ml and 435 cells/μl in the Group A and 187,370 copies/ml and 331 cells/μl in the Group B. The EEG data were also collected in 50 matched control HIV-negative subjects. Cortical EEG sources were assessed by LORETA software. Compared to the Control Group, the HIV Groups showed lower alpha (8-12 Hz) source activity at T0 while the Group B also exhibited higher delta source activity. The treatment partially normalized alpha and delta source activity in the Group A and B, respectively, in association with improved VL, CD4, and cognitive functions. Different cART regimens induced diverse beneficial effects in delta or alpha source activity in the two naive HIV Groups."

According to the news editors, the research concluded: "These sources might unveil different neurophysiological effects of diverse cART on brain function in naive HIV Groups as a function of clinical status and/or therapeutic compounds."

For more information on this research see: Brain and cognitive functions in two groups of naive HIV patients selected for a different plan of antiretroviral therapy: A qEEG study. *Clinical Neurophysiology*, 2016;127(11):3455-3469. *Clinical Neurophysiology* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Clinical Neurophysiology - www.journals.elsevier.com/clinical-neurophysiology/)

Findings from Institute for Cancer Research and Treatment (IRCCS) in the Area of Chemotherapy Described (Efficacy of adjuvant chemotherapy in early stage uterine leiomyosarcoma: A systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Chemotherapy is now available. According to news reporting originating in Milan, Italy, by NewsRx journalists, research stated, "We sought to review the current evidence in order to test the efficacy of adjuvant chemotherapy in improving disease-free survival in patients affected by early stage uterine leiomyosarcoma. On July 2016, literature was searched in order to identify trials comparing different postoperative adjuvant strategies for patients diagnosed with early stage uterine leiomyosarcoma."

The news reporters obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Our analysis included 360 patients: 145 (40%), 53 (15%), and 155 (43%) had chemotherapy (with or without radiotherapy), radiotherapy, and observation, respectively. Seven (2%) patients who had radiotherapy with or without chemotherapy were excluded from further analysis in order to reduce risk of biases. Administration of chemotherapy (with or without radiotherapy) did not improve outcomes in comparison to observation (OR: 0.79 (95%CI: 0.48, 1.29)), or radiotherapy (OR: 0.90 (95%CI: 0.42, 1.94)). Loco-regional recurrence rate was similar comparing patients undergoing chemotherapy (with or without radiotherapy) with having observation alone (OR: 0.84 (95%CI: 0.44, 1.60)). Similarly, pooled results suggested that chemotherapy administration did not affect distant recurrence rate in comparison to no chemotherapy (OR: 0.80 (95%CI: 0.50, 1.28)), and observation alone (OR: 0.99 (95%CI: 0.60, 1.64)). However, patients undergoing chemotherapy (with or without radiotherapy) experienced a trend towards lower risk of developing distant recurrences (OR: 0.49 (95%CI: 024,1.03)) and a higher risk of developing loco-regional recurrences (OR: 3.45 (95%CI: 1.02, 11.73)) than patients undergoing radiotherapy. In early stage uterine leiomyosarcoma, the role of adjuvant chemotherapy remains unclear."

According to the news reporters, the research concluded: "Owing to the high recurrence rate, even in the early stage of disease, further innovative therapeutic strategies have to be tested."

For more information on this research see: Efficacy of adjuvant chemotherapy in early stage uterine leiomyosarcoma: A systematic review and meta-analysis. Gynecologic Oncology, 2016;143(2):443-447. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Gynecologic Oncology - www.journals.elsevier.com/gynecologic-oncology/)
Oncology - Squamous Cell Carcinoma

Findings from Institute for Cancer Research and Treatment (IRCCS) in the Area of Squamous Cell Carcinoma Described (Phase II clinical study of valproic acid plus cisplatin and cetuximab in recurrent and/or metastatic squamous cell carcinoma of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Squamous Cell Carcinoma. According to news reporting from Naples, Italy, by NewsRx journalists, research stated, "Recurrent/metastatic squamous cell carcinoma of the head and neck (SCCHN) has a poor prognosis and the combination of cisplatin and cetuximab, with or without 5-fluorouracil, is the gold standard treatment in this stage. Thus, the concomitant use of novel compounds represents a critical strategy to improve treatment results."

The news correspondents obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Histone deacetylase inhibitors (HDACi) enhance the activity of several anticancer drugs including cisplatin and anti-Epidermal Growth Factor Receptor (anti-EGFR) compounds. Preclinical studies in models have shown that vorinostat is able to down regulate Epidermal Growth Factor Receptor (EGFR) expression and to revert epithelial to mesenchimal transition (EMT). Due to its histone deacetylase (HDAC) inhibiting activity and its safe use as a chronic therapy for epileptic disorders, valproic acid (VPA) has been considered a good candidate for anticancer therapy. A reasonable option may be to employ the combination of cisplatin, cetuximab and VPA in recurrent/metastatic SCCHN taking advantage of the possible positive interaction between histone deacetylase inhibitors, cisplatin and/or anti-EGFR. Method/Design: V-CHANCE is a phase 2 clinical trial evaluating, in patients with recurrent/metastatic squamous cell carcinoma of the head and neck never treated with first-line chemotherapy, the concomitant standard administration of cisplatin (on day 1, every 3 weeks) and cetuximab (on day 1, weekly), in combination with oral VPA given daily from day -14 with a titration strategy in each patient (target serum level of 50-100 μg/ml). Primary end point is the objective response rate measured according to Response Evaluation Criteria in Solid Tumors (RECIST). Sample size, calculated according to Simon 2 stage minimax design will include 21 patients in the first stage with upper limit for rejection being 8 responses, and 39 patients in the second stage, with upper limit for rejection being 18 responses. Secondary
Endpoints are time to progression, duration of response, overall survival, safety. Objectives of the translational study are the evaluation on tumor samples of markers of treatment efficacy/resistance (i.e., H2AX, p21/WAF, RAD51, XRCC1, EGFR, p-EGFR, Ki-67) and specific markers of VPA HDAC inhibitory activity (histones and proteins acetylation, Histone deacetylase isoforms) as well as valproate test, histones and proteins acetylation of peripheral blood mononuclear cell, tested on blood samples at baseline and at different time points during treatment. Overall, this study could provide a less toxic and more effective first-line chemotherapy regimen in patients with recurrent/metastatic squamous cell carcinoma of the head and neck by demonstrating the feasibility and efficacy of cisplatin/cetuximab plus valproic acid.

According to the news reporters, the research concluded: "Moreover, correlative studies could help to identify responder patients, and will add insights in the mechanism of the synergistic interaction between these agents."

For more information on this research see: Phase II clinical study of valproic acid plus cisplatin and cetuximab in recurrent and/or metastatic squamous cell carcinoma of Head and Neck-V-CHANCE trial. correspondents, research stated, "Botulinum neurotoxins (BoNT) are the most toxic substances known, and their neurotoxic properties and paralysing effects are exploited for medical treatment of a wide spectrum of disorders. To accurately quantify the potency of a pharmaceutical BoNT preparation, its physiological key activities (binding to membrane receptor, translocation, and proteolytic degradation of SNARE proteins) need to be determined."

Financial support for this research came from 3R Foundation Switzerland.

Our news editors obtained a quote from the research from Institute for Food Research, "To date, this was only possible using animal models, or, to a limited extent, cell-based assays. We here report a novel in vitro system for BoNT/B analysis, based on nerve-cell mimicking liposomes presenting motoneuronal membrane receptors required for BoNT binding. Following triggered membrane translocation of the toxin's Light Chain, the endopeptidase activity can be quantitatively monitored employing a FRET-based reporter assay within the functionalized liposomes."

According to the news editors, the research concluded: "We were able to detect BoNT/B physiological activity at picomolar concentrations in short time, opening the possibility for future replacement of animal experimentation in pharmaceutical BoNT testing."

The news editors report that additional information may be obtained by contacting O.G. Weingart, ETH, Inst Food Nutr & Hlth, CH-8092 Zurich, Switzerland.

Cardiovascular Diseases

Findings from Institute for Health Research Provide New Insights into Cardiovascular Diseases [Association between a dietary carbohydrate index and cardiovascular disease in the SUN (Seguimiento Universidad de Navarra) Project]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases is the subject of a report. According to news originating from Pamplona, Spain, by NewsRx correspondents, research stated, "Beyond the quantity of carbohydrate intake, further research is needed to know the relevance of carbohydrate quality following operational indices. No previous longitudinal study has assessed the association between an index for quality of dietary carbohydrate intake and the
risk of cardiovascular disease (CVD)."

Our news journalists obtained a quote from the research from Institute for Health Research, "Here, we examined the association between a carbohydrate quality index (CQI) and the risk of CVD. We used a validated semi-quantitative 136-item food-frequency questionnaire (FFQ) in a prospective follow-up study of 17,424 middle-aged adults from Spain. The CQI was defined by four criteria: dietary fiber intake, glycemic index, whole-grain/total-grain carbohydrate ratio, and solid/total carbohydrate ratio. We observed 129 incident cases of CVD during 10.1 y of median follow-up. An inverse association for CQI was found (hazard ratio = 0.44, 95% confidence interval (CI): 0.25-0.78 for the highest versus the lowest tertile, p for trend = 0.008). Participants in the highest tertile of the whole-grain/total-grain carbohydrate ratio had 47% lower risk of CVD (95% CI: 0.33-0.85, p for trend = 0.008). Participants with higher baseline CQI and higher baseline energy from carbohydrates had the lowest risk of CVD. In this Mediterranean cohort, a better quality of dietary carbohydrates measured by the CQI, showed a significant inverse association with the incidence of CVD."

According to the news editors, the research concluded: "Specially, a higher proportion of carbohydrates from whole grains was strongly inversely associated with CVD. 'Heart-healthy' diets should be focused not only on carbohydrate quantity but also on a multidimensional assessment of the type and quality of carbohydrates."

For more information on this research see: Association between a dietary carbohydrate index and cardiovascular disease in the SUN (Seguimiento Universidad de Navarra) Project. Nutrition Metabolism and Cardiovascular Diseases, 2016;26(11):1048-1056. Nutrition Metabolism and Cardiovascular Diseases can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England.

The news correspondents report that additional information may be obtained from M.A. Martinez-Gonzalez, Navarra Inst Hlth Res IdiSN A, Pamplona, Spain. Additional authors for this research include S. Santiago, A. Gea, M. Ruiz-Canela, S. Carlos, M. Bes-Rastrollo and M.A. Martinez-Gonzalez.

Oncology - Liver Cancer

Findings from Institute for Medical Research Yields New Findings on Liver Cancer (Liver Fibrosis and Body Mass Index Predict Hepatocarcinogenesis following Eradication of Hepatitis C Virus RNA by Direct-Acting Antivirals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Liver Cancer. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Predictive factors for hepatocarcinogenesis following eradication of hepatitis C virus (HCV) RNA by antiviral therapy with direct-acting antivirals are unknown. Especially the impact of treatment with or
without interferon on hepatocarcinogenesis is not clear."

The news correspondents obtained a quote from the research from Institute for Medical Research, "A total of 958 patients with HCV genotype 1-related chronic liver disease and a sustained virological response defined as negative HCV RNA 24 weeks after cessation of antiviral therapy with direct-acting antivirals (triple therapy of NS3/4A protease inhibitor/peginterferon/ribavirin or all-oral combination therapy with NS3/4A protease inhibitor plus NS5A inhibitor) were included in a retrospective study. None of the patients had hepatocellular carcinoma before and during antiviral therapy. In all, 14 patients developed hepatocellular carcinoma during follow-up, and the development rate per 1,000 person-years was 7.35. The cumulative hepatocarcinogenesis rates were 4.2 and 4.2% at the end of 5 and 7 years, respectively. Multivariate analysis identified fibrosis 4 (FIB4) index (≥ 2.7) and body mass index (≥ 23.0) as determinants of hepatocarcinogenesis, but they did not identify the treatment regimen. In patients with a FIB4 index the hepatocarcinogenesis rates with the interferon regimen were not different from those for the regimen without interferon, regardless of gender."

According to the news reporters, the research concluded: "Liver fibrosis and body mass index, but not treatment regimen, are important predictors of hepatocarcinogenesis following eradication of HCV RNA by direct-acting antivirals."

For more information on this research see: Liver Fibrosis and Body Mass Index Predict Hepatocarcinogenesis following Eradication of Hepatitis C Virus RNA by Direct-Acting Antivirals. *Oncology*, 2016;91(6):341-347. *Oncology* can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. **Biotechnology - Liposomes**

**Findings from Institute for Physical Chemistry Provide New Insights into Liposomes (Platinum-carbon electrocatalytic composites via liposome-directed electrodeposition at conductive diamond)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Biotechnology - Liposomes are discussed in a new report. According to news originating from Bucharest, Romania, by NewsRx correspondents, research stated, "A Pt precursor was entrapped in phosphatidylcholine-cholesterol vesicles and the liposomal suspension was used for direct electrodeposition of a Pt-based catalyst on boron doped diamond (BDD). The average size of the deposited particles (ca. 15 to ca. 40 nm) is closely related to that of the liposomes and Pt particles are partially embedded into a carbonaceous matrix."

Our news journalists obtained a quote from the research from Institute for Physical Chemistry, "Methanol anodic oxidation was used for gauging the electrocatalytic activity of the composites and it was found that the electrodeposition with prior adsorption of the liposomes enables more efficient use of platinum. Without preliminary adsorption, a much higher resistance to fouling was observed for the electrocatalyst This behavior was ascribed to the presence on the electrodes surface of PtO2 and of a higher amount of oxygenated carbon states."

According to the news editors, the research concluded: "These species act as oxygen donors contributing to an easier eviction of the adsorbed CO, thus partially regenerating active sites from the electrocatalyst surface."

The news correspondents report that additional information may be obtained from T. Spataru, Inst Phys Chem Ilie Murgulescu, Bucharest 060021, Romania. Additional authors for this research include T. Spataru, L. Preda, M. Anastasescu, P. Osiceanu, C. Munteanu, R.D. Baratou, A.A. Iovescu and N. Spataru.

**Immune System Diseases and Conditions - HIV/AIDS**

**Findings from Institute for Tropical Medicine Has Provided New Data on HIV/AIDS (Sensitivity and specificity of dried blood spots for HIV-1 viral load quantification A laboratory assessment of 3 commercial assays)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news reporting out of Antwerp, Belgium, by NewsRx editors, research stated, "The use of dried blood spots (DOS) instead of plasma as a specimen type for HIV-1 viral load (VL) testing facilitates the decentralization of specimen collection and can increase access to VL testing in resource-limited settings. The performance of DBS for VL testing is lower, however, when compared to the gold standard sample type plasma."

Our news journalists obtained a quote from the research from Institute for Tropical Medicine, "In this diagnostic accuracy study, we evaluated 3 VL assays with DDS. Participants were recruited between August 2012 and April 2015. Both plasma and DBS specimens were..."
prepared and tested for HIV-1 VL with the Roche CAP/CTM HIV-1 test v2.0, the Abbott RealTime HIV-1, and the bioMerieux NucliSENS EasyQ HIV-1 v2.0. Sensitivity and specificity to detect treatment failure at a threshold of 1000 cps/mL with DBS were determined. A total of 272 HIV-positive patients and 51 HIV-negative people were recruited in the study. The mean difference or bias between plasma and DOS VL was <0.5 log cps/mL with all 3 assays but > 25% of the specimens differed by >0.5 log cps/mL. All 3 assays had comparable sensitivities around 80% and specificities around 90%. Upward misclassification rates were around 10%. but downward misclassification rates ranged from 20.3% to 23.6%. Differences in between assays were not statistically significant (P > 0.1). The 3 VL assays evaluated had suboptimal performance with DBS but still performed better than immunological or clinical monitoring. Even after the introduction of the much-anticipated point-of-care VL devices, it is expected that DBS will remain important as a complementary option for supporting access to VL monitoring, particularly in rural, resource-limited settings."

According to the news editors, the research concluded: "Manufacturers should accelerate efforts to develop more reliable, sensitive and specific methods to test VL on DOS specimens."

For more information on this research see: Sensitivity and specificity of dried blood spots for HIV-1 viral load quantification A laboratory assessment of 3 commercial assays. Medicine, 2016;95(48):144-147. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Oncology - Melanoma

Findings from Institute of Biomedical Chemistry in the Area of Melanoma Reported (Bringing Down Cancer Aircraft: Searching for Essential Hypomutated Proteins in Skin Melanoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Melanoma is the subject of a report. According to news originating from Moscow, Russia, by NewsRx correspondents, research stated, "We propose an approach to detection of essential genes/proteins required for cancer cell survival. A gene is considered essential if a mutation with high impact upon the function of encoded protein causes death of the cancer cell."

Our news journalists obtained a quote from the research from the Institute of Biomedical Chemistry, "We draw an analogy between essential cancer proteins and well-known Abraham Wald's work on estimating the plane critical areas using data on survivability of
aircraft encountering enemy fire. Wald reasoned that parts with no bullet holes on the airplanes returned to the airbase from a combat flight are the most crucial ones for the airplane functioning: a hit in one of these parts downs an airplane, so it does not return back for the survey. We have envisaged that the airplane surface is a cancer genome and the bullets are somatic mutations with high impact upon protein function. Similarly we propose that genes specifically essential for tumor cell survival should carry less high-impact mutations in cancer cells compared to polymorphisms found in normal cells. We used data on mutations from the Cancer Genome Atlas and polymorphisms found in healthy humans (from 1000 Genomes Project) to predict 91 protein-coding genes essential for melanoma. These genes were selected according to several criteria, including negative selection, expression in melanocytes and decrease in the proportion of high-impact mutations in cancer compared with normal cells. The Gene Ontology analysis revealed enrichment of essential proteins related to membrane and cell periphery. We speculate that this could be a sign of immune system-driven negative selection of cancer neo-antigens. Another finding is the overrepresentation of semaphorin receptors, which can mediate distinctive signaling cascades and are involved in various aspects of tumor development. Cytokine receptors CCR5 and CXCR1 were also identified as cancer essential proteins and this is confirmed by other studies. Overall, our goal was to illustrate the idea of detecting proteins whose sequence integrity and functioning is important for cancer cell survival."

According to the news editors, the research concluded: "Hopefully, this prediction of essential cancer proteins may point to new targets for anti-tumor therapies."

The news correspondents report that additional information may be obtained from M. Pyatnitskiy, Institute of Biomedical Chemistry, 119121, Pogodinskaya str, 10, Moscow, Russia. Additional authors for this research include D. Karpov, E. Poverennaya, A. Lisitsa and S. Moshkovskii.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1371/journal.pone.0142819. This DOI is a link to an online electronic document that is either free or for purchase.

Proteins - Lectins

Findings from Institute of Biomedicine in the Area of Lectins Described (Lactose-Functionalized Gold Nanorods for Sensitive and Rapid Serological Diagnosis of Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Lectins. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Timely and accurate diagnosis of cancer is crucial to cancer treatment. However, serological diagnosis of cancer still faces great challenge because the conventional methodology based on
the enzyme-linked immune sorbent assay (ELISA) is costly, time-consuming, and complicated, involving multiple steps."

Funders for this research include Research Grants Council, University Grants Committee, Hong Kong, City University of Hong Kong, National Natural Science Foundation of China, Shenzhen Science and Technology Innovation Committee, Guangdong Province.

Our news journalists obtained a quote from the research from the Institute of Biomedicine, "Herein, lactose-functionalized gold nanorods (Lac-GNRs) are fabricated as efficient biosensors to detect cancerous conditions based on the unique surface plasmon resonance properties of GNRs and high specificity of lactose to the galectin-1 cancer biomarker. A trace concentration of galectin-1 as small as 10(-13) M can be detected by Lac-GNRs. The comparative study among BSA, galectin-3, and galectin-1 demonstrates the good specificity of Lac-GNRs to galectin-1 either in aqueous solutions or in the complex and heterogeneous serum specimens. Clinical tests show that the Lac-GNRs biosensors can readily distinguish the serums of cancer patients from those of healthy persons simply by using a microplate reader or even direct visual observation."

According to the news editors, the research concluded: "The Lac-GNRs biosensing platform is highly efficient and easy to use and have great potential in rapid screening of cancer patients."

Our news journalists report that additional information may be obtained by contacting Y. Zhao, Institute of Biomedicine and Biotechnology, Shenzhen Institutes of Advanced Technology, Chinese Academy of Sciences, Shenzhen 518055, Guangdong, People's Republic of China. Additional authors for this research include L. Tong, Y. Li, H. Pan, W. Zhang, M. Guan, W. Li, Y. Chen, Q. Li, Z. Li, H. Wang, X.F. Yu and P.K Chu.

**Neurodegenerative Diseases and Conditions -...**

**Findings from Institute of Biophysics Provide New Insights into Alzheimer Disease (Vps35-dependent recycling of Trem2 regulates microglial function)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Triggering receptor expressed on myeloid cells 2 (Trem2), an immune-modulatory receptor, is preferentially expressed in microglia of central nervous
system. Trem2 might be involved in the development of Alzheimer's disease (AD) through regulating the inflammatory responses and phagocytosis of microglia."

Our news journalists obtained a quote from the research from the Institute of Biophysics, "However, the intracellular trafficking of Trem2 remains unclear. In this study, we showed that Trem2 in the plasma membrane underwent endocytosis and recycling. Trem2 is internalized in a clathrin-dependent manner and then recycled back to the plasma membrane through vacuolar protein sorting 35 (Vps35), the key component of cargo recognition core of retromer complex, but not Rab11. When Vps35 is knocked down, Trem2 accumulated in the lysosomes but was not degraded. More importantly, Vps35 deficiency leads to excessive lipopolysaccharide (LPS)-induced inducible nitric oxide synthase (iNOS) expression and IL-6 production, which can be abolished by Trem2 overexpression. Furthermore, R47H Trem2, an AD-associated mutant, failed to interact with Vps35 and became unstable compared with wild-type Trem2."

According to the news editors, the research concluded: "Our study suggests that Vps35/retromer is responsible for recycling of Trem2 in the regulation of microglial function such as proinflammatory responses, whereas R47H mutation impairs Trem2 trafficking, which might contribute to AD."

Our news journalists report that additional information may be obtained by contacting S.Q. Zhao, Chinese Academy Sci, Inst Biophys, State Key Lab Brain & Cognit Sci, Beijing 100101, People's Republic of China. Additional authors for this research include X.C. Liu, Q. He, L.J. Zhou, Z.Q. Yuan and S.Q. Zhao.

Skin Diseases and Conditions - Actinic Keratosis

Findings from Institute of Cancer in the Area of Actinic Keratosis Reported (Pigmentation-Independent Susceptibility Loci for Actinic Keratosis Highlighted by Compound Heterozygosity Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Skin Diseases and Conditions - Actinic Keratosis. According to news reporting originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "Actinic keratosis (AK) is a skin disease frequently found in European elderly, and it represents the precursor of cutaneous squamous cell carcinoma. Our recent genome-wide association study highlighted DNA variants in two pigmentation genes, IRF4 and MC1R, that confer AK risk in Europeans."

Our news editors obtained a quote from the research from the Institute of Cancer, "Here, we performed a genome-wide search for relaxed forms of compound heterozygosity in association with AK using our recently developed software CollapsABEL. In a discovery dataset
of 3,193 Dutch Europeans, a total of 15 genetic loci showed genome-wide significant
association with AK (P < 1.25 x 10(-10)). Of those, three loci (6p21.2, 6p12.2, and 6q13) were
confirmed in a replication dataset that included 624 additional Dutch Europeans (P < 0.05).
These replicated loci harbored six genes (KCNK5/KCNK17, PAQR8/GSTA2, and
KCNQ5/KHDC1), none of them known to be involved in pigmentation. A candidate compound
heterozygosity analysis for 12 pigmentation loci highlighted SLC24A4 at 14q32.12 as showing
significant association with AK (P = 8.83 x 10(-9)). The four significantly AK-associated
compound heterozygosity single-nucleotide polymorphism pairs together explained 4.37% of
the total AK variation, which was 2.62 times greater than the two top-associated individual
single nucleotide polymorphisms together (1.67%) identified in the previous conventional
genome-wide association study.

According to the news editors, the research concluded: "CollapsABEL showed
compound heterozygosity in non-pigmentation-and pigmentation-related loci conferring genetic
risk of AK."

For more information on this research see: Pigmentation-Independent Susceptibility
Loci for Actinic Keratosis Highlighted by Compound Heterozygosity Analysis. Journal of
Investigative Dermatology, 2017;137(1):77-84. Journal of Investigative Dermatology can be

Drugs and Therapies - Pharmacology

Findings from Institute of Cardiovascular Sciences Broaden
Understanding of Pharmacology (Effect of Dexmedetomidine on Normal
Coronary Vessel Diameter)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Researchers detail new data in Drugs and Therapies - Pharmacology.
According to news reporting from Bangalore, India, by NewsRx journalists, research stated,
"Dexmedetomidine is a selective alpha2 agonist, which is widely used for conscious sedation in
ICU patients. It is being increasingly used to provide conscious sedation in out-of-theatre
procedures like CT scan, MRI, endoscopies and catheterization (cath) procedures."

The news correspondents obtained a quote from the research from the Institute of
Cardiovascular Sciences, "There is limited data till date regarding the effect of
dexmedetomidine on coronary vessel diameter. The aim of this prospective observational study was to observe the effect of dexmedetomidine on normal coronary vessel diameter. Fifty patients who had come for elective coronary angiography in the cath lab were enrolled in the study. After taking the first shot of the coronary angiogram and confirming that the right coronary artery (RCA) is normal, dexmedetomidine was administered in a dose of 1 μg/kg intravenously over 15 min. Immediately after that, another shot was taken to check the diameter of RCA. Paired Student's t test was used to analyze the data. The mean diameter of RCA before giving dexmedetomidine was 2.7634 ± 0.3189 mm. The mean diameter decreased significantly to 2.6296 ± 0.3379 mm after administration of dexmedetomidine (p value <0.0001)."

According to the news reporters, the research concluded: "Thus, dexmedetomidine decreases the coronary vessel diameter."

Our news journalists report that additional information may be obtained by contacting T.S. Kundra, Sri Jayadeva Inst Cardiovasc Sci & Res, Dept. of Anaesthesia, Bangalore, Karnataka, India.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000447746. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Brugada Syndrome

Findings from Institute of Cardiovascular Sciences Provide New Insights into Brugada Syndrome (Suicidal Zinc Phosphide Poisoning Unmasking Brugada Syndrome and Triggering Near Fatal Ventricular Arrhythmia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Brugada Syndrome. According to news reporting originating from Bangalore, India, by NewsRx correspondents, research stated, "Brugada syndrome (BrS) is an inherited channelopathy associated with increased incidence of ventricular arrhythmias and has many acquired triggers. Zinc phosphide (ZnP) is a rodenticide and is commonly implicated in suicidal poison ingestion."

Our news editors obtained a quote from the research from the Institute of Cardiovascular Sciences, "ZnP poisoning can cause myocardial toxicity and death. We report a case of ZnP poisoning that triggered a type I Brugada pattern and ventricular fibrillation in a 67-year-old male. He had no other features of toxicity and recovered later."

According to the news editors, the research concluded: "As metal phosphide is the commonest toxin involved in suicidal poisoning in India and BrS being endemic here, this case
highlights an important clinical problem."

The news editors report that additional information may be obtained by contacting M.A. Prabhu, Dept. of Cardiology, Electrophysiology Unit, Sri Jayadeva Institute of Cardiovascular Sciences and Research, Bangalore, India. Additional authors for this research include R. Agustinus and J. Shenthar.

**Inflammation**

**Findings from Institute of Clinical and Experimental Medicine in the Area of Inflammation Described (Identification Of Gene Transcripts Implicated In Peritoneal Membrane Alterations)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Inflammation are discussed in a new report. According to news reporting from Prague, Czech Republic, by NewsRx journalists, research stated, "Permanent stimulation of the peritoneum during peritoneal dialysis (PD) is likely to result in increased expression of genes encoding proteins involved in inflammation and tissue remodeling. Peritoneal fibrosis and neoangiogenesis may develop."

The news correspondents obtained a quote from the research from the Institute of Clinical and Experimental Medicine, "To assess highly expressed genes potentially involved in peritoneal alterations during PD treatment using an animal model. A PD catheter was implanted in 36 male Wistar rats after 70% nephrectomy. The rats were divided into 3 groups, exposed to dialysis solution for 8 weeks, and sacrificed 2 weeks later. Group B was exposed to a buffer, group D was exposed to a 3.86% glucose-based dialysis solution, and in group D+H, a second hit of intraperitoneal blood on top of the dialysis solution was given to induce the development of peritoneal sclerosis. Before sacrifice, peritoneal function was assessed. Omental tissue was obtained for analysis of gene expression using RT-qPCR. Fibrosis scores, vessel counts, and peritoneal function parameters were not different between the groups. Genes involved in the transforming growth factor beta signaling pathway, cell proliferation, angiogenesis, and inflammation were more expressed (p < 0.05) in the D+H group. Almost no differences were found between the control groups. We identified 4 genes that were related to peritoneal transport."

According to the news reporters, the research concluded: "Already a mid-term peritoneal exposure, when no microscopical and functional alterations are present, provokes activation of gene pathways of cell proliferation, fibrosis, neoangiogenesis, and inflammation."

Our news journalists report that additional information may be obtained by contacting A. Parikova, Inst Clin & Expt Med, Transplant Center, Dept. of Nephrol, Prague, Czech Republic. Additional authors for this research include A. Vlijm, I. Brabcova, M. de Graaff, D.G. Struijk, O. Viklicky and R.T. Krediet.

**Liver Diseases and Conditions - Liver Failure**

**Findings from Institute of Liver and Biliary Sciences in Liver Failure Provides New Insights (Acute-on-chronic liver failure: terminology, mechanisms and management)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Liver Failure have been published. According to news reporting originating in New Delhi, India, by NewsRx journalists, research stated, "Acute-on-chronic liver failure (ACLF) is a distinct clinical entity and differs from acute liver failure and decompensated cirrhosis in timing, presence of acute precipitant, course of disease and potential for unaided recovery. The definition involves outlining the acute and chronic insults to include a homogenous patient group with liver failure and an expected outcome in a specific timeframe."

The news reporters obtained a quote from the research from the Institute of Liver and Biliary Sciences, "The pathophysiology of ACLF relates to persistent inflammation, immune dysregulation with initial wide-spread immune activation, a state of systematic inflammatory response syndrome and subsequent sepsis due to immune paresis. The disease severity and outcome can be predicted by both hepatic and extrahepatic organ failure(s). Clinical recovery is expected with the use of nucleoside analogues for hepatitis B, and steroids for severe alcoholic hepatitis and, possibly, severe autoimmune hepatitis. Artificial liver support systems help remove toxins and metabolites and serve as a bridge therapy before liver transplantation. Hepatic regeneration during ongoing liver failure, although challenging, is possible through the use of growth factors. Liver transplantation remains the definitive treatment with a good outcome."

According to the news reporters, the research concluded: "Pre-emptive antiviral agents for hepatitis B before chemotherapy to prevent viral reactivation and caution in using potentially hepatotoxic drugs can prevent the development of ACLF."

For more information on this research see: Acute-on-chronic liver failure: terminology, mechanisms and management. *Nature Reviews Gastroenterology & Hepatology,*
Findings from Institute of Ophthalmology Broaden Understanding of Human Genetics (Mutations in CPAMD8 Cause a Unique Form of Autosomal-Recessive Anterior Segment Dysgenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics - Human Genetics is now available. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Anterior segment dysgeneses (ASDs) comprise a spectrum of developmental disorders affecting the anterior segment of the eye. Here, we describe three unrelated families affected by a previously unclassified form of ASD."

Funders for this research include National Institute for Health Research (NIHR) Biomedical Research Centre (BRC) at Moorfields Eye Hospital NHS Foundation Trust and UCL Institute of Ophthalmology, Rosetrees Trust, Moorfields Eye Charity, NIHR BRC at Great Ormond Street Hospital, Great Ormond Street Hospital Charity, MRC/Wellcome Trust Human Developmental Biology Resource.

Our news journalists obtained a quote from the research from the Institute of Ophthalmology, "Shared ocular manifestations include bilateral iris hypoplasia, ectopia lentis, corectopia, ectropion uveae, and cataracts. Whole-exome sequencing and targeted Sanger sequencing identified mutations in CPAMD8 (C3 and PZP-like alpha-2-macroglobulin domain-containing protein 8) as the cause of recessive ASD in all three families. A homozygous missense mutation in the evolutionarily conserved alpha-2-macroglobulin (A2M) domain of CPAMD8, c.4351T >C (p.Ser1451Pro), was identified in family 1. In family 2, compound heterozygous frameshift, c.2352_2353insC (p.Arg785Glnfs*23), and splice-site, c.4549-1G >A, mutations were identified. Two affected siblings in the third family were compound heterozygous for splice-site mutations c.700_1G >T and c.4002_1G >A. CPAMD8 splice-site mutations caused aberrant pre-mRNA splicing in vivo or in vitro. Intriguingly, our phylogenetic analysis revealed rodent lineage-specific CPAMD8 deletion, precluding a developmental expression study in mice. We therefore investigated the spatiotemporal expression of CPAMD8 in the developing human eye. RT-PCR and in situ hybridization revealed CPAMD8 expression in the lens, iris, cornea, and retina early in development, including strong expression in the distal
tips of the retinal neuroepithelium that form the iris and ciliary body, thus correlating CPAMD8 expression with the affected tissues."

According to the news editors, the research concluded: "Our study delineates a unique form of recessive ASD and defines a role for CPAMD8, a protein of unknown function, in anterior segment development, implying another pathway for the pathogenicity of ASD."

**Drugs and Therapies - BCR-ABL Tyrosine Kinase…**

**Findings from Institute of Pediatrics Broaden Understanding of BCR-ABL Tyrosine Kinase Inhibitors (Field-assisted paper spray mass spectrometry for the quantitative evaluation of imatinib levels in plasma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - BCR-ABL Tyrosine Kinase Inhibitors are discussed in a new report. According to news reporting from Padua, Italy, by NewsRx journalists, research stated, "Drug levels in patients' bloodstreams vary among individuals and consequently therapeutic drug monitoring (TDM) is fundamental to controlling the effective therapeutic range. For TDM purposes, different analytical approaches have been used, mainly based on immunoassay, liquid chromatography-ultraviolet, liquid chromatography-mass spectrometry and liquid chromatography-tandem mass spectrometry (LC-MS/MS) methods."

The news correspondents obtained a quote from the research from the Institute of Pediatrics, "More recently a matrix-assisted laser desorption/ionisation method has been proposed for the determination of irinotecan levels in the plasma of subjects under therapy and this method has been cross-validated by comparison with data achieved by LC-MS/MS. However, to reach an effective point-of-care monitoring of plasma drug concentrations, a TDM platform technology for fast, accurate, low-cost assays is required. In this frame, recently the use of paper spray mass spectrometry, which is becoming a popular and widely employed MS
method, has been proposed. In this paper we report the results obtained by the development of a paper spray-based method for quantitative analysis in plasma samples of imatinib, a new generation of anticancer drug. Preliminary experiments showed that poor sensitivity, reproducibility and linear response were obtained by the 'classical' paper spray set-up. In order to achieve better results, it was thought of interest to operate in presence of a higher and more homogeneous electrical field. For this aim, a stainless steel needle connected with the high voltage power supply was mounted below the paper triangle. Furthermore, in order to obtain valid quantitative data, we analysed the role of the different equilibria participating to the phenomena occurring in paper spray experiments, depending either on instrumental parameters or on the chemical nature of analyte and solvents. A calibration curve was obtained by spiking plasma samples containing different amounts of imatinib (1) with known amounts of deuterated imatinib (1(d3)) as internal standard, with molar ratios [1]/[1(d3)] in the range 0.00-2.00.

According to the news reporters, the research concluded: "A quite good linearity was obtained (R-2 = 0.975) and some experiments performed on spiked plasma samples with known amounts of 1 confirmed the validity of this method."

Our news journalists report that additional information may be obtained by contacting P. Traldi, Inst Paediat Res Citta Speranza, Nanoinspired Biomed Lab, I-35127 Padua, Italy. Additional authors for this research include E. Calandra, S. Crotti, G. Toffoli, E. Marangon, B. Posocco, P. Traldi and M. Agostini.

The news reporters obtained a quote from the research from the Institute of Pharmacology, "The dysregulated mTOR pathway in TSC leads to characteristic structural and physiologic abnormalities in multiple organs. In this review we focus on the pharmacological properties of mTOR inhibitors and clinical investigations of mTOR inhibitors for two important neurological TSC manifestations: subependymal giant cell astrocytomas (SEGAs) and epilepsy."

According to the news reporters, the research concluded: "Moreover, we present a safety profile of those agents and their current role in clinical practice."

For more information on this research see: Current Use of mTOR Inhibitors for the Treatment of Subependymal Giant Cell Astrocytomas and Epilepsy in Patients with TSC. **Cardiovascular Diseases and Conditions - Thrombosis**

**Findings from Institute of Urology Broaden Understanding of Thrombosis (Endovascular Removal of Intracardiac Thrombus Prior to Radical Nephrectomy and Inferior Vena Cava Thrombectomy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Thrombosis is the subject of a report. According to news reporting out of Burlington, Massachusetts, by NewsRx editors, research stated, "We report a case of a 54-year-old patient with a T3c renal mass with intracardiac extension of the thrombus to the level of the pulmonary valve."

Our news journalists obtained a quote from the research from the Institute of Urology, "The patient was not a candidate for cardiopulmonary bypass due to recent pulmonary embolism. Under transesophageal echocardiogram guidance, the intracardiac thrombus was removed percutaneously via transvenous mechanical thrombectomy."

According to the news editors, the research concluded: "The patient was effectively downstaged to T3b and underwent successful radical nephrectomy and inferior vena cava thrombectomy without the use of cardiopulmonary bypass."

Our news journalists report that additional information may be obtained by contacting D.A. Palmer, Lahey Hosp & Med Center, Inst Urol, Burlington, MA 01805, United States. Additional authors for this research include J.E. Humphrey, A. Fredrick, T.C. Piemonte and J.A. Libertino.

Oncology - Head and Neck Cancer

Findings from International Agency for Research on Cancer Update Knowledge of Head and Neck Cancer (Head and neck cancer burden and preventive measures in Central and South America)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Head and Neck Cancer. According to news reporting originating in Lyon, France, by NewsRx journalists, research stated, "Rationale and objective: Central and South America comprise one of the areas characterized by high incidence rates for head and neck cancer. We describe the geographical and temporal trends in incidence and mortality of head and neck cancers in the Central and South American region in order to identify opportunities for intervention on the major identified risk factors: tobacco control, alcohol use and viral infections."

The news reporters obtained a quote from the research from International Agency for Research on Cancer, "We obtained regional- and national-level incidence data from 48 population-based cancer registries in 13 countries and cancer deaths from the WHO mortality database for 18 countries. Age-standardized incidence (ASR) and mortality (ASMR) rates per 100,000 person-years were estimated. Brazil had the highest incidence rates for oral and pharyngeal cancer in the region for both sexes, followed by Cuba, Uruguay and Argentina. Cuba had the highest incidence and mortality rates of laryngeal cancer in the region for males and females. Overall, males had rates about four times higher than those in females. Most countries in the region have implemented WHO recommendations for both tobacco and alcohol public policy control. Head and neck squamous-cell cancer (HNSCC) incidence and mortality rates in the Central and South America region vary considerably across countries, with Brazil, Cuba, French Guyana, Uruguay and Argentina experiencing the highest rates in the region. Males carry most of the HNSCC burden."

According to the news reporters, the research concluded: "Improvement and implementation of comprehensive tobacco and alcohol control policies as well as the monitoring of these factors are fundamental to prevention of head and neck cancers in the region."

For more information on this research see: Head and neck cancer burden and preventive measures in Central and South America. Cancer Epidemiology, 2016;44():S43-S52. Cardiovascular Diseases and Conditions...

Findings from Iran University of Medical Sciences Provide New Insights into Atherosclerosis (Carotid duplex ultrasound and transcranial Doppler findings in commercial divers and pilots)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Atherosclerosis is now available. According to news reporting out of Tehran, Iran, by NewsRx editors, research stated, "The risky working environments of divers and pilots, and the possible role of extreme ambient pressure in carotid stenosis, make ischemic stroke an important occupational concern among these professionals. In this study, we aimed to evaluate the association of being exposed to hyperbaric or hypobaric conditions with carotid artery stenosis by comparing common carotid intima-media thickness (CCIMT) and blood flow velocities of cerebral arteries in divers and pilots using carotid duplex ultrasound (CDUS) and transcranial Doppler (TCD)."

Our news journalists obtained a quote from the research from the Iran University of Medical Sciences, "CDUS and transtemporal TCD were performed in 29 divers, 36 pilots and 30 control participants. Medical history, blood pressure, lipid profile and blood sugar were recorded to control the previously well-known risk factors of atherosclerosis. Findings of the CDUS and TCD [including: CCIMT and blood flow velocities of internal carotid artery (ICA), common carotid artery (CCA), and middle cerebral artery (MCA)] of divers and pilots were compared with those of the control group using regression analysis models. Both right and left side CCIMT were significantly higher in divers (P < 0.05) and pilots (P < 0.05) in comparison with the control group. Carotid index [peak systolic velocity (PSV) of ICA/PSV of CCA] of divers and pilots were also higher than the control group. TCD findings were not significantly different between divers, pilots, and the control group."

According to the news editors, the research concluded: "Increased CCIMT and carotid index in diver and pilot groups appear to be suggestive of accelerated atherosclerosis of carotid artery in these occupational groups."

For more information on this research see: Carotid duplex ultrasound and transcranial Doppler findings in commercial divers and pilots. Neurological Sciences, 2016;37 (12):1911-1916. Neurological Sciences can be contacted at: Springer-Verlag Italia Srl, Via Decembrio, 28, Milan, 20137, Italy. (Springer - www.springer.com; Neurological Sciences - www.springerlink.com/content/1590-1874/)

**Nutritional and Metabolic Diseases and Conditions**

**Findings from Isfahan University of Medical Sciences Provide New Insights into Vitamin D Deficiency (Association Between Acute Infectious Mononucleosis and Vitamin D Deficiency)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Vitamin D Deficiency. According to news originating from Esfahan, Iran, by NewsRx correspondents, research stated, "Epstein-Barr virus and vitamin D both have been implicated in the pathogenesis of autoimmune diseases, especially multiple sclerosis (MS). Vitamin D influences both innate and adaptive immune responses and has been linked to increased susceptibility to other viral infections such as influenza."

Our news journalists obtained a quote from the research from the Isfahan University of Medical Sciences, "Here we aimed to examine the association between vitamin D and acute infectious mononucleosis (IM). This study is a case-control study that was conducted on IM patients and a control group of healthy individuals at infectious disease clinics of Isfahan University of Medical Sciences. Patients were recruited from January to December 2014. The viral capsid antigen (VCA) IgM titer and vitamin D levels were measured at the time of acute infection in IM patients. We also measured vitamin D levels in healthy controls recruited during the same period of time. A total number of 60 IM patients with the mean age of 23.26 +/- 7.59 and a healthy control group with the mean age of 25.13 +/- 6.72 were enrolled. In the IM patients, there was no significant association between 25(OH) D3 levels and VCA IgM titers (r = 0.190, p = 0.146). Mean 25(OH) D3 levels in IM patients were significantly lower than in the control group (15.61 +/- 9.72 vs. 21.41 +/- 12.64, p = 0.006)."

According to the news editors, the research concluded: "Our findings showed significantly lower vitamin D levels in IM patients at the time of infection than in the control group, providing some evidence that the two major risk factors for autoimmune diseases (e.g., MS) might not be independent risk factors."

For more information on this research see: Association Between Acute Infectious Mononucleosis and Vitamin D Deficiency. *Viral Immunology*, 2016;29(7):398-400. *Viral Immunology* can be contacted at: Mary Ann Liebert, Inc., 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. The news correspondents report that additional information may be obtained from H. Maghzi, Isfahan Univ Med Sci, Multiple Sclerosis Res Comm, Esfahan 8174673461, Iran. Additional authors for this research include B. Ataei, F. Khorvash, M. Yaran and A.H. Maghzi.
Findings from Iuliu Hatieganu University of Medicine and Pharmacy in Allergic Rhinitis Provides New Insights (In Vivo Anti-Inflammatory Effect of H1 Antihistamines in Allergic Rhinitis: A Randomized Clinical Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immune System Diseases and Conditions - Allergic Rhinitis is now available. According to news reporting from Cluj Napoca, Romania, by NewsRx journalists, research stated, "Allergic rhinitis is characterized by a chronic inflammation of nasal mucosa and represents a risk factor for asthma occurrence. H1 antihistamines reduce the symptoms of rhinitis, but some compounds may have anti-inflammatory properties."

The news correspondents obtained a quote from the research from the Iuliu Hatieganu University of Medicine and Pharmacy, "We evaluated the plasma level of some cytokines in patients with persistent allergic rhinitis (PAR) and their evolution after a 4-week treatment with H1 anti-histamines, as well as the risk of asthma after 1.5 years. Randomized clinical trial. Eighty-five patients with PAR and 30 healthy volunteers were included in the study. The patients with PAR were randomly divided into 2 groups: 41 patients treated with 5 mg/day desloratadine and 44 patients under 5 mg/day levocetirizine for 4 weeks. The clinical and biological evaluations were performed before and after treatment and included rhinitis symptoms and total symptoms score, type of sensitization, and plasmatic levels of total IgE, IL-1b, IL-6, IL-8 and TNF-a. IL-8 and TNF-a were significantly increased in patients with PAR compared to healthy volunteers (5.85 vs 3.12, p<0.001 and 2.32 vs 1.06, p<0.001, respectively). Both H1 antihistamines reduce all symptoms of allergic rhinitis, including nasal congestion and the plasmatic level of IL-1b, IL-6, IL-8 and TNF-a, after 4 weeks of treatment. The reduction of cytokine levels was not influenced by patients' age, sex, duration or severity of rhinitis, or type of sensitization. Levocetirizine has a superior effect compared to desloratadine in reducing the rhinitis symptoms and cytokines' level. Twenty eight (32.9%) of the patients presented asthma symptoms after 1.5 years. The occurrence of asthma was influenced by house dust sensitization (OR-14.6; CI 95% 1.8-116.3; p=0.01), but baseline values of cytokines were not predictive factors for its appearance. Levocetirizine and desloratadine as a prolonged therapy reduce plasmatic levels of some pro-inflammatory cytokines in patients with PAR. Levocetirizine has a better effect on decreasing the symptoms and plasmatic levels of IL-1b and IL-8. (ClinicalTrials.gov Identifier: NCT02507635)."

According to the news reporters, the research concluded: "POSDRU and University
of Medicine and Pharmacy, Iuliu Hatieganu, Cluj Napoca."

Our news journalists report that additional information may be obtained by contacting C.I. Bocsan, Dept. of Clinical Pharmacology, Iuliu Hatieganu University of Medicine and Pharmacy, Cluj Napoca, Romania. Additional authors for this research include A.I. Bujor, N. Miron, S.C. Vesa, D. Deleanu and A.D Buzoianu.

**Lentivirus**

**Findings from J. Chen and Colleagues Update Understanding of Lentivirus (Targeting HIF-1 alpha and VEGF by lentivirus-mediated RNA interference reduces liver tumor cells migration and invasion under hypoxic conditions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lentivirus have been presented. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Hypoxia-inducible factor-1 alpha (HIF-1 alpha) is a key transcription factor to initiate the expressions of distinct pro-angiogenic growth genes, particularly the expression of vascular endothelial growth factor (VEGF). CoCl2 was used in rat liver tumor cell line McA RH-7777 to stimulate hypoxia to mimic the hypoxic conditions induced by transcatheter arterial chemoembolization (TACE)."

Our news journalists obtained a quote from the research, "CCK8 assays were performed to examine the effect of hypoxia on cell viability. Real-time qRT-PCR, western blot and ELISA assays were used to measure the expression of HIF-1 alpha and VEGF in McA RH-7777 cells under hypoxic conditions, respectively. Lentivirus-mediated HIF-1 alpha and/or VEGF-specific shRNA was used to establish single or HIF-1 alpha and VEGF double knocking-down McA RH-7777 cells. Transwell assays were performed to examine the effect of HIF-1 alpha and VEGF knocking-down on McA RH-7777 cells migration and invasion. The mRNA and protein expression level of HIF-1 alpha and VEGF were remarkably up-regulated in McA RH-7777 cells under hypoxic conditions, respectively. The knockdown of HIF-1 alpha or VEGF significantly reduced the expression of the secreted VEGF. More importantly, knockdown of both HIF-1 alpha and VEGF resulted in the best effective inhibitory effect in VEGF expression, and in turn remarkably reduced the cell migration and invasion activity."

According to the news editors, the research concluded: "Our findings showed that HIF-1 alpha play an important role in the stimulation of the secreted VEGF expression under
hypoxic conditions, suggesting that targeting both HIF-1 alpha and VEGF could represent a potential therapeutic strategy in combination with TACE in the treatment of liver tumors."

For more information on this research see: Targeting HIF-1 alpha and VEGF by lentivirus-mediated RNA interference reduces liver tumor cells migration and invasion under hypoxic conditions. *Neoplasma*, 2016;63(6):934-940. *Neoplasma* can be contacted at: Aepress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

The news correspondents report that additional information may be obtained from M. Huang, Ling Nan Hosp, Dept. of Intervent Radiol, Guangzhou 510530, Guangdong, People's Republic of China. Additional authors for this research include L. Lai, S. Liu, C. Zhou, C. Wu, M. Huang and Q. Lin.

**Oncology - Gastric Cancer**

**Findings from J. Dreanic and Co-Authors Broaden Understanding of Gastric Cancer (Gastric Carcinoma at the Era of Targeted Therapies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news originating from Paris, France, by NewsRx correspondents, research stated, "Gastric and gastro-esophageal cancers (GC/GEJ) appear as the second cancer-related death worldwide. Diagnosis is made at an advanced stage offering a curative attempt in less than 50% of cases."

Our news journalists obtained a quote from the research, "Despite the improvements of the systemic cytotoxic chemotherapy regimens, the prognosis of patients with metastatic GC/GEJ cancer remains poor. Recent insights in biochemical pathways have permitted to identify potential targets. The extracellular domain of HER2 receptors is implicated in cells' proliferation and in the anti-apoptotic process occurring in GC/GEJ cancers. Trastuzumab, a monoclonal antibody targeting HER2, in addition to chemotherapy permitted to obtain more than one year of survival in HER2-positive advanced GC/GEJ cancers. Recently, ramucirumab, a humanized monoclonal antibody targeting VEGFR-2 receptor demonstrated its efficacy as a second line treatment for patients with advanced GC/GEJ cancer. These encouraging results have justified evaluating targeted therapies in GC/GEJ cancers."

According to the news editors, the research concluded: "In this review, we summarize targeted therapies that might present clinical efficacy in the treatment of advanced GC/GEJ cancers."

The news correspondents report that additional information may be obtained from J. Dreanic, Gastroenterology and Endoscopy Unit, Hopital Cochin, 27, rue du faubourg Saint
Findings from J. Ettersperger and Co-Researchers in the Area of Celiac Disease Described (Interleukin-15-Dependent T-Cell-like Innate Intraepithelial Lymphocytes Develop in the Intestine and Transform into Lymphomas in Celiac Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Celiac Disease. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "The nature of gut intraepithelial lymphocytes (IELs) lacking antigen receptors remains controversial. Herein we showed that, in humans and in mice, innate intestinal IELs expressing intracellular CD3 (iCD3(+)) differentiate along an Id2 transcription factor (TF)independent pathway in response to TF NOTCH1, interleukin-15 (IL-15), and Granzyme B signals."

Our news editors obtained a quote from the research, "In NOTCH1-activated human hematopoietic precursors, IL-15 induced Granzyme B, which cleaved NOTCH1 into a peptide lacking transcriptional activity. As a result, NOTCH1 target genes indispensable for T cell differentiation were silenced and precursors were reprogrammed into innate cells with T cell marks including intracellular CD3 and T cell rearrangements. In the intraepithelial lymphoma complicating celiac disease, iCD3(+) innate IELs acquired gain-of-function mutations in Janus kinase 1 or Signal transducer and activator of transcription 3, which enhanced their response to IL-15."

According to the news editors, the research concluded: "Overall we characterized gut T cell-like innate IELs, deciphered their pathway of differentiation and showed their malignant transformation in celiac disease."

For more information on this research see: Interleukin-15-Dependent T-Cell-like Innate Intraepithelial Lymphocytes Develop in the Intestine and Transform into Lymphomas in Celiac Disease. Immunity, 2016;45(3):610-625. Immunity can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. Findings from J. She and Co-Authors Reveals New Information on Blood Pressure (Validation of the RisingSun RS-651 Blood Pressure Monitor Based on Auscultation in Adults According to the ANSI/AAMI/ISO 81060-2:2013 Standard)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Pressure have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "This study validated the RisingSun RS-651 blood pressure (BP) monitor based on auscultation in adults according to the American National Standards Institute/Association for the Advancement of Medical Instrumentation/International Organization for Standardization (ANSI/AAMI/ISO) 81060-2:2013 standard. The RS-651 device was evaluated in a study of 97 participants."

Funders for this research include National Natural Science Foundation of China, National Key Technology Research and Development Program of China.

The news reporters obtained a quote from the research, "The same arm simultaneous method, as defined in the ANSI/AAMI/ISO standard, was used. The mean differences +/- standard deviation for criterion 1 were 0.8 +/- 2.3 mm Hg for systolic BP (SBP) and -0.1 +/- 2.9 mm Hg for diastolic BP (DBP). Analysis for criterion 2 resulted in values of 0.8 +/- 1.5 mm Hg for SBP and -0.1 +/- 2.1 mm Hg for DBP. All of the data fulfilled the ANSI/AAMI/ISO 81060-2:2013 standard requirements to pass the validation."

According to the news reporters, the research concluded: "The RisingSun RS-651 device can be recommended for both clinical and self/home use in adults according to the ANSI/AAMI/ISO 81060-2:2013 standard."

Our news correspondents report that additional information may be obtained by contacting H.Y. Xiang, Aviat Med Engn Center, Inst Aviat Med, Beijing, People's Republic of
Findings from J. Stingele and Co-Researchers in the Area of Peptide Hydrolases Reported (Mechanism and Regulation of DNA-Protein Crosslink Repair by the DNA-Dependent Metalloprotease SPRTN)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Enzymes and Coenzymes - Peptide Hydrolases. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Covalent DNA-protein crosslinks (DPCs) are toxic DNA lesions that interfere with essential chromatin transactions, such as replication and transcription. Little was known about DPC-specific repair mechanisms until the recent identification of a DPC-processing protease in yeast."

Funders for this research include NCI, Cancer Research UK, UK Medical Research Council, The Wellcome Trust.

Our news journalists obtained a quote from the research, "The existence of a DPC protease in higher eukaryotes is inferred from data in Xenopus laevis egg extracts, but its identity remains elusive. Here we identify the metalloprotease SPRTN as the DPC protease acting in metazoans. Loss of SPRTN results in failure to repair DPCs and hypersensitivity to DPC-inducing agents. SPRTN accomplishes DPC processing through a unique DNA-induced protease activity, which is controlled by several sophisticated regulatory mechanisms. Cellular, biochemical, and structural studies define a DNA switch triggering its protease activity, a ubiquitin switch controlling SPRTN chromatin accessibility, and regulatory autcatalytic cleavage."

According to the news editors, the research concluded: "Our data also provide a molecular explanation on how SPRTN deficiency causes the premature aging and cancer predisposition disorder Ruijs-Aalfs syndrome."

For more information on this research see: Mechanism and Regulation of DNA-Protein Crosslink Repair by the DNA-Dependent Metalloprotease SPRTN. *Molecular Cell*, 2016;64(4):688-703. *Molecular Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. Findings from J.B. Whitney and Co-Authors Broaden Understanding of Assisted Reproduction and Genetics (Single center validation of routine blastocyst biopsy implementation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics - Assisted Reproduction and Genetics is now available. According to news reporting originating from Newport Beach, California, by NewsRx correspondents, research stated, "The study aims to contrast the efficacy of trophectoderm biopsy preimplantation genetic screening (PGS)/vitrification (VTF)-all cycles to past treatment protocols. Specifically, do these applied technologies increase live birth rates on a per cycle/first transfer basis? An observational, retrospective cohort study of first transfer outcomes was performed in two groups."

Financial support for this research came from Study supported by internal funds: Southern California Institutes for Reproductive Sciences.

Our news editors obtained a quote from the research, "Group 1 (PGS) included PGS/VTF-all cycles, and group 2 (no PGS) included the first transfer from non-PGS fresh cycles or VTF-ALL cycles. In group 1, all blastocysts were biopsied on days 5/6, vitrified and array CGH performed. Group 2 patients had embryo transfers on day 3 or day 5. All blastocysts were vitrified and warmed according to mu S-VTF protocols. Clinical pregnancies and implantation were confirmed by ultrasound and live birth information attained. Results were stratified by age with donor cycles excluded, and to eliminate bias, the same groups were then validated on a per cycle basis. Chi-squared used to determine significance. Analyzing 287 embryo transfers and 1,000+ PGS-tested blastocysts, an overall 97 % increase in live births favored group 1 (PGS). When utilizing PGS/VTF-ALL cycles, patients under 43 years old exhibited higher implantation, clinical pregnancy, and ongoing/live birth rates. Re-analyzing the data to include all cycles initiated revealed higher live birth rates in group 1 age groups <= 34 and 38-40 years old. Validating PGS on a per cycle basis eliminated data bias by including patients without blastocysts to biopsy or euploid embryos."

According to the news editors, the research concluded: "Clearly, PGS uses blastocysts more efficiently to achieve success, while many women over 40 may benefit most by understanding why some failures occur. None."

The news editors report that additional information may be obtained by contacting M.C. Schiewe, Ovat Fertil, Newport Beach, CA 92663, United States. Additional authors for this research include M.C. Schiewe and R.E. Anderson.

Hemodialysis

Findings from J.C. Luo et al Has Provided New Information about Hemodialysis (Spectrum and Burden of Erythropoiesis-Stimulating Agent Hyporesponsiveness Among Contemporary Hemodialysis Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hemodialysis are presented in a new report. According to news originating from Minneapolis, Minnesota, by NewsRx correspondents, research stated, "Hemodialysis patients with erythropoiesis-stimulating agent (ESA) hyporesponsiveness have been a topic of active research. However, there have been no studies of ESA hyporesponsiveness among US patients following the dramatic change in anemia management that resulted from the 2011 changes in ESA product labeling and bundling of dialysis remuneration."

Our news journalists obtained a quote from the research, "Retrospective observational study. We studied prevalent hemodialysis patients treated at a large dialysis organization in calendar years 2012 to 2013 (N 5 98,972). Predictor: ESA hyporesponsiveness, defined as 2 consecutive hemoglobin measurements < 10 g/dL (every other week) with contemporaneous ESA dose > 7,700 U/treatment. Patients with ESA hyporesponsiveness were identified during the first quarter of 2012 and followed up through 2013 using intention-to-treat principles. Associations between the study exposure (ESA hyporesponsiveness) and mortality, missed hemodialysis treatments, ESA and iron use, and hemoglobin levels were determined using generalized estimating equations adjusting for imbalanced baseline covariates. At baseline, 12,361 (12.5%) patients were identified as having ESA hyporesponsiveness. The mean hemoglobin level among patients with ESA hyporesponsiveness was similar to 1 g/dL lower than in patients without ESA hyporesponsiveness at baseline, narrowing over follow-up to 0.4 g/dL. Initially, mean ESA use was approximately 3-fold greater for patients with ESA hyporesponsiveness than for those without ESA hyporesponsiveness, decreasing to 2-fold greater at study end; iron use and missed hemodialysis treatment rates were also greater among patients with ESA hyporesponsiveness throughout. ESA hyporesponsiveness was associated with enhanced mortality risk versus non-ESA hyporesponsiveness: adjusted incidence rate ratios were estimated at 2.24 (95% CI, 1.93-2.60) in the second quarter, gradually decreasing to 1.48 (95% CI, 1.18-1.84) by study end. Limitations: It is possible that an alternative ESA hyporesponsiveness definition may be optimal. As such, the associations we observed may be conservative estimates of true relationships."

According to the news editors, the research concluded: "When using a contemporary definition at one point in time, ESA hyporesponsiveness was potently and persistently associated with greater mortality, greater iron and ESA use, and lower hemoglobin levels..."
compared to non-ESA hyporesponsiveness."

The news correspondents report that additional information may be obtained from J.C. Luo, DaVita Clin Res, Minneapolis, MN, United States. Additional authors for this research include D.E. Jensen, B.J. Maroni and S.M. Brunelli.

Cytoskeletal Proteins - Microfilament Proteins

Findings from J.P.J. Ungerer and Colleagues Update Understanding of Microfilament Proteins (Discordance with 3 Cardiac Troponin I and T Assays: Implications for the 99th Percentile Cutoff)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cytoskeletal Proteins - Microfilament Proteins are discussed in a new report. According to news reporting originating from Herston, Australia, by NewsRx correspondents, research stated, "We compared the 99th percentile reference intervals with 3 modern cardiac troponin assays in a single cohort and tested the hypothesis that the same individuals will be identified as above the cutoff and that differences will be explained by analytical imprecision. Blood was collected from 2005 apparently healthy blood donors."

Our news editors obtained a quote from the research, "Cardiac troponin was measured with Abbott Architect STAT high sensitive troponin I, Beckman Coulter Access AccuTnI + 3, and Roche Elecsys troponin T highly sensitive assays. The 99th percentile cutoff limits were as follows: Abbott cardiac troponin I (cTnI) 28.9 ng/L; Beckman Coulter cTnI 31.3 ng/L; and Roche cardiac troponin T (cTnT) 15.9 ng/L. Correlation among the assays was poor: Abbott cTnI vs Beckman Coulter cTnI, R-2 = 0.18; Abbott cTnI vs Roche cTnT, R-2 = 0.04; and Beckman Coulter cTnI vs Roche cTnT R-2 = 0.01. Of the results above the cutoff 50% to 70% were unique to individual assays, with only 4 out of 20 individuals above the cutoff for all 3 assays. The observed differences among assays were larger than predicted from analytical imprecision. The 99th percentile cutoff values were in agreement with those reported elsewhere. The poor correlation and concordance amongst the assays were notable. The differences found could not be explained by analytical imprecision and indicate the presence of inaccuracy (bias) that is unique to sample and assay combinations."

According to the news editors, the research concluded: "Based on these findings we recommend less emphasis on the cutoff value and greater emphasis on delta values in the diagnosis of myocardial infarction."

For more information on this research see: Discordance with 3 Cardiac Troponin I and T Assays: Implications for the 99th Percentile Cutoff. Clinical Chemistry, 2016;62
Findings from JMI Laboratories Broaden Understanding of Antibiotics
(Effect of the beta-Lactamase Inhibitor Vaborbactam Combined with Meropenem against Serine Carbapenemase-Producing Enterobacteriaceae)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antibiotics have been published. According to news originating from North Liberty, Iowa, by NewsRx correspondents, research stated, "Klebsiella pneumoniae carbapenemase (KPC)-producing isolates have become increasingly prevalent worldwide, and these organisms are often multidrug resistant, limiting the therapeutic options available for treating infections. We evaluated the activity of meropenem combined with the serine beta-lactamase inhibitor vaborbactam (formerly RPX7009) against 315 serine carbapenemase-producing Enterobacteriaceae (CPE) isolates by use of checkerboard-designed panels to assess the optimal inhibitor concentration (range tested, 0.5 to 32 μg/ml)."

Our news journalists obtained a quote from the research from JMI Laboratories, "Overall, meropenem alone (MIC50 and MIC90, 16 and > 64 μg/ml, respectively) inhibited only 2.2% of the isolates at <= 1 μg/ml (the CLSI susceptibility breakpoint) and 7.3% of the isolates at <= 2 μg/ml (the EUCAST breakpoint). Vaborbactam restored meropenem activity for 72.7 to 98.1% of CPE isolates at <= 2 μg/ml, and maximum potentiation was achieved with fixed concentrations of >8 μg/ml of the inhibitor (≥ 96.5% of isolates were inhibited at <= 2 μg/ml of meropenem-vaborbactam). Meropenem-vaborbactam with a fixed concentration of 8 μg/ml of the inhibitor (MIC50, <= 0.06 μg/ml for all organisms) inhibited 93.7% of the CPE isolates displaying elevated meropenem MICs at <= 1 μg/ml. Meropenem-vaborbactam MICs were elevated for isolates producing metallo-beta-lactamases (MIC, 16 to > 64 μg/ml) or displaying decreased expression of OmpK37 and/or elevated expression of the AcrAB-ToLC efflux system (MIC, 16 μg/ml). Vaborbactam showed no antibacterial activity alone (all MICs, > 64 μg/ml)."

According to the news editors, the research concluded: "Meropenem-vaborbactam appears to be a good candidate for further development and it could increase the options for treatment of serious infections caused by carbapenemase-producing pathogens."
For more information on this research see: Effect of the beta-Lactamase Inhibitor Vaborbactam Combined with Meropenem against Serine Carbapenemase-Producing Enterobacteriaceae. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5454-5458. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Neurodegenerative Diseases and Conditions -...**

**Findings from Jadavpur University in Huntington Disease Reported (First molecular modeling report on novel arylpyrimidine kynurenine monooxygenase inhibitors through multi-QSAR analysis against Huntington's disease: A proposal to chemists!)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Huntington Disease. According to news reporting from Bengal, India, by NewsRx journalists, research stated, "Huntington's disease (HD) is caused by mutation of huntingtin protein (mHtt) leading to neuronal cell death. The mHtt induced toxicity can be rescued by inhibiting the kynurenine monooxygenase (KMO) enzyme."

The news correspondents obtained a quote from the research from Jadavpur University, "Therefore, KMO is a promising drug target to address the neurodegenerative disorders such as Huntington's diseases. Fiftysix arylpyrimidine KMO inhibitors are structurally explored through regression and classification based multi-QSAR modeling, pharmacophore mapping and molecular docking approaches."

According to the news reporters, the research concluded: "Moreover, ten new compounds are proposed and validated through the modeling that may be effective in accelerating Huntington's disease drug discovery efforts."

Mycobacterium Infections - Tuberculosis

Findings from Jadavpur University in the Area of Tuberculosis Reported (In search of Tuberculosis drug design : An in silico approach to azoimidazolyl derivatives as antagonist for Cytochrome P450)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mycobacterium Infections - Tuberculosis have been published. According to news reporting out of Kolkata, India, by NewsRx editors, research stated, "Tuberculosis is a deadly disease and is caused by Mycobacterium tuberculosis (Mtb). Cytochrome P450s (CYPs) in the Mtb genome is playing important physiological role for its growth and survivability."

Our news journalists obtained a quote from the research from Jadavpur University, "Azole drugs have potent anti-mycobacterial activity and molecular docking studies indicate that CYP inhibition is the major target of the drugs. Out of six structures of CYPs in PDB (CYP51, CYP121, CYP124, CYP125, CYP130 and CYP142) CYP121 has shown better binding affinity with fluconazole, an antifungal medicine. In this work we have searched for a series of arylazoimidazole molecules, the structural analogue of fluconazole, those act as antagonist via in-silico approach with CYP121. It is calculated that arylazoimidazole ligands have better binding affinity and higher docking score compared to fluconazole and other available azole drugs. Most of the molecules have crossed the druglikeness filter though Lipinski's rule and Ghosh's rule. QSAR calculation has shown that there is positive correlation (R-2 > 0.5) among the docking scores and molecular properties of the azole structure analogous."

According to the news editors, the research concluded: "ADMET calculation has also shown that one of the arylazoimidazoles, (E)-6-((3-((1H-imidazol-2-yl)diazenyl) naphthalen-2-yl)amino)-2H-chromen-2-one (Molecular ID-85; Mol. wt., 453.54; docking score, -10.9; log P, 3.928), is best docked and druglikeness passed and crossed the barrier of ADMET filter."

For more information on this research see: In search of Tuberculosis drug design : An in silico approach to azoimidazolyl derivatives as antagonist for Cytochrome P450. Journal of the Indian Chemical Society, 2016;93(9):1067-1084. Oncology - Kidney Cancer

Findings from Jagiellonian University Has Provided New Information about Kidney Cancer (Obesity and renal cancer incidence and mortality--a systematic review of prospective cohort studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Kidney Cancer. According to news reporting originating in Krakow, Poland, by NewsRx journalists, research stated, "There have been many studies published recently on obesity and the risk of renal cancer; however, the epidemiological evidence for such an association has not been consistent. Therefore, a systematic review was conducted of the prospective cohort studies to assess the association between obesity and the risk of renal cancer incidence and death."

The news reporters obtained a quote from the research from Jagiellonian University, "A search was conducted of the PubMed database and references to published studies from inception until May 2013. Guidelines for Assessing Quality in Prognostic Studies on the Basis of Framework for Potential Biases were followed for quality assessment of studies included in the systematic review. Twenty eligible studies were identified and included in the systematic review. Among the 20 selected studies, overall study quality was high. Although the evidence from the prospective cohort studies, linking obesity with renal cancer incidence, has not been entirely consistent, there is a convincing body of data for a positive relationship. Moreover, cumulative data is compelling for a strong positive association between obesity and fatal renal cancer. There is a relatively consistent amount of evidence that obesity increases the risk of renal cancer and fatal renal cancer."

According to the news reporters, the research concluded: "Further research is needed as better understanding of mechanisms by which obesity may influence renal cancer development and progression will aid the fostering of strategies for prevention and treatment of one of the most lethal human malignancies."

For more information on this research see: Obesity and renal cancer incidence and mortality--a systematic review of prospective cohort studies. Annals of Agricultural and Environmental Medicine, 2016;23(1):37-43.

Our news correspondents report that additional information may be obtained by contacting T. Golabek, Dept. of Urology, Collegium Medicum of the Jagiellonian University, Cracow, Poland. Cell Surface Extensions

Findings from Japan Science and Technology Agency Provide New Insights into Cell Surface Extensions [Loss of ift122, a Retrograde Intraflagellar Transport (IFT) Complex Component, Leads to Slow, Progressive Photoreceptor Degeneration Due to ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cell Surface Extensions have been published. According to news reporting out of Osaka, Japan, by NewsRx editors, research stated, "In the retina, aberrant opsin transport from cell bodies to outer segments leads to retinal degenerative diseases such as retinitis pigmentosa. Opsiin transport is facilitated by the intra-flagellar transport (LET) system that mediates the bidirectional movement of proteins within cilia."

Funders for this research include Japan Science and Technology Agency, Takeda Science Foundation, Uehara Memorial Foundation, Novartis Foundation, Mochida Memorial Foundation for Medical and Pharmaceutical Research, Naito Foundation, Kato Memorial Bioscience Foundation, Daiichi-Sankyo Foundation of Life Science, Suzuken Memorial Foundation, National Institutes of Health, National Eye Institute, Grants-in-Aid for Scientific Research on Innovative Areas, Grant-in-Aid for Scientific Research (B) and (C), Young Scientists (B), Osaka Community Foundaion.

Our news journalists obtained a quote from the research from Japan Science and Technology Agency, "In contrast to functions of the anterograde transport executed by IFT complex B (IFT-B), the precise functions of the retrograde transport mediated by LET complex A (IFT-A) have not been well studied in photoreceptor cilia. Here, we analyzed developing zebrafish larvae carrying a null mutation in ift122 encoding a component of IFT-A. ift122 mutant larvae show unexpectedly mild phenotypes, compared with those of mutants defective in IFT-B. ift122 mutants exhibit a slow onset of progressive photoreceptor degeneration mainly after 7 days post-fertilization. ift122 mutant larvae also develop cystic kidney but not curly body, both of which are typically observed in various ciliary mutants. ift122 mutants display a loss of cilia in the inner ear hair cells and nasal pit epithelia. Loss of ift122 causes disorganization of outer segment discs. Ectopic accumulation of an IFT-B component, ift88, is observed in the ift122 mutant photoreceptor cilia. In addition, pulse chase experiments using GFP-opsin fusion proteins revealed that ift122 is required for the efficient transport of opsin and the distal elongation of outer segments."

According to the news editors, the research concluded: "These results show that IFT-A is essential for the efficient transport of outer segment proteins, including opsin, and for the survival of retinal photo-receptor cells, rendering the ift122 mutant a unique model for human retinal degenerative diseases."

For more information on this research see: Loss of ift122, a Retrograde Intraflagellar Transport (IFT) Complex Component, Leads to Slow, Progressive Photoreceptor Degeneration

**Myeloid Cells**

**Findings from Jawaharlal Nehru University Broaden Understanding of Myeloid Cells [Role of Macrophage (M1 and M2) in Titanium-Dioxide Nanoparticle-Induced Oxidative Stress and Inflammatory Response in Rat]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Myeloid Cells. According to news reporting from New Delhi, India, by NewsRx journalists, research stated, "Titanium-dioxide nanoparticles (TNP) are used in various consumable goods. Evidence has demonstrated the cytotoxicity of TNPs, but exact mechanism is yet to be elucidated."

The news correspondents obtained a quote from the research from Jawaharlal Nehru University, "The present study has been aimed at finding out the mechanism of TNP-induced toxicity in biological system. Different doses of anatase-TNPs administrated intravenously to Wistar rats for once a week for 1 month and properties of T-H cells, macrophages, cytokines secretion, oxidative damage, apoptotic pathway, and hematological and pathological changes were investigated as downstream events of TNP-mediated cytotoxicity. Result suggests that TNPs induce T-H1 and T-H2 response as measured by immunophenotyping (interferon gamma (IFN-gamma) and interleukin (IL)-4) of T-H cells, causing induction of M1 (nitric oxide (NO), nitric oxide synthase (iNOS), NF-kappaB (NF-kappa B), cyclooxygenase-2 (COX-2), IL-1, IL-6, and TNF-alpha) and M2 (Arg-1, Ym1) macrophages response. At lower dose, T-H1 or M1 response counteracted by T-H2 or M2 response, resulting in insignificant oxidative damage. However, with increasing dose of TNPs, the M1 response was increased over M2 response resulting in significant tissue damage. The M1-induced inflammatory response was found to cause DNA and chromosomal damage resulting apoptosis induction via upregulation of Bax/Bcl-2 ratio and subsequent loss of mitochondrial membrane potential and cyto c release in splenocytes."

According to the news reporters, the research concluded: "The TNP-led inflammatory response also causes damage at different tissue levels."

Respiratory Tract Diseases and Conditions - Pleural…

Findings from Jiaxing University in the Area of Pleural Effusion Reported (Promoter hypermethylation of Wnt inhibitory factor-1 in patients with lung cancer A systematic meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Respiratory Tract Diseases and Conditions - Pleural Effusion. According to news reporting originating from Jiaxing, People's Republic of China, by NewsRx correspondents, research stated, "Promoter hypermethylation of Wnt inhibitory factor-1 (WIF-1)-a tumor suppressor gene-has been detected in several types of human tumors. However, the association between WIF-1 promoter hypermethylation and lung cancer remains to be elucidated."

Our news editors obtained a quote from the research from Jiaxing University, "Therefore, we conducted this study to evaluate the clinical significance of WIF-1 promoter hypermethylation in lung cancer. A comprehensive literature search was conducted to obtain eligible studies. The combined odds ratios (ORs) or hazard ratios and 95% confidence intervals were used to estimate the strength of associations. A total of 8 eligible publications with 626 cases and 512 controls were included in our study. The combined ORs revealed that WIF-1 promoter hypermethylation was significantly higher in lung cancer than in controls (OR 10.53, P < 0.001). Moreover, WIF-1 promoter hypermethylation was significantly associated with smoking behavior (OR 1.88, P = 0.002). No significant correlation was found between WIF-1 promoter hypermethylation and sex status, age status, tumor stage, and pathological types in cancer. Multivariate analysis results indicated the absence of correlation between WIF-1 promoter hypermethylation and with relapse-free survival and overall survival. Subgroup analysis by sample type demonstrated that promoter hypermethylation of WIF-1 was significantly associated with an increased risk of lung cancer in the tissue (OR 7.89, P< 0.001), blood (OR 21.83, P = 0.034), and pleural effusion subgroups (OR 157.43, P = 0.001). Promoter hypermethylation of WIF-1 may play a crucial role in lung cancer carcinogenesis. It may be a
noninvasive biomarker using blood or pleural effusion detection. WIF-1 promoter hypermethylation is correlated with smoking behavior, but not with sex status, age status, tumor stage, pathological types, and the prognosis of lung cancer patients in terms of relapse-free survival and overall survival."

According to the news editors, the research concluded: "More investigations, including a larger number of subjects, are required to further confirm the findings of our analysis."

For more information on this research see: Promoter hypermethylation of Wnt inhibitory factor-1 in patients with lung cancer A systematic meta-analysis. Medicine, 2016;95 (49):134-141. Lupus

Findings from Jichi Medical University Update Understanding of Lupus (Wide discrepancies in activated clotting times measured by two devices were detected for a patient with lupus anticoagulant in a cardiac surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lupus is the subject of a report. According to news reporting from Saitama, Japan, by NewsRx journalists, research stated, "For a patient with lupus anticoagulant (LA), activated coagulation time (ACT) was measured with two different types of devices (HEMOCHRON ® 801 and HEMOCHRON ® Jr)."

The news correspondents obtained a quote from the research from Jichi Medical University, "ACTs during heparinization measured with the HEMOCHRON ® 801 were over the range of measurement, while those with the HEMOCHRON ® Jr. reflected an almost normal response to heparin. The phospholipid contained in an activating agent of the HEMOCHRON ® Jr was suggested to have counteracted the effect of LA.”

According to the news reporters, the research concluded: "It was indicated that the coagulation status for LA-positive patients might be better assessed by ACT measured with phospholipid in an activating agent, although careful interpretation is required."

For more information on this research see: Wide discrepancies in activated clotting times measured by two devices were detected for a patient with lupus anticoagulant in a cardiac surgery. Perfusion-Uk, 2016;31(8):709-710. Perfusion-Uk can be contacted at: Sage
Apoptosis

Findings from Jilin University Provides New Data on Apoptosis (A polysaccharide from the leaves of Aralia elata induces apoptosis in U-2 OS cells via mitochondrial-dependent pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Apoptosis. According to news reporting originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "In the present study, we isolated and characterized one purified polysaccharide (AEP-1) from the leaves of Aralia elata, and investigated its effect on human osteosarcoma (OS) U-2 OS cell line and analyzed its mechanism. mu assays showed that AEP-1 markedly inhibited the growth of U-2 OS cells in a dose and time-dependent fashion, suggesting a cytotoxic effect. The AEP-1 also dose-dependently induced DNA fragmentation and caused apoptotic death in U-2 OS cells."

Our news editors obtained a quote from the research from Jilin University, "The event of apoptosis was accompanied by increased ratio of Bax/Bcl-2, depolarization of mitochondrial membrane potential (Delta ym) and the release of cytochrome c from mitochondria into the cytoplasm. Moreover, AEP-1 treatment triggered the activation of caspase-9 and caspase-3, as well as the cleavage of poly (ADP-ribose) polymerase (PAPR) in U-2 OS cells."

According to the news editors, the research concluded: "All these results suggest that the induction of apoptosis by AEP-1 in U-2 OS cells occurs through the mitochondrial-dependent pathway and AEP-1 may be useful in treating OS and improving cancer chemotherapy."

The news editors report that additional information may be obtained by contacting D.H. Sun, Jilin University, Bethune Hosp 1, Dept. of Orthopaed Trauma, Changchun, People's Republic of China. Additional authors for this research include Y. Sheng, M. Zhang and D.H. Sun.

Findings from Jiwaji University Update Understanding of Gallbladder Cancer (Global methylation profiling to identify epigenetic signature of gallbladder cancer and gallstone disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gallbladder Cancer. According to news reporting originating in Madhya Pradesh, India, by NewsRx journalists, research stated, "Promoter methylation in various tumor suppressor genes is reported to influence gallbladder carcinogenesis. Here, we aimed to identify methylation status in gallbladder cancer (GBC) by performing a comprehensive genome-wide DNA methylation profiling."

The news reporters obtained a quote from the research from Jiwaji University, "The methylation status of 485,577 CpG sites were investigated using Illumina's Infinium Human Methylation 450 BeadChip array in 24 tissues (eight each of tumor, adjacent non-tumor, and gallstone). About 33,443 differentially methylated sites (DMRs) were obtained in the whole human genome, of which 24,188 (72 %) were hypermethylated and 9255 (28 %) were hypomethylated. The data also revealed that majority of the DMRs are localized on the proximal promoter region [Transcription start sites (TSS200, TSS1500) and 5' untranslated region (5' UTR)] and first exon. Exclusion of first exon detected a total of 10,123 (79 %) hypermethylated and 2703 (21 %) hypomethylated sites. Comparative analysis of the later with our differential proteomics data resulted in identification of 7 hypermethylated or down-regulated (e.g., FBN1, LPP, and SOD3) and 61 hypomethylated or up-regulated markers (e.g., HBE1, SNRPF, TPD52) for GBC."

According to the news reporters, the research concluded: "These genes could be further validated on the basis of their methylation/expression status in order to identify their utility to be used as biomarker/s for early diagnosis and management of GBC."

Our news correspondents report that additional information may be obtained by contacting P.K. Tiwari, Jiwaji Univ, Mol & Human Genet Div, Center Genom, Gwalior 474011, Madhya Pradesh, India. Additional authors for this research include S. Bhunia, S.S. Poojary, D.S. Tekcham, M.A. Barbhuiya, S. Gupta, B.R. Shrivastav and P.K. Tiwari.

Findings from John Radcliffe Hospital Provides New Data about Hematology Research (A novel 33-Gene targeted resequencing panel provides accurate, clinical-grade diagnosis and improves patient management for rare inherited anaemias)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Hematology Research have been published. According to news reporting from Oxford, United Kingdom, by NewsRx journalists, research stated, "Accurate diagnosis of rare inherited anaemias is challenging, requiring a series of complex and expensive laboratory tests. Targeted next-generation-sequencing (NGS) has been used to investigate these disorders, but the selection of genes on individual panels has been narrow and the validation strategies used have fallen short of the standards required for clinical use."

Funders for this research include BRC Blood Theme, BRC/NHS Translational Molecular Diagnostics Centre, Oxford University Hospitals and MRC Molecular Haematology Unit, University Of Oxford, National Institute for Health Research.

The news correspondents obtained a quote from the research from John Radcliffe Hospital, "Clinical-grade validation of negative results requires the test to distinguish between lack of adequate sequencing reads at the locations of known mutations and a real absence of mutations. To achieve a clinically-reliable diagnostic test and minimize false-negative results we developed an open-source tool (CoverMi) to accurately determine base-coverage and the discoverability' of known mutations for every sample. We validated our 33-gene panel using Sanger sequencing and microarray. Our panel demonstrated 100% specificity and 997% sensitivity. We then analysed 57 clinical samples: molecular diagnoses were made in 22/57 (386%), corresponding to 32 mutations of which 16 were new. In all cases, accurate molecular diagnosis had a positive impact on clinical management."

According to the news reporters, the research concluded: "Using a validated NGS-based platform for routine molecular diagnosis of previously undiagnosed congenital anaemias is feasible in a clinical diagnostic setting, improves precise diagnosis and enhances management and counselling of the patient and their family."

Our news journalists report that additional information may be obtained by contacting I. Roberts, John Radcliffe Hosp, Mol Haematol Unit, Weatherall Inst Mol Med, Oxford OX3 9DU, United Kingdom. Additional authors for this research include E.A. Wilson,
Findings from Johns Hopkins University Bloomberg School of Public Health in HIV/AIDS Reported (Gender-based violence against female sex workers in Cameroon: prevalence and associations with sexual HIV risk and access to health services and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immune System Diseases and Conditions - HIV/AIDS have been presented. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Female sex workers (FSWs) are at risk for HIV and physical and sexual gender-based violence (GBV). We describe the prevalence of lifetime GBV and its associations with HIV risk behaviour, access to health services and barriers in accessing justice among FSWs in Cameroon."

Financial support for this research came from National Institute of Allergy and Infectious Diseases.

Our news journalists obtained a quote from the research from the Johns Hopkins University Bloomberg School of Public Health, "FSWs (n=1817) were recruited for a cross-sectional study through snowball sampling in seven cities in Cameroon. We examined associations of lifetime GBV with key outcomes via adjusted logistic regression models. Overall, 60% (1098/1817) had experienced physical or sexual violence in their lifetime. GBV was associated with inconsistent condom use with clients (adjusted OR (AOR) 1.49, 95% CI 1.18 to 1.87), being offered more money for condomless sex (AOR 2.09, 95% CI 1.56 to 2.79), having had a condom slip or break (AOR 1.53, 95% CI 1.25 to 1.87) and difficulty suggesting condoms with non-paying partners (AOR 1.47, 95% CI 1.16 to 1.87). Violence was also associated with fear of health services (AOR 2.25, 95% CI 1.61 to 3.16) and mistreatment in a health centre (AOR 1.66, 95% CI 1.01 to 2.73). Access to justice was constrained for FSWs with a GBV history, specifically feeling that police did not protect them (AOR 1.41, 95% CI 1.12 to 1.78). Among FSWs in Cameroon, violence is prevalent and undermines HIV prevention and access to healthcare and justice. Violence is highly relevant to FSWs' ability to successfully negotiate condom use and engage in healthcare."

According to the news editors, the research concluded: "In this setting of criminalised sex work, an integrated, multisectoral GBV-HIV strategy that attends to structural risk is needed to enhance safety, HIV prevention and access to care and justice."

For more information on this research see: Gender-based violence against female sex workers in Cameroon: prevalence and associations with sexual HIV risk and access to
health services and justice. *Sexually Transmitted Infections*, 2016;92(8):599-604. *Sexually Transmitted Infections* can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. **Eye Diseases and Conditions - Age-Related Macular...**

**Findings from Johns Hopkins University Broaden Understanding of Age-Related Macular Degeneration (Statins for age-related macular degeneration)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Eye Diseases and Conditions - Age-Related Macular Degeneration have been presented. According to news reporting originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Age-related macular degeneration (AMD) is a progressive, late-onset disorder of the macula affecting central vision. It is the leading cause of blindness in people over 65 years in industrialized countries."

Our news editors obtained a quote from the research from Johns Hopkins University, "Recent epidemiologic, genetic, and pathologic evidence has shown that AMD shares a number of risk factors with atherosclerosis, leading to the hypothesis that statins may exert protective effects in AMD. The objective of this review was to examine the effectiveness of statins compared with other treatments, no treatment, or placebo in delaying the onset and progression of AMD. Search methods We searched the Cochrane Central Register of Controlled Trials (CENTRAL) (which contains the Cochrane Eyes and Vision Trials Register) (2016, Issue 3), Ovid MEDLINE, Ovid MEDLINE In-Process and Other Non-Indexed Citations, Ovid MEDLINE Daily, Ovid OLD MEDLINE (January 1946 to March 2016), EMBASE (January 1980 to March 2016), Latin American and Caribbean Health Sciences Literature Database (LILACS) (January 1982 to March 2016), PubMed (January 1946 to March 2016), the metaRegister of Controlled Trials (mRCT) (www.controlled-trials.com) (last searched 5 June 2014), ClinicalTrials.gov (www.clinicaltrials.gov), and the WHO International Clinical Trials Registry Platform (ICTRP) (www.who.int/ictrp/search/en). We did not use any date or language restrictions in the electronic searches for trials. We last searched the electronic databases on 31 March 2016. Selection criteria We included randomized controlled trials (RCTs) and quasi-
randomized trials that compared statins with other treatments, no treatment, or placebo in people who were diagnosed as having the early stages of AMD. Data collection and analysis We used standard methodological procedures expected by Cochrane. Two review authors independently evaluated the search results against the selection criteria, abstracted data, and assessed risk of bias. We did not perform meta-analysis due to heterogeneity in the interventions and outcomes between the included studies. Two RCTs with a total of 144 participants met the selection criteria. Both trials compared simvastatin versus placebo in older people (older than 50 or 60 years) with high risk of developing AMD (drusen present on examination). Overall, we judged the quality of the evidence to be low, as we downgraded all outcomes due to limitations in the designs of the trials and insufficient outcome reporting. The larger trial, with 114 participants, was conducted in Australia and used a higher dose (40 mg daily) of simvastatin for three years. Participants and study personnel in this trial were adequately masked, however data were missing for 30% of participants at three years' follow-up. The smaller trial, with 30 participants, was conducted in Italy and used a lower dose (20 mg) of simvastatin for three months. This trial reported insufficient details to assess the risk of bias. Neither trial reported data for change in visual acuity. Low-quality evidence from the smaller trial, with 30 participants, did not show a statistically significant difference between the simvastatin and placebo groups in visual acuity values at three months of treatment (decimal visual acuity 0.21 +/- 0.56 in simvastatin group and 0.19 +/- 0.40 in placebo group) or 45 days after the completion of treatment (decimal visual acuity 0.20 +/- 0.50 in simvastatin group and 0.19 +/- 0.48 in placebo group). The lack of a difference in visual acuity was not explained by lens or retina status, which remained unchanged during and after the treatment period for both groups. Partial results of 42 participants who had completed 12 months' follow-up in the larger trial did not show a statistically significant difference between simvastatin and the placebo groups for visual acuity, drusen score, or visual function (effect estimates and confidence intervals were not available). Complete data for these outcomes at three years' follow-up were not reported. At three years, low-quality evidence showed an effect of simvastatin in slowing progression of AMD compared with placebo to be uncertain (odds ratio 0.51, 95% confidence interval 0.23 to 1.09). One trial did not report adverse outcomes. The second trial reported no difference between groups in terms of adverse events such as death, muscle aches, and acute hepatitis.

According to the news editors, the research concluded: "Authors' conclusions Evidence from currently available RCTs is insufficient to conclude that statins have a role in preventing or delaying the onset or progression of AMD."

For more information on this research see: Statins for age-related macular degeneration. Cochrane Database of Systematic Reviews, 2016;(8):2109-2143. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news editors report that additional information may be obtained by contacting P. Gehlbach, Johns Hopkins University, Sch Med, Retina Div, Wilmer Eye Inst, Baltimore, MD 21231, United States. Additional authors for this research include T.J. Li and E. Hatef.

Findings from Johns Hopkins University Broaden Understanding of Pulmonary Hypertension (Update on novel targets and potential treatment avenues in pulmonary hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lung Diseases and Conditions - Pulmonary Hypertension. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Pulmonary hypertension (PH) is a condition marked by a combination of constriction and remodeling within the pulmonary vasculature. It remains a disease without a cure, as current treatments were developed with a focus on vasodilatory properties but do not reverse the remodeling component."

Funders for this research include HHS | NIH | National Heart, Lung, and Blood Institute (NHBLI), HHS | NIH | National Institute of Child Health and Human Development (NICHD).

Our news journalists obtained a quote from the research from Johns Hopkins University, "Numerous recent advances have been made in the understanding of cellular processes that drive pathologic remodeling in each layer of the vessel wall as well as the accompanying maladaptive changes in the right ventricle. In particular, the past few years have yielded much improved insight into the pathways that contribute to altered metabolism, mitochondrial function, and reactive oxygen species signaling and how these pathways promote the proproliferative, promigratory, and antiapoptotic phenotype of the vasculature during PH. Additionally, there have been significant advances in numerous other pathways linked to PH pathogenesis, such as sex hormones and perivascular inflammation."

According to the news editors, the research concluded: "Novel insights into cellular pathology have suggested new avenues for the development of both biomarkers and therapies that will hopefully bring us closer to the elusive goal: a therapy leading to reversal of disease."

Our news journalists report that additional information may be obtained by contacting L.A. Shimoda, Johns Hopkins Sch Med, Dept. of Med, Div Pulm & Crit Care Med, Baltimore, MD, United States. Additional authors for this research include K. Suresh, M. Bernier and L.A. Shimoda.

Findings from Johns Hopkins University Provide New Insights into HIV/AIDS (Context of First Same-Sex Condom Use and Nonuse in Young Black Gay and Bisexual Males)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - HIV/AIDS are presented in a new report. According to news reporting originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Despite high human immunodeficiency virus (HIV) rates among young Black men who have sex with men (YBMSM), there are limited data about condom use during first same-sex (FSS). This study sought to understand socio-contextual factors of 50 YBMSM aged 15-19 years that influenced condom use during FSS."

Financial supporters for this research include National Institute of Child Health and Human Development, ASTDA Development Award.

Our news editors obtained a quote from the research from Johns Hopkins University, "Condom use was influenced by individual, partner, and community factors. Individual factors—recent illness or sexually transmitted infections (STI)—prompted condom use, while frequent HIV testing prompted nonuse. Partner factors—proactive encouragement from partners—prompted condom use, while trust and condom discomfort prompted nonuse. Larger community factors—such as presence of females—were key for use, while limited sexual health information combined with peers who discouraged condoms prompted nonuse."

According to the news editors, the research concluded: "A multilevel approach may be useful in developing sexual health programming for these young men."

The news editors report that additional information may be obtained by contacting R. Arrington-Sanders, Johns Hopkins Sch Med, Baltimore, MD, United States. Additional authors for this research include A. Morgan, J. Oidtman, M.C. Gomez, A. Ogunbajo, M. Trent and J.D. Fortenberry.

Findings from Johns Hopkins University School of Medicine Broaden Understanding of Chronic Obstructive Pulmonary Disease (Safety and efficacy of tiotropium Respimat versus HandiHaler in patients naive to treatment with inhaled anticholinergics: ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease are presented in a new report. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "Patients with chronic obstructive pulmonary disease (COPD) who were naive to anticholinergics before the TIOtropium Safety and Performance In Respimat (TIOSPIR) trial may reflect patients seen in practice, in particular in primary care. In addition, investigating safety in these patients avoids the potential bias in patients who previously received anticholinergics and may be tolerant of their effects."

The news correspondents obtained a quote from the research from the Johns Hopkins University School of Medicine, "The aim of this study was to evaluate whether patients naive to anticholinergic therapy who were treated with tiotropium Respimat 2.5 or 5 mg had different safety and efficacy outcomes than patients treated with tiotropium HandiHaler 18 mg. A post hoc analysis of patients who were not receiving anticholinergics before TIOSPIR (N=6,966/17,135) was conducted. Primary end points were risk of death from any cause and risk of COPD exacerbation. Secondary outcomes included severe exacerbation and major adverse cardiovascular events (MACE). Additional analysis of exacerbations was carried out in anticholinergic-naive patients with moderate (GOLD II) disease. Anticholinergic-naive patients had less severe disease than the total TIOSPIR population. Discontinuations because of anticholinergic side effects were infrequent (0.9% overall). Similar to the primary study, patients in the tiotropium Respimat groups had no difference in the risk of death or risk of any or severe exacerbation than patients treated with tiotropium HandiHaler. Risk of MACE was similar across the Respimat and HandiHaler groups. Rates of exacerbations in the subgroup of patients with moderate disease were similar across the Respimat and HandiHaler groups."

According to the news reporters, the research concluded: "Tiotropium Respimat and HandiHaler have similar safety and efficacy profiles in patients who are naive to anticholinergic therapy."

For more information on this research see: Safety and efficacy of tiotropium Respimat versus HandiHaler in patients naive to treatment with inhaled anticholinergics: a post hoc analysis of the TIOSPIR trial. *Npj Primary Care Respiratory Medicine*, 2015;25():15067.

Oncology - Duodenal Cancer

Findings from Johns Hopkins University Update Knowledge of Duodenal Cancer (A Polycythemia Vera JAK2 Mutation Masquerading as a Duodenal Cancer Mutation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Duodenal Cancer. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "Next-generation sequencing (NGS) is increasingly being used in cancer care to identify both somatic tumor driver mutations that can be targeted for therapy, and heritable mutations in the germline associated with increased cancer risk. This report presents a case of a JAK2 V617F mutation falsely identified as a duodenal cancer mutation via NGS."

The news correspondents obtained a quote from the research from Johns Hopkins University. "The patient was found to have a history of polycythemia vera, a disorder with a high incidence of JAK2 somatic mutations. Buccal cell DNA showed heterozygosity for the mutation, suggesting that it was potentially germline. However, subsequent resequencing of tumor, adjacent normal tissue, and fingernail DNA confirmed the mutation was somatic, and its presence in tumor and buccal cells resulted from contaminating blood cells."

According to the news reporters, the research concluded: "This report highlights important nuances of NGS that can lead to misinterpretation of results with potential clinical implications."

For more information on this research see: A Polycythemia Vera JAK2 Mutation Masquerading as a Duodenal Cancer Mutation. *Journal of the National Comprehensive Cancer Network*, 2016;14(12):1495-1498. *Journal of the National Comprehensive Cancer Network* can be contacted at: Harborside Press, 37 Main St, Cold Spring Harbor, NY 11724, USA.

Findings from Johns Hopkins University in the Area of Cystic Fibrosis Described (A sequence upstream of canonical PDZ-binding motif within CFTR COOH-terminus enhances NHERF1 interaction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Cystic Fibrosis is the subject of a report. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "The development of cystic fibrosis transmembrane conductance regulator (CFTR) targeted therapy for cystic fibrosis has generated interest in maximizing membrane residence of mutant forms of CFTR by manipulating interactions with scaffold proteins, such as sodium/hydrogen exchange regulatory factor-1 (NHERF1). In this study, we explored whether COOH-terminal sequences in CFTR beyond the PDZ-binding motif influence its interaction with NHERF1."

Financial supporters for this research include Cystic Fibrosis Foundation Therapeutics (Cystic Fibrosis Foundation Therapeutics, Inc.), National Institute of Health.

Our news journalists obtained a quote from the research from Johns Hopkins University, "NHERF1 displayed minimal self-association in blot overlays (NHERF1, K-d = 1,382 +/- 61.1 nM) at concentrations well above physiological levels, estimated at 240 nM from RNA-sequencing and 260 nM by liquid chromatography tandem mass spectrometry in sweat gland, a key site of CFTR function in vivo. However, NHERF1 oligomerized at considerably lower concentrations (10 nM) in the presence of the last 111 amino acids of CFTR (20 nM) in blot overlays and cross-linking assays and in coimmunoprecipitations using differently tagged versions of NHERF1. Deletion and alanine mutagenesis revealed that a six-amino acid sequence (EENKVR1422)-E-1417 and the terminal (TRL1480)-T-1478 (PDZ-binding motif) in the COOH-terminus were essential for the enhanced oligomerization of NHERF1. Full-length CFTR stably expressed in Madin-Darby canine kidney epithelial cells fostered NHERF1 oligomerization that was substantially reduced (similar to 5-fold) on alanine substitution of EEN, KVR, or EENKVR residues or deletion of the TRL motif. Confocal fluorescent microscopy revealed that the EENKVR and TRL sequences contribute to preferential localization of CFTR to the apical membrane."

According to the news editors, the research concluded: "Together, these results indicate that COOH-terminal sequences mediate enhanced NHERF1 interaction and facilitate the localization of CFTR, a property that could be manipulated to stabilize mutant forms of CFTR at the apical surface to maximize the effect of CFTR-targeted therapeutics."

Gram-Negative Bacteria - Escherichia coli

Findings from Joint Genome Institute in the Area of Escherichia coli

Reported [Degradation of tris(2-chloroethyl) phosphate by ultraviolet-persulfate: Kinetics, pathway and intermediate impact on proteome of Escherichia coli]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Escherichia coli. According to news reporting out of Walnut Creek, California, by NewsRx editors, research stated, "Organophosphorus flame retardants (OPFRs) are commonly applied in many consumer products, resulting in their widespread distribution in water, soil and indoor air. It is in urgent need of developing efficient and safe removal methods for OPFRs."

Financial supporters for this research include National Natural Science Foundation of China, Science and Technology Planning Project of Guangdong Province.

Our news journalists obtained a quote from the research from Joint Genome Institute, "The degradation kinetics and mechanism of tris(2-chloroethyl) phosphate (TCEP), a representative OPFR, by ultraviolet-persulfate (UV/PS) were explored, and the toxicological assessment of degrading intermediate mixture was performed using isobaric tags for relative and absolute quantitation proteomic technology. The results indicated that UV/PS had a high transformation efficiency of TCEP ([TCEP](0) = 3.5 μM, [S2O8^2-](0) = 175 μM, apparent rate constant reached 0.1272 min^(-1)) with the generations of three primary intermediates, including C4H9Cl2O4P (m/z 222.97, 224.97), C6H13Cl2O5P (m/z 266.99, 268.99) and C2H6ClO4P (m/z 160.98, 162.97), through the selective electron-transfer reactions induced by activated sulfate radical. Compared to that of TCEP, the Escherichia coli ATCC11303 exposed to intermediate mixture expressed 64 up-regulated proteins those primarily associated with nutrient import, energy generation, DNA protection and signal transduction. The 86 down-regulated proteins were related to DNA repair, protein turnover and stress response, suggesting that the toxicity of the degrading intermediate mixture decreased significantly."

According to the news editors, the research concluded: "The current study provided insights into the molecular mechanisms of TCEP and its degrading intermediate mixture on E. coli, clarifying that the UV/PS degradation is an alternative efficient and safe treatment method for TCEP."

For more information on this research see: Degradation of tris(2-chloroethyl) phosphate by ultraviolet-persulfate: Kinetics, pathway and intermediate impact on proteome of Escherichia coli. Chemical Engineering Journal, 2017;308():386-395. Chemical Engineering Journal can be contacted at: Elsevier Science Sa, PO Box 564, 1001 Lausanne, Switzerland. Neuropeptides - Calcitonin

Findings from Justus-Liebig-University Broaden Understanding of Calcitonin [Spatial expression of components of a calcitonin receptor-like receptor (CRL) signalling system (CRL, calcitonin gene-related peptide, adrenomedullin, ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Neuropeptides - Calcitonin have been presented. According to news originating from Giessen, Germany, by NewsRx correspondents, research stated, "Heart valves are highly organized structures determining the direction of blood flow through the heart. Smooth muscle cells within the valve are thought to play an active role during the heart cycle, rather than just passive flaps."

Financial supporters for this research include German Academic Exchange Service (DAAD) to GM, Higher Education Commission (HEC) Pakistan to GM.

Our news journalists obtained a quote from the research from Justus-Liebig-University, "The mature heart valve is composed of extracellular matrix (ECM), various differentiations of valvular interstitial cells (VIC), smooth muscle cells and overlying endothelium. VIC are important for maintaining the structural integrity of the valve, thereby affecting valve function and ECM remodelling. Accumulating evidence suggests an important role of calcitonin receptor-like receptor (CRL) signalling in preventing heart damage under several pathological conditions. Thus we investigate the existence of a putative CRL signalling system in mouse and human heart valves by real-time RT-PCR, laser-assisted microdissection, immunofluorescence and NADPH-diaphorase histochemistry. Mouse and human heart valves expressed mRNAs for the CRL ligands adrenomedullin (AM), adrenomedullin-2 (AM-2) and calcitonin gene-related peptide (CGRP) and for their receptor components, i.e., CRL and receptor-activity-modifying proteins 1-3. Immunofluorescence analysis revealed AM-, AM-2- and CRL-immunolabelling in endothelial cells and VIC, whereas CGRP immunoreactivity was restricted to nerve fibres and some endothelial cells. Nitric oxide synthase activity, as demonstrated by NADPH-diaphorase histochemistry, was shown mainly in valvular endothelial cells in mice, whereas in human aortic valves, VIC and smooth muscle cells were positive."

According to the news editors, the research concluded: "Our results showed the
presence of an intrinsic AM/AM-2/CGRP signalling system in murine and human heart valves with distinct cellular localization, suggesting its involvement in the regulation of valve stiffness and ECM production and turnover."

For more information on this research see: Spatial expression of components of a calcitonin receptor-like receptor (CRL) signalling system (CRL, calcitonin gene-related peptide, adrenomedullin, adrenomedullin-2/intermedin) in mouse and human heart valves. *Cell and Tissue Research*, 2016;366(3):587-599. *Cell and Tissue Research* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Cell and Tissue Research - www.springerlink.com/content/0302-766x/)

The news correspondents report that additional information may be obtained from U. Pfeil, Justus Liebig Univ, Inst Anat & Cell Biol, Excellence Cluster Cardiopulm Syst, German Center Lung Res DZL, Giessen, Germany. Additional authors for this research include S. Bharathala, G. Murtaza, P. Mermer, T. Papadakis, A. Boening and W. Kummer.

**Oncology - Breast Cancer**

**Findings from K. Vazquez-Santillan et al in Breast Cancer Reported (NF-kappaB-inducing kinase regulates stem cell phenotype in breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting from Mexico City, Mexico, by NewsRx journalists, research stated, "Breast cancer stem cells (BCSCs) overexpress components of the Nuclear factor-kappa B (NF-kappa B) signaling cascade and consequently display high NF-kappa B activity levels. Breast cancer cell lines with high proportion of CSCs exhibit high NF-kappa B-inducing kinase (NIK) expression."

The news correspondents obtained a quote from the research, "The role of NIK in the phenotype of cancer stem cell regulation is poorly understood. Expression of NIK was analyzed by quantitative RT-PCR in BCSCs. NIK levels were manipulated through transfection of specific shRNAs or an expression vector. The effect of NIK in the cancer stem cell properties was assessed by mammosphere formation, mice xenografts and stem markers expression. BCSCs expressed higher levels of NIK and its inhibition through small hairpin (shRNA), reduced the expression of CSC markers and impaired clonogenicity and tumorigenesis. Genome-wide expression analyses suggested that NIK acts on ERK1/2 pathway to exert its activity. In addition, forced expression of NIK increased the BCSC population and enhanced breast cancer cell tumorigenicity. The in vivo relevance of these results is further supported by a
tissue microarray of breast cancer samples in which we observed correlated expression of Aldehyde dehydrogenase (ALDH) and NIK protein."

According to the news reporters, the research concluded: "Our results support the essential involvement of NIK in BCSC phenotypic regulation via ERK1/2 and NF-kappa B."

For more information on this research see: Scientific Reports, 2016;6():1-17. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Bone Research

Findings from K. Yamawaki and Co-Researchers in the Area of Bone Research Reported (The soluble form of BMPRIB is a novel therapeutic candidate for treating bone related disorders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Bone Research is now available. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Bone morphogenetic proteins (BMPs) are multi-functional growth factors that belong to the TGF-beta superfamily. Recently, several soluble BMP receptors, such as ActRIIA-Fc, ActRIIB-Fc, and ALK1-Fc, are undergoing clinical trials."

Our news journalists obtained a quote from the research, "Both BMPRIA and BMPRIB are type I BMP receptors, and while BMPRIA-Fc has been reported to have bone-increasing properties, there have been no investigations concerning the biological functions of BMPRIB-Fc. Therefore, comparing the effects of BMPRIA-Fc and BMPRIB-Fc in vivo should be helpful in revealing the differences in biological function between BMPRIA and BMPRIB, and would also aid in the evaluation of BMPRIB-Fc as a therapeutic agent. Here, we produced Tg chimeras in which BMPRIA-Fc and BMPRIB-Fc proteins circulated at high concentrations (36.8-121.4 mg/mL). Both Tg chimeras showed a significant increase of bone volume and strength. Using histological analysis, adenoma of the glandular stomach was observed only in BMPRIA-Fc chimeras suggesting the tumorigenic activity of this protein. Administration of recombinant BMPRIB-Fc protein to normal mice also increased bone volumes. Finally, treatment with BMPRIB-Fc decreased the area of osteolytic regions in a mouse model of breast cancer metastasis."

According to the news editors, the research concluded: "Our data suggest that
BMPRIB-Fc can be used for the treatment of bone-related disorders with a lower risk than BMPRIA-Fc."

For more information on this research see: The soluble form of BMPRIB is a novel therapeutic candidate for treating bone related disorders. *Scientific Reports*, 2016;6():18849. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Cardiovascular Diseases and Conditions - Thrombosis**

**Findings from K.A. Fiedler and Co-Researchers Advance Knowledge in Thrombosis (Impact of bivalirudin on post-procedural epicardial blood flow, risk of stent thrombosis and mortality after percutaneous coronary intervention)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Thrombosis are presented in a new report. According to news reporting from Munich, Germany, by NewsRx journalists, research stated, "We aimed to assess the association of bivalirudin with post-procedural Thrombolysis In Myocardial Infarction (TIMI) flow, acute (<=24 hours) and 30-day stent thrombosis (ST), and one-year mortality. The study included 11,623 patients undergoing percutaneous coronary intervention (PCI)."

The news correspondents obtained a quote from the research, "The primary outcomes were post-procedural TIMI flow grade (<=2) and definite acute ST. In groups treated with bivalirudin (n=3,135), abciximab plus unfractionated heparin (UFH; n=3,539) and UFH alone (n=4,949), post-procedural TIMI was (<=)2 in 5.2%, 3.2% and 3.2% of patients, respectively (adjusted odds ratio [OR]=1.96 [95% confidence interval] 1.47-2.56 for bivalirudin versus abciximab plus UFH and OR=1.56 [1.20-2.04] for bivalirudin versus UFH). Definite acute ST occurred in two patients (0.06%) treated with bivalirudin, two patients (0.06%) treated with abciximab plus UFH, and seven patients (0.14%) treated with UFH (p=0.47). Bivalirudin was not associated with increased risk of 30-day ST (hazard ratio [HR]=1.20 [0.59-2.43] versus abciximab plus UFH, and HR=0.93 [0.48-1.82] versus UFH) or one-year mortality (HR=0.95 [0.70-1.28] versus abciximab plus UFH, and HR=1.05 [0.78-1.41] versus UFH)."

According to the news reporters, the research concluded: "Bivalirudin was associated with higher risk of suboptimal post-PCI TIMI flow but not with increased risk of acute or 30-day definite ST or one-year mortality compared with abciximab plus UFH or UFH alone."

For more information on this research see: Impact of bivalirudin on post-procedural...

Our news journalists report that additional information may be obtained by contacting K.A. Fiedler, Deutsches Herzzentrum, Technische Universität, Munich, Germany. Additional authors for this research include G. Ndreppepa, S. Schulz, S. Floh, P. Hopppmann, S. Kufner, I. Bernlochner, R.A. Byrne, H. Schunkert, K.L. Laugwitz and A. Kastrati.

**Digestive System Diseases and Conditions -…**

**Findings from K.C. Hu and Colleagues Update Understanding of Pancreatitis (How Does Aging Affect Presentation and Management of Biliary Stones?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Digestive System Diseases and Conditions - Pancreatitis have been presented. According to news reporting out of Taipei, Taiwan, by NewsRx editors, research stated, "Common bile duct (CBD) stones are common in elderly adults, but the effect of aging on the presentation of CBD stones remains to be evaluated. Recent studies have demonstrated that the clinical presentation of CBD stones may vary with age."

Our news journalists obtained a quote from the research, "Younger adults may present with classical biliary colic symptoms, whereas elderly adults may have no unapparent clinical features. Younger adults with CBD stones were significantly more likely to have abnormal liver function tests than those without. The sensitivity and accuracy of transabdominal ultrasound scans in screening for CBD stones increases with age. Antibiotic agents should be promptly administered to individuals with CBD stones complicated by cholangitis, but the effects of pharmacotherapy on renal function should be considered in elderly adults. Endoscopic retrograde cholangiopancreatography (ERCP) is considered to be first-line treatment for CBD stones, and endoscopic biliary sphincterotomy (EST) or endoscopic papillary balloon dilation (EPBD) along with ERCP is an adequate biliary drainage method in individuals with CBD stones. EPBD has a lower bleeding risk but higher post-ERCP risk of pancreatitis than EST."

According to the news editors, the research concluded: "Longer-duration (>1 minute) EPBD may be preferred over EST because it is associated with a comparable risk of pancreatitis but a lower rate of overall complications, although recurrent cholangitis or unfavorable outcomes will increase during CBD dilation or in the presence of residual CBD stones."

Our news journalists report that additional information may be obtained by

Myelofibrosis

Findings from K.L. Davis and Colleagues Update Understanding of Myelofibrosis (Real-World Assessment of Clinical Outcomes in Patients with Lower-Risk Myelofibrosis Receiving Treatment with Ruxolitinib)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Myelofibrosis. According to news reporting out of Research Triangle Park, North Carolina, by NewsRx editors, research stated, "Few trial-based assessments of ruxolitinib in patients with lower-risk myelofibrosis (MF) have been conducted, and no studies have made such assessments in a real-world population. We assessed changes in spleen size and constitutional symptoms during ruxolitinib treatment using a retrospective, observational review of anonymized US medical record data of patients diagnosed with IPSS low-risk (n=25) or intermediate-1-risk (n=83) MF."

Our news journalists obtained a quote from the research, "The majority of patients were male (low risk, 60%; intermediate-1 risk, 69%). Most patients (92% and 77%) were still receiving ruxolitinib at the medical record abstraction date (median observation/exposure time, 8 months). The proportion of patients with moderate or severe palpable splenomegaly (\(>=10\) cm) decreased from diagnosis (56%) to best response (12%). Fatigue was reported in 47% of patients and was the most common constitutional symptom. For most symptoms in both risk groups, shifts in the distribution of severity from more to less severe from diagnosis to best response were observed. Both patients with low-risk and intermediate-1-risk MF experienced a substantial decrease in spleen size with ruxolitinib treatment in real-world settings. For most symptoms examined, there were distinct improvements in the distribution of severity during ruxolitinib treatment."

According to the news editors, the research concluded: "These findings suggest that patients with lower-risk MF may benefit clinically from ruxolitinib treatment."

For more information on this research see: Real-World Assessment of Clinical Outcomes in Patients with Lower-Risk Myelofibrosis Receiving Treatment with Ruxolitinib. Advances In Hematology, 2015;2015():848473. (Hindawi Publishing - www.hindawi.com; Advances In Hematology - www.hindawi.com/journals/ah/)

Our news journalists report that additional information may be obtained by contacting K.L. Davis, RTI Health Solutions, Research Triangle Park, NC 27709, United States. Additional authors for this research include I. Cote, J.A. Kaye, E. Mendelson, H. Gao and J.
Propanolamines

Findings from K.M. Mohamed and Co-Researchers in the Area of Propanolamines Described (A GC-MS Method for Detection and Quantification of Cathine, Cathinone, Methcathinone and Ephedrine in Oral Fluid)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Propanolamines have been published. According to news reporting out of Riyadh, Saudi Arabia, by NewsRx editors, research stated, "The stimulating herbal drug khat (cathine, cathinone) and its analog methcathinone are common substances of abuse in most countries. A GC-MS method was developed and validated for the detection and quantification of cathine, cathinone, methcathinone and ephedrine in oral fluid specimens."

Our news journalists obtained a quote from the research, "The analytes and internal standard (amphetamine-d5) were extracted from 0.5 mL oral fluids by ethyl acetate, and then the dried extracts were derivatized with heptafluorobutyric anhydride at 70 degrees C for 30 min. The MS was used in selected ion monitoring mode. Ions monitored were m/z 117, 240 and 330 for cathine, m/z 77, 105 and 240 for cathinone, m/z 105, 210 and 254 for methcathinone, m/z 210, 254 and 344 for ephedrine and m/z 244 and 336 for amphetamine-d(5). The calibration curves were linear (r(2) > 0.98) in the concentration range 20-2,000 ng/mL for all analytes. The intra-and inter-assay imprecisions were within (1.6-12.5%) and (1.5-9.5%), respectively, for all analytes. Intra-assay accuracies were between -5.9 and 6.7% for all analytes."

According to the news editors, the research concluded: "The method was successfully applied to detect and quantify the target analytes from oral fluid specimens collected from Khat and methcathinone users."

Our news journalists report that additional information may be obtained by contacting K.M. Mohamed, Naif Arab Univ Secur Sci, Coll Forens Sci, Forens Chem Department, Riyadh, Saudi Arabia. Additional authors for this research include A.H. Al-Hazmi, A.M. Alasiri and M.E. Ali.

Peptides - Oligopeptides

Findings from Kangwon National University Broaden Understanding of Oligopeptides (Genetic overexpressing of GPx-1 attenuates cocaine-induced renal toxicity via induction of anti-apoptotic factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptides - Oligopeptides. According to news reporting from Chunchon, South Korea, by NewsRx journalists, research stated, "The present study investigates the role of the glutathione peroxidase (GPx)-1 gene in cocaine-induced renal damage in mice. Multiple doses of cocaine increased lipid peroxidation, protein oxidation, and glutathione oxidation in the kidney of the non-transgenic mice (non-TG mice)."

Funders for this research include National Research Foundation of Korea, Korea Food and Drug Administration.

The news correspondents obtained a quote from the research from Kangwon National University, "The enzymatic activities of GPx and glutathione reductase were significantly decreased in non-TG mice, whereas superoxide dismutase was increased in the early phase of cocaine exposure. Treatment with cocaine resulted in significant decreases in expression of Bcl-2 and Bcl-x1 in the kidney of non-TG mice, which resulted in significant increases in Bax and cleaved-caspase 3. Consistently, cocaine-induced tubular epithelial vacuolization and focal tubular necrosis were mainly observed in the proximal tubules in the kidneys of non-TG mice. These renal pathologic changes were much less pronounced in GPx-1 TG than in non-TG mice."

According to the news reporters, the research concluded: "These results suggest that the GPx-1 gene is a protective factor against nephrotoxicity induced by cocaine via interactive modulations between antioxidant and cell survival signaling processes."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1440-1681.12557. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from Kaohsiung Medical University Hospital Provides New Data about Rheumatoid Arthritis (Soluble vascular cell adhesion molecular-1 is a potential biological indicator of hemophilic arthropathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Autoimmune Diseases and Conditions - Rheumatoid Arthritis is now available. According to news reporting originating from Kaohsiung, Taiwan, by NewsRx correspondents, research stated, "Hemophilic arthropathy is the most common chronic complication in patients with hemophilia. The pathogenesis of hemophilic arthropathy involves the inflammatory processes associated with rheumatoid arthritis (RA)."

Our news editors obtained a quote from the research from Kaohsiung Medical University Hospital, "Determining the severity and/or progression of joint damage is crucial when evaluating the effect of treatment modalities. Identifying reliable biomarkers in the peripheral blood of patients with hemophilic arthropathy may be beneficial in clinical practice. Circulating soluble vascular cell adhesion molecule-1 (sVCAM-1), E-selectin, and P-selectin levels are elevated in patients with RA. Our study investigated whether these soluble adhesion molecules can be used as biological indicators in the course of joint damage in patients with hemophilia A. Patients with hemophilia A (mild, moderate, and severe) were enrolled. The plasma levels of sVCAM-1, E-selectin, and P-selectin in patients with hemophilia A and control were measured using specific enzyme-linked immunosorbent assay kits. Joint damages were evaluated using Pettersson scores. No statistically significant differences were observed in E-selectin and P-selectin levels between patients and controls. The sVCAM-1 level was significantly higher in patients with hemophilia A than in controls. The differences remained significant in patients with severe hemophilia A but not in patients with mild or moderate hemophilia A. The degree of hemophilic arthropathy was evaluated using Pettersson scores, and a score higher than 5 indicated marked arthropathy."

According to the news editors, the research concluded: "Patients with more than 1 joint with marked arthropathy showed significantly higher sVCAM-1 levels. sVCAM-1 levels in patients with hemophilia A are associated with the severity of hemophilic arthropathy."

For more information on this research see: Soluble vascular cell adhesion molecular-1 is a potential biological indicator of hemophilic arthropathy. Medicine, 2016;95 (46):283-288. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Findings from Kaohsiung Medical University Provides New Data about Cell Adhesion Molecules (G9a orchestrates PCL3 and KDM7A to promote histone H3K27 methylation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cell Research - Cell Adhesion Molecules have been published. According to news reporting originating from Kaohsiung, Taiwan, by NewsRx correspondents, research stated, "Methylation of histone H3-lysine 9 (H3K9) and H3K27 by the methyltransferase G9a and polycomb repressive complex 2 (PRC2) inhibits transcription of target genes. A crosstalk between G9a and PRC2 via direct physical interaction has been shown recently."

Our news editors obtained a quote from the research from Kaohsiung Medical University, "Here, we demonstrate an alternative mechanism by which G9a promotes H3K27 methylation. Overexpression of G9a increases both H3K9 and H3K27 methylation, reduces E-cadherin expression, and induces epithelial-mesenchymal transition in PANC-1 pancreatic cancer cells. Conversely, the depletion of G9a or ectopic expression of methyltransferase-dead G9a in G9a-overexpressing gemcitabine-resistant PANC-1-R cells exhibits opposite effects. G9a promotes H3K27 methylation of the E-cadherin promoter by upregulating PCL3 to increase PRC2 promoter recruitment and by downregulating the H3K27 demethylase KDM7A to silence E-cadherin gene. The depletion of PCL3 or overexpression of KDM7A elevated expression of E-cadherin in PANC-1-R cells while ectopic expression of PCL3 or knockdown of KDM7A downregulated E-cadherin in PANC-1 cells."

According to the news editors, the research concluded: "Collectively, we provide evidence that G9a orchestrates the dynamic balance within histone-modifying enzymes to regulate H3K27 methylation and gene expression."

For more information on this research see: G9a orchestrates PCL3 and KDM7A to promote histone H3K27 methylation. Scientific Reports, 2015;5():18709. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Lung Diseases and Conditions - Asthma

Findings from Kaohsiung Medical University in the Area of Asthma Reported (Protective effects of elafin against adult asthma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Asthma. According to news reporting from Kaohsiung, Taiwan, by NewsRx journalists, research stated, "Elafin inhibits serine proteases, such as human neutrophil elastase and proteinase 3, to prevent excessive damage during inflammation. However, the relationship between elafin and asthma is still unclear."

The news correspondents obtained a quote from the research from Kaohsiung Medical University, "Microarray technology was used to evaluate smoking-and asthma-related biomarkers in a discovery-driven manner. We identified candidate genes, e.g., proteinase inhibitor 3 (PI3), related to asthma and smoking from gene expression microarray data sets and evaluated their potential as biomarkers for asthma. We used human genome microarray data sets from smoking-and asthma-related gene expression data sets and performed real-time quantitative polymerase chain reaction to measure and validate differences in gene expression. We also recruited adult patients with asthma and age-and sex-matched control patients who were administered a structured questionnaire and evaluated for lung function and plasma elafin levels, which are encoded by the PI3 gene. Six significantly altered candidate genes, PI3, protein kinase C iota, phosphoserine phosphatase, IQ motif-containing GTPase activating protein 1, interleukin 13 receptor a 1, and signal transducing adaptor molecule SH3 domain and ITAM motif 2, were identified from comparisons across the four asthma-and four smoking-related data sets included in this study. An in vitro study of human airway epithelial cells (A549) and a human monocytic cell line (THP-1) demonstrated that PI3 messenger RNA levels were significantly altered by nicotine exposure. Elafin concentration was significantly higher in control patients than in patients with asthma (p <0.001). The plasma elafin concentration in the highest quartile ( (>=)12.69 ng/mL) was inversely associated with asthma (adjusted odds ratio 0.122 [95% confidence interval, 0.053-0.278]) compared with the lowest quartile (<5.82 ng/mL) after adjusting for age, sex, smoking status, waist-to-hip ratio, percentage predicted forced expiratory volume in 1 second, cockroaches in the home, incense burning, and family history. Our study revealed that high elafin levels identified in smoking-and asthma-related microarray data sets and an epidemiologic study significantly reduced the risk of asthma."

According to the news reporters, the research concluded: "Further studies of elafin as a potential therapy for asthma are warranted."

For more information on this research see: Protective effects of elafin against adult asthma. Allergy and Asthma Proceedings, 2016;37(2):15-24.

Our news journalists report that additional information may be obtained by contacting Y.S. Tsai, Dept. of Public Health, College of Health Science, Kaohsiung Medical University, Kaohsiung, Taiwan. Findings from Karolinska Institute Broaden Understanding of Microcirculation (Fetal growth is associated with first-trimester maternal vascular function)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Microcirculation have been published. According to news reporting from Stockholm, Sweden, by NewsRx journalists, research stated, "To investigate the relationship between maternal endothelial function in the first trimester, assessed in both the brachial artery and the forearm skin microcirculation, and fetal growth. Vascular function was assessed in 56 pregnant women during gestational weeks 11-14."

The news correspondents obtained a quote from the research from Karolinska Institute, "Vascular reactivity in the brachial artery was evaluated by postischemic hyperemia-induced flow-mediated vasodilatation (FMD) and by vasodilatation following administration of sublingual glyceryl trinitrate (GTN). Forearm skin microcirculation was investigated by laser Doppler perfusion imaging during iontophoresis of acetylcholine (ACh) and sodium nitroprusside (SNP) to assess endothelium-dependent and -independent microvascular vasodilatation, respectively. Fetal growth was measured at study inclusion and birth-weight centile was calculated after delivery. FMD and GTN-induced vasodilatation were both associated with birth-weight centile. On multivariate analysis (adjusted for brachial artery diameter at rest, blood pressure, maternal age and heart rate), for FMD beta=1.7 (95% CI, 0.06-3.34), r(2) = 0.26 and P=0.042, and for GTN-induced vasodilatation beta=2.6 (95% CI, 0.44-4.68), r(2) = 0.15 and P=0.02. Endothelium-dependent and -independent microvascular reactivity were also associated with birth-weight centile: for ACh beta=7.82 (95% CI, 1.81-13.83), r(2) = 0.12 and P=0.029, and for SNP beta=6.27 (95% CI, 1.20-11.34), r(2)=0.11 and P=0.016. First-trimester maternal vascular dilatation capacity (rather than endothelial function alone) is associated with fetal growth."

According to the news reporters, the research concluded: "These findings were consistent in both the brachial artery and the forearm skin microcirculation."

Our news journalists report that additional information may be obtained by contacting C. Iacobaus, Karolinska Inst, Danderyd Hospital, Dept. of Clin Sci, Div Östhet & Gynecol, SE-18288 Stockholm, Sweden. Additional authors for this research include T. Kahan, G. Jorneskog, K. Bremme, M. Thorsell and E. Andolf.

Keywords for this news article include: Stockholm, Sweden, Europe, Microcirculation, Brachial Artery, Endothelium, Hematology, Angiology, Karolinska Institute.

Drugs and Therapies - Toxicology and Pharmacology

Findings from Karolinska Institute Update Understanding of Toxicology and Pharmacology (Testing in artificial sweat - Is less more? Comparison of metal release in two different artificial sweat solutions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Toxicology and Pharmacology. According to news reporting originating from Stockholm, Sweden, by NewsRx correspondents, research stated, "Metal release from materials immersed in artificial sweat can function as a measure of potential skin exposure. Several artificial sweat models exist that, to various degree, mimic realistic conditions."

Our news editors obtained a quote from the research from Karolinska Institute, "Study objective was to evaluate metal release from previously examined and well characterized materials in two different artificial sweat solutions; a comprehensive sweat model intended for use within research, based on the composition of human sweat; and the artificial sweat, EN1811, intended for testing compliance with the nickel restriction in REACH. The aim was to better understand whether there are advantages using either of the sweat solutions in bio-elution testing of materials. Metal release in two different artificial sweat solutions was compared for discs of a white gold alloy and two hard metals, and a rock drilling insert of tungsten carbide at 1 h, 24 h, 1 week and 1 month. The released amount of metal was analysed by means of inductively coupled plasma mass spectrometry. Similar levels of released metals were measured from test materials in the two different artificial sweat solutions."

According to the news editors, the research concluded: "For purposes in relation to legislations, it was concluded that a metal release test using a simple artificial sweat composition may provide results that sufficiently indicate the degree of metal release at skin contact."

For more information on this research see: Testing in artificial sweat - Is less more? Comparison of metal release in two different artificial sweat solutions. Regulatory Toxicology and Pharmacology, 2016:81():381-386. Oncology - Leukemia

Findings from Karolinska University Hospital Update Understanding of Leukemia [Role of ribosomal protein mutations in tumor development (Review)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Leukemia. According to news reporting originating in Stockholm, Sweden, by NewsRx journalists, research stated, "Ribosomes are cellular machines essential for protein synthesis. The biogenesis of ribosomes is a highly complex and energy consuming process that initiates in the nucleolus."

The news reporters obtained a quote from the research from Karolinska University Hospital, "Recently, a series of studies applying whole-exome or whole-genome sequencing techniques have led to the discovery of ribosomal protein gene mutations in different cancer types. Mutations in ribosomal protein genes have for example been found in endometrial cancer (RPL22), T-cell acute lymphoblastic leukemia (RPL10, RPL5 and RPL11), chronic lymphocytic leukemia (RPS15), colorectal cancer (RPS20), and glioma (RPL5). Moreover, patients suffering from Diamond-Blackfan anemia, a bone marrow failure syndrome caused by mutant ribosomal proteins are also at higher risk for developing leukemia, or solid tumors. Different experimental models indicate potential mechanisms whereby ribosomal proteins may initiate cancer development. In particular, deregulation of the p53 tumor suppressor network and altered mRNA translation are mechanisms likely to be involved. We envisage that changes in expression and the occurrence of ribosomal protein gene mutations play important roles in cancer development."

According to the news reporters, the research concluded: "Ribosome biology constitutes a re-emerging vital area of basic and translational cancer research."

Our news correspondents report that additional information may be obtained by contacting K.M. Goudarzi, Dept. of Oncology-Pathology, Karolinska Institutet, Cancer Center Karolinska, CCK R8:05, Karolinska University Hospital in Solna, Stockholm, Sweden.

Heart Disorders and Diseases - Heart Failure

Findings from Kasugai Municipal Hospital Has Provided New Data on Heart Failure (Clinical characteristics of patients hospitalized for acute heart failure according to hospital arrival timing)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Failure are presented in a new report. According to news originating from Kasugai, Japan, by NewsRx correspondents, research stated, "Whether clinical characteristics and outcomes in patients suffering acute heart failure (AHF) vary according to the timing of hospital arrival is unclear. We aimed to evaluate differences between subjects presenting in the daytime and nighttime."

Our news journalists obtained a quote from the research from Kasugai Municipal Hospital, "A total of 679 patients with AHF were examined, classified into the two groups from the viewpoint of hospital arrival period into daytime (n = 370; 8 am-6 pm) and nighttime (n = 309; 6 pm-8 am). The prevalence of malnutrition and longer pre-hospital delay (>= 48 h) were greater, whereas a previous history of myocardial infarction, proportion of arrival by ambulance, and the frequency of New York Heart Association class IV symptoms, as well as systolic and diastolic blood pressure, and heart rate were lower in subjects presenting in the daytime. Patients with malnutrition defined as >= of the Controlling Nutrition Status scores demonstrate a longer pre-hospital delay compared to those without (34.2% vs. 19.9%, p< 0.05). There was no significant difference in the 30-day outcomes but length of stay was significantly longer in subjects presenting in the daytime than in the nighttime. Multivariable logistic regression analysis revealed that systolic blood pressure, malnutrition, and chronic kidney disease were significantly related to prolonged length of stay."

According to the news editors, the research concluded: "Our present results suggest that patients with AHF who present in the daytime may have higher rate of malnutrition status and lower systolic blood pressure compared to those presenting in the nighttime."

For more information on this research see: Clinical characteristics of patients hospitalized for acute heart failure according to hospital arrival timing. Journal of Cardiology, 2016;68(5-6):379-383. Heart Disorders and Diseases - Atrial Fibrillation

Findings from Kidney Disease Center Broadens Understanding of Atrial Fibrillation (Presence of Atrial Fibrillation at the Time of Dialysis Initiation Is Associated with Mortality and Cardiovascular Events)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Atrial Fibrillation. According to news originating from Nagoya, Japan, by NewsRx correspondents, research stated, "Death in dialysis patients results mainly from cardiovascular and cerebrovascular diseases. To our knowledge, no prospective study has compared the rates of mortality or cardiovascular events between patients with and without atrial fibrillation (AF) at the time of dialysis initiation."

Our news journalists obtained a quote from the research from Kidney Disease Center, "This study included 1,516 patients who were initiated into dialysis between October 2011 and August 2013. Rates of mortality and cardiovascular events were compared between patients with and without AF, and between AF patients with and without warfarin (WF) treatment. The study comprised 1,025 men and 491 women with a mean age of 67.5 ? 13.1. Of these patients, 93 had AF, while 1,423 did not; 22.6% of the former group and 9.7% of the latter group died by March 2014 (p <0.01). Cardiovascular events occurred in 34.4% of patients with AF and 15.1% of patients without (p <0.01). Even after adjustments for various factors, AF remained an independent risk factor for mortality (hazard ratio (HR) 1.873, 95% CI 1.168-3.002, p<0.01). It was also an independent risk factor for cardiovascular events (HR 1.872, 95% CI 1.262-2.778, p<0.01). No difference in any parameter was noted between the groups that did and did not receive WF treatment. Patients with AF at the time of dialysis initiation show a poor prognosis and are at high risk of cardiovascular events."

According to the news editors, the research concluded: "Therefore, AF should be taken into consideration in dialysis patients."

The news correspondents report that additional information may be obtained from A. Tanaka, Kidney Disease Center, Japanese Red Cross Nagoya Daini Hospital, Nagoya, Japan. Additional authors for this research include D. Inaguma, H. Shinjo, M. Murata and A. Takeda.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Non-Hodgkin Lymphoma. According to news reporting originating in Bengaluru, India, by NewsRx journalists, research stated, "Lenalidomide an immunomodulatory agent has shown activity in relapsed/refractory lymphoma. This study was conducted to evaluate its efficacy and optimal dose in Indian patients with relapsed/refractory lymphoma who were unable or unwilling to undergo autologous hematopoietic stem cell transplant."

The news reporters obtained a quote from the research from the Kidwai Memorial Institute of Oncology, "Patients received oral lenalidomide at 20 mg on days 1-21 every 28 days until disease progression or unacceptable toxicity. A total of 25 patients received lenalidomide at a starting dose of 20 mg. Majority of patients were diffuse large B-cell lymphoma (DLBCL). The overall response rate (ORR) was 48%, with 16% achieved complete remission (CR)/unconfirmed CR (CRu), 32% partial response (PR) and 16% stable disease (SD) Among patients with DLBCL the ORR was of 33.3%; with CR/CRu 20%, PR (13.3%), 20% had SD, progressive disease (PD) was seen in seven patients (46.6%). All follicular lymphoma patients responded to treatment, with CR in one patient and PR in other two. Among patients with mantle cell lymphoma, ORR was 75% with PR in (75%) and SD in 25%. One case of transformed lymphoma had a PR and peripheral T-cell lymphoma had no response to treatment. The median duration of response was 8.5 months, with a time to response of 3 months. Median progression free survival was not reached in responding patients."

According to the news reporters, the research concluded: "Lenalidomide is an effective treatment option in relapsed refractory non-hodgkin's lymphoma."

Our news correspondents report that additional information may be obtained by contacting K.S. Rachan Shetty, Dept. of Medical Oncology, Kidwai Memorial Institute of Oncology, Bengaluru, Karnataka, India. Additional authors for this research include K.S. Rachan Shetty, V. Sathyanarayanan, D. **Coronavirus**

**Findings from King Saud bin Abdulaziz University for Health Sciences Yields New Findings on Coronavirus (Middle East respiratory syndrome coronavirus on inanimate surfaces: A risk for health care transmission)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Coronavirus have been published. According to news reporting originating in Riyadh, Saudi Arabia, by NewsRx journalists, research stated,
"The Middle East Respiratory syndrome coronavirus (MERS-CoV) has been responsible for multiple health care-associated outbreaks. We investigated whether high-touch surfaces in 3 rooms of laboratory-confirmed MERS-CoV patients were contaminated with MERS-CoV RNA."

The news reporters obtained a quote from the research from King Saud bin Abdulaziz University for Health Sciences, "We found 2 out of 51 surfaces were contaminated with MERS-CoV viral genetic material. Hence, environmental contamination may be a potential source of health care transmission and outbreaks."

According to the news reporters, the research concluded: "Meticulous environmental cleaning may be important in preventing transmission within the health care setting."

Our news correspondents report that additional information may be obtained by contacting R.M. Khan, King Saud bin Abdulaziz Univ Hlth Sci, King Abdullah Int Med Res Center, Dept. of Intens Care, Riyadh, Saudi Arabia. Additional authors for this research include H.M. Al-Dorzi, S. Al Johani, H.H. Balkhy, T.H. Alenazi, S. Baharoon and Y.M. Arabi.

Retinal Neurons

Findings from Kitasato University in Retinal Neurons Reported (Apelin-36 is protective against N-methyl-D-aspartic-acid-induced retinal ganglion cell death in the mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Retinal Neurons have been published. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "Retinal ganglion cell death in glaucoma is caused at least in part by a large Ca2+ influx through N-methyl-D-aspartic acid (NMDA) receptors. Apelin is a peptide originally found in the tissue extracts of bovine stomach."

Financial support for this research came from Japan Society for the Promotion of Science Grant-in-Aid for Scientific Research (C).

The news reporters obtained a quote from the research from Kitasato University, "Recent studies have been shown that apelin protects against the ischemic-reperfused injury in the brain. We examined whether apelin had protective effects on the NMDA-induced retinal ganglion cell (RGC) death using B6.Cg-TgN(Thyl-CFP)23Jrs/J transgenic mice, which express the enhanced cyan fluorescent protein in RGCs in the retina, in vivo. The mice were anesthetized by ketamine and xylazine, and NMDA (40 nmol/eye) was intravitreally injected."
We evaluated the effects of apelin-13, [Glp(1)]-apelin-13, a potent agonist of apelin receptor, and apelin-36 on the NMDA-induced retinal ganglion cell death. NMDA-induced retinal ganglion cell loss was clearly seen 7 days after NMDA injection. Intravitreal apelin-36 (0.33 nmol/eye), but not apelin-13 (1 nmol/eye) nor [Glp(1)]-apelin-13 (1 nmol/eye), simultaneously injected with NMDA significantly reduced the cell loss. The protective effect of apelin-36 was not reduced by ML221 (0.1 nmol/eye; 5-[(4-Nitrobenzooyl)oxy]-2-[(2-pyrimidinylthio)methyl]-4H-pyran-4-one), an apelin receptor antagonist, GF109203X (0.03 nmol/eye), a protein kinase C inhibitor, U0126 (0.2 nmol/eye), a MAPK/ERK kinase inhibitor, LY294002 (0.1 nmol/eye), a phosphoinositide 3-kinase inhibitor, Akti 1/2 (0.05 nmol/eye), an Akt inhibitor, or 4,5,6,7-tetrabromobenzotriazole (0.2 nmol/eye), a casein kinase-2 inhibitor. In addition, human apelin-36 did not affect the kainic-acid (20 nmol/eye)-induced ganglion cell death.

According to the news reporters, the research concluded: "The present study suggests that apelin-36 protects against the NMDA-induced ganglion cell death independently of the activation of apelin receptor in the murine retina in vivo."

Our news correspondents report that additional information may be obtained by contacting K. Sakamoto, Kitasato University, Sch Pharmaceut Sci, Dept. of Mol Pharmacol, Tokyo 1088641, Japan. Additional authors for this research include Y. Murakami, S. Sawada, H. Ushikubo, A. Mori, T. Nakahara and K. Ishii.

### Amrinone

**Findings from Kobe University Hospital Has Provided New Data on Amrinone (Impact of Milrinone Administration in Adult Cardiac Surgery Patients: Updated Meta-Analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Amrinone have been published. According to news reporting originating from Hyogo, Japan, by NewsRx correspondents, research stated, "To determine the effects of milrinone on short-term mortality in cardiac surgery patients with focus on the presence or absence of heterogeneity of the effect. A systematic review and meta-analysis."

Our news editors obtained a quote from the research from Kobe University Hospital, "Five hundred thirty-seven adult cardiac surgery patients from 12 RCTs. Milrinone
administration. The authors conducted a systematic Medline and Pubmed search to assess the effect of milrinone on short-term mortality in adult cardiac surgery patients. Subanalysis was performed according to the timing for commencement of milrinone administration and the type of comparators. The primary outcome was any short-term mortality. Overall analysis showed no difference in mortality rates in patients who received milrinone and patients who received comparators (odds ratio = 1.25, 95% CI 0.45-3.51, p = 0.67). In subanalysis for the timing to commence milrinone administration and the type of comparators, odds ratio for mortality varied from 0.19 (placebo as control drug, start of administration after cardiopulmonary bypass) to 2.58 (levosimendan as control drug, start of administration after cardiopulmonary bypass). Among RCTs to assess the effect of milrinone administration in adult cardiac surgery patients, there are wide variations of the odds ratios of administration of milrinone for short-term mortality according to the comparators and the timing of administration.

According to the news editors, the research concluded: "This fact may suggest that a simple pooling meta-analysis is not applicable for assessing the risk and benefit of milrinone administration in an adult cardiac surgery cohort."

The news editors report that additional information may be obtained by contacting M. Egi, Kobe Univ Hosp, Dept. of Anesthesiol, Kobe, Hyogo, Japan. Additional authors for this research include M. Egi, J. Wakabayashi, T. Nishimura, Y. Miyatake, N. Obata and S. Mizobuchi.

**Oncology - Colon Cancer**

**Findings from Koc University in the Area of Colon Cancer Reported (Evidence-based medical oncology and interventional radiology paradigms for liver-dominant colorectal cancer metastases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting out of Istanbul, Turkey, by NewsRx editors, research stated, "Colorectal cancer metastasizes predictably, with liver predominance in most cases. Because liver involvement has been shown to be a major determinant of survival in this population, liver-
directed therapies are increasingly considered even in cases where there is (limited) extrahepatic disease."

Our news journalists obtained a quote from the research from Koc University, "Unfortunately, these patients carry a known risk of recurrence in the liver regardless of initial therapy choice. Therefore, there is a demand for minimally invasive, non-surgical, personalized cancer treatments to preserve quality of life in the induction, consolidation, and maintenance phases of cancer therapy."

According to the news editors, the research concluded: "This report aims to review evidence-based conceptual, pharmacological, and technological paradigm shifts in parenteral and percutaneous treatment strategies as well as forthcoming evidence regarding next-generation systemic, locoregional, and local treatment approaches for this patient population."

Our news journalists report that additional information may be obtained by contacting A.A. Sag, Alan Alper Sag, Division of Interventional Radiology, Dept. of Radiology, Koc University School of Medicine, Istanbul 34450, Turkey. Additional authors for this research include F. Selcukbiricik and N.M Mandel.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i11.3127. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Turkey, Eurasia, Istanbul, Oncology, Radiology, Colon Cancer, Article Review, Gastroenterology, Colorectal Research, Risk and Prevention.

**Enzymes and Coenzymes - Ligases**

**Findings from Konkuk University Broaden Understanding of Ligases (LIN-23, an E3 Ubiquitin Ligase Component, Is Required for the Repression of CDC-25.2 Activity during Intestinal Development in Caenorhabditis elegans)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Enzymes and Coenzymes - Ligases are discussed in a new report. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Caenorhabditis elegans (C. elegans) utilizes two different cell-cycle modes, binucleations during the L1 larval stage and endoreduplications at four larval moltings, for its postembryonic intestinal development. Previous genetic studies indicated that CDC-25.2 is specifically required for binucleations at the L1 larval stage and is repressed before endoreduplications."

Our news journalists obtained a quote from the research from Konkuk University, "Furthermore, LIN-23, the C. elegans beta-TrCP ortholog, appears to function as a repressor of CDC-25.2 to prevent excess intestinal divisions. We previously reported that intestinal..."
hyperplasia in lin-23(e1883) mutants was effectively suppressed by the RNAi depletion of cdc-25.2. Nevertheless, LIN-23 targeting CDC-25.2 for ubiquitination as a component of E3 ubiquitin ligase has not yet been tested. In this study, LIN-23 is shown to be the major E3 ubiquitin ligase component, recognizing CDC-25.2 to repress their activities for proper transition of cell-cycle modes during the C. elegans postembryonic intestinal development.

According to the news editors, the research concluded: "In addition, for the first time that LIN-23 physically interacts with both CDC-25.1 and CDC-25.2 and facilitates ubiquitination for timely regulation of their activities during the intestinal development."

The news correspondents report that additional information may be obtained from Y.H. Shim, Konkuk University, Dept. of Biosci & Biotechnol, Seoul 05029, South Korea. Additional authors for this research include I. Kawasaki, B.K. Oh and Y.H. Shim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.14348/molcells.2016.0238. This DOI is a link to an online electronic document that is either free or for purchase.

Enzymes and Coenzymes - Fatty Acid Desaturases

Findings from Korea Polar Research Institute in Fatty Acid Desaturases Reported (Characterization of Stearoyl-CoA Desaturases from a Psychrophilic Antarctic Copepod, Tigriopus kingsejongensis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - Fatty Acid Desaturases. According to news originating from Inchon, South Korea, by NewsRx correspondents, research stated, "Stearoyl-CoA desaturase is a key regulator in fatty acid metabolism that catalyzes the desaturation of stearic acid to oleic acid and controls the intracellular levels of monounsaturated fatty acids (MUFAs). Two stearoyl-CoA desaturases (SCD, Delta 9 desaturases) genes were identified in an Antarctic copepod, Tigriopus kingsejongensis, that was collected in a tidal pool near the King Sejong Station, King George Island, Antarctica."

Our news journalists obtained a quote from the research from Korea Polar Research Institute, "Full-length complementary DNA (cDNA) sequences of two T. kingsejongensis SCDs (TkSCDs) were obtained from next-generation sequencing and isolated by reverse transcription PCR. DNA sequence lengths of the open reading frames of TkSCD-1 and TkSCD-2 were determined to be 1110 and 681 bp, respectively. The molecular weights deduced from the corresponding genes were estimated to be 43.1 kDa (TkSCD-1) and 26.1 kDa (TkSCD-2). The
Amino acid sequences were compared with those of fatty acid desaturases and sterol desaturases from various organisms and used to analyze the relationships among TkSCDs. As assessed by heterologous expression of recombinant proteins in Escherichia coli, the enzymatic functions of both stearoyl-CoA desaturases revealed that the amount of C16:1 and C18:1 fatty acids increased by greater than 3-fold after induction with isopropyl beta-d-thiogalactopyranoside. In particular, C18:1 fatty acid production increased greater than 10-fold in E. coli expressing TkSCD-1 and TkSCD-2."

According to the news editors, the research concluded: "The results of this study suggest that both SCD genes from an Antarctic marine copepod encode a functional desaturase that is capable of increasing the amounts of palmitoleic acid and oleic acid in a prokaryotic expression system."

For more information on this research see: Characterization of Stearoyl-CoA Desaturases from a Psychrophilic Antarctic Copepod, Tigriopus kingsejongensis. Marine Biotechnology, 2016;18(5):564-574. Marine Biotechnology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Marine Biotechnology - www.springerlink.com/content/1436-2228/)

The news correspondents report that additional information may be obtained from S. Kim, Korea Polar Res Inst, Div Polar Life Sci, KIOST, Inchon 21990, South Korea. Additional authors for this research include E. Kim, S. Han, H.G. Choi and S. Kim.

Oncology - Gastric Cancer

Findings from Korea University Update Knowledge of Gastric Cancer (The roles of HOXB7 in promoting migration, invasion, and anti-apoptosis in gastric cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gastric Cancer have been presented. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "The aim of this study was to compare HOXB7 expression level between gastric cancer and non-cancerous gastric tissues. Additionally, the functional effects of HOXB7, including its pro-migration or invasion and anti-apoptosis roles, were evaluated in gastric cancer cells."

The news reporters obtained a quote from the research from Korea University, "Both gene and protein expression levels of HOXB7 were examined in gastric cancer cell lines, and HOXB7 expression was compared between primary or metastatic gastric cancer tissues and chronic gastritis or intestinal metaplasia tissues. Functional studies included a wound healing assay, a Matrigel invasion assay, and an Annexin-V assay were performed, and Akt/PTEN activity was measured by western blotting. Both gene and protein expression levels of HOXB7 could be clearly detected in various gastric cancer cell lines except MKN-28 cell. HOXB7
expression was significantly higher in primary or metastatic gastric cancer tissues than in chronic gastritis or intestinal metaplasia tissues. HOXB7 knockdown led to inhibition of cell invasion and migration, had an apoptotic effect, downregulated phosphor-Akt, and upregulated PTEN in AGS and SNU-638 cells. Reinforced expression of HOXB7 caused the opposite effects in MKN-28 and MKN-45 cells."

According to the news reporters, the research concluded: "Our study suggests that HOXB7 has an oncogenic role in gastric cancer, which might be related to the modulation of Akt/PTEN activity to induce cell migration/invasion and anti-apoptotic effects."

Our news correspondents report that additional information may be obtained by contacting J.J. Park, Korea University, Coll Med, Guro Hosp, Div GastroenterolDept Internal Med, Seoul 152703, South Korea. Additional authors for this research include J.J. Park, H.S. Yoo, B.J. Lee, H.J. Chun, S.W. Lee and Y.T. Bak.

Lung Diseases and Conditions - Chronic Obstructive…

Findings from Kumamoto University Provides New Data on Chronic Obstructive Pulmonary Disease (Pharmacological and genetic reappraisals of protease and oxidative stress pathways in a mouse model of obstructive lung diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease are presented in a new report. According to news reporting from Kumamoto, Japan, by NewsRx journalists, research stated, "Protease-antiprotease imbalance and oxidative stress are considered to be major pathophysiological hallmarks of severe obstructive lung diseases including chronic obstructive pulmonary disease (COPD) and cystic fibrosis (CF), but limited information is available on their direct roles in the regulation of pulmonary phenotypes. Here, we utilized beta ENaC-transgenic (Tg) mice, the previously established mouse model of severe obstructive lung diseases, to produce lower-mortality but pathophysiologically highly useful mouse model by backcrossing the original line with C57/BL6J mice."

The news correspondents obtained a quote from the research from Kumamoto University, "C57/BL6J-beta ENaC-Tg mice showed higher survival rates and key pulmonary abnormalities of COPD/CF, including mucous hypersecretion, inflammatory and emphysematous phenotypes and pulmonary dysfunction. DNA microarray analysis confirmed that protease-and oxidative stress-dependent pathways are activated in the lung tissue of
C57/BL6J-beta ENaC-Tg mice. Treatments of C57/BL6J-beta ENaC-Tg mice with a serine protease inhibitor ONO-3403, a derivative of camostat methylate (CM), but not CM, and with an anti-oxidant N-acetylcystein significantly improved pulmonary emphysema and dysfunction. Moreover, depletion of a murine endogenous antioxidant vitamin C (VC), by genetic disruption of VC-synthesizing enzyme SMP30 in C57/BL6J-beta ENaC-Tg mice, exaggerated pulmonary phenotypes.

According to the news reporters, the research concluded: "Thus, these assessments clarified that protease-antiprotease imbalance and oxidative stress are critical pathways that exacerbate the pulmonary phenotypes of C57/BL6J-beta ENaC-Tg mice, consistent with the characteristics of human COPD/CF."

Keywords for this news article include: Kumamoto, Japan, Asia, Chronic Obstructive Pulmonary Disease, Lung Diseases and Conditions, Enzymes and Coenzymes, Cystic Fibrosis, Pharmacology, Protease, Genetics, Therapy, Kumamoto University.

**Mental Health Diseases and Conditions - Schizophrenia**

**Findings from Kunming Institute of Zoology in Schizophrenia Reported (No association between schizophrenia susceptibility variants and macroscopic structural brain volume variation in healthy subjects)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mental Health Diseases and Conditions - Schizophrenia. According to news reporting from Kunming, People's Republic of China, by NewsRx journalists, research stated, "Previous studies have suggested that genetic variants for schizophrenia susceptibility might contribute to structural brain volume variations in schizophrenia patients, including total brain volume, hippocampal volume, and amygdalar volume. However, whether these schizophrenia susceptibility variants are associated with macroscopic structural brain volume (i.e., intracranial volume, total brain volume, and hippocampal volume) in healthy subjects is still unclear."

Funders for this research include 100 Talents Program (BaiRenJiHua) of the Chinese Academy of Sciences, Thousand Talents Program (Recruitment Program of Global Youth Experts) of China.

The news correspondents obtained a quote from the research from the Kunming Institute of Zoology, "In this study, we investigated the associations between 47 schizophrenia
susceptibility variants (from 25 well-characterized schizophrenia susceptibility genes) and cranial volume variation in a healthy Chinese sample (N=1,013). We also extracted the association between these 47 schizophrenia risk variants and the macroscopic structural brain volume (intracranial volume, total brain volume and hippocampal volume) in a large healthy sample of European ancestry (ENIGMA sample, N=5,775). We identified several single-nucleotide polymorphisms (SNPs) nominally associated with intracranial volume, total brain volume, and hippocampal volume at p<0.05 (uncorrected). However, after Bonferroni corrections for multiple testing, no SNP showed significant association.

According to the news reporters, the research concluded: "Hence, our results do not support previous observations that schizophrenia susceptibility variants are associated with brain structure (e.g., hippocampal volume) in healthy individuals, and indicate that single schizophrenia risk variant may not contribute significantly to macroscopic brain structure (e.g., intracranial volume or hippocampal volume) variation in healthy subjects."

Our news journalists report that additional information may be obtained by contacting M. Li, Key Laboratory of Animal Models and Human Disease Mechanisms of the Chinese Academy of Sciences & Yunnan Province, Kunming Institute of Zoology, Kunming, Yunnan, People's Republic of China. Additional authors for this research include L. Huang, J. Wang, B. Su and X.J Luo.

Averaged CT (Ave-CT) and expiratory CT (Ex-CT) images were reconstructed for each patient using 4-dimensional CT data. Dose distributions were initially calculated using the Ave-CT images and recalculated (in the same monitor units [MU]) by employing Ex-CT images with the same beam arrangements. The dose-volume parameters, including D-95, D-90, D-50, and D-2 of the planning target volume (PTV), were compared between the 2 image sets. To explore the influence of dose-calculation algorithms and prescription methods on the differences in dose distributions evident between Ave-CT and Ex-CT images, we calculated dose distributions using the following 3 different algorithms: x-ray Voxel Monte Carlo (XVMC), Acuros XB (AXB), and the anisotropic analytical algorithm (AAA). We also used 2 different dose prescription methods; the isocenter prescription and the PTV periphery prescription methods.

All differences in PTV dose-volume parameters calculated using Ave-CT and Ex-CT data were within 3 percentage points (%pts) employing the isocenter prescription method, and within 1.5% pts using the PTV periphery prescription method, irrespective of which of the 3 algorithms (XVMC, AXB, and AAA) was employed. The frequencies of dose-volume parameters differing by > 1%pt when the XVMC and AXB were used were greater than those associated with the use of the AAA, regardless of the dose prescription method employed.

According to the news editors, the research concluded: "All differences in PTV dose-volume parameters calculated using Ave-CT and Ex-CT data on patients who underwent lung SBRT were within 3%pts, regardless of the dose calculation algorithm or the dose-prescription method employed."

The news editors report that additional information may be obtained by contacting M. Nakamura, Kyoto University, Grad Sch Med, Dept. of Radiat Oncol & Image Appl Therapy, Kyoto, Japan. Additional authors for this research include M. Nakamura, Y. Matsuo, N. Ueki, A. Nakamura, Y. Iizuka, W.A. Mampuya, T. Mizowaki and M. Hiraoka.

Wellness Week -- Current study results on Transplant Medicine - Kidney Transplants have been published. According to news reporting originating from Kyoto, Japan, by NewsRx correspondents, research stated, "Sodium retention causes posttransplant hypertension, and sodium restriction is recommended in kidney allograft recipients. However, there have been few studies on the impact of dietary counseling on sodium intake and blood pressure (BP) in this population."

Our news editors obtained a quote from the research from Kyoto University, "To determine the effect of dietary counseling on sodium intake and consequent BP control in kidney allograft recipients. A prospective single-arm study to determine the effect of dietary counseling on sodium intake. Enrolled were renal allograft recipients with sodium intake >100 mEq/d, BP >130/80, antihypertensive use, or body mass index >25 kg/m(2). Of 53 renal transplant recipients who met the criteria, 48 participated in the present study. Sodium intake was estimated based on 24-hour urinary sodium excretion before and after 3 sessions of dietary counseling by a board-certified dietitian. Sodium intake was significantly decreased after dietary counseling (158.7 vs 129.6 mEq/d; P =.005). Systolic BP was significantly decreased from 124 mm Hg (interquartile range: 122-134) before counseling to 121 mm Hg (interquartile range: 117-128) after counseling (P <.001). The number of patients with systolic BP > 130 mm Hg was decreased by 30% (n = 19-13; P =.07). Among 34 patients on antihypertensive medications, 8 (23.5%) ceased or reduced their drugs due to improvement in BP, whereas 2 increased or changed the drugs due to poor control of BP."

According to the news editors, the research concluded: "Dietary counseling showed a short-term efficacy of reducing sodium intake and clinically relevant BP improvement in renal allograft recipients."

The news editors report that additional information may be obtained by contacting O. Ogawa, Kyoto University, Dept. of Urol, Grad Sch Med, Kyoto, Japan. Additional authors for this research include T. Kobayashi, H. Miyata, Y. Tanaka, Y. Okada, K. Sakai, H. Negoro, T. Kamba, H. Tsuji, K. Shide, M. Yanagita, N. Inagaki and O. Ogawa.

Lung Diseases and Conditions - Pulmonary Embolism

Findings from Kyungpook National University School of Medicine Provides New Data on Pulmonary Embolism (Clinical characteristics of pulmonary embolism with concomitant pneumonia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Current study results on Lung Diseases and Conditions - Pulmonary Embolism have been published. According to news reporting originating in Daegu, South Korea, by NewsRx journalists, research stated, "Although pneumonia is associated with an increased risk of venous thromboembolism, patients with pulmonary embolism and concomitant pneumonia are uncommon. The aim of the present study was to investigate the clinical features of pulmonary embolism with coexisting pneumonia."

The news reporters obtained a quote from the research from the Kyungpook National University School of Medicine, "We retrospectively compared clinical, radiologic and laboratory parameters between patients with pulmonary embolism and concomitant pneumonia (pneumonia group) and those with unprovoked pulmonary embolism (unprovoked group), and then between the pneumonia group and those with pulmonary infarction (infarction group). Of 794 patients with pulmonary embolism, 36 (5%) had coexisting pneumonia and six (1%) had no provoking factor other than pneumonia. Stroke was significantly more common in the pneumonia group, than either the unprovoked group or the infarction group. In the pneumonia group, fever was significantly more common and serum C-reactive protein levels were significantly higher. By contrast, central pulmonary embolism and right ventricular dilation on computed tomography were significantly less frequent in the pneumonia group. In addition, an adverse outcome due to pulmonary embolism was less common in the pneumonia group than in either of the other two groups. The coexistence of pulmonary embolism and pneumonia is rarely encountered in clinical practice, especially without the presence of other factors that could provoke venous thromboembolism and is commonly associated with stroke."

According to the news reporters, the research concluded: "It is characterized by lower incidences of central pulmonary embolism and right ventricular dilation and by a lower rate of adverse outcomes due to pulmonary embolism itself."

For more information on this research see: Clinical characteristics of pulmonary embolism with concomitant pneumonia. Blood Coagulation & Fibrinolysis, 2016;27(3):281-6. (Lippincott Williams and Wilkins - www.lww.com; Blood Coagulation & Fibrinolysis - journals.lww.com/bloodcoagulation/pages/default.aspx)

Oncology - Soft Tissue Sarcomas

Findings from Kyushu University Provide New Insights into Soft Tissue Sarcomas (Efficacy analysis of the aprepitant-combined antiemetic prophylaxis for non-round cell soft-tissue sarcoma patients received Adriamycin and Ifosfamide therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Soft Tissue Sarcomas. According to news reporting originating in Fukuoka, Japan, by NewsRx journalists, research stated, "Appropriate antiemetic prophylaxis for moderately emetogenic chemotherapy in patients with non-round cell soft-tissue sarcomas (NRC-STS) remains unclear. We retrospectively investigated efficacy and safety of aprepitant-combined antiemetic prophylaxis in patients with NRC-STS receiving Adriamycin plus Ifosfamide (AI) therapy."

The news reporters obtained a quote from the research from Kyushu University, "Forty NRC-STS patients were enrolled, their median age was 50 years (range 18-74), and 13 (32.5%) were female. Median cycle number of AI therapy was 4. Twenty patients received the doublet antiemetic prophylaxis (5-hydroxytryptamine-3 receptor antagonist and dexamethasone), and 20 received triplet (5-hydroxytryptamine-3 receptor antagonist, dexamethasone, and aprepitant). In the overall period, complete response rate for nausea and emesis in the triplet group was significantly higher than that in the doublet group (70% vs 35%; P=0.027). Patients with no-emesis in the overall period were more frequently observed in the triplet group than in the doublet group (90% vs 65%; P=0.058). All toxicities other than emesis were almost equivalent in both the groups."

According to the news reporters, the research concluded: "These results suggest that a triplet antiemetic prophylaxis may be optimal in the treatment with AI therapy for NRC-STS."

For more information on this research see: Efficacy analysis of the aprepitant-combined antiemetic prophylaxis for non-round cell soft-tissue sarcoma patients received Adriamycin and Ifosfamide therapy. Medicine, 2016;95(49):163-167. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Oncology - Melanoma

Findings from Kyushu University Update Understanding of Melanoma
(Epigallocatechin-3-O-gallate up-regulates microRNA-let-7b expression by activating 67-kDa laminin receptor signaling in melanoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Melanoma. According to news reporting from Fukuoka, Japan, by NewsRx journalists, research stated, "MicroRNAs (miRNAs) are non-coding RNAs involved in various biological processes by regulating their target genes. Green tea polyphenol (-)-epigallocatechin-3-O-gallate (EGCG) inhibits melanoma tumor growth by activating 67-kDa laminin receptor (67LR) signaling."

The news correspondents obtained a quote from the research from Kyushu University, "To examine the effect of EGCG on miRNA expression in melanoma cells, we performed miRNA microarray analysis. We showed that EGCG up-regulated miRNA-let-7b expression through 67LR in melanoma cells. The EGCG-induced up-regulation of let-7b led to down-regulation of high mobility group A2 (HMGA2), a target gene related to tumor progression. 67LR-dependent cAMP/protein kinase A (PKA)/protein phosphatase 2A (PP2A) signaling pathway activation was involved in the up-regulation of let-7b expression induced by EGCG."

According to the news reporters, the research concluded: "These findings provide a basis for understanding the mechanism of miRNA regulation by EGCG."

For more information on this research see: Epigallocatechin-3-O-gallate up-regulates microRNA-let-7b expression by activating 67-kDa laminin receptor signaling in melanoma cells. Scientific Reports, 2016;6():19225. (Nature Publishing Group - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting S. Yamada, Division of Applied Biological Chemistry, Dept. of Bioscience and Biotechnology, Faculty of Agriculture, Kyushu University, Fukuoka 812-8581, Japan. Blood Pressure

Findings from Kyushu University in the Area of Blood Pressure Described (The Relationship between Snoring Sound Intensity and Morning Blood Pressure in Workers)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Blood Pressure. According to news reporting originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "This study aimed to determine the consequences of snoring independent of obstructive sleep apnea (OSA) and hypothesized that snoring sound intensity, as assessed by mean tracheal sound (TS) energy (Leq), is related to morning blood pressure (BP). A home-based TS monitoring study was performed for two nights on 191 workers in Japan using an IC recorder."

Our news editors obtained a quote from the research from Kyushu University, "Leq and the respiratory disturbance index (RDI) were calculated from the TS data. RDI was used as a marker of OSA severity. Systolic and diastolic BP measurements in the evening and morning (eSBP/eDBP and mSBP/mDBP, respectively) were done before and after TS recording. The data of the second night were analyzed. Leq was significantly related to both mSBP and mDBP (r = 0.32, p< 0.0001; r = 0.34, p< 0.0001, respectively). Leq was also significantly related to morning BP after adjustment for age, sex, and body mass index. However, the relationship was no longer significant when both RDI and Leq were included in the multiple regression model. In non-apneic, non-obese subjects, Leq was significantly related to both mSBP and mDBP (r = 0.38, p< 0.0001; r = 0.33, p = 0.0004, respectively). In this group, Leq was associated with mSBP after adjusting for all confounding factors (n = 106, p = 0.022). The association between night TS intensity and morning BP suggests a pathological role of heavy snoring."

According to the news editors, the research concluded: "To understand this association, a prospective cohort study in a general population is warranted."

For more information on this research see: The Relationship between Snoring Sound Intensity and Morning Blood Pressure in Workers. *Journal of Clinical Sleep Medicine*, 2016;12(12):1601-1606. *Journal of Clinical Sleep Medicine* can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

**Oncology - Breast Cancer**

**Findings from L. Gonzalez et al Update Understanding of Breast Cancer (Gene Expression Profile of Normal and Cancer-Associated Fibroblasts According to Intratumoral Inflammatory Cells Phenotype From Breast Cancer Tissue)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Gijon, Spain, by NewsRx correspondents, research stated, "The biological heterogeneity of breast cancer leads to the need for finding new approaches to
understand the mechanisms implicated in breast cancer progression. The tumor stroma appears as a key in the progression of solid tumors towards a malignant phenotype."

Our news journalists obtained a quote from the research, "Cancer associated fibroblasts (CAFs) may orchestrate a functional 'corrupted' stroma which in turn helps metastatic spread. In this study, we investigated by real-time PCR, the expression of 19 factors by normal breast-associated fibroblasts (NAFs) and CAFs, which were implicated in several actions promoting tumor growth, such as extracellular matrix remodeling, inflammation and invasion. Also, we explored the influence of inflammatory cells phenotypes (MMP11 status) and breast cancer cell lines (MCF-7 and MDA-MB-231) on the molecular profile of CAFs. If we consider that one of the major sources of CAFs are resident NAFs, the transition of NAFs into CAFs is associated with molecular changes involving the overexpression of some molecular factors of biological importance in tumor progression. In addition, the characterization of the tumor stroma regarding to the MMP11 status by MICs reflects a type of fibroblasts which contribute even more to tumor progression. Moreover, different patterns in the induction of the expression of factors by CAFs were observed, depending on the tumor cell line which they were co-cultured with. Furthermore, CAFs influence TGF beta expression in both cancer cell lines."

According to the news editors, the research concluded: "Therefore, this study can help to a better characterization of tumor stroma in order to improve the prognostic evaluation, as well as to define the different populations of CAFs as potential therapeutic targets in breast cancer."

The news correspondents report that additional information may be obtained from F.J. Vizoso, Fdn Hosp Jove, Serv Ciruga Gen, Gijon, Spain. Additional authors for this research include N. Eiro, B. Fernandez-Garcia, L.O. Gonzalez, F. Dominguez and F.J. Vizoso.

Ischemia

Findings from L. Monassier and Co-Authors in the Area of Ischemia Reported (Targeting myocardial reperfusion injuries with cyclosporine in the CIRCUS Trial - pharmacological reasons for failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Ischemia is the subject of a report. According to news reporting originating from Strasbourg, France, by NewsRx correspondents, research stated, "The mitochondrial permeability transition (mPTP) is a key feature of cardiac cell death in ischaemia-reperfusion injury (I/R). The mPTP blocker, cyclosporine A (CsA), has been shown to give protection against reperfusion-induced myocardial necrosis and troubles generated by acute coronary artery repermeabilization."
Our news editors obtained a quote from the research, "Nevertheless, the results of the CIRCUS trial (Does Cyclosporine Improve Clinical Outcome in ST-Elevation Myocardial Infarction Patients) seem to go against this hypothesis. Pharmacological reasons linked to CsA pharmacokinetics and pharmacodynamics could be suggested. First, it could be explained by a limited diffusion of the drug in the area at risk, due to the only inclusion of patients with a TIMI 0 or 1 coronary blood flow in the anterior territory and the absence of collateral perfusion. Second, to explain a low tissue diffusion of the compound, blood cell capture and high metabolism could be suggested. Moreover, CsA is highly metabolized by cytochrome P450 3A4 (CYP3A4), a polymorphic enzyme leading to variations of Cmax and AUC between 10-20% in patients using CsA. Finally, CsA blocks calcineurin, a protein implied in I/R damage but calcineurin inhibition could contribute to protection towards I/R damage only when Rcan1, a calcineurin natural inhibitor, expression is low. The results of the CIRCUS trial are disappointing and could contribute to the withdrawal of the mPTP blockade pharmacological strategy as a way to protect the myocardium from I/R lesions."

According to the news editors, the research concluded: "Nevertheless, many pharmacological insights could have contributed to an increased variability and, as a consequence, an important reduction of the pharmacological power of the study."

The news editors report that additional information may be obtained by contacting L. Monassier, Laboratoire de Neurobiologie et Pharmacie Cardiovasculaire (EA7296), CHU de Strasbourg, Federation de Medecine Translationnelle de Strasbourg, Faculte de Medecine, 11 rue Humann, Strasbourg, France. Additional authors for this research include E. Ayme-Dietrich, G. Aubertin-Kirch and A. Pathak.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/fcp.12177. This DOI is a link to an online electronic document that is either free or for purchase.

Nephrology

**Findings from L. Prieto-Garcia and Co-Authors Provide New Insights into Nephrology (Mechanisms of triple whammy acute kidney injury)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nephrology. According to news reporting originating in Salamanca, Spain, by NewsRx journalists, research stated, "Pre-renal acute kidney injury (AKI) results from glomerular haemodynamic alterations leading to reduced glomerular filtration rate (GFR) with no parenchymal compromise. Renin-angiotensin system inhibitors, such as angiotensin-converting enzyme inhibitors (ACEIs), angiotensin receptor
antagonists (ARAs), non-steroidal anti-inflammatory drugs (NSAIDs) and diuretics, are highly prescribed drugs that are frequently administered together."

Funders for this research include Instituto de Salud Carlos III, FEDER, REDINREN-FEDER, Ministerio de Economia y Competitividad.

The news reporters obtained a quote from the research, "Double and triple associations have been correlated with increased pre-renal AKI incidence, termed 'double whammy' and 'triple whammy', respectively. This article presents an integrative analysis of the complex interplay among the effects of NSAIDs, ACEIs/ARAs and diuretics, acting alone and together in double and triple therapies. In addition, we explore how these drug combinations alter the equilibrium of regulatory mechanisms controlling blood pressure (renal perfusion pressure) and GFR to increase the odds of inducing AKI through the concomitant reduction of blood pressure and distortion of renal autoregulation. Using this knowledge, we propose a more general model of pre-renal AKI based on a multi whammy model, whereby several factors are necessary to effectively reduce net filtration. The triple whammy was the only model associated with pre-renal AKI accompanied by a course of other risk factors, among numerous potential combinations of clinical circumstances causing hypoperfusion in which renal autoregulation is not operative or is deregulated."

According to the news reporters, the research concluded: "These factors would uncouple the normal BP-GFR relationship, where lower GFR values are obtained at every BP value."

Our news correspondents report that additional information may be obtained by contacting F.J. Lopez-Hernandez, Grp Theranost Renal & Cardiovasc Dis TERCARD, Salamanca, Spain. Additional authors for this research include M. Pericacho, S.M. Sancho-Martinez, A. Sanchez, C. Martinez-Salgado, J.M. Lopez-Novoa and F.J. Lopez-Hernandez.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.pharmthera.2016.07.011. This DOI is a link to an online electronic document that is either free or for purchase.

news reporting from Florianopolis, Brazil, by NewsRx journalists, research stated, "To identify factors associated with early mortality from cancer in adolescents and young adults in a reference institution for oncology treatment in Santa Catarina, Brazil. We studied a retrospective cohort with an intentional sample of adolescents (ages 15-19) and young adults (ages 20-29) diagnosed with neoplasia."

The news correspondents obtained a quote from the research, "Secondary data were acquired from January 2002 to December 2013. Kaplan-Meier and Cox regression methods were used for survival analysis. Logistical analysis tested the association between early death (lower tertile between diagnosis and death, according to cancer type) and clinical or sociodemographic variables. We included a total of 889 cases with an average age of 23, with similar gender distributions and a predominance of Caucasian ethnicity. Using the Cox framework of proportional risks adjusted for neoplasia types and gender, individuals with non-hematological neoplasia (solid tumors) presented a 47% higher risk of dying when compared with individuals diagnosed with leukemias and lymphomas (HR: 1.47; 95% CI: 1.12-1.93). Chances of death were 31% higher for males than for females (HR: 1.31; 95% CI: 1.02-1.69). When adjusting for type of neoplasia and age (15-24 and 25-29) the risk of death by cancer was 51% greater in individuals diagnosed with non-hematological neoplasia when compared with individuals diagnosed with leukemias and lymphomas (HR: 1.51; 95% CI: 1.15-1.99). The chance of death by cancer in patients under the age of 25 was 33% greater when compared to that in older patients between the ages of 25 and 29 (HR: 1.33; 95% CI: 1.04-1.75). In multiple regression analysis, factors associated with early mortality from cancer were the number of years in school (P = 0.011) and time between diagnosis and start of treatment (P < 0.001). The sample studied with a longer period of time between diagnosis and the start of treatment (access to oncology therapy) and with fewer years in school showed that these factors had important roles in early death from cancer for the observed individuals."

According to the news reporters, the research concluded: "This must be considered when planning and identifying risk in young cancer patients in order to lower the impact of the disease on mortality for this age group."

For more information on this research see: Cancer mortality among adolescents and young adults: A historical cohort in a reference institution for cancer treatment in Santa Catarina/South of Brazil 2002-2013. Immune System Diseases and Conditions - HIV/AIDS

Findings from L.M. Lopez and Co-Authors Provide New Insights into HIV/AIDS (Theory-based interventions for contraception)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immune System Diseases and Conditions - HIV/AIDS. According to news originating from Durham, North Carolina, by NewsRx correspondents, research stated, "The explicit use of theory in research helps expand the knowledge base. Theories and models have been used extensively in HIV-prevention research and in interventions for preventing sexually transmitted infections (STIs)."

Our news journalists obtained a quote from the research, "The health behavior field uses many theories or models of change. However, many educational interventions addressing contraception have no explicit theoretical base. To review randomized controlled trials (RCTs) that tested a theoretical approach to inform contraceptive choice and encourage or improve contraceptive use. Search methods To 1 November 2016, we searched for trials that tested a theory-based intervention for improving contraceptive use in PubMed, CENTRAL, POPLINE, Web of Science, ClinicalTrials.gov, and ICTRP. For the initial review, we wrote to investigators to find other trials. Selection criteria Included trials tested a theory-based intervention for improving contraceptive use. Interventions addressed the use of one or more methods for contraception. The reports provided evidence that the intervention was based on a specific theory or model. The primary outcomes were pregnancy and contraceptive choice or use. Data collection and analysis We assessed titles and abstracts identified during the searches. One author extracted and entered the data into Review Manager; a second author verified accuracy. We examined studies for methodological quality. For unadjusted dichotomous outcomes, we calculated the Mantel-Haenszel odds ratio (OR) with 95% confidence interval (CI). Cluster randomized trials used various methods of accounting for the clustering, such as multilevel modeling. Most reports did not provide information to calculate the effective sample size. Therefore, we presented the results as reported by the investigators. We did not conduct meta-analysis due to varied interventions and outcome measures. We included 10 new trials for a total of 25. Five were conducted outside the USA. Fifteen randomly assigned individuals and 10 randomized clusters. This section focuses on nine trials with high or moderate quality evidence and an intervention effect. Five based on social cognitive theory addressed preventing adolescent pregnancy and were one to two years long. The comparison was usual care or education. Adolescent mothers with a home-based curriculum had fewer second births in two years (OR 0.41, 95% CI 0.17 to 1.00). Twelve months after a school-based curriculum, the intervention group was more likely to report using an effective contraceptive method (adjusted OR 1.76 +/- standard error (SE) 0.29) and using condoms during last intercourse (adjusted OR 1.68 +/- SE 0.25). In alternative schools, after five months the intervention group reported more condom use during last intercourse (reported adjusted OR 2.12, 95% CI 1.24 to 3.56). After a school-based risk-reduction program, at three months the intervention group was less likely to report no condom use at last intercourse (adjusted OR 0.67, 95% CI 0.47 to 0.96). The risk avoidance group (abstinence-focused) was less likely to do so at 15 months (OR 0.61, 95% CI 0.45 to 0.85). At 24 months after a case management and peer-leadership program, the intervention group reported more consistent use of hormonal contraceptives (adjusted relative risk (RR) 1.30, 95% CI 1.06 to 1.58), condoms (RR 1.57, 95% CI 1.28 to 1.94), and dual methods (RR 1.36, 95% CI 1.01 to 1.85). Four of the nine trials used motivational interviewing (MI). In three studies, the comparison group received handouts. The MI group more often reported effective contraception use at nine months (OR 2.04, 95% CI 1.47 to 2.83). In two
studies, the MI group was less likely to report using ineffective contraception at three months (OR 0.31, 95% CI 0.12 to 0.77) and four months (OR 0.56, 95% CI 0.31 to 0.98), respectively. In the fourth trial, the MI group was more likely than a group with non-standard counseling to initiate long-acting reversible contraception (LARC) by one month (OR 3.99, 95% CI 1.36 to 11.68) and to report using LARC at three months (OR 3.38, 95% CI 1.06 to 10.71). Authors' conclusions The overall quality of evidence was moderate. Trials based on social cognitive theory focused on adolescents and provided multiple sessions. Those using motivational interviewing had a wider age range but specific populations. Sites with low resources need effective interventions adapted for their settings and their typical clients."

According to the news editors, the research concluded: "Reports could be clearer about how the theory was used to design and implement the intervention."

For more information on this research see: Theory-based interventions for contraception. Cochrane Database of Systematic Reviews, 2016;(11):2160-2293. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news correspondents report that additional information may be obtained from L.M. Lopez, FHI 360, Clin & Epidemiol Sci, Durham, NC 27701, United States. Additional authors for this research include T.W. Grey, M. Chen, E.E. Tolley and L.L. Stockton.

Oncology - Melanoma

Findings from L.Z. Chen and Co-Researchers in the Area of Melanoma Reported (AMPK activation by GSK621 inhibits human melanoma cells in vitro and in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Melanoma. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Recent studies suggest that forced activation of AMP-activated protein kinase (AMPK) could inhibit melanoma cell proliferation. In this report, we evaluated the anti-melanoma cell activity by a novel small-molecular AMPK activator, GSK621."

Our news editors obtained a quote from the research, "Treatment of GSK621 decreased survival and proliferation of human melanoma cells (A375, WM-115 and SK-Mel-2 lines), which was accompanied by activation of caspase-3/-9 and apoptosis. Reversely, caspase inhibitors attenuated GSK621-induced cytotoxicity against melanoma cells. Significantly, GSK621 was more potent than other AMPK activators (A769662, Compound 13 and AICAR) in inhibiting melanoma cells. Intriguingly, same GSK621 treatment was non-cytotoxic or pro-apoptotic against human melanocytes. Molecularly, we showed that activation of AMPK mediated GSK621's activity against melanoma cells. AMPK alpha 1 shRNA knockdown or dominant negative mutation (T172A) dramatically attenuated GSK621-induced melanoma cell lethality. Further studies revealed that MEK-ERK activation might be the primary resistance factor of GSK621. MEK-ERK inhibition, either genetically or pharmacologically, significantly
sensitized melanoma cells to GSK-621. Remarkably, intraperitoneal (i.p.) injection of GSK621 inhibited A375 tumor growth in SCID mice. Co-administration of MEK-ERK inhibitor MEK162 further sensitized GSK621-induced anti-A375 tumor activity in vivo. Together, the results imply that targeted activation of AMPK by GSK621 inhibits melanoma cell survival and proliferation.

According to the news editors, the research concluded: "MEK-ERK inhibition may further sensitize GSK621's anti-melanoma cell activity in vitro and in vivo."

For more information on this research see: AMPK activation by GSK621 inhibits human melanoma cells in vitro and in vivo. Biochemical and Biophysical Research Communications, 2016;480(4):515-521. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Transplant Medicine - Heart Transplants

Findings from La Trobe University Yields New Data on Heart Transplants (Physical function after extracorporeal membrane oxygenation in patients pre or post heart transplantation - An observational study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Heart Transplants have been published. According to news originating from Melbourne, Australia, by NewsRx correspondents, research stated, "To describe physical function, leg complications and health-related quality of life (HRQOL) in the three months following extracorporeal membrane oxygenation (ECMO) pre-or post-heart transplantation (HTx). Little is known about functional recovery following ECMO before or after HTx."

Our news journalists obtained a quote from the research from La Trobe University, "A 2-year retrospective study in patients who received ECMO pre- or post HTx. Strength, mobility, leg complications and HRQOL were recorded to hospital discharge. Six-minute walk distance (6MWD) was assessed at hospital discharge and 3 months. 25 patients were included, with 80% (20/25) survival to hospital discharge. At ICU discharge, strength and mobility were poor but improved by hospital discharge (p < 0.001) despite leg complications in 44% (11/25) of patients. The 6MWD improved over time (mean 203 m, 95% confidence interval 140-265). HRQOL scores were lower than Australian norms (p < 0.05)."

According to the news editors, the research concluded: "Patients requiring ECMO pre or post HTx had impaired physical function at ICU discharge and leg complications were

The news correspondents report that additional information may be obtained from K. Hayes, La Trobe University, Discipline Physiotherapy, Melbourne, Vic, Australia. Additional authors for this research include A.E. Holland, V.A. Pellegrino, A.S. Leet, L.M. Fuller and C.L. Hodgson.

**Immunology - Immunophilins**

**Findings from Lanzhou University Provides New Data about Immunophilins (Shengmai Formula suppressed over-activated Ras/MAPK pathway in C. elegans by opening mitochondrial permeability transition pore via regulating cyclophilin D)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - Immunophilins have been presented. According to news originating from Lanzhou, People's Republic of China, by NewsRx correspondents, research stated, "Since about 30% of all human cancers contain mutationaly activated Ras, down regulating the over-activation of Ras/MAPK pathway represents a viable approach for treating cancers. Over-activation of Ras/MAPK pathway is accompanied by accumulation of reactive oxygen species (ROS)."

Our news journalists obtained a quote from the research from Lanzhou University, "One approach for developing anti-cancer drugs is to target ROS production and their accumulation. To test this idea, we have employed C. elegans of let-60 (gf) mutant, which contain over-activated let-60 (the homolog of mammalian ras) and exhibit tumor-like symptom of multivulva phenotype, to determine whether anti-oxidants can affect their tumor-like phenotype. Specifically we studied the effect of Shengmai formula (SM), a traditional Chinese medicine that has strong anti-oxidant activity, on the physiology of let-60 (gf) mutants. Unexpectedly, we found that SM treatment led to the opening of mitochondrial permeability transition pore by regulating cyclophilin D and then triggered oxidative stress and related signaling pathway activation, including p53, JNK, and p38/MAPK pathways. Finally, SM induced mitochondrial pathway of apoptosis and inhibited the tumor-like symptom of the multivulva phenotype of let-60(gf) mutants."

According to the news editors, the research concluded: "Our results provide evidences to support that SM act as a pro-oxidant agent and could serve as a potential drug candidate for combating over-activated Ras-related cancer."

For more information on this research see: Shengmai Formula suppressed over-

**Oncology - Lung Cancer**

**Findings from Leibniz University Update Knowledge of Lung Cancer (Preferences of lung cancer patients for treatment and decision-making: a systematic literature review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Lung Cancer are presented in a new report. According to news reporting from Hannover, Germany, by NewsRx journalists, research stated, "The consideration of patient preferences in decision-making has become more important, especially for life-threatening diseases such as lung cancer. This paper aims to identify the preferences of lung cancer patients with regard to their treatment and involvement in the decision-making process."

Financial support for this research came from Bundesministerium fur Bildung und Forschung.

The news correspondents obtained a quote from the research from Leibniz University, "We conducted a systematic literature review from 12 electronic databases and included studies published between 2000 and 2012. A total of 20 studies were included in this review. These revealed that lung cancer patients do have preferences that should be considered in treatment decisions; however, these preferences are not homogenous. We found that patients often consider life extension to be more important than the health-related quality of life or undesirable side effects. This preference seems to depend on patient age. Nausea and vomiting are the most important side effects to be avoided; the relevance of other side effects differs highly between subgroups. The majority of lung cancer patients, nevertheless, seem to prefer a passive rather than an active role in decision-making, although the self-reported preferences differed partly from the physicians' perceptions."

According to the news reporters, the research concluded: "Overall, we identified an urgent need for larger studies that are suitable for subgroup analyses and incorporate multi-attributive measurement techniques."

For more information on this research see: Preferences of lung cancer patients for treatment and decision-making: a systematic literature review. *European Journal of Cancer Care*, 2016;25(4):580-591. *European Journal of Cancer Care* can be contacted at: Wiley-

Prostheses

Findings from Leiden University in the Area of Prostheses Described (Prosthesis Dislocation After Transapical Valve-In-Valve Mitral Valve Implantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Prostheses are discussed in a new report. According to news reporting from Leiden, Netherlands, by NewsRx journalists, research stated, "Transapical valve-in-valve mitral valve implantation (TA-MVI) has been described as an alternative treatment option in patients with degenerated bioprostheses in the mitral position."

The news correspondents obtained a quote from the research from Leiden University, "We report the first case of prosthesis dislocation and migration into the left atrium after TA-MVI. A new prosthesis was implanted using the same approach."

According to the news reporters, the research concluded: "The dislocated prosthesis was successfully removed through the left atrial appendage through an extended anterolateral thoracotomy without the use of cardiopulmonary bypass."

Our news journalists report that additional information may be obtained by contacting A. Tomsic, Leiden University, Dept. of Cardiothorac Surg, Medical Center, NL-2300 RC Leiden, Netherlands. Findings from London School of Hygiene and Tropical Medicine Broaden Understanding of Vaccines (Near real-time vaccine safety surveillance using electronic health records-a systematic review of the application of statistical methods)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immunization - Vaccines. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "Pre-licensure studies have limited ability to detect rare adverse events (AEs) to vaccines, requiring timely post-licensure studies. With the increasing availability of electronic health records (EHR) near real-time vaccine safety surveillance using these data has emerged as an option."

Financial support for this research came from National Institute for Health Research Health Protection Research Unit (NIHR HPRU).

The news reporters obtained a quote from the research from the London School of Hygiene and Tropical Medicine, "We reviewed methods currently used to inform development of similar systems for countries considering their introduction. Medline, EMBASE and Web of Science were searched, with additional searches of conference abstract books. Questionnaires were sent to organizations worldwide to ascertain unpublished studies. Eligible studies used EHR and regularly assessed pre-specified AE to vaccine(s). Key features of studies were compared descriptively. From 2779 studies, 31 were included from the USA (23), UK (6), and Taiwan and New Zealand (1 each). These were published/conducted between May 2005 and April 2015. Thirty-eight different vaccines were studied, focusing mainly on influenza (47.4%), especially 2009 H1N1 vaccines. Forty-six analytic approaches were used, reflecting frequency of EHR updates and the AE studied. Poisson-based maximized sequential probability ratio test was the most common (43.5%), followed by its binomial (23.9%) and conditional versions (10.9%). Thirty-seven of 49 analyses (75.5%) mentioned control for confounding, using an adjusted expected rate (51.4% of those adjusting), stratification (16.2%) or a combination of a self-controlled design and stratification (13.5%). Guillain-Barré syndrome (11.9%), meningitis/encephalitis/myelitis (11.9%) and seizures (10.8%) were studied most often. Near real-time vaccine safety surveillance using EHR has developed over the past decade but is not yet widely used."

According to the news reporters, the research concluded: "As more countries have access to EHR, it will be important that appropriate methods are selected, considering the data available and AE of interest."

Our news correspondents report that additional information may be obtained by contacting A. Leite, Faculty of Epidemiology and Population Health, London School of Hygiene & Tropical Medicine, London, UK. Additional authors for this research include N.J. Andrews and S.L Thomas.

Findings from Loyola College Yields New Findings on Chemometrics
(Analytical expressions for topological properties of polycyclic benzenoid networks)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Chemometrics have been published. According to news reporting originating from Tamil Nadu, India, by NewsRx correspondents, research stated, "Quantitative structure-activity and structure-property relationships of complex polycyclic benzenoid networks require expressions for the topological properties of these networks. Structure-based topological indices of these networks enable prediction of chemical properties and the bioactivities of these compounds through quantitative structure-activity and structure-property relationships methods."

Our news editors obtained a quote from the research from Loyola College, "We consider a number of infinite convex benzenoid networks that include polyacene, parallelogram, trapezium, triangular, bitrapezium, and circumcoronelike benzenoid networks. For all such networks, we compute analytical expressions for both vertex-degree and edge-based topological indices such as edge-Wiener, vertex-edge Wiener, vertex-Szeged, edge-Szeged, edge-vertex Szeged, total-Szeged, Padmakar-Ivan, Schultz, Gutman, Randic, generalized Randic, reciprocal Randic, reduced reciprocal Randic, first Zagreb, second Zagreb, reduced second Zagreb, hyper Zagreb, augmented Zagreb, atom-bond connectivity, harmonic, sum-connectivity, and geometric-arithmetic indices."

According to the news editors, the research concluded: "In addition we have obtained expressions for these topological indices for 3 types of parallelogram-like polycyclic benzenoid networks."

The news editors report that additional information may be obtained by contacting J. Clement, Loyola College, Dept. of Math, Chennai 600034, Tamil Nadu, India. Additional authors for this research include J. Clement and K. Balasubramanian.

Keywords for this news article include: Tamil Nadu, India, Asia, Chemometrics, Drugs and Therapies, Loyola College.

Findings from Luigi Sacco University Hospital Yields New Findings on Antibiotics (Therapeutic drug management of linezolid: a missed opportunity for clinicians?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a new report. According to news reporting originating from Milan, Italy, by NewsRx correspondents, research stated, "Some studies have shown that adjustments to the linezolid dose guided by therapeutic drug monitoring (TDM) can reduce interindividual variability in drug exposure and improve linezolid tolerability. In this study, 6 years of linezolid TDM, a diagnostic service for our hospital and others in the Milan (Italy) area, is described."

Our news editors obtained a quote from the research from Luigi Sacco University Hospital, "Samples were collected immediately before the morning dose intake (trough concentrations) in steady-state conditions. Linezolid concentrations were quantified by a validated high-performance liquid chromatography (HPLC) method. Four hundred linezolid trough concentrations from 220 patients were collected. A 20-fold variability in linezolid levels was observed. Positive and significant correlations between linezolid trough concentrations and patient age (r = 0.325, P< 0.01) or serum creatinine (r = 0.511, P< 0.01) were found. A progressive increase in linezolid concentrations with time was observed in a subgroup of patients with more than one TDM assessment. Elderly patients, especially those aged >80 years and with impaired renal function, are at a higher risk of overexposure to linezolid."

According to the news editors, the research concluded: "Despite the observed progressive increase in linezolid concentrations over time, most physicians did not change the drug dose according to the TDM results, even in the presence of frank overexposure to linezolid."

The news editors report that additional information may be obtained by contacting D. Cattaneo, Luigi Sacco Univ Hosp, Clin Pharmacol Unit, I-20157 Milan, Italy. Additional authors for this research include C. Gervasoni, V. Cozzi, S. Castoldi, S. Baldelli and E. Clementi.

**Cardiovascular Research**

**Findings from M. Birkholz and Co-Authors Broaden Understanding of Cardiovascular Research (Continuously Operating Biosensor and Its Integration into a Hermetically Sealed Medical Implant)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Research are discussed in a new report. According to news reporting originating in Frankfurt, Germany, by NewsRx journalists, research stated, "An integration concept for an implantable biosensor for the continuous monitoring of blood sugar levels is presented. The system architecture is based on technical modules used in cardiovascular implants in order to minimize legal certification efforts for its perspective usage in medical applications."

The news reporters obtained a quote from the research, "The sensor chip operates via the principle of affinity viscometry, which is realized by a fully embedded biomedical microelectromechanical systems (BioMEMS) prepared in 0.25-mum complementary metal-oxide-semiconductor (CMOS)/BiCMOS technology. Communication with a base station is established in the 402-405 MHz band used for medical implant communication services (MICS). The implant shall operate within the interstitial tissue, and the heretical sealing of the electronic system against interaction with the body fluid is established using titanium housing. Only the sensor chip and the antenna are encapsulated in an epoxy header closely connected to the metallic housing."

According to the news reporters, the research concluded: "The study demonstrates that biosensor implants for the sensing of low-molecular-weight metabolites in the interstitial may successfully rely on components already established in cardiovascular implantology."

For more information on this research see: Continuously Operating Biosensor and Its Integration into a Hermetically Sealed Medical Implant. *Micromachines*, 2016;7(10):198-205. *Micromachines* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

**Central Nervous System Diseases and Conditions –…**

**Findings from M. Tondelli and Co-Authors Reveals New Information on Epilepsy (Cortical and subcortical brain alterations in Juvenile Absence Epilepsy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System Diseases and Conditions - Épilepsy
are presented in a new report. According to news originating from Modena, Italy, by NewsRx correspondents, research stated, "Despite the common assumption that genetic generalized epilepsies are characterized by a macroscopically normal brain on magnetic resonance imaging, subtle structural brain alterations have been detected by advanced neuroimaging techniques in Childhood Absence Epilepsy syndrome. We applied quantitative structural MRI analysis to a group of adolescents and adults with Juvenile Absence Epilepsy (JAE) in order to investigate micro-structural brain changes using different brain measures."

Our news journalists obtained a quote from the research, "We examined grey matter volumes, cortical thickness, surface areas, and subcortical volumes in 24 patients with JAE compared to 24 healthy controls; wholebrain voxel-based morphometry (VBM) and Freesurfer analyses were used. When compared to healthy controls, patients revealed both grey matter volume and surface area reduction in bilateral frontal regions, anterior cingulate, and right mesial-temporal lobe. Correlation analysis with disease duration showed that longer disease was correlated with reduced surface area in right pre- and post-central gyrus. A possible effect of valproate treatment on brain structures was excluded."

According to the news editors, the research concluded: "Our results indicate that subtle structural brain changes are detectable in JAE and are mainly located in anterior nodes of regions known to be crucial for awareness, attention and memory."

The news correspondents report that additional information may be obtained from S. Meletti, AUSL Modena, NOCSAE Hosp, Modena, Italy. Additional authors for this research include A.E. Vaudano, A. Ruggieri and S. Meletti.

Cardiovascular Research

*Findings from M.E. Kleber and Colleagues Update Understanding of Cardiovascular Research (Omega-3 fatty acids and mortality in patients referred for coronary angiography. The Ludwigshafen Risk and Cardiovascular Health Study)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Research. According to news reporting originating in Halle, Germany, by NewsRx journalists, research stated, "There is an ongoing debate whether omega-3-fatty acids protect from cardiovascular disease mortality. We examined the associations of erythrocyte omega-3 fatty acids with mortality in patients referred for coronary angiography."
The news reporters obtained a quote from the research, "Erythrocyte omega-3 fatty acid proportions were measured at baseline in 3259 participants of the Ludwigshafen Risk and Cardiovascular Health Study (LURIC) using the HS-Omega-3 Index method. Associations of omega-3 fatty acid proportions with mortality were investigated using Cox proportional hazards regression. During a median follow-up of 9.9 years, 975 patients (29.9%) died, 614 patients (18.8%) from cardiovascular causes. Proportions of eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) were inversely associated with all-cause and cardiovascular mortality in models adjusted for conventional cardiovascular risk factors. The strongest association was observed for EPA with a hazard ratio (HR) of 0.89 (0.83-0.96) per increase of one standard deviation. Furthermore, we obtained evidence for a non-linear relation between EPA and mortality."

According to the news reporters, the research concluded: "EPA and DHA were associated with reduced mortality in LURIC, independent of other risk factors, with the association of EPA with mortality being non-linear."

For more information on this research see: Omega-3 fatty acids and mortality in patients referred for coronary angiography. The Ludwigshafen Risk and Cardiovascular Health Study. *Atherosclerosis*, 2016;252():175-181. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Lung Diseases and Conditions - Pulmonary...**

**Findings from M.L. Zheng and Co-Authors Broaden Understanding of Pulmonary Tuberculosis (MiRNA-155 and miRNA-132 as potential diagnostic biomarkers for pulmonary tuberculosis: A preliminary study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Pulmonary Tuberculosis. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "In our study, we aimed to profile a panel microRNAs (miRNAs) as potential biomarkers for the early diagnosis of pulmonary tuberculosis (PTB) and to illuminate the molecular mechanisms in the development of PTB. Firstly, gene expression profile of E-GEOD-49951 was downloaded from ArrayExpress database, and quantile-adjusted conditional maximum likelihood method was utilized to identify statistical difference between miRNAs of Mycobacterium tuberculosis (MTB)-infected individuals and healthy subjects."
Our news journalists obtained a quote from the research, "Furthermore, in order to assess the performance of our methodology, random forest (RF) classification model was utilized to identify the top 10 miRNAs with better Area Under The Curve (AUC) using 10-fold cross-validation method. Additionally, Monte Carlo Cross-Validation was repeated 50 times to explore the best miRNAs. In order to learn more about the differentially-expressed miRNAs, the target genes of differentially-expressed miRNAs were retrieved from TargetScan database and Ingenuity Pathways Analysis (IPA) was used to screen out biological pathways where target genes were involved. After normalization, a total of 478 miRNAs with higher than 0.25-fold quantile average across all samples were required. Based on the differential expression analysis, 38 differentially expressed miRNAs were identified when the significance was set as false discovery rate (FDR) < 0.01. Among the top 10 differentially expressed miRNAs, miRNA-155 obtained a highest AUC value 0.976, showing a good performance between PTB and control groups. Similarly, miRNA-449a, miRNA-212 and miRNA-132 revealed also a good performance with AUC values 0.947, 0.931 and 0.930, respectively. Moreover, miRNA-155, miRNA-449a, miRNA-29b-1* and miRNA-132 appeared in 50, 49, 49 and 48 bootstraps."

According to the news editors, the research concluded: "Thus, miRNA-155 and miRNA-132 might be important in the progression of PTB and thereby, might present potential signatures for diagnosis of PTB."

The news correspondents report that additional information may be obtained from M.L. Zheng, PLA, Dept. of Chest Surg, Hosp 309, Beijing 100091, People's Republic of China. Additional authors for this research include N.K. Zhou and C.H. Luo.

frequently been linked to the pathogenesis of myocarditis (MC) and its progression towards dilated cardiomyopathy (DCM). The exact role of the presence of B19V and its load remains controversial, as this virus is also found in the heart of healthy subjects."

Our news editors obtained a quote from the research from Maastricht University, "Moreover, the prognostic relevance of B19V prevalence in endomyocardial biopsies still remains unclear. As a result, it is unclear whether the presence of B19V should be treated. This review provides an overview of recent literature investigating the presence of B19V and its pathophysiological relevance in MC and DCM, as well as in normal hearts. In brief, no difference in B19V prevalence is observed between MC/DCM and healthy control hearts. Therefore, the question remains open whether and how cardiac B19V may be of pathogenetic importance. Findings suggest that B19V is aetiologically relevant either in the presence of other cardiotropic viruses, or when B19V load is high and/or actively replicating, which both may maintain myocardial (low-grade) inflammation. Therefore, future studies should focus on the prognostic relevance of the viral load, replicative status and virus co-infections."

According to the news editors, the research concluded: "In addition, the immunogenetic background of MC/DCM patients that makes them susceptible to develop heart failure upon presence of B19V should be more thoroughly investigated."

The news editors report that additional information may be obtained by contacting J. Verdonschot, Maastricht University, Medical Center, CARIM, Dept. of Cardiol, NL-6200 MD Maastricht, Netherlands. Additional authors for this research include M. Hazebroek, J. Merken, Y. Debing, R. Dennert, H.P. Brunner-La Rocca and S. Heymans.

**Digestive System Diseases and Conditions**

**Findings from Maastricht University Broaden Understanding of Sclerosing Cholangitis (Elevated interleukin-8 in bile of patients with primary sclerosing cholangitis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Digestive System Diseases and Conditions - Sclerosing Cholangitis are discussed in a new report. According to news reporting originating from Maastricht, Netherlands, by NewsRx correspondents, research stated, "To better understand the pathogenesis of primary sclerosing cholangitis, anti-and pro-inflammatory factors were studied in bile. Ductal bile of PSC patients (n = 36) and controls (n = 20) was collected by endoscopic retrograde cholangiography."
Financial supporters for this research include Dutch Digestive Diseases Foundation, Norwegian PSC Consortium, German Crohn's & Ulcerative Colitis Association.

Our news editors obtained a quote from the research from Maastricht University, "Gallbladder bile was collected at liver transplantation. Bile samples were analysed for cytokines, FGF19 and biliary lipids. Hepatobiliary tissues of PSC and non-PSC patients (n = 8-11 per patient group) were collected at transplantation and were analysed for IL8 and FGF19 mRNA expression and IL8 localization. The effect of IL8 on proliferation of primary human cholangiocytes and expression of pro-fibrotic genes was studied. In PSC patients, median IL8 in ductal bile was 6.6 ng/ml vs. 0.24 ng/ml in controls. Median IL8 in gallbladder bile was 7.6 ng/ml in PSC vs. 2.2 and 0.3 ng/ml in two control groups. IL8 mRNA in PSC gallbladder was increased and bile ducts stained positive for IL8. In vitro, IL8 induced proliferation of primary human cholangiocytes and increased the expression of pro-fibrotic genes. Elevation of IL8 in bile of PSC patients, collected at different stages of disease, indicates an ongoing inflammatory stimulus that drives IL8 production."

According to the news editors, the research concluded: "This challenges the idea that advanced PSC is a burned-out disease, and calls for reconsideration of anti-inflammatory therapy in PSC."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/liv.13092. This DOI is a link to an online electronic document that is either free or for purchase.

**Hematology - Blood Coagulation Factors**

**Findings from Maastricht University Yields New Data on Blood Coagulation Factors (Cardiac troponin T degradation in serum is catalysed by human thrombin)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
Wellness Week -- Current study results on Hematology - Blood Coagulation Factors have been published. According to news reporting originating from Maastricht, Netherlands, by NewsRx correspondents, research stated, "Cardiac troponin T (cTnT) has been shown to be present in fragmented forms in human serum after acute myocardial infarction (AMI). While calpain-1 and caspase-3 have been identified as intracellular proteases able to cleave the N-terminus of cTnT, it is still unclear which proteases are responsible for the extensive and progressive cTnT fragmentation observed in serum of AMI-patients."

Our news editors obtained a quote from the research from Maastricht University, "In this pilot study we have investigated the possibility that human thrombin may be involved in this process. Purified human cTnT was spiked in unprocessed and deproteinated serum in the presence or absence of either purified human thrombin or PPACK thrombin inhibitor. After immunoprecipitation, SDS-PAGE and Western blotting we observed an increase in cTnT fragmentation when purified thrombin was added to deproteinated serum. Consequently, the addition of thrombin inhibitor to unprocessed serum resulted in a decrease of cTnT fragmentation."

According to the news editors, the research concluded: "Our results suggest that multiple enzymes are involved in cTnT degradation, and that thrombin plays an important role."

For more information on this research see: Cardiac troponin T degradation in serum is catalysed by human thrombin. Biochemical and Biophysical Research Communications, 2016;481(1-2):165-168. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Findings from Maastricht University in Obesity, Fitness and Wellness Reported (New insights into the generation and role of de novo mutations in health and disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Obesity, Fitness and Wellness are presented in a new report.
According to news reporting out of Maastricht, Netherlands, by NewsRx editors, research stated, "Aside from inheriting half of the genome of each of our parents, we are born with a small number of novel mutations that occurred during gametogenesis and postzygotically. Recent genome and exome sequencing studies of parent-offspring trios have provided the first insights into the number and distribution of these de novo mutations in health and disease, pointing to risk factors that increase their number in the offspring."

Our news journalists obtained a quote from the research from Maastricht University, "De novo mutations have been shown to be a major cause of severe early-onset genetic disorders such as intellectual disability, autism spectrum disorder, and other developmental diseases. In fact, the occurrence of novel mutations in each generation explains why these reproductively lethal disorders continue to occur in our population. Recent studies have also shown that de novo mutations are predominantly of paternal origin and that their number increases with advanced paternal age."

According to the news editors, the research concluded: "Here, we review the recent literature on de novo mutations, covering their detection, biological characterization, and medical impact."

For more information on this research see: New insights into the generation and role of de novo mutations in health and disease. Genome Biology, 2016;17():1-19. Genome Biology can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. (BioMed Central - www.biomedcentral.com; Genome Biology - genomebiology.com)

Our news journalists report that additional information may be obtained by contacting J.A. Veltman, Maastricht University, Medical Center, GROW Sch Oncol & Dev Biol, Dept. of Clin Genet, NL-6229 ER Maastricht, Netherlands. Additional authors for this research include J.A. Veltman and A. Hoischen.

Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm Reported (Application of an Adaptive Polynomial Chaos Expansion on Computationally Expensive Three-Dimensional Cardiovascular Models for Uncertainty Quantification and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm are presented in a new report. According to news reporting originating in Maastricht, Netherlands, by NewsRx journalists, research stated, "When applying models to patient-specific situations, the impact of model input uncertainty on the model output uncertainty has to be assessed. Proper uncertainty quantification (UQ) and sensitivity analysis (SA) techniques are indispensable for this purpose."

The news reporters obtained a quote from the research from Maastricht University, "An efficient approach for UQ and SA is the generalized polynomial chaos expansion (gPCE) method, where model response is expanded into a finite series of polynomials that depend on
the model input (i.e., a meta-model). However, because of the intrinsic high computational cost of three-dimensional (3D) cardiovascular models, performing the number of model evaluations required for the gPCE is often computationally prohibitively expensive. Recently, Blatman and Sudret (2010, 'An Adaptive Algorithm to Build Up Sparse Polynomial Chaos Expansions for Stochastic Finite Element Analysis,' Probab. Eng. Mech., 25(2), pp. 183-197) introduced the adaptive sparse gPCE (agPCE) in the field of structural engineering. This approach reduces the computational cost with respect to the gPCE, by only including polynomials that significantly increase the meta-model's quality. In this study, we demonstrate the agPCE by applying it to a 3D abdominal aortic aneurysm (AAA) wall mechanics model and a 3D model of flow through an arteriovenous fistula (AVF). The agPCE method was indeed able to perform UQ and SA at a significantly lower computational cost than the gPCE, while still retaining accurate results."

According to the news reporters, the research concluded: "Cost reductions ranged between 70-80% and 50-90% for the AAA and AVF model, respectively."

Our news correspondents report that additional information may be obtained by contacting S. Quicken, Maastricht University, Dept. of Biomed Engn, Sch Cardiovasc Dis CARIM, NL-6229 ER Maastricht, Netherlands. Additional authors for this research include W.P. Donders, E.M.J. van Disseldorp, K. Gashi, B.M.E. Mees, F.N. van de Vosse, R.G.P. Lopata, T. Delhaas and W. Huberts.

**Gram-Negative Bacteria - Escherichia coli**

**Findings from Mahatma Gandhi University Has Provided New Information about Escherichia coli (Bioconversion of sodium dodecyl sulphate to rhamnolipids by transformed Escherichia coli DH5a cells-a novel strategy for rhamnolipid synthesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Escherichia coli have been published. According to news reporting originating from Kottayam, India, by NewsRx correspondents, research stated, "Biological synthesis of rhamnolipids from SDS by Pseudomonas aeruginosa S15 is found to be a cost effective mode of rhamnolipid synthesis. This study aimed to attempt rhamnolipid synthesis by transformant Escherichia coli DH5a cells."

Our news editors obtained a quote from the research from Mahatma Gandhi University, "Molecular analysis by curing experiments revealed that the properties of SDS based rhamnolipid synthesis were plasmid borne. Transformation of 10 kb plasmid to E. coli DH5a
cells conferred rhamnolipid synthetic ability to transformant. Various genetic elements involved in SDS based rhamnolipid synthesis were analyzed using PCR based and restriction digestion based approaches. PCR amplification using primers specific for sdsA gene encoding alkylsulfatases yielded two significant amplicons viz, 1.2 kb fragment and 422 bp fragment, coding for putative dehydratase and ABC transporter respectively. Amplicon of sdsB gene lacked ability of SDS degradation and rhamnolipid synthesis. Rhamnolipid biosynthesis by transformant E. coli DH5a containing the whole of the 10 kb plasmid, was optimized to yield of 3.38 g l(-1) in 5 days of incubation. Plasmid encoded rhamnolipid synthesis from recombinant E. coli cells is novel and could serve as yet another promising approach among various steps adopted for safe and effective rhamnolipid synthesis. SDS based rhamnolipid synthesis by S15 attained a high substrate (SDS) to product (Rhamnolipid) conversion ratio. However, the use of Pseudomonas strains is always discouraged as they are opportunistic pathogens and could sometimes turn infectious."

According to the news editors, the research concluded: "Thus, transformation of genetic elements coding SDS based rhamnolipid synthesis to nonpathogenic strains could be promising."

The news editors report that additional information may be obtained by contacting S. Rebello, School of Biosciences, Mahatma Gandhi University, Kottayam, India. Additional authors for this research include B.V. Joseph, S.V. Joseph, L. Jose, S. Mundayoor and M.S Jisha.

**Immune System Diseases and Conditions** -

**Findings from Mahidol University Provide New Insights into Hypersensitivity (Skin testing with beta-lactam antibiotics for diagnosis of beta-lactam hypersensitivity in children)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immune System Diseases and Conditions - Hypersensitivity. According to news originating from Bangkok, Thailand, by NewsRx correspondents, research stated, "Skin testing with penicilloyl-polylysine (PPL) and a minor determinant mixture (MDM) were previously recommended for evaluating P-lactam hypersensitivity. However, PPL and MDM have not been commercially available."

Our news journalists obtained a quote from the research from Mahidol University,
This study was to determine the negative predictive value (NPV) of skin testing with beta-lactam antibiotics for the diagnosis of beta-lactam hypersensitivity. Patients age 1-18 years old with a history of β-lactam hypersensitivity were evaluated by skin tests. (a skin prick test, an intradermal test) with penicillin G, ampicillin, amoxicillin-clavulanic acid, and the suspect beta-lactam. The patients who had a negative skin test were performed with a drug provocation test (DPT) in a 3-dose-graded challenge. The hypersensitivity reactions were classified into immediate and non-immediate reactions. Results: A total of 126 patients were evaluated for β-lactam hypersensitivity. Twenty-two patients (17.4%) were confirmed with a beta-lactam hypersensitivity. 12 (54.54%) of them were confirmed by a skin test. There was no systemic reaction occurring after the skin tests. Ten patients (9.6%) from 104 patients with negative skin test showed reactions after a DPT providing the NPV of the skin test with a 91.2% value. Among those children with a history of beta-lactam hypersensitivity, skin testing with penicillin G, ampicillin, amoxicillin-clavulanic acid, and the suspect beta-lactam was safe and provided a good NPV when PPL and MDM were unavailable.

According to the news editors, the research concluded: "However, a skin test with beta-lactam antibiotics alone did not provide a high sensitivity; thus a DPT procedure was necessary in order to confirm the diagnosis of beta-lactam hypersensitivity."

The news correspondents report that additional information may be obtained from W. Manuyakorn, Mahidol University, Div Pediat Allergy & Immunol, Dept. of Pediat, Fac MedRamathibodi Hosp, Bangkok, Thailand. Additional authors for this research include P. Singvijarn, S. Benjaponpitak, W. Kamchaisatian, T. Rerkpattanapipat, C. Sasisakulporn and W. Jotikasthira.

Keywords for this news article include: Bangkok, Thailand, Asia, beta-Lactams, Diagnostics and Screening, Immune System Diseases and Conditions, Antibacterial Agents, Drugs and Therapies, Sulfur Compounds, Hypersensitivity, Antimicrobials, Antibiotics, Mahidol University.

on patients who account for the differences between ANCA type and disease type classifications: antimyeloperoxidase (MPO)-ANCA-positive and ANCA-negative patients with granulomatosis with polyangiitis (Wegener's) (GPA)."

Our news journalists obtained a quote from the research from Massachusetts General Hospital, "We performed a pooled analysis of the Wegener's Granulomatosis Etanercept Trial and the Rituximab in ANCA-Associated Vasculitis trial comparing patients with MPO-ANCA-positive GPA and patients with ANCA-negative GPA to patients with proteinase 3 (PR3)-ANCA-positive GPA and patients with MPO-ANCA-positive microscopic polyangiitis (MPA). Of the 365 patients analyzed, 273 (75%) had PR3-ANCA-positive GPA, 33 (9%) had MPO-ANCA-positive GPA, 15 (4%) had ANCA-negative GPA, and 44 (12%) had MPO-ANCA-positive MPA. MPO-ANCA-positive GPA patients were younger at diagnosis compared to MPO-ANCA-positive MPA patients (53 versus 61 years; P=0.02). Their disease manifestations and rates of relapse were similar to those of PR3-ANCA-positive GPA patients. Relapse was more frequent in MPO-ANCA-positive GPA patients than in patients with MPO-ANCA-positive MPA at trial entry as well as at 12 and 18 months. ANCA-negative patients with GPA had lower Birmingham Vasculitis Activity Score for Wegener's Granulomatosis scores at trial entry than PR3-ANCA-positive patients with GPA (4.5 versus 7.7; P< 0.01), primarily because of a lower prevalence of renal involvement."

According to the news editors, the research concluded: "We were unable to demonstrate important clinical differences between MPO-ANCA-positive and PR3-ANCA-positive patients with GPA."

For more information on this research see: Myeloperoxidase-Antineutrophil Cytoplasmic Antibody (ANCA)-Positive and ANCA-Negative Patients With Granulomatosis With Polyangiitis (Wegener's) Distinct Patient Subsets. Arthritis & Rheumatology, 2016;68 (12):2945-2952. Arthritis & Rheumatology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Research. According to news reporting originating from Cambridge, Massachusetts, by NewsRx correspondents, research stated, "Long non-coding RNAs (lncRNAs) are an emerging class of transcripts that can modulate gene expression; however, their mechanisms of action remain poorly understood. Here, we experimentally determine the secondary structure of Braveheart (Bvht) using chemical probing methods and show that this similar to 590 nt transcript has a modular fold."

Our news editors obtained a quote from the research from the Massachusetts Institute of Technology, "Using CRISPR/Cas9-mediated editing of mouse embryonic stem cells, we find that deletion of 11 nt in a 5' asymmetric G-rich internal loop (AGIL) of Bvht (bvht(dAGIL)) dramatically impairs cardiomyocyte differentiation. We demonstrate a specific interaction between AGIL and cellular nucleic acid binding protein (CNBP/ZNF9), a zinc-finger protein known to bind single-stranded G-rich sequences. We further show that CNBP deletion partially rescues the bvht(dAGIL) mutant phenotype by restoring differentiation capacity."

According to the news editors, the research concluded: "Together, our work shows that Bvht functions with CNBP through a well-defined RNA motif to regulate cardiovascular lineage commitment, opening the door for exploring broader roles of RNA structure in development and disease."

For more information on this research see: A G-Rich Motif in the lncRNA Braveheart Interacts with a Zinc-Finger Transcription Factor to Specify the Cardiovascular Lineage. Molecular Cell, 2016;64(1):37-50. Molecular Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Molecular Cell - www.journals.elsevier.com/molecular-cell/)

The news editors report that additional information may be obtained by contacting L.A. Boyer, MIT, Dept. of Biol Engn, Cambridge, MA 02139, United States. Additional authors for this research include S. Hennelly, B. Doyle, A.A. Gulati, I.V. Novikova, K.Y. Sanbonmatsu and L.A. Boyer.

Pharmacokinetics

Findings from Massachusetts Institute of Technology Yields New Data on Pharmacokinetics (Quantitative Assessment of Population Variability in Hepatic Drug Metabolism Using a Perfused Three-Dimensional Human Liver Microphysiological Systems)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacokinetics. According to news originating from Cambridge, Massachusetts, by NewsRx correspondents, research stated, "In this work, we first describe the population variability in hepatic drug metabolism using
cryopreserved hepatocytes from five different donors cultured in a perfused three-dimensional human liver microphysiological system, and then show how the resulting data can be integrated with a modeling and simulation framework to accomplish in vitro-in vivo translation. For each donor, metabolic depletion profiles of six compounds (phenacetin, diclofenac, lidocaine, ibuprofen, propranolol, and prednisolone) were measured, along with metabolite formation, mRNA levels of 90 metabolism-related genes, and markers of functional viability [lactate dehydrogenase (LDH) release, albumin, and urea production]."

Our news journalists obtained a quote from the research from the Massachusetts Institute of Technology, "Drug depletion data were analyzed with mixed-effects modeling. Substantial interdonor variability was observed with respect to gene expression levels, drug metabolism, and other measured hepatocyte functions. Specifically, interdonor variability in intrinsic metabolic clearance ranged from 24.1% for phenacetin to 66.8% for propranolol (expressed as coefficient of variation). Albumin, urea, LDH, and cytochrome P450 mRNA levels were identified as significant predictors of in vitro metabolic clearance. Predicted clearance values from the liver microphysiological system were correlated with the observed in vivo values. A population physiologically based pharmacokinetic model was developed for lidocaine to illustrate the translation of the in vitro output to the observed pharmacokinetic variability in vivo. Stochastic simulations with this model successfully predicted the observed clinical concentration-time profiles and the associated population variability."

According to the news editors, the research concluded: "This is the first study of population variability in drug metabolism in the context of a microphysiological system and has important implications for the use of these systems during the drug development process."

The news correspondents report that additional information may be obtained from M. Cirit, MIT, Dept. of Biol Engn, Cambridge, MA 02139, United States. Additional authors for this research include T. Kostrzewski, C.L. Stokes, L.G. Griffith, D.J. Hughes and M. Cirit.

**Skin Diseases and Conditions - Lichen Planus**

**Findings from Mayo Clinic Reveals New Findings on Lichen Planus (Oesophageal lichen planus: the efficacy of topical steroid-based therapies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Skin Diseases and Conditions - Lichen Planus have been presented. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Oesophageal lichen planus is an idiopathic inflammatory
disorder characterized by significant oesophageal stricturing. Oesophageal lichen planus is a rare, difficult to diagnose, and likely an under recognized disease."

Financial support for this research came from Mayo Clinic.

Our news editors obtained a quote from the research from Mayo Clinic, "As a result, there is no standardized approach to therapy and treatment strategies vary. To examine the utility of topical steroid therapy (fluticasone or budesonide) in the management of oesophageal lichen planus. A retrospective chart review was conducted of patients diagnosed with oesophageal lichen planus who underwent baseline and follow up endoscopy pre and post topical steroid therapy between 1995 and 2016 at Mayo Clinic, Rochester MN. Average time between upper GI endoscopy was 3.2 months (0.7-11.7). Swallowed steroid preparations included fluticasone 880 μg twice daily or budesonide 3 mg twice daily. Patients were reviewed for symptomatic response to therapy using the Dakkak-Bennett dysphagia score (0-4, no dysphagia to total aphagia). Pre-and post-endoscopic findings were assessed. Additional baseline demographic, endoscopic, and histologic data were also obtained. We identified 40 patients who met the inclusion criteria. A significant reduction in median dysphagia score from 1 (0-4) to 0 (0-3) after steroid therapy (P < 0.001) was noted. 62% of patients reported resolution of their dysphagia after receiving topical corticosteroids. 72.5% had an endoscopic response to steroid therapy."

According to the news editors, the research concluded: "Topical swallowed budesonide or fluticasone appear to effective treatment for oesophageal lichen planus."

The news editors report that additional information may be obtained by contacting M. Halland, Mayo Clinic, Div Gastroenterol & Hepatol, Rochester, MN 55905, United States. Additional authors for this research include D. Sunjaya, T.C. Smyrk, J.A. Murray, M. Binder, D.A. Katzka, J.A. Alexander and M. Halland.

Acute Kidney Injury

Findings from Mayo Clinic in Acute Kidney Injury Provides New Insights (Acute Kidney Injury: Tubular Markers and Risk for Chronic Kidney Disease and End-Stage Kidney Failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Acute Kidney Injury are presented in a new report. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Acute kidney injury (AKI) is a common clinical syndrome directly related to patient short-term and long-term morbidity and mortality. Over the last decade, the occurrence rate of AKI has been increasing, and there has also been a growing epidemic of chronic kidney diseases (CKD) and end-stage kidney disease (ESRD) linked to severe and repeated episodes of AKIs."

Our news editors obtained a quote from the research from Mayo Clinic, "The detection and management of AKI are currently far from satisfactory. A large proportion of AKI patients, especially those with preexisting CKD, are at an increased risk of non-resolving AKI and progressing to CKD and ESRD. Proposed pathological processes that contribute to the transition of AKI to CKD and ESRD include severity and frequency of kidney injury, alterations of tubular cell phenotype with cells predominantly in the G2/M phase, interstitial fibrosis and microvascular rarefication related to loss of endothelial-pericyte interactions and pericyte dedifferentiation. Innate immune responses, especially dendritic cell responses related to inadequate adenosine receptor (2a)-mediated signals, autophagic insufficiency and renin-angiotensin system activation have also been implicated in the progression of AKI and transitions from AKI to CKD and ESRD."

According to the news editors, the research concluded: "Although promising advances have been made in understanding the pathophysiology of AKI and AKI consequences, much more work needs to be done in developing biomarkers for detecting early kidney injury, prognosticating kidney disease progression and developing strategies to effectively treat AKI and to minimize AKI progression to CKD and ESRD."

The news editors report that additional information may be obtained by contacting H.L. Tan, Division of Nephrology and Hypertension Dept. of Medicine, Mayo Clinic College of Medicine, Rochester, MN, United States. Additional authors for this research include J.Q. Yap and Q. Qian.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000441269. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from Mayo Clinic in the Area of Cholestasis Reported [Low incidence of primary biliary cirrhosis (PBC) in the first-degree relatives of PBC probands after 8 years of follow-up]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Cholestasis have been published. According to news reporting originating in Rochester, Minnesota, by NewsRx journalists, research stated, "Primary biliary cirrhosis (PBC) is characterized by chronic cholestasis and disease-specific antimitochondrial antibodies (AMA). A high prevalence of AMAs in first-degree relatives (FDRs) of PBC probands has been reported, although the natural history of such patients has not been described."

Financial supporters for this research include National Institutes of Health, Sigismunda Palumbo Charitable Trust.

The news reporters obtained a quote from the research from Mayo Clinic, "We aimed to assess the risk of developing PBC in AMA+FDRs of patients with PBC. First-degree relatives recruited to the Mayo Clinic PBC Genetic Epidemiology Registry and Biorepository were followed for disease onset after recruitment. Development of PBC was ascertained via self-report during a telephone interview and/or via proband report on a questionnaire. Chi-squared test and t-test were used to assess the differences between categorical and continuous variables respectively. A mixed-effects model was used to assess the change in biochemical profiles over time. Forty AMA+ and 423 AMA- subjects were included and followed for a median of 8.9 and 8.4 years respectively. Overall, 3% (n = 15) of FDRs were diagnosed with PBC, and AMA+FDRs had a higher risk than AMA- FDRs (24% vs. 0.7%, P < 0.01). However, among undiagnosed FDRs, only 4% of AMA+(n = 1) and 0.4% of AMA- (n = 1) FDRs were diagnosed with PBC (P = 0.17) during the follow-up period. None of the AMA+FDRs with normal alkaline phosphatase at baseline developed PBC in follow-up. Our results suggest a low risk of developing PBC over time in FDRs of patients with PBC, particularly those without biochemical evidence of cholestasis at baseline."

According to the news reporters, the research concluded: "These data are useful in counselling and reassuring relatives of their overall favourable prognosis."

Our news correspondents report that additional information may be obtained by contacting K.N. Lazaridis, Mayo Clinic, Div Gastroenterol & Hepatol, Center Basic Res Digest Dis, Rochester, MN 55905, United States. Additional authors for this research include B.D. Juran, E.J. Atkinson, B. McCauley, E. Schlicht and K.N. Lazaridis.

Findings from McGill University Yields New Findings on Proinsulin (Hyperinsulinemic-normoglycemic clamp administered together with amino acids induces anabolism after cardiac surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Peptide Proteins - Proinsulin are discussed in a new report. According to news reporting originating in Montreal, Canada, by NewsRx journalists, research stated, "Cardiac surgery triggers an inflammatory stress response, leading to protein catabolism, a process that even high-dose insulin therapy alone cannot reverse. To determine whether hyperinsulinemic-normoglycemic clamp and perioperative amino acid (AA) supplementation improves whole body protein balance, 20 patients scheduled for elective coronary artery bypass grafting surgery were randomly assigned to have intra-and postoperative hyperinsulinemic-normoglycemic clamp, with or without intravenous AA supplementation."

Financial support for this research came from Association des Anesthesiologistes du Quebec.

The news reporters obtained a quote from the research from McGill University, "Primed continuous infusions of [6,6-H-2(2)] glucose and L-[1-C-13] leucine were used to quantify whole body protein and glucose metabolism before and after surgery. Adipose tissue and serum cytokines were also analyzed to measure their responsiveness to the anabolic effect of AA administration. During hyperinsulinemic-normoglycemic clamp, AA supplementation successfully stimulated whole body protein synthesis, resulting in a positive whole body protein balance after surgery (insulin: -13.6 +/- 4.5 vs. insulin + AA: 2.1 +/- 5.4 mu mol.kg(-1). h(-1), P < 0.001). Endogenous glucose production was equally suppressed in both groups (insulin: 0.0 +/- 3.8 vs. insulin + AA 1.6 +/- 1.6 mu mol. kg(-1). min (-1), P = 0.230). AA supplementation led to significant changes in serum and tissue IL-6 (insulin: 246.6 +/- 111.2 vs. insulin + AA: 124.5 +/- 79.3 pg/ml, P = 0.011)."

According to the news reporters, the research concluded: "Hyperinsulinemic-normoglycemic clamp technique, together with AA supplementation, can induce an anabolic state after open-heart surgery, as quantified by a positive whole body protein balance."

For more information on this research see: Hyperinsulinemic-normoglycemic clamp administered together with amino acids induces anabolism after cardiac surgery. American Journal of Physiology-Regulatory Integrative and Comparative Physiology, 2016;311 (6):R1085-R1092. Cardiology
Findings from McMaster University Broaden Understanding of Cardiology (Guidance signalling regulates leading edge behaviour during collective cell migration of cardiac cells in Drosophila)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting originating in Hamilton, Canada, by NewsRx journalists, research stated, "Collective cell migration is the coordinated movement of cells, which organize tissues during morphogenesis, repair and some cancers. The motile cell membrane of the advancing front in collective cell migration is termed the Leading Edge."

Financial support for this research came from NSERC Discovery.

The news reporters obtained a quote from the research from McMaster University, "The embryonic development of the vertebrate and Drosophila hearts are both characterized by the coordinated medial migration of a bilateral cluster of mesodermal cells. In Drosophila, the cardioblasts form cohesive bilateral rows that migrate collectively as a unit towards the dorsal midline to form the dorsal vessel. We have characterized the collective cell migration of cardioblasts as an in vivo quantitative model to study the behaviour of the Leading Edge. We investigated whether guidance signalling through Slit and Netrin pathways plays a role in cell migration during heart development. Through time-lapse imaging and quantitative assessment of migratory behaviour of the cardioblasts in loss of-function mutants, we demonstrate that both Slit and Netrin mediated signals are autonomously and concomitantly required to maximize migration velocity, filopodial and lamellipodial activities. Additionally, we show that another Slit and Netrin receptor, Dscam1, the role of which during heart development was previously unknown, is required for both normal migration of cardioblasts and luminal expansion. Leading edge behaviour analysis revealed a dosage dependent genetic interaction between Slit and Netrin receptors suggesting that downstream signalling through these receptors converge on a common output that increases leading edge activity of the cardioblasts."

According to the news reporters, the research concluded: "Finally, we found that guidance signalling maintains the balance between epithelial and mesenchymal characteristics of the migrating cardioblasts."

For more information on this research see: Guidance signalling regulates leading edge behaviour during collective cell migration of cardiac cells in Drosophila. Developmental Biology, 2016;419(2):285-297. Developmental Biology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Developmental Biology - www.journals.elsevier.com/developmental-biology/)
Findings from Medical College of Wisconsin Provides New Data on Bacteremia (Bacteremia in Patients with Heterotaxy: A Review and Implications for Management)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Bacterial Infections and Mycoses - Bacteremia have been published. According to news reporting out of Milwaukee, Wisconsin, by NewsRx editors, research stated, "Heterotaxy (HTX) is a laterality defect resulting in abnormal arrangement of the thoracic and abdominal organs across the right-left axis, and is associated with multiple anatomic and physiologic disruptions. HTX often occurs in association with complex congenital heart disease."

Our news journalists obtained a quote from the research from the Medical College of Wisconsin, "Splenic abnormalities are also common and convey an increased risk of bacteremia (bacteremia) with a high associated mortality. We performed a systematic review of the literature studying the risk of infection in HTX patients and strategies that can be utilized to prevent such infections. Studies were identified for inclusion using PubMed, EMBASE, and OVID, as well as hand search of references from previously identified papers. Published studies specifically investigating bacteremia in HTX were identified and included as long as they were in English. Data were extracted by two separate authors independently with review of any findings that differed between the two authors. There were 42 documented cases of bacteremia in 32 patients. Approximately, 79% of these had absence of a spleen. The average age of bacteremia was 17 months. HTX patients are at high risk for bacteremia leading to mortality, regardless of anatomic splenic type."

According to the news editors, the research concluded: "We propose strategies for the evaluation of splenic function in HTX patients, and review management practices to reduce the impact of infection risk in the HTX population."

For more information on this research see: Bacteremia in Patients with Heterotaxy: A Review and Implications for Management. Congenital Heart Disease, 2016;11(6):537-547. Congenital Heart Disease can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Loomba, Medical College of Wisconsin, Children's Hospital of Wisconsin, Div Cardiol, Milwaukee, WI 53226, United States. Additional authors for this research include G.C. Geddes, D. Basel, D.W. Benson, S.R. Leuthner, D.A. Hehir, N. Ghanayem and A.J.
Cardiovascular Diseases and Conditions - Thrombosis

Findings from Medical University Has Provided New Data on Thrombosis (Perceval Sutureless Valve Dysfunction Caused by Valvular Thrombosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Thrombosis. According to news originating from Graz, Austria, by NewsRx correspondents, research stated, "Until now, to our knowledge no case of bioprosthetic valvular thrombosis after implantation of the sutureless Sorin Perceval valve has been reported."

Our news journalists obtained a quote from the research from Medical University, "Although sutureless aortic valve replacement has become a powerful tool in our daily practice, recent guidelines from the European Society of Cardiology, the European Association for Cardio-Thoracic Surgery, the American College of Cardiology, and the American Heart Association do not give specific recommendations on postoperative anticoagulation therapy."

According to the news editors, the research concluded: "We report the first case of valve dysfunction resulting from thrombosis 12 months after implantation with a possible link to postoperative cortisole therapy."

For more information on this research see: Perceval Sutureless Valve Dysfunction Caused by Valvular Thrombosis. 

The news correspondents report that additional information may be obtained from A. Votsch, Medical University of Graz, Inst Pathol, Graz, Austria. Additional authors for this research include W. Weihs, M. Asslaber and O. Dapunt.

Findings from Medical University Has Provided New Information about Biological Pigments (Microphthalmia-associated transcription factor regulates the visual cycle genes Rlbp1 and Rdh5 in the retinal pigment epithelium)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Biological Factors - Biological Pigments. According to news reporting originating from Wenzhou, People's Republic of China, by NewsRx correspondents, research stated, "Regeneration of the visual pigment by cells of the retinal pigment epithelium (RPE) is fundamental to vision. Here we show that the microphthalmia-associated transcription factor, MITF, which plays a central role in the development and function of RPE cells, regulates the expression of two visual cycle genes, Rlbp1 which encodes retinaldehyde binding protein-1 (RLBP1), and Rdh5, which encodes retinol dehydrogenase-5 (RDH5)."

Our news editors obtained a quote from the research from Medical University, "First, we found that Rlbp1 and Rdh5 are downregulated in optic cups and presumptive RPEs of Mitf-deficient mouse embryos. Second, experimental manipulation of MITF levels in human RPE cells in culture leads to corresponding modulations of the endogenous levels of RLBP1 and RDH5. Third, the retinal degeneration associated with the disruption of the visual cycle in Mitf-deficient mice can be partially corrected both structurally and functionally by an exogenous supply of 9-cis-retinal."

According to the news editors, the research concluded: "We conclude that the expression of Rlbp1 and Rdh5 critically depends on functional Mitf in the RPE and suggest that MITF has an important role in controlling retinoid processing in the RPE."

For more information on this research see: Microphthalmia-associated transcription factor regulates the visual cycle genes Rlbp1 and Rdh5 in the retinal pigment epithelium. Scientific Reports, 2016;6():21208. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting B. Wen, Laboratory of Developmental Cell Biology and Disease, School of Ophthalmology and Optometry and Eye Hospital, Wenzhou Medical University, Wenzhou, 325003, People's Republic of China. Findings from Medical University Provides New Data about Echocardiography (Echocardiographic Assessment of Aortic Pulse-Wave Velocity: Validation against Invasive Pressure Measurements)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Medical Imaging - Echocardiography are discussed in a new report. According to news reporting originating in Warsaw, Poland, by NewsRx journalists, research stated, "Aortic pulse-wave velocity (PWV) is a measure of aortic stiffness that has a prognostic role in various diseases and in the general population. A number of methods are used to measure PWV, including Doppler ultrasound."

The news reporters obtained a quote from the research from Medical University, "Although echocardiography has been used for PWV measurement, to the authors' knowledge, it has never been tested against an invasive reference method at the same time point. Therefore, the aim of this study was to compare prospectively an echocardiographic PWV measurement, called echo-PWV, with an invasive study. Forty-five patients (mean age, 66 years; 60% men) underwent simultaneous intra-arterial pressure recording and echocardiographic Doppler flow evaluation during elective cardiac catheterization. Proximal pressure and Doppler waveforms were acquired in the aortic arch. Distal pressure waveforms were registered in the right and distal Doppler waveforms in the left external iliac artery. Transit time was measured as a delay of the foot of pressure or Doppler waveform in the distal relative to the proximal location. Distance was measured on the catheter for invasive PWV and over the surface for echo-PWV. Echo-PWV was calculated as distance divided by transit time. In the whole group, mean invasive PWV was 9.38 m/sec and mean echo-PWV was 9.51 m/sec (P = .78). The Pearson' correlation coefficient between methods was 0.93 (P < .0001). A Bland-Altman plot revealed a mean difference between invasive PWV and echo-PWV of 0.13 +/- 0.79 m/sec. Echo-PWV, based on Doppler echocardiography, is a reliable method of aortic PWV measurement, with a close correlation with invasive assessment."

According to the news reporters, the research concluded: "Wider implementation of the echo-PWV method for the evaluation of aortic wall stiffness can further expand the clinical and scientific utility of echocardiography."

Our news correspondents report that additional information may be obtained by contacting C. Szmigielski, Medical University of Warsaw, Dept. of Internal Med Hypertens & Angiol, PL-02097 Warsaw, Poland. Additional authors for this research include A. Rdzanek, A. Pietrasik, J. Kochman, Z. Huczek, P. Sobieraj, Z. Gacion and C. Szmigielski.

Findings from Medical University Provides New Data on Prostate Cancer (Se-methylselenocysteine suppresses the growth of prostate cancer cell DU145 through connexin 43-induced apoptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Prostate Cancer are discussed in a new report. According to news reporting out of Weifang, People's Republic of China, by NewsRx editors, research stated, "Se-methylselenocysteine (MSC), as a chemopreventive agent, shows antitumor effects in some cancer models, but its mechanism is still unclear. This study is to explore whether MSC induces apoptosis in prostate cancer (PCa) cells DU145 through connexin 43 (Cx43) activation."

Our news journalists obtained a quote from the research from Medical University, "The experiment was performed in a PCa cell line model DU145 and using a series of biological assay methods to investigate the regulating pathway from MSC through Cx43 to downstream molecules, demonstrating an important role of Cx43 in PCa development and as a potential treatment target. The human PCa cell line DU145 was used as a model. The effects of MSC on Cx43 expression were examined by reverse transcription-polymerase chain reaction, western blot; effects on cell growth and proliferation were determined by WST-1 and colony formation assay; small interfering ribonucleic acid was used to evaluate the direct contribution of Cx43 to cancer cell apoptosis. Student's t-test was used to calculate the difference between the groups in SPSS software. MSC inhibited the growth and colony formation of the DU145 cells; MSC induced cell apoptosis by increasing Cx43 expression at messenger ribonucleic acid and protein levels; MSC decreased B-cell lymphoma-2 (Bcl-2) and increased bad levels of DU145 cells."

According to the news editors, the research concluded: "As a conclusion, MSC exerts pro-apoptosis effects through increasing Cx43 expression, which in turn down-regulates Bcl-2 and up-regulates bad expression."

Our news journalists report that additional information may be obtained by contacting L. Qi, Dept. of Oncology, Clinical College of Weifang Medical University, Weifang 261031, People's Republic of China. Additional authors for this research include L. Qi, G.X. Li, X.J. Bo, G.D. Liu and J.M Wang.

Findings from Medical University Reveals New Findings on Liver Failure (Invasive Aspergillosis of the Stomach and Co-infection With Candida krusei in a Patient With Terminal Liver Failure: A Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Liver Failure have been published. According to news reporting originating from Warsaw, Poland, by NewsRx correspondents, research stated, "Invasive aspergillosis (IA) is diagnosed almost exclusively in immunocompromised patients. It is located mainly in the lungs or paranasal sinuses, but occasionally other organs and the gastrointestinal tract may also be affected either alone or as a part of a disseminated disease."

Our news editors obtained a quote from the research from Medical University, "The main risk factors predisposing to IA are neutropenia, immunosuppressive and steroid therapy, as well as severe underlying disease. Despite progress in diagnostics and therapy of IA, it is still characterized by a high mortality rate. In the disseminated aspergillosis of the gastrointestinal tract, mainly the small or large intestine are affected, rarely the upper gastrointestinal tract. To our best knowledge only a very few cases of IA of the gastric wall have been reported so far in the literature. We describe a unique case of this very rare location of IA in the stomach in a patient who underwent orthotopic liver transplantation in the course of active IA and Candida krusei infection of the stomach wall."

According to the news editors, the research concluded: "The patient's condition improved on combination therapy of voriconazole and caspofungin."

The news editors report that additional information may be obtained by contacting M. Wroblewska, Medical University of Warsaw, Dept. of Dental Microbiol, PL-02097 Warsaw, Poland. Additional authors for this research include W. Figiel, M. Krawczyk and M. Wroblewska.

Central Nervous System Diseases and Conditions —

Findings from Medical University Update Knowledge of Epilepsy [Focal cortical dysplasia: Molecular disturbances and clinicopathological classification (Review)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System Diseases and Conditions - Epilepsy are presented in a new report. According to news reporting from Warsaw, Poland, by NewsRx journalists, research stated, "Focal cortical dysplasia (FCD) is one of the most important causes of drug-resistant epilepsy in paediatric patients, particularly in those below the age of 3. Even though over 40 years have passed since the first description of the entity by Taylor, the exact mechanisms causing these cortical abnormalities remain unelucidated. In this review, we summarise the current knowledge on clinical and histopathological aspects, taking into account the new classification system proposed by the International League Against Epilepsy."

The news correspondents obtained a quote from the research from Medical University, "We focus on the clinicopathological associations and differences in post-surgical outcome among FCD subtypes, in particular isolated FCD vs. FCD associated with principal lesions, which have not been summarised to date. We also recapitulate genetic studies, pointing to the possible mechanisms of the cortical dysregulation and drug resistance, and summarise novel factors which may contribute to epileptogenesis in FCD."

According to the news reporters, the research concluded: "Furthermore, we compare FCD type IIB (FCDIIB) with brain tumours found in a neurocutaneous disorder, tuberous sclerosis, as we evaluate the hypothesis that FCD IIB may be a local form of this disease."

For more information on this research see: Focal cortical dysplasia: Molecular disturbances and clinicopathological classification (Review). International Journal of Molecular Medicine, 2016;38(5):1327-1337. International Journal of Molecular Medicine can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

Oncology - Colon Cancer

Findings from Medical University Update Understanding of Colon Cancer (Hypoxia-inducible factor-1 modulates upregulation of mutT homolog-1 in colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According
to news reporting originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "To investigate the roles and interactions of mutT homolog (MTH)-1 and hypoxia-inducible factor (HIF)-1α in human colorectal cancer (CRC). The expression and distribution of HIF-1α and MTH-1 proteins were detected in human CRC tissues by immunohistochemistry and quantitative real-time polymerase chain reaction (qRT-PCR)."

Our news editors obtained a quote from the research from Medical University, "SW480 and HT-29 cells were exposed to normoxia or hypoxia. Protein and mRNA levels of HIF-1α and MTH-1 were analyzed by western blotting and qRT-PCR, respectively. In order to determine the effect of HIF-1α on the expression of MTH-1 and the amount of 8-oxo-deoxyguanosine triphosphate (dGTP) in SW480 and HT-29 cells, HIF-1α was silenced with small interfering RNA (siRNA). Growth studies were conducted on cells with HIF-1α inhibition using a xenograft tumor model. Finally, MTH-1 protein was detected by western blotting in vivo. High MTH-1 mRNA expression was detected in 64.2% of cases (54/84), and this was significantly correlated with tumor stage (p=0.023) and size (p=0.043). HIF-1α protein expression was correlated significantly with MTH-1 expression (R=0.640; p<0.01) in human CRC tissues. Hypoxic stress induced mRNA and protein expression of MTH-1 in SW480 and HT-29 cells. Inhibition of HIF-1α by siRNA decreased the expression of MTH-1 and led to the accumulation of 8-oxo-dGTP in SW480 and HT-29 cells. In the in vivo xenograft tumor model, expression of MTH-1 was decreased in the HIF-1α siRNA group, and the tumor volume was much smaller than that in the mock siRNA group."

According to the news editors, the research concluded: "MTH-1 expression in CRC cells was upregulated via HIF-1α in response to hypoxic stress, emphasizing the crucial role of HIF-1α-induced MTH-1 in tumor growth."

The news editors report that additional information may be obtained by contacting Y. Qiu, Yuan Qiu, Li-Hua Sun, Ke Peng, Wei-Dong Xiao, Hua Yang. Dept. of General Surgery, Xinqiao Hospital, Third Military Medical University, Chongqing 400037, People's Republic of China. Additional authors for this research include H. Zheng, L.H. Sun, K. Peng, W.D. Xiao and H. Yang.

Findings from Medical University in the Area of Non-Small Cell Lung Cancer Reported (Epidermal growth factor receptor and notch signaling in non-small-cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news reporting originating in Bialystok, Poland, by NewsRx editors, the research stated, "Lung cancer is the most common reason of cancer deaths and about 85% of these are non-small-cell lung cancer. Currently, lung cancer therapy is mainly based on the tumor node metastasis (TNM) disease staging and tumor histological classification."

Financial support for this research came from Iuventus Plus.

The news reporters obtained a quote from the research from Medical University, "Despite therapeutic innovations, the prognosis for lung cancer patients has not significantly changed in the last years. Therefore, a proper understanding of cell signaling pathways involved in cancer pathogenesis seems to be essential for improvement in cancer therapy field. The knowledge of crosstalk between epidermal growth factor receptor (EGFR) and Notch pathway can lead to enhanced screening for the expression of these genes allowing patients to optimize treatment options and predict potential treatment resistance."

According to the news reporters, the research concluded: "This review focuses on recent advances related to the mechanisms of EGFR and Notch signaling in non-small-cell lung cancer and the effectiveness of current Notch- and EGFR-targeted therapies."

Our news correspondents report that additional information may be obtained by contacting J. Pancewicz-Wojtkiewicz, Medical University of Bialystok, Dept. of Histol & Embryol, PL-15269 Bialystok, Poland.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cam4.944. This DOI is a link to an online electronic document that is either free or for purchase.

**Teichoic Acids**

**Findings from Merck & Company in Teichoic Acids Reported (TarO-specific inhibitors of wall teichoic acid biosynthesis restore b-lactam efficacy against methicillin-resistant staphylococci)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Teichoic Acids is the subject of a report. According to news reporting from Kenilworth, New Jersey, by NewsRx journalists, research stated, "The widespread emergence of methicillin-resistant *Staphylococcus aureus* (MRSA) has dramatically eroded the efficacy of current b-lactam antibiotics and created an urgent need for new treatment options. We report an *S. aureus* phenotypic screening strategy involving chemical suppression of the growth inhibitory consequences of depleting late-stage wall teichoic acid biosynthesis."

The news correspondents obtained a quote from the research from Merck & Company, "This enabled us to identify early-stage pathway-specific inhibitors of wall teichoic acid biosynthesis predicted to be chemically synergistic with b-lactams. We demonstrated by genetic and biochemical means that each of the new chemical series discovered, herein named tarocin A and tarocin B, inhibited the first step in wall teichoic acid biosynthesis (TarO). Tarocins do not have intrinsic bioactivity but rather demonstrated potent bactericidal synergy in combination with broad-spectrum b-lactam antibiotics against diverse clinical isolates of methicillin-resistant staphylococci as well as robust efficacy in a murine infection model of MRSA."

According to the news reporters, the research concluded: "Tarocins and other inhibitors of wall teichoic acid biosynthesis may provide a rational strategy to develop Gram-positive bactericidal b-lactam combination agents active against methicillin-resistant staphylococci."

For more information on this research see: TarO-specific inhibitors of wall teichoic acid biosynthesis restore b-lactam efficacy against methicillin-resistant staphylococci. *Science Translational Medicine*, 2016;8(329):329ra32.

Findings from Merck Research Labs Provides New Data on Antiretrovirals (Efavirenz does not meaningfully affect the single dose pharmacokinetics of 1200mg raltegravir)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antiretrovirals. According to news originating from Kenilworth, New Jersey, by NewsRx correspondents, research stated, "Raltegravir is a human immunodeficiency virus (HIV)-1 integrase strand transfer inhibitor currently marketed at a dose of 400mg twice daily (BID). Raltegravir for once daily regimen (QD) at a dose of 1200mg (2 x 600mg) is under development and offers a new treatment option for HIV-1 infected treatment-naive subjects."

Our news journalists obtained a quote from the research from Merck Research Labs, "Since raltegravir is eliminated mainly by metabolism via an UDP-glucuronosyltransferase (UGT) 1A1-mediated glucuronidation pathway, co-administration of UGT1A1 inducers may alter plasma levels of raltegravir. Efavirenz, an UGT1A1 inducer, was used to assess the impact of altered UGT activity on a 1200mg QD dose of raltegravir. An open label, randomized, 2-period fixed-sequence Phase 1 study was performed in adult healthy male and female subjects (non-childbearing potential)19 and 55years of age, with a body mass index (BMI)18.5 and 32.0kg/m(2). Subjects (n=21) received a single oral dose of 1200mg raltegravir at bedtime on an empty stomach on Day 1 in Period 1. After a washout period of at least 7days, subjects received oral doses of 600mg efavirenz QD at bedtime for 14 consecutive days in Period 2. Subjects received a single oral dose of 1200mg raltegravir co-administered with 600mg efavirenz on Day 12 of Period 2. Pharmacokinetic (PK) samples were collected for 72hours following raltegravir dosing and analyzed using a validated bioanalytical method to quantify raltegravir plasma concentrations. PK parameters were estimated using non-compartmental analysis. Administration of single 1200mg oral doses of raltegravir alone and co-administered with multiple oral doses of efavirenz were generally well tolerated in healthy subjects. Co-administration with efavirenz yielded geometric mean ratios (GMRs) and their associated 90% confidence intervals (90% CIs) for raltegravir AUC(0-,) C-max, and C-24 of 0.86 (0.73, 1.01), 0.91 (0.70, 1.17), and 0.94 (0.76, 1.17), respectively. The results show that efavirenz modestly reduced the exposure of raltegravir."

According to the news editors, the research concluded: "The reduction in raltegravir exposure is not considered clinically meaningful."

The news correspondents report that additional information may be obtained from R. Krishna, Merck & Co Inc, Merck Res Labs, Kenilworth, NJ, United States. Additional authors for this research include L. East, P. Larson, T. Siringhaus, L. Herpok, C. Bethel-Brown, H. Manthos, J. Brejda and M. Gartner.

Findings from Michigan State University in the Area of Apoptosis
Reported (The unfolded protein response controls ER stress-induced apoptosis of lung epithelial cells through angiotensin generation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Apoptosis have been published. According to news reporting from East Lansing, Michigan, by NewsRx journalists, research stated, "Recent work from this laboratory showed that endoplasmic reticulum (ER) stress-induced apoptosis of alveolar epithelial cells (AECs) is regulated by the autocrine angiotensin (ANG) II/ANG1-7 system. The proteasome inhibitor MG132 or surfactant protein C (SP-C) BRICHOS domain mutation G100S induced apoptosis in human AECs by activating the proapoptotic cathepsin D and reducing antiapoptotic angiotensin converting enzyme-2 (ACE-2)."

Financial support for this research came from PHS NHLBI.

The news correspondents obtained a quote from the research from Michigan State University, "This study tested the hypothesis that ER stress-induced apoptosis of human AECs might be mediated by influence of the unfolded protein response (UPR) on the autocrine ANGII/ANG1-7 system. A549 cells were challenged with MG132 or SP-C BRICHOS domain mutant G100S to induce ER stress and activation of UPR pathways. The results showed that either MG132 or G100S SP-C mutation activated all three canonical pathways of the UPR (IRE1/XBP1, ATF6, and PERK/εIF2 alpha), which led to a significant increase in cathepsin D or in TACE (an ACE-2 ectodomain shedding enzyme) and eventually caused AEC apoptosis. However, ER stress-induced AEC apoptosis could be prevented by chemical chaperone or by UPR blockers. It is also suggested that ATF6 and IRE1 pathways might play important role in regulation of angiotensin system. These data demonstrate that ER stress induces apoptosis in human AECs through mediation of UPR pathways, which in turn regulate the autocrine ANGII/ANG1-7 system."

According to the news reporters, the research concluded: "They also demonstrated that ER stress-induced AEC apoptosis can be blocked by inhibition of UPR signaling pathways."

Our news journalists report that additional information may be obtained by contacting B.D. Uhal, Michigan State University, Dept. of Physiol, East Lansing, MI 48824, United States.

Findings from Middle Tennessee State University Broaden Understanding of Cardiovascular Diseases [An isoflavonoid-enriched extract from Pueraria lobata (kudzu) root protects human umbilical vein endothelial cells against oxidative stress induced ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases is the subject of a report. According to news reporting from Murfreesboro, Tennessee, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Reactive oxygen species (ROS) mediate vascular cell dysfunction and lead to atherosclerosis and other chronic cardiovascular diseases. The root of Pueraria lobata (Willd.) Ohwi, also known as kudzu or Gegen (Chinese name), is one of the most important herbs in traditional Chinese medicine and has been widely used in the treatment of cardiovascular diseases, diabetes, osteonecrosis and neurodegradation diseases."

Financial support for this research came from TCBMR.

The news correspondents obtained a quote from the research from Middle Tennessee State University, "In this study, an ethanol extract from kudzu root was prepared and the in vitro protective effect of the kudzu root extract (KUD) on human umbilical vein endothelial cells (HUVECs) was investigated. An ethanol extract of dried kudzu root was purified with an AB-8 resin column, and the concentrations of puerarin, daidzin and daidzein in the KUD were determined using UV spectroscopy. HUVECs were pretreated with various concentrations of the KUD with or without rotenone and the viability was assessed by AlamarBlue cell viability assay. Next, HUVECs were pretreated with the KUD and then treated with rotenone, and the levels of ROS generation, apoptosis, and changes of the mitochondrial membrane potential (Delta Psi m) in HUVECs were measured using fluorescent staining assay and high-content analysis. The contents of three major isoflavonoids (puerarin, daidzin and daidzein) were enriched by 7.75-27.51 fold in the extract. The KUD enhanced the proliferation of HUVECs, and protected HUVECs against rotenone-induced oxidative stress and apoptosis. Additionally, the KUD prevented the loss of WPM in HUVECs stimulated by oxidative stress."

According to the news reporters, the research concluded: "We demonstrated that an isoflavonoid-rich extract prepared from kudzu root has the potential to act as a protector for vascular endothelial cells against intracellular ROS mediated apoptosis and mitochondrial damage."

For more information on this research see: An isoflavonoid-enriched extract from Pueraria lobata (kudzu) root protects human umbilical vein endothelial cells against oxidative stress induced apoptosis. *Journal of Ethnopharmacology*, 2016;193():524-530. *Journal of*
Findings from Mie University Yields New Data on Portal Hypertension (A Novel Predictor of Posttransplant Portal Hypertension in Adult-To-Adult Living Donor Liver Transplantation: Increased Estimated Spleen/Graft Volume Ratio)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Portal Hypertension have been presented. According to news reporting originating in Mie, Japan, by NewsRx journalists, research stated, "In adult living donor liver transplantation (ALDLT), graft-to-recipient weight ratio of less than 0.8 is incomplete for predicting portal hypertension (>20 mm Hg) after reperfusion. We aimed to identify preoperative factors contributing to portal venous pressure (PVP) after reperfusion and to predict portal hypertension, focusing on spleen volume-to-graft volume ratio (SVGVR)."

The news reporters obtained a quote from the research from Mie University, "In 73 recipients with ALDLT between 2002 and 2013, first we analyzed survival according to PVP of 20 mm Hg as the threshold, evaluating the efficacy of splenectomy. Second, we evaluated various preoperative factors contributing to portal hypertension after reperfusion. All of the recipients with PVP greater than 20 mm Hg (n = 19) underwent PVP modulation by splenectomy, and their overall survival was favorable compared with 54 recipients who did not need splenectomy (PVP 20 mm Hg). Graft-to-recipient weight ratio had no correlation with PVP. Multivariate analysis revealed that estimated graft and spleen volume were significant factors contributing to PVP after reperfusion (P < 0.0001 and P< 0.0001, respectively). Furthermore, estimated SVGVR showed a significant negative correlation to PVP after reperfusion (R = 0.652), and the best cutoff value for portal hypertension was 0.95."

According to the news reporters, the research concluded: "In ALDLT, preoperative assessment of SVGVR is a good predictor of portal hypertension after reperfusion can be used to indicate the need for splenectomy before reperfusion."

For more information on this research see: A Novel Predictor of Posttransplant
*Transplantation* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Transplantation - journals.lww.com/transplantjournal/pages/default.aspx)

**Stem Cell Research - Embryonic Stem Cells**

**Findings from Miguel Hernandez University Provides New Data on Embryonic Stem Cells (Effects of mipafox, paraoxon, chlorpyrifos and its metabolite chlorpyrifos-oxon on the expression of biomarker genes of differentiation in D3 mouse embryonic ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Stem Cell Research - Embryonic Stem Cells have been published. According to news reporting originating from Elche, Spain, by NewsRx correspondents, research stated, "Chlorpyrifos (CPS) is an organophosphorus compound (OP) capable of causing well-known cholinergic and delayed syndromes through the inhibition of acetylcholinesterase and Neuropathy Target Esterase (NTE), respectively. CPS is also able to induce neurodevelopmental toxicity in animals."

Our news editors obtained a quote from the research from Miguel Hernandez University, "NTE is codified by the Pnpla6 gene and plays a central role in differentiation and neurodifferentiation. We tested, in D3 mouse embryonic stem cells under differentiation, the effects of the NTE inhibition by the OPs mipafox, CPS and its main active metabolite chlorpyrifos-oxon (CPO) on the expression of genes Vegfa, Bcl2, Amot, Nes and Jun, previously reported to be under- or overexpressed after Pnpla6 silencing in this same cellular model. Mipafox did not significantly alter the expression of such genes at concentrations that significantly inhibited NTÉ. However, CPS and CPO at concentrations that caused NTE inhibition at similar levels to mipafox statistically and significantly altered the expression of most of these genes. Paraoxon (another OP with capability to inhibit esterases but not NTE) caused similar effects to CPS and CPO."

According to the news editors, the research concluded: "These findings suggest that the molecular mechanism for the neurodevelopmental toxicity induced by CPS is not based on NTE inhibition, and that other unknown esterases might be potential targets of neurodevelopmental toxicity."

For more information on this research see: Effects of mipafox, paraoxon, chlorpyrifos and its metabolite chlorpyrifos-oxon on the expression of biomarker genes of

**Drugs and Therapies - Antibiotics**

**Findings from Monash University Provides New Data on Antibiotics**

*(Updated US and European Dose Recommendations for Intravenous Colistin: How Do They Perform?)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news reporting originating in Melbourne, Australia, by NewsRx journalists, research stated, "The US Food and Drug Administration (FDA) and European Medicines Agency (EMA) have approved updated dose recommendations for intravenous colistin in patients with various degrees of renal function. We assessed the recommendations in relation to their ability to achieve clinically relevant plasma colistin concentrations."

Financial supporters for this research include National Institute of Allergy and Infectious Diseases (NIAID), National Institutes of Health, NIAID.

The news reporters obtained a quote from the research from Monash University, "Pharmacokinetic data from 162 adult critically ill patients (creatinine clearance range, 5.4-211 mL/min) were used to determine the average steady-state plasma colistin concentration (Css,avg) that would be achieved if each patient received the FDA or EMA dose. Target attainment rates for FDA-and EMA-approved daily doses to achieve colistin Css,avg of (>=)0.5, (>=)1, (>=)2, and (>=)4 mg/L were determined for each creatinine clearance category ( (>=)80 mL/min, 50 to <80 mL/min, 30 to <50 mL/min, and <30 mL/min). For creatinine clearance <30 mL/min, 100% of patients receiving the EMA dose achieved a colistin Css,avg (>=)1 mg/L, but the attainment rate was as low as 53.1% for patients receiving the FDA-approved dose. For colistinCss,avg (>=)2 mg/L, the attainment rates were 87.5% with the EMA dose but only 6.3%-34.4% in patients receiving the FDA dose. Differences in attainment rates for a colistin Css,avg of (>=)2 mg/L and (>=)4 mg/L extended to patients with creatinine clearance 30 to <50 mL/min. For patients with creatinine clearance (>=)80 mL/min, only approximately 65%-75% of patients achieved a colistin Css,avg of (>=)1 mg/L with either set of recommendations."
According to the news reporters, the research concluded: "The study highlights important differences between the FDA-and EMA-approved dose recommendations and informs the setting of clinical breakpoints."

Our news correspondents report that additional information may be obtained by contacting R.L. Nation, Drug Delivery, Disposition and Dynamics, Monash Institute of Pharmaceutical Sciences, Monash University, Melbourne, Australia. Additional authors for this research include S.M. Garonzik, J. Li, V. Thamlikitkul, E.J. Giamarellos-Bourboulis, D.L. Paterson, J.D. Turnidge, A. Forrest and F.P Silveira.

**Drugs and Therapies - Chemotherapy**

**Findings from Monash University Update Understanding of Chemotherapy (Guidelines for timely initiation of chemotherapy: a proposed framework for access to medical oncology and haematology cancer clinics and chemotherapy services)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Chemotherapy have been published. According to news reporting from Melbourne, Australia, by NewsRx journalists, research stated, "These guidelines, informed by the best available evidence and consensus expert opinion, provide a framework to guide the timely initiation of chemotherapy for treating cancer. They sit at the intersection of patient experience, state-of-the-art disease management and rational efficient service provision for these patients at a system level."

The news correspondents obtained a quote from the research from Monash University, "Internationally, cancer waiting times are routinely measured and publicly reported. In Australia, there are existing policies and guidelines relating to the timeliness of cancer care for surgery and radiation therapy; however, until now, equivalent guidance for chemotherapy was lacking. Timeliness of care should be informed, where available, by evidence for improved patient outcomes. Independent of this, it should be recognised that shorter waiting periods are likely to reduce patient anxiety. While these guidelines were developed as part of a proposed framework for consideration by the Victorian Department of Health, they are clinically relevant to national and international cancer services. They are intended to be used by clinical and administrative staff within cancer services. Adoption of these guidelines, which are for the timely triage, review and treatment of cancer patients receiving systemic chemotherapy, aims to ensure that patients receive care within a timeframe that will maximise health outcomes, and
that access to care is consistent and equitable across cancer services."

According to the news reporters, the research concluded: "Local monitoring of performance against this guideline will enable cancer service providers to manage proactively future service demand."

**Immune System Diseases and Conditions - HIV/AIDS**

**Findings from Monash University in the Area of HIV/AIDS Reported (A 'test and treat' prevention strategy in Australia requires innovative HIV testing models: a cohort study of repeat testing among 'high-risk' men who have sex with men)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immune System Diseases and Conditions - HIV/AIDS is the subject of a report. According to news reporting out of Melbourne, Australia, by NewsRx editors, research stated, "HIV diagnoses among men who have sex with men (MSM) in several high-income countries, including Australia, have increased substantially over recent years. Australia, in line with global prevention strategies, has emphasised a 'test and treat' HIV prevention strategy which relies on timely detection of HIV through frequent testing by those at risk."

Our news journalists obtained a quote from the research from Monash University, "We examined trends in repeat testing among MSM defined as 'high-risk' according to Australian testing guidelines. HIV test records from MSM attending high caseload clinics in Melbourne 2007-2013 and classified as high-risk were analysed. Binary outcomes of 'test within 3 months' and 'test within 6 months' were assigned to tests within individuals' panel of records. Negative binomial regressions assessed trends in overall HIV testing and returning within 3 and 6 months. Annualised proportions of return tests (2007-2012) were compared using two-sample z tests. Across 18 538 tests among 7117 high-risk MSM attending primary care clinics in Melbourne (2007-2013), the number of annual HIV tests increased (p <0.01). Between 2007 and 2012 annualised proportions of tests with a subsequent test within 3 and 6 months also increased (p <0.01); however, by 2012 only 36.4% and 15.1% of tests were followed by another test inside 6 and 3 months, respectively. Repeat testing among high-risk MSM in Australia remains
unacceptably low, with recent modest increases in testing unlikely to deliver meaningful prevention impact."

According to the news editors, the research concluded: "Removing known barriers to HIV testing is needed to maximise the potential benefit of test and treat-based HIV prevention."

For more information on this research see: A 'test and treat' prevention strategy in Australia requires innovative HIV testing models: a cohort study of repeat testing among 'high-risk' men who have sex with men. *Sexually Transmitted Infections*, 2016;92(6):464-466.

**Public Health - Disease Outbreaks**

**Findings from Morehouse School of Medicine in the Area of Disease Outbreaks Reported (Clinical profile and containment of the Ebola virus disease outbreak in two large West African cities, Nigeria, July-September 2014)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Public Health - Disease Outbreaks. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "The Ebola virus disease (EVD) outbreak in Nigeria began when an infected diplomat from Liberia arrived in Lagos, the most populous city in Africa, with subsequent transmission to another large city. First-, second-, and third-generation contacts were traced, monitored, and classified."

The news correspondents obtained a quote from the research from the Morehouse School of Medicine, "Symptomatic contacts were managed at Ebola treatment centers as suspected, probable, and confirmed EVD cases using standard operating procedures adapted from the World Health Organization EVD guidelines. Reverse transcription PCR tests confirmed EVD. Socio-demographic, clinical, hospitalization, and outcome data of the July-September 2014 Nigeria EVD cohort were analyzed. The median age of the 20 EVD cases was 33 years (interquartile range 26-62 years). More females (55%), health workers (65%), and persons < 40 years old (60%) were infected than males, non-health workers, and persons aged > = 40 years. No EVD case management worker contracted the disease. Presenting symptoms were fever (85%), fatigue (70%), and diarrhea (65%). Clinical syndromes were gastroenteritis (45%), hemorrhage (30%), and encephalopathy (15%). The case-fatality rate was 40% and there was one mental health complication. The average duration from symptom onset to presentation
was 3 +/- 2 days among survivors and 5 +/- 2 days for non-survivors. The mean duration from symptom onset to discharge was 15 +/- 5 days for survivors and 11 +/- 2 days for non-survivors. Mortality was higher in the older age group, males, and those presenting late. The EVD outbreak in Nigeria was characterized by the severe febrile gastroenteritis syndrome typical of the West African outbreak, better outcomes, rapid containment, and no infection among EVD care-providers."

According to the news reporters, the research concluded: "Early case detection, an effective incident management system, and prompt case management with on-site mobilization and training of local professionals were key to the outcome."

Aortic Stenosis

Findings from Morristown Medical Center Update Understanding of Aortic Stenosis (Medical Treatment of Aortic Stenosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Aortic Stenosis is now available. According to news reporting originating from Morristown, New Jersey, by NewsRx correspondents, research stated, "Untreated, severe, symptomatic aortic stenosis is associated with a dismal prognosis. The only treatment shown to improve survival is aortic valve replacement; however, before symptoms occur, aortic stenosis is preceded by a silent, latent phase characterized by a slow progression at the molecular, cellular, and tissue levels."

Our news editors obtained a quote from the research from Morristown Medical Center, "In theory, specific medical therapy should halt aortic stenosis progression, reduce its hemodynamic repercussions on left ventricular function and remodeling, and improve clinical outcomes. In the present report, we performed a systematic review of studies focusing on the medical treatment of patients with aortic stenosis. Lipid-lowering therapy, antihypertensive
drugs, and anticalcific therapy have been the main drug classes studied in this setting and are reviewed in depth."

According to the news editors, the research concluded: "A critical appraisal of the preclinical and clinical evidence is provided, and future research avenues are presented."

For more information on this research see: Medical Treatment of Aortic Stenosis. Circulation, 2016;134(22):1766-1784. Circulation can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

The news editors report that additional information may be obtained by contacting P. Genereux, Morristown Med Center, Morristown, NJ, United States. Additional authors for this research include B. Redfors, M.B. Leon and P. Genereux.

DNA Research

Findings from Mount Sinai Hospital Provides New Data about DNA Research (A mechanism for the suppression of homologous recombination in G1 cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on DNA Research are presented in a new report. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "DNA repair by homologous recombination is highly suppressed in G1 cells to ensure that mitotic recombination occurs solely between sister chromatids. Although many homologous recombination factors are cell-cycle regulated, the identity of the events that are both necessary and sufficient to suppress recombination in G1 cells is unknown."

Our news journalists obtained a quote from the research from Mount Sinai Hospital, "Here we report that the cell cycle controls the interaction of BRCA1 with PALB2-BRCA2 to constrain BRCA2 function to the S/G2 phases in human cells. We found that the BRCA1-interaction site on PALB2 is targeted by an E3 ubiquitin ligase composed of KEAP1, a PALB2-interacting protein, in complex with cullin-3 (CUL3)-RBX1 (ref. 6). PALB2 ubiquitylation suppresses its interaction with BRCA1 and is counteracted by the deubiquitylase USP11, which is itself under cell cycle control. Restoration of the BRCA1-PALB2 interaction combined with the activation of DNA-end resection is sufficient to induce homologous recombination in G1, as measured by RAD51 recruitment, unscheduled DNA synthesis and a CRISPR-Cas9-based gene-targeting assay. We conclude that the mechanism prohibiting homologous recombination in G1 minimally consists of the suppression of DNA-end resection coupled with a multi-step block of the recruitment of BRCA2 to DNA damage sites that involves the inhibition of BRCA1-PALB2-BRCA2 complex assembly."

According to the news editors, the research concluded: "We speculate that the ability to induce homologous recombination in G1 cells with defined factors could spur the
development of gene-targeting applications in non-dividing cells.

For more information on this research see: A mechanism for the suppression of homologous recombination in G1 cells. *Nature*, 2015;528(7582):422-6. (Nature Publishing Group - www.nature.com/nature/)

Arthroplasty

**Findings from Mt. Carmel Health System in the Area of Arthroplasty Reported (Risk of Periprosthetic Fractures With Direct Anterior Primary Total Hip Arthroplasty)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Arthroplasty. According to news reporting originating from New Albany, Ohio, by NewsRx correspondents, research stated, "Despite increasing interest in the anterior approach for cementless, primary total hip arthroplasty (THA), studies examining the incidence of periprosthetic fractures with this approach are lacking. The purpose of this study was to (1) investigate the incidence of early periprosthetic fractures associated with primary THA performed through an anterior supine intermuscular (ASI) approach without the use of a specialized table and (2) identify potential risk factors for these fractures."

Our news editors obtained a quote from the research from Mt. Carmel Health System, "We identified 2869 primary THAs performed via the ASI approach using a single cementless, tapered titanium femoral component with short and standard length options between February 2007 and April 2014. Fifty-two percent of THAs were in female patients, whereas 48% were in males. Short stems were used in 59% vs standard length in 41%. There were 26 (0.9%) early periprosthetic femoral fractures, with 23 requiring revision. When looking at the potential risk factors of age, gender, body mass index, and stem length, the only significant finding was that increased age was associated with increased risk of femoral fracture. Logistic regression analysis revealed a significant age-fracture association for female gender only, which remained when controlled for body mass index, stem length, or both. The muscle-sparing ASI approach appears to be a safe technique for performing primary THA when used in a suitable patient population."

According to the news editors, the research concluded: "The early periprosthetic femoral fracture rate in our series may warrant consideration of using a different design or different approach in elderly female patients."

The news editors report that additional information may be obtained by contacting K.R. Berend, Mt Carmel Hlth Syst, New Albany, OH, United States. Additional authors for this research include A.J. Mirza, M.J. Morris and A.V. Lombardi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.arth.2016.03.007. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from N. Rogenhofer and Co-Researchers in the Area of Spontaneous Abortion Described (Lessons From the ETHIGII Trial: Proper Putative Benefit Assessment of Low-Molecular-Weight Heparin Treatment in M2/ANXA5 Haplotype Carriers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pregnancy Complications - Spontaneous Abortion. According to news reporting out of Munster, Germany, by NewsRx editors, research stated, "This study presents sample size considerations derived from the Efficacy of Thromboprophylaxis as an Intervention during Gravidity (ETHIGII) trial (ClinicalTrials.gov: NCT00400387) to address the question of low-molecular-weight heparin (LMWH) treatment in women with recurrent pregnancy loss (RPL) depending on the M2/ANXA5 haplotype. To evaluate the possible influence of such treatment on miscarriage rates of trial participants, a post hoc analysis of ANXA5 promoter genotypes in the light of M2/ANXA5 (RPRGL3) distribution was performed using logistic models."

Our news journalists obtained a quote from the research, "DNA for genotyping was available from 129 LMWH and 95 control patients, 44 (19.6%) of whom were M2/ANXA5 carriers. Miscarriages occurred in 1 (4.0%) of 25 M2/ANXA5 carriers from the LMWH group compared to 4 (21.1%) of 19 in the control group, resulting in an odds ratio (95% confidence interval) for miscarriage of 0.16 (0.016-1.5) for women treated with LMWH. In noncarriers, miscarriage rates were 6 (5.8%) of 104 versus 7 (9.2%) of 76 for the LMWH and the control groups, respectively, corresponding to an odds ratio for miscarriage of 0.60 (0.19-1.9). The apparent beneficial effects of miscarriage rate reduction in M2/ANXA5 carriers with RPL concur with biological considerations about improvement in reduced ANXA5 function through LMWH treatment in an adequate murine model."

According to the news editors, the research concluded: "The data obtained were instrumental to design proper assessment of the existence and magnitude of this effect."

Our news journalists report that additional information may be obtained by contacting A. Markoff, WWU Muenster, Munster, Germany. Additional authors for this research include A. Markoff, A. Wagner, H.G. Klein, D. Petroff, E. Schleussner and C.J. Thaler.

Environmental Research

**Findings from N. Roth et al Has Provided New Information about Environmental Research [A critical review of frameworks used for evaluating reliability and relevance of (eco)toxicity data: Perspectives for an integrated eco-human decision-making ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Environmental Research have been published. According to news originating from Basel, Switzerland, by NewsRx correspondents, research stated, "Considerable efforts have been invested so far to evaluate and rank the quality and relevance of (eco)toxicity data for their use in regulatory risk assessment to assess chemical hazards. Many frameworks, have been developed to improve robustness and transparency in the evaluation of reliability and relevance of individual tests, but these frameworks typically focus on either environmental risk assessment (ERA) or human health risk assessment (HHRA), and there is little cross talk between them."

Financial support for this research came from European Commission Seventh Framework Programme.

Our news journalists obtained a quote from the research, "There is a need to develop a common approach that would support a more consistent, transparent and robust evaluation and weighting of the evidence across ERA and HHRA. This paper explores the applicability of existing Data Quality Assessment (DQA) frameworks for integrating environmental toxicity hazard data into human health assessments and vice versa. We performed a comparative analysis of the strengths and weaknesses of eleven frameworks for evaluating reliability and/or relevance of toxicity and ecotoxicity hazard data. We found that a frequent shortcoming is the lack of a clear separation between reliability and relevance criteria. A further gaps and needs analysis revealed that none of the reviewed frameworks satisfy the needs of a common eco-human DQA system. Based on our analysis, some key characteristics, perspectives and recommendations are identified and discussed for building a common DQA system as part of a future integrated eco-human decision-making framework."

According to the news editors, the research concluded: "This work lays the basis for
developing a common DQA system to support the further development and promotion of Integrated Risk Assessment."

The news correspondents report that additional information may be obtained from N. Roth, Swiss Center Appl Human Toxicol SCAHT Directorate, Regulatory Toxicol Unit, CH-4055 Basel, Switzerland.

**Imino Acids**

**Findings from N. Sahu et al Has Provided New Information about Imino Acids (Proline Starvation Induces Unresolved ER Stress and Hinders mTORC1-Dependent Tumorigenesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Imino Acids. According to news originating from San Francisco, California, by NewsRx correspondents, research stated, "The role of essential amino acids in metabolic reprogramming of cancer cells is now well established, whereas the role of non-essential amino acids (NEAAs) in malignancy remains less clear. Here, we have identified an important role for the NEAA proline in the tumorigenic potential of a subset of cancer cells."

Our news journalists obtained a quote from the research, "By profiling a large panel of cancer cell lines, we observed that proline consumption and expression of proline biosynthesis enzymes were well correlated with clonogenic and tumorigenic potential. Moreover, proline starvation or inhibition of proline biosynthesis enzymes impaired clonogenic/tumorigenic potential. Cancer cells exhibiting dependency on exogenous proline displayed hyperactivation of the mTORC1-mediated 4EBP1 signaling axis, as well as unresolved ER stress. Exogenous proline alleviated ER stress and promoted cellular homeostasis and clonogenicity."

According to the news editors, the research concluded: "Increased dependence on proline may therefore define a specific vulnerability in some cancers that can be exploited by proline depletion."

For more information on this research see: Proline Starvation Induces Unresolved ER Stress and Hinders mTORC1-Dependent Tumorigenesis. *Cell Metabolism*, 2016;24(5):753-761. *Cell Metabolism* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor,

Biomedical Engineering - Tissue Engineering

Findings from N.H. Marei and Co-Authors in the Area of Tissue Engineering Reported (Mesenchymal stem cells growth and proliferation enhancement using PLA vs PCL based nanofibrous scaffolds)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Biomedical Engineering - Tissue Engineering. According to news reporting originating in Giza, Egypt, by NewsRx journalists, research stated, "Electrospinning of polymers is the most commonly used technique for nanofiber fabrication. polylactic acid (PLA) and polycaprolactone (PCL) have been shown to be ideal for nanofiber preparation in various biomedical applications, due to characteristics such as biodegradability and their ability to promote the cell growth, similar to native tissues. The aim of this study was to develop biocompatible and biodegradable PLA and PCL-based nanofibrous scaffolds for enhancing stem cell growth and proliferation."

The news reporters obtained a quote from the research, "The scaffolds were prepared by electrospinning, and their physicochemical properties were studied using Fourier Transform Infrared spectroscopy (FTIR), differential scanning calorimetry (DSC), thermogravimetric analysis (TGA) and X-ray diffraction (XRD). The surface morphology of the developed scaffolds was determined using scanning electron microscopy (SEM). Mesenchymal stem cells (MSCs), derived from both adipose tissue and bone marrow, were seeded onto the prepared nanofibrous scaffolds. The effect of scaffold type, and structural characteristics on survival and proliferation of MSCs were evaluated."

According to the news reporters, the research concluded: "Our results show that after full physicochemical characterization of PCL and PLA nanofibrous scaffolds both were safe and non-toxic to the evaluated cells and both scaffolds supported cell attachment and proliferation of bone marrow and adipose tissue-derived MSCs."

For more information on this research see: Mesenchymal stem cells growth and proliferation enhancement using PLA vs PCL based nanofibrous scaffolds. International Journal of Biological Macromolecules, 2016;93():9-19. **Oncology - Prostate Cancer**

**Findings from NHS Foundation Trust in the Area of Prostate Cancer Described (Focal therapy in prostate cancer: A review of seven common controversies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Radical treatments such as prostatectomy and radiotherapy have demonstrated success in terms of biochemical and disease-specific survival for localised prostate cancer."

The news correspondents obtained a quote from the research from NHS Foundation Trust, "However, whilst the end goal of any cancer treatment is to control or cure disease it must also do so by minimising any side effects that may be experienced by the patient. Focal therapy as a concept aims to redress this established therapeutic ratio by treating areas of the prostate affected by significant disease as opposed to treating the entire gland."

According to the news reporters, the research concluded: "However, there are a number of common criticisms of focal therapy - we deem the seven sins that require further interrogation."

Our news journalists report that additional information may be obtained by contacting E.J. Bass, UCLH NHS Fdn Trust, Dept. of Urol, London, United Kingdom.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ctrv.2016.07.004. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Pharmaceutical Research

Findings from NIPER Provides New Data on Pharmaceutical Research (Co amorphous systems: A product development perspective)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Pharmaceutical Research are presented in a new report. According to news reporting originating in Andhra Pradesh, India, by NewsRx journalists, research stated, "Solubility is one of the major problems associated with most of the new chemical entities that can be reasonably addressed by drug amorphization. However, being a high-energy form, it usually tends to recrystallize, necessitating new formulation strategies to stabilize amorphous drugs."

The news reporters obtained a quote from the research from NIPER, "Polymeric amorphous solid dispersion (PASD) is one of the widely investigated strategies to stabilize amorphous drug, with major limitations like limited polymer solubility and hygroscopicity. Co amorphous system (CAM), a new entrant in amorphous arena is a promising alternative to PASD. CAMs are multi component single phase amorphous solid systems made up of two or more small molecules that may be a combination of drugs or drug and excipients. Excipients explored for CAM preparation include amino acids, carboxylic acids, nicotinamide and saccharine. Advantages offered by CAM include improved aqueous solubility and physical stability of amorphous drug, with a potential to improve therapeutic efficacy. This review attempts to address different aspects in the development of CAM as drug products."

According to the news reporters, the research concluded: "Criterion for co-former selection, various methods involved in CAM preparation, characterization tools, stability, scale up and regulatory requirements for the CAM product development are discussed."

Our news correspondents report that additional information may be obtained by contacting N.R. Shastri, NIPER, Dept. of Pharmaceut, SSPRG, Hyderabad, Andhra Pradesh, India. Additional authors for this research include R. Thipparaboina, D. Kumar and N.R. Shastri.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.043. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from Nagasaki University Broaden Understanding of Bone and Mineral Research (Cbfb2 Isoform Dominates More Potent Cbfb1 and Is Required for Skeletal Development)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Health and Medicine - Bone and Mineral Research. According to news reporting from Nagasaki, Japan, by NewsRx journalists, research stated, "Cbfb is a cotranscription factor that forms a heterodimer with Runx proteins Runx1, Runx2, and Runx3. It is required for fetal liver hematopoiesis and skeletal development."

The news correspondents obtained a quote from the research from Nagasaki University, "Cbfb has two functional isoforms, Cbfb1 and Cbfb2, which are formed by alternative splicing. To address the biological functions of these isoforms in skeletal development, we examined Cbfb1(-/-) and Cbfb2(-/-) mouse embryos. Intramembranous and endochondral ossification was retarded and chondrocyte and osteoblast differentiation was inhibited in Cbfb2(-/-) embryos but not in Cbfb1(-/-) embryos. Cbfb2 mRNA was upregulated in calvariae, limbs, livers, thymuses, and hearts of Cbfb1(-/-) embryos but Cbfb1 mRNA was not in those of Cbfb2(-/-) embryos, and the total amount of Cbfb1 and Cbfb2 mRNA in Cbfb1(-/-) embryos was similar to that in wild-type embryos but was severely reduced in Cbfb2(-/-) embryos. The levels of Runx proteins were reduced in calvariae, limbs, and primary osteoblasts from Cbfb2(-/-) embryos, but the reduction in Runx2 protein was very mild. Furthermore, the amounts of Runx proteins and Cbfb in Cbfb2(-/-) embryos differed similarly among skeletal tissues, livers, and thymuses, suggesting that Runx proteins and Cbfb are mutually required for their stability. Although Cbfb1(-/-) embryos developed normally, Cbfb1 induced chondrocyte and osteoblast differentiation and enhanced DNA binding of Runx2 more efficiently than Cbfb2. Our results indicate that modulations in the relative levels of the isoforms may adjust transcriptional activation by Runx2 to appropriate physiological levels. Cbfb2 was more abundant, but Cbfb1 was more potent for enhancing Runx2 activity."

According to the news reporters, the research concluded: "Although only Cbfb2 loss generated overt skeletal phenotypes, both may play major roles in skeletal development with functional redundancy."

Our news journalists report that additional information may be obtained by contacting T. Komori, Nagasaki University, Grad Sch Biomed Sci, Dept. of Cell Biol, Nagasaki 8528588, Japan. Additional authors for this research include X. Qin, T. Kawane, H. Komori, Y. Matsuo, I. Taniuchi, K. Ito, S. Izumi and T. Komori.

Findings from Nanchang University in Hypertension Reported (Risk of bradykinin B2 receptor-58T/C gene polymorphism on hypertension: A meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news reporting out of Nanchang, People's Republic of China, by NewsRx editors, research stated, "The risk of bradykinin B2 receptor (BDKRB2)-58T/C gene polymorphism on hypertension remains controversial. The Cochrane Library, Chinese Biomedical Database, EBSCO, Embase, ISI, MEDLINE, and PubMed were retrieved, and relevant articles were selected."

Our news journalists obtained a quote from the research from Nanchang University, "The significant association between BDKRB2-58T/C gene polymorphism and risk of hypertension were found under C-allele comparison (odds ratio (OR): 1.22, 95% confidential intervals (CI): 1.05-1.42), recessive model (OR: 1.32, 95% CI: 1.07-1.64), dominant model (OR: 0.74, 95% CI: 0.58-0.94), homozygote model (OR: 1.66, 95% CI: 1.11-2.47) and heterozygote model (OR: 1.23, 95% CI: 1.06-1.43). The magnitude of the association between the BDKRB2-58T/C gene polymorphism and risk of hypertension was substantiated in Asians under C-allele comparison (OR: 1.24, 95% CI: 1.04-1.49), recessive model (OR: 1.39, 95% CI: 1.04-1.86), dominant model (OR: 0.72, 95% CI: 0.56-0.93), homozygote model (OR: 1.78, 95% CI: 1.09-2.90) and heterozygote model (OR: 1.26, 95% CI: 1.07-1.49). No publication bias was found in the meta-analysis. The meta-analysis suggested -58C allele and -58CC genotype increase the risk of hypertension in Asians and African-Americans."

According to the news editors, the research concluded: "Inversely, -58TT genotype decreases the risk of hypertension in Asians and African-Americans."

Our news journalists report that additional information may be obtained by contacting G.S. Xu, Nanchang University, Affiliated Hosp 2, Dept. of Nephrol, Nanchang 330006, People's Republic of China. Additional authors for this research include P.P. Yang and G.S. Xu.

**Immunology**

**Findings from Nanjing Medical University Provides New Data on Immunology (BPTF Is Essential for T Cell Homeostasis and Function)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology have been presented. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Bromodomain PHD finger transcription factor (BPTF), a ubiquitously expressed ATP-dependent chromatin-remodeling factor, is critical for epigenetically regulating DNA accessibility and gene expression. Although BPTF is important for the development of thymocytes, its function in mature T cells remains largely unknown."

Our news editors obtained a quote from the research from Nanjing Medical University, "By specifically deleting BPTF from late double-negative 3/ double-negative 4 stage of developing T cells, we found that BPTF was critical for the homeostasis of T cells via a cell-intrinsic manner. In addition, BPTF was essential for the maintenance and function of regulatory T (Treg) cells. Treg cell specific BPTF deletion led to reduced Foxp3 expression, increased lymphocyte infiltration in the nonlymphoid organs, and a systemic autoimmune syndrome."

According to the news editors, the research concluded: "These findings therefore reveal a vital role for BPTF in T and Treg cell function and immune homeostasis."

For more information on this research see: BPTF Is Essential for T Cell Homeostasis and Function. *Journal of Immunology*, 2016;197(11):4325-4333. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. **Oncology - Bladder Cancer**

**Findings from Nanjing Medical University in Bladder Cancer Reported (LINC00312 inhibits the migration and invasion of bladder cancer cells by targeting miR-197-3p)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Bladder Cancer is the subject of a report. According to news reporting originating in Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "To investigate the influence of the long non-coding RNA
LINC00312 on bladder cancer (BC) cell invasion and metastasis by targeting miR-197-3p. BC and corresponding adjacent tissues were collected.

Financial support for this research came from Jiangsu Planned Projects for Postdoctoral Research Fund.

The news reporters obtained a quote from the research from Nanjing Medical University. "LINC00312 and miR-197-3p were measured, and their correlation was detected through quantitative real-time PCR (qRT-PCR). BC cell line T24 was transfected and grouped (five groups) according to different transfection conditions. A scratch test was applied to analyze cell migration, and a Transwell assay was used to test cell invasion ability. Western blotting was to measure matrix metalloproteinase (MMP)-2, MMP-9, and the tissue inhibitor of metalloproteinase 2 (TIMP2) protein levels. qRT-PCR indicated that LINC00312 expression was lower but miR-197-3p expression was higher in BC tissues compared with adjacent tissues; LINC00312 was negatively correlated with miR-197-3p. The migration test revealed that the downregulation of miR-197-3p and overexpression of LINC00312 inhibited cell migration and invasion abilities, while the overexpression of miR-197-3p and the upregulation of LINC00312 promoted cell migration and invasion. BC cells with downregulated miR-197-3p or upregulated LINC00312 had low MMP-2 and MMP-9 levels but high TIMP2."

According to the news reporters, the research concluded: "LINC00312 inhibited BC cell invasion and metastasis through mediating miR-197-3p."

For more information on this research see: LINC00312 inhibits the migration and invasion of bladder cancer cells by targeting miR-197-3p. Tumor Biology, 2016;37(11):14553-14563. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Our news correspondents report that additional information may be obtained by contacting J.S. Phenols

Findings from Nanjing Normal University Has Provided New Data on Phenols (Propofol inhibits hERG K+ channels and enhances the inhibition effects on its mutations in HEK293 cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Phenols are discussed in a new report. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx corresponding, research stated, "QT interval prolongation, a potential risk for arrhythmias, may
result from gene polymorphisms relevant to cardiomyocyte repolarization. Another noted cause of QT interval prolongation is the administration of chemical compounds such as anesthetics, which may affect a specific type of cardiac K+ channel encoded by the human ether-a-go-go-related gene (hERG). hERG K+ current was recorded using whole-cell patch clamp in human embryonic kidney (HEK293) cells expressing wild type (WT) or mutated hERG channels.

Financial support for this research came from National Natural Science Foundation of China.

Our news editors obtained a quote from the research from Nanjing Normal University, "Expression of hERG K+ channel proteins was evaluated using western blot and confirmed by fluorescent staining and imaging. Computational modeling was adopted to identify the possible binding site(s) of propofol with hERG K+ channels. Propofol had a significant inhibitory effect on WT hERG K+ currents in a concentration-dependent manner, with a half-maximal inhibitory concentration (IC50) of 60.9 +/- 6.4 mu M. Mutations in drug-binding sites (Y652A or F656C) of the hERG channel were found to attenuate hERG current blockage by propofol. However, propofol did not inhibit the trafficking of hERG protein to the cell membrane. Meanwhile, for the three selective hERG K+ channel mutant heterozygotes WT/Q738X-hERG, WT/A422T-hERG, and WT/H562P-hERG, the IC50 of propofol was calculated as 14.2 +/- 2.8 mu M, 3.3 +/- 1.2 mu M, and 5.9 +/- 1.9 mu M, respectively, which were much lower than that for the wild type."

According to the news editors, the research concluded: "These findings indicate that propofol may potentially increase QT interval prolongation risk in patients via direct inhibition of the hERG K+ channel, especially in those with other concurrent triggering factors such as hERG gene mutations."

For more information on this research see: Propofol inhibits hERG K+ channels and enhances the inhibition effects on its mutations in HEK293 cells. European Journal of Pharmacology, 2016;791():168-178. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Findings from Nankai University in the Area of Type 2 Diabetes Reported (Toxicology Assessment of a Dual-Function Peptide 5rolGLP-HV in Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "5rolGLP-HV had an ideal therapeutic potential in the prevention of hyperglycemia in type 2 diabetes and delay of the thrombosis. The objective of the study was to investigate the toxicology effects of 5rolGLP-HV and guarantee its safety."

Financial support for this research came from Key Project of Tianjin.

Our news editors obtained a quote from the research from Nankai University, "In acute toxicity test, the mice were orally receiving 5rolGLP-HV at a single dose of 300 mg/kg or 2000 mg/kg. For sub-chronic toxicity study, the mice received 5rolGLP-HV at doses of 800 mg/kg or 1600 mg/kg for 9 weeks. No significant adverse effects were evident in acute and sub-chronic toxicity tests, indicating that the LD50 value is greater than 2000 mg/kg. Although the liver and kidney exhibited a little abnormal in sub-chronic toxicity study, they could recovery to normal after withdrawal 5rolGLP-HV for 2 weeks. In micronucleus assay, the mice received 5rolGLP-HV at doses of 250, 500, or 1000 mg/kg for two consecutive days. The micronucleus numbers and the polychromatic erythrocytes to normochromatic erythrocytes (PCE/NCE) ratios among 5rolGLP-HV groups were within the normal range. Similarly, sperm aberration test demonstrated that 5rolGLP-HV had no teratogenic effect on the mice sperm."

According to the news editors, the research concluded: "The combined results clearly demonstrated the safety of 5rolGLP-HV and support its use as a drug to treat diabetes and thrombosis."

For more information on this research see: Toxicology Assessment of a Dual-Function Peptide 5rolGLP-HV in Mice. Applied Biochemistry and Biotechnology, 2016;180 (7):1276-1285. Applied Biochemistry and Biotechnology can be contacted at: Humana Press Inc, 999 Riverview Drive Suite 208, Totowa, NJ 07512, USA. Arsenic

Findings from Nantong University Broaden Understanding of Arsenic (Arsenic trioxide mediates HAPI microglia inflammatory response and the secretion of inflammatory cytokine IL-6 via Akt/NF-kappa B signaling pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Arsenic are presented in a new report. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "Arsenic is a widely distributed toxic metalloid in around the world. Inorganic arsenic species are deemed to affect astrocytes functions and to cause neuron apoptosis."

Our news journalists obtained a quote from the research from Nantong University, "Microglia are the key cell type involved in innate immune responses in CNS, and microglia activation has been linked to inflammation and neurotoxicity. In this study, using ELISA and reverse transcriptase PCR (RT-PCR), we showed that Arsenic trioxide up-regulated the expression and secretion of IL-6 in a dose-dependent manner and a time dependent manner in cultured HAPI microglia cells. These pro-inflammatory responses were inhibited by the Akt blocker, LY294002. Further, Arsenic trioxide exposure could induce phosphorylation and degradation of I kappa B alpha, and the translocation of NF-kappa B p65 from the cytosol to the nucleus in this HAPI microglia cell line. Thus, the NF-kappa B signaling pathway can be activated after Arsenic trioxide treatment. Besides, Akt blocker LY294002 also obviously attenuated NF-kappa B activation and transnuclear induced by Arsenic trioxide."

According to the news editors, the research concluded: "In concert with these results, we highlighted that the secretion of pro-inflammatory cytokine and NF-kappa B activation induced by Arsenic trioxide can be mediated by elevation of p-Akt in HAPI microglia cells."

For more information on this research see: Arsenic trioxide mediates HAPI microglia inflammatory response and the secretion of inflammatory cytokine IL-6 via Akt/NF-kappa B signaling pathway. Regulatory Toxicology and Pharmacology, 2016;81():480-488. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Regulatory Toxicology and Pharmacology - www.journals.elsevier.com/regulatory-toxicology-and-pharmacology/)

Our news journalists report that additional information may be obtained by contacting Q.Y. Wu, Nantong University, Sch Public Hlth, Dept. of Nutr & Food Hyg, Nantong 226001, Jiangsu, People's Republic of China. Additional authors for this research include J.M. Mao, J.M. Zhao, Y. Zhang, T. Findings from Nanyang Technological University in Chemotherapy Reported (Polymeric Prodrug Grafted Hollow Mesoporous Silica Nanoparticles Encapsulating Near-Infrared Absorbing Dye for Potent Combined Photothermal-Chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Chemotherapy. According to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "In this study, polymeric prodrug coated hollow mesoporous silica nanoparticles (HMSNs) with encapsulated near-infrared (NIR) absorbing dye were prepared and explored for combined photothermal-chemotherapy. A copolymer integrated with tert-butoxycarbonyl protected hydrazide groups and oligoethylene glycols was initially grafted on the surface of HMSNs via reversible addition-fragmentation chain-transfer (RAFT) polymerization followed by the deprotection to reactivate the hydrazide groups for the conjugation of anticancer drug doxorubicin (DOX)."

Financial supporters for this research include Agency for Science, Technology and Research, National Research Foundation-Prime Minister's office, Republic of Singapore, Nanyang Technological University, Northwestern Institute for Nanomedicine, Nanyang Technological University.

Our news editors obtained a quote from the research from Nanyang Technological University, "DOX was covalently bound onto the polymer substrate by acid-labile hydrazone bond and released quickly in weak acidic environment for chemotherapy. The hollow cavity of HMSNs was loaded with an NIR absorbing dye IR825 to form the final multifunctional hybrid denoted as HMSNs-DOX/IR825. The hybrid exhibited good dispersity and stability as well as high light-to-heat conversion efficiency. As revealed by confocal microscopy and flow cytometry analysis, the hybrid was efficiently taken up by cancer cells, and the conjugated DOX could be released under the cellular environment. In vitro cytotoxicity study demonstrated that anticancer activity of HMSNs-DOX/IR825 could be significantly improved by the NIR irradiation, which led to a satisfactory therapeutic efficacy through the combination treatment."

According to the news editors, the research concluded: "Thus, the developed hybrid could be a promising candidate for the combined photothermal-chemotherapy of cancer."

The news editors report that additional information may be obtained by contacting Y. Zhang, Division of Chemistry and Biological Chemistry, School of Physical and Mathematical Sciences, Nanyang Technological University, 21 Nanyang Link, Singapore 637371, Singapore. Additional authors for this research include C.Y. Ang, M. Li, S.Y. Tan, Q. Qu and Y. Zhao.

Findings from Nara Medical University in Cardiology Reported  
(Prediction of contrast-induced nephropathy by the serum creatinine level on the day following cardiac catheterization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiology. According to news originating from Nara, Japan, by NewsRx correspondents, research stated, "The majority of patients who undergo coronary arteriography are discharged from the hospital on the day of the procedure or on the following day. The aim of this study is to investigate whether the change in serum creatinine (SCr) and estimated glomerular filtration rate (eGFR) on the day following cardiac catheterization can predict the development of contrast-induced nephropathy (CIN)."

Our news journalists obtained a quote from the research from Nara Medical University, "This is a multicenter prospective observational study, which consists of 860 patients who underwent cardiac catheterization. We measured SCr and eGFR before cardiac catheterization, on the following day, and 48-72 h post-procedure. Definition of CIN is changes in SCr >= 0.5 mg/dL or >= 25% from baseline 48-72 h after contrast exposure. CIN occurred in 40 patients. SCr levels significantly increased from a baseline of 1.55 +/- 1.08 mg/dL to 1.79 +/- 1.26 mg/dL on the following day in patients with CIN (p < 0.0001), but significantly decreased from a baseline of 1.21 +/- 0.65 mgic/L to 1.18 +/- 0.61 mg/dL on the following day in those without CIN (p < 0.0001). eGFR significantly decreased from a baseline of 47.3 +/- 28.3 mL/min/1.73 m(2) to 40.6 +/- 26.7 mL/min/1.73 m(2) on the following day in patients with CIN (p < 0.0001), but significantly increased from a baseline of 53.1 +/- 22.0 mg/dL to 53.6 +/- 21.2 mg/dL on the following day in those without CIN (p = 0.0236). Receiver operating characteristic curve analysis indicated that SCr change >= 0.1 mg/dL [area under the curve (AUC) = 0.852, sensitivity 72.5%, specificity 86.1%] and eGFR change <=-1.1 mL/min/1.73 m(2) (AUC = 0.789, sensitivity 85.0%, specificity 64.9%) were the best cut-off values for predicting CIN. Multivariate logistic regression showed that a change in SCr >= 0.1 mg/dL [odds ratio (OR), 29.3; 95% confidence interval (CI), 10.8-96.2] and change in eGFR <=-1.1 mL/min/1.73 m(2) (OR, 69.7; 95% CI, 13.3-952) were powerful independent predictors of CIN."

According to the news editors, the research concluded: "Changes in SCr and eGFR on the day following cardiac catheterization predict the development of CIN."

For more information on this research see: Prediction of contrast-induced nephropathy by the serum creatinine level on the day following cardiac catheterization. Journal of Cardiology, 2016;68(5-6):412-418. Journal of Cardiology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Findings from Naresuan University in Acinetobacter baumannii
Reported (Distribution of virulence genes involved in biofilm formation in multi-drug resistant Acinetobacter baumannii clinical isolates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Acinetobacter baumannii have been published. According to news reporting originating from Phitsanulok, Thailand, by NewsRx correspondents, research stated, "Acinetobacter baumannii is an opportunistic bacterial pathogen that is the major cause of hospital-acquired infections. It has been shown that A. baumannii with high biofilm formation increases the risk of acquiring infection."

Our news editors obtained a quote from the research from Naresuan University, "In this study, the prevalence of virulence genes involved in biofilm formation was determined in 225 A. baumannii clinical isolates from three hospitals in Thailand. Most of the isolates were multidrug-resistant A. baumannii strains (86.2%). Among all isolates, 76.9% (173/225) showed biofilm formation ability. The association between biofilm forming ability and gentamicin resistance was found (P < 0.05). The presence of virulence genes, epsA, bap, ompA, bfmS and blaper-1 genes, was investigated by PCR. The prevalence of ompA, bfmS, bap, blaper-1 and epsA genes among the isolated strains was 84.4%, 84%, 48%, 30.2%, respectively. Biofilm formation related genes, ompA and bap were associated with multidrug-resistant A. baumannii strains. The result of this study revealed that a high prevalence of biofilm-forming phenotypes among A. baumannii strains obtained from different hospitals."

According to the news editors, the research concluded: "Effective strategies to prevent infection due to A. baumannii that produce biofilms are therefore needed."

For more information on this research see: Distribution of virulence genes involved in biofilm formation in multi-drug resistant Acinetobacter baumannii clinical isolates. International Microbiology, 2016;19(2):121-129. International Microbiology can be contacted at: Inst Estudis Catalans, Carrer Del Carme, 47, Barcelona, 08001, Spain. Findings from National Cancer Institute in Medical Research Reported (T-Cell Transfer Therapy Targeting Mutant KRAS in Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Health and Medicine - Medical Research are discussed in a new report. According to news reporting out of Bethesda, Maryland, by NewsRx editors, research stated, "We identified a polyclonal CD8+ T-cell response against mutant KRAS G12D in tumor-infiltrating lymphocytes obtained from a patient with metastatic colorectal cancer. We observed objective regression of all seven lung metastases after the infusion of approximately 1.11x10^{11} HLA-C*08:02-restricted tumor-infiltrating lymphocytes that were composed of four different T-cell clonotypes that specifically targeted KRAS G12D."

Our news journalists obtained a quote from the research from National Cancer Institute, "However, one of these lesions had progressed on evaluation 9 months after therapy. The lesion was resected and found to have lost the chromosome 6 haplotype encoding the HLA-C*08:02 class I major histocompatibility complex (MHC) molecule. The loss of expression of this molecule provided a direct mechanism of tumor immune evasion."

According to the news editors, the research concluded: "Thus, the infusion of CD8+ cells targeting mutant KRAS mediated effective antitumor immunotherapy against a cancer that expressed mutant KRAS G12D and HLA-C*08:02."

For more information on this research see: T-Cell Transfer Therapy Targeting Mutant KRAS in Cancer. New England Journal of Medicine, 2016;375(23):2255-2262. New England Journal of Medicine can be contacted at: Massachusetts Medical Soc, Waltham Woods Center, 860 Winter St, Waltham, MA 02451-1413, USA.

Findings from National Center for Scientific Research (CNRS) Broaden Understanding of Osteoarthritis (Fibroblast Growth Factor 23 drives MMP13 expression in human osteoarthritic chondrocytes in a Klotho-independent manner)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Musculoskeletal Diseases and Conditions - Osteoarthritis is now available. According to news reporting out of Vandoeuvre les Nancy, France, by NewsRx editors, research stated, "Fibroblast Growth Factor 23 (FGF23) may represent an attractive candidate that could participate to the osteoarthritic (OA)-induced phenotype switch of chondrocytes. To address this hypothesis, we investigated the expression of FGF23, its receptors (FGFRs) and co-receptor (Klotho) in human cartilage and studied the effects of rhFGF23 on OA chondrocytes." Financial supporters for this research include CNRS, Universite de Lorraine, Fondation pour la Recherche Medicale.

Our news journalists obtained a quote from the research from National Center for Scientific Research (CNRS), "Gene expression or protein levels were analysed by RT-PCR and immunohistochemistry. Collagenase 3 (MMP13) activity was measured by a fluorescent assay. MAPK signalling pathways were investigated by phosphoprotein array, immunoblotting and the use of selective inhibitors. RNA silencing was performed to confirm the respective contribution of FGFR1 and Klotho. We showed that the expression of FGF23, FGFR1 and Klotho was up-regulated at both mRNA and protein levels in OA chondrocytes when compared to healthy ones. These overexpressions were markedly elevated in the damaged regions of OA cartilage. When stimulated with rhFGF23, OA chondrocytes displayed an extended expression of FGF23 and of markers of hypertrophy such as MMP13, COL10A1, and VEGF. We demonstrated that FGF23 auto-stimulation was both FGFR1- and Klotho-dependent, whereas the expression of markers of hypertrophy was mainly dependent on FGFR1 alone. Finally, we showed that FGF23-induced MMP13 expression was strongly regulated by the MEK/ERK cascade and to a lesser extent, by the PI-3K/AKT pathway."

According to the news editors, the research concluded: "These results demonstrate that FGF23 sustains differentiation of OA chondrocytes in a Klotho-independent manner."

Our news journalists report that additional information may be obtained by contacting A. Bianchi, Biopole Univ Lorraine, CNRS, UMR 7365, Univ Lorraine Ingn Mol & Physiopathol Articulaire, F-54505 Vandoeuvre Les Nancy, France. Additional authors for this research include M. Guibert, F. Cailotto, A. Gasser, N. Presle, D. Mainard, P. Netter, H. Kempf, J.Y. Jouzeau and P. Reboul.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.joca.2016.06.003. This DOI is a link to an online electronic document that is either free or for purchase.
Findings from National Cheng Kung University Broaden Understanding of Bone Cancer (Alleviating Bone Cancer-induced Mechanical Hypersensitivity by Inhibiting Neuronal Activity in the Anterior Cingulate Cortex)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Bone Cancer. According to news reporting from Tainan, Taiwan, by NewsRx journalists, research stated, "The anterior cingulate cortex (ACC) is a brain region that has been critically implicated in the processing of pain perception and modulation. While much evidence has pointed to an increased activity of the ACC under chronic pain states, less is known about whether pain can be alleviated by inhibiting ACC neuronal activity."

The news correspondents obtained a quote from the research from National Cheng Kung University, "The authors used pharmacologic, chemogenetic, and optogenetic approaches in concert with viral tracing technique to address this issue in a mouse model of bone cancer-induced mechanical hypersensitivity by intratibia implantation of osteolytic fibrosarcoma cells. Bilateral intra-ACC microinjections of -aminobutyric acid receptor type A receptor agonist muscimol decreased mechanical hypersensitivity in tumor-bearing mice (n = 10). Using adenoviral-mediated expression of engineered G(i/o)-coupled human M4 (hM4Di) receptors, we observed that activation of G(i/o)-coupled human M4 receptors with clozapine-N-oxide reduced ACC neuronal activity and mechanical hypersensitivity in tumor-bearing mice (n = 11). In addition, unilateral optogenetic silencing of ACC excitatory neurons with halorhodopsin significantly decreased mechanical hypersensitivity in tumor-bearing mice (n = 4 to 9), and conversely, optogenetic activation of these neurons with channelrhodopsin-2 was sufficient to provoke mechanical hypersensitivity in sham-operated mice (n = 5 to 9). Furthermore, we found that excitatory neurons in the ACC send direct descending projections to the contralateral dorsal horn of the lumbar spinal cord via the dorsal corticospinal tract."

According to the news reporters, the research concluded: "The findings of this study indicate that enhanced neuronal activity in the ACC contributes to maintain bone cancer-induced mechanical hypersensitivity and suggest that the ACC may serve as a potential therapeutic target for treating bone cancer pain."

For more information on this research see: Alleviating Bone Cancer-induced Mechanical Hypersensitivity by Inhibiting Neuronal Activity in the Anterior Cingulate Cortex. Anesthesiology. 2016;125(4):779-792. Anesthesiology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Findings from National Chung Hsing University Update Understanding of Allergies (Cloning, expression, and purification of recombinant major mango allergen Mani 1 in Escherichia coli)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - Allergies have been published. According to news originating from Taichung, Taiwan, by NewsRx correspondents, research stated, "In recent years, the number of people around the world who suffer from fruit allergies has increased. Mango can induce anaphylaxis, and two major mango allergens have been identified-Mani 1 and Mani 2. Apart from their molecular weights and pI values, no other information about them is known."

Our news journalists obtained a quote from the research from National Chung Hsing University, "This work identifies the DNA and amino acid sequences of Man i 1 and constructs an expression system for recombinant Man i 1 (rMan i 1). Firstly, 3' and 5' RACE assays were used to identify the cDNA fragment of Man i 1. Subsequently, the full length of Man i 1 cDNA was inserted into a pET-21a(+) vector, and the inserted plasmid was transformed to Escherichia coli BL21 (DE3) to express rMan i 1. The conditions for the expression of rMan i 1, including IPTG concentration, induction temperature, and induction time, were optimized. The highest amount of soluble rMan i 1 was obtained after induction with 0.1 mM IPTG at 16 degrees C for 20 h. The His-tagged rMan i 1 was purified using Ni-NTA agarose and its identity was verified using an anti-histidine antibody and the serum of a mango-allergic person."

According to the news editors, the research concluded: "Additionally, rMan i 1 was identified as glyceraldehyde 3-phosphate dehydrogenase (GAPDH) and shared 86.2% identity in amino acid sequence of GAPDH from wheat. Finally, an E. coli expression system of rMan i 1 was established, with the potential to be used in immunotherapy against mango allergy or the development of assays for detecting the residues of mango allergens."

For more information on this research see: Cloning, expression, and purification of recombinant major mango allergen Mani 1 in Escherichia coli. Protein Expression and Purification, 2017;130():35-43. Protein Expression and Purification can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Oncology - Head and Neck Cancer

Findings from National Defense Medical College Provides New Data on Head and Neck Cancer (Serum midkine as a biomarker for malignancy, prognosis, and chemosensitivity in head and neck squamous cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Head and Neck Cancer. According to news reporting originating in Tokoroza wa, Japan, by NewsRx journalists, research stated, "Improved therapies for individuals with head and neck squamous cell carcinoma (HNSCC) may be developed by identification of appropriate biomarkers. The aim of this study was to evaluate the usefulness of serum midkine measurement as a biomarker for HNSCC."

Financial supporters for this research include Ministry of Defense of Japan, Ministry of Education, Culture, Sports, Science, and Technology.

The news reporters obtained a quote from the research from National Defense Medical College, "Pretreatment serum midkine concentrations were measured in 103 patients with HNSCC and 116 control individuals by enzyme-linked immunosorbent assay. Midkine expression in tumor tissues from 33 patients with HNSCC who underwent definitive surgical resection without preoperative treatment was examined by immunohistochemistry. The cut-off serum midkine concentrations for predicting the presence of head and neck malignancy and chemosensitivity to induction chemotherapy, as determined using receiver operating characteristic curves, were 482 and 626 pg/mL, respectively. Spearman bivariate correlations showed positive correlations between serum midkine levels and immunohistochemistry staining score (r=0.612, p<0.001). The sensitivity, specificity, positive predictive value, negative predictive value, and accuracy of serum midkine concentration for detection of HNSCC were 57.3, 85.3, 77.6, 69.2, and 72.1%, respectively. However, for predicting the response to induction chemotherapy, the values were 84.6, 60.9, 71.0, 77.8, and 73.5%, respectively. Serum midkine concentration was identified as an independent prognostic factor by multivariate analysis, using Cox's proportional hazards model (p=0.027). Overexpression of serum midkine yielded a relative risk of death of 3.77, with 95% confidence limits ranging from 1.15 to 17.0. Serum midkine levels in patients with HNSCC were associated with malignancy, chemosensitivity, and prognosis."

According to the news reporters, the research concluded: "Serum midkine may be a useful, minimally invasive biomarker for early detection, therapeutic decision-making, and predicting prognosis."

Our news correspondents report that additional information may be obtained by contacting T. Yamashita, Dept. of Otorhinolaryngology-Head and Neck Surgery, National Defense Medical College, Tokorozawa, Saitama, 359-8513, Japan. Additional authors for this

Digestive System Diseases and Conditions

Findings from National Hospital Organization Has Provided New Data on Intrahepatic Cholestasis (Recurrence of Progressive Familial Intrahepatic Cholestasis Type 2 Phenotype After Living-donor Liver Transplantation: A Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Intrahepatic Cholestasis. According to news reporting from Hiroshima, Japan, by NewsRx journalists, research stated, "Progressive familial intrahepatic cholestasis 2 (PFIC2) is the result of mutations in the ABCB11, which encodes for bile salt export pump (BSEP). An absence of BSEP in the canalicular membrane causes cholestasis and leads to the development of end-stage liver disease in the first decade of life."

The news correspondents obtained a quote from the research from National Hospital Organization, "Liver transplantation (LT) has been considered curative for BSEP disease. However, patients with PFIC2 having undergone LT have recently been reported to develop recurrence of cholestasis together with the clinical and histological features of primary BSEP disease. We herein present a rare case of a patient with PFIC2 who developed post transplantation recurrence of progressive intrahepatic cholestasis due to antibodies against BSEP after living-donor LT, which mimicked primary BSEP disease. The patient had mutations in the ABCB11 gene, resulting in the complete absence of BSEP in the native liver, explaining the lack of tolerance. Immunofluorescence staining of normal human liver sections with the patient's serum and using an anti-human immunoglobulin G antibody to detect serum antibodies showed reactivity to the BSEP epitope in the canalicular membrane. We suggest that the patients having undergone LT had been associated with a risk of autoantibody formation against the BSEP protein."

According to the news reporters, the research concluded: "The absence of primary tolerance for the BSEP epitopes may explain the formation of the anti-BSEP antibodies after LDLT."

Our news journalists report that additional information may be obtained by
Mycobacterium Infections - Tuberculosis

Findings from National Hospital Organization Provide New Insights into Tuberculosis (Anti-PD1 Antibody Treatment and the Development of Acute Pulmonary Tuberculosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mycobacterium Infections - Tuberculosis is the subject of a report. According to news reporting originating in Kyoto, Japan, by NewsRx journalists, research stated, "Recently, cancer immunotherapy by immune checkpoint inhibitors has been considered one of the pillars for the treatment of cancer. Nivolumab is the first immune checkpoint inhibitor approved for lung cancer treatment in Japan."

The news reporters obtained a quote from the research from National Hospital Organization, "Although nivolumab has superior survival benefits and fewer adverse events than cytotoxic agents, it can generate dys-immune toxicities, known as immune-related adverse events. Although autoimmune manifestations are well-known immune-related adverse events, the development of infectious diseases is rare."

According to the news reporters, the research concluded: "Here, we report on a patient with advanced NSCLC in whom pulmonary tuberculosis developed rapidly during nivolumab treatment and discuss the potential mechanisms as well as what is known about infections during checkpoint inhibitor therapy."

Our news correspondents report that additional information may be obtained by contacting K. Fujita, National Hospital Organization, Kyoto Med Center, Div Resp Med, Kyoto, Japan. Additional authors for this research include T. Terashima and T. Mio.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jtho.2016.07.006. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from National Human Genome Research Institute Broaden Understanding of Cardiovascular Diseases (Associations between Vitamin D and Cardiovascular Disease Risk Factors in African Americans Are Partly Explained by Circulating Adipokines ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases. According to news reporting from Bethesda, Maryland, by NewsRx journalists, research stated, "Although it is recognized that vitamin D deficiency is associated with cardiovascular disease (CVD) risk factors, and is more common in African Americans (AAs), the pathologic mechanisms by which vitamin D may influence these risk factors are poorly understood. We explored the association between vitamin D status, as reflected by serum 25-hydroxyvitamin D [25(OH)D] concentrations, and CVD risk factors including mean arterial pressure (MAP), fasting plasma glucose (FPG), plasma HDL cholesterol, and waist circumference (WC) in adult AAs."

The news correspondents obtained a quote from the research from National Human Genome Research Institute, "We also tested whether plasma C-reactive protein (CRP), adipokines (adiponectin and leptin), and aldosterone mediated the associations between 25(OH)D and these risk factors. Data on 4010 (63.8% women; mean age: 54.0 y) individuals from the Jackson Heart Study were analyzed. Multivariable linear regression models were used to examine the associations of 25(OH)D with CVD risk factors. We used path analysis and bootstrapping methods to quantify and test the share of these associations that was statistically explained by each of the mediators by decomposing the associations into direct and indirect effects. Serum 25(OH)D concentrations were inversely associated with WC, FPG, and MAP and were positively associated with HDL cholesterol in multivariable analysis. A nearly 20% effect of 25(OH)D on MAP was masked by aldosterone (total indirect effect: beta = 0.01, P< 0.05). Approximately 23% of the effect of 25(OH)D on WC (beta = 0.03, P< 0.05) and similar to 9% of the effect of 25(OH)D on FPG (beta = -0.02, P< 0.05) were mediated through CRP, adiponectin, and leptin together. A 23% share of the association between 25(OH)D and HDL cholesterol was mediated by adiponectin alone (beta = 0.03, P< 0.05). Our findings suggest that the associations between vitamin D status and CVD risk factors in AAs are partially mediated through circulating adipokines and CRP."

According to the news reporters, the research concluded: "More evidence, however, is required from longitudinal and randomized controlled studies to validate our findings."

Our news journalists report that additional information may be obtained by contacting R.J. Khan, NHGRI, Metab Cardiovasc & Inflammatory Dis Genom Branch, Cardiovasc Sect, Social Epidemiol Unit NIH, Bethesda, MD 20892, United States. Additional authors for this research include S.Y. Gebreab, P. Riestra, M. Sims, A. Gaye, R.H. Xu and S.K. Davis.

Liver Diseases and Conditions - Liver Fibrosis

Findings from National Institute of Immunology Update Understanding of Liver Fibrosis (Molecular and Cellular Functions Distinguish Superior Therapeutic Efficiency of Bone Marrow CD45 Cells Over Mesenchymal Stem Cells in Liver Cirrhosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Liver Fibrosis. According to news reporting from New Delhi, India, by NewsRx journalists, research stated, "Liver fibrosis is strongly associated with chronic inflammation. As an alternative to conventional treatments for fibrosis, mesenchymal stem cells (MSCs) therapy is found to be attractive due to its immunomodulatory functions."

Financial support for this research came from Department of Biotechnology, Government of India for generous support for the Center for Molecular Medicine programme.

The news correspondents obtained a quote from the research from the National Institute of Immunology, "However, low survival rate and profibrogenic properties of MSCs remain the major concerns, leading to skepticism in many investigators. Here, we have asked the question whether bone marrow (BM)-derived CD45 cells is the better candidate than MSCs to treat fibrosis, if so, what are the molecular mechanisms that make such distinction. Using CC14 -induced liver fibrosis mouse model of a Metavir fibrosis score 3, we showed that BM-CD45 cells have better antifibrotic effect than adipose-derived (AD)-MSCs. In fact, our study revealed that antifibrotic potential of CD45 cells are compromised by the presence of MSCs. This difference was apparently due to significantly high level expressions of matrix metalloproteinases-9 and 13, and the suppression of hepatic stellate cells' (HpSCs) activation in the CD45 cells transplantation group. Mechanism dissection studied in vitro supported the above opposing results and revealed that CD45 cell-secreted FasL induced apoptotic death of activated HpSCs. Further analyses suggest that MSC-secreted transforming growth factor b and insulin-like growth factor-1 promoted myofibroblastic differentiation of HpSCs and their
proliferation. Additionally, the transplantation of CD45 cells led to functional improvement of the liver through repair and regeneration."

According to the news reporters, the research concluded: "Thus, BM-derived CD45 cells appear as a superior candidate for the treatment of liver fibrosis due to structural and functional improvement of CCl4-induced fibrotic liver, which were much lower in case of AD-MSC therapy."

Our news journalists report that additional information may be obtained by contacting P. Baligar, Stem Cell Biology Laboratory, National Institute of Immunology, New Delhi, India. Additional authors for this research include S. Mukherjee, V. Kochat, A. Rastogi and A. Mukhopadhyay.

Mental Health Diseases and Conditions - Schizophrenia

Findings from National Institute of Mental Health and Neurosciences Update Understanding of Schizophrenia (The impact of HLA-G 3' UTR variants and sHLA-G on risk and clinical correlates of schizophrenia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mental Health Diseases and Conditions - Schizophrenia have been published. According to news reporting originating in Bangalore, India, by NewsRx journalists, research stated, "The Major Histocompatibility Complex (MHC)/Human Leukocyte Antigen (HLA) is known to influence the pathogenesis of several complex human diseases resulting from gene-environmental interactions. Recently, it has emerged as one of the risk determinants of schizophrenia."

The news reporters obtained a quote from the research from the National Institute of Mental Health and Neurosciences, "The HLA-G protein (a non-classical MHC class I molecule), encoded by the HLA-G gene, is shown to play important role in embryonic development. Importantly, its genetic variations and aberrant expression have been implicated in pregnancy complications like preeclampsia, inflammation, and autoimmunity. Converging evidence implicates these phenomena as risk mechanisms of schizophrenia. However, the functional implications of HLA-G in schizophrenia are yet to be empirically examined. The impact of two functional polymorphisms [14 bp Insertion/Deletion (INDEL) and +3187 A>G] and soluble HLA-G (sHLA-G) levels on schizophrenia risk was evaluated. In this exploratory study, the Ins/Ins genotype of 14 bp INDEL was found to confer a strong risk for schizophrenia."
According to the news reporters, the research concluded: "Further, low levels of sHLA-G were shown to have a significant impact on Clinical Global Impression (CGI) severity in people with schizophrenia."

For more information on this research see: The impact of HLA-G 3 ' UTR variants and sHLA-G on risk and clinical correlates of schizophrenia. *Human Immunology*, 2016;77 (12):1166-1171. *Human Immunology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Organelles**

**Findings from National Pingtung University of Science and Technology**

Update Knowledge of Organelles (Cytotoxicity of 11-epi-Sinulariolide Acetate Isolated from Cultured Soft Corals on HA22T Cells through the Endoplasmic Reticulum Stress Pathway ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Organelles are presented in a new report. According to news reporting originating in Pingtung, Taiwan, by NewsRx journalists, research stated, "Natural compounds from soft corals have been increasingly used for their antitumor therapeutic properties. This study examined 11-epi-sinulariolide acetate (11-epi-SA), an active compound isolated from the cultured soft coral Sinularia flexibilis, to determine its potential antitumor effect on four hepatocellular carcinoma cell lines."

The news reporters obtained a quote from the research from the National Pingtung University of Science and Technology, "Cell viability was investigated using 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide assay, and the results demonstrated that 11-epi-SA treatment showed more cytotoxic effect toward HA22T cells. Protein profiling of the 11-epi-SA-treated HA22T cells revealed substantial protein alterations associated with stress.
response and protein synthesis and folding, suggesting that the mitochondria and endoplasmic reticulum (ER) play roles in 11-epi-SA-initiated apoptosis. Moreover, 11-epi-SA activated caspase-dependent apoptotic cell death, suggesting that mitochondria-related apoptosis genes were involved in programmed cell death. The unfolded protein response signaling pathway-related proteins were also activated on 11-epi-SA treatment, and these changes were accompanied by the upregulated expression of growth arrest and DNA damage-inducible protein (GADD153) and CCAAT/enhancer binding protein (C/EBP) homologous protein (CHOP), the genes encoding transcription factors associated with growth arrest and apoptosis under prolonged ER stress. Two inhibitors, namely salubrinal (Sal) and SP600125, partially abrogated 11-epi-SA-related cell death, implying that the protein kinase R (PKR)-like endoplasmic reticulum kinase (PERK)-activating transcription factor (ATF) 6-CHOP or the inositol-requiring enzyme 1 alpha (IRE1 alpha)-c-Jun N-terminal kinase (JNK)-cJun signal pathway was activated after 11-epi-SA treatment.

According to the news reporters, the research concluded: "In general, these results suggest that 11-epi-SA exerts cytotoxic effects on HA22T cells through mitochondrial dysfunction and ER stress cell death pathways."

For more information on this research see: Cytotoxicity of 11-epi-Sinulariolide Acetate Isolated from Cultured Soft Corals on HA22T Cells through the Endoplasmic Reticulum Stress Pathway and Mitochondrial Dysfunction. Oncology - Colon Cancer

**Findings from National Research Council Broaden Understanding of Colon Cancer (Preventive screening of colorectal cancer with a device based on chemoresistive sensors)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Florence, Italy, by NewsRx journalists, research stated, "Colorectal cancer is one of the widely diffused tumors. Despite its high curable rate, if diagnosed in its polyp state, an efficient screening method is highly desirable for preventing and decreasing deaths."

The news reporters obtained a quote from the research from National Research Council, "Tumor biomarkers, emitted by the peroxidation of the cell membrane, may alter the composition of feces. We developed an array of chemoresistive sensors (both metal oxides and
sulfides) capable of distinguishing between real stool samples of healthy subjects and of patients with colorectal cancer at diverse degeneration stages. Preliminary clinical validation of real samples was carried out. Results have shown the selectivity of the sensor array towards tumor affected and healthy subject samples."

According to the news reporters, the research concluded: "A quadratic discriminant analysis was performed, with a classification error of about 5%.

For more information on this research see: Preventive screening of colorectal cancer with a device based on chemoresistive sensors. Sensors and Actuators B-Chemical, 2017;238 ():1098-1101. Sensors and Actuators B-Chemical can be contacted at: Elsevier Science Sa, PO Box 564, 1001 Lausanne, Switzerland.

Our news correspondents report that additional information may be obtained by contacting G. Zonta, CNR, INO, I-50124 Florence, Italy. Additional authors for this research include G. Anania, B. Fabbri, A. Gaiardo, S. Gherardi, A. Giberti, N. Landini, C. Malagu, L. Scaglierini and V. Guidi.

Musculoskeletal Diseases and Conditions ...

Findings from National Taiwan University Reveals New Findings on Osteoarthritis (C-phycocyanin alleviates osteoarthritic injury in chondrocytes stimulated with H2O2 and compressive stress)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Osteoarthritis. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "During the progression of osteoarthritis (OA), dysregulation of extracellular matrix anabolism, abnormal generation of reactive oxygen species (ROS) and inflammatory cytokines have been shown to accelerate the degradation process of cartilage. The potency of c-phycocyanin (C-PC) to protect cellular components against oxidative stress, along with its anti-inflammation and anti-apoptosis effects, are well documented; however, effects of C-PC on OA are still unclear."

Financial support for this research came from National Science Council.

The news reporters obtained a quote from the research from National Taiwan University. "In this study, we aimed to investigate the effects of C-PC on OA using H2O2 or compression-stimulated OA-like porcine chondrocyte models. The results showed that C-PC had the ability to inhibit ROS production, reverse caspase-3 activity, and reduce apoptosis cell population. C-PC also reversed aggrecan and type II collagen gene expressions after stimulation with 1 mM H2O2 or 60 psi of compression. Inhibition of IL-6 and MMP-13 genes was observed in compression-stimulated chondrocytes but not in H2O2-treated cells. In dimethylmethylen blue assay and alcian blue staining, C-PC maintained the sulfated-glycosaminoglycan (sGAG) content after stimulation with compression. We concluded that C-PC can prevent early signs of..."
According to the news reporters, the research concluded: "Therefore, we suggest that C-PC can be used as a potential drug candidate for chronic OA treatment."

Our news correspondents report that additional information may be obtained by contacting F.H. Lin, National Taiwan University, Inst Biomed Engn, Taipei 10672, Taiwan. Additional authors for this research include S.T. Chuang, C.H. Hsu, Y.J. Sun and F.H. Lin. **Neurodegenerative Diseases and Conditions -...**

**Findings from National Yang Ming University Has Provided New Information about Alzheimer Disease (Antroquinonol Lowers Brain Amyloid-b Levels and Improves Spatial Learning and Memory in a Transgenic Mouse Model of Alzheimer's Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Alzheimer's disease (AD) is the most common form of dementia. The deposition of brain amyloid-b peptides (Ab), which are cleaved from amyloid precursor protein (APP), is one of the pathological hallmarks of AD."

Our news journalists obtained a quote from the research from National Yang Ming University, "Ab-induced oxidative stress and neuroinflammation play important roles in the pathogenesis of AD. Antroquinonol, a ubiquinone derivative isolated from Antrodia camphorata, has been shown to reduce oxidative stress and inflammatory cytokines via activating the nuclear transcription factor erythroid-2-related factor 2 (Nrf2) pathway, which is downregulated in AD. Therefore, we examined whether antroquinonol could improve AD-like pathological and behavioral deficits in the APP transgenic mouse model. We found that antroquinonol was able to cross the blood-brain barrier and had no adverse effects via oral intake. Two months of antroquinonol consumption improved learning and memory in the Morris water maze test, reduced hippocampal Ab levels, and reduced the degree of astrogliosis. These effects may be mediated through the increase of Nrf2 and the decrease of histone deacetylase 2..."
(HDAC2) levels."

According to the news editors, the research concluded: "These findings suggest that antroquinonol could have beneficial effects on AD-like deficits in APP transgenic mouse."

For more information on this research see: Antroquinonol Lowers Brain Amyloid-b Levels and Improves Spatial Learning and Memory in a Transgenic Mouse Model of Alzheimer's Disease. Scientific Reports, 2015;5():15067. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from W.H. Chang, Institute of Brain Science, National Yang-Ming University, Taipei, Taiwan. Additional authors for this research include M.C. Chen and I.H Cheng.

Oncology - Gliomas

Findings from Nencki Institute of Experimental Biology Provides New Data on Gliomas (BIX01294, an inhibitor of histone methyltransferase, induces autophagy-dependent differentiation of glioma stem-like cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gliomas. According to news reporting from Warsaw, Poland, by NewsRx journalists, research stated, "Glioblastoma (GBM) contains rare glioma stem-like cells (GSCs) with capacities of self-renewal, multi-lineage differentiation, and resistance to conventional therapy. Drug-induced differentiation of GSCs is recognized as a promising approach of anti-glioma therapy."

The news correspondents obtained a quote from the research from the Nencki Institute of Experimental Biology, "Accumulating evidence suggests that unique properties of stem cells depend on autophagy. Here we demonstrate that BIX01294, an inhibitor of a G9a histone methyltransferase (introducing H3K9me2 and H3K27me3 repressive marks) triggers autophagy in human glioma cells. Pharmacological or genetic inhibition of autophagy decreased LC3-II accumulation and GFP-LC3 punctation in BIX01294-treated cells. GSCs-enriched spheres originating from glioma cells and GBM patient-derived cultures express lower levels of autophagy related (ATG) genes than the parental glioma cell cultures. Typical differentiation inducers that upregulate neuronal and astrocytic markers in sphere cultures, increase the level of ATG mRNAs. G9a binds to the promoters of autophagy (LC3B, WIP1) and differentiation-related (GFAP, TUBB3) genes in GSCs. Higher H3K4me3 (an activation mark) and lower H3K9me2 (the repressive mark) levels at the promoters of studied genes were detected in serum-differentiated cells than in sphere cultures. BIX01294 treatment upregulates the expression of autophagy and differentiation-related genes in GSCs."

According to the news reporters, the research concluded: "Pharmacological inhibition of autophagy decreases GFAP and TUBB3 expression in BIX01294-treated GSCs.
suggesting that BIX01294-induced differentiation of GSCs is autophagy-dependent."

Our news journalists report that additional information may be obtained by contacting I.A. Ciechomska, Polish Academy Sci, Mol Neurobiol Lab, Neurobiol Center, Nencki Inst Expt Biol, PL-02093 Warsaw, Poland. Additional authors for this research include P. Przanowski, J. Jackl, B. Wojtas and B. Kaminska.

Oncology - Bladder Cancer

**Findings from Netherlands Cancer Institute Broaden Understanding of Bladder Cancer (Pathological downstaging and survival after induction chemotherapy and radical cystectomy for clinically node-positive bladder cancer-Results of a nationwide ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Bladder Cancer. According to news originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Induction chemotherapy (IC) for clinically node-positive bladder cancer is applied without clinical evidence of improved outcome. Our objective was to compare complete pathological downstaging (pCD) and overall survival (OS) for IC versus upfront radical cystectomy (RC) in cT1-4aN1-3M0 urothelial carcinoma (UC)."

Our news journalists obtained a quote from the research from Netherlands Cancer Institute, "This population-based study included 659 cN+ patients treated with RC between 1995 and 2013. IC was applied in 212 (32%) patients. We defined pCD as <(y)pT1N0 at RC. Multivariable analyses were preformed to identify independent predictors of pCD and OS. In cN1 and cN2-3 patients, 31% and 19% of patients proved to be pN0 at upfront RC. In cN1, pCD was achieved in 39% following IC versus 5% for upfront RC (P < 0.001). In cN2-3 UC, rates were 27% versus 3% (P < 0.001). Three-year OS for pCD and ypCD were 81% and 84%, respectively. Three-year OS rates were 66% versus 37% (cN1) and 43% versus 22% (cN2-3), again in favour of IC (P < 0.001). In multivariable analyses, IC was associated with pCD (Odds ratio, 14; 95% confidence interval [CI], 7.4-25) and a 53% decreased risk of death (Hazard ratio [HR], 0.47; 95% CI, 0.36-0.61). Indication bias and unequal distributions of factors associated with OS (e.g. patients proceeding to RC) limit interpretation of our results. Patients with clinical nodal involvement should not be neglected. Up to 1/4 of patients with cN+ disease had pN0 at upfront RC. Moreover, IC followed by RC for clinically node-positive UC was associated with improved pathological downstaging compared with RC alone. A potential OS benefit for IC needs to be validated in a randomised trial. Take home message: IC followed by RC for
clinically node-positive UC is associated with improved pathological downstaging compared with RC alone."

According to the news editors, the research concluded: "A potential OS benefit for IC needs to be validated in a randomised trial."

The news correspondents report that additional information may be obtained from B.W.G. van Rhijn, Antoni van Leeuwenhoek Hosp, Netherlands Canc Inst, Dept. of Surg Oncol, Div Urol, NL-1066 CX Amsterdam, Netherlands. **Hematopoietic**

**Findings from New York University in the Area of Hematopoietic Reported (MED12 Regulates HSC-Specific Enhancers Independently of Mediator Kinase Activity to Control Hematopoiesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematopoietic. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Hematopoietic-specific transcription factors require coactivators to communicate with the general transcription machinery and establish transcriptional programs that maintain hematopoietic stem cell (HSC) self-renewal, promote differentiation, and prevent malignant transformation. Mediator is a large coactivator complex that bridges enhancer-localized transcription factors with promoters, but little is known about Mediator function in adult stem cell self-renewal and differentiation."

Our news journalists obtained a quote from the research from New York University, "We show that MED12, a member of the Mediator kinase module, is an essential regulator of HSC homeostasis, as in vivo deletion of Med12 causes rapid bone marrow aplasia leading to acute lethality. Deleting other members of the Mediator kinase module does not affect HSC function, suggesting kinase-independent roles of MED12. MED12 deletion destabilizes P300 binding at lineage-specific enhancers, resulting in H3K27Ac depletion, enhancer de-activation, and consequent loss of HSC stemness signatures."

According to the news editors, the research concluded: "As MED12 mutations have been described recently in blood malignancies, alterations in MED12-dependent enhancer regulation may control."

For more information on this research see: MED12 Regulates HSC-Specific
enhancers independently of mediator kinase activity to control hematopoiesis. cell stem cell, 2016;19(6):784-799. cell stem cell can be contacted at: cell press, 600 technology square, 5th floor, cambridge, ma 02139, usa. oncology - squamous cell carcinoma

findings from nippon school of medicine in squamous cell carcinoma reported (insulin-like growth factor 2 mrna-binding protein-3 as a marker for distinguishing between cutaneous squamous cell carcinoma and keratoacanthoma)

2017 jan 14 (newsrx) -- by a news reporter-staff news editor at obesity, fitness & wellness week -- current study results on oncology - squamous cell carcinoma have been published. according to news reporting from tokyo, japan, by newsrx journalists, research stated, "in the histopathological diagnosis of cutaneous tumors, the differential diagnosis of squamous cell carcinoma (scm) with crateriform architecture and keratoacanthoma (ka) is often difficult so an accurate understanding of the biological features and the identification of reliable markers of scm and ka are crucial issues. insulin-like growth factor 2 mrna-binding protein-3 (igf2bp3, also known as imp3) is thought of as a bona fide oncofetal protein, which is overexpressed and is involved in cell proliferation, migration, and invasion in several kinds of tumors."

the news correspondents obtained a quote from the research from the nippon school of medicine, "however, the role of imp3 in cutaneous scm and ka has not been well studied. therefore, we focused on studying the biological functions of imp3 in scm and ka. in human skin scm cell lines, hsc-1 and hsc-5, and the human keratinocyte cell line, hacaT, imp3 mrna levels were significantly higher than that of normal human skin. the knockdown of imp3 expression reduced the proliferation of hsc-1, and significantly reduced invasion by hsc-1 and hsc-5. in contrast, the knockdown of imp3 did not significantly affect invasion by hacaT cells. in immunohistochemical studies of scm and ka tissues, the ki-67 labeling index (li) of the suprabasal cell layer was significantly higher in scm, compared with ka tissues and the tumor-free margin (tfm) adjacent to scm and ka. most scm tissues stained strongly positive for imp3, but ka tissues and tfm were mostly negative for imp3. the ki-67 li of the...
IMP3-positive group was significantly higher than that of the IMP3-negative group in the suprabasal cell layer of SCC. These results suggest that IMP3 plays an important role in proliferation and, more significantly, in the invasion of SCC, and may be a suitable marker for the histopathological diagnosis of SCC with a crateriform architecture and KA.

According to the news reporters, the research concluded: "Furthermore, IMP3 may potentially be a new therapeutic target for SCC."

For more information on this research see: Insulin-like growth factor 2 mRNA-binding protein-3 as a marker for distinguishing between cutaneous squamous cell carcinoma and keratoacanthoma. *International Journal of Oncology*, 2016;48(3):1007-15.

Our news journalists report that additional information may be obtained by contacting A. Kanzaki, Dept. of Integrated Diagnostic Pathology, Nippon Medical School, Tokyo, Japan. **Enzymes and Coenzymes - Cysteine Endopeptidases**

**Findings from Northwest A&F University Update Knowledge of Cysteine Endopeptidases [3-Monochloro-1,2-propanediol (3-MCPD) induces apoptosis via mitochondrial oxidative phosphorylation system impairment and the caspase cascade pathway]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Enzymes and Coenzymes - Cysteine Endopeptidases are presented in a new report. According to news reporting out of Yangling, People's Republic of China, by NewsRx editors, research stated, "3-Monochloro-1,2-propanediol (3-MCPD) is the most toxic chloropropanols compounds in foodstuff which mainly generated during thermal processing. Kidney is one of the primary target organs for 3-MCPD."

Financial supporters for this research include National Natural Science Foundation of China, Fundamental Research Funds for the Central Universities of China.

Our news journalists obtained a quote from the research from Northwest A&F University, "Using human embryonic kidney cell (HEK293FT) as an in vitro model, we found that 3-MCPD caused concentration-dependent increase in cytotoxicity as assessed by dye uptake, lactatedehydrogenase (LDH) leakage and MTT assays. HEK293FT cell treated with 3-MCPD suffered the decrease of mitochondrial membrane potential and the impairment of mitochondrial oxidative phosphorylation system, especially the reduced amount of mRNA expression and protein synthesis of electron transport chain complex II, complex IV, and complex III. More importantly, energy release (ATP synthesis) was significantly inhibited by 3-MCPD resulting from the down regulation expressions of ATP synthase (ATP6 and ATP8), as well as the loss of
transmembrane potential required for synthesis of ATP. The decreased ratio of mitochondrial apoptogenic factors Bax/Bcl-2 and the cytochrome-c release from mitochondria to cytosol followed by the activation of apoptotic initiators caspase 9 and apoptotic executioners (caspase 3, caspase 6 and caspase 7) leading to apoptosis."

According to the news editors, the research concluded: "The activation of caspase 8 and caspase 2 implied that there were probably other factors to induce the caspase-dependent apoptosis."

For more information on this research see: 3-Monochloro-1,2-propanediol (3-MCPD) induces apoptosis via mitochondrial oxidative phosphorylation system impairment and the caspase cascade pathway. Toxicology, 2016;372():1-11. Toxicology can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Toxicology - www.journals.elsevier.com/toxicology/)

Respiratory Tract Diseases and Conditions - …

Findings from Northwestern Memorial Hospital Broaden Understanding of Pneumothorax (Primary Spontaneous Pneumothorax in Menstruating Women Has High Recurrence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Respiratory Tract Diseases and Conditions - Pneumothorax are presented in a new report. According to news reporting originating in Chicago, Illinois, by NewsRx journalists, research stated, "Primary spontaneous pneumothorax (PSP) is treated on the basis of studies that have predominantly consisted of tall male subjects. Here, we determined recurrence of PSP in average-statured menstruating women and studied prevalence of catamenial pneumothorax (CP) in this population."

The news reporters obtained a quote from the research from Northwestern Memorial Hospital, "Men and menstruating women, aged 18 to 55 years, without underlying lung disease or substance abuse were retrospectively studied between 2009 and 2015. A chest pathologist reviewed all specimens for thoracic endometriosis. Kaplan-Meier curves were constructed to determine recurrence. The median age of women (n = 33) and men (n = 183) was 33.4 and 31.6 years, respectively. In women, 9 (27%) had left-sided and 24 (73%) had right-sided PSP, treated with tube thoracostomy. Recurrence occurred in 21 women (64%) with median follow-up of 14 months, and they were treated with thoracoscopic pleurodesis. Right PSP had higher recurrence (70%) than left PSP (56%, p = 0.02). Four women (12%) presented with recurrent tension
pneumothorax within 6 months. Eight patients (24%) had PSP within 72 hours of menses, meeting clinical criteria of CP. All these were placed on hormonal suppression after initial episode but went on to experience recurrence that was treated with pleurodesis. Classical endometrial glands were not found in any biopsy specimens obtained during the thoracoscopy. In contrast to female subjects, only 8 average-statured men (4.4%) had recurrence (p < 0.001) with a median follow-up of 16 months. PSP in healthy average-statured menstruating women has high recurrence compared with male counterparts."

According to the news reporters, the research concluded: "CP is a clinical diagnosis and often recurs despite hormonal suppression therapy."

Our news correspondents report that additional information may be obtained by contacting A. Bharat, Northwestern Mem Hosp, Dept. of Pathol, Chicago, IL 60611, United States. Oncology - Breast Cancer

Findings from Northwestern University Provide New Insights into Breast Cancer (Radiology as the Point of Cancer Patient and Care Team Engagement: Applying the 4R Model at a Patient’s Breast Cancer Care Initiation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting from Chicago, Illinois, by NewsRx journalists, research stated, "Radiologists aspire to improve patient experience and engagement, as part of the Triple Aim of health reform. Patient engagement requires active partnerships among health providers and patients, and rigorous teamwork provides a mechanism for this."

The news correspondents obtained a quote from the research from Northwestern University, "Patient and care team engagement are crucial at the time of cancer diagnosis and care initiation but are complicated by the necessity to orchestrate many interdependent consultations and care events in a short time. Radiology often serves as the patient entry point into the cancer care system, especially for breast cancer. It is uniquely positioned to play the value-adding role of facilitating patient and team engagement during cancer care initiation. The 4R approach (Right Information and Right Care to the Right Patient at the Right Time),
previously proposed for optimizing teamwork and care delivery during cancer treatment, could be applied at the time of diagnosis. The 4R approach considers care for every patient with cancer as a project, using project management to plan and manage care interdependencies, assign clear responsibilities, and designate a quarterback function. The authors propose that radiology assume the quarterback function during breast cancer care initiation, developing the care initiation sequence, as a project care plan for newly diagnosed patients, and engaging patients and their care teams in timely, coordinated activities. After initial consultations and treatment plan development, the quarterback function is transitioned to surgery or medical oncology. This model provides radiologists with opportunities to offer value-added services and solidifies radiology's relevance in the evolving health care environment."

According to the news reporters, the research concluded: "To implement 4R at cancer care initiation, it will be necessary to change the radiology practice model to incorporate patient interaction and teamwork, develop 4R content and local adaption approaches, and enrich radiology training with relevant clinical knowledge, patient interaction competence, and teamwork skill set."

Central Nervous System - Metencephalon

Findings from Nova Southeastern University Update Understanding of Metencephalon (Heterologous regulation of the cannabinoid type 1 receptor by angiotensin II in astrocytes of spontaneously hypertensive rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Central Nervous System - Metencephalon is now available. According to news originating from Fort Lauderdale, Florida, by NewsRx correspondents, research stated, "Brainstem and cerebellar astrocytes have critical roles to play in hypertension and attention-deficit hyperactivity disorder, respectively. Angiotensin (Ang) II, via the astroglial Ang type 1 receptor (AT1R), has been demonstrated to elevate pro-inflammatory mediators in the brainstem and the cerebellum."

Financial supporters for this research include President's Faculty Research &
Development Grant, Health Professions Grant.

Our news journalists obtained a quote from the research from Nova Southeastern University, "The activation of astroglial cannabinoid type 1 receptor (CB1R), a master regulator of homeostasis, has been shown to neutralize inflammatory states. Factors that drive disease progression are known to alter the expression of CB1Rs. In this study, we investigated the role of Ang II in regulating CB1R protein and mRNA expression in astrocytes isolated from the brainstem and the cerebellum of spontaneously hypertensive rats (SHRs). The results were then compared with their normotensive counterpart, Wistar rats. Not only was the basal expression of CB1R protein and mRNA significantly lower in SHR brainstem astrocytes, but treatment with Ang II resulted in lowering it further in the initial 12h. In the case of cerebellum, Ang II upregulated the CB1R protein and mRNA in SHR astrocytes. While the effect of Ang II on CB1R protein was predominantly mediated via the AT1R in SHR brainstem; both AT1R- and AT2R-mediated Ang II's effect in the SHR cerebellum. These data are strongly indicative of a potential new mode of cross-talk between components of the renin angiotensin system and the endocannabinoid system in astrocytes."

According to the news editors, the research concluded: "The consequence of such a cross-talk could be a potential reduced endocannabinoid tone in brainstem in hypertensive states, but not in the cerebellum under the same conditions."

The news correspondents report that additional information may be obtained from M.A. Clark, Nova Southeastern Univ, Coll Pharm, Dept. of Pharmaceut Sci, Fort Lauderdale, FL 33328, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jnc.13776. This DOI is a link to an online electronic document that is either free or for purchase.

**Skin Diseases and Conditions - Atopic Dermatitis**

**Findings from O. Nemoto and Co-Researchers Advance Knowledge in Atopic Dermatitis (The first trial of CIM331, a humanized anti-human interleukin-31 receptor A antibody, in healthy volunteers and patients with atopic dermatitis to evaluate ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Skin Diseases and Conditions - Atopic Dermatitis have
been presented. According to news reporting originating in Hokkaido, Japan, by NewsRx journalists, research stated, "The cytokine interleukin-31 (IL-31) is considered to be responsible for the development of pruritus in humans. At present, no available evidence has been provided on the safety and efficacy of blocking the IL-31 signal in humans for the amelioration of pruritus in atopic dermatitis (AD)."

The news reporters obtained a quote from the research, "CIM331 is a humanized antihuman IL-31 receptor A (IL-31RA) monoclonal antibody, which binds to IL-31RA to inhibit subsequent IL-31 signalling. To assess the tolerability, safety, pharmacokinetics and preliminary efficacy of CIM331 in healthy Japanese and white volunteers, and Japanese patients with AD. In this randomized, double-blind, placebo-controlled phase I/Ib study, CIM331 was administered in a single subcutaneous dose. The primary outcomes were safety and tolerability; the exploratory analysis was efficacy. No deaths, serious adverse events (AEs) or discontinuations due to AEs were reported in any part of the study. No dose-dependent increase in the incidence of AEs occurred in any part of the study. In healthy volunteers, all AEs occurred once in the placebo groups, and increased creatine phosphokinase was more common in the CIM331 groups. In patients with AD, CIM331 reduced pruritus visual analogue scale score to about -50% at week 4 with CIM331 compared with -20% with placebo. CIM331 increased sleep efficiency and decreased the use of hydrocortisone butyrate. A single subcutaneous administration of CIM331 was well tolerated in healthy volunteers and patients with AD. It decreased pruritus, sleep disturbance and topical use of hydrocortisone."

According to the news reporters, the research concluded: "CIM331 may become a novel therapeutic option for AD by inhibiting IL-31."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bjd.14207. This DOI is a link to an online electronic document that is either free or for purchase.

**Heart Disorders and Diseases - Left Ventricular...**

**Findings from Obafemi Awolowo University in the Area of Left Ventricular Dysfunction Reported (Correlation between volume overload, chronic inflammation, and left ventricular dysfunction in chronic kidney disease patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Left Ventricular Dysfunction is the subject of a report. According to news reporting out of Ife, Nigeria, by NewsRx editors, research stated, "Fluid overload is common in chronic kidney disease (CKD) patients, potentially driving chronic inflammation and left ventricular dysfunction. We investigated the association between volume overload, chronic inflammation, and left ventricular dysfunction across subgroups of CKD patients."

Our news journalists obtained a quote from the research from Obafemi Awolowo University, "The study included 160 participants, comprising peritoneal dialysis (PD), hemodialysis (HD), stage-3 CKD patients, and age-and sex-matched controls (40 in each group). Fluid status was assessed using a body composition monitor (BCM); serum endotoxin, lipopolysaccharide binding protein (LBP), C-reactive protein (CRP). and interleukin-6 (IL-6) levels were measured as markers of inflammation. Echocardiography was done to assess left ventricular dimension and function. Endotoxemia and volume overload were common across the spectrum of CKD patients and were aggravated by worsening kidney function. Among HD cohorts, postdialysis endotoxemia was increased among patients with dialysis-induced hemodynamic instability and was also closely related to ultrafiltration volume. Endotoxin, IL-6, CRP, and LBP levels were elevated in patients with volume overload compared to euvolemic patients (p < 0.05). Patients with elevated circulating endotoxemia had higher left ventricular mass index (LVMI) compared to patients with lower endotoxin levels. Fluid overload correlated with endotoxin levels, IL-6, and LVMI; while LVMI correlated weakly with LBP and CRP. CKD patients typically presented with significant endotoxemia and overt volume overload, which may contribute significantly to chronic low-grade inflammation and left ventricular dysfunction."

According to the news editors, the research concluded: "An additive contribution from hemodialysis treatment may strongly enhance the severity of endotoxemia in HD patients."

For more information on this research see: Correlation between volume overload, chronic inflammation, and left ventricular dysfunction in chronic kidney disease patients. *Clinical Nephrology*, 2016;86():S131-S135. *Clinical Nephrology* can be contacted at: Dustri-Verlag Dr Karl Feistle, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

Our news journalists report that additional information may be obtained by contacting M.O. Hassan, Obafemi Awolowo University, Teaching Hosp Complex, Dept. of Med, Renal Unit, Ife, Osun State, Nigeria. Additional authors for this research include R. Duarte, T. Dix-Peek, A. Vachiat, S. Naidoo, C. Dickens, S. Grinter, P. Manga and S. Naicker.

Findings from Ohio State University Broaden Understanding of Anterior Cruciate Ligament (Effect of High-Grade Preoperative Knee Laxity on Anterior Cruciate Ligament Reconstruction Outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Anterior Cruciate Ligament are discussed in a new report. According to news reporting originating in Columbus, Ohio, by NewsRx journalists, research stated, "Knee laxity in the setting of suspected anterior cruciate ligament (ACL) injury is frequently assessed through physical examination using the Lachman, pivot-shift, and anterior drawer tests. The degree of laxity noted on these examinations may influence treatment decisions and prognosis."

The news reporters obtained a quote from the research from Ohio State University, "Increased preoperative knee laxity would be associated with increased risk of subsequent revision ACL reconstruction and worse patient-reported outcomes 2 years postoperatively. Cohort study; Level of evidence, 2. From an ongoing prospective cohort study, 2333 patients who underwent primary isolated ACL reconstruction without collateral or posterior cruciate ligament injury were identified. Patients reported by the operating surgeons as having an International Knee Documentation Committee (IKDC) grade D for Lachman, anterior drawer, or pivot-shift examination were classified as having high-grade laxity. Multiple logistic regression modeling was used to evaluate whether having high-grade preoperative laxity was associated with increased odds of undergoing revision ACL reconstruction within 2 years of the index procedure, controlling for patient age, sex, Marx activity level, level of competition, and graft type. Multiple linear regression modeling was used to evaluate whether having high-grade preoperative laxity was associated with worse IKDC score or Knee injury and Osteoarthritis Outcome Score Knee-Related Quality of Life subscale (KOOS-QOL) scores at a minimum 2 years postoperatively, controlling for baseline score, patient age, ethnicity, sex, body mass index, marital status, smoking status, sport participation, competition level, Marx activity rating score, graft type, and articular cartilage and meniscus status. Pre-reconstruction laxity data were available for 2325 patients (99.7%). Two-year revision data were available for 2259 patients (96.8%), and patient-reported outcomes were available for 1979 patients (84.8%). High-grade preoperative laxity was noted in 743 patients (31.9%). The mean postoperative IKDC score was 81.8 15.9, and the mean KOOS-QOL score was 72.0 +/- 22.0. The presence of high-grade pre-reconstruction laxity was associated with significantly increased odds of ACL graft revision (odds ratio [OR] = 1.87 [95% CI, 1.19-2.95]; P = .007). The presence of high-grade pre-reconstruction laxity was not associated with any difference in postoperative IKDC ( = -0.56, P = .44) or KOOS-QOL ( = 0.04, P = .97)."

According to the news reporters, the research concluded: "The presence of high-grade pre-reconstruction knee laxity as assessed by manual physical examination under anesthesia is associated with significantly increased odds of revision ACL surgery but has no association with patient-reported outcome scores at 2 years after ACL reconstruction."

For more information on this research see: Effect of High-Grade Preoperative Knee Laxity on Anterior Cruciate Ligament Reconstruction Outcomes. American Journal of Sports Medicine, 2016;44(12):3077-3082. American Journal of Sports Medicine can be contacted at:
Genetics - Human Genetics

Findings from Ohio State University Has Provided New Data on Human Genetics (Block-based association tests for rare variants using Kullback-Leibler divergence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Genetics - Human Genetics is the subject of a report. According to news originating from Columbus, Ohio, by NewsRx correspondents, research stated, "Although genome-wide association studies have successfully detected numerous associations between common variants and complex diseases, these variants typically can only explain a small part of the heritable component of a disease. With the advent of next-generation sequencing, attention has turned to rare variants."

Our news journalists obtained a quote from the research from Ohio State University, "Recently, a variety of approaches for detecting associations of rare variants have been proposed, including the Kullback-Leibler divergence-based tests (KLTs) for detecting genotypic differences between cases and controls. However, few of these approaches consider linkage disequilibrium (LD) structure among rare variants and common variants. In this study, we propose two block-based association tests for testing the effects of rare variants on a disease. The main idea for this approach comes from the hypothesis that a region of interest may consist of two or more LD blocks such that single-nucleotide variants (SNVs) within each block are correlated, whereas SNVs in different blocks are independent or weakly correlated. Under this hypothesis, we propose two tests that are generalizations of the KLTs by taking the block structure into account. A simulation study under various scenarios shows that the proposed methods have well-controlled type I error rates and outperform some leading methods in the literature."

According to the news editors, the research concluded: "Moreover, application to the Dallas Heart Study data demonstrates the feasibility and performance of the two proposed methods in a realistic setting."

For more information on this research see: Block-based association tests for rare variants using Kullback-Leibler divergence. Journal of Human Genetics, 2016;61(11):965-975. Journal of Human Genetics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group - www.nature.com/; Journal
Findings from Ohio State University Reveals New Findings on Periodontitis (Comparative metagenomics reveals taxonomically idiosyncratic yet functionally congruent communities in periodontitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Periodontal Diseases and Conditions - Periodontitis are presented in a new report. According to news reporting originating in Columbus, Ohio, by NewsRx journalists, research stated, "The phylogenetic characteristics of microbial communities associated with periodontitis have been well studied, however, little is known about the functional endowments of this ecosystem. The present study examined 73 microbial assemblages from 25 individuals with generalized chronic periodontitis and 25 periodontally healthy individuals using whole genome shotgun sequencing."

The news reporters obtained a quote from the research from Ohio State University, "Core metabolic networks were computed from taxa and genes identified in at least 80% of individuals in each group. 50% of genes and species identified in health formed part of the core microbiome, while the disease-associated core microbiome contained 33% of genes and only 1% of taxa. Clinically healthy sites in individuals with periodontitis were more aligned with sites with disease than with health. 68% of the health-associated metagenome was dedicated to energy utilization through oxidative pathways, while in disease; fermentation and methanogenesis were predominant energy transfer mechanisms. Expanded functionality was observed in periodontitis, with unique-or over-representation of genes encoding for fermentation, antibiotic resistance, detoxification stress, adhesion, invasion and intracellular resistance, proteolysis, quorum sensing, Type III/IV secretion systems, phages and toxins in the disease-associated core microbiome. However, different species or consortia contributed to these functions in each individual."

According to the news reporters, the research concluded: "Several genes, but not species, demonstrated robust discriminating power between health and disease."

For more information on this research see: Comparative metagenomics reveals taxonomically idiosyncratic yet functionally congruent communities in periodontitis. Scientific Reports, 2016;6():1-13. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting P.S. Kumar, Ohio State University, Coll Dental, Div Periodontol, Columbus, OH 43210, United States. Additional authors for this research include S.M. Ganesan and P.S. Kumar.
Findings from Ohio State University Update Knowledge of Clinical Trials and Studies (Real-World Assessment of Acute Left Ventricular Lead Implant Success and Complication Rates: Results from the Attain Success Clinical Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Research - Clinical Trials and Studies. According to news reporting originating in Columbus, Ohio, by NewsRx journalists, research stated, "Left ventricular lead (LVL) implant success rates have historically ranged between 70.5% and 95.5%. To date, there are few large studies that evaluate LVL implant success utilizing a single family of delivery catheters and leads."

The news reporters obtained a quote from the research from Ohio State University, "The Attain Success study was a prospective nonrandomized multicenter global study with the main objectives of assessing single-system LVL implant success and complication rates. Patients undergoing cardiac resynchronization therapy implantation were eligible for enrollment. There was no prespecified level of experience for investigator participation. LVL implant success and complication rates were assessed through 3 months of follow-up. A total of 2,014 patients (69.1 +/- 12.0 years, 71% male and 38% atrial fibrillation) were enrolled from 114 centers with a follow-up of 3.5 +/- 2.1 months. Coronary sinus cannulation success rate was 96.4% with Attain Family delivery catheters. Implant success rate for Attain Family leads using Attain Family catheters was 94.0%; overall LVL implant success rate was 97.1%. Median procedure time was 4 minutes for cannulation and 9 minutes for LVL placement. Median fluoroscopy time was 17 minutes and median contrast used was 25 cc. There were 55 catheter or LVL-related complications in 53 subjects; the majority were LVL dislodgements (34, 1.7%) and extracardiac stimulation (11, 0.5%). The Kaplan-Meier estimate of the 3-month complication probability was 2.6%.

According to the news reporters, the research concluded: "This study represents the largest prospective evaluation of LVL implantation to date, revealing a high LVL implant success rate and low complication rate using a single family of leads and delivery catheters."

For more information on this research see: Real-World Assessment of Acute Left Ventricular Lead Implant Success and Complication Rates: Results from the Attain Success Clinical Trial. PACE-Pacing and Clinical Electrophysiology, 2016;39(11):1246-1253. PACE-Pacing and Clinical Electrophysiology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Drugs and Therapies - Phenylpiperazine…

Findings from Ohio State University Yields New Findings on Phenylpiperazine Antidepressants (Effects of trazodone on behavioral signs of stress in hospitalized dogs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Phenylpiperazine Antidepressants have been published. According to news reporting out of Columbus, Ohio, by NewsRx editors, research stated, "To determine the effects of trazodone treatment on behavioral signs of stress in hospitalized dogs. Prospective observational study."

Our news journalists obtained a quote from the research from Ohio State University, "ANIMALS 120 client-owned dogs. PROCEDURES Hospitalized dogs administered trazodone (n = 60) were observed for stress-related signs or behaviors = 45 minutes after the drug was administered (time 1) and approximately 90 minutes later (time 2). Dogs that did not receive trazodone (n = 60) were selected to serve as controls for environmental stimuli that could affect behavior and were observed at the same times. Signs or behaviors (scored as present or absent) were assessed individually and grouped into behavioral summation categories (frenetic [lip licking, pacing, panting, spinning, trembling, wet dog shake, whining, and yawning], freeze [averting gaze, pinning back ears, and whale eye sign], or fractious [growling, lunging, showing teeth, and snapping], with lifting of a forelimb and pupil dilation included in all categories). Results were compared between groups and within groups over time. Logistic regression was performed to assess associations between reduction in stress-related signs or behaviors and trazodone administration while controlling for environmental influences. Lip licking, panting, and whining were reduced (defined as present at time 1 and absent at time 2) in trazodone-treated but not environmentally matched dogs. The median number of stress-related behaviors and of frenetic and freeze behaviors was significantly lower at time 2, compared with time 1, in trazodone-treated dogs. Odds of reduced panting and reduced frenetic behaviors at time 2 for trazodone-treated dogs were > 2 times those for environmentally matched dogs."

According to the news editors, the research concluded: "Results indicated that trazodone administration reduced stress-related signs and behaviors in hospitalized dogs and may thereby improve patient welfare."

For more information on this research see: Effects of trazodone on behavioral signs of stress in hospitalized dogs. *Javma-Journal of the American Veterinary Medical Association, 2016;249(11):1281-1291. Findings from Ohio State University in Pancreatic Cancer Reported [STAT3 as a potential therapeutic target in ALDH(+) and CD44(+)/CD24(+)) stem cell-like pancreatic cancer cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Pancreatic Cancer are presented in a new report. According to news reporting out of Columbus, Ohio, by NewsRx editors, research stated, "Persistent activation of signal transducers and activators of transcription 3 (STAT3) is commonly detected in many types of cancer including pancreatic cancer. Whether STAT3 is activated in stem cell-like pancreatic cancer cells and the effect of STAT3 inhibition, is still unknown."

Our news journalists obtained a quote from the research from Ohio State University, "Flow cytometry was used to isolate pancreatic cancer stem-like cells which are identified by both aldehyde dehydrogenase (ALDH)-positive (ALDH(+)) as well as cluster of differentiation (CD) 44-positive/CD24-positive subpopulations (CD44(+)/CD24(+)). STAT3 activation and the effects of STAT3 inhibition by STAT3 inhibitors, LLL12, FLLL32, and Stattic in ALDH and CD44(+)/CD24(+) cells were examined. Our results showed that ALDH(+) and CD44(+)/CD24(+) pancreatic cancer stem-like cells expressed higher levels of phosphorylated STAT3, an active form of STAT3, compared to ALDH-negative (ALDH(-)) and CD44-negative/CD24-negative (CD44(-)/CD24(-)) pancreatic cancer cells, suggesting that STAT3 is activated in pancreatic cancer stem-like cells. Small molecular STAT3 inhibitors inhibited STAT3 phosphorylation, STAT3 downstream target gene expression, cell viability, and tumoursphere formation in ALDH and CD44-CD24(+) cells."

According to the news editors, the research concluded: "Our results indicate that STAT3 is a novel therapeutic target in pancreatic cancer stem-like cells and inhibition of activated STAT3 in these cells by STAT3 inhibitors may offer an effective treatment for pancreatic cancer."

For more information on this research see: STAT3 as a potential therapeutic target in ALDH(+) and CD44(+)/CD24(+) stem cell-like pancreatic cancer cells. International Journal of Oncology, 2016;49(6):2265-2274. International Journal of Oncology can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

Findings from Ohio State University in the Area of Pancreatic Cancer Described (The Impact of Obesity on Gallstone Disease, Acute Pancreatitis, and Pancreatic Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Pancreatic Cancer. According to news reporting originating in Columbus, Ohio, by NewsRx journalists, research stated, "Obesity is a well-recognized risk factor for gallstone formation and increases the risk for gallstone-related complications. Pancreatic diseases are impacted adversely by obesity."

The news reporters obtained a quote from the research from Ohio State University, "Although weight loss surgery increases the risk of gallstone disease, evidence suggests that bariatric surgery mitigates the obesity-associated adverse prognostication in acute pancreatitis. Obesity is also a significant risk factor for pancreatic cancer. Obesity is a global epidemic and is increasing worldwide and among all age groups. There is an urgent need for focused health policies aimed at reducing the incidence and prevalence of obesity."

According to the news reporters, the research concluded: "This article summarizes the current literature highlighting the association between obesity and the pathophysiology and outcome of gallstone disease, pancreatitis, and pancreatic cancer."

Our news correspondents report that additional information may be obtained by contacting S.G. Krishna, Ohio State University, Wexner Med Center, Div Gastroenterol Hepatol & Nutr, Sect Pancreat Dis, Columbus, OH 43210, United States. Additional authors for this research include D.L. Conwell and S.G. Krishna.

Findings from Ohio University Yields New Findings on Type 2 Diabetes (Fenofibrate Decreases Insulin Clearance and Insulin Secretion to Maintain Insulin Sensitivity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is the subject of a report. According to news reporting originating in Athens, Ohio, by NewsRx journalists, research stated, "High fat diet reduces the expression of CEACAM1 (carcinoembryonic antigen-related cell adhesion molecule 1), a transmembrane glycoprotein that promotes insulin clearance and down-regulates fatty acid synthase activity in the liver upon its phosphorylation by the insulin receptor. Because peroxisome proliferator-activated receptor (PPAR) transcriptionally suppresses CEACAM1 expression, we herein examined whether high fat down-regulates CEACAM1 expression in a PPAR-dependent mechanism."

Financial support for this research came from National Institutes of Health.

The news reporters obtained a quote from the research from Ohio University, "By activating PPAR, the lipid-lowering drug fenofibrate reverses dyslipidemia and improves insulin sensitivity in type 2 diabetes in part by promoting fatty acid oxidation. Despite reducing glucose-stimulated insulin secretion, fenofibrate treatment does not result in insulin insufficiency. To examine whether this is mediated by a parallel decrease in CEACAM1-dependent hepatic insulin clearance pathways, we fed wild-type and Ppar(-/-) null mice a high fat diet supplemented with either fenofibrate or Wy14643, a selective PPAR agonist, and examined their effect on insulin metabolism and action. We demonstrated that the decrease in insulin secretion by fenofibrate and Wy14643 is accompanied by reduction in insulin clearance in wild-type but not Ppar(-/-) mice, thereby maintaining normoinsulinemia and insulin sensitivity despite continuous high fat intake. Intact insulin secretion in L-CC1 mice with protected hepatic insulin clearance and CEACAM1 levels provides in vivo evidence that insulin secretion responds to changes in insulin clearance to maintain physiologic insulin and glucose homeostasis."

According to the news reporters, the research concluded: "These results also emphasize the relevant role of hepatic insulin extraction in regulating insulin sensitivity."

Our news correspondents report that additional information may be obtained by contacting S.M. Najjar, Ohio University, Dept. of Biomed Sci, Heritage Coll Osteopath Med, Athens, OH 45701, United States. Additional authors for this research include L. Russo, S.S. Ghanem, P.R. Patel, A.M. Oyarce, G. Heinrich and S.M. Najjar.

Platinum Compounds

Findings from Ondokuz Mayis University Has Provided New Data on Platinum Compounds (Effects of Ginkgo biloba extract on brain oxidative condition after cisplatin exposure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Platinum Compounds is now available. According to news reporting from Samsun, Turkey, by NewsRx journalists, research stated, "The purpose of this study was to evaluate the efficacy of Ginkgo biloba extract (EGb 761) on oxidative events of brain in cisplatin-administrated rats. Rats were divided into four experimental groups: 1) control (n=6); 2) cisplatin (8 mg/kg, intraperitoneally one dose, n=6); 3) EGb 761 (100 mg/kg intraperitoneally for 15 days, n=6); and 4) cisplatin + EGb 761 (n=6)."

The news correspondents obtained a quote from the research from Ondokuz Mayis University, "After drug administration, rats were sacrificed and brain tissues were removed. Nitric oxide (NO), malondialdehyde (MDA) and glutathione (GSH) levels were evaluated in brain tissues. Single dose cisplatin administration significantly increased NO and GSH levels, but decreased MDA levels in brain tissue samples. EGb 761 treatment reversed the effects of cisplatin on NO and GSH levels, but did not affect the decreased MDA levels. Results of the study indicate that oxidative stress can be an important pathogenetic mechanism of cisplatin-induced neurotoxicity."

According to the news reporters, the research concluded: "EGb 761, an standardized extract of G. biloba leaves that has antioxidant properties, may improve the oxidative stress-related neurological side effects of cisplatin."

For more information on this research see: Effects of Ginkgo biloba extract on brain oxidative condition after cisplatin exposure. *Clinical and Investigative Medicine*, 2016;39 (6):S100-S105. *Clinical and Investigative Medicine* can be contacted at: Canadian Soc Clinical Investigation, Csci Head Office, 774 Echo Drive, Ottawa, On K1S 5N8, Canada.

Our news journalists report that additional information may be obtained by contacting E. Agar, Ondokuz Mayis University, Fac Med, Dept. of Physiol, Samsun, Turkey. Additional authors for this research include E.G.G. Peker, M.D. Karakurt, A. Gurel, M. Ayyildiz, S.C. Cevher, E. Agar and S. Dane.

Musculoskeletal Diseases and Conditions - Myotonic...

Findings from Oregon Health and Science University Provides New Data about Myotonic Dystrophy (Results from an external proficiency testing program: 11 years of molecular genetics testing for myotonic dystrophy type 1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Musculoskeletal Diseases and Conditions - Myotonic Dystrophy. According to news originating from Portland, Oregon, by NewsRx correspondents, research stated, "The aim of this study was to examine the performance of laboratories offering assessment for myotonic dystrophy type 1 (DM1) using external proficiency testing samples. DM1, a dominant disorder, has a prevalence of 1:20,000 due to the expansion of CTG trinucleotide repeats in the DMPK gene."

Our news journalists obtained a quote from the research from Oregon Health and Science University, "External proficiency testing administered by the College of American Pathologists/American College of Medical Genetics and Genomics distributes three samples twice yearly. Responses from 2003 through the first distribution of 2013 were analyzed after stratification by location (United States/international). Both the repeat sizes (analytic validity) and clinical interpretations were assessed. Over the 21 distributions, 45 US and 29 international laboratories participated. Analytic sensitivity for detecting and reporting expanded repeats (>= 50) was 99.2% (382/385 challenges) and 97.1% (133/137 challenges), respectively. Analytic specificity (to within two repeats of the consensus) was 99.2% (1,790/1,805 alleles) and 98.6% (702/712 alleles), respectively. Clinical interpretations were correct for 99.3% (450/453) and 98.2% (224/228) of positive challenges and in 99.9% (936/937) and 99.6% (455/457) of negative challenges, respectively. Of four incorrect interpretations made in the United States, two were probably due to sample mix-up."

According to the news editors, the research concluded: "This review of laboratory performance regarding laboratory-developed genetic tests indicates very high performance for both the analytic and interpretative challenges for DM1."

For more information on this research see: Results from an external proficiency testing program: 11 years of molecular genetics testing for myotonic dystrophy type 1. Genetics in Medicine, 2016;18(12):1290-1294. Genetics in Medicine can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. Phenanthrenes

Findings from Oregon State University in Phenanthrenes Reported (Dibenzo[def,p]chrysene transplacental carcinogenesis in wild-type, Cyp1b1 knockout, and CYP1B1 humanized mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Phenanthrenes. According to news reporting out of Corvallis, Oregon, by NewsRx editors, research stated, "The cytochrome P450 (CYP) 1 family is active toward numerous environmental pollutants, including polycyclic aromatic hydrocarbons (PAHs). Utilizing a mouse model, null for Cyp1b1 and expressing human CYP1B1, we tested the hypothesis that hCYP1B1 is important for dibenzo[def,p]chrysene (DBC) transplacental carcinogenesis."

Our news journalists obtained a quote from the research from Oregon State University, "Wild-type mCyp1b1, transgenic hCYP1B1 (mCyp1b1 null background), and mCyp1b1 null mice were assessed. Each litter had an equal number of siblings with Ahr(b-1/d) and Ahr(d/d) alleles. Pregnant mice were dosed (gavage) on gestation day 17 with 6.5 or 12mg/kg of DBC or corn oil. At 10 months of age, mortality, general health, lymphoid disease and lung tumor incidence, and multiplicity were assessed. hCYP1B1 genotype did not impact lung tumor multiplicity, but tended to enhance incidence compared to Cyp1b1 wild-type mice (P=0.07). As with Cyp1b1 in wild-type mice, constitutive hCYP1B1 protein is non-detectable in liver but was induced with 2,3,7,8-tetrachlorodibenzo-p-dioxin. Wild-type mice were 59% more likely to succumb to T-cell Acute Lymphoblastic Leukemia (T-ALL). Unlike an earlier examination of the Ahr genotype in this model (Yu et al., Cancer Res, 2006;66:755-762), but in agreement with a more recent study (Shorey et al., Toxicol Appl Pharmacol, 2013;270:60-69), this genotype was not associated with lung tumor incidence, multiplicity, or mortality. Sex was not significant with respect to lung tumor incidence or mortality but males exhibited significantly greater multiplicity. Lung tumor incidence was greater in mCyp1b1 nulls compared to wild-type mice."

According to the news editors, the research concluded: "To our knowledge, this is the first application of a humanized mouse model in transplacental carcinogenesis."

Our news journalists report that additional information may be obtained by contacting D.E. Williams, Oregon State University, Superfund Res Program, Corvallis, OR 97331, United States. Additional authors for this research include C.V. Lohr, H. You, L.K. Siddens, S.K. Krueger, R.H. Dashwood, F.J. Gonzalez, W.M. Baird, E. Ho, L. Bramer, K.M. Waters and D.E. Williams.

Heart Disorders and Diseases - Acute Coronary…

Findings from Osaka City University Broaden Understanding of Acute Coronary Syndrome (New insights into spotty calcification and plaque rupture in acute coronary syndrome: an optical coherence tomography study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Acute Coronary Syndrome have been published. According to news originating from Osaka, Japan, by NewsRx correspondents, research stated, "Although recent optical coherence tomography (OCT) studies have focused on spotty calcification, whether there were any characteristics in the concomitant existence of calcification and plaque rupture remains unknown. The aim of the present study was to investigate the characteristics of spotty calcification in acute coronary syndrome (ACS) patients with or without plaque rupture, using OCT."

Our news journalists obtained a quote from the research from Osaka City University, "This study enrolled 98 consecutive patients with ACS. OCT image acquisitions were performed in the culprit lesions, and patients were divided into the plaque rupture group (n = 38) and the non-rupture group (n = 60). The frequency of spotty calcification (p = 0.006), thin-capped fibroatheroma (p = 0.012), macrophage infiltration (p = 0.022), and the number of spotty calcification per patient (p < 0.001) were significantly higher and the largest arc and the minimum depth of spotty calcification from the luminal surface were significantly smaller in the rupture group. Moreover, in the rupture group, most of the spotty calcifications in the site nearest to the minimum lumen area were observed in the proximal portion of that site, and tended to be located near the plaque rupture. Multivariate analysis revealed that the presence of spotty calcification (OR 3.19, 95 % CI 1.12-9.76, p = 0.030) and age (OR 1.08, 95 % CI 1.02-1.14, p = 0.008) were independent predictive factors for plaque rupture. This study demonstrates the characteristics of spotty calcification in ACS patients with plaque rupture and the positional relationship between spotty calcification and plaque rupture."

According to the news editors, the research concluded: "These detailed observations could impact on treatment strategies for the prevention of ACS."

For more information on this research see: New insights into spotty calcification and plaque rupture in acute coronary syndrome: an optical coherence tomography study. Heart and Vessels, 2016;31(12):1915-1922. Heart and Vessels can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Heart Disorders and Diseases - Dilated

Findings from Osaka Medical College Provide New Insights into Dilated Cardiomyopathy (Is cardiac and hepatic iron status assessed by MRI T2* associated with left ventricular function in patients with idiopathic cardiomyopathy?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Dilated Cardiomyopathy have been published. According to news originating from Takatsuki, Japan, by NewsRx correspondents, research stated, "Excess accumulation of iron in the heart is known to aggravate cardiac function in some cases of genetic and acquired iron overload. We investigated the possible association between cardiac function and iron content in the heart and liver, estimated non-invasively by T2 star (T2*)-weighted magnetic resonance (MR) imaging among patients with cardiomyopathy."

Our news journalists obtained a quote from the research from Osaka Medical College, "MR images were acquired on a 3.0 T MR imaging system using an 8-channel phased-array cardiac coil. Average T2* values of the heart were estimated at regions of interest that were located on short axis mid-ventricular slices positioned at the cardiac septum. In total, 82 patients were enrolled: 48 patients with dilated cardiomyopathy (DCM), 16 patients with hypertrophic cardiomyopathy (HCM), and 18 patients without apparent cardiovascular abnormalities. Cardiac T2* values were lower in the DCM group (median 18.6 ms) than in the HCM (22.0 ms) and control (21.4 ms) groups, although hepatic T2* values did not differ significantly across the groups. Among the whole population, the highest cardiac T2* tertile (ae <yen >21.2 ms) was significantly negatively associated with a low left ventricular ejection fraction (LVEF) of < 50 %, and this association retained statistical significance after adjustment for sex, age, renal function, hemoglobin and hepatic T2*. Among DCM patients, both hemoglobin and cardiac T2* were selected as parameters that were, respectively, negatively and positively, associated with LVEF (P < 0.05). DCM patients with lower cardiac T2*, and thus higher iron content, were found to have lower LVEF."

According to the news editors, the research concluded: "The possibility that cardiac iron overload may have a role in reducing the systolic cardiac function in DCM patients who do not have systemic iron overload requires further investigation in the future."

For more information on this research see: Is cardiac and hepatic iron status assessed by MRI T2* associated with left ventricular function in patients with idiopathic cardiomyopathy? Heart and Vessels, 2016;31(12):1950-1959. Heart and Vessels can be contacted at: Springer, 233 Spring St. New York, NY 10013, USA. (Springer - www.springer.com; Heart and Vessels - www.springerlink.com/content/0910-8327/)

**DNA Research**

**Findings from Osaka University Provides New Data on DNA Research (A chimeric protein composed of NuMA fused to the DNA binding domain of LANA is sufficient for the ori-P-dependent DNA replication)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in DNA Research. According to news reporting out of Osaka, Japan, by NewsRx editors, research stated, "The Kaposi's sarcoma-associated herpesvirus (KSHV) genome is stably maintained in KSHV-infected PEL cell lines during cell division. We previously showed that accumulation of LANA in the nuclear matrix fraction could be important for the latent DNA replication, and that the functional significance of LANA should be its recruitment of ori-P to the nuclear matrix."

Financial support for this research came from Japan Society for the Promotion of Science (JSPS).

Our news journalists obtained a quote from the research from Osaka University, "Here, we investigated whether the forced localization of the LANADNA binding domain (DBD) to the nuclear matrix facilitated ori-P-containing plasmid replication. We demonstrated that chimeric proteins constructed by fusion of LANA DBD with the nuclear mitotic apparatus protein (NuMA), which is one of the components of the nuclear matrix, could bind with ori-P and enhance replication of an ori-P-containing plasmid, compared with that in the presence of DBD alone."

According to the news editors, the research concluded: "These results further suggested that the ori-P recruitment to the nuclear matrix through the binding with DBD is important for latent viral DNA replication."

For more information on this research see: A chimeric protein composed of NuMA fused to the DNA binding domain of LANA is sufficient for the ori-P-dependent DNA replication. *Virology*, 2017;500():190-197. *Virology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; *Virology* - www.journals.elsevier.com/virology/)

Clinical Research - Clinical Trials and Studies

Findings from Oslo University Hospital Broadens Understanding of Clinical Trials and Studies (Phase I trial of EpCAM-targeting immunotoxin MOC31PE, alone and in combination with cyclosporin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Clinical Research - Clinical Trials and Studies is the subject of a report. According to news reporting out of Oslo, Norway, by NewsRx editors, research stated, "A phase I trial was performed to determine the maximum tolerated dose (MTD), safety, pharmacokinetics and immunogenicity of the anti-EpCAM immunotoxin (IT) MOC31PE in cancer patients. An important part of the study was to investigate whether the addition of Sandimmune (cyclosporin, CsA) suppressed the development of anti-IT antibodies."

Our news journalists obtained a quote from the research from Oslo University Hospital, "Patients with EpCAM-positive metastatic disease were eligible for treatment with intravenous MOC31PE using a modified Fibonacci dose escalation sequence. Maximum tolerated dose was first established without, then with intravenously administered CsA. Sixty-three patients were treated with MOC31PE in doses ranging from 0.5 to 8 mg kg(-1). Maximum tolerated dose was 8 mg kg(-1) for MOC31PE alone, and 6.5 mg kg(-1) when combined with CsA. The dose-limiting adverse event was reversible liver toxicity. No radiological complete or partial responses were observed, whereas stable disease was seen in 36% of the patients receiving MOC31PE only. The pharmacokinetic profile of MOC31PE was characterised by linear kinetics and with a half-life of &sim;3 h. The addition of CsA delayed the generation of anti-IT antibodies. Intravenous infusion of MOC31PE can safely be administered to cancer patients. Immune suppression with CsA delays the development of anti-MOC31PE antibodies."

According to the news editors, the research concluded: "The antitumour effect of MOC31PE warrants further evaluation in EpCAM-positive metastatic disease."

For more information on this research see: Phase I trial of EpCAM-targeting immunotoxin MOC31PE, alone and in combination with cyclosporin. British Journal of Cancer, 2015;113(11):1548-55. (Nature Publishing Group - www.nature.com/; British Journal of Cancer - www.nature.com/bjc/)

Our news journalists report that additional information may be obtained by contacting Y. Andersson, Dept. of Tumor Biology, Institute for Cancer Research, Oslo University Hospital Radiumhospitalet, 0424 Oslo, Norway. Additional authors for this research include O. Engebraaten, S. Juell, S. Aamdal, P. Brunsvig, O. Fodstad and S. Dueland.

Findings from Oslo University Hospital Provide New Insights into Prostate Cancer (Low $\beta_2$-adrenergic receptor level may promote development of castration resistant prostate cancer and altered steroid metabolism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Prostate Cancer is the subject of a report. According to news reporting out of Oslo, Norway, by NewsRx editors, research stated, "The underlying mechanisms responsible for the development of castration-resistant prostate cancer (CRPC) in patients who have undergone androgen deprivation therapy are not fully understood. This is the first study to address whether $\beta_2$-adrenergic receptor (ADRB2)-mediated signaling may affect CRPC progression in vivo."

Our news journalists obtained a quote from the research from Oslo University Hospital, "By immunohistochemical analyses, we observed that low levels of ADRB2 is associated with a more rapid development of CRPC in a Norwegian patient cohort. To elucidate mechanisms by which ADRB2 may affect CRPC development, we stably transfected LNCaP cells with shRNAs to mimic low and high expression of ADRB2. Two UDP-glucuronosyltransferases, UGT2B15 and UGT2B17, involved in phase II metabolism of androgens, were strongly downregulated in two LNCaP shADRB2 cell lines. The low-ADRB2 LNCaP cell lines displayed lowered glucuronidation activities towards androgens than high-ADRB2 cells. Furthermore, increased levels of testosterone and enhanced androgen responsiveness were observed in LNCaP cells expressing low level of ADRB2. Interestingly, these cells grew faster than high-ADRB2 LNCaP cells, and sustained their low glucuronidation activity in castrated NOD/SCID mice. ADRB2 immunohistochemical staining intensity correlated with UGT2B15 staining intensity in independent TMA studies and with UGT2B17 in one TMA study. Similar to ADRB2, we show that low levels of UGT2B15 are associated with a more rapid CRPC progression."

According to the news editors, the research concluded: "We propose a novel mechanism by which ADRB2 may affect the development of CRPC through downregulation of UGT2B15 and UGT2B17."

For more information on this research see: Low $\beta_2$-adrenergic receptor level may promote development of castration resistant prostate cancer and altered steroid metabolism. Oncotarget, 2016;7(2):1878-94.

**Helper-Inducer T-Lymphocytes**

**Findings from Oslo University Hospital Provides New Data about Helper-Inducer T-Lymphocytes (Adoptive Transfer of Tumor-Specific Th2 Cells Eradicates Tumors by Triggering an In Situ Inflammatory Immune Response)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Helper-Inducer T-Lymphocytes. According to news reporting originating in Oslo, Norway, by NewsRx journalists, research stated, "Adoptive cell therapy (ACT) trials to date have focused on transfer of autologous tumor-specific cytotoxic CD8(+) T cells; however, the potential of CD4(+) T helper (Th) cells for ACT is gaining interest. While encouraging results have been reported with IFN gamma-producing Th1 cells, tumor-specific Th2 cells have been largely neglected for ACT due to their reported tumor-promoting properties."

The news reporters obtained a quote from the research from Oslo University Hospital, "In this study, we tested the efficacy of idiotype-specific Th2 cells for the treatment of mice with MHC class II-negative myeloma. Th2 ACT efficiently eradicated sub-cutaneous myeloma in an antigen-specific fashion. Transferred Th2 cells persisted in vivo and conferred long-lasting immunity. Cancer eradication mediated by tumor-specific Th2 cells did not require B cells, natural killer T cells, CD8(+) T cells, or IFN gamma. Th2 ACT was also curative against B-cell lymphoma. Upon transfer, Th2 cells induced a type II inflammation at the tumor site with massive infiltration of M2-type macrophages producing arginase. In vivo blockade of arginase strongly inhibited Th2 ACT, consistent with a key role of arginase and M2 macrophages in myeloma elimination by Th2 cells. These results illustrate that cancer eradication may be achieved by induction of a tumor-specific Th2 inflammatory immune response at the tumor site."

According to the news reporters, the research concluded: "Thus, ACT with tumor-specific Th2 cells may represent a highly efficient immunotherapy protocol against cancer."

For more information on this research see: Adoptive Transfer of Tumor-Specific Th2 Cells Eradicates Tumors by Triggering an In Situ Inflammatory Immune Response. *Cancer Research*, 2016;76(23):6864-6876. *Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Findings from P. Benotti and Co-Authors Update Knowledge of Obstructive Sleep Apnea (The impact of obstructive sleep apnea on nonalcoholic fatty liver disease in patients with severe obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea. According to news originating from Danville, Pennsylvania, by NewsRx correspondents, research stated, "Obstructive sleep apnea (OSA) is common among candidates for bariatric surgery. OSA and its associated intermittent hypoxia have been implicated in the pathogenesis of nonalcoholic fatty liver disease (NAFLD) and nonalcoholic steatohepatitis."

Our news journalists obtained a quote from the research, "A large cohort of bariatric surgery patients was studied in an effort to explore the relationship between OSA severity, hypoxia, metabolic syndrome, and the severity of NAFLD. Bariatric surgery candidates who underwent both polysomnography and liver biopsy were studied. The severity of OSA as determined by the apnea-hypopnea index (AHI) and parameters of hypoxia was studied in relation to extent of abnormalities of liver histology as measured by the presence of hepatic steatosis, inflammation, and fibrosis. The study cohort included 362 patients with a mean age of 46.2 years and BMI of 49.9 kg/m(2). On the basis of AHI, 26% of the cohort had no OSA, 32% mild OSA, 22% moderate OSA, and 20% severe OSA. For the study subjects without metabolic syndrome, positive correlations were found between OSA severity, as measured by AHI, and parameters of hypoxia, with the severity of NAFLD."

According to the news editors, the research concluded: "OSA severity and its accompanying hypoxia are associated with the severity of NAFLD."

For more information on this research see: The impact of obstructive sleep apnea on nonalcoholic fatty liver disease in patients with severe obesity. Obesity, 2016;24(4):871-7. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

**Drugs and Therapies - Adrenal Cortical Steroids**

**Findings from P. Daull and Co-Researchers Advance Knowledge in Adrenal Cortical Steroids (Efficacy of a new topical cationic emulsion of cyclosporine A on dry eye clinical signs in an experimental mouse model of dry eye)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Adrenal Cortical Steroids are presented in a new report. According to news originating from Evry, France, by NewsRx correspondents, research stated, "Dry eye disease (DED) is a complex, multifactorial pathology characterized by corneal epithelium lesions and inflammation. The aim of the present study was to evaluate the efficacy of a cationic emulsion of cyclosporine A (CsA) in a mouse model that mimics severe dry eye."

Our news journalists obtained a quote from the research, "Eight to 12-week-old female C57BL/6N mice with tail patches of scopolamine were housed in controlled environment chambers to induce dry eye. At day three, following dry eye confirmation by corneal fluorescein staining (CFS, score 0-15) and phenol red thread (PRT) lacrimation test, the mice (n = 10/gp) were either treated 3 times a day in both eyes with drug-free cationic emulsion, a 0.1% CsA cationic emulsion, or 1% methylprednisolone (positive control), or non-treated. Aqueous tear production and CFS scores were evaluated at baseline and throughout the treatment period. The lacrimation test confirmed the scopolamine-induced decrease in aqueous production by the lacrimal gland. A reduction of 59% in induced-CFS was observed following topical treatment with 0.1% CsA. The beneficial effect of the cationic emulsion vehicle itself on keratitis was also clearly evidenced by its better performance over 1% methylprednisolone, -36%, vs.-28% on the CFS scores, respectively. This study indicates that the cationic emulsion of CsA (0.1%) was a very effective formulation for the management of corneal epithelium lesions in a severe DED mouse model. In addition, it performed better than a potent glucocorticosteroid (1% methylprednisolone)."

According to the news editors, the research concluded: "This cationic emulsion of CsA (0.1%), combining CsA and a tear film oriented therapy (TFOT), i.e. with vehicle properties that mechanically stabilize the tear film, represents a promising new treatment strategy for the management of the signs of dry eye."

The news correspondents report that additional information may be obtained from J.S. Garrigue, SANTEN SAS, Novagali Innovat Center, F-91458 Evry, France. Additional authors for this research include L. Feraille, S. Barabino, N. Cimbolini, S. Antonelli, V. Mauro.
and J.S. Garrigue.

Drugs and Therapies - Antiretrovirals

Findings from P. Suntharasamai and Co-Authors Update Knowledge of Antiretrovirals (Assessment of Oral Fluid HIV Test Performance in an HIV Pre-Exposure Prophylaxis Trial in Bangkok, Thailand)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antiretrovirals are discussed in a new report. According to news reporting originating from Bangkok, Thailand, by NewsRx correspondents, research stated, "Rapid easy-to-use HIV tests offer opportunities to increase HIV testing among populations at risk of infection. We used the OraQuick Rapid HIV-1/2 antibody test (OraQuick) in the Bangkok Tenofovir Study, an HIV pre-exposure prophylaxis trial among people who inject drugs."

Our news editors obtained a quote from the research, "The Bangkok Tenofovir Study was a randomized, double-blind, placebo-controlled trial. We tested participants' oral fluid for HIV using OraQuick monthly and blood using a nucleic-acid amplification test (NAAT) every 3 months. We used Kaplan-Meier methods to estimate the duration from a positive HIV NAAT until the mid-point between the last non-reactive and first reactive oral fluid test and proportional hazards to examine factors associated with the time until the test was reactive. We screened 3678 people for HIV using OraQuick. Among 447 with reactive results, 436 (97.5%) were confirmed HIV-infected, 10 (2.2%) HIV-uninfected, and one (0.2%) had indeterminate results. Two participants with non-reactive OraQuick results were, in fact, HIV-infected at screening yielding 99.5% sensitivity, 99.7% specificity, a 97.8% positive predictive value, and a 99.9% negative predictive value. Participants receiving tenofovir took longer to develop a reactive OraQuick (191.8 days) than participants receiving placebo (16.8 days) (p=0.02) and participants infected with HIV CRF01_AE developed a reactive OraQuick earlier than participants infected with other subtypes (p=0.04). The oral fluid HIV test performed well at screening, suggesting it can be used when rapid results and non-invasive tools are preferred. However, participants receiving tenofovir took longer to develop a reactive oral fluid test result than those receiving placebo."

According to the news editors, the research concluded: "Thus, among people using pre-exposure prophylaxis, a blood-based HIV test may be an appropriate choice."

The news editors report that additional information may be obtained by contacting P. Suntharasamai, Bangkok Tenofovir Study Group, Bangkok, Thailand. Additional authors for this research include M. Martin, K. Choopanya, S. Vanichseni, U. Sangkum, P. Tararut, W.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1371/journal.pone.0145859. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Ethnopharmacology

Findings from Panjab University Update Understanding of Ethnopharmacology (Isolation, characterization and quantification of an anxiolytic constituent - mahanimbine, from Murraya koenigii Linn. Spreng Leaves)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Ethnopharmacology have been published. According to news reporting from Chandigarh, India, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Leaves of M. koenigii Linn. Spreng (Rutaceae) have been used as traditional medicine for anxiety disorders."

The news correspondents obtained a quote from the research from Panjab University, "Aim of the study was to isolate antianxiety principle(s) from the leaves of M. koenigii using bioactivity guided approach. Hydroalcoholic extract of M. koenigii leaves was prepared using soxhlet apparatus, and the same was evaluated for antianxiety activity at 250, 500 and 750 mg/kg, po, using Elevated plus-maze (EPM). The extract was further partitioned successively with pet'ether, chloroform, ethyl acetate and 1-butanol. All the fractions were evaluated for antianxiety activity. The bioactive ethyl acetate fraction was column chromatographed to get 5 fractions (F-1-F-5). All the fractions were evaluated for antianxiety activity using EPM. A pure compound, separated out from F-2, was characterized using standard spectroscopic techniques, and its anxiolytic activity was evaluated using EPM. Antianxiety activity of isolated compound was further evaluated using Actophotometer and m-CPP induced anxiety model. TLC-densitometric method was developed to quantify mahanimbine in the plant. The present study resulted in the isolation of mahanimbine, which exhibits potent antianxiety activity at 3 mg/kg, and the activity was statistically comparable to that of diazepam (2 mg/kg). The developed TLC-densitometric method is specific, linear, precise, accurate, repeatable and robust. This study validates the ethnopharmacological use of M. koenigii leaves in the management of anxiety disorders."

According to the news reporters, the research concluded: "Mahanimbine is responsible for the antianxiety effect of M. koenigii leaves."

For more information on this research see: Isolation, characterization and quantification of an anxiolytic constituent - mahanimbine, from Murraya koenigii Linn. Spreng Leaves. *Journal of Ethnopharmacology*, 2016;193():706-711. *Journal of Ethnopharmacology* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon,
Findings from Paratek Pharmaceuticals in Chemotherapy Reported (In Vitro and In Vivo Assessments of Cardiovascular Effects with Omadacycline)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Chemotherapy. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Omadacycline is a first-in-class aminomethylcycline antibiotic with a broad spectrum of activity against Gram-positive and Gram-negative aerobes and anaerobes and atypical bacterial pathogens. A series of nonclinical studies, including mammalian pharmacologic receptor binding studies, human ether-a-go-go-related gene (hERG) channel binding studies, studies of the effects on ex vivo sinoatrial (SA) node activity, and studies of in vivo effects on cardiovascular function in the cynomolgus monkey, was undertaken to assess the cardiovascular risk potential."

Our news editors obtained a quote from the research from Paratek Pharmaceuticals, "Omadacycline was found to bind almost exclusively to the muscarinic subtype 2 acetylcholine receptor (M-2), and in the SA node model it antagonized the effect of a pan-muscarinic agonist (carbamylcholine) in a concentration-dependent manner. Omadacycline exhibited no effect on hERG channel activity at 100 mu g/ml (179.5 mu M), with a 25% inhibitory concentration of 166 mu g/ml (298.0 mu M). Omadacycline had no effect on QTc in conscious monkeys at doses up to 40 mg/kg of body weight."

According to the news editors, the research concluded: "Overall, omadacycline appears to attenuate the parasympathetic influence on the heart rate but has a low potential to induce cardiac arrhythmia or to have clinically significant cardiovascular toxicity."

For more information on this research see: In Vitro and In Vivo Assessments of Cardiovascular Effects with Omadacycline. Antimicrobial Agents and Chemotherapy, 2016;60 (9):5247-5253. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Drugs and Therapies - Antifungals
Findings from Pasteur Institute in the Area of Antifungals Described (Administration of Zinc Chelators Improves Survival of Mice Infected with Aspergillus fumigatus both in Monotherapy and in Combination with Caspofungin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antifungals have been published. According to news reporting out of Paris, France, by NewsRx editors, research stated, "Aspergillus fumigatus can infect immunocompromised patients, leading to high mortality rates due to the lack of reliable treatment options. This pathogen requires uptake of zinc from host tissues in order to successfully grow and cause virulence."

Our news journalists obtained a quote from the research from Pasteur Institute, "Reducing the availability of that micronutrient could help treat A. fumigatus infections. In this study, we examined the in vitro effects of seven chelators using a bioluminescent strain of A. fumigatus. 1,10-Phenanthroline and N, N, N', N'-tetrakis(2-pyridylmethyl) ethane-1,2-diamine (TPEN) proved to be the chelators most effective at inhibiting fungal growth. Intraperitoneal administration of either phenanthroline or TPEN resulted in a significant improvement in survival and decrease of weight loss and fungal burden for immunosuppressed mice intranasally infected with A. fumigatus. In vitro both chelators had an indifferent effect when employed in combination with caspofungin. The use of TPEN in combination with caspofungin also significantly increased survival compared to that when using these drugs individually."

According to the news editors, the research concluded: "Our results suggest that zinc chelation may be a valid strategy for dealing with A. fumigatus infections and that both phenanthroline and TPEN could potentially be used either independently or in combination with caspofungin, indicating that their use in combination with other antifungal treatments might also be applicable."

For more information on this research see: Administration of Zinc Chelators Improves Survival of Mice Infected with Aspergillus fumigatus both in Monotherapy and in Combination with Caspofungin. Antimicrobial Agents and Chemotherapy, 2016;60(10):5631-5639. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Drugs and Therapies - Cancer Therapy**

**Findings from Payame Noor University in the Area of Cancer Therapy Described (Novel dual stimuli-responsive ABC triblock copolymer: RAFT synthesis, "schizophrenic" micellization, and its performance as an anticancer drug delivery nanosystem)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Cancer Therapy is the subject of a report. According to news reporting from Tehran, Iran, by NewsRx journalists, research stated, "A novel pH- and thermo-responsive ABC triblock copolymer poly[(2-succinyloxyethyl methacrylate)-b-(N-isopropylacrylamide)-b-[(N-4-vinylbenzyl),N,N-diethylamine] ] [P(SEMA-b-NIPAAm-b-VEA)] was successfully synthesized via reversible addition of fragmentation chain transfer (RAFT) polymerization technique. The molecular weights of PHEMA, PNIPAAm, and PVEA segments in the synthesized triblock copolymer were calculated to be 10,670, 6140, and 9060 g mol(-1), respectively, from proton nuclear magnetic resonance (1H NMR) spectroscopy."

The news correspondents obtained a quote from the research from Payame Noor University, "The schizophrenic self-assembly behavior of the synthesized P(SEMA-b-NIPAAm-b-VEA) triblock copolymer under pH and thermal stimulus were investigated by means of 1H NMR and ultraviolet-visible (UVvis) spectroscopies as well as dynamic light scattering (DLS) and zeta potential (ξ) measurements. The doxorubicin hydrochloride (DOX)-loading capacity, and stimuli-responsive drug release ability of the synthesized triblock copolymer were also investigated. The biocompatibility of the synthesized triblock copolymer was confirmed through the assessing survival rate of breast cancer cell line (MCF7) using MTT assay. In contrast, DOX-loaded triblock copolymer exhibited an efficient anticancer performance in comparison with free DOX verified by MTT and DAPI staining assays."

According to the news reporters, the research concluded: "As the results, we envision that the synthesized P(SEMA-b-NIPAAm-b-VEA) triblock copolymer can be applied as an enhanced anticancer drug delivery nanosystem, mainly due to its smart physicochemical and biocompatibility properties."

Our news journalists report that additional information may be obtained by contacting B. Massoumi, Payame Noor Univ, Dept. of Chem, Tehran, Iran. Additional authors for this research include A. Ghahmehr, E. Alizadeh, B. Massoumi and M. Jaymand.

Findings from Peking Union Medical College Has Provided New Data on Abdominal Aortic Aneurysm (Application of physician-modified fenestrated stent graft in urgent endovascular repair of abdominal aortic aneurysm with hostile neck anatomy Case ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "This study aimed to evaluate the feasibility and effectiveness of the Gore Excluder aortic stent graft (WL Gore & Associates, Inc., Flagstaff, AZ) using the C3 Delivery System after physician modification of fenestration for the urgent treatment of patients with abdominal aortic aneurysm showing hostile neck anatomy. Case summary: Three urgent cases of abdominal aortic aneurysm with hostile neck anatomy symptom with abdominal pain were reported."

Our news journalists obtained a quote from the research from Peking Union Medical College, "The same fenestration method was applied to align the target superior mesenteric artery and bilateral renal arteries with 1 scallop and 2 fenestrations, followed by the reconstruction of the target artery using a bare-metal stent or stent graft. Balloon-assisted positioning and image fusion technology were intraoperatively applied to assist the accurate release of the stent graft body. The follow-up periods for all cases exceeded 6 months, showing smooth circulation in the target arteries with no endoleaks. In the absence of other available treatment methods, it is feasible to use a stent graft with physician-modified fenestration for the urgent endovascular repair of abdominal aortic aneurysm with hostile neck anatomy."

According to the news editors, the research concluded: "However, this procedure's long-term efficacy needs to be further investigated."

For more information on this research see: Application of physician-modified fenestrated stent graft in urgent endovascular repair of abdominal aortic aneurysm with hostile neck anatomy Case report. Medicine, 2016;95(46):420-425. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Findings from Peking Union Medical College Yields New Findings on Obesity, Fitness and Wellness (First-in-Human Percutaneous Balloon Pulmonary Valvuloplasty Under Echocardiographic Guidance Only)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Obesity, Fitness and Wellness have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "The objective of this study was to assess the feasibility of percutaneous balloon pulmonary valvuloplasty (PBPV) under echocardiographic guidance only. PBPV has become the preferred choice for pulmonary valve stenosis (PS)."

The news reporters obtained a quote from the research from Peking Union Medical College, "We report the first-in-human successful PBPV under only echocardiography guidance for isolated PS. From March 2013 to December 2014, 34 patients with congenital PS underwent PBPV with echocardiography as the only imaging modality in the ordinary operation room or catheter lab. Outpatient follow-up including chest radiography, electrocardiography, and transthoracic echocardiography (TTE) was conducted at 1, 3, 6, and 12 months. All 34 patients successfully underwent PBPV under echocardiography guidance without radiation and contrast agent. The pulmonic transvalvular pressure gradient dropped from 62.8 +/- 10.1 mm Hg to 14.7 +/- 4.2 mm Hg measured on catheterization (P <.05). The balloon diameter/pulmonary annulus diameter ratio was 1.34 +/- 0.07. Slight regurgitation of the pulmonary valve occurred in five patients and mild pulmonary regurgitation occurred in one patients. The pulmonic transvalvular pressure gradient measured on TTE 12 months after the procedure was 14.1 +/- 4.6 mm Hg. No pericardial effusion and peripheral vascular complications occurred."

According to the news reporters, the research concluded: "This study demonstrated that PBPV can be successfully performed under only echocardiography guidance and appears safe and effective while avoiding radiation and contrast agent use."

Our news correspondents report that additional information may be obtained by contacting X.B. Pan, Peking Union Med College, Beijing 100037, People's Republic of China. Additional authors for this research include W.B. Ou-Yang, S.S. Hu, K.J. Pang, Y. Liu, F.W. Zhang, D.W. Zhang and X.B. Pan.

Findings from Peking Union Medical College in Cardiovascular Research Reported (Ambient Fine Particulate Matter Exposure and Risk of Cardiovascular Mortality: Adjustment of the Meteorological Factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Research have been published. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Few studies have explicitly explored the impacts of the extensive adjustment (with a lag period of more than one week) of temperature and humidity on the association between ambient fine particulate matter (PM2.5) and cardiovascular mortality. In a time stratified case-crossover study, we used a distributed lag nonlinear model to assess the impacts of extensive adjustments of temperature and humidity for longer lag periods (for 7, 14, 21, 28 and 40 days) on effects of PM2.5 on total cardiovascular mortality and mortality of cerebrovascular and ischemic heart disease and corresponding exposure-response relationships in Beijing, China, between 2008 and 2011."

Our news editors obtained a quote from the research from Peking Union Medical College, "Compared with results only controlled for temperature and humidity for 2 days, the estimated effects of PM2.5 were smaller and magnitudes of exposure-response curves were decreased when longer lag periods of temperature and relative humidity were included for adjustments, but these changes varied across subpopulation, with marked decreases occurring in males and the elderly who are more susceptible to PM2.5-related mortalities. Our findings suggest that the adjustment of meteorological factors using lag periods shorter than one week may lead to overestimated effects of PM2.5."

According to the news editors, the research concluded: "The associations of PM2.5 with cardiovascular mortality in susceptible populations were more sensitive to further adjustments for temperature and relative humidity."

The news editors report that additional information may be obtained by contacting K. Luo, Chinese Academy Med Sci, Center Environm & Hlth Sci, Peking Union Med College, Beijing 100005, People's Republic of China. Additional authors for this research include W.J. Li, R.M. Zhang, R.K. Li, Q. Xu and Y. Cao.

Thrombolysis

Findings from Peking University Provide New Insights into Thrombolysis (Regional variation in acute stroke care organisation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Thrombolysis are discussed in a new report. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Few studies have assessed regional variation in the organisation of stroke services, particularly health care resourcing, presence of protocols and discharge planning. Our aim was to compare stroke care organisation within middle- (MIC) and high-income country (HIC) hospitals participating in the Head Position in Stroke Trial (HeadPoST)."

Financial support for this research came from NHMRC.

Our news editors obtained a quote from the research from Peking University, "HeadPoST is an on-going international multicenter crossover cluster-randomized trial of 'sitting-up' versus 'lying-flat' head positioning in acute stroke. As part of the start-up phase, one stroke care organisation questionnaire was completed at each hospital. The World Bank gross national income per capita criteria were used for classification. 94 hospitals from 9 countries completed the questionnaire, 51 corresponding to MIC and 43 to HIC. Most participating hospitals had a dedicated stroke care unit/ward, with access to diagnostic services and expert stroke physicians, and offering intravenous thrombolysis. There was no difference for the presence of a dedicated multidisciplinary stroke team, although greater access to a broad spectrum of rehabilitation therapists in HIC compared to MIC hospitals was observed. Significantly more patients arrived within a 4-h window of symptoms onset in HIC hospitals (41 vs. 13%; P<0.001), and a significantly higher proportion of acute ischemic stroke patients received intravenous thrombolysis (10 vs. 5%; P=0.002) compared to MIC hospitals. Although all hospitals provided advanced care for people with stroke, differences were found in stroke care organisation and treatment."

According to the news editors, the research concluded: "Future multilevel analyses aims to determine the influence of specific organisational factors on patient outcomes."

For more information on this research see: Regional variation in acute stroke care organisation. Journal of the Neurological Sciences, 2016;371():126-130. Journal of the Neurological Sciences can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of the Neurological Sciences - www.journals.elsevier.com/journal-of-the-neurological-sciences/)

Oncology - Non-Small Cell Lung Cancer

Findings from Peking University Reveals New Findings on Non-Small Cell Lung Cancer (Upregulation of programmed cell death ligand 1 promotes resistance response in non-small-cell lung cancer patients treated with neo-adjuvant chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Non-Small Cell Lung Cancer is now available. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "To assess the association of the programmed cell death ligand 1 (PD-L1) with cisplatin-based neo-adjuvant chemotherapy (NAC) response, we investigated the level of PD-L1 and found increased PD-L1 expression in chemo-resistant tumors compared with chemo-sensitive tumors according to RNA-Seq analysis. In a cohort of 92 patients with NAC, the positive staining of PD-L1 was correlated with TNM stage, lower sensitive-response rates and shorter overall survival rates."

Funders for this research include Peking University, Beijing Municipal Administration of Hospitals' Clinical Medicine Development Special Fund, Capital Health Research and Development Special Fund, National High Technology Research and Development Program of China.

Our news journalists obtained a quote from the research from Peking University, "In another 30 paired tumor specimens pre- and post-chemotherapy, the patients with high PD-L1 expression post-chemotherapy had a worse outcome and higher stable disease rate. CD8(+) tumor-infiltrating lymphocytes were found to be related to chemosensitive response and better prognosis and negative PD-L1 expression. Furthermore, in two patient-derived xenograft models and cell lines A549 and PC-9, cisplatin upregulated PD-L1 expression, and the enhancement of PD-L1 in cancer cell lines was in a drug dose-dependent manner. Moreover, the depletion of PD-L1 significantly reduced cisplatin resistance. When phosphatidylinositol 3-kinase/protein kinase B signaling was inhibited by corresponding inhibitors, PD-L1 expression was downregulated and apoptosis was upregulated in the cisplatin-treated cancer cells. These results suggest that the upregulation of PD-L1 promotes a resistance response in lung cancer cells that might be through activation of the phosphatidylinositol 3-kinase/protein kinase B pathway and suppression of tumor-infiltrating lymphocytes."

According to the news editors, the research concluded: "The high expression of PD-L1 after NAC could be an indication of therapeutic resistance and poor prognosis in patients with non-small-cell lung cancer."

The news correspondents report that additional information may be obtained from Y. Yang, Peking University, Canc Hosp & Inst, Minist Educ Beijing, Dept. of Thorac Surg 2Key Lab Carcinogenesis & Trans, Beijing, People's Republic of China. Additional authors for this

RNA Viruses - Simian Immunodeficiency Virus

Findings from Peking University in Simian Immunodeficiency Virus Reported (Simian Immunodeficiency Virus Impacts MicroRNA-16 Mediated Post-Transcriptional Regulation of mu Opioid Receptor in CEM ?174 Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in RNA Viruses - Simian Immunodeficiency Virus. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Although the mechanism which regulates transcription in the 5'-UTR of the mc opioid receptor gene (OPRM1) in lymphocytes has been well-studied, a question remains as to whether there is post-transcriptional regulation of OPRM1 gene in lymphocytes. In this study, the authors describe both the role played by miRNAs and the impact of SIVmac239 infection on post-transcriptional regulation of OPRM1 gene in CEM ?174 cells."

Funders for this research include National Natural Science Foundation of China, Beijing Natural Science Foundation, Guangdong Province Natural Science Fund Project, Shenzhen Research Fund.

Our news editors obtained a quote from the research from Peking University, "Our results show that miR-16 is able to bind the target site in the range of 8699-8719 nt from the stop codon in MOR-1 mRNA 3'-UTR and suppress the expression of OPRM1 gene. Mutation of this target site reduces the effect of miR-16. Morphine (1 ?M) inhibits the expression of miR-16, and this effect is reversed by the antagonist naloxone. Thus, morphine may up-regulate receptor level by both stimulating OPRM1 gene transcription and stabilizing its mRNA. SIVmac239 infection results in an apparent elevation of miR-16 and gradual reduction of OPRM1 gene expression. The inverse correlation of elevated miR-16 and reduced OPRM1 gene expression under viral loading confirmed the effect of SIVmac239 on post-transcriptional regulation of OPRM1 gene in lymphocytes. The authors conclude that miR-16 is a primary factor in post-transcriptional regulation of OPRM1 gene. SIVmac239 upregulates miR-16 levels and consequently suppresses OPRM1 gene expression."

According to the news editors, the research concluded: "This finding will be helpful for full understanding of the regulatory mechanism of OPRM1 gene in lymphocytes, as well as the synergistic mechanism of HIV infection and morphine addiction in the pathogenesis of
AIDS."

The news editors report that additional information may be obtained by contacting W. Hou, Dept. of Biochemistry and Molecular Biology, Peking University Health Science Center, Peking University, Beijing, 100191, People's Republic of China. Additional authors for this research include H. Li, W. Jiang, C. Zhang, M.A. McNutt and G. Li.

**Cardiology**

**Findings from Pennsylvania State University Yields New Data on Cardiology (Self-organizing visualization and pattern matching of vectorcardiographic QRS waveforms)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting from University Park, Pennsylvania, by NewsRx journalists, research stated, "QRS morphology is commonly used in the electrocardiographic diagnosis of ventricular depolarization such as left bundle branch block (LBBB) and ventricular septal infarction. We investigated whether pattern matching of QRS loops in the 3-dimensional vectorcardiogram (VCG) will improve the grouping of patients whose spacetime electrical activity akin to each other, thereby assisting in clinical decision making."

Funders for this research include National Science Foundation, Harold and Inge Marcus Career Professorship.

The news correspondents obtained a quote from the research from Pennsylvania State University, "First, pattern dissimilarity of VCG QRS loops is qualitatively measured and characterized among patients, resulting in a 93x93 distance matrix of patient-to-patient dissimilarity. Each patient is then represented as a node in the network (or a star in the galaxy), but node locations are optimized to preserve the dissimilarity matrix. The optimization is achieved with a self-organizing algorithm that iteratively minimizes the network energy. Experimental results showed that patients' locations converge as the representation error reaches a stable phase. The convergence is independent of initial locations of network nodes. Most importantly, 93 patients are automatically organized into 3 clusters of healthy control, LBBB, and infarction. Spatial coordinates of nodes (or patients) are evidently novel predictors that can
be used in the computer-assisted detection of cardiac disorders."

According to the news reporters, the research concluded: "Self-organizing pattern matching is shown to have strong potentials for large-scale unsupervised learning of patient groups."

Our news journalists report that additional information may be obtained by contacting H. Yang, Pennsylvania State University, Complex Syst Monitoring Modeling & Control Lab, University Park, PA 16802, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.compbiomed.2016.09.020. This DOI is a link to an online electronic document that is either free or for purchase.

**Liver Diseases**

**Findings from Pennsylvania State University Yields New Data on Liver Diseases [Regulation of Cytochrome P450 2B10 (CYP2B10) Expression in Liver by Peroxisome Proliferator-activated Receptor-beta/delta Modulation of SP1 Promoter Occupancy]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases have been published. According to news reporting out of University Park, Pennsylvania, by NewsRx editors, research stated, "Alcoholic liver disease is a pathological condition caused by overconsumption of alcohol. Because of the high morbidity and mortality associated with this disease, there remains a need to elucidate the molecular mechanisms underlying its etiology and to develop new treatments."

Our news journalists obtained a quote from the research from Pennsylvania State University, "Because peroxisome proliferator-activated receptor-beta/delta (PPAR beta/delta) modulates ethanol-induced hepatic effects, the present study examined alterations in gene expression that may contribute to this disease. Chronic ethanol treatment causes increased hepatic CYP2B10 expression in Ppar beta/delta(+/+) mice but not in Ppar beta/delta(-/-) mice. Nuclear and cytosolic localization of the constitutive androstane receptor (CAR), a transcription factor known to regulate Cyp2b10 expression, was not different between genotypes. PPAR gamma co-activator 1 alpha, a co-activator of both CAR and PPAR beta/delta, was up-regulated in Ppar beta/delta(+/-) liver following ethanol exposure, but not in Ppar beta/delta(-/-) liver. Functional mapping of the Cyp2b10 promoter and ChIP assays revealed that PPAR beta/delta-dependent modulation of SP1 promoter occupancy up-regulated Cyp2b10 expression in response to ethanol. These results suggest that PPAR beta/delta regulates Cyp2b10 expression indirectly by modulating SP1 and PPAR gamma co-activator 1 alpha expression and/or activity.
independent of CAR activity. Ligand activation of PPAR beta/delta attenuates ethanol-induced Cyp2b10 expression in Ppar beta/delta(+/+) liver but not in Ppar beta/delta(-/-) liver. Strikingly, Cyp2b10 suppression by ligand activation of PPAR beta/delta following ethanol treatment occurred in hepatocytes and was mediated by paracrine signaling from Kupffer cells."

According to the news editors, the research concluded: "Combined, results from the present study demonstrate a novel regulatory role of PPAR beta/delta in modulating CYP2B10 that may contribute to the etiology of alcoholic liver disease."

Our news journalists report that additional information may be obtained by contacting J.M. Peters, Pennsylvania State University, Center Mol Toxicol & Carcinogenesis, University Park, PA 16802, United States. Additional authors for this research include P.L. Yao, M. Goudarzi, I.A. Murray, G. Balandaram, F.J. Gonzalez, G.H. Perdew, A.J. Fornace and J.M. Peters.

Vascular Endothelial Growth Factor

Findings from People's Hospital Provides New Data on Vascular Endothelial Growth Factor (Mechanistic Study of the Inhibitory Effect of Kaempferol on Uterine Fibroids In Vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Vascular Endothelial Growth Factor is now available. According to news reporting originating from Liaocheng, People's Republic of China, by NewsRx correspondents, research stated, "This study examined the effect of kaempferol on uterine fibroids in vitro and the underlying mechanism, and investigated the potential of kaempferol as a clinical drug for the treatment of uterine fibroids. Uterine fibroid tissue and surrounding smooth muscle tissue were collected for primary culture."

Our news editors obtained a quote from the research from People's Hospital, "Different concentrations of kaempferol (12 mu M, 24 mu M, and 48 mu M) were used to treat the cells for 24, 48, and 72 hours. Ethanol was used in the control group. A CCK-8 colorimetric assay was used to detect cell proliferation. Real-time PCR and immunoblot were used to detect estrogen receptor (ER), insulin-like growth factor-1 (IGF-1), and vascular endothelial growth
factor (VEGF) levels in mRNA and protein. The differences in proliferation at different time points and concentrations of kaempferol were statistically significant. The inhibitory effect of kaempferol on mRNA levels of ER and IGF, and protein levels of ER, VEGF, and IGF-1 were positively correlated with kaempferol concentration. Changes in kaempferol concentration showed no effect on VEGF mRNA expression. Treatment with kaempferol significantly lowered myocardin levels in uterine fibroid tissue compared to normal uterine smooth muscle (P < 0.05).

According to the news editors, the research concluded: "Kaempferol might be used for clinical treatment of uterine fibroids due to its inhibitory effect on the proliferation of uterine fibroids cells."

For more information on this research see: Mechanistic Study of the Inhibitory Effect of Kaempferol on Uterine Fibroids In Vitro. Medical Science Monitor, 2016;22():1-6. Medical Science Monitor can be contacted at: Int Scientific Literature, Inc, 361 Forest Lane, Smithtown, NY 11787, USA.

The news editors report that additional information may be obtained by contacting Y.X. Li, Second Peoples Hosp Liaocheng, Dept. of Gynaecol, Liaocheng, Shandong, People's Republic of China. Additional authors for this research include Z.X. Ding and C.Z. Wu.

Oncology - Breast Cancer

**Findings from Periyar University Broaden Understanding of Breast Cancer [Synergistic effect of chemo-photothermal for breast cancer therapy using folic acid (FA) modified zinc oxide nanosheet]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting from Tamil Nadu, India, by NewsRx journalists, research stated, "Modern therapies for malignant breast cancer in clinics are not efficacious and often result in deprived patient compliance owing to squat therapeutic effectiveness and strong systemic side effects. In order to overcome this, we combined chemo-photothermal targeted therapy of breast cancer within one novel multifunctional drug delivery system."

Financial support for this research came from University Grant Commission, New Delhi, India.

The news correspondents obtained a quote from the research from Periyar University, "Folic Acid-functionalized polyethylene glycol coated Zinc Oxide nanosheet (FA-PEG-ZnO NS), was successfully synthesized, characterized and introduced to the drug delivery field for the first time. A doxorubicin (DOX)-loaded FA-PEG-ZnO NS based system (DOX-FAPEG-ZnO NS) showed stimulative effect of heat, pH responsive and sustained drug release properties. Cytotoxicity experiments confirmed that combined therapy mediated the maximum rate of death in breast cancer cells compared to that of single chemotherapy or photothermal therapy. In vivo toxicity evaluation showed that the DOX-FA-PEG-ZnO NS contains minimum systemic toxicity in the mice model system. The findings of the present study provided an ideal drug delivery system for breast cancer therapy due to the advanced chemo-photothermal synergistic targeted therapy and good drug release properties of DOX-FA-PEG-ZnO NS, which
could effectively avoid frequent and invasive dosing and improve patient compliance."

According to the news reporters, the research concluded: "Thus, functionalized-ZnO NS could be used as a novel nanomaterial for selective chemo-photothermal therapy."

Our news journalists report that additional information may be obtained by contacting K. Vimala, Periyar Univ, Dept. of Zool, Prote & Mol Cell Physiol Lab, Salem 636011, Tamil Nadu, India. Additional authors for this research include K. Shanthi, S. Sundarraj and S. Kannan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jcis.2016.10.067. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Rectal Cancer**

**Findings from Peter MacCallum Cancer Center Update Understanding of Rectal Cancer (Predicting pathological complete response to neoadjuvant chemoradiotherapy in locally advanced rectal cancer: a systematic review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Rectal Cancer have been presented. According to news originating from Melbourne, Australia, by NewsRx correspondents, research stated, "Approximately 20% of patients treated with neoadjuvant chemoradiotherapy (nCRT) for locally advanced rectal cancer achieve a pathological complete response (pCR) while the remainder derive the benefit of improved local control and downstaging and a small proportion show a minimal response. The ability to predict which patients will benefit would allow for improved patient stratification directing therapy to those who are likely to achieve a good response, thereby avoiding ineffective treatment in those unlikely to benefit."

Our news journalists obtained a quote from the research from Peter MacCallum Cancer Center, "A systematic review of the English language literature was conducted to identify pathological factors, imaging modalities and molecular factors that predict pCR following chemoradiotherapy. PubMed, MEDLINE and Cochrane Database searches were conducted with the following keywords and MeSH search terms: 'rectal neoplasm', 'response', 'neoadjuvant', 'preoperative chemoradiation', 'tumor response'. After review of title and abstracts, 85 articles addressing the prediction of pCR were selected. Clear methods to predict pCR before chemoradiotherapy have not been defined. Clinical and radiological features of the primary cancer have limited ability to predict response. Molecular profiling holds the greatest potential
to predict pCR but adoption of this technology will require greater concordance between cohorts for the biomarkers currently under investigation. At present no robust markers of the prediction of pCR have been identified and the topic remains an area for future research. This review critically evaluates existing literature providing an overview of the methods currently available to predict pCR to nCRT for locally advanced rectal cancer."

According to the news editors, the research concluded: "The review also provides a comprehensive comparison of the accuracy of each modality."

The news correspondents report that additional information may be obtained from J.E. Ryan, Division of Cancer Surgery, Peter MacCallum Cancer Centre, Melbourne, Victoria, Australia. Additional authors for this research include S.K. Warrier, A.C. Lynch, R.G. Ramsay, W.A. Phillips and A.G Heriot.

Endoscopic Submucosal Dissection

Findings from Portuguese Oncology Institute Update Knowledge of Endoscopic Submucosal Dissection (Risk factors for bleeding after gastric endoscopic submucosal dissection: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Endoscopic Submucosal Dissection is now available. According to news reporting out of Oporto, Portugal, by NewsRx editors, research stated, "Postprocedural bleeding (PPB) is the most common adverse event associated with endoscopic resection. Several studies have tried to identify risk factors for PPB after gastric EMR and endoscopic submucosal dissection (ESD), with controversial results."

Our news journalists obtained a quote from the research from Portuguese Oncology Institute, "This systematic review and meta-analysis aimed to identify significant risk factors for PPB after gastric EMR and ESD. Three online databases were searched. Pooled odds ratio (OR) was computed for each risk factor using a random-effects model, and heterogeneity was assessed by Cochran's Q test and I-2. Seventy-four articles were included. Pooled PPB rate was 5.1% (95% confidence interval, 4.5%-5.7%), which did not vary according to different study designs. Male sex (OR, 1.25), cardiopathy (OR, 1.54), antithrombotic drugs (OR, 1.63), cirrhosis (OR, 1.76), chronic kidney disease (OR, 3.38), tumor size > 20 mm (OR, 2.70), resected specimen size > 30 mm (OR, 2.85), localization in the lesser curvature (OR, 1.74), flat/depressed morphology (OR, 1.43), carcinoma histology (OR, 1.46), and ulceration (OR, 1.64) were identified as significant risk factors for PPB, whereas age, hypertension, submucosal
invasion, fibrosis, and localization (upper, middle, or lower third) were not. Procedure duration > 60 minutes (OR, 2.05) and the use of histamine-2 receptor antagonists instead of proton pump inhibitors (OR, 2.13) were the procedural factors associated with PPB, whereas endoscopist experience and preprocedural proton pump inhibitors were not. Second-look endoscopy was not associated with decreased PPB (OR, 1.34; 95% confidence interval, .85-2.12). Risk factors for PPB were identified that can help to guide management after gastric ESD, namely adjusting further management.

According to the news editors, the research concluded: "Second-look endoscopy is not associated with decreased PPB."

Our news journalists report that additional information may be obtained by contacting D. Libanio, Portuguese Oncol Inst Porto, Dept. of Gastroenterol, P-4200072 Oporto, Portugal. Additional authors for this research include M.N. Costa, P. Pimentel-Nunes and M. Dinis-Ribeiro.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.gie.2016.06.033. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Fatty Liver

Findings from Postgraduate Institute of Medical Education and Research Reveals New Findings on Fatty Liver (Genetic polymorphism in CD14 gene, a co-receptor of TLR4 associated with non-alcoholic fatty liver disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Fatty Liver have been presented. According to news reporting from Chandigarh, India, by NewsRx journalists, research stated, "To evaluate the pathogenic role of toll-like receptor (TLR) gene polymorphisms in patients with non-alcoholic fatty liver disease (NAFLD). Two hundred and fifty subjects (NAFLD = 200, healthy volunteers = 50) underwent polymerase chain reaction and restriction fragment length polymorphism to assess one polymorphism in the toll-like receptor 2 (TLR2) gene (A753G), two polymorphisms in the TLR4 gene (TLR4 Asp299Gly and Thr399Ile allele), and two polymorphisms in the cluster of differentiation 14 (CD14) (C-159T and C-550T) gene, a co-receptor of TLR4."

The news correspondents obtained a quote from the research from the Postgraduate Institute of Medical Education and Research, "Association of TLR gene polymorphisms with
NAFLD and its severity was evaluated by genetic models of association. On both multiplicative and recessive models of gene polymorphism association, there was significant association of CD14 C (-159) T polymorphism with NAFLD; patients with TT genotype had a 2.6 fold increased risk of developing NAFLD in comparison to CC genotype. There was no association of TLR2 Arg753Gln, TLR4 Asp299Gly, Thr399Ile, and CD14 C (-550) T polymorphisms with NAFLD. None of the TLR gene polymorphisms had an association with histological severity of NAFLD.

According to the news reporters, the research concluded: "Patients with CD14 C (-159) T gene polymorphism, a co-receptor of TLR4, have an increased risk of NAFLD development."

Our news journalists report that additional information may be obtained by contacting A. Duseja, Postgraduate Inst Med Educ & Res, Dept. of Hepatol, Chandigarh 160012, India. Additional authors for this research include A. Duseja, B.K. Sharma, B. Singla, A. Chakraborti, A. Das, P. Ray, R.K. Dhiman and Y. Chawla.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i42.9346. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Colon Cancer**

**Findings from Postgraduate Institute of Medical Education and Research in the Area of Colon Cancer Reported (Frequent Activation of the beta-Catenin Gene in Sporadic Colorectal Carcinomas: A Mutational & Expression Analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting originating in Chandigarh, India, by NewsRx journalists, research stated, "Beta-catenin (CTNNB1), an oncogene/onco-protein and an adhesion molecule is a key effector in colorectal cancer (CRC). Its activation, and subsequent up-regulation of Wnt-signaling, is an important event in the development of certain human cancers including CRC."

The news reporters obtained a quote from the research from the Postgraduate Institute of Medical Education and Research, "Mutations in the beta-catenin gene in the region of serine-threonine glycogen kinase (GSK)-3 beta phosphorylation target sites have been identified in colorectal cancer in humans. In the current study, we investigated 60 sporadic..."
colorectal adenocarcinomas along with adjoining and normal mucosa cases in humans for beta-catenin mutations. Thirteen of sixty colorectal tumors from humans had point mutations with a frequency of 21.66% at codons 24, 26, 27, 32, 34, 35, 41, 42, 43, 46, 49, 54, 55, or 67 sites which are mutated in colorectal cancer and some of these sites in other cancers. Thus, there appears to be a key involvement of beta-catenin activation in human colorectal carcinogenesis. mRNA expression analysis using q-Real Time PCR showed 21.5-fold up-regulation of beta-catenin mRNA in tumor tissue compared to normal and adjoining mucosa. Protein expression analysis using immunohistochemistry, confocal microscopy, and Western blot confirmed aberrant accumulation of beta-catenin protein along the nucleus and cytoplasm following mutation.

According to the news reporters, the research concluded: "The observed mutations and up-regulation of mRNA in tumors, and the increased expression of beta-catenin protein in CRC suggest that these alterations are early and prognostic events in sporadic colorectal carcinogenesis in humans."

Keywords for this news article include: Chandigarh, India, Asia, Armadillo Domain Proteins, Carcinogenesis, Genetics, Transcription Factors, Colorectal Research, Gastroenterology, beta Catenin, Colon Cancer, Carcinomas, Oncology, Catenins, Postgraduate Institute of Medical Education and Research.

Immune System Diseases and Conditions - HIV/AIDS

Findings from Public Hospital System Broaden Understanding of HIV/AIDS (Total HIV-1 DNA, a Marker of Viral Reservoir Dynamics with Clinical Implications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immune System Diseases and Conditions - HIV/AIDS are discussed in a new report. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "HIV-1 DNA persists in infected cells despite combined antiretroviral therapy (cART), forming viral reservoirs. Recent trials of strategies targeting latent HIV reservoirs have rekindled hopes of curing HIV infection, and reliable markers are thus needed to evaluate viral reservoirs."

The news reporters obtained a quote from the research from Public Hospital System, "Total HIV DNA quantification is simple, standardized, sensitive, and reproducible. Total HIV DNA load influences the course of the infection and is therefore clinically relevant. In particular, it is predictive of progression to AIDS and death, independently of HIV RNA load and the CD4 cell count. Baseline total HIV DNA load is predictive of the response to cART. It declines during cART but remains quantifiable, at a level that reflects both the history of infection (HIV RNA zenith, CD4 cell count nadir) and treatment efficacy (residual viremia, cumulative viremia, immune restoration, immune cell activation). Total HIV DNA load in blood is also predictive of the presence and severity of some HIV-1-associated end-organ disorders. It can be useful to guide individual treatment, notably, therapeutic de-escalation. Although it does not distinguish between replication-competent and -defective latent viruses, the total HIV DNA load in blood, tissues, and cells provides insights into HIV pathogenesis, probably because all viral
forms participate in host cell activation and HIV pathogenesis. Total HIV DNA is thus a biomarker of HIV reservoirs, which can be defined as all infected cells and tissues containing all forms of HIV persistence that participate in pathogenesis. This participation may occur through the production of new virions, creating new cycles of infection and disseminating infected cells; maintenance or amplification of reservoirs by homeostatic cell proliferation; and viral transcription and synthesis of viral proteins without new virion production."

According to the news reporters, the research concluded: "These proteins can induce immune activation, thus participating in the vicious circle of HIV pathogenesis."

For more information on this research see: Total HIV-1 DNA, a Marker of Viral Reservoir Dynamics with Clinical Implications. *Clinical Microbiology Reviews*, 2016;29 (4):859-880. *Clinical Microbiology Reviews* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Clinical Microbiology Reviews - cmr.asm.org)

Our news correspondents report that additional information may be obtained by contacting V. Avettand-Fenoel, Hopital Necker Enfants Malad, AP HP, Virol Lab, Paris, France. **Autoimmune Diseases and Conditions - Psoriatic…**

**Findings from Public Hospital System Broaden Understanding of Psoriatic Arthritis (Management of psoriatic arthritis in 2016: a comparison of EULAR and GRAPPA recommendations)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Psoriatic Arthritis. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "Psoriatic arthritis (PsA) is a heterogeneous, potentially severe disease. Many therapeutic agents are now available for PsA, but treatment decisions are not always straightforward."

The news reporters obtained a quote from the research from Public Hospital System, "To assist in this decision making, two sets of recommendations for the management of PsA were published in 2016 by international organizations - the European League Against Rheumatism (EULAR) and the Group for Research and Assessment of Psoriasis and Psoriatic Arthritis (GRAPPA). In both sets of recommendations, the heterogeneity of PsA is recognized and the place of various drugs in the therapeutic armamentarium is discussed. Such agents include conventional DMARDs, such as methotrexate, and targeted therapies including biologic agents, such as ustekinumab, secukinumab and TNF inhibitors, or the targeted synthetic drug
apremilast. The proposed sequential use of these drugs, as well as some other aspects of PsA management, differ between the two sets of recommendations. This disparity is partly the result of a difference in the evaluation process; the focus of EULAR was primarily rheumatological, whereas that of GRAPPA was balanced between the rheumatological and dermatological aspects of disease."

According to the news reporters, the research concluded: "In this Perspectives article, we address the similarities and differences between these two sets of recommendations and the implications for patient management."

Our news correspondents report that additional information may be obtained by contacting L. Gossec, Pitie Salpetriere Hospital, AP HP, Serv Rhumatol, F-75013 Paris, France. Eye Diseases and Conditions - Uveitis

Findings from Q.D. Nguyen et al Update Understanding of Uveitis [Intravitreal Sirolimus for Noninfectious Uveitis: A Phase III Sirolimus Study Assessing Double-masKed Uveitis TReAtment (SAKURA)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Eye Diseases and Conditions - Uveitis are discussed in a new report. According to news reporting originating in Omaha, Nebraska, by NewsRx journalists, research stated, "To evaluate the efficacy and safety of intravitreal sirolimus in the treatment of noninfectious uveitis (NIU) of the posterior segment (i.e., posterior, intermediate, or panuveitis). Phase III, randomized, double-masked, active-controlled, 6-month study with intravitreal sirolimus."

The news reporters obtained a quote from the research, "Adults with active NIU of the posterior segment (intermediate, posterior, or panuveitis), defined as a vitreous haze (VH) score >1+. Subjects discontinued NIU medications before baseline, except for systemic corticosteroids, which were allowed only for those already receiving them at baseline and were rapidly tapered after baseline per protocol. Intravitreal sirolimus assigned 1:1:1 at doses of 44 (active control), 440, or 880 mg, administered on Days 1, 60, and 120. The primary efficacy outcome was the percentage of subjects with VH 0 response at Month 5 (study eye) without use
of rescue therapy. Secondary outcomes at Month 5 were VH 0 or 0.5+ response rate, corticosteroid tapering success rate (i.e., tapering to a prednisone-equivalent dosage of <= 5 mg/day), and changes in best-corrected visual acuity (BCVA). Adverse events during the double-masked treatment period are presented. A total of 347 subjects were randomized. Higher proportions of subjects in the intravitreal sirolimus 440 mg (22.8%; P = 0.025) and 880 mg (16.4%; P = 0.182) groups met the primary end point than in the 44 mg group (10.3%). Likewise, higher proportions of subjects in the 440 mg (52.6%; P = 0.008) and 880 mg (43.1%; P = 0.228) groups achieved a VH score of 0 or 0.5+ than in the 44 mg group (35.0%). Mean BCVA was maintained throughout the study in each dose group, and the majority of subjects receiving corticosteroids at baseline successfully tapered off corticosteroids (44 mg [63.6%], 440 mg [76.9%], and 880 mg [66.7%]). Adverse events in the treatment and active control groups were similar in incidence, and all doses were well tolerated."

According to the news reporters, the research concluded: "Intravitreal sirolimus 440 mg demonstrated a significant improvement in ocular inflammation with preservation of BCVA in subjects with active NIU of the posterior segment."

Our news correspondents report that additional information may be obtained by contacting Q.D. Nguyen, Ocular Imaging Res & Reading Center, Omaha, NE, United States. Additional authors for this research include P.T. Merrill, W.L. Clark, A.S. Banker, C. Fardeau, P. Franco, P. LeHoang, S. Ohno, S.R. Rathinam, S. Thurau, A. Abraham, L. Wilson, Y. Yang and N. Shams.

**Wilson's Disease**

**Findings from Q.J. Zhang and Co-Authors Provide New Insights into Wilson's Disease (Four-year follow-up of a Wilson disease pedigree complicated with epilepsy and hypopituitarism Case report with a literature review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Wilson's disease have been presented. According to news reporting out of Fuzhou, People's Republic of China, by NewsRx editors, research stated, "Wilson's disease (WD) is an autosomal recessive inherited disorder of copper metabolism with excellent prognosis if treated timely. However, WD is usually prone to neglect and misdiagnosis
at an early stage."

Our news journalists obtained a quote from the research, "We reported a rare WD pedigree, and the clinical features, laboratory tests, and gene mutations were analyzed in detail. Patient concerns: The patient was a 17-year-old and 136-cm-tall girl who presented with limb weakness, combined with multi-organ disorders including blind eye, epilepsy, and hypopituitarism. Diagnoses: Clinical tests showed a low serum ceruloplasmin level, high urinary copper excretion and Kayser-Fleischer (K-F) rings. She carried a compound heterozygous mutations in ATP7B gene (c.2828G >A and c.3884C >T). Her younger brother, as an asymptomatic patient, manifested with elevation of transaminases but without neurological and hepatic symptoms. They were diagnosed as WD finally. They were treated with sodium dimercaptosulphonate, supplemented with zinc gluconate, vitamin B6, vitamin C, as well as restriction of dietary copper. The urinary copper excretion and serum transaminase level decreased gradually. The abnormal signals in brainstem and basal ganglia were also remarkably decreased after 4-year of de-copper treatment. Lessons: As to the patients with complicated clinical manifestations, the extrapyramidal symptom and basal ganglia signals should be concerned."

According to the news editors, the research concluded: "The serum ceruloplasmin detection and ATP7B gene mutation screening are necessary."

For more information on this research see: Four-year follow-up of a Wilson disease pedigree complicated with epilepsy and hypopituitarism Case report with a literature review. Medicine, 2016;95(49):71-76. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Membrane Proteins - Membrane Glycoproteins

Findings from Qiqihar Medical University Update Knowledge of Membrane Glycoproteins (Acid-sensing ion channels are expressed in the ventrolateral medulla and contribute to central chemoreception)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Membrane Proteins - Membrane Glycoproteins have been presented. According to news reporting originating in Heilongjiang, People's Republic of China, by NewsRx journalists, research stated, "The role of acid-sensing ion channels (ASICs) in the ventrolateral medulla (VLM) remains uncertain. Here, we found that ASIC1a and ASIC2 are widely expressed in rat medulla, and the expression level is higher at neonatal stage as
compared to adult stage."

The news reporters obtained a quote from the research from Qiqihar Medical University, "The two ASIC subunits co-localized in medulla neurons. Furthermore, pH reduction triggered typical ASIC-type currents in the medulla, including the VLM. These currents showed a pH(50) value of 6.6 and were blocked by amiloride. Based on their sensitivity to psalmotoxin 1 (PcTx1) and zinc, homomeric ASIC1α and heteromeric ASIC1α/2 channels were likely responsible for acid-mediated currents in the mouse medulla. ASIC currents triggered by pH 5 disappeared in the VLM neurons from ASIC1(-/-), but not ASIC2(-/-) mice. Activation of ASICs in the medulla also triggered neuronal excitation. Moreover, microinjection of artificial cerebrospinal fluid at a pH of 6.5 into the VLM increased integrated phrenic nerve discharge, inspiratory time and respiratory drive in rats. Both amiloride and PcTx1 inhibited the acid-induced stimulating effect on respiration."

According to the news reporters, the research concluded: "Collectively, our data suggest that ASICs are highly expressed in the medulla including the VLM, and activation of ASICs in the VLM contributes to central chemoreception."

For more information on this research see: Acid-sensing ion channels are expressed in the ventrolateral medulla and contribute to central chemoreception. Scientific Reports, 2016;6():1-15. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting X.P. Chu, Qiqihar Med Univ, Sch Mental Hlth, Qiqihar 161006, Heilongjiang, People's Republic of China. Enzymes and Coenzymes - Amidohydrolases

Findings from Quaid-i-Azam University in Amidohydrolases Provides New Insights (Iminothiazoline-Sulfonamide Hybrids as Jack Bean Urease Inhibitors; Synthesis, Kinetic Mechanism and Computational Molecular Modeling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Amidohydrolases have been published. According to news originating from Islamabad, Pakistan, by NewsRx correspondents, research stated, "The present work reports the synthesis of several 2-iminothiazoline derivatives of sulfanilamide (3a-j) as inhibitors of jack bean ureases. The title compounds were synthesized by the heterocyclization of sulfanilamide thioureas with propargyl bromide in dry ethanol in the presence of 1,8-Diazabicyclo[5.4.0]undec-7-ene as a base."

Our news journalists obtained a quote from the research from Quaid-i-Azam
University, "All of the compounds showed higher urease inhibitory activity than the standard thionurea. The compounds (3h) and (3i) exhibited excellent enzyme inhibitory activity with IC₅₀ 0.064 and 0.058 mm, respectively, while IC₅₀ of thionurea is 20.9 mm. The kinetic mechanism analyzed by Dixon plot showed that compound (3h) is a mixed-type inhibitor while (3i) is a competitive one. Docking studies suggested that Asp633, Ala636, His492, Ala440, Lue523, Asp494 and Arg439 are the major interacting residues in the binding site of the protein and may have an instrumental role in the inhibition of enzyme's function. 2-iminothiazoline analogues (3a-j) showed good docking score (-10.6466 to -8.7215 Kcal/mol) and binding energy (London dG ranging from -14.4825 to -10.4087 Kcal/mol) which is far better than the standard thionurea (binding score in S field -4.5790 Kcal/mol London dG -4.7726 Kcal/mol).

According to the news editors, the research concluded: "Our results inferred compound (3i) may serve as a structural model for the design of most potent urease inhibitors."

The news correspondents report that additional information may be obtained from A. Saeed, Dept. of Chemistry, Quaid-i-Azam University, Islamabad, 45320, Pakistan. Additional authors for this research include S.U. Mahmood, M. Rafiq, Z. Ashraf, F. Jabeen and S.Y Seo.

**Oncology - Colon Cancer**

**Findings from Queen's University Broaden Understanding of Colon Cancer (Statin use and survival in colorectal cancer: Results from a population-based cohort study and an updated systematic review and meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting originating from Belfast, United Kingdom, by NewsRx correspondents, research stated, "The aim of this study was to investigate the association between statin use and survival in a population-based colorectal cancer (CRC) cohort and perform an updated meta-analysis to quantify the magnitude of any association. A cohort of 8391 patients with newly diagnosed Dukes' A-C CRC (2009-2012) was identified from the Scottish Cancer Registry."

Our news editors obtained a quote from the research from Queen's University, "This cohort was linked to the Prescribing Information System and the National Records of Scotland..."
Death Records (until January 2015) to identify 1064 colorectal cancer-specific deaths. Adjusted hazard ratios (HRs) and 95% confidence intervals (CIs) for cancer-specific mortality by statin use were calculated using time dependent Cox regression models. The systematic review included relevant studies published before January 2016. Meta-analysis techniques were used to derive combined HRs for associations between statin use and cancer-specific and overall mortality. In the Scottish cohort, statin use before diagnosis (HR = 0.84, 95% CI 0.75-0.94), but not after (HR = 0.90, 95% CI 0.77-1.05), was associated with significantly improved cancer-specific mortality. The systematic review identified 15 relevant studies. In the meta-analysis, there was consistent (I² = 0%, heterogeneity P = 0.57) evidence of a reduction in cancer-specific mortality with statin use before diagnosis in 6 studies (n = 86,622, pooled HR = 0.82, 95% CI 0.79-0.86) but this association was less apparent and more heterogeneous (I² = 67%, heterogeneity P = 0.03) with statin use after diagnosis in 4 studies (n = 19,152, pooled HR = 0.84, 95% CI 0.68-1.04). In a Scottish CRC cohort and updated meta-analysis there was some evidence that statin use was associated with improved survival.

According to the news editors, the research concluded: "However, these associations were weak in magnitude and, particularly for post-diagnosis use, varied markedly between studies."

For more information on this research see: Statin use and survival in colorectal cancer: Results from a population-based cohort study and an updated systematic review and meta-analysis. Cancer Epidemiology, 2016;45():71-81. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Cancer Epidemiology - www.journals.elsevier.com/cancer-epidemiology/)

The news editors report that additional information may be obtained by contacting R.T. Gray, Queen's University Belfast, Royal Victoria Hospital, Center Public Hlth, Canc Epidemiol & Hlth Serv Res Grp, Belfast BT12 6BA, Antrim, United Kingdom. Drugs and Therapies - Alkylating Agents

Findings from R. Daillere et al Has Provided New Information about Alkylating Agents (Enterococcus hirae and Barnesiella intestinohominis Facilitate Cyclophosphamide-Induced Therapeutic Immunomodulatory Effects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Alkylating Agents are discussed in a new report. According to news reporting out of Villejuif, France, by NewsRx editors, research stated, "The efficacy of the anti-cancer immunomodulatory agent
cyclophosphamide (CTX) relies on intestinal bacteria."

Our news journalists obtained a quote from the research, "How and which relevant bacterial species are involved in tumor immunosurveillance, and their mechanism of action are unclear. Here, we identified two bacterial species, Enterococcus hirae and Barnesiella intestinihominis that are involved during CTX therapy. Whereas E. hirae translocated from the small intestine to secondary lymphoid organs and increased the intratumoral CD8/Treg ratio, B. intestinihominis accumulated in the colon and promoted the infiltration of IFN-gamma-producing gamma delta Tau cells in cancer lesions."

According to the news editors, the research concluded: "The immune sensor, NOD2, limited CTX-induced cancer immunosurveillance and the bioactivity of these microbes. Finally, E. hirae and B. intestinihominis specific-memory Th1 cell immune responses selectively predicted longer progression-free survival in advanced lung and ovarian cancer patients treated with chemo-immunotherapy. Altogether, E. hirae and B. intestinihominis represent valuable "oncomicrobiotics" ameliorating the efficacy of the most common alkylating immunomodulatory compound."

For more information on this research see: Enterococcus hirae and Barnesiella intestinihominis Facilitate Cyclophosphamide-Induced Therapeutic Immunomodulatory Effects. *Immunity*, 2016;45(4):931-943. *Immunity* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Immunity - www.journals.elsevier.com/immunity/)

Drugs and Therapies - Aldosterone Receptor...

**Findings from R. Fung et al Has Provided New Information about Aldosterone Receptor Antagonists (Differential Effects of Cyproterone Acetate vs Spironolactone on Serum High-Density Lipoprotein and Prolactin Concentrations in the Hormonal ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Aldosterone Receptor Antagonists have been published. According to news reporting from Toronto, Canada, by NewsRx journalists, research stated, "Spironolactone and cyproterone acetate (CPA) are the two
main antiandrogen medications used in feminizing hormone therapy in transgender women. Previous studies have suggested that these two agents might have opposite effects on high-density lipoprotein (HDL) level when used in this context, and limited data have suggested CPA increases prolactin more than spironolactone."

The news correspondents obtained a quote from the research, "To compare the effects of spironolactone and CPA on HDL and prolactin serum concentrations in transgender women. A retrospective chart review was conducted at three clinical sites in Toronto, Ontario, Canada. Patients were selected if they (i) identified as a transgender woman, (ii) had newly started spironolactone or CPA with estrogen or restarted spironolactone or CPA after a washout period of at least 6 months, and (iii) had not used other antiandrogens within the previous 6 months. HDL and prolactin concentrations between the two treatment groups at baseline and at 12 months. Eighty-two patients were included in the spironolactone group and 31 patients were included in the CPA group. Baseline HDL and prolactin levels were not significantly different between the two groups. At 12 months, HDL increased by 0.10 mmol/L (SD = 0.24) in the spironolactone group but decreased by 0.07 mmol/L (SD = 0.21) in the CPA group (P = .002). The difference remained significant after adjusting for baseline HDL, use of lipid-lowering drugs, and age. The change in prolactin was +3.10 μg/L (SD = 5.70) in the spironolactone group and +11.8 μg/L (SD = 8.63) in the CPA group (P < 0.001). This difference also remained significant after adjusting for baseline prolactin level. These data suggest that spironolactone use in transgender women increases HDL levels and that CPA has the opposite effect. CPA also is associated with a larger increase in prolactin."

According to the news reporters, the research concluded: "These factors should be considered when choosing between these two antiandrogen agents."

Our news journalists report that additional information may be obtained by contacting R. Fung, Toronto East Hlth Network, Michael Garron Hosp, Toronto, ON, Canada. Additional authors for this research include M. Hellstern-Layefsky, C. Tastenhoye, I. Lega and L. Steele.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jsxm.2016.09.012. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from R. Goldberg and Co-Authors Provide New Insights into Inflammatory Bowel Disease (Thiopurine metabolite testing in inflammatory bowel disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Inflammatory Bowel Disease have been published. According to news originating from Melbourne, Australia, by NewsRx correspondents, research stated, "Thiopurine use in inflammatory bowel disease (IBD) is limited by drug toxicity and lack of therapeutic efficacy. We assessed the utility of thiopurine metabolite testing and the relationship between disease activity, dose, and metabolite levels in a real world setting."

Our news journalists obtained a quote from the research, "Patients identified from pathology databases (2007-2012) at two tertiary IBD centers were included if they had thiopurines for at least four weeks. Demographics, dose, test indication, clinical status, action taken, and outcome were obtained by retrospective medical record review. A total of 169 patients were included. 6-Thioguanine (TGN) levels were sub-therapeutic in 52%, therapeutic in 34%, and supratherapeutic in 14%. Test indication was active disease (79%), adverse effect (11%), or adherence assessment (7%). TGN trended lower in the active disease group compared to those with adverse effects (273 (plusminus)23.2 versus 447 (plusminus)117.7 pmol/8 ? 10 (8) RBC, p=0.05). Weight-based dosing did not improve rates of therapeutic TGN levels (under-dosed 31.5% vs standard dose 35.4%), but was significantly associated with shunting toward 6-MMP (23.1% vs 6.8%, p=0.008, OR=4.1). Testing resulted in a change in patient treatment in 86% of patients with active disease and subtherapeutic levels and in 68% of tested patients overall. Metabolite testing resulted in a change in management in most patients not responding to thiopurines or experiencing adverse events."

According to the news editors, the research concluded: "Weight-based dosing did not increase rates of therapeutic levels but was associated with increased 6MMP shunting."

The news correspondents report that additional information may be obtained from R. Goldberg, Monash Health, Melbourne, Victoria, Australia. Additional authors for this research include G. Moore, G. Cunningham, J. Schulberg, P. Marsh, S. Brown, W. Connell, M. Lust, M.A. Kamm and S. Bell.

Drugs and Therapies - Indomethacin Therapy

Findings from R. Kamel et al in Indomethacin Therapy Reported (Development and optimization of self-assembling nanosystem for intra-articular delivery of indomethacin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Indomethacin Therapy have been published. According to news reporting originating from Cairo, Egypt, by NewsRx correspondents, research stated, "Osteoarthritis is a propagated debilitating condition affecting patients' quality of life. Intra-articular injection approach was investigated as a localized treatment strategy providing: site-specific delivery, decreased side effects and, increased patient compliance."

Our news editors obtained a quote from the research, "A 3(2) full factorial experimental design was employed to prepare the indomethacin-loaded self-assembling nanosystems (SANS). The surfactant (Poloxamer 407/Tetronic 90R4) ratio and the poly(lactic-co-glycolic acid) (PLGA) concentration significantly affected encapsulation efficiency and drug release (p < 0.05). The optimized formula was subjected to modification by addition of different proteoglycans, as a compensatory treatment, to improve its pharmacological properties. The modified SANS, containing glucosamine (150 mg), was selected for in-vivo studies as it had a sustained drug release profile and a small particle size (173.90 nm). The effect of the optimized SANS, with or without PLGA, was compared with the modified formula containing glucosamine and, with the drug suspension on the arthritic knee joints of rats. It was found that the formulation containing PLGA and glucosamine showed significantly higher reduction in both, knee diameter and TNF-a levels, compared to other groups. Furthermore, all SANS showed histological improvement in the cellularity of the synovial membranes and joints."

According to the news editors, the research concluded: "Our results indicate that SANS containing PLGA and glucosamine is capable of treating arthritic joints."

The news editors report that additional information may be obtained by contacting A.A. Mahmoud, Future Univ Egypt, Fac Pharmaceut Sci & Pharmaceut Ind, Dept. of Pharmaceut & Pharmaceut Technol, Cairo, Egypt. Additional authors for this research include A.H. Salama and A.A. Mahmoud.

Connective Tissue Cells

Findings from R.G. Scheraga et al Has Provided New Information about Connective Tissue Cells (Activation of heat shock response augments fibroblast growth factor-1 expression in wounded lung epithelium)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Connective Tissue Cells. According to news reporting originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "We previously showed that coincident exposure to heat shock (HS; 42 degrees C for 2 h) and TNF-alpha synergistically induces apoptosis in mouse lung epithelium. We extended this work by analyzing HS effects on human lung epithelial responses to clinically relevant injury."

Funders for this research include HHS | NIH | National Heart, Lung, and Blood Institute (NHBLI), Vetrarans Administration.

Our news editors obtained a quote from the research, "Cotreatment with TNF-alpha and HS induced little caspase-3 and poly(ADP-ribose) polymerase cleavage in human small airway epithelial cells, A549 cells, and BEAS2B cells. Scratch wound closure rates almost doubled when A549 and BEAS2B cells and air-liquid interface cultures of human bronchial epithelial cells were heat shocked immediately after wounding. Microarray, qRT-PCR, and immunoblotting showed fibroblast growth factor 1 (FGF1) to be synergistically induced by HS and wounding. Enhanced FGF1 expression in HS/wounded A549 was blocked by inhibitors of p38 MAPK (SB203580) or HS factor (HSF)-1 (KNK-437) and in HSF1 knockout BEAS2B cells. PCR demonstrated FGF1 to be expressed from the two most distal promoters in wounded/HS cells. Wound closure in HS A549 and BEAS2B cells was reduced by FGF receptor-1/3 inhibition (SU-5402) or FGF1 depletion. Exogenous FGF1 accelerated A549 wound closure in the absence but not presence of HS. In the presence of exogenous FGF1, HS slowed wound closure, suggesting that it increases FGF1 expression but impairs FGF1-stimulated wound closure. Frozen sections from normal and idiopathic pulmonary fibrosis (IPF) lung were analyzed for FGF1 and HSP70 by immunofluorescence confocal microscopy and qRT-PCR. FGF1 and HSP70 mRNA levels were 7.5 and 5.9-fold higher in IPF than normal lung, and the proteins colocalized to fibroblastic foci in IPF lung."

According to the news editors, the research concluded: "HS signaling may have an important impact on gene expression contributing to lung injury, healing, and fibrosis."

Oncology - Breast Cancer

Findings from R.H. Hamunyela and Co-Researchers Advance Knowledge in Breast Cancer (Strong Strong synergism between small molecule inhibitors of HER2, PI3K, mTOR and Bcl-2 in human breast cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting from Windhoek, Namibia, by NewsRx journalists, research stated, "Targeting pro-survival cell signaling components has been promising in cancer therapy, but the benefit of targeting with single agents is limited. For malignancies such as triple-negative breast cancer, there is a paucity of targets that are amenable to existing interventions as they are devoid of the human epidermal growth factor receptor 2 (HER2), progesterone receptor (PR), and estrogen receptor (ER)."

The news correspondents obtained a quote from the research, "Concurrent targeting of cell signaling entities other than HER2, PR and ER with multiple agents may be more effective. Evaluating modes of interaction between agents can inform efficient selection of agents when used in cocktails. Using clonogenic cell survival, interaction between inhibitors of HER2 (TAK-165), phosphoinositide 3-kinase (PI3K) and mammalian target of rapamycin (mTOR) (NVP-BEZ235), and the pro-survival gene (Bcl-2) (ABT-263) in three human breast cell lines (MDA-MB-231, MCF-7 and MCF-12A) ranged from strong to very strong synergism. The strongest synergy was demonstrated in PR and ER negative cells. Inhibition of PI3K, mTOR and Bcl-2 could potentially be effective in the treatment of triple-negative cancers. The very strong synergy observed even at lowest concentrations of inhibitors indicates that these cocktails might be able to be used at a minimised risk of systemic toxicity."

According to the news reporters, the research concluded: "Concurrent use of multiple inhibitors can potentiate conventional interventions like radiotherapy and chemotherapy."

Our news journalists report that additional information may be obtained by contacting R.H. Hamunyela, Minist Hlth & Social Serv, Dr B May Canc Care Center, Windhoek, Namibia. Additional authors for this research include A.M. Serafin and J.M. Akudugu.

Heart Disorders and Diseases - Heart Attack

Findings from R.N. Leao and Co-Authors Provide New Insights into Heart Attack (Therapeutic hypothermia after cardiac arrest: outcome predictors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Attack are presented in a new report. According to news reporting originating in Lisbon, Portugal, by NewsRx journalists, research stated, "The determination of coma patient prognosis after cardiac arrest has clinical, ethical and social implications. Neurological examination, imaging and biochemical markers are helpful tools accepted as reliable in predicting recovery."

The news reporters obtained a quote from the research, "With the advent of therapeutic hypothermia, these data need to be reconfirmed. In this study, we attempted to determine the validity of different markers, which can be used in the detection of patients with poor prognosis under hypothermia. Data from adult patients admitted to our intensive care unit for a hypothermia protocol after cardiac arrest were recorded prospectively to generate a descriptive and analytical study analyzing the relationship between clinical, neurophysiological, imaging and biochemical parameters with 6-month outcomes defined according to the Cerebral Performance Categories scale (good 1-2, poor 3-5). Neuron-specific enolase was collected at 72 hours. Imaging and neurophysiologic exams were carried out in the 24 hours after the rewarming period. Sixty-seven patients were included in the study, of which 12 had good neurological outcomes. Ventricular fibrillation and electroencephalographic theta activity were associated with increased likelihood of survival and improved neurological outcomes. Patients who had more rapid cooling (mean time of 163 versus 312 minutes), hypoxic-ischemic brain injury on magnetic resonance imaging or neuron-specific enolase >58ng/mL had poor neurological outcomes (p <0.05). Hypoxic-ischemic brain injury on magnetic resonance imaging and neuron-specific enolase were strong predictors of poor neurological outcomes."

According to the news reporters, the research concluded: "Although there is the belief that early achievement of target temperature improves neurological prognoses, in our study, there were increased mortality and worse neurological outcomes with earlier target-temperature achievement."

Our news correspondents report that additional information may be obtained by contacting R.N. Leao, Unidade de Urgencia Medica, Centro Hospitalar de Lisboa Central, Lisboa, Portugal. Additional authors for this research include P. Avila, R. Cavaco, N. Germano and L. Bento.

**Drugs and Therapies - Toxicology and Pharmacology**

**Findings from R.R. Dalefield and Co-Authors Update Knowledge of Toxicology and Pharmacology (A 28-day oral toxicity study of echimidine and lasiocarpine in Wistar rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Toxicology and Pharmacology. According to news reporting from Wellington, New Zealand, by NewsRx journalists, research stated, "Pyrrolizidine alkaloids (PAs) are a class of naturally-occurring plant toxins. Echimidine is one of the predominant PAs found in honeys produced in Australia and New Zealand."

Financial supporters for this research include Rural Industries Research and Development Corporation, Australia, Bee Products Standards Council, Ministry of Primary Industries.

The news correspondents obtained a quote from the research, "There is a lack of information on the oral toxicity of echimidine on which to base regulatory decisions concerning the risk to humans of these honeys. This GLP study was conducted to assess the subchronic dietary toxicity of echimidine to rats compared to that of lasiocarpine as a positive control. Wistar rats, 10/sex, were fed diets containing 0, 0.6, 1.2 or 2.5 mg/kg bw echimidine. Positive control groups, 10/sex, were fed diets containing 0.6, 1.2 or 2.5 mg/kg bw lasiocarpine. Neither PA had any effect on survival, food consumption, clinical signs, gross lesions, or histopathology. Consumption of lasiocarpine, but not echimidine, decreased bodyweight gain in males at >= 1.2 mg/kg bw, and in females at 2.5 mg/kg bw. Slight alterations in white cell counts and serum ALT concentrations at 2.5 mg/kg bw of both PAs were not clinically significant, had no histological correlates, and were considered to be of equivocal relevance."

According to the news reporters, the research concluded: "The subchronic No Observed Adverse Effect Level (NOAEL) for echimidine is 2.5 mg/kg bw/day, whereas, on the basis of a treatment-related decrease in bodyweight gain in males at 1.2 mg/kg bodyweight, the NOAEL for lasiocarpine is 0.6 mg/kg bw/day." For more information on this research see: A 28-day oral toxicity study of echimidine and lasiocarpine in Wistar rats. *Regulatory Toxicology and Pharmacology*, 2016;81 ():146-154. *Regulatory Toxicology and Pharmacology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Smoking

Findings from RAND Update Understanding of Smoking (Hiding the tobacco power wall reduces cigarette smoking risk in adolescents: using an experimental convenience store to assess tobacco regulatory options at retail point-of-sale)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Smoking. According to news reporting originating in Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "This experiment tested whether changing the location or visibility of the tobacco power wall in a life sized replica of a convenience store had any effect on adolescents' susceptibility to future cigarette smoking. The study was conducted in the RAND StoreLab (RSL), a life sized replica of a convenience store that was developed to experimentally evaluate how changing aspects of tobacco advertising displays in retail point-of-sale environments influences tobacco use risk and behaviour."

The news reporters obtained a quote from the research from RAND, "A randomised, between-subjects experimental design with three conditions that varied the location or visibility of the tobacco power wall within the RSL was used. The conditions were: cashier (the tobacco power wall was located in its typical position behind the cash register counter); sidewall (the tobacco power wall was located on a sidewall away from the cash register); or hidden (the tobacco power wall was located behind the cashier but was hidden behind an opaque wall). The sample included 241 adolescents. Hiding the tobacco power wall significantly reduced adolescents' susceptibility to future cigarette smoking compared to leaving it exposed (ie, the cashier condition; p=0.02). Locating the tobacco power wall on a sidewall away from the cashier had no effect on future cigarette smoking susceptibility compared to the cashier condition (p=0.80)."

According to the news reporters, the research concluded: "Hiding the tobacco power wall at retail point-of-sale locations is a strong regulatory option for reducing the impact of the retail environment on cigarette smoking risk in adolescents."

For more information on this research see: Hiding the tobacco power wall reduces cigarette smoking risk in adolescents: using an experimental convenience store to assess tobacco regulatory options at retail point-of-sale. Tobacco Control, 2016;25(6):679-684. Tobacco Control can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. (BMJ Publishing Group - group.bmj.com/; Tobacco Control - tobaccocontrol.bmj.com/)

Our news correspondents report that additional information may be obtained by contacting W.G. Shadel, RAND Corp, Pittsburgh, PA 15213, United States. Additional authors for this research include S.C. Martino, C.M. Setodji, D.M. Scharf, D. Kusuke, A. Sicker and M. Gong.

Findings from Radboud University Broaden Understanding of Antiretrovirals (Ribavirin concentration determines treatment success of first-generation DAA-based chronic HCV therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antiretrovirals is the subject of a report. According to news reporting out of Nijmegen, Netherlands, by NewsRx editors, research stated, "Monitoring ribavirin concentrations during hepatitis C treatment with dual therapy can help optimize treatment response and minimize anaemia. A defined therapeutic range for ribavirin during direct-acting antiviral-based therapies is lacking."

Our news journalists obtained a quote from the research from Radboud University, "This analysis explores whether a therapeutic range for ribavirin concentrations can be defined in patients treated with boceprevir- or telaprevir-based triple therapies. Treatment-naive patients from ADVANCE, ILLUMINATE, OPTIMIZE and SPRINT-2, and treatment-experienced patients from RESPOND-2 were included. Multivariable logistic regression analyses were performed to evaluate whether ribavirin concentrations were an independent predictor of sustained virological response or anaemia. Optimal cutoff values and the percentage of patients within the proposed therapeutic range were determined, along with the associated chance of response. Overall, 1,502 patients were included. In both regimens, ribavirin concentrations were significantly associated with anaemia (haemoglobin level <10 g/dl) at all time points (1.75 < odds ratio [OR] <2.45) and sustained virological response was associated with ribavirin concentrations at week 8 (OR=1.43 for telaprevir and 1.78 for boceprevir). A therapeutic range for ribavirin at week 8 of 2.2-3.5 mg/l was defined for telaprevir treatment. Of the 48% of patients with a concentration within this range, 81% achieved sustained virological response and only 5.1% reported anaemia. For boceprevir treatment, the week 8 optimal range was defined as 2.2-3.6 mg/l and 50% of patients had a concentration within this range, of whom 69% achieved sustained virological response and 46% developed anaemia."

According to the news editors, the research concluded: "We established the therapeutic range for ribavirin in boceprevir-and telaprevir-based therapy that balances safety and efficacy."

Our news journalists report that additional information may be obtained by contacting C.T. de Kanter, Radboud University, Medical Center, Radboud Inst Hlth Sci, Nijmegen, Netherlands. Additional authors for this research include M. Buti, R. DeMasi, S. Ouwerkerk-Mahadevan, A.S. Dofferhoff, J. Witek, J.P. Drenth, S. Zeuzem and D.M. Burger.

Findings from Radboud University Update Understanding of Metabolic Syndrome (Exercise Improves Insulin Sensitivity in the Absence of Changes in Cytokines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Metabolic Syndrome. According to news reporting out of Nijmegen, Netherlands, by NewsRx editors, research stated, "The benefits of aerobic exercise training on insulin sensitivity in subjects with metabolic syndrome (MetS) are, at least in part, associated with changes in cytokines. Recent studies identified novel cytokines (e.g., fractalkine, omentin, and osteopontin) that are strongly involved in glucose homeostasis and therefore potentially contribute in the exercise-induced changes in insulin sensitivity."

Our news journalists obtained a quote from the research from Radboud University, "Therefore, we aim to examine changes in skeletal muscle RNA expression and plasma levels of novel cytokines after exercise training and correlate these changes to the exercise-induced changes in insulin sensitivity. Women with metabolic syndrome (MetS, n = 11) and healthy women (n = 10) participated in a 6-month aerobic exercise training intervention (three times a week, 45 min per session at 65%-85% of individual heart rate reserve). Before and after training, we examined insulin sensitivity (M value during hyperinsulinemic euglycemic clamp) and circulating blood levels of cytokines (venous blood sample; leptin, adiponectin, omentin, fractalkin, and osteopontin). The skeletal muscle RNA expression of these cytokines (muscle biopsy) was examined in two subgroups (MetS, n = 6; healthy women, n = 6). At baseline, plasma levels of omentin (85.8 +/- 26.2 ng.mL(-1)) and adiponectin (5.0 +/- 1.7 mu g.mL(-1)) levels were significantly higher in controls compared with MetS (51.1 +/- 27.1; 3.6 +/- 1.1 respectively), and leptin levels were lower in controls (18.7 +/- 11.5 vs 53.0 +/- 23.5 ng.mL(-1)). M value was significantly higher in controls (8.1 +/- 1.9 mg.kg(-1).min(-1)) than in MetS (4.0 +/- 1.7). Exercise training significantly improved M values in both groups (P < 0.01). Exercise training did not alter plasma and skeletal muscle RNA expression levels of cytokines, but no correlation was observed between changes in cytokine level/RNA expression and M values (P > 0.05)."

According to the news editors, the research concluded: "Although exercise training successfully improves insulin sensitivity in MetS and healthy women, we found no change in plasma and mRNA expression levels of novel cytokines."

For more information on this research see: Exercise Improves Insulin Sensitivity in the Absence of Changes in Cytokines. Medicine and Science in Sports and Exercise, 2016;48 (12):2378-2386. Medicine and Science in Sports and Exercise can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Findings from Ragon Institute Has Provided New Data on Human Genetics (HLA-C Level Is Regulated by a Polymorphic Oct1 Binding Site in the HLA-C Promoter Region)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Genetics - Human Genetics. According to news reporting from Cambridge, Massachusetts, by NewsRx journalists, research stated, "Differential HLA-C levels influence several human diseases, but the mechanisms responsible are incompletely characterized. Using a validated prediction algorithm, we imputed HLA-C cell surface levels in 228 individuals from the 1000 Genomes dataset."

Funders for this research include Frederick National Laboratory for Cancer Research, NIH, Frederick National Lab, Center for Cancer Research, European Research Council, NIHR Oxford Biomedical Research Centre and Wellcome Trust, Wellcome Trust, Medical Research Council, NIHR Oxford Biomedical Research Centre, Rhodes Trust.

The news correspondents obtained a quote from the research from Ragon Institute, "We tested 68,726 SNPs within the MHC for association with HLA-C level. The HLA-C promoter region variant, rs2395471, 800 bp upstream of the transcription start site, gave the most significant association with HLA-C levels (p = 4.2 x 10(-66)). This imputed expression quantitative trait locus, termed impeQTL, was also shown to associate with HLA-C expression in a genome-wide association study of 273 donors in which HLA-C mRNA expression levels were determined by quantitative PCR (qPCR) (p = 1.8 x 10(-20)) and in two cohorts where HLA-C cell surface levels were determined directly by flow cytometry (n = 369 combined, p<10(-15)). rs2395471 is located in an Oct1 transcription factor consensus binding site motif where the A allele is predicted to have higher affinity for Oct1 than the G allele. Mobility shift electrophoresis demonstrated that Oct1 binds to both alleles in vitro, but decreased HLA-C promoter activity was observed in a luciferase reporter assay for rs2395471_G relative to rs2395471_A on a fixed promoter background. The rs2395471 variant accounts for up to 36% of the explained variation of HLA-C level."

According to the news reporters, the research concluded: "These data strengthen our understanding of HLA-C transcriptional regulation and provide a basis for understanding the potential consequences of manipulating HLA-C levels therapeutically."

Our news journalists report that additional information may be obtained by contacting M. Carrington, Ragon Inst MGH MIT & Harvard, Cambridge, MA 02139, United States. Additional authors for this research include H.C. Li, V. Ramsuran, V. Naranbhai, F.M.
Duh, B.P. Fairfax, B. Saleh, J.C. Knight, S.K. Anderson and M. Carrington.

Life Science Research - Apoptosis and Cell Death

Findings from Regina Elena Cancer Institute Has Provided New Information about Apoptosis and Cell Death (Affinity purification-mass spectrometry analysis of bcl-2 interactome identified SLIRP as a novel interacting protein)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Life Science Research - Apoptosis and Cell Death is the subject of a report. According to news reporting originating in Rome, Italy, by NewsRx journalists, research stated, "Members of the bcl-2 protein family share regions of sequence similarity, the bcl-2 homology (BH) domains. Bcl-2, the most studied member of this family, has four BH domains, BH1-4, and has a critical role in resistance to antineoplastic drugs by regulating the mitochondrial apoptotic pathway."

The news reporters obtained a quote from the research from Regina Elena Cancer Institute, "Moreover, it is also involved in other relevant cellular processes such as tumor progression, angiogenesis and autophagy. Deciphering the network of bcl-2-interacting factors should provide a critical advance in understanding the different functions of bcl-2. Here, we characterized bcl-2 interactome by mass spectrometry in human lung adenocarcinoma cells. In silico functional analysis associated most part of the identified proteins to mitochondrial functions. Among them we identified SRA stem-loop interacting RNA-binding protein, SLIRP, a mitochondrial protein with a relevant role in regulating mitochondrial messenger RNA (mRNA) homeostasis. We validated bcl-2/SLIRP interaction by immunoprecipitation and immunofluorescence experiments in cancer cell lines from different histotypes. We showed that, although SLIRP is not involved in mediating bcl-2 ability to protect from apoptosis and oxidative damage, bcl-2 binds and stabilizes SLIRP protein and regulates mitochondrial mRNA levels."

According to the news reporters, the research concluded: "Moreover, we demonstrated that the BH4 domain of bcl-2 has a role in maintaining this binding."

For more information on this research see: Affinity purification-mass spectrometry analysis of bcl-2 interactome identified SLIRP as a novel interacting protein. Cell Death & Disease, 2016;7();e2090. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

Drugs and Therapies - Anticholinergics

Findings from Regina Margherita Children's Hospital Reveals New Findings on Anticholinergics (Pain-relieving agents for infantile colic)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Anticholinergics are presented in a new report. According to news reporting originating from Turin, Italy, by NewsRx correspondents, research stated, "Infantile colic is a common disorder in the first months of life, affecting somewhere between 4% and 28% of infants worldwide, depending on geography and definitions used. Although it is self limiting and resolves by four months of age, colic is perceived by parents as a problem that requires action."

Our news editors obtained a quote from the research from Regina Margherita Children's Hospital, "Pain-relieving agents, such as drugs, sugars and herbal remedies, have been suggested as interventions to reduce crying episodes and severity of symptoms. To assess the effectiveness and safety of pain-relieving agents for reducing colic in infants younger than four months of age. Search methods We searched the following databases in March 2015 and again in May 2016: CENTRAL, Ovid MEDLINE, Embase and PsycINFO, along with 11 other databases. We also searched two trial registers, four thesis repositories and the reference lists of relevant studies to identify unpublished and ongoing studies. Selection criteria We included randomised controlled trials (RCTs) and quasi-RCTs evaluating the effects of pain-relieving agents given to infants with colic. Data collection and analysis We used the standard methodological procedures of The Cochrane Collaboration. We included 18 RCTs involving 1014 infants. All studies were small and at high risk of bias, often presenting major shortcomings across multiple design factors (e.g. selection, performance, attrition, lack of washout period). Three studies compared simethicone with placebo, and one with Mentha piperita; four studies compared herbal agents with placebo; two compared sucrose or glucose with placebo; five compared dicyclomine with placebo; and two compared cimetropium - one against placebo and the other at two different dosages. One multiple-arm study compared sucrose and herbal tea versus no treatment. Simethicone. Comparison with placebo revealed no difference in daily hours of crying reported for simethicone at the end of treatment in one small, low-quality study involving 27 infants. A meta-analysis of data from two cross-over studies comparing simethicone with placebo showed no difference in the number of infants who responded positively to treatment (risk ratio (RR) 0.95, 95% confidence interval (CI) 0.73 to 1.23; 110 infants, low-quality evidence). One small study (30 participants) compared simethicone with Mentha piperita and found no difference in crying duration, number of crying episodes or number of responders. Herbal agents. We found low-quality evidence suggesting that herbal agents reduce the duration of crying compared with placebo (mean difference (MD) 1.33, 95% CI 0.71 to 1.96; three studies, 279 infants), with different magnitude of benefit noted across studies (I-2 = 96%). We found moderate-quality evidence indicating that herbal agents
increase response over placebo (RR 2.05, 95% CI 1.56 to 2.70; three studies, 277 infants). Sucrose. One very low-quality study involving 35 infants reported that sucrose reduced hours spent crying compared with placebo (MD 1.72, 95% CI 1.38 to 2.06). Dicyclomine. We could consider only one of the five studies of dicyclomine (48 infants) for the primary comparison. In this study, more of the infants given dicyclomine responded than than those given placebo (RR 2.50, 95% CI 1.17 to 5.34). Cimetropium bromide. Data from one very low-quality study comparing cimetropium bromide with placebo showed reduced crying duration among infants treated with cimetropium bromide (MD -30.20 minutes per crisis, 95% CI -39.51 to -20.89; 86 infants). The same study reported that cimetropium increased the number of responders (RR 2.29, 95% CI 1.44 to 3.64). No serious adverse events were reported for all of the agents considered, with the exception of dicyclomine, for which two of five studies reported relevant adverse effects (longer sleep 4%, wide-eyed state 4%, drowsiness 13%).

Authors' conclusions
At the present time, evidence of the effectiveness of pain-relieving agents for the treatment of infantile colic is sparse and prone to bias. The few available studies included small sample sizes, and most had serious limitations. Benefits, when reported, were inconsistent. We found no evidence to support the use of simethicone as a pain-relieving agent for infantile colic. Available evidence shows that herbal agents, sugar, dicyclomine and cimetropium bromide cannot be recommended for infants with colic. Investigators must conduct RCTs using standardised measures that allow comparisons among pain-relieving agents and pooling of results across studies."

According to the news editors, the research concluded: "Parents, who most often provide the intervention and assess the outcome, should always be blinded."

For more information on this research see: Pain-relieving agents for infantile colic. Cochrane Database of Systematic Reviews, 2016;(9):329-434. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news editors report that additional information may be obtained by contacting F. Savino, Regina Margherita Childrens Hosp, Dept. of Pediat, I-10126 Turin, Italy. Additional authors for this research include V. Tarasco, C. Lingua, L. Moja and F. Savino.

most cells, recognized as new candidates with important roles in intercellular and tissue-level communication."

The news correspondents obtained a quote from the research from the Renmin Hospital of Wuhan University, "Cells can package proteins and RNA messages into exosome and secret to recipient cells, which regulate gene expression in recipient cells. The research on exosomes in cardiovascular disease is just emerging. It is well-known that exosomes from cardiomyocyte can transflect endothelial cells, stem cells, fibroblasts and smooth muscle cells to induce cellular changes. After myocardial infarction (MI), the exosomes play important roles in local and distant microcommunication. Nowadays, exosomal microRNAs transportation has been found to deliver signals to mediate cardiac repair after MI. However, the exosomes quality and quantities are variable under different pathological conditions."

According to the news reporters, the research concluded: "Therefore, we speculate that the monitoring of the quality and quantity of exosomes may serve as diagnosis and prognosis biomarkers of MI, and the study of exosomes will provide insights for the new therapeutics to cardiac remodeling after MI."

Our news journalists report that additional information may be obtained by contacting M.J. Yuan, 1 Dept. of Cardiology, Renmin Hospital of Wuhan University, Wuhan 430060, People's Republic of China. Additional authors for this research include T. Maghsoudi and T. Wang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.7150/ijms.14112. This DOI is a link to an online electronic document that is either free or for purchase.

**Eye Diseases and Conditions - Retinitis Pigmentosa**

**Findings from Research Foundation Reveals New Findings on Retinitis Pigmentosa (Homozygosity mapping guided next generation sequencing to identify the causative genetic variation in inherited retinal degenerative diseases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Eye Diseases and Conditions - Retinitis Pigmentosa have been presented. According to news reporting from Tamil Nadu, India, by NewsRx journalists, research stated, "Inherited retinal degeneration (IRD) are a group of genetically heterogeneous disease of which retinitis pigmentosa (RP) and Leber congenital amaurosis (LCA) are the most common and severe type. In our study we had taken three unrelated South Indian consanguineous IRD families."

The news correspondents obtained a quote from the research from Research
Foundation, "Homozygosity mapping was done using Affymetrix 250K Nsp1 GeneChip in each of LCA, Cone-Rod dystrophy (CRD) and autosomal recessive RP (arRP) families followed by targeted re-sequencing by next generation sequencing (NGS) on Illumina MiSeq. Known candidate genes ranging from 1-8 in numbers within the homozygous blocks were identified by homozygosity mapping and targeted NGS revealed the causative mutations; RDH12 c.832A >C, ABCA4 c.1462G >T, CDHR1 c. 1384_1392delCTCCTGGACinsG, in the LCA, CRD and arRP families, respectively. The identified mutations were validated by Sanger sequencing, segregation in the families and their absence in 200 control chromosomes. Homozygosity mapping guided targeted NGS, especially when more numbers of known candidate genes within the homozygous blocks are observed is a comprehensive method for mutation identification. Molecular data from a larger retinal degenerative disease cohort would reveal the spectrum and prevalence of mutations and genes in Indian population."

According to the news reporters, the research concluded: "Molecular diagnosis also aids in genetic counseling, offering carrier and prenatal testing to family members."

For more information on this research see: Homozygosity mapping guided next generation sequencing to identify the causative genetic variation in inherited retinal degenerative diseases. *Journal of Human Genetics*, 2016;61(11):951-958. *Journal of Human Genetics* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group - www.nature.com/; Journal of Human Genetics - www.nature.com/jhg/)

Our news journalists report that additional information may be obtained by contacting N. Soumittra, Vis Res Fdn, SNONGC Dept. of Genet & Mol Biol, Madras 600006, Tamil Nadu, India. Additional authors for this research include M. Swaminathan, P. Sen, T. Arokiasamy, S. Deshpande, N. John, R.A. Gadkari, A.U. Mannan and N. Soumittra.

**Cell Research - Cell Adhesion Molecules**

**Findings from Research Hospital Broaden Understanding of Cell Adhesion Molecules (Association between the Levels of IL-6, sE-Selectin and Distal Sensory Nerve Conduction Studies in Patients with Prediabetes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cell Research - Cell Adhesion Molecules is now available. According to news reporting out of Izmir, Turkey, by NewsRx editors, research stated, "To determine the association between interleukin-6 (IL-6) and soluble E-selectin (sE-selectin) levels with the electrodiagnostic abnormalities in patients with impaired fasting glucose (IFG) and impaired glucose tolerance (IGT). Serum HbA1c, C-reactive protein (CRP), erythrocyte sedimentation rate (ESR), fibrinogen, IL-6 and sE-selectin levels were analyzed in 25 IFG patients, 22 IGT patients and 41 controls."
Our news journalists obtained a quote from the research from Research Hospital, "Nerve conduction studies (NCS) of sural, dorsal sural (DS), medial dorsal cutaneous and medial plantar sensory nerves were conducted. HbA1c and IL-6 levels were significantly higher in IFG and IGT patients than the controls. IGT patients had higher sE-selectin levels compared to controls and IFG patients. IL-6 levels were significantly correlated with levels of CRP, fibrinogen, ESR and sE-selectin in patients with prediabetes. Both IFG and IGT patients had substantial impairments in very distal sensory NCS. IL-6 levels were positively correlated with HbA1c and negatively correlated with DS NCS in prediabetic patients. Inflammation and endothelial dysfunction might be important in patients with IFG or IGT. Furthermore, our findings strengthen the idea that inflammation (increased levels of IL-6) might be associated with early electrophysiological impairments in patients with prediabetes. NCS of the most distal sensory nerves significantly enhanced the diagnosis of subclinical neuropathy in patients with prediabetes."

According to the news editors, the research concluded: "Subclinical peripheral sensory neuropathy should be investigated in prediabetes to lower the number of future outcomes they are associated with."

Our news journalists report that additional information may be obtained by contacting B.I. Tiftikcioglu, Dept. of Neurology, Tepecik Education and Research Hospital, Izmir, Turkey. Additional authors for this research include T. Duksal, S. Bilgin, S. Kose and Y. Zorlu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000444661. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Takotsubo...

Findings from Research Hospital in Takotsubo Cardiomyopathy Reported (Warm-up Brugada phenocopy associated with takotsubo cardiomyopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Takotsubo Cardiomyopathy have been published. According to news reporting originating in Ankara, Turkey, by NewsRx journalists, research stated, "Rapid diagnosis of ST-segment elevation myocardial infarction (STEMI) is essential for the appropriate management of patients; however, various conditions may present with an identical electrocardiographic pattern as STEMI in clinical practice."

The news reporters obtained a quote from the research from Research Hospital, "Obtaining a satisfactory history, comparing previous electrocardiograms, and assessing serial
tests may provide valuable clues. Brugada syndrome or phenocopy also has been reported as amisdiagnosis of STEMI in clinical practice."

According to the news reporters, the research concluded: "We present an interesting image of progressive Brugada-type ST elevation in precordial leads associated with takotsubo cardiomyopathy."

Keywords for this news article include: Ankara, Turkey, Eurasia, Cardiovascular Diseases and Conditions, Heart Disorders and Diseases, Left Ventricular Dysfunction, Takotsubo Cardiomyopathy, Cardiomyopathies, Heart Disease, Research Hospital.

Oncology - Neuroblastomas

Findings from Research Institute Update Understanding of Neuroblastomas (MicroRNA-497 impairs the growth of chemoresistant neuroblastoma cells by targeting cell cycle, survival and vascular permeability genes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Neuroblastomas have been presented. According to news reporting from Barcelona, Spain, by NewsRx journalists, research stated, "Despite multimodal therapies, a high percentage of high-risk neuroblastoma (NB) become refractory to current treatments, most of which interfere with cell cycle and DNA synthesis or function, activating the DNA damage response (DDR). In cancer, this process is frequently altered by deregulated expression or function of several genes which contribute to multidrug resistance (MDR)."

The news correspondents obtained a quote from the research from Research Institute, "MicroRNAs are outstanding candidates for therapy since a single microRNA can modulate the expression of multiple genes of the same or different pathways, thus hindering the development of resistance mechanisms by the tumor. We found several genes implicated in the MDR to be overexpressed in high-risk NB which could be targeted by microRNAs simultaneously. Our functional screening identified several of those microRNAs that reduced proliferation of chemoresistant NB cell lines, the best of which was miR-497. Low expression of miR-497 correlated with poor patient outcome. The overexpression of miR-497 reduced the proliferation of multiple chemoresistant NB cell lines and induced apoptosis in MYCN-amplified cell lines. Moreover, the conditional expression of miR-497 in NB xenografts reduced tumor growth and inhibited vascular permeabilization."
According to the news reporters, the research concluded: "MiR-497 targets multiple genes related to the DDR, cell cycle, survival and angiogenesis, which renders this molecule a promising candidate for NB therapy."

For more information on this research see: MicroRNA-497 impairs the growth of chemoresistant neuroblastoma cells by targeting cell cycle, survival and vascular permeability genes. *Oncotarget*, 2016;7(8):9271-87.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18632/oncotarget.7005. This DOI is a link to an online electronic document that is either free or for purchase.

**Chemistry - Cell Biochemistry**

**Findings from Research Institute Yields New Findings on Cell Biochemistry (Intracellular MMP3 Promotes HSP Gene Expression in Collaboration With Chromobox Proteins)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Chemistry - Cell Biochemistry. According to news reporting from Aichi, Japan, by NewsRx journalists, research stated, "Matrix metalloproteinases (MMPs) are crucial factors in tumor progression, inflammatory/immune responses and tissue development/regeneration. Of note, it has been known that MMPs promote genome instability, epithelial-mesenchymal transition, invasion, and metastasis in tumor progression."

The news correspondents obtained a quote from the research from Research Institute, "We previously reported that human MMP3 could translocate into cellular nuclei and control transcription in human chondrosarcoma-derived cells and in articular cartilage (Eguchi et al. [2008] Mol Cell Biol 28(7):2391-2413); however, further transcriptional target genes and cofactors of intranuclear MMP3 have not been uncovered. In this paper, we used transcriptomics analysis in order to examine novel transcriptional target genes regulated by intracellular MMP3. We found that mRNA levels of HSP family members (HSP70B, HSP72, HSP40/DNAJ, and HSP20/CRYAB) are upregulated by the intracellular MMP3 overload. Bioinformatic analysis predicted several transcription factors that possibly interact with MMP3. Among these factors, heat shock factor 1 (HSF1) cooperated with the MMP3 to activate the HSP70B gene promoter in reporter gene assays, while a dominant negative HSF1 blocked the role for MMP3 in the trans-activation. The hemopexin-like repeat (PEX) domain of the human MMP3 was essential for transcriptional induction of the HSP70B gene. In addition, chromobox proteins CBX5/HP1 and CBX3/HP1 cooperated with the PEX domain in induction of HSP70B
mRNA."

According to the news reporters, the research concluded: "Taken together, this study newly clarified that intracellular MMP3 cooperate with CBXs/HP1s in transcriptional promotion of HSP genes. J. Cell. Biochem. 118: 43-51, 2017."

Our news journalists report that additional information may be obtained by contacting T. Eguchi, Natl Center Geriatr & Gerontol, Res Inst, Dept. of Oral Dis Res, Obu, Aichi 4748511, Japan. Additional authors for this research include S.K. Calderwood, M. Takigawa, S. Kubota and K. Kozaki.

Keywords for this news article include: Aichi, Japan, Asia, Cell Biochemistry, Chemistry, Genetics, Genetics, Research Institute.

**Skin Diseases and Conditions - Psoriasis**

**Findings from Rockefeller University in the Area of Psoriasis Reported (Increased expression of interleukin-17 pathway genes in nonlesional skin of moderate-to-severe psoriasis vulgaris)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases and Conditions - Psoriasis are presented in a new report. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Psoriasis vulgaris is an inflammatory immune-mediated disease, with lesional skin characterized by sharply demarcated, erythematous scaly plaques. Uninvolved psoriatic skin appears clinically similar to normal skin."

Financial supporters for this research include 2012 LEO Pharma Research Foundation Silver Award, National Center for Advancing Translational Sciences, National Institutes of Health, Irma T. Hirschl/Monique Weill-Caulier research award.

Our news editors obtained a quote from the research from Rockefeller University, "However, it has been hypothesized that inflammatory cytokines, e.g. interleukin (IL)-17, may affect any organ or tissue having a vascular supply; thus, distant uninvolved skin could be exposed to increased circulating IL-17. To establish comparative genomic profiles between noninvolved skin and normal skin, in particular, determining immune abnormalities in distant uninvolved skin. We performed a meta-analysis on three gene array studies, comparing the nonlesional (NL) psoriatic skin transcriptome with normal gene expression. We investigated immunological features of noninvolved skin, particularly linked to IL-17 signalling. We detected 252 differentially expressed gene transcripts in uninvolved skin compared with normal skin; multiple immune-related genes, including IL-17-downstream genes, were upregulated. Increased expression of IL-17-signature genes (e.g. DEFB4 and S100A7) was associated with an increased number of CD3+, CD8+ and DC-LAMP+ cells in NL skin vs. normal controls. Inducible T-cell costimulator (ICOS) expression was detected only in a few T-cells within NL skin."
According to the news editors, the research concluded: "Our data described the genomic profile in NL skin, characterizing the immune activation that was mainly attributed to IL-17 signalling."

The news editors report that additional information may be obtained by contacting A. Chiricozzi, Laboratory of Investigative Dermatology, The Rockefeller University, New York City, NY, United States. Additional authors for this research include M. Suarez-Farinas, J. Fuentes-Duculan, I. Cueto, K. Li, S. Tian, C. Brodmkerk and J.G Krueger.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bjd.14034. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Diseases**

**Findings from Roma Tor Vergata University in the Area of Cardiovascular Diseases Reported (Preterm delivery and elevated maternal total vascular resistance: signs of suboptimal cardiovascular adaptation to pregnancy?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases is now available. According to news reporting out of Rome, Italy, by NewsRx editors, research stated, "To evaluate the maternal hemodynamic profile in women with a diagnosis of threatened preterm delivery (TPD) in order to understand the possible pathophysiologic mechanism leading to an increased lifetime risk for future cardiovascular disease. Patients with a diagnosis of TPD were enrolled and assessed using a non-invasive method (USCOM ®) for the determination of hemodynamic parameters."

Our news journalists obtained a quote from the research from Roma Tor Vergata University, "Vaginal and rectal swabs were taken, cervical length, blood inflammatory indices, fetal blood-vessel Doppler velocimetry were measured and gestational age at the time of delivery and neonatal outcomes were noted. A total of 68 patients were enrolled and included in the analysis. The population was divided into two groups according to total vascular resistance (TVR): Group A with a TVR of <= 1000 dynesxs/cm(5) (n=48) and Group B with a TVR of > 1000 dynesxs/cm(5) (n = 20). C-reactive protein (CRP) was higher in Group B than in Group A, suggesting a systemic inflammation status. Group B delivered earlier (32+4weeks vs 38+2weeks; P<0.01) and neonatal outcome was worse than in Group A. Significantly lower values of cardiac output, stroke volume, peak velocity of flow, velocity time integral, minute distance, stroke volume index, cardiac index, stroke work, cardiac power, inotropy index and potential-to-kinetic energy ratio were observed in Group B than in Group A. Women with a diagnosis of
TPD showing TVR values of > 1000 dynesxs/cm(5) and elevated levels of CRP are at high risk of preterm delivery."

According to the news editors, the research concluded: "An impaired maternal cardiovascular adaptation during pregnancy in these patients might suggest a possible higher risk for subsequent future cardiovascular disease."

Our news journalists report that additional information may be obtained by contacting H. Valensise, Roma Tor Vergata University, Policinico Casilino, Dept. of Bioimaging Obstet & Gynecol, Rome, Italy. Additional authors for this research include D. Farsetti, D. Lo Presti, I. Pisani, G.M. Tiralongo, G. Gagliardi, B. Vasapollo and G.P. Novelli.

Keywords for this news article include: Rome, Italy, Europe, Cardiovascular Physiological Phenomena, Cardiovascular Physiological Processes, Cardiovascular Diseases and Conditions, Stroke Volume, Risk and Prevention, Vascular Resistance, Cardiac Output, Hemodynamics, Cardiology, Roma Tor Vergata University.

Findings from Royal Brompton Hospital Provide New Insights into Left Ventricular Hypertrophy (Differential diagnosis of left ventricular hypertrophy: usefulness of multimodality imaging and tissue characterization with cardiac magnetic resonance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Left Ventricular Hypertrophy are presented in a new report. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Differential diagnosis of asymmetrical left ventricular hypertrophy may be challenging, particularly in patients with history of hypertension. A middle-aged man underwent an echocardiographic examination during workup for hypertension, which unexpectedly showed significant asymmetrical septal hypertrophy and raised suspicion for hypertrophic cardiomyopathy."

Funders for this research include Imperial College London, NIHR Cardiovascular Biomedical Research Unit of Royal Brompton & Harefield NHS Foundation Trust.

Our news editors obtained a quote from the research from Royal Brompton Hospital, "Cardiovascular magnetic resonance confirmed the asymmetrical hypertrophy. No myocardial late gadolinium contrast enhancement was seen. However, precontrast T1 mapping revealed a low native myocardial T1 value. This was highly suggestive of Anderson-Fabry disease, which was subsequently proved with very low alpha galactosidase enzyme levels and mutation analysis."

According to the news editors, the research concluded: "The case illustrates clinical usefulness of multimodality imaging and the novel tissue characterization techniques for
assessment of left ventricular hypertrophy."

The news editors report that additional information may be obtained by contacting C. Izgi, Royal Brompton Hosp, NIHR Cardiovasc Biomed Res Unit, London, United Kingdom. Additional authors for this research include V. Vassiliou, A.J. Baksi and S.K. Prasad.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/echo.13367. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: London, United Kingdom, Europe, Cardiovascular Diseases and Conditions, Heart Disorders and Diseases, Left Ventricular Hypertrophy, Magnetic Resonance, Hypertension, Cardiology, Genetics, Royal Brompton Hospital.

Heart Disorders and Diseases - Rheumatic Heart…

**Findings from Royal Children's Hospital Has Provided New Data on Rheumatic Heart Disease (Adherence to secondary antibiotic prophylaxis for patients with rheumatic heart disease diagnosed through screening in Fiji)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Rheumatic Heart Disease. According to news reporting originating from Parkville, Australia, by NewsRx correspondents, research stated, "Echocardiographic screening for rheumatic heart disease (RHD) can detect subclinical cases; however, adequate adherence to secondary antibiotic prophylaxis (SAP) is required to alter disease outcomes. We aimed to investigate the adherence to SAP among young people with RHD diagnosed through echocardiographic screening in Fiji and to investigate factors associated with adherence."

Financial supporters for this research include Cure Kids, National Health and Medical Research Council, National Heart Foundation of Australia, University of Melbourne Nossal Global Scholars program.

Our news editors obtained a quote from the research from Royal Children's Hospital, "Patients diagnosed with RHD through echocardiographic screening in Fiji from 2006 to 2014 were included. Dates of benzathine penicillin G injections were collected from 76 health clinics nationally from December 2011 to December 2014. Adherence was measured using the proportion of days covered (PDC). Multivariate logistic regression analysis was used to identify characteristics associated with any adherence (= 1 injection received) and adequate adherence (PDC = 0.80). Of 494 patients, 268 (54%) were female and the median age was 14 years. Overall, 203 (41%) had no injections recorded and just 33 (7%) had adequate adherence. Multivariate logistic regression showed increasing age (OR 0.93 per year, 95% CI 0.87-0.99)
and time since diagnosis = 1.5 years (OR 0.53, 95% CI 0.37-0.79) to be inversely associated with any adherence. Non-iTaukei ethnicity (OR 2.58, 95% CI 1.04-6.33) and urban residence (OR 3.36, 95% CI 1.54-7.36) were associated with adequate adherence, whereas time since diagnosis = 1.5 years (OR 0.38, 95% CI 0.17-0.83) was inversely associated with adequate adherence. Adherence to SAP after screening in Fiji is currently inadequate for individual patient protection or population disease control."

According to the news editors, the research concluded: "Secondary prevention should be strengthened before further screening can be justified."

For more information on this research see: Adherence to secondary antibiotic prophylaxis for patients with rheumatic heart disease diagnosed through screening in Fiji. Tropical Medicine & International Health, 2016;21(12):1583-1591. Tropical Medicine & International Health can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com; Tropical Medicine & International Health - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1365-3156)

The news editors report that additional information may be obtained by contacting D. Engelman, Royal Children's Hospital, Parkville, Vic, Australia. Additional authors for this research include R.L. Mataika, J.H. Kado, M.A. Kee, S. Donath, T. Parks and A.C. Steer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/tmi.12796. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Parkville, Australia, Australia and New Zealand, Chemoprevention, Diagnostics and Screening, Cardiovascular Diseases and Conditions, Heart Disorders and Diseases, Streptococcal Infections, Rheumatic Heart Disease, Antibiotic Prophylaxis, Gram-Positive Bacteria, Rheumatic Fever, Premedication, Cardiology, Royal Children's Hospital.

of Surgeons, "The model has been characterized in C57BL/6, BALB/c, and SJL mice where strain-specific differences were found in the extent of hippocampal damage. 129/P mice are a common baciground strain for genetic models and may display unique characteristics in this model. We therefore compared responses to intraamygdala kainic acid between 129/P and C57BL/6 mice. Racine scale-scored convulsive behavior during status epilepticus was substantially lower in 129/P mice compared with that in C57BL/6 mice. Analysis of surface-recorded electroencephalogram (EEG) showed differences between strains in several frequency bands; EEG total power was greater during ictal episodes while duration of seizures was slightly shorter in 129/P mice. Histological analysis revealed similar hippocampal injury between strains, with neuronal death mainly confined to the ipsilateral CA3 subfield. Expression of genes associated with gliosis and neuroinflammatory responses was also similar between strains after seizures. Video EEG telemetry recordings showed that 129/P mice first display spontaneous seizures within a few days of status epilepticus similar to C57BL/6 mice. However, high mortality in 129/P mice prevented a quantitative comparison of the epileptic seizure phenotypes between strains. This study defined behavioral, EEG, and histopathologic features of this mouse strain in a model increasingly useful for the study of the genetic contribution to acquired epilepsy."

According to the news reporters, the research concluded: "Intraamygdala kainic acid in 129/P mice could serve as a model of nonconvulsive status epilepticus, but long-term assessments will require model adjustment to mitigate the severity of the emergent epileptic phenotype."

For more information on this research see: Distinct behavioral and epileptic phenotype differences in 129/P mice compared to C57BL/6 mice subject to intraamygdala kainic acid-induced status epilepticus. Epilepsy & Behavior, 2016;64():186-194. Epilepsy & Behavior can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Epilepsy & Behavior - www.journals.elsevier.com/epilepsy-and-behavior/)

**Hormones - Anterior Pituitary Hormones**

**Findings from Royal Manchester Children's Hospital Update**

**Understanding of Anterior Pituitary Hormones (Effect of summer daylight exposure and genetic background on growth in growth hormone-deficient children)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hormones - Anterior Pituitary Hormones. According to news reporting originating in Manchester, United Kingdom, by NewsRx journalists, research stated, "The response to growth hormone in humans is dependent on phenotypic, genetic and environmental factors. The present study in children with growth hormone deficiency (GHD) collected worldwide characterised gene-environment interactions on growth response to recombinant human growth hormone (r-hGH)."

The news reporters obtained a quote from the research from Royal Manchester Children’s Hospital, "Growth responses in children are linked to latitude, and we found that a correlate of latitude, summer daylight exposure (SDE), was a key environmental factor related to growth response to r-hGH. In turn growth response was determined by an interaction between both SDE and genes known to affect growth response to r-hGH. In addition, analysis of associated networks of gene expression implicated a role for circadian clock pathways and specifically the developmental transcription factor NANOG."

According to the news reporters, the research concluded: "This work provides the first observation of gene-environment interactions in children treated with r-hGH."

Our news correspondents report that additional information may be obtained by contacting A. Stevens, Cent Manchester Univ Hosp NHS Fdn Trust, Royal Manchester Children’s Hospital, Manchester Academy Hlth Sci Center, Manchester M13 9WL, Lancs, United Kingdom. Additional authors for this research include P. Chatelain, C. Knight, P. Clayton and A. Stevens.

Gram-Positive Bacteria - Staphylococcus aureus

Findings from Royal Prince Alfred Hospital in the Area of Staphylococcus aureus Reported (Prevention and Control of Methicillin-Resistant Staphylococcus aureus in Acute Care Settings)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Positive Bacteria - Staphylococcus aureus are presented in a new report. According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "Methicillin-resistant Staphylococcus aureus (MRSA) is a leading cause of health care associated infections worldwide."

The news reporters obtained a quote from the research from Royal Prince Alfred
Hospital, "Controversies with regard to the effectiveness of various MRSA control strategies have contributed to varying approaches to the control of this pathogen in different settings. However, new evidence from large-scale studies has emerged, particularly with regards to MRSA screening and decolonization strategies, which will inform future control practices."

According to the news reporters, the research concluded: "The implementation as well as outcomes of control measures in the real world is not only influenced by scientific evidence but also depends on economic, administrative, governmental, and political influences."

Our news correspondents report that additional information may be obtained by contacting A.S. Lee, Royal Prince Alfred Hospital, Dept. of Microbiol, Sydney, NSW 2050, Australia. Additional authors for this research include B. Huttner and S. Harbarth.

Clinical Research - Clinical Trials and Studies

Findings from Royal United Hospital Update Understanding of Clinical Trials and Studies [Safety and effectiveness of hormonal treatment versus hormonal treatment with vigabatrin for infantile spasms (ICISS): a randomised, multicentre, open-label ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Clinical Research - Clinical Trials and Studies have been presented. According to news originating from Avon, United Kingdom, by NewsRx correspondents, research stated, "Infantile spasms constitutes a severe infantile epilepsy syndrome that is difficult to treat and has a high morbidity. Hormonal therapies or vigabatrin are the most commonly used treatments."

Our news journalists obtained a quote from the research from Royal United Hospital, "We aimed to assess whether combining the treatments would be more effective than hormonal therapy alone. In this multicentre, open-label randomised trial, 102 hospitals (Australia [three], Germany [11], New Zealand [two], Switzerland [three], and the UK [83]) enrolled infants who had a clinical diagnosis of infantile spasms and a hypsarrhythmic (or similar) EEG no more than 7 days before enrolment. Participants were randomly assigned (1:1) by a secure website to
receive hormonal therapy with vigabatrin or hormonal therapy alone. If parents consented, there was an additional randomisation (1:1) of type of hormonal therapy used (prednisolone or tetracosactide depot). Block randomisation was stratified for hormonal treatment and risk of developmental impairment. Parents and clinicians were not masked to therapy, but investigators assessing electro-clinical outcome were masked to treatment allocation. Minimum doses were prednisolone 10 mg four times a day or intramuscular tetracosactide depot 0.5 mg (40 IU) on alternate days with or without vigabatrin 100 mg/kg per day. The primary outcome was cessation of spasms, which was defined as no witnessed spasms on and between day 14 and day 42 from trial entry, as recorded by parents and carers in a seizure diary. Analysis was by intention to treat. The trial is registered with The International Standard Randomised Controlled Trial Number (ISRCTN), number 54363174, and the European Union Drug Regulating Authorities Clinical Trials (EUDRACT), number 2006-000788-27. Between March 7, 2007, and May 22, 2014, 766 infants were screened and, of those, 377 were randomly assigned to hormonal therapy with vigabatrin (186) or hormonal therapy alone (191). All 377 infants were assessed for the primary outcome. Between days 14 and 42 indusive no spasms were witnessed in 133 (72%) of 186 patients on hormonal therapy with vigabatrin compared with 108 (57%) of 191 patients on hormonal therapy alone (difference 15.0%, 95% CI 1.2-24.9, p=0.002). Serious adverse reactions necessitating hospitalisation occurred in 33 infants (16 on hormonal therapy alone and 17 on hormonal therapy with vigabatrin). The most common serious adverse reaction was infection occurring in five infants on hormonal therapy alone and four on hormonal therapy with vigabatrin. There were no deaths attributable to treatment. Hormonal therapy with vigabatrin is significantly more effective at stopping infantile spasms than hormonal therapy alone."

According to the news editors, the research concluded: "The 4 week period of spasm cessation required to achieve a primary clinical response to treatment suggests that the effect seen might be sustained, but this needs to be confirmed at the 18 month follow-up."

The news correspondents report that additional information may be obtained from F.K. O'Callaghan, Royal United Hosp Bath NHS Fdn Trust, Childrens Department, Bath, Avon, United Kingdom. Heart Disorders and Diseases - Atrial Fibrillation

Findings from Ruhr University Has Provided New Information about Atrial Fibrillation (Vdrive Evaluation of Remote Steering and Testing in Lasso Electrophysiology Procedures Study: The VERSA TILE Study in Atrial Fibrillation Ablation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Atrial Fibrillation is now available. According to news reporting out of Bad Oeynhausen, Germany, by NewsRx editors, research stated, "Circular mapping catheters (CMC) are an essential tool in most atrial fibrillation ablation procedures. The Vdrive? with V-Loop? system enables a physician to remotely manipulate a CMC during electrophysiology studies."

Financial supporters for this research include Stereotaxis, Inc, Clinical Trials.gov.

Our news journalists obtained a quote from the research from Ruhr University, "Our aim was to compare the clinical performance of the system to conventional CMC navigation according to efficiency and safety endpoints. A total of 120 patients scheduled to undergo a CMC study followed by pulmonary vein isolation (PVI) were included. Treatment allocation was randomized 2:1, remote navigation:manual navigation. The primary effectiveness endpoint was assessed based on both successful navigation to the targeted pulmonary vein (PV) and successful recording of PV electrograms. All PVs were treated independently within and between patients. The primary safety endpoint was assessed based on the occurrence of major adverse events (MAEs) through seven days after the study procedure. Primary effectiveness endpoints were achieved in 295/302 PVs in the Vdrive arm (97.7%) and 167/167 PVs in the manual arm (100%). Effectiveness analysis indicates Vdrive non-inferiority (pnon-inferiority=0.0405; d=-0.05) per the Cochran-Mantel-Haenszel test adjusted for PV correlation. Five MAEs related to the ablation procedure occurred (three in the Vdrive arm-3.9%; two in the manual arm-2.33%). No device-related MAEs were observed; safety analysis indicates Vdrive non-inferiority (pnon-inferiority=0.0441; d=0.07) per the normal Z test. Remote navigation of a CMC is equivalent to manual in PVI in terms of safety and effectiveness."

According to the news editors, the research concluded: "This allows for single-operator procedures in conjunction with a magnetically guided ablation catheter."

Our news journalists report that additional information may be obtained by contacting G. Nolker, Clinic for Cardiology, Herz- und Diabeteszentrum Nordrhein-Westfalen, Ruhr-Universitat Bochum, Bad Oeynhausen, Germany. Additional authors for this research include B. Schwagten, J.B. Deville, J.D. Burkhardt, R.P. Horton, Q. Sha and G. Tomassoni.

Findings from Rutgers State University Reveals New Findings on Hyperalgesia (Contribution of the Suppressor of Variegation 3-9 Homolog 1 in Dorsal Root Ganglia and Spinal Cord Dorsal Horn to Nerve Injury-induced Nociceptive Hypersensitivity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nervous System Diseases and Conditions - Hyperalgesia is now available. According to news reporting originating from Newark, New Jersey, by NewsRx correspondents, research stated, "Peripheral nerve injury-induced gene alterations in the dorsal root ganglion (DRG) and spinal cord likely participate in neuropathic pain genesis. Histone methylation gates gene expression."

Our news editors obtained a quote from the research from Rutgers State University, "Whether the suppressor of variegation 3-9 homolog 1 (SUV39H1), a histone methyltransferase, contributes to nerve injury-induced nociceptive hypersensitivity is unknown. Quantitative real-time reverse transcription polymerase chain reaction analysis, Western blot analysis, or immunohistochemistry were carried out to examine the expression of SUV39H1 mRNA and protein in rat DRG and dorsal horn and its colocalization with DRG mu-opioid receptor (MOR). The effects of a SUV39H1 inhibitor (chaetocin) or SUV39H1 siRNA on fifth lumbar spinal nerve ligation (SNL)-induced DRG MOR down-regulation and nociceptive hypersensitivity were examined. SUV39H1 was detected in neuronal nuclei of the DRG and dorsal horn. It was distributed predominantly in small DRG neurons, in which it coexpressed with MOR. The level of SUV39H1 protein in both injured DRG and ipsilateral fifth lumbar dorsal horn was time dependently increased after SNL. SNL also produced an increase in the amount of SUV39H1 mRNA in the injured DRG (n = 6/time point). Intrathecal chaetocin or SUV39H1 siRNA as well as DRG or intraspinal microinjection of SUV39H1 siRNA impaired SNL-induced alldynia and hyperalgesia (n = 5/group/treatment). DRG microinjection of SUV39H1 siRNA also restored SNL-induced DRG MOR down-regulation (n = 6/group). The findings of this study suggest that SUV39H1 contributes to nerve injury-induced allodynia and hyperalgesia through gating MOR expression in the injured DRG."

According to the news editors, the research concluded: "SUV39H1 may be a potential target for the therapeutic treatment of nerve injury-induced nociceptive hypersensitivity."

For more information on this research see: Contribution of the Suppressor of Variegation 3-9 Homolog 1 in Dorsal Root Ganglia and Spinal Cord Dorsal Horn to Nerve Injury-induced Nociceptive Hypersensitivity. Central Nervous System Diseases and Conditions –…

Findings from S. Fischer et al Update Understanding of Intracranial Aneurysm [Single-center experience in the endovascular treatment of wide-necked intracranial aneurysms with a bridging intra-/extra-aneurysm implant (pCONus)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Intracranial Aneurysm have been published. According to news reporting from Bochum, Germany, by NewsRx journalists, research stated, "To retrospectively evaluate the safety and efficacy of the endovascular treatment of wide-necked intracranial aneurysms assisted by a novel intra-/extra-aneurysm stent-like implant (pCONus). Initial and follow-up angiographic and clinical results are presented of 25 patients with 25 unruptured and ruptured wide-necked intracranial aneurysms treated by reconstruction of the aneurysm neck using the pCONus implant followed by coil occlusion of the fundus."

The news correspondents obtained a quote from the research, "Successful intra-/extra-aneurysm deployment of the pCONus with coil occlusion of the fundus was achieved in all but one case. Procedure-related ischemic complications were observed in three cases with permanent deterioration in one. Acceptable aneurysm occlusion was achieved in all cases. Follow-up angiography revealed sufficient occlusion in 81.0% of the aneurysms. Intimal hyperplasia in the stented segment of the parent artery or device migration has not been observed to date. The pCONus device offers a promising treatment option for complex wide-necked bifurcation intracranial aneurysms."

According to the news reporters, the research concluded: "Acute or delayed dislocations of coils into the parent artery are successfully avoided."

Our news journalists report that additional information may be obtained by contacting S. Fischer, Knappschaftskrankenhaus Bochum, Inst Diagnost & Interv ent Radiol, Langendreer Univ Klin, Neuroradiol & Nukl Med, D-44892 Bochum, Germany. Additional
authors for this research include A. Weber, A. Titschert, C. Brenke, A. Kowoll and W. Weber.

Drugs and Therapies - Pharmacology

Findings from S. Klenke and Co-Authors Broaden Understanding of Pharmacology (Easy-to-use strategy for reference gene selection in quantitative real-time PCR experiments)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Pharmacology have been presented. According to news reporting originating in Essen, Germany, by NewsRx journalists, research stated, "Real-time PCR is an indispensable technique for mRNA expression analysis but conclusions depend on appropriate reference gene selection. However, while reference gene selection has been a topic of publications, this issue is often disregarded when measuring target mRNA expression."

The news reporters obtained a quote from the research, "Therefore, we (1) evaluated the frequency of appropriate reference gene selection, (2) suggest an easy-to-use tool for least variability reference gene selection, (3) demonstrate application of this tool, and (4) show effects on target gene expression profiles. All 2015 published articles in Naunyn-Schmiedeberg's Archives of Pharmacology were screened for the use of quantitative real-time PCR analysis and selection of reference genes. Target gene expression (Vegfa, Grk2, Sirt4, and Timp3) in H9c2 cells was analyzed following various interventions (hypoxia, hyperglycemia, and/or isoflurane exposure with and without subsequent hypoxia) in relation to putative reference genes (Actb, Gapdh, B2m, Sdha, and Rplp1) using the least variability method vs. an arbitrarily selected but established reference gene. In the vast majority (18 of 21) of papers, no information was provided regarding selection of an appropriate reference gene. In only 1 of 21 papers, a method of appropriate reference gene selection was described and in 2 papers reference gene selection remains unclear. The method of reference gene selection had major impact on interpretation of target gene expression. With hypoxia, for instance, the least variability gene was Rplp1 and target gene expression (Vegfa) heavily showed a 2-fold up-regulation (p = 0.022) but no change (p = 0.3) when arbitrarily using Gapdh."

According to the news reporters, the research concluded: "Frequency of appropriate reference gene selection in this journal is low, and we propose our strategy for reference gene selection as an easy tool for proper target gene expression."

For more information on this research see: Easy-to-use strategy for reference gene selection in quantitative real-time PCR experiments. Naunyn-Schmiedebergs Archives of Pharmacology, 2016;389(12):1353-1366. Naunyn-Schmiedebergs Archives of Pharmacology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.
Our news correspondents report that additional information may be obtained by contacting S. Klenke, Univklinikum Essen, D-45122 Essen, Germany. Additional authors for this research include K. Renckhoff, A. Engler, J. Peters and U.H. Frey.

Oncology - Colon Cancer

Findings from S. Mukherjee and Colleagues Provides New Insights into Colon Cancer (Chromosomal microarray provides enhanced targetable gene aberration detection when paired with next generation sequencing panel in profiling lung and colorectal ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news reporting originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "The development of targeted therapies based on specific genomic alterations has altered the treatment and management of lung and colorectal cancers. Chromosomal microarray (CMA) has allowed identification of copy number variations (CNVs) in lung and colorectal cancers in great detail, and next-generation sequencing (NGS) is used extensively to analyze the genome of cancers for molecular subtyping and use of molecularly guided therapies."

Our news editors obtained a quote from the research, "The main objective of this study was to evaluate the utility of combining CMA and NGS for a comprehensive genomic assessment of lung and colorectal adenocarcinomas, especially for detecting drug targets. We compared the results from NGS and CMA data from 60 lung and 51 colorectal tumors. From CMA analysis, 33% were amplified, 89% showed gains, 75% showed losses and 41% demonstrated loss of heterozygosity; pathogenic variants were identified in 81% of colon and 67% lung specimens through NGS. KRAS mutations commonly occurred with loss in TP53 and there was significant loss of BRCA1 and NF1 among male patients with lung cancer. For clinically actionable targets, 23% had targetable CNVs when no pathogenic variants were detected by NGS."

According to the news editors, the research concluded: "The data thus indicate that combining the two approaches provides significant benefit in a routine clinical setting not available by NGS alone."

The news editors report that additional information may be obtained by contacting P.A. Lennon, PathGrp, Nashville, TN 37203, United States. Additional authors for this research...
Cyclohexanes

Findings from S. Sassano-Higgins and Co-Researchers in the Area of Cyclohexanes Reported (A Review Of Ketamine Abuse And Diversion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cyclohexanes have been published. According to news reporting originating in Atlanta, Georgia, by NewsRx journalists, research stated, "Ketamine was discovered in the 1960s and released for public use in 1970. Originally developed as a safer alternative to phencyclidine, ketamine is primarily used in clinical settings for analgesia and sedation."

The news reporters obtained a quote from the research, "In recent years, other uses have been developed, including pain management and treatment of asthma and depression. Clinical use of ketamine causes dissociation and emergence delirium. These effects have led to recreational abuse. Although death from direct pharmacologic effects appears rare, the disinhibition and altered sensory perceptions caused by ketamine puts users at risk of environmental harm. Ketamine has also been implicated in nonconsensual sexual intercourse. Data continue to build that chronic ketamine use may lead to morbidity. Impairment of memory and persistent dissociative, depressive, and delusional thinking has also been reported with long-term use. Lower urinary tract symptoms, including cystitis have been described. Gastric and hepatic pathology have also been noted, including abnormal liver function tests, choleodochal cysts and dilations of the common bile duct. S- ketamine, an enantiomer in racemic ketamine, has been shown to be hepatotoxic in vitro. Abstinence from ketaminemay reduce the adverse effects of chronic use and is considered the mainstay of treatment."

According to the news reporters, the research concluded: "Specialized urine drug testing may be required to detect use, as not all point of care urine drug screens include ketamine."

Our news correspondents report that additional information may be obtained by contacting S. Sassano-Higgins, Rivermend Hlth, Atlanta, GA, United States. Additional authors for this research include D. Baron, G. Juarez, N. Esmaili and M. Gold.

Keywords for this news article include: Atlanta, Georgia, United States, North and
Findings from S. Svenson and Co-Authors Broaden Understanding of Small Interference RNAs (siRNAs) (Tumor Selective Silencing Using an RNAi-Conjugated Polymeric Nanopharmaceutical)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Small Interference RNAs (siRNAs). According to news reporting originating from Waltham, Massachusetts, by NewsRx correspondents, research stated, "Small interfering RNA (siRNA) therapeutics have potential advantages over traditional small molecule drugs such as high specificity and the ability to inhibit otherwise 'undruggable' targets. However, siRNAs have short plasma half-lives in vivo, can induce a cytokine response, and show poor cellular uptake."

Our news editors obtained a quote from the research, "Formulating siRNA into nanoparticles offers two advantages: enhanced siRNA stability against nuclease degradation beyond what chemical modification alone can provide; and improved site-specific delivery that takes advantage of the enhanced permeability and retention (EPR) effect. Existing delivery systems generally suffer from poor delivery to tumors. Here we describe the formation and biological activity of polymeric nanopharmaceuticals (PNPs) based on biocompatible and biodegradable poly(lactic-co-glycolic acid) (PLGA) conjugated to siRNA via an intracellular cleavable disulfide linker (PLGA-siRNA). Additionally, these PNPs contain (1) PLGA conjugated to polyethylene glycol (PEG) for enhanced pharmacokinetics of the nanocarrier; (2) a cation for complexation of siRNA and charge compensation to avoid high negative zeta potential; and (3) neutral poly(vinyl alcohol) (PVA) to stabilize the PNPs and support the PEG shell to prevent particle aggregation and protein adsorption. The biological data demonstrate that these PNPs achieve prolonged circulation, tumor accumulation that is uniform throughout the tumor, and prolonged tumor-specific knockdown. PNPs employed in this study had no effect on body weight, blood cell count, serum chemistry, or cytokine response at doses >10 times the effective dose."

According to the news editors, the research concluded: "PNPs, therefore, constitute a promising solution for achieving durable siRNA delivery and gene silencing in tumors."

For more information on this research see: Tumor Selective Silencing Using an RNAi-Conjugated Polymeric Nanopharmaceutical. Molecular Pharmaceutics, 2016;13(3):737-47. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

The news editors report that additional information may be obtained by contacting S. Svenson, Cerulean Pharma Inc., 35 Gatehouse Drive, Waltham, Massachusetts 02451, United States. Gram-Negative Bacteria - Enterobacteriaceae

Findings from S.D. Braun and Co-Researchers in the Area of Enterobacteriaceae Described (Carbapenemase-producing Enterobacteriaceae: a 2-year surveillance in a hospital in Iasi, Romania)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Enterobacteriaceae have been published. According to news reporting originating in Jena, Germany, by NewsRx journalists, research stated, "Limited information is currently available about the prevalence of carbapenemase-producing Enterobacteriaceae (CPE) in Romania. Routine tests of 1,993 clinical isolates at a hospital in Iasi yielded 46 isolates that were resistant to carbapenems."

The news reporters obtained a quote from the research, "All 46 isolates were phenotypically and genotypically analyzed using VITEK-2 and DNA microarray-based assays. Isolates were assigned to Klebsiella pneumoniae and Enterobacter cloacae. For 39 isolates, carbapenem resistance was confirmed and 37 harbored at least one carbapenem resistance gene. Two isolates were probably resistant due to AmpC β-lactamases in combination with a porin loss. The overall concordance between detected phenotype and genotype was 95%."

According to the news reporters, the research concluded: "Our data show that carbapenemase-producing isolates with different underlying resistance mechanisms are still rare in Iasi, but the global rise of CPE warrants intensified surveillance."

For more information on this research see: Carbapenemase-producing Enterobacteriaceae: a 2-year surveillance in a hospital in Iasi, Romania. Future Microbiology, 2016;11(3):391-401.

Our news correspondents report that additional information may be obtained by contacting S.D. Braun, Alere Technologies GmbH, Jena, Germany. Additional authors for this research include O.S. Dorneanu, T. Vremera, A. Reißig, S. Monecke and R. Ehricht.

Findings from S.K. Singh and Co-Researchers Provides New Data on Urinary Tract Infection (Detection of AmpC beta-lactamase and adherence factors in uropathogenic Escherichia coli isolated from aged patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Urologic Diseases and Conditions - Urinary Tract Infection. According to news reporting originating from Jamshedpur, India, by NewsRx correspondents, research stated, "Escherichia coli mediated urinary tract infection has been reported to be most prevalent among patients of different class, gender and ages. Currently, multidrug resistant E. coli harboring several virulence factors are most perilous threats for patients especially for elders."

Our news editors obtained a quote from the research, "The aim of this study was to determine the antibiotic resistance pattern, co-resistance and phenotypic virulence factors present in uropathogenic E. coli isolated from aged patients. Thirty-nine E. coli isolates were collected during May June 2014 from patients between 50 to 80 years of age. Experiments have been carried out to determine the antibiotic resistance, co-resistances and phenotypic adherence factors present in each isolate. Clonal relatedness was also determined in the AmpC positive uropathogenic E. coli (UPEC). 97.43% isolates were found to be multidrug resistant and 41.02% of them were AmpC producer. AmpC producer group showed higher multiple antibiotic resistance index than AmpC non-producer (p value < 0.01) group. Interestingly, adherence factor Type 1 fimbriae were found among 84.61% of total isolates which were more prevalent in elderly female patients than males. Biofilm production studies revealed that 84.61% of total isolates are more common in elderly males."

According to the news editors, the research concluded: "This study adds value for the proper empiric selection of antibiotic therapy as well as calls for continuous monitoring of the incidence of drug resistance virulent uropathogenic E. coli mediated urinary tract infection in elderly patients."

The news editors report that additional information may be obtained by contacting M. Gupta, TATA Main Hosp, Jamshedpur, Jharkhand, India. Additional authors for this research include K. Seema and M. Gupta.

Findings from S.S. Saha and Colleagues Provides New Insights into Cancer Research (Identification of genetic variation in the IncRNA HOTAIR associated with HPV16-related cervical cancer pathogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cancer Research are presented in a new report. According to news reporting from Bengal, India, by NewsRx journalists, research stated, "Previously, over-expression of the long noncoding RNA (IncRNA) HOTAIR has been found to be associated with the invasive and metastatic capacities of several epithelial cancers, including cervical cancer (CaCx). Here, we aimed at identifying functionally relevant genetic variants that may be employed to differentiate between clinically distinct CaCx subtypes, i.e., those exhibiting high HOTAIR levels and molecular signatures of metastasis and those lacking such signatures in the presence of low HOTAIR expression levels."

Funders for this research include Department of Biotechnology, Ministry of Science and Technology, National Institute of Biomedical Genomics, Kalyani.

The news correspondents obtained a quote from the research, "Genomic DNA isolated from various cervical tissue samples (characterized by histopathology and HPV status) was used for HOTAIR amplicon sequencing, followed by validation of the findings by Sanger sequencing. The impact of the genetic variants found on the secondary structure of HOTAIR and the concomitant alterations in miRNA binding sites were determined through in silico analysis, followed by miRNA expression analysis by quantitative real-time PCR and confirmation of miRNA binding using a luciferase reporter assay. We found that rs2366152C was over-represented [ORage-adjusted = 2.58 (1.23-5.57); p = 0.014] in low HOTAIR expressing HPV positive CaCx cases compared to HPV negative controls. This genetic variant showed the propensity of a secondary structure alteration and gain of a miR-22 binding site in HOTAIR, which was found to be concordant with miR-22 over-expression in low HOTAIR CaCx cases compared to controls. We found that miR-22 expression negatively correlated with HOTAIR and E7 expression in HPV16 positive cases and in an E7 transfected HPV negative CaCx-derived cell line (C33A), but was not altered in high HOTAIR cases compared to controls. Reduced luciferase activity of a HOTAIR rs2366152C expression plasmid in C33A cells through miR-22 co-transfection confirmed the ability of miR-22 to specifically target rs2366152C-harbouring HOTAIR IncRNA in CaCx cells, ultimately leading to its down-regulation."

According to the news reporters, the research concluded: "Our data indicate that rs2366152C not only has the potential to serve as a marker for singling out CaCx cases lacking metastatic molecular signatures, but also to explain the functional inactivation of HOTAIR in these cases, including the mechanism of its down-regulation."

Our news journalists report that additional information may be obtained by contacting S. Sengupta, Netaji Subhas Sanat, Natl Inst Biomed Genom, Kalyani 741251, W Bengal, India. Additional authors for this research include R.R. Chowdhury, N.R. Mondal, B.
Findings from Sacred Heart Catholic University Provides New Data on Colon Cancer (Infliximab does not increase colonic cancer risk associated to murine chronic colitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting from Rome, Italy, by NewsRx journalists, research stated, "To explore the influence of Infliximab (IFX) on cancer progression in a murine model of colonic cancer associated to chronic colitis. AOM/DSS model was induced in C57BL/6 mice."

The news correspondents obtained a quote from the research from Sacred Heart Catholic University, "Mice were injected with IFX (5 mg/kg) during each DSS cycle while control mice received saline. Body weight, occult blood test and stool consistency were measured to calculate the disease activity index (DAI). Mice were sacrificed at week 10 and colons were analyzed macroscopically and microscopically for number of cancers and degree of inflammation. MTT assay was performed on CT26 to evaluate the potential IFX role on metabolic activity and proliferation. Cells were incubated with TNF-alpha or IFX or TNF-alpha plus IFX, and cell vitality was evaluated after 6, 24 and 48 h. The same setting was used after pre-incubation with TNF-alpha for 24 h. IFX significantly reduced DAI and body weight loss in mice compared with controls, preserving also colon length at sacrifice. Histological score was also reduced in treated mice. At macroscopic analysis, IFX treated mice showed a lower number of tumor lesions compared to controls. This was confirmed at microscopic analysis, although differences were not statistically significant. In vitro, IFX treated CT26 maintained similar proliferation ability at MTT test, both when exposed to IFX alone and when associated to TNF-alpha."

According to the news reporters, the research concluded: "IFX did not increase colonic cancer risk in AOM-DSS model of cancer on chronic colitis nor influence directly the proliferation of murine colon cancer epithelial cells."

Our news journalists report that additional information may be obtained by contacting F. Scaldaferri, Sacred Heart Catholic University, Div Gastroenterol, I-00168 Rome, Italy. Additional authors for this research include V. Petito, T. Zinicola, C. Graziani, V. Gerardi,
Findings from Safarik University Yields New Findings on Polycystic Ovary Syndrome (The Effect of Alfacalcidiol and Metformin on Phenotype Manifestations in Women with Polycystic Ovary Syndrome - a Preliminary Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Endocrine System Diseases and Conditions - Polycystic Ovary Syndrome have been presented. According to news reporting originating from Kosice, Slovakia, by NewsRx correspondents, research stated, "Aim of this study was to evaluate the effect of vitamin D supplementation in obese, insulin resistant and vitamin D deficient PCOS women on biochemical and clinical hyperandrogenism and menstrual irregularity in comparison to effect of metformin or combined metformin plus vitamin D therapy. Thirty nine PCOS women were randomized into three groups and treated with alfacalcidiol (Group 1), combined alfacalcidiol and metformin therapy (Group 2) and metformin (Group 3) for 6 months."

Our news editors obtained a quote from the research from Safarik University, "Serum TST, fTST, DHEAS, LH and LH/FSH were measured before and after six months of treatment. Menstrual cycle regularity, hirsutism, acne and pregnancy rate were assessed at the same time. There was a significant decrease in TST levels in the Group 2 and slight but not significant decrease in the Group 3. No significant changes in other parameters (fTST, DHEAS, LH, LH/FSH) have been found after 6 months therapy in all three groups. An improvement of menstrual cycle was detected in 78 % of patients in Group 1 (p <0.04), 80 % in the Group 2 (p <0.03) and in 90 % in the Group 3 (p <0.002), respectively. There was no significant improvement of acne and hirsutism in all three groups (all p not significant). Pregnancy rate was higher in the Group 3 as compared with Groups 1 and 2 (67 % vs. 0 % and 25 %, respectively), however without statistical significance. Vitamin D administration has no significant effect on androgen levels and clinical features of hyperandrogenism in obese vitamin D deficient PCOS women."

According to the news editors, the research concluded: "However, it can potentiate effect of metformin on testosterone levels and LH/FSH ratio but not on clinical hyperandrogenism and pregnancy rate."

For more information on this research see: The Effect of Alfacalcidiol and Metformin on Phenotype Manifestations in Women with Polycystic Ovary Syndrome - a Preliminary Study. *Physiological Research*, 2016;65(5):815-822. *Physiological Research* can
Findings from Sahmyook University Provides New Data about Drug Delivery Systems (On-Demand Drug Delivery System Using Micro-organogels with Gold Nanorods)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "In this study, we designed a biocompatible drug carrier: micro-organogels prepared by emulsification using vegetable oils and self-assembled gelator fibers."

Financial support for this research came from National Research Foundation of Korea.

Our news journalists obtained a quote from the research from Sahmyook University, "Flurbiprofen was chosen as a hydrophobic model drug and is classified as a nonsteroidal anti-inflammatory drug. In the absence of NIR light, flurbiprofen encapsulated in micro-organogels with gold nanorods (GNRs) was released slowly, while release was accelerated in the presence of NIR light due to the increase in the temperature surrounding the GNRs that transforms the gels into liquid."

According to the news editors, the research concluded: "These results suggest that our system can be efficiently used as a versatile scaffold for on-demand drug delivery systems."

Our news journalists report that additional information may be obtained by contacting M.H. Park, Sahmyook Univ, Dept. of Chem, Seoul 01795, South Korea. Additional authors for this research include S. Yang, J.Y. Kang and M.H. Park.

Findings from Saitama Medical University Broaden Understanding of Human Genetics (HDR: a statistical two-step approach successfully identifies disease genes in autosomal recessive families)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics - Human Genetics. According to news reporting originating from Saitama, Japan, by NewsRx correspondents, research stated, "In the search for sequence variants underlying disease, commonly applied filtering steps usually result in a number of candidate variants that cannot further be narrowed down. In autosomal recessive families, disease usually occurs only in one generation so that genetic linkage analysis is unlikely to help."

Our news editors obtained a quote from the research from Saitama Medical University, "Because homozygous recessive mutations tend to be inherited together with flanking homozygous variants, we developed a statistical method to detect pathogenic variants in autosomal recessive families: We look for differences in patterns of homozygosity around candidate variants between patients and control individuals and expect that such differences are greater for pathogenic variants than random candidate variants. In six autosomal recessive mitochondrial disease families, in which pathogenic homozygous variants have already been identified, our approach succeeded in prioritizing pathogenic mutations."

According to the news editors, the research concluded: "Our method is applicable to single patients from recessive families with at least a few dozen control individuals from the same population; it is easy to use and is highly effective for detecting causative mutations in autosomal recessive families."

The news editors report that additional information may be obtained by contacting Y. Okazaki, Saitama Med Univ, Res Center Genom Med, Div Funct Genom & Syst Med, Saitama, Japan. Additional authors for this research include M. Kohda, A. Nakaya, Y. Sakata, K. Murayama, A. Ohtake, M. Lathrop, Y. Okazaki and J. Ott.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/jhg.2016.85. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Hepatitis C Virus

Findings from Saitama Medical University Provide New Insights into Hepatitis C Virus (Development of rare resistance-associated variants that are extremely tolerant against NS5A inhibitors during daclatasvir/asunaprevir therapy by a two-hit ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Hepatitis C Virus have been published. According to news reporting out of Saitama, Japan, by NewsRx editors, research stated, "The virologic characteristics of resistance-associated variants (RAVs) developing in patients receiving dual oral therapy with daclatasvir/asunaprevir, including those with previous triple therapy with simeprevir, were evaluated. A total of 206 patients with genotype-1b HCV infection, including 5 patients with previous simeprevir therapy, were treated with daclatasvir/asunaprevir for 24 weeks."

Our news journalists obtained a quote from the research from Saitama Medical University, "Resistance-associated variants in the NS5A regions at baseline and during/after therapy were evaluated using cycling-probe real-time polymerase chain reaction combined with direct sequencing. The dynamics of rare RAVs were also assessed using ultra-deep sequencing. A sustained virologic response (SVR12) was achieved in 180 patients (87%); the rates were 95% in patients without baseline NS5A-RAVs and 83%, 59%, and 77% in those with hepatitis C virus (HCV) strains carrying NS5A-L31M, NS5A-Y93H/C, and NS5A-R30Q/H/L mutations, respectively. A multivariate analysis revealed baseline NS5A-R30Q/H/L mutation and NS5A-Y93H mutations as significant factors associated with SVR12. Virologic failure developed in all 5 patients with previous simeprevir treatment, and rare RAVs (HCV strains with NS5A-R30H, NS5A-A92K, NS5A-P29del, and NS5A-P32del) developed at virologic failure. Ultra-deep sequencing revealed that HCV strains with NS5AP29del or NS5A-P32del were absent at baseline and emerged within 4 weeks of dual oral therapy among the strains appearing after simeprevir administration. NS5A-R30Q/H/L and NS5A-Y93H mutations at baseline determined the therapeutic efficacy of dual oral therapy with daclatasvir/asunaprevir, but rare NS5A-RAVs developed frequently in patients with previous simeprevir treatment."

According to the news editors, the research concluded: "Such RAVs may develop in a two-hit manner, with simeprevir altering the quasispecies of HCV strains in the NS5A regions, leading to the emergence of HCV strains with NS5A-P29del and NS5A-P32del during exposure to daclatasvir/asunaprevir."

For more information on this research see: Development of rare resistance-associated variants that are extremely tolerant against NS5A inhibitors during daclatasvir/asunaprevir therapy by a two-hit mechanism. Hepatology Research, 2016;46 (12):1234-1246. Hepatology Research can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Elsevier - www.elsevier.com; Hepatology Research - www.journals.elsevier.com/hepatology-research/)

Our news journalists report that additional information may be obtained by contacting S. Mochida, Saitama Med Univ, Dept. of Gastroenterol & Hepatol, Fac Med, Moroyama, Saitama 3500495, Japan. Additional authors for this research include J. Kouyama, K. Naiki, K. Sugawara, M. Inao, Y. Imai, N. Nakayama and S. Mochida.
Heart Disorders and Diseases - Cardiogenic Shock

Findings from San Gerardo Hospital Broaden Understanding of Cardiogenic Shock (Effects of Levosimendan on Endothelial Function and Hemodynamics During Weaning From Veno-Arterial Extracorporeal Life Support)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Cardiogenic Shock. According to news reporting from Monza, Italy, by NewsRx journalists, research stated, "Weaning from veno-arterial extracorporeal life support is challenging. The objective of this trial was to investigate the endothelial and hemodynamic effects of levosimendan in cardiogenic shock patients supported with veno-arterial extracorporeal life support."

The news correspondents obtained a quote from the research from San Gerardo Hospital, "This was a prospective observational trial. Cardiovascular intensive care unit of a large tertiary care university hospital in Monza, Italy. Flow-mediated dilatation of the brachial artery and hemodynamic parameters were assessed in 10 cardiogenic shock patients supported with veno-arterial extracorporeal life support, before and after the infusion of levosimendan. Flow-mediated dilatation increased both as absolute value and as a percentage after levosimendan, from 0.10 +/- 0.12 to 0.61 +/- 0.21 mm (p < 0.001) and from 3.2 +/- 4.2% to 17.8 +/- 10.4% (p < 0.001), respectively. Cardiac index increased from 1.93 +/- 0.83 to 2.64 +/- 0.97 L/min/m(2) (p = 0.008) while mixed venous oxygen saturation increased from 66.0% to 71.5% (p = 0.006) and arterial lactate levels decreased from 1.25 to 1.05 mmol/L (p = 0.004) without significant variations in arterial oxygen saturation or hemoglobin levels. This made it possible for clinicians to reduce extracorporeal membrane oxygenation blood flow from 1.92 +/- 0.65 to 1.12 +/- 0.49 L/min/m(2) (p < 0.001)."

According to the news reporters, the research concluded: "In the authors' study population of adult cardiogenic shock patients supported with veno-arterial extracorporeal life support, their observations supported the use of levosimendan to improve endothelial function and hemodynamics and facilitate weaning from the extracorporeal support."

Our news journalists report that additional information may be obtained by contacting F. Sangalli, San Gerardo Hosp, Dept. of Anesthesia & Intens Care Med, Monza,
Italy. Additional authors for this research include L. Avalli, M. Laratta, F. Formica, E. Maggioni, R. Caruso, M.C. Costa, M. Guazzi and R. Fumagalli.

Oncology - Epithelial Cancer

Findings from Sapienza-University Broaden Understanding of Epithelial Cancer [Interleukin-15 enhances cytokine induced killer (CIK) cytotoxic potential against epithelial cancer cell lines via an innate pathway]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Epithelial Cancer are discussed in a new report. According to news reporting out of Rome, Italy, by NewsRx editors, research stated, "CIK cells are a subset of effector lymphocytes endowed with a non-MHC restricted anti-tumor activity making them an appealing and promising cell population for adoptive immunotherapy. CIK are usually generated ex-vivo by initial priming with Interferon-gamma (IFN-gamma) and monoclonal antibody against CD3 (anti-CD3), followed by culture in medium containing Interleukin-2 (IL-2)."

Financial support for this research came from Ministero dell’Istruzione, dell’Università e della Ricerca.

Our news journalists obtained a quote from the research from Sapienza-University, "Interleukin-15 (IL-15) shares with IL-2 similar biological functions and recently it has been reported to induce CIK with increased anti leukemic potential. The aim of the study was to compare the killing efficacy of CIK generated by IL-2 alone or IL-2 and IL-15 toward tumor targets of different origins, leukemic cells and malignant cells from epithelial solid tumors. CIK bulk cultures were examined for cell proliferation, surface phenotype and cytotoxic potential against tumor cell lines K562, HL60, HeLa and MCF-7. The results showed that IL-15 is able to induce a selective expansion of CIK cells, but it is less effective in sustaining CIK cell proliferation compared to IL-2."

According to the news editors, the research concluded: "Conversely, our data confirm and reinforce the feature of IL-15 to induce CIK cells with a potent cytotoxic activity mostly against tumor cells from epithelial solid malignancies via NKG2D-mediated mechanism."

For more information on this research see: Interleukin-15 enhances cytokine induced killer (CIK) cytotoxic potential against epithelial cancer cell lines via an innate pathway. Human Immunology, 2016;77(12):1239-1247. Human Immunology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Oncology - Breast Cancer

Findings from Sarah Cannon Research Institute Provide New Insights into Breast Cancer (Ramucirumab With Eribulin Versus Eribulin in Locally Recurrent or Metastatic Breast Cancer Previously Treated With Anthracycline and Taxane Therapy: A ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting out of Nashville, Tennessee, by NewsRx editors, research stated, "We describe the efficacy and safety of ramucirumab with eribulin versus eribulin monotherapy as third-to fifth line therapy in women with advanced breast cancer. The primary end point of progression-free survival was not met."

Our news journalists obtained a quote from the research from Sarah Cannon Research Institute, "Screening for brain metastases upon trial entry showed an unanticipated prevalence of asymptomatic brain disease, raising new considerations for screening in late-stage metastatic breast cancer irrespective of HER2 or hormone receptor status. Use of antiangiogenic agents in treatment of metastatic breast cancer (MBC) remains controversial. We evaluated the efficacy and safety of ramucirumab and eribulin versus eribulin alone as third-to fifth-line therapy in women with advanced breast cancer. In this randomized (1:1), open-label, phase II study, US women aged 18 years or older with 2 to 4 previous chemotherapy regimens for locally recurrent or MBC, previous anthracycline and taxane treatment, and Eastern Cooperative Oncology Group performance status of 0 or 1 received ramucirumab with eribulin or eribulin alone in 21-day cycles (eribulin 1.4 mg/m(2) intravenously on days 1 and 8; ramucirumab 10 mg/kg intravenously on day 1). Randomization was stratified according to previous antiangiogenic therapy and triple-negative status. The primary end point was progression-free survival (PFS) in the intention to treat population. One hundred forty-one women were randomized to ramucirumab with eribulin (n = 71) or eribulin alone (n = 70). Median PFS for ramucirumab with eribulin was 4.4 months (95% confidence interval [CI], 3.1-6.7) compared with 4.1 months (95% CI, 3.2-5.6) for eribulin (hazard ratio [HR], 0.83; 95% CI, 0.56-1.23; P =.35). Median overall survival in patients who received ramucirumab with eribulin was 13.5 months (95% CI, 10.4-17.9) compared with 11.5 months (95% CI, 9.0-17.3) in patients who received eribulin alone (HR, 0.91; 95% CI, 0.59-1.41; P =.68); objective response rate was 21% (13 of 62 patients) for the combination and 28% (17 of 60 patients) for eribulin alone. No unexpected toxicity was identified for the combination."

According to the news editors, the research concluded: "Ramucirumab combined
with eribulin did not significantly improve PFS in advanced MBC."

For more information on this research see: Ramucirumab With Eribulin Versus Eribulin in Locally Recurrent or Metastatic Breast Cancer Previously Treated With Anthracycline and Taxane Therapy: A Multicenter, Randomized, Phase II Study. *Clinical Breast Cancer*, 2016;16(6):471-479. *Clinical Breast Cancer* can be contacted at: Cig Media Group, Lp, 3500 Maple Avenue, Ste 750, Dallas, TX 75219-3931, USA. **Apoptosis**

**Findings from Sathyabama University Yields New Data on Apoptosis (Pectin mediated gold nanoparticles induces apoptosis in mammary adenocarcinoma cell lines)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Apoptosis. According to news reporting originating from Tamil Nadu, India, by NewsRx correspondents, research stated, "Pectin and its several modified forms have shown remarkable impact in therapeutic use against various cancers. In the present study, pectin, an anionic polysaccharide isolated from Musa paradisiaca is employed for the synthesis of gold nanoparticles at ambient temperature conditions."

Our news editors obtained a quote from the research from Sathyabama University, "The synthesized nanoparticles were characterized using microscopic and spectroscopic studies and its anti-cancer potential was evaluated in mammary adenocarcinoma cell lines MCF-7 and MDA-MB-231. Apoptosis induction was evident from increase in sub-G1 population studied using flow cytometry analysis. DNA damage followed by cell death in pectin mediated gold nanoparticles (p-GNPs) treated cells was confirmed by Comet assay."

According to the news editors, the research concluded: "Uptake of p-GNPs by cancer cells (MCF-7 and MDA-MB-231) was analyzed using FE-SEM which revealed the presence of p-GNPs as aggregates over the surface of cells with loss in cellular integrity compared to control cells."

For more information on this research see: Pectin mediated gold nanoparticles

The news editors report that additional information may be obtained by contacting K. Govindaraju, Sathyabama Univ, Nanosci Div, Center Ocean Res, Madras 600119, Tamil Nadu, India. Additional authors for this research include K. Govindaraju, V.G. Kumar, V. Karthick and K. Parthasarathy.

Findings from School of Medicine Broaden Understanding of Biochemistry (MAGI-1 Interacts with Nephrin to Maintain Slit Diaphragm Structure through Enhanced Rap1 Activation in Podocytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Chemistry - Biochemistry have been published. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "MAGI-1 is a multidomain cytosolic scaffolding protein that in the kidney is specifically located at the podocyte slit diaphragm, a specialized junction that is universally injured in proteinuric diseases. There it interacts with several essential molecules, including nephrin and nephl, which are required for slit diaphragm formation and as an intracellular signaling hub."

Funders for this research include National Institute of Diabetes and Digestive and Kidney Diseases, European Research Council, Bundesministerium fur Bildung und Forschung, Deutsche Forschungsgemeinschaft.

Our news journalists obtained a quote from the research from the School of Medicine, "Here, we show that diminished MAGI-1 expression in cultured podocytes reduced nephrin and nephl membrane localization and weakened tight junction integrity. Global magil knock-out mice, however, demonstrated normal glomerular histology and function into adulthood. We hypothesized that a second mild but complementary genetic insult might induce glomerular disease susceptibility in these mice. To identify such a gene, we utilized the developing fly eye to test for functional complementation between MAGI and its binding partners. In this way, we identified diminished expression of fly Hibris (nephrin) or Roughbest (nephl) as dramatically exacerbating the effects of MAGI depletion. Indeed, when these combinations were studied in mice, the addition of nephrin, but not nephl, heterozygosity to homozygous deletion of MAGI-1 resulted in spontaneous glomerulosclerosis. In cultured podocytes, MAGI-1 depletion reduced intercellular contact-induced Rap1 activation, a pathway critical for proper podocyte function. Similarly, magi1 knock-out mice showed diminished glomerular Rap1 activation, an effect dramatically enhanced by concomitant nephrin haploinsufficiency. Finally, combined overexpression of MAGI-1 and nephrin increased Rap1 activation, but not when substituting a mutant MAGI-1 that cannot bind nephrin."

According to the news editors, the research concluded: "We conclude that the interaction between nephrin and MAGI-1 regulates Rap1 activation in podocytes to maintain long term slit diaphragm structure."

For more information on this research see: MAGI-1 Interacts with Nephrin to Maintain Slit Diaphragm Structure through Enhanced Rap1 Activation in Podocytes. Journal of Biological Chemistry, 2016;291(47):24406-24417,661. Journal of Biological Chemistry can
Findings from School of Medicine Broaden Understanding of Malignant Hypertension (Incidence and risk of hypertension in patients newly treated for multiple myeloma: a retrospective cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Malignant Hypertension. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Hypertension is commonly reported in multiple myeloma (MM) patients and may be associated with older age, disease-related complications and consequences of MM treatments. This study evaluated the incidence rates of and risk factors for hypertension and malignant hypertension in newly-treated MM patients in the United States."

The news correspondents obtained a quote from the research from the School of Medicine, "Newly-treated adult MM patients were identified from Truven MarketScan claims database from 1/1/05 to 3/31/14. Inclusion criteria were new diagnosis of MM with start of MM treatment, >= 12 months continuous enrollment prior to diagnosis, >= 30 days of continuous enrollment following initial diagnosis, and prescription drug coverage. Non-MM patients were matched for age (within +/-5 years), sex and distribution of index dates to MM patients. Baseline cardiovascular (CV) comorbidities, incidence rate of hypertension and malignant hypertension in the follow-up period, and risk of hypertension and malignant hypertension based on existing baseline CV comorbidities were evaluated. A total of 7895 MM patients (38% with hypertension history) and 23,685 non-MM patients (24% with hypertension history) were included in the study. Twenty-two percent of MM patients versus 3% of non-MM patients had baseline renal failure. A higher percentage of MM versus non-MM patients had baseline hypertension in combination with renal failure, congestive heart failure or both. The incidence rate of hypertension in MM and non-MM patients was 260 and 178 per 1000 person-years, respectively. There was a 30% increase in the risk of hypertension for MM versus non-MM patients: hazard ratio (HR) 1.30 (95% confidence interval [CI] 1.22, 1.37). In MM patients with a history of hypertension, the risk of malignant hypertension was significantly increased with the following comorbid conditions: cardiomyopathy, HR 2.79 (95% CI 1.20, 6.48); renal failure, HR 2.13 (95% CI 1.36, 3.34); and diabetes mellitus, HR 1.59 (95% CI 1.05, 2.39). This study
confirms that the incidence of hypertension and malignant hypertension is significantly higher in newly-treated MM versus non-MM patients. Hypertension is a risk factor for MM patients developing malignant hypertension."

According to the news reporters, the research concluded: "Management of CV comorbidities in MM patients is important based on the increased risk of hypertension and malignant hypertension among patients with these comorbidities."

Our news journalists report that additional information may be obtained by contacting A. Chari, Icahn Sch Med Mt Sinai, New York, NY 10029, United States. Additional authors for this research include K. Mezzi, S. Zhu, W. Werther, D. Felici and A.R. Lyon.

**Nephrology**

**Findings from School of Medicine Broaden Understanding of Nephrology (Photothermal Ablation of in Situ Renal Tumor by PEG-IR780-C13 Micelles and Near-Infrared Irradiation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nephrology are presented in a new report. According to news reporting out of Nanjing, People's Republic of China, by NewsRx editors, research stated, "PEG-IR780-C13 micelles have been demonstrated to be a novel photothermal agent with tumor-targeting property. This study was designed to explore the feasibility of applying PEG-IR780-C13 micelles and near-infrared (NIR) irradiation for thermal ablation of renal tumor by using an in situ tumor model."

Funders for this research include Natural Science Foundation of Jiangsu Province, National Natural Science Foundation of China, Changzhou Biotechnology and Pharmaceutical Technology Special Project, Changzhou Special Project of Biotechnology and Biopharmacy.

Our news journalists obtained a quote from the research from the School of Medicine, "In addition, the potential thermal injury to normal renal tissue was evaluated. PEG-IR780-C13 micelles were intended to accumulate in renal tumor after systemic delivery. In vitro results revealed that PEG-IR780-C13 micelles were uptaken by RENCA cells mainly through caveola-mediated endocytosis and mainly distributed in late endosomes and lysosomes. Upon NIR irradiation, PEG-IR780-C13 micelles generated heat effectively both in vitro and in vivo, exhibiting a promising photothermal therapeutic property. The photothermal effect of PEG-
IR780-C13 micelles could effectively destroy RENCA cells in vitro and adequately inhibit growth of in situ renal tumor in vivo. Meanwhile, PEG-IR780-C13 micelles mediated photothermal therapy (PTT) resulting in only limited injury to normal renal tissue surrounding tumor sites."

According to the news editors, the research concluded: "Our data indicated that PEG-IR780-C13 micelles mediating PTT could generate tumor-specific heat for destruction of renal tumor in a minimally invasive way, providing a novel strategy for thermal ablation of renal tumor."

Our news journalists report that additional information may be obtained by contacting X. Qiu, State Key Laboratory of Pharmaceutical Biotechnology, Medical School of Nanjing University, Nanjing 210093, People's Republic of China. Additional authors for this research include L. Xu, Y. Zhang, A. Yuan, K. Wang, X. Zhao, J. Wu, H. Guo and Y. Hu.

Digestive System Diseases and Conditions - ...

Findings from School of Medicine Broadens Understanding of Sclerosing Cholangitis (The features of mucosa-associated microbiota in primary sclerosing cholangitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Digestive System Diseases and Conditions - Sclerosing Cholangitis are presented in a new report. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Little is known about the role of the microbiome in primary sclerosing cholangitis. To explore the mucosa-associated microbiota in primary sclerosing cholangitis (PSC) patients across different locations in the gut, and to compare it with inflammatory bowel disease (IBD)-only patients and healthy controls."

Financial supporters for this research include National Institutes of Health, National Institute of Diabetes and Digestive and Kidney Diseases, Chemotherapy Foundation, Helmsley Foundation.

The news reporters obtained a quote from the research from the School of Medicine, "Biopsies from the terminal ileum, right colon, and left colon were collected from patients and healthy controls undergoing colonoscopy. Microbiota profiling using bacterial 16S rRNA sequencing was performed on all biopsies. Forty-four patients were recruited: 20 with PSC (19 with PSC-IBD and one with PSC-only), 15 with IBD-only and nine healthy controls. The overall microbiome profile was similar throughout different locations in the gut. No differences in the global microbiome profile were found. However, we observed significant PSC-associated..."
enrichment in Barnesiellaceae at the family level, and in Blautia and an unidentified Barnesiellaceae at the genus level. At the operational taxa unit level, most shifts in PSC were observed in Clostridiales and Bacteroidales orders, with approximately 86% of shifts occurring within the former order. The overall microbiota profile was similar across multiple locations in the gut from the same individual regardless of disease status."

According to the news reporters, the research concluded: "In this study, the mucosa associated-microbiota of patients with primary sclerosing cholangitis was characterised by enrichment of Blautia and Barnesiellaceae and by major shifts in operational taxa units within Clostridiales order."

Our news correspondents report that additional information may be obtained by contacting J. Torres, Division of Gastroenterology, Dept. of Medicine, Icahn School of Medicine at Mount Sinai, New York, NY, United States. Additional authors for this research include X. Bao, A. Goel, J.F. Colombel, J. Pekow, B. Jabri, K.M. Williams, A. Castillo, J.A. Odin, K. Meckel, F. Fasihuddin, I. Peter, S. Itzkowitz and J. Hu.

**Heart Disorders and Diseases - Heart Attack**

**Findings from School of Medicine Provide New Insights into Heart Attack (Amiodarone or nifekalant upon hospital arrival for refractory ventricular fibrillation after out-of-hospital cardiac arrest)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Attack are presented in a new report. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "We evaluated the association between nifekalant or amiodarone on hospital admission and in-hospital mortality for cardiac arrest patients with persistent ventricular fibrillation on hospital arrival. This was a retrospective cohort study using the Japanese Diagnosis Procedure Combination inpatient database."

Funders for this research include Ministry of Health, Labour and Welfare, Japan, Scientific Research, Japan.

Our news journalists obtained a quote from the research from the School of Medicine, "We identified 2961 patients who suffered cardiogenic out-of-hospital cardiac arrest and who had ventricular fibrillation on hospital arrival between July 2007 and March 2013. Patients were categorized into amiodarone (n = 2353) and nifekalant (n = 608) groups, from
which 525 propensity score-matched pairs were generated. We found a significant difference in the admission rate between the nifekalant and amiodarone groups in propensity score-matched groups (75.6% vs. 69.3%, respectively; difference, 6.3%; 95% confidence interval (CI), 0.9-11.7). An analysis using the hospital nifekalant/amiodarone rate as an instrumental variable found that receiving nifekalant was associated with an improved admission rate (22.2%, 95% CI, 11.9-32.4). We found no significant difference in in-hospital mortality between the nifekalant and amiodarone groups (81.5% vs. 82.1%, respectively; difference, -0.6%; 95% CI, -5.2 to 4.1). Instrumental variable analysis showed that receiving nifekalant was not associated with reduced in-hospital mortality (6.2%, 95% CI, -2.4 to 14.8). This nationwide study suggested no significant in-hospital mortality association between nifekalant and amiodarone for cardiogenic out-of-hospital cardiac arrest patients with ventricular fibrillation/persistent ventricular tachycardia on hospital arrival."

According to the news editors, the research concluded: "Although nifekalant may potentially improve hospital admission rates compared with amiodarone for these patients, further studies are required to confirm our results."

Our news journalists report that additional information may be obtained by contacting T. Tagami, Tama Nagayama Hosp, Nippon Med Sch, Dept. of Emergency & Crit Care Med, Tama, Tokyo, Japan. Additional authors for this research include H. Matsui, S. Ishinokami, M. Oyanagi, A. Kitahashi, R. Fukuda, K. Unemoto, K. Fushimi and H. Yasunaga.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.resuscitation.2016.08.017. This DOI is a link to an online electronic document that is either free or for purchase.

Breast Diseases and Conditions

Findings from School of Medicine Provides New Data about Breast Diseases and Conditions (Endothelial cell colony forming units derived from malignant breast diseases are resistant to tumor necrosis factor-alpha-induced apoptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Breast Diseases and Conditions. According to news reporting out of Taipei, Taiwan, by NewsRx editors, research stated, "Mobilisation of endothelial progenitor cells (EPCs) from the bone marrow is a crucial step in the formation of de novo blood vessels, and levels of peripheral blood EPCs have been shown to be elevated in certain malignant states. Using flow cytometry and a Hill-based colony forming unit (CFU) assay, the present study indicated that higher levels of CD34 and vascular
endothelial growth factor receptor 2 (VEGFR2) double-positive EPCs, as well as increased formation of endothelial cell colony-forming units (EC-CFUs) are associated with benign and malignant breast diseases, providing possible indicators for breast disease detection.

Our news journalists obtained a quote from the research from the School of Medicine, "Gene expression profiles revealed a genetic difference between CD34(+) VEGFR2 (+) EPCs and EC-CFUs. Decreased expression of tumour necrosis factor receptor 2 (TNFR2) signalling-related genes and inhibition of tumour necrosis factor (TNF)-induced signalling were demonstrated in EC-CFUs derived from patients with malignant breast disease in comparison with those from healthy controls."

According to the news editors, the research concluded: "Interestingly, our data provided the first evidence that EC-CFUs derived from patients with malignant breast disease were resistant to TNF-alpha-induced apoptosis, indicating a plausible target for future therapeutic interventions."

For more information on this research see: Endothelial cell colony forming units derived from malignant breast diseases are resistant to tumor necrosis factor-alpha-induced apoptosis. Scientific Reports, 2016;6():1-12. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting C.P. Chou, Natl Def Med Center, Sch Med, Taipei, Taiwan. Additional authors for this research include S.S. Jiang, H.B. Pan, Y.C. Yen, H.H. Tseng, Y.T. Hung, S.H. Wang, Y.L. Chen and Y.W. Chen.

Keywords for this news article include: Taipei, Taiwan, Asia, Skin and Connective Tissue Diseases and Conditions, Intercellular Signaling Peptides and Proteins, Breast Diseases and Conditions, Skin Diseases and Conditions, Tumor Necrosis Factor-alpha, Tumor Necrosis Factors, Endothelial Cells, Membrane Proteins, Blood Proteins, Glycoproteins, Monokines, Cytokines, Apoptosis, Genetics, School of Medicine.

Drugs and Therapies - Pharmaceutical Research

Findings from School of Medicine Provides New Data on Pharmaceutical Research (Immune checkpoint inhibitors for cancer treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmaceutical Research. According to news reporting originating in Daejeon, South Korea, by NewsRx journalists, research stated, "During immune responses antigen-specific T cells are regulated by several mechanisms, including through inhibitory receptors and regulatory T cells, to avoid excessive or persistent immune responses. These regulatory mechanisms, which are called 'immune checkpoints', suppress T cell responses, particularly in patients with chronic viral infections and cancer where viral antigens or tumor antigens persist for a long time and contribute to T cell exhaustion."

Financial supporters for this research include Ministry of Health and Welfare, National Research Foundation of Korea.
The news reporters obtained a quote from the research from the School of Medicine, "Among these regulatory mechanisms, cytotoxic T lymphocyte associated protein-4 (CTLA-4) and programmed cell death 1 (PD-1) are the most well-known receptors and both have been targeted for drug development. As a result, anti-CTLA-4 and anti-PD-1 (or anti-PD-L1) antibodies were recently developed as immune checkpoint inhibitors for use in cancer treatments."

According to the news reporters, the research concluded: "In this review we describe several receptors that function as immunological checkpoints as well as the pharmaceuticals that target them."

For more information on this research see: Immune checkpoint inhibitors for cancer treatment. *Archives of Pharmacal Research*, 2016;39(11):1577-1587. *Archives of Pharmacal Research* can be contacted at: Pharmaceutical Soc Korea, 1489-3 Suhcho-Dong, Suhcho-Ku, Seoul 137-071, South Korea. showed significant values for differentiating CD from PIL included multiple-site lesions, longitudinal ulcer, irregular ulcer, and intraluminal proliferative mass (P < 0.05). The CTE parameters that were useful in the identification of the two conditions included involvement of <= 3 segments, circular thickening of the bowel wall, wall thickness > 8 mm, aneurysmal dilation, stricture with proximal dilation, 'comb sign', mass showing the 'sandwich sign', and intussusceptions (P < 0.05). The sensitivity, specificity, accuracy, positive predictive value, and negative predictive value of the differentiation model were 91.8%, 96.4%, 93.6%, 97.5%, and 88.5%, respectively. The cutoff value was 0.5. The area under the ROC curve was 0.989.

According to the news editors, the research concluded: "The differentiation model that integrated the various parameters together may yield a high diagnostic efficacy in the differential diagnosis between CD and PIL."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i42.9411. This DOI is a link to an online electronic document that is either free or for purchase.

**Lung Diseases and Conditions - Pneumonia**

**Findings from School of Medicine in Pneumonia Reported (Dual-seq transcriptomics reveals the battle for iron during Pseudomonas aeruginosa acute murine pneumonia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Pneumonia have been published. According to news reporting originating in Morgantown, West Virginia, by NewsRx journalists, research stated, "Determining bacterial gene expression during infection is fundamental to understand pathogenesis. In this study, we used dual RNA-seq to simultaneously measure P. aeruginosa and the murine host's gene expression and response to respiratory infection."
The news reporters obtained a quote from the research from the School of Medicine, "Bacterial genes encoding products involved in metabolism and virulence were differentially expressed during infection and the type III and VI secretion systems were highly expressed in vivo. Strikingly, heme acquisition, ferric-enterobactin transport, and pyoverdine biosynthesis genes were found to be significantly up-regulated during infection. In the mouse, we profiled the acute immune response to P. aeruginosa and identified the pro-inflammatory cytokines involved in acute response to the bacterium in the lung. Additionally, we also identified numerous host iron sequestration systems upregulated during infection."

According to the news reporters, the research concluded: "Overall, this work sheds light on how P. aeruginosa triggers a pro-inflammatory response and competes for iron with the host during infection, as iron is one of the central elements for which both pathogen and host fight during acute pneumonia."

For more information on this research see: Dual-seq transcriptomics reveals the battle for iron during Pseudomonas aeruginosa acute murine pneumonia. Scientific Reports, 2016;6():14-25. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting M. Barbier, West Virginia Univ, Sch Med, Dept. of Microbiol Immunol & Cell Biol, Morgantown, WV 26505, United States. Additional authors for this research include A.G. Oglesby-Sherrouse, A. Wilks and M. Barbier.

Proteins - Mitochondrial Proteins

Findings from School of Pharmacy Yields New Findings on Mitochondrial Proteins (Identification of small molecules that bind to the mitochondrial protein mitoNEET)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Mitochondrial Proteins. According to news reporting out of Morgantown, West Virginia, by NewsRx editors, research stated, "MitoNEET (CISD1) is a 2Fe-2S iron-sulfur cluster protein belonging to the zinc-finger protein family. Recently mitoNEET has been shown to be a major role player in the mitochondrial function associated with metabolic type diseases such as obesity and cancers."

Financial supporters for this research include Michael J. Fox Foundation for Parkinson’s Research, National Institute of General Medical Sciences.

Our news journalists obtained a quote from the research from the School of Pharmacy. "The anti-diabetic drug pioglitazone and rosiglitazone were the first identified ligands to mitoNEET. Since little is known about structural requirements for ligand binding to
mitoNEET, we screened a small set of compounds to gain insight into these requirements. We found that the thiazolidinedione (TZD) warhead as seen in rosiglitazone was not an absolutely necessity for binding to mitoNEET."

According to the news editors, the research concluded: "These results will aid in the development of novel compounds that can be used to treat mitochondrial dysfunction seen in several diseases."

Our news journalists report that additional information may be obtained by contacting W.J. Geldenhuys, West Virginia Univ, Sch Pharm, Dept. of Pharmaceut Sci, Morgantown, WV 26506, United States. Additional authors for this research include H.M. Yonutas, D.L. Morris, P.G. Sullivan, A.S. Darvesh and T.C. Leeper.

**Gastroenterology**

**Findings from School of Science Reveals New Findings on Gastroenterology (3D engineered In vitro hepatospheroids for studying drug toxicity and metabolism)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gastroenterology is now available. According to news originating from Maharashtra, India, by NewsRx correspondents, research stated, "Drug toxicity is one of the reasons for late stage drug attrition, because of hepatotoxicity. Various in vitro liver models like primary human hepatocytes, immortalized human hepatic cell lines, liver slices and microsomes have been used; but limited by viability, hepatic gene expression and function."

Financial support for this research came from Jawaharlal Nehru Memorial Fund.

Our news journalists obtained a quote from the research from the School of Science, "The 3D-engineered construct of hepatocyte-like-cells (HLCs) differentiated from stem cells, may provide a limitless source of hepatocytes with improved reproducibility. Towards this end, we used hepatospheroids (diameter = 50-80 pm) differentiated from human-umbilical-cord-mesenchymal stem cells (hUC-MSCs) on 3D scaffold GEVAC (Gelatin-vinyl-acetate -copolymer) as in vitro model for studying drug metabolism/toxicity. Our data demonstrated that hUC-MSCs-derived-hepatospheroids cultured on GEVAC expressed significantly higher drug-metabolizing enzymes (CYPs) both at mRNA and activity level compared to 2D culture, using HR-LC/MS. We further showed that hepatospheroids convert phenacetin (by CYP1A2) and testosterone (by CYP3A4) to their human-specific metabolites acetaminophen and 6 beta-
hydroxytestosterone with a predictive clearance rate of 0.011 ml/h/10(6) cells and 0.021 ml/h/10 (6) cells respectively, according to first-order kinetics. Hepatotoxicity was confirmed by exposing hepatospheroids to ethanol and acetaminophen; ROS generation cell viability, cytoskeleton structure, elevation of liver function enzymes, i.e. AST and ALT, was analyzed.

According to the news editors, the research concluded: "To the best of our knowledge, this is the first report to use hUC-MSCs-derived-hepatospheroids on GEVAC in vitro model for drug metabolism/toxicity study; which can replace the conventional 2D-models used in drug development."

The news correspondents report that additional information may be obtained from A. Khanna, SVKMS NMIMS Deemed To Be Univ, Sunandan Divatia Sch Sci, Dept. of Biol Sci, Bombay 400056, Maharashtra, India. Additional authors for this research include P. Nair and A. Khanna.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.tiv.2016.10.009. This DOI is a link to an online electronic document that is either free or for purchase.

FISH. A subset of ESs (5/51) showed biallelic deletion of SMARCB1 with no overexpression of any miRNA, suggesting these tumors could be the counterpart of pediatric RT, at least genetically. Another subset (5/51) was genetically either intact or monoallelic deleted with at least threefold overexpression of one of miR-206,-381,-671-5p, suggesting epigenetic regulation only. 39/51 ESs had a biallelic deletion (>20% by FISH and/or by MLPA) but with overexpressed miR-206,-381, and 671-5p, suggesting intratumoral heterogeneity, i.e., both genetic and epigenetic regulation. At least threefold overexpression of one of miR-206,-381, and 671-5p was detected in all MPNSTs, EMCSs, SSs and 7 MCs. Except for ESs, four SSs and one MPNST, there was no event above threefold overexpression of miR-765 among all 195 tested tumors. Our results suggest a general role of miR-206,-381, and 671-5p in SMARCB1 gene silencing of ES, MC, EMCS, MPNST and SS.

According to the news reporters, the research concluded: "In the future, miR-765 could possibly be a diagnostic tool for ES because of its 97% specificity and 80% sensitivity."

Our news journalists report that additional information may be obtained by contacting Z. Sapi, Semmelweis University, Dept. of Pathol & Expt Canc Res, Budapest, Hungary. Additional authors for this research include G. Papp, M. Szendroi, Z. Papai, V. Plotar, T. Krausz and C.D.M. Fletcher.

**Drugs and Therapies - Antifungals**

**Findings from Semmelweis University Reveals New Findings on Antifungals (Development and characterization of the voriconazole loaded lipid-based nanoparticles)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antifungals is now available. According to news reporting originating in Budapest, Hungary, by NewsRx journalists, research stated, "The number of topical fungal infections is growing, mostly owing to immunosuppressive therapy. Several topical fungal infections, such as eye mycoses, can be treated by local administration of antifungal drugs."

The news reporters obtained a quote from the research from Semmelweis University, "One major group of the antifungal agents is triazole, such as voriconazole (VCZ), which is used as the first line treatment of aspergillosis. A disadvantage of VCZ is its low water solubility making the drug difficult to administer in a liquid preparation. The lipid-based nanoparticles (LNP) have attracted increasing attention due to their advantageous properties. Contrarily to the conventional carrier systems, LNP can improve the poor solubility of topically used drugs, such as VCZ. Therefore, LNP represents promising alternatives to traditional carrier..."
systems. The aim of the study was to formulate VCZ loaded lipid-based nanoparticles (VCZ-LNP) by high pressure homogenization (HPH). The developed LNPs were characterized by particle size analysis, IR spectroscopy, differential scanning calorimetry, dialysis test and antifungal efficacy studies. The particle size of the optimized nanoparticles from the selected lipid base, Witepsol ® W35, was 182 +/- 4.1 nm after five cycles of homogenization at 600 bar."

According to the news reporters, the research concluded: "The antifungal study confirmed that the optimized VCZ-LNP inhibited the fungus reproduction."

For more information on this research see: Development and characterization of the voriconazole loaded lipid-based nanoparticles. *Journal of Pharmaceutical and Biomedical Analysis*, 2017;132():184-189. *Journal of Pharmaceutical and Biomedical Analysis* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Oncology - Esophageal Cancer**

**Findings from Seoul National University in the Area of Esophageal Cancer Described (Risk Factors for Local Recurrence and Optimal Length of Esophagectomy in Esophageal Squamous Cell Carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Esophageal Cancer is now available. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "The risk factors for local recurrence in residual esophagus after esophagectomy have not been well documented. This study aimed to identify risk factors of local recurrence and optimal length of esophageal resection in esophageal cancer."

The news correspondents obtained a quote from the research from Seoul National University. "Patients who underwent curative esophagectomy with more than 2 years of follow-up were included. Patients who received preoperative chemoradiation or in whom the ex vivo length of proximal margin (LPM) from resected tumor was not documented in the pathologic report were excluded. A total of 551 patients from January 1995 to February 2013 were included. Complete resection was possible in 516 patients (94%), and mean LPM was 3.4 +/- 2.5 cm. Sex, age, location of tumor, location of anastomosis, minimally invasive esophagectomy, three-field lymphadenectomy, cell type, differentiation, proximal resection
margin status, tumor size, number of dissected lymph nodes, and T stages were not risk factors for local recurrence in multivariate analysis. The N stage (p = 0.034) and LPM (p = 0.007) were risk factors for local recurrence in multivariate analysis. The LPM was not related to local recurrence in N0, but 5-year freedom from local recurrence was higher for LPM of 5 cm or greater in ND esophageal cancer (72% in LPM less than 5 cm versus 93% in LPM of 5 cm or greater, p = 0.040). Local recurrence after esophagectomy in esophageal cancer is related to lymphatic metastasis rather than to proximal margin status, which raises the possibility that the main mechanism of local recurrence is submucosal lymphatic metastasis."

According to the news reporters, the research concluded: "Esophagectomy with LPM more than 5 cm is recommended for esophageal cancer with nodal metastasis."

Our news journalists report that additional information may be obtained by contacting C.H. Kang, Seoul National University, Seoul National University, Coll Med, Dept. of Thorac & Cardiovasc Surg, Seoul, South Korea. Additional authors for this research include Y. Hwang, H.J. Lee, I.K. Park and Y.T. Kim.

Oncology - Carcinomas
Findings from Shandong Academy of Medical Sciences in the Area of Carcinomas Described (Differentiating Brain Metastases from Different Pathological Types of Lung Cancers Using Texture Analysis of T1 Postcontrast MR)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Carcinomas are discussed in a new report. According to news reporting from Jinan, People's Republic of China, by NewsRx journalists, research stated, "The goal of this study was to investigate the feasibility of differentiating brain metastases from different types of lung cancers using texture analysis (TA) of T1 postcontrast MR images. TA was performed, and four subset textures were extracted and calculated separately."

The news correspondents obtained a quote from the research from the Shandong Academy of Medical Sciences, "The capability of each texture to classify the different types of lung carcinoma was investigated using the Kruskal-Wallis test and receiver operating
characteristic analysis. K-nearest neighbor (KNN) classifier model and back-propagation artificial neural network (BP-ANN) classifier model were used to build models and improve the predictive ability of TA. Texture-based lesion classification was highly specific in differentiating brain metastases originated from different types of lung cancers, with misclassification rates of 3.1%, 4.3%, 5.8%, and 8.1%, respectively, for small cell lung carcinoma, squamous cell carcinoma, adenocarcinoma, and large cell lung carcinoma. The BP-ANN model had a better predictive ability than the KNN model. No texture feature could distinguish between all four types of lung cancer. TA may predict the differences among various pathological types of lung cancer with brain metastases."

According to the news reporters, the research concluded: "The texture parameters, which reflect the tumor histopathology structure, may serve as an adjunct tool for clinically accurate diagnoses and deserves further investigation."

Our news journalists report that additional information may be obtained by contacting B.S. Li, Shandong Academy Med Sci, Shandong Canc Hosp, Dept. of Radiat Oncol, Key Lab Radiat Oncl Shandong ProvChest Sect, Jinan, People's Republic of China. Additional authors for this research include Y. Mao, H.S. Li, G. Yu, H.L. Wan and B.S. Li.

Keywords for this news article include: Jinan, People's Republic of China, Asia, Lung Neoplasms, Lung Cancer, Carcinomas, Oncology, Shandong Academy of Medical Sciences.

Chemistry - Chemistry and Materials Research

Findings from Shandong University Broaden Understanding of Chemistry and Materials Research (Multifunctional Mixed Micelles for Efficient Docetaxol Delivery for Cancer Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Chemistry - Chemistry and Materials Research. According to news reporting out of Shandong, People's Republic of China, by NewsRx editors, research stated, "The objective of this study was to build mixed micelles based on two functional co-polymers, including the redox-sensitive polymer-drug conjugate methoxy poly(ethylene glycol)-poly(2-benzyl l-glutamate)-disulfide-docetaxel (PEG-PBLG-SS-SS-DTX) and the actively targeting methoxy poly(ethylene glycol)-folic acid (PEG-FA), for enhanced target specificity and improved anticancer efficiency of docetaxel (DTX). The spherical PEG-PBLG-SS-SS-DTX/PEG-FA mixed micelles prepared by the dialysis method revealed a narrowly distributed size at 129.7 +/- 2.1nm with low polydispersity of 0.10 +/- 0.02."

Financial supporters for this research include National Natural Science Foundation of China, NSFC.

Our news journalists obtained a quote from the research from Shandong University,
"Furthermore, the critical micelle concentration of the mixed micelles was 5.08gmL(-1), indicating excellent self-assembly ability in water and stability against dilution in blood circulation. The invitro release study revealed that the conjugated DTX was rapidly released in response to dl-dithiothreitol (DTT), a reducing agent. Only 12.3% of DTX was released from the mixed micelles after 120h in the absence of DTT. However, the accumulative release of DTX dramatically accelerated and reached more than 40% in 120h after addition of DTT. The invitro cytotoxicity, cellular uptake and cell apoptosis experiments on the mixed micelles were performed using MTT assay, fluorescence inverted microscopy and flow cytometric analysis, and 4,6-diamidino-2-phenylindole (DAPI) staining, respectively, on folate receptor (FR)-negative A549 and FR-positive MCF-7 cells. The mixed micelles could be taken up efficiently by MCF-7 cells by FR-mediated endocytosis compared with PEG-PBLG-SS-DTX micelles. Furthermore, remarkable cytotoxicity and cell apoptosis were identified for the mixed micelles against MCF-7 cells, which was consistent with the results of the cellular uptake study."

According to the news editors, the research concluded: "On the basis of these results, the redox-sensitive PEG-PBLG-SS-DTX/PEG-FA mixed micelles using FA as a targeting ligand revealed prominent antitumor efficiency and might be a latent drug carrier for cancer chemotherapy."

Our news journalists report that additional information may be obtained by contacting Y.X. Luan, Shandong University, Sch Pharmaceut Sci, Jinan 250012, Shandong, People's Republic of China. Additional authors for this research include W.X. He, H.Y. Zhang, C.Z. Huang, D.J. Zhao and Y.X. Luan.

Cardiovascular Diseases and Conditions - Thrombosis

Findings from Shandong University Update Understanding of Thrombosis (Neoadjuvant Transcatheter Arterial Chemoembolization For Biliary Tumor Thrombosis: A Retrospective Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Thrombosis. According to news reporting from Shandong, People's Republic of China, by NewsRx journalists, research stated, "Curative hepatectomy and tumor thrombectomy for hepatocellular carcinoma with complicating biliary tumor thrombosis (HCC/BTT) is associated with high surgical morbidity and mortality. This retrospective study evaluated the effectiveness
and safety of neoadjuvant transcatheter arterial chemoembolization (TACE) in HCC/BTT patients scheduled for curative resection."

The news correspondents obtained a quote from the research from Shandong University, "Thirty consecutive patients with diagnosed HCC/BTT were hospitalized for neoadjuvant TACE and elective curative liver resection (group A; n = 20) or curative liver resection alone (group B; n = 10). The primary outcome measure was median survival. Group A had a significantly shorter overall operative time (160 +/- 25 versus 190 +/- 35 min; p<.01) and duration of inflow control (14.3 +/- 3.6 versus 25.1 +/- 5.1 min; p<.01) and significantly less intraoperative blood loss (150 +/- 35 versus 520 +/- 75 ml; p<.01) and transfusion (100 +/- 40 versus 375 +/- 55 ml; p<.01) as compared to group B. Among patients undergoing both thrombectomy and curative resection, the median survival of group A was significantly longer than that of group B (28.5 [9-54] versus 21.5 [6-39] months; p<.01); among those who received thrombectomy alone, the median survival of group A was also significantly longer than that of group B (12.8 [6-25] versus 4.5 [2-7] months; p<.01)."

According to the news reporters, the research concluded: "Neoadjuvant TACE significantly reduced the surgical risk of curative liver resection and significantly prolonged median survival in HCC patients with complicating BTT."

Our news journalists report that additional information may be obtained by contacting H. Tian, Shandong University, Shandong Academy Med Sci, Shandong Canc Hosp, Jinan, Shandong, People's Republic of China. Additional authors for this research include P. Li, K. Cui, Z.D. Wang, F.C. Yu, H. Tian and S. Li.

**Enterovirus**

**Findings from Shandong University Yields New Data on Enterovirus (In Vitro Assessment of Combinations of Enterovirus Inhibitors against Enterovirus 71)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enterovirus have been published. According to news reporting originating in Qingdao, People's Republic of China, by NewsRx journalists,
research stated, "Enterovirus 71 (EV-A71) is a major causative pathogen of hand, foot, and mouth disease (HFMD) epidemics. No antiviral therapies are currently available for treating EV-A71 infections."

Financial supporters for this research include National Natural Science Foundation of China (NSFC), Science and Technology Commission of Shanghai Municipality (STCSM).

The news reporters obtained a quote from the research from Shandong University, "Here, we selected five reported enterovirus inhibitors (suramin, itraconazole [ITZ], GW5074, rupintrivir, and favipiravir) with different mechanisms of action to test their abilities to inhibit EV-A71 replication alone and in combination. All selected compounds have anti-EV-A71 activities in cell culture. The combination of rupintrivir and ITZ or favipiravir was synergistic, while the combination of rupintrivir and suramin was additive. The combination of suramin and favipiravir exerted a strong synergistic antiviral effect. The observed synergy was not due to cytotoxicity, as there was no significant increase in cytotoxicity when compounds were used in combinations at the tested doses. To investigate the potential inhibitory mechanism of favipiravir against enterovirus, two favipiravir-resistant EV-A71 variants were independently selected, and both of them carried an S121N mutation in the finger subdomain of the 3D polymerase. Reverse engineering of this 3D S121N mutation into an infectious clone of EV-A71 confirmed the resistant phenotype. Moreover, viruses resistant to ITZ or favipiravir remained susceptible to other inhibitors. Most notably, combined with ITZ, rupintrivir prevented the development of ITZ-resistant variants."

According to the news reporters, the research concluded: "Taken together, these results provide a rational basis for the design of combination regimens for use in the treatment of EV-A71 infections."

For more information on this research see: In Vitro Assessment of Combinations of Enterovirus Inhibitors against Enterovirus 71. Antimicrobial Agents and Chemotherapy, 2016;60(9):5357-5367. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Cyclohydrolase 1 in Vivo

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Hyperglycemia have been published. According to news reporting from Shandong, People's Republic of China, by NewsRx journalists, research stated, "GTP cyclohydrolase 1 (GCH1) deficiency is critical for endothelial nitric oxide synthase uncoupling in endothelial dysfunction. MicroRNAs (miRs) are a class of regulatory RNAs that negatively regulate gene expression."

The news correspondents obtained a quote from the research from Shandong University, "We investigated whether statins prevent endothelial dysfunction via miR-dependent GCH1 upregulation. Endothelial function was assessed by measuring acetylcholine-induced vasorelaxation in the organ chamber. MiR-133a expression was assessed by quantitative reverse transcription polymerase chain reaction and fluorescence in situ hybridization. We first demonstrated that GCH1 mRNA is a target of miR-133a. In endothelial cells, miR-133a was robustly induced by cytokines/oxidants and inhibited by lovastatin. Furthermore, lovastatin upregulated GCH1 and tetrahydrobiopterin, and recoupled endothelial nitric oxide synthase in stressed endothelial cells. These actions of lovastatin were abolished by enforced miR-133a expression and were mirrored by a miR-133a antagonim. In mice, hyperlipidemia- or hyperglycemia-induced ectopic miR-133a expression in the vascular endothelium, reduced GCH1 protein and tetrahydrobiopterin levels, and impaired endothelial function, which were reversed by lovastatin or miR-133a antagonim. These beneficial effects of lovastatin in mice were abrogated by in vivo miR-133a overexpression or GCH1 knockdown. In rats, multiple cardiovascular risk factors including hyperglycemia, dyslipidemia, and hyperhomocysteinemia resulted in increased miR-133a vascular expression, reduced GCH1 expression, uncoupled endothelial nitric oxide synthase function, and induced endothelial dysfunction, which were prevented by lovastatin. Statin inhibits aberrant miR-133a expression in the vascular endothelium to prevent endothelial dysfunction by targeting GCH1."

According to the news reporters, the research concluded: "Therefore, miR-133a represents an important therapeutic target for preventing cardiovascular diseases."

For more information on this research see: Inhibition of Aberrant MicroRNA-133a Expression in Endothelial Cells by Statin Prevents Endothelial Dysfunction by Targeting GTP Cyclohydrolase 1 in Vivo. Circulation, 2016;134(22):1752-1765. Circulation can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Findings from Shandong University in the Area of Esophageal Cancer Described (Longitudinal, observational study on associations between postoperative nutritional vitamin D supplementation and clinical outcomes in esophageal cancer patients ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Esophageal Cancer is now available. According to news reporting from Shandong, People's Republic of China, by NewsRx journalists, research stated, "Vitamin D can exert anticancer effect beyond bone and calcium metabolism. We aimed to investigate whether postoperative vitamin D supplementation affects quality of life (QOL) and survival in esophageal cancer (EC) patients."

The news correspondents obtained a quote from the research from Shandong University, "We utilized the widely used EORTC QLQ-C30 and QLQ-OES18 to assess QOL at EC diagnosis and 24 months after surgery. Generalized estimating equations (GEEs) were used to analyze the association of vitamin D supplement use with QOL. Kaplan-Meier method and Cox regression model were used to evaluate the prognostic value of vitamin D supplementation. The notably improved QOL were found among vitamin D supplementation users compared with non-users (p < 0.05). Kaplan-Meier analysis revealed that vitamin D supplement use was significantly associated with improved disease-free survival (DFS) (p = 0.030), but not related to overall survival (OS) (p = 0.303). The multivariable analysis further demonstrated vitamin D supplement use as an independent prognostic factor for DFS (p = 0.040; HR 0.610; 95% CI 0.381-0.978)."

According to the news reporters, the research concluded: "These results showed that vitamin D supplement use could serve as a promising intervention to enhancing QOL and prolonging DFS in EC."

For more information on this research see: Longitudinal, observational study on associations between postoperative nutritional vitamin D supplementation and clinical outcomes in esophageal cancer patients undergoing esophagectomy. *Scientific Reports*, 2016;6():1-10. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Oncology - Oral Squamous Cell Carcinoma

Findings from Shanghai Jiao-Tong University Broaden Understanding of Oral Squamous Cell Carcinoma (Overexpression of stathmin/oncoprotein 18 correlates with poorer prognosis and interacts with p53 in oral squamous cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Oral Squamous Cell Carcinoma are presented in a new report. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The stathmin/oncoprotein 18 (STMN1) is overexpressed in various human cancers. The aim of our study was to investigate its clinical significance and interaction with p53 in oral squamous cell carcinoma (OSCC)."

Our news editors obtained a quote from the research from Shanghai Jiao-Tong University, "Stathmin expression was assessed by Oncomine, Gene Expression Omnibus (GEO) database, western blotting, and reverse transcription polymerase chain reaction. We investigated the relationship between stathmin expression and clinical characteristics among 109 OSCC patients by immunohistochemical staining. The prognosis factors were analyzed using univariate and multivariate analysis. Immunoprecipitation assay and The Cancer Genome Atlas (TCGA) analysis were used to detect the relationship between mutant p53 and stathmin. Stathmin was overexpressed in OSCC. In immunohistochemical analysis, high stathmin expression correlated with gender (P = 0.040), T stage (P = 0.015), TNM stage (P = 0.045), and pathological differentiation (P = 0.000). We found a correlation between the stathmin expression and overall survival (P = 0.027). Multivariate analysis suggested only lymph node metastasis (P = 0.007) and stathmin expression (P = 0.013) as independent prognostic factors. There was interaction between stathmin and p53 in OSCC cell lines with mutant p53 through immunoprecipitation assay."

According to the news editors, the research concluded: "These results suggest that overexpression of stathmin could contribute to cancer progression/prognosis, and that interaction between p53 and stathmin may contribute to the gain-of-function of p53."

The news editors report that additional information may be obtained by contacting Z.Y. Zhang, Shanghai Jiao Tong University, Shanghai Peoples Hosp 9, Shanghai Key Lab Stomatol, Dept. of Oral Maxillofacial Head & Neck OncolSch Med, Shanghai 200011, People's Republic of China. Additional authors for this research include S.F. Jin, W.J. Tao, M.L. Zhang and Z.Y. Zhang.

Spermatogenesis

Findings from Shanghai Jiao-Tong University Broadens Understanding of Spermatogenesis (Dynamics of the Transcriptome during Human Spermatogenesis: Predicting the Potential Key Genes Regulating Male Gametes Generation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Spermatogenesis. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Many infertile men are the victims of spermatogenesis disorder. However, conventional clinical test could not provide efficient information on the causes of spermatogenesis disorder and guide the doctor how to treat it."

The news reporters obtained a quote from the research from Shanghai Jiao-Tong University, "More effective diagnosis and treating methods could be developed if the key genes that regulate spermatogenesis were determined. Many works have been done on animal models, while there are few works on human beings due to the limited sample resources. In current work, testis tissues were obtained from 27 patients with obstructive azoospermia via surgery. The combination of Fluorescence Activated Cell Sorting and Magnetic Activated Cell Sorting was chosen as the efficient method to sort typical germ cells during spermatogenesis. RNA Sequencing was carried out to screen the change of transcriptomic profile of the germ cells during spermatogenesis. Differential expressed genes were clustered according to their expression patterns."

According to the news reporters, the research concluded: "Gene Ontology annotation, pathway analysis, and Gene Set Enrichment Analysis were carried out on genes with specific expression patterns and the potential key genes such as HOXs, JUN, SPI, and TCF3 which were involved in the regulation of spermatogenesis, with the potential value serve as molecular tools for clinical purpose, were predicted."

For more information on this research see: Dynamics of the Transcriptome during Human Spermatogenesis: Predicting the Potential Key Genes Regulating Male Gametes Generation, Scientific Reports, 2016;6():19069. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting Z. Zhu, Dept. of Urology, Ren Ji Hospital, School of Medicine, Shanghai Jiao Tong University, 1630 Dongfang Road, Shanghai 200127, People's Republic of China. Curettage

Findings from Shanghai Jiao-Tong University Yields New Findings on Curettage (Management of Cesarean Scar Pregnancy Using Ultrasound-Guided Dilation and Curettage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Curettage is now available. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "To evaluate the potential risk factors associated with failed ultrasound-guided dilation and curettage (D&C) treatment of cesarean scar pregnancy (CSP). Retrospective study. University hospital. Fifty-one patients diagnosed with CSP and treated with ultrasound-guided D&C at Shanghai General Hospital of Shanghai Jiao Tong University."

The news correspondents obtained a quote from the research from Shanghai Jiao-Tong University, "Lesion resection using ultrasound-guided D&C. Clinical characteristics, vaginal bleeding, abdominal pain, the size of the gestational sac, cardiac motion, blood flow around the gestational sac, cesarean scar thickness, and serum beta-human chorionic gonadotropin (beta-hCG) levels were compared between the successful operation group and the failed operation group. Cesarean scar thickness was the main risk factor that determined the success of ultrasound-guided D&C. The success rates were 50% and 97.67% for those with cesarean scars <3 mm thick and those with scars >3 mm thick, respectively (p = .001). The success rate was also associated with the abundance of blood flow surrounding the capsule and size of the gestational sac (p < .005). Surgical success was not affected by abnormal vaginal bleeding, abdominal pain, cardiac motion, or serum beta-hCG levels. Ultrasound-guided D&C is the first choice for treating CSP if the cesarean scar is >3 mm thick, blood flow is not abundant, and the maximum diameter of the gestational sac is <30 mm."

According to the news reporters, the research concluded: "A transabdominal procedure is preferred for patients with high-risk factors."

Our news journalists report that additional information may be obtained by contacting Y.Y. Sun, Shanghai Jiao Tong University, Sch Med, Shanghai Gen Hosp, Dept. of Obstet & Gynecol, Shanghai 201600, People's Republic of China. Additional authors for this research include J. Sun, B. Cai, X.W. Xi, L. Yang and Y.Y. Sun.

**Nutritional and Metabolic Diseases and Conditions**

**Findings from Shanghai Jiao-Tong University in Type 2 Diabetes Reported (Glucose enhances rat islet function via stimulating CART expression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Cocaine- and amphetamine-regulated transcript (CART) is an anorexigenic peptide widely expressed in the central and peripheral nervous systems, as well as in endocrine cells. CART is markedly upregulated in the beta-cells of several rodent models of type-2 diabetes."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "The stimulatory effect of exogenous CART peptide on insulin secretion is CAMP dependent. Glucose is the most important regulator of islet function. However, the role of CART in glucose-potentiated insulin secretion remains unclear. Here, our results showed that glucose time- and dose-dependently elicited CART mRNA expression in rat islets. Both the glucokinase agonist GKA50 and the long-acting GLP-1 analogue exendin-4 increased CART mRNA expression. The protein kinase A (PKA) inhibitor H89 and the inactivation of cAMP response element binding protein (CREB) suppressed forskolin-stimulated CART mRNA expression. Furthermore, CART overexpression amplified insulin secretion from rat islets in response to glucose and forskolin, and ameliorated dexamethasone-impaired insulin secretion."

According to the news editors, the research concluded: "These findings suggest that islet-derived CART is involved, at least in part, in high glucose-potentiated pancreatic beta-cell function."

For more information on this research see: Glucose enhances rat islet function via stimulating CART expression. *Biochemical and Biophysical Research Communications*, 2016;481(1-2):84-89. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Chalcones

Findings from Shanghai Jiao-Tong University in the Area of Chalcones Described (Chalcone-benzoxaborole hybrids as novel anticancer agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Chalcones. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "In this study, we report the synthesis of a series of chalcone-benzoxaborole hybrid molecules and the evaluation of their anticancer activity. Their anticancer potency and toxicity were tested on three human cancer cell lines and two normal cell lines."

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "The 4-fluoro compound 15 was found to be the most potent compound with an IC50 value of 1.4 μM on SKOV3 cells. The 4-iodo compound 18 and 3-methoxy-4-amino compound 47 showed good potency on SKOV3 cells while exhibiting low toxicity on normal cells."

According to the news editors, the research concluded: "This work extended the application of benzoxaboroles to the field of anticancer research."

Oncology - Cancer Research

Findings from Shanghai Normal University Update Understanding of Cancer Research (Rap1A promotes ovarian cancer metastasis via activation of ERK/p38 and notch signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Research have been published. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "As one of the Ras-associated proteins, Rap1A has been linked to cancer initiation and development. However, the precise function of Rap1A in ovarian cancer is still not understood."

Financial supporters for this research include National Natural Science Foundation of China, National Key Research and Development Program of China, Ministry of Education of the People's Republic of China.

The news correspondents obtained a quote from the research from Shanghai Normal University, "Here, we show that Rap1A promotes ovarian cancer tumorigenesis and metastasis via stimulating cell proliferation, migration and invasion both in vivo and in vitro. Mechanistic study showed that Rap1A activates extracellular signal-regulated kinase (ERK), p38 mitogen-activated protein kinase (MAPK) and Notch pathways, leading to the enhanced expression of several epithelial-mesenchymal transition (EMT) markers such as slug, zeb1, vimentin, fibronectin, and MMP9. However, the pretreatment of Rap1A-overexpressing cells with the Notch inhibitor DAPT or ERK inhibitor (U0126) inhibited the up-regulated expression of those molecules."

According to the news reporters, the research concluded: "These findings provide the first evidence linking Rap1A with ovarian cancer development through the ERK/p38 and Notch signaling pathways, indicating that Rap1A may be used as a novel diagnostic marker or a therapeutic target for ovarian cancer."

Findings from Shanghai University Yields New Data on Science (Remarkable alterations of Nav1.6 in reactive astrogliosis during epileptogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science have been published. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Voltage-gated sodium channels (VGSCs) play a vital role in controlling neuronal excitability. Nav1.6 is the most abundantly expressed VGSCs subtype in the adult central nervous system and has been found to contribute to facilitate the hyperexcitability of neurons after electrical induction of status epilepticus (SE)."

Our news journalists obtained a quote from the research from Shanghai University, "To clarify the exact expression patterns of Nav1.6 during epileptogenesis, we examined the expression of Nav1.6 at protein and mRNA levels in two distinct animal models of temporal lobe epilepsy (TLE) including a post-SE model induced by kainic acid (KA) intrahippocampal injection and a kindling model evoked by pentylenetetrazole (PTZ). A prominent, seizure intensity-dependent increase of Nav1.6 expression in reactive astrocytes was observed in ipsilateral hippocampus of post-SE rats, reaching the peak at 21 days after SE, a time point during the latent stage of epileptogenesis. However, Nav1.6 with low expression level was selectively expressed in the hippocampal neurons rather than astrocytes in PTZ-kindled animals."

According to the news editors, the research concluded: "This seizure-related increase of a VGSCs subtype in reactive astrocytes after SE may represent a new mechanism for signal communication between neuron and glia in the course of epileptogenesis, facilitating the neuronal hyperexcitability."

For more information on this research see: Remarkable alterations of Nav1.6 in reactive astrogliosis during epileptogenesis. Scientific Reports, 2016;6():1-14. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting H.Y. Findings from Shanxi Medical University Update Understanding of Apoptosis (Overproduction of reactive oxygen species and activation of MAPKs are involved in apoptosis induced by PM2.5 in rat cardiac H9c2 cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Apoptosis. According to news originating from Taiyuan, People's Republic of China, by NewsRx correspondents, research stated, "Epidemiological studies show a positive correlation between the air levels of fine particulate matter (PM2.5) and cardiovascular disorders, but how PM2.5 affects cardiomyocytes has not been studied in great deal. The aim of the present study was to obtain an insight into the links among intracellular levels of reactive oxygen species (ROS), apoptosis and mitogen-activated protein kinases (MAPKs) in rat cardiac H9c2 cells exposed to PM2.5."

Our news journalists obtained a quote from the research from Shanxi Medical University, "H9c2 cells were incubated with PM2.5 at 100-800 ?g ml(-1) to evaluate the effects of PM2.5 on cell viability, cell apoptosis, intracellular levels of ROS and expression of apoptosis-related proteins as well as activation of MAPKs. PM2.5 decreased cell viability, increased the cell apoptosis rate and intracellular ROS production in a concentration-dependent manner. PM2.5 decreased the Bcl-2/Bax ratio and increased cleaved caspase-3 levels. A Western blots study showed up-regulation of phosphorylated MAPKs including extracellular signal-regulated protein kinases (ERKs), c-Jun NH2-terminal kinases (JNKs) and p38 MAPK in the PM2.5-treated cells. The p38 MAPK inhibitor SB239063 attenuated whereas the ERKs inhibitor PD98059 augmented the effects of PM2.5 on apoptosis and the expression of related proteins."

According to the news editors, the research concluded: "PM2.5 decreases cell viability and increases apoptosis by enhancing intracellular ROS production and activating the MAPKs signaling pathway in H9c2 cells. The MAPKs signaling pathway could be a new promising target for clinical therapeutic strategies against PM2.5-induced cardiac injury."

For more information on this research see: Overproduction of reactive oxygen species and activation of MAPKs are involved in apoptosis induced by PM2.5 in rat cardiac H9c2 cells. Journal of Applied Toxicology, 2015;36(4):609-17. (Wiley-Blackwell - www.wiley.com/; Journal of Applied Toxicology - onlinelibrary.wiley.com/journal/10.1002/(ISSN)1099-1263)

Findings from Shihezi University Has Provided New Data on Ethnopharmacology (Protective effects of seed melon extract on CCl4-induced hepatic fibrosis in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Ethnopharmacology are presented in a new report. According to news reporting originating from Shihezi, People's Republic of China, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: Citrullus lanatus ssp. vulgaris var. megalaspermus Lin et Chao, was also known as watermelon belongs to family Cucurbitaceae, variously used as healthy food and in the treatment of liver and lungs problems. Currently, Citrullus lanatus has become a major economic crop of medicinal and edible effects with regional characteristics."

Financial support for this research came from Support Technology Program of Xinjiang Production and Construction Corps.

Our news editors obtained a quote from the research from Shihezi University, "This study was designed to evaluate the hepatoprotective and antioxidant activity of the seed melon (Citrullus lanatus ssp. vulgaris var. megalaspermus Lin et Chao) extract (SME) against carbon tetrachloride (CCl4) induced hepatic fibrosis in mice. In this study, mice were randomly divided into 7 groups, including normal control, model, silymarin tablets as the positive control, SME 100, 200, 400, and 800 mg/kg. After 8 weeks, activities of serum alanine aminotransferase (ALT), aspartate aminotransferase (AST), triglycerides (TG), hyaluronic acid (HA) and laminin (LN) were checked. The levels of antioxidant enzymes such as superoxide dismutase (SOD), glutataion (GSH) and glutathione peroxidase (GSH-Px) were determined after SME administration. The hydroxyproline (HYP) levels, malondialdehyde (MDA) levels and histopathologic examinations of hepatocyte fibrosis were also determined. Additionally, effects of SME on alpha-smooth muscle actin (alpha-SMA) and transforming growth factor beta-1 (TGF-beta 1) protein expressions were determined. We found that SME could significantly lower the serum levels of hepatic enzyme markers AST, ALT, HA and LN (P < 0.01). Compared with the CCl4-only treatment group, levels of hepatic SOD and GSH-Px were significantly increased, and the MDA levels were remarkably decreased in mice treated by SME at medium dose (400 mg/kg) and high dose (800 mg/kg) (P < 0.01). A histological examination of the liver showed that lesions, including necrosis, lymphocyte infiltration and fatty degeneration, were partially healed by treatment with SME. The results of protein expressions studies displayed that SME could inhibit alpha-SMA and TGF-beta 1 protein expression (P < 0.01)."

According to the news editors, the research concluded: "The present results suggested that protective effect of SME against CCl4-induced hepatic fibrosis may rely on its effect on reducing oxidative stress and improving drug metabolizing enzyme activity in liver."

The news editors report that additional information may be obtained by contacting L.P. Tian, Shihezi Univ, Sch Pharm, Minist Educ, Key Lab Xinjiang Phytomed Resources, Shihezi 832000, People's Republic of China. Additional authors for this research include J.H.

Cell Research - Cell Adhesion Molecules

Findings from Shihezi University Has Provided New Information about Cell Adhesion Molecules (Meta-analysis of downregulated E-cadherin as a poor prognostic biomarker for cervical cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cell Research - Cell Adhesion Molecules. According to news reporting originating in Xinjiang, People's Republic of China, by NewsRx journalists, research stated, "This meta-analysis was conducted to evaluate the diagnostic and prognostic functions of E-cadherin expression in cervical cancer. PubMed and other databases were searched for articles associated with E-cadherin and cervical cancer."

The news reporters obtained a quote from the research from Shihezi University, "These articles were published before June 2015 and written in English or Chinese. Random-effects model was used to pool odds ratios on the heterogeneity test in the meta-analysis. All of 20 studies were analyzed, in which 522 (42.6%) subjects exhibited reduced E-cadherin expression. Evaluation of clinicopathologic features showed that the downregulation of E-cadherin was related to the overall survival, clinicopathological parameters and age. Downregulation of E-cadherin in cervical cancer patients showed poor overall survival."

According to the news reporters, the research concluded: "Therefore, E-cadherin may be a metastasis-suppressor gene in cervical cancer."

Our news correspondents report that additional information may be obtained by contacting J. Peng, Dept. of Pathology, Shihezi University School of Medicine & the Key Laboratories for Xinjiang Endemic & Ethnic Diseases, Chinese Ministry of Education, Shihezi, Xinjiang 832002, People's Republic of China. Findings from Shiraz University in Leptospira Reported (Prevalence of renal lesions in slaughtered cattle in Shiraz, Iran, and detection of Leptospira in them by nested PCR-RFLP)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Leptospira. According to news reporting from Shiraz, Iran, by NewsRx journalists, research stated, "Renal diseases in cattle are frequently not recognized due to the subclinical conditions. Some species of Leptospira are the main cause of infectious agents that damage the kidneys and lead to abortion and economic losses in cattle and are also of major concern in the public health."

The news correspondents obtained a quote from the research from Shiraz University, "This study was aimed to assess the prevalence of renal lesions of slaughtered cattle in the Shiraz abattoir and to determine the correlation between rejected kidneys and infection with Leptospira using nested PCR-restriction fragment length polymorphism (RFLP) techniques. Out of 1000 inspected animals, 205 (20.5 %) revealed the renal lesions. Chronic nephritis (7.5 %), white-spotted kidney (7.3 %), and petechial hemorrhage (3.5 %) were the most prevalent forms of the lesions. A direct correlation between increasing the age and significant increase in the rate of lesions was also observed (P = 0.03). Using nested PCR-RFLP assay, 40.8 % of the tested kidneys were turned to be infected to the pathogenic species of Leptospira. The risk of infection of the kidneys with white spot to pathogenic species of Leptospira (53.8 %) was more than that of the kidneys with other lesions (25.0 %) (P = 0.014). The odd ratio indicates that the kidneys with white spot lesions are likely to be infected with pathogenic species of Leptospira, five times greater than other lesions. This study showed that renal lesions especially white-spotted kidney, which were considerably associated with Leptospira in slaughtered cattle in Shiraz, were very high."

According to the news reporters, the research concluded: "This is important in terms of public health and in particular, increases the risk of transmission of disease to human specially in the high-risk careers including farmers, veterinarians, and abattoir workers."

Our news journalists report that additional information may be obtained by contacting S. Hosseinzadeh, Shiraz Univ, Sch Vet Med, Dept. of Food Hyg, Shiraz 744169155, Iran. Additional authors for this research include S. Hosseinzadeh, S.S. Shekarforoush and A. Samiei.

Leukocyte Diseases and Conditions - Neutropenia

Findings from Shizuoka Prefectural General Hospital in the Area of Neutropenia Described (Augmented Renal Clearance in Patients With Febrile Neutropenia is Associated With Increased Risk for Subtherapeutic Concentrations of Vancomycin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Leukocyte Diseases and Conditions - Neutropenia are discussed in a new report. According to news reporting originating in Shizuoka, Japan, by NewsRx journalists, research stated, "Augmented renal clearance (ARC) has frequently been observed in critically ill patients. The risk factors for ARC in patients, including those in the general ward, and their influences on vancomycin (VCM) treatment remain unclear."

The news reporters obtained a quote from the research from Shizuoka Prefectural General Hospital, "The aims of this study were to investigate the risk factors for ARC and to evaluate the influence of ARC on the pharmacokinetic parameters of VCM. This study included a total of 292 patients with VCM treatment who had normal serum creatinine concentrations. ARC was defined by an estimated creatinine clearance $\geq 130 \text{ mL.min}^{-1}.1.73 \text{ m}^{-2}$. The risk factors for ARC were determined with stepwise logistic regression analysis. The pharmacokinetic parameters of VCM were estimated through the Bayesian method using a 2-compartment model. ARC was observed in 48 patients (16.4%). Age $\leq 65$ years [odds ratio (OR): 5.77; 95% CI: 2.89-11.97; $P < 0.0001$], brain injury (OR: 5.11; 95% CI: 1.49-17.57; $P = 0.0086$), febrile neutropenia (OR: 2.76; 95% CI: 1.11-6.67; $P = 0.0086$), and a mean volume of infusion fluid $\geq 1500 \text{ mL/d}$ (OR: 2.53; 95% CI: 1.27-5.16; $P = 0.0091$) were independent risk factors for the occurrence of ARC. The patients with ARC exhibited higher VCM clearance values than the non-ARC patients. The median trough serum concentrations of VCM were 7.4 (interquartile range: 5.2-11.6) mcg/mL in the ARC patients and 12.2 (8.9-16.3) mcg/mL in the non-ARC patients ($P < 0.0001$). Subtherapeutic trough concentrations of VCM ($<10.0 \text{ mcg/mL}$) were found in 68.8% of the ARC patients and in 32.8% of the non-ARC patients ($P < 0.0001$). This observational study investigated the influence of febrile neutropenia on the emergency of ARC for the first time. ARC was strongly associated with VCM pharmacokinetics, and twothirds of the ARC patients had subtherapeutic VCM concentrations."

According to the news reporters, the research concluded: "In patients with ARC, individualized dosing regimens are required to achieve the target trough concentration."

For more information on this research see: Augmented Renal Clearance in Patients With Febrile Neutropenia is Associated With Increased Risk for Subtherapeutic Concentrations of Vancomycin. Therapeutic Drug Monitoring, 2016;38(6):706-710. Therapeutic Drug Monitoring can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Central Nervous System Diseases and Conditions —

**Findings from Sichuan University Broadens Understanding of Meningitis (Clinical features, Outcomes and Molecular Profiles of Drug Resistance in Tuberculous Meningitis in non-HIV Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System Diseases and Conditions - Meningitis are presented in a new report. According to news originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "Tuberculous meningitis continues to be a serious problem for physicians because it is difficult to make an early diagnosis and the consequences of delaying treatment are severe. The objective of this study is to provide data for the optimization of diagnostic and timely treatment of tuberculous meningitis."

Our news journalists obtained a quote from the research from Sichuan University, "Of the 401 human immunodeficiency virus (HIV)-negative tuberculous meningitis patients in our study, 332 were found to have an impaired blood brain barrier (82.8%). Nearly 17.0% of patients failed to be timely diagnosed. Headache (53.6%) and fever (48.6%) were the most common features, and Computed Tomography/Magnetic Resonance Imaging (CT/MRI) detected 96 patients (23.9%) with abnormal meningeal imaging. Cerebrospinal fluid real-time polymerase chain reaction was positive in 73.8% of the tuberculous meningitis patients, whereas, smears and cultures detected only 6.7% and 5.2%, respectively. Further analysis identified striking differences between drug-resistant and drug-susceptible tuberculous meningitis. Patients with drug resistance correlated with grave prognosis. Tuberculous meningitis diagnosis should overall embody clinical symptoms, laboratory and cerebral imaging findings, and more sensitive diagnostic approaches are still warranted."

According to the news editors, the research concluded: "Our data suggest cerebrospinal fluid polymerase chain reaction for mycobacterial DNA and molecular drug susceptibility testing as routine assays for suspected tuberculous meningitis patients, and observation of the blood brain barrier function could be performed for individual management."

For more information on this research see: Clinical features, Outcomes and Molecular Profiles of Drug Resistance in Tuberculous Meningitis in non-HIV Patients. *Scientific Reports*, 2016;6():19072. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from J. Zhang, Dept. of Laboratory Medicine, West China Hospital, Sichuan University, Chengdu 610041, Sichuan Province, People's Republic of China. Additional authors for this research

**Oncology - Breast Cancer**

**Findings from Sinai Urban Health Institute in the Area of Breast Cancer Described (Black:white disparities in breast cancer mortality in the 50 largest cities in the United States, 2005-2014)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news originating from Chicago, Illinois, by NewsRx correspondents, research stated, "This paper presents race-specific breast cancer mortality rates and the corresponding rate ratios for the 50 largest U.S. cities for each of the 5-year intervals between 2005 and 2014. The 50 largest cities in the U.S. were the units of analysis."

Our news journalists obtained a quote from the research from Sinai Urban Health Institute, "Numerator data were abstracted from national death files where the cause was malignant neoplasm of the breast (ICD-10 = C50) for women. based denominators were obtained from the U.S. Census Bureau for 2010-2014. To measure the racial disparity, we calculated Black: White rate ratios (RRs) and confidence intervals for each 5-year period. To determine whether changes over time in the disparity were statistically significant, we calculated a 2-sided z score for the change in the relative percent difference between the Black and White rates for 2005-2009 and 2010-2014. At the most recent time point (2010-2014), the RR was significantly greater than 1.00 in the US and 24 cities. The change in the Black: White disparity was statistically significant in five cities and the US. The percent difference increased significantly in Atlanta, GA (from 4.1 to 117.4, p< 0.001); San Antonio, TX (from 24.4 to 79.3, p = 0.034); and the US (from 39.7 to 43.1, p = 0.007). The percent difference decreased significantly in Memphis, TN (from 111.0 to 68.9, p = 0.043); Philadelphia, PA (from 43.1 to 23.5, p = 0.049); and Boston, MA (from 48.9 to 0.7, p = 0.022). This analysis provides updated city-level breast cancer mortality data for Black and White women through 2014, and reveals that in the US and 24 of the 43 largest US cities, Black women continue to die from breast cancer at a higher rate than their White counterparts."

According to the news editors, the research concluded: "Importantly, however, a few cities, Memphis, Boston and Philadelphia, showed a decrease in the Black: White breast cancer mortality disparity between 2005-2009 and 2010-2014."

For more information on this research see: Black:white disparities in breast cancer mortality in the 50 largest cities in the United States, 2005-2014. *Cancer Epidemiology*, 2016;45():169-173. *Cancer Epidemiology* can be contacted at: Elsevier Sci Ltd, The
Oncology - Gastric Cancer

Findings from Singapore National University Update Knowledge of Gastric Cancer (A simple biomarker scoring matrix for early gastric cancer detection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gastric Cancer have been presented. According to news reporting from Singapore, Singapore, by NewsRx journalists, research stated, "Gastric cancer (GC) is a major cause of death in many parts of the world. While 90% of early GC is curable by resection, only about 5% of patients diagnosed in the late stages survive beyond five years."

Funders for this research include Singapore Gastric Cancer Consortium, Translational and Clinical Research.

The news correspondents obtained a quote from the research from Singapore National University, "This provides strong impetus to push for early GC detection through the use of non-invasive biomarkers, before metastatic complications arise. It is also of strong medical interest to identify patients of the diffuse subtype at the earliest time possible, since the disease variant progresses very rapidly and is associated with much higher mortality rate. In this study, we compared quantitatively the gastric fluid proteome of 70 GC patients to 17 individuals with benign gastritis in search of potential biomarkers that aid in GC diagnosis, prognosis and subtype stratification. We report that as much as half of the gastric fluid proteome is subject to regulation in diseased states, and propose a simple biomarker panel scoring matrix for early GC detection with diagnostic sensitivity of 95.7%.

According to the news reporters, the research concluded: "We also demonstrate as proof-of-concept that a digitised record generated with SWATH-MS based on 380 protein abundance signatures from the gastric fluid could segregate patients with diffuse-type GC."

Our news journalists report that additional information may be obtained by contacting M.C.M. Chung, Singapore National University, Dept. of Biol Sci, Fac Sci, Singapore, Singapore. Additional authors for this research include W.W. Yong and M.C.M. Chung.

Mesotheliomas

Findings from Sir Charles Gairdner Hospital Yields New Data on Mesotheliomas (The IASLC Mesothelioma Staging Project: Proposals for Revisions of the T Descriptors in the Forthcoming Eighth Edition of the TNM Classification for Pleural...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mesotheliomas. According to news reporting out of Nedlands, Australia, by NewsRx editors, research stated, "The current T component for malignant pleural mesothelioma (MPM) has been predominantly informed by surgical data sets and consensus. The International Association for the Study of Lung Cancer undertook revision of the seventh edition of the staging system for MPM with the goal of developing recommendations for the eighth edition."

Funders for this research include Mesothelioma Applied Research Foundation, National Institutes of Health/National Cancer Institute Cancer Center.

Our news journalists obtained a quote from the research from Sir Charles Gairdner Hospital, "Data elements including detailed T descriptors were developed by consensus. Tumor thickness at three pleural levels was also recorded. An electronic data capture system was established to facilitate data submission. A total of 3519 cases were submitted to the database. Of those eligible for T-component analysis, 509 cases had only clinical staging, 836 cases had only surgical staging, and 642 cases had both available. Survival was examined for T categories according to the current seventh edition staging system. There was clear separation between all clinically staged categories except T1a versus T1b (hazard ratio = 0.99, p = 0.95) and T3 versus T4 (hazard ratio = 1.22, p = 0.09), although the numbers of T4 cases were small. Pathological staging failed to demonstrate a survival difference between adjacent categories with the exception of T3 versus T4. Performance improved with collapse of T1a and T1b into a single T1 category; no current descriptors were shifted or eliminated. Tumor thickness and nodular or rindlike morphology were significantly associated with survival. A recommendation to collapse both clinical and pathological T1a and T1b into a T1 classification will be made for the eighth edition staging system."

According to the news editors, the research concluded: "Simple measurement of pleural thickness has prognostic significance and should be examined further with a view to incorporation into future staging."

Our news journalists report that additional information may be obtained by contacting A.K. Nowak, Sir Charles Gairdner Hosp, Dept. of Med Oncol, Nedlands, WA, Australia. Additional authors for this research include K. Chansky, D.C. Rice, H.I. Pass, H.L. Kindler, L. Shemanski, A. Bille, R.C. Rintoul, H.F. Batirel, C.F. Thomas, J. Friedberg, S. Oncology - Cancer Genetics

Findings from Soochow University Broaden Understanding of Cancer Genetics [Clinical and molecular cytogenetic studies in ten patients with hematological malignancies characterized by t(20;21)(q11;q11) resulted from del(20q)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Genetics. According to news reporting from Suzhou, People's Republic of China, by NewsRx journalists, research stated, "This study reports 10 patients with hematological malignancies with t(20;21)(q11;q11) resulting from del(20q) (for example, der(20)del(20)(q11;q13)t(20;21)(q11;q11) and der(21)t(20;21)(q11;q11)) and described their clinical features and the possible prognostic significance of this abnormality. The t(20;21)(q11;q11) was a rare but recurrent abnormality secondary to del(20q) besides i(20q)."

The news correspondents obtained a quote from the research from Soochow University, "The frequency of der(20)del(20)(q11;q13)t(20;21)(q11;q11) among our patients with del(20q) was 2.4%. It was considered that the 20q deletion preceded translocation with chromosome 21. This abnormality is often cryptic, occurs predominantly in older men and is observed most often in myelodysplastic syndromes. Patients with this abnormality have an unfavorable prognosis, similar to patients with i(20q-). The molecular consequences of der(20)del(20)(q11q13)420;21)(q11;q11) may be different from patients with i(20q-)."

According to the news reporters, the research concluded: "To the best of our knowledge this is the largest dataset published to date."

For more information on this research see: Clinical and molecular cytogenetic studies in ten patients with hematological malignancies characterized by t(20;21)(q11;q11) resulted from del(20q). Cancer Genetics, 2016;209(10):456-462. Cancer Genetics can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Oncology - Gastric Cancer

Findings from Soochow University Provides New Data about Gastric Cancer [Rs56288038 (C/G) in 3'UTR of IRF-1 Regulated by MiR-502-5p Promotes Gastric Cancer Development]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Gastric Cancer is now available. According to news reporting originating from Suzhou, People's Republic of China, by NewsRx correspondents, research stated, "Interferon regulatory factor 1 (IRF-1) has been shown to function as a transcriptional activator or repressor of a variety of target genes. However, its upstream, non-coding RNA-related regulatory capacity remains unknown."

Our news editors obtained a quote from the research from Soochow University, "In this study, we focus on the miRNA-associated single nucleotide polymorphisms (SNPs) in the 3' untranslated region (UTR) of IRF-1 to further investigate the functional relationship and potential diagnostic value of the SNPs and miRNAs among Chinese gastric cancer (GC) patients. We performed a case control study with 819 GC patients and 756 cancer-free controls. Genotyping by real-time PCR assay, cell transfection, and the dual luciferase reporter assay were used in our study, and the 5-year overall survival rate and relapse-free survival rate in different groups were investigated. We found that patients suffering from Helicobacter pylori (Hp) infection were the susceptible population compared to controls. SNP rs56288038 (C/G) in IRF-1 3'UTR was involved in the occurrence of GC by acting as a tumor promoter factor. SNP rs56288038 (C/G) could be up-regulated by miR-502-5p, which caused a down-regulation of IRF-1 in cell lines and decreased apoptosis induced by IFN-gamma. Carrying the G genotype was related to significantly low expression of IRF-1 and Hp infection, poor differentiation, big tumor size, invasion depth, as well as the high probability of metastasis, and moreover, the C/G SNP was associated with shorter survival of GC patients with five years of follow-up study."

According to the news editors, the research concluded: "Our findings have shown that the SNP rs56288038 (C/G) in IRF-1 3'UTR acted as a promotion factor in GC development through enhancing the regulatory role of miR-502-5p in IRF-1 expression."

For more information on this research see: Rs56288038 (C/G) in 3'UTR of IRF-1 Regulated by MiR-502-5p Promotes Gastric Cancer Development. Cellular Physiology and Biochemistry, 2016;40(1-2):391-399. Cellular Physiology and Biochemistry can be contacted at: Karger, Allschwilerstrasse 10, CH-4009 Basel, Switzerland. Therapeutics

Findings from Sorbonne University in Therapeutics Reported (Highly selective inhibition of myosin motors provides the basis of potential therapeutic application)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Therapeutics. According to news originating from Paris, France, by NewsRx correspondents, research stated, "Direct inhibition of smooth muscle myosin (SMM) is a potential means to treat hypercontractile smooth muscle diseases. The selective inhibitor CK-2018571 prevents strong binding to actin and promotes muscle relaxation in vitro and in vivo."

Financial supporters for this research include Fondation pour la Recherche Medicale (Foundation for Medical Research in France), Agence Nationale de la Recherche (L' Agence Nationale de la Recherche), AFM-Telethon (French Muscular Dystrophy Association).

Our news journalists obtained a quote from the research from Sorbonne University, "The crystal structure of the SMM/drug complex reveals that CK-2018571 binds to a novel allosteric pocket that opens up during the 'recovery stroke' transition necessary to reprime the motor. Trapped in an intermediate of this fast transition, SMM is inhibited with high selectivity compared with skeletal muscle myosin (IC50 = 9 nM and 11,300 nM, respectively), although all of the binding site residues are identical in these motors. This structure provides a starting point from which to design highly specific myosin modulators to treat several human diseases."

According to the news editors, the research concluded: "It further illustrates the potential of targeting transition intermediates of molecular machines to develop exquisitely selective pharmacological agents."

Nutritional and Metabolic Diseases and Conditions:  

**Findings from Southeast University in the Area of Type 2 Diabetes Described (Renal Denervation: A Potential Novel Treatment for Type 2 Diabetes Mellitus?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Type 2 diabetes mellitus (T2DM) is a group of metabolic diseases of multiple etiologies. Although great progress has been made, researchers are still working on the pathogenesis of T2DM and how to best use the treatments available."

Our news journalists obtained a quote from the research from Southeast University, "Aside from several novel pharmacological approaches, catheter-based sympathetic renal denervation (RDN) has gained a significant role in resistant hypertension, as well as improvements in glycemic control in T2DM. In this article, we will summarize herein the role sympathetic activation plays in the progression of T2DM and review the recent clinical RDN experience in glucose metabolism. We performed systematic review in online databases, including PubMed, EmBase, and Web of Science, from inception until 2015. Studies were included if a statistical relationship was investigated between RDN and T2DM. The quality of each included study was assessed by Newcastle-Ottawa scale score. To synthesize these studies, a random-effects model or a fixed-effects model was applied as appropriate. Then, we calculated heterogeneity, performed sensitivity analysis, tested publication bias, and did meta-regression analysis. Finally, we identified 4 eligible articles. In most studies, RDN achieved via novel catheter-based approach using radiofrequency energy has gained a significant role in resistant hypertension, as well as improvements in glycemic control in T2DM. But the DREAMS-Study showed that RDN did not change median insulin sensitivity nor systemic sympathetic activity. Firstly, the current published studies lacked a proper control group, along with the sample capacity was small. Also, data obtained in the subgroups of diabetic patients were not separately analyzed and the follow-up period was very short."

According to the news editors, the research concluded: "In addition, a reduction in blood pressure accounts for the improvements in glucose metabolism and insulin resistance cannot be excluded. If the favorable result of better glucose metabolism is confirmed in large-scale, randomized studies, RDN may emerge as a novel therapeutic option for patients with T2DM."

For more information on this research see: Renal Denervation: A Potential Novel Treatment for Type 2 Diabetes Mellitus? *Medicine*, 2015;94(44):e1932. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)
The news correspondents report that additional information may be obtained from T. Pan, From the Dept. of Interventional and Vascular Surgery, Zhongda Hospital, Southeast University, Jiangsu, People's Republic of China. Additional authors for this research include J.H. Guo and G.J Teng.

**Oncology - Squamous Cell Carcinoma**

**Findings from Southern Medical University Broadens Understanding of Squamous Cell Carcinoma (Epb41l3 suppresses esophageal squamous cell carcinoma invasion and inhibits MMP2 and MMP9 expression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Squamous Cell Carcinoma have been published. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "EPB41L3 may play a role as a metastasis suppressor by supporting regular arrangements of actin stress fibres and alleviating the increase in cell motility associated with enhanced metastatic potential. Down regulation of epb41l3 has been observed in many cancers, but the role of this gene in esophageal squamous cell carcinoma (ESCC) remains unclear."

Funders for this research include National Natural Science Foundation of China, Natural Science Foundation of Guangdong Province.

The news correspondents obtained a quote from the research from Southern Medical University, "Our study aimed to determine the effect of epb41l3 on ESCC cell migration and invasion. We investigated epb41l3 protein expression in tumor and non-tumour tissues by immunohistochemical staining. Expression in the non-neoplastic human esophageal cell line Het-1a and four ESCC cell lines -Kyse150, Kyse510, Kyse450 and Caes17 -was assessed by quantitative Polymerase Chain Reaction (qPCR) and Western blotting. Furthermore, an EPB41L3 overexpression plasmid and EPB41L3-specific small interfering RNA were used to upregulate EPB41L3 expression in Kyse150 cells and to downregulate EPB41L3 expression in Kyse450 cells, respectively. Cell migration and invasion were evaluated by wound healing and transwell assays, respectively. The expression levels of p-AKT, matrix metalloproteinase (MMP)2 and MMP9 were evaluated. Expression of epb41l3 was significantly lower in tumor tissues than in non-tumour tissues and in ESCC cell lines compared with the Het-1a cell line, Kyse450 and Caes17 cells exhibited higher expression of epb41l3 than Kyse150 and Kyse510 cells. Overexpressing epb41l3 decreased Kyse150 cell migration and invasion, whereas EPB41L3-specific small interfering RNA silencing increased these functions in Kyse450 cells. Furthermore, overexpressing epb41l3 led to downregulation of MMP2 and MMP9 in Kyse150 and Kyse510 cells."
According to the news reporters, the research concluded: "Our findings reveal that EPB41L3 suppresses tumor cell invasion and inhibits MMP2 and MMP9 expression in ESCC cells."

Our news journalists report that additional information may be obtained by contacting R. Zeng, Oncology Center, Zhujiang Hospital, Southern Medical University, Guangzhou, Guangdong, People's Republic of China. Additional authors for this research include J.P. Huang, X.F. Li, W.B. Mental Health Diseases and Conditions - Depression

Findings from Southern Medical University in the Area of Depression Described (A pilot integrative genomics study of GABA and glutamate neurotransmitter systems in suicide, suicidal behavior, and major depressive disorder)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mental Health Diseases and Conditions - Depression is now available. According to news reporting from Guangzhou, People's Republic of China, by NewsRx journalists, research stated, "Gamma-amino butyric acid (GABA) and glutamate are the major inhibitory and excitatory neurotransmitters in the mammalian central nervous system, respectively, and have been associated with suicidal behavior and major depressive disorder (MDD). We examined the relationship between genotype, brain transcriptome, and MDD/suicide for 24 genes involved in GABAergic and glutamatergic signaling."

The news correspondents obtained a quote from the research from Southern Medical University, "In part 1 of the study, 119 candidate SNPs in 24 genes (4 transporters, 4 enzymes, and 16 receptors) were tested for associations with MDD and suicidal behavior in 276 live participants (86 nonfatal suicide attempters with MDD and 190 non-attempters of whom 70% had MDD) and 209 postmortem cases (121 suicide deaths of whom 62% had MDD and 88 sudden death from other causes of whom 11% had MDD) using logistic regression adjusting for sex and age. In part 2, RNA-seq was used to assay isoform-level expression in dorsolateral prefrontal cortex of 59 postmortem samples (21 with MDD and suicide, 9 MDD without suicide, and 29 sudden death non-suicides and no psychiatric illness) using robust regression adjusting for sex, age, and RIN score. In part 3, SNPs with subthreshold (uncorrected) significance levels below 0.05 for an association with suicidal behavior and/or MDD in part 1 were tested for eQTL effects in prefrontal cortex using the Brain eQTL Almanac.
(www.braineac.org). No SNPs or transcripts were significant after adjustment for multiple comparisons. However, a protein coding transcript (ENST00000414552) of the GABA A receptor, gamma 2 (GABRG2) had lower brain expression postmortem in suicide (p=0.01) and evidence for association with suicide death (p=0.03) in a SNP that may be an eQTL in prefrontal cortex (rs424740, p=0.02)."

According to the news reporters, the research concluded: "These preliminary results implicate GABRG2 in suicide and warrant further investigation and replication in larger samples."

Our news journalists report that additional information may be obtained by contacting H. Yin, Dept. of Psychiatry, Nanfang Hospital, Southern Medical University, Guangzhou, People's Republic of China. Additional authors for this research include S.P. Pantazatos, H. Galfalvy, Y.Y. Huang, G.B. Rosoklija, A.J. Dwork, A. Burke, V. Arango, M.A. Oquendo and J.J. Mann.

**Pharmacokinetics**

**Findings from Southwest University Has Provided New Data on Pharmacokinetics (Pharmacokinetics, excretion of 8-cetylberberine and its main metabolites in rat urine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Pharmacokinetics. According to news originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "Berberine (BBR) is a bioactive plant ingredient derived from the roots and bark of Berberis aristata and Coptis chinensis and has a wide variety of pharmacological effects. 8-cetylberberine (8-BBR-C16) is the berberine (BBR) derivative reconstructed from adding octadecyl at C-8 of BBR to enhance its activity. This study presents a reliable method for the determination of BBR and 8-BBR-C16 in rat plasma, urine and feces."

Funders for this research include Specialized Research Fund for the Doctoral Program of Higher Education of China, High-end Engineering and Technical Personnel Training Plan of Chongqing, Achievement Transfer Program of Institutions of Higher Education in Chongqing, Special Program for Scientific and Technical Innovation of Chongqing Social
Livelihood, County-University Cooperation Innovation Funds of Southwest University.

Our news journalists obtained a quote from the research from Southwest University, "BBR and 8-BBR-C16 were determined by HPLC-UV after liquid-liquid extraction for plasma samples, and solid-phase extraction for urinary and fecal samples. The method was linear over the concentration range of 10-300 ng.ml(-1) for the plasma samples, 25-2000 ng.ml(-1) for the urinary samples, and 100-2000 ng.g(-1) for the fecal samples. Furthermore, a metabolic investigation on urine was performed by LC/MS/MS analysis to identify the structures of 8-BBR-C16 metabolites by full scan and product ion scan. Adult Sprague-Dawley rats were divided into two groups. In the control group, rats received 80 mg.kg(-1) BBR, and in the drug-treated group, rats received 80 mg.kg(-1) 8-BBR-C16. The results indicate that there were significant differences in the pharmacokinetic parameters and in the accumulated excretion levels between the control group and the drug-treated group. The C-max and AUC(0-t) of 8-BBR-C16 were 2.8 and 12.9 times higher than those of BBR, and the relative bioavailability of BBR to 8-BBR-C16 was 7.7%. The total excretion amount through the urine and feces of 8-BBR-C16 was 76.9%, but that of BBR was only 20.5%.

According to the news editors, the research concluded: "Additionally, 8-BBR-C16 was metabolized in rat urine with phase I demethylation and phase II glucuronidation or sulfation."

The news correspondents report that additional information may be obtained from X.G. Li, Southwest University, Coll Pharmaceut Sci, Chongqing 400715, People's Republic of China. Additional authors for this research include S.J. Fan, X.B. Liao, C. Chen, L. Su and X.G. Li.

Peptidoglycan

Findings from Spanish National Research Council (CSIC) Provides New Data about Peptidoglycan (Orthologous and Paralogous AmpD Peptidoglycan Amidases from Gram-Negative Bacteria)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Peptidoglycan are presented in a new report. According to news reporting originating from Madrid, Spain, by NewsRx correspondents, research stated, "Cell wall recycling and beta-lactam antibiotic resistance are linked in Enterobacteriaceae and in Pseudomonas aeruginosa."
Our news editors obtained a quote from the research from Spanish National Research Council (CSIC), "This process involves a large number of murolytic enzymes, among them a cytoplasmic peptidoglycan amidase AmpD, which plays an essential role by cleaving the peptide stem from key intermediates en route to the beta-lactamase production (a resistance mechanism) and cell wall recycling. Uniquely, P. aeruginosa has two additional paralogues of AmpD, designated AmpDh2 and AmpDh3, which are periplasmic enzymes. Despite the fact that AmpDh2 and AmpDh3 share a common motif for their respective catalytic domains, they are each comprised of multidomain architectures and exhibit distinct oligomerization properties."

According to the news editors, the research concluded: "We review herein the structural and biochemical properties of orthologous and paralogous AmpD proteins and discuss their implication in cell wall recycling and antibiotic resistance processes."

For more information on this research see: Orthologous and Paralogous AmpD Peptidoglycan Amidases from Gram-Negative Bacteria. Microbial Drug Resistance, 2016;22 (6):470-1. Microbial Drug Resistance can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. (Mary Ann Liebert, Inc. - www.liebertpub.com; Microbial Drug Resistance - www.liebertpub.com/overview/microbial-drug-resistance/44/)

Oncology - Prostate Cancer

Findings from Stanford University Provides New Data about Prostate Cancer (Fluorescence Monitoring of the Oxidative Repair of DNA Alkylation Damage by ALKBH3, a Prostate Cancer Marker)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting from Stanford, California, by NewsRx journalists, research stated, "The 2-oxoglutarate-dependent iron enzyme ALKBH3 is an antitumor target and a potential diagnostic marker for several tumor types, including prostate cancer. However, there is at present no simple way to measure this enzyme's activity."

Funders for this research include National Cancer Institute, Army Research Office, Human Frontier Science Program, National Institute of General Medical Sciences. The news correspondents obtained a quote from the research from Stanford University. "Here we describe a fluorogenic probe design (MAQ) that is directly responsive to ALKBH3 repair activity. It makes use of the fluorescence-quenching properties of 1-
methyladenine; removal of the alkyl group results in a >10-fold light-up signal. The probe is specific for ALKBH3 over its related homologue ALKBH2 and can be used to identify and measure the effectiveness of enzyme inhibitors. Measurements of the enzyme substrate parameters show that MAQ displays Km and kcat values essentially the same as those of the native substrate. Finally, we show that the probe functions efficiently in cells, allowing imaging and quantitation of ALKBH3 activity by microscopy and flow cytometry.

According to the news reporters, the research concluded: "We expect that MAQ probes will be broadly useful in the study of the basic biology of ALKBH3 and in clinical cancer applications as well."

Our news journalists report that additional information may be obtained by contacting A.A. Beharry, Dept. of Chemistry, Stanford University, Stanford, California 94305, United States. Additional authors for this research include S. Lacoste, T.R. O'Connor and E.T Kool.

**Cardiology**

**Findings from Stanford University in the Area of Cardiology Reported (Transcriptomic Profiling Maps Anatomically Patterned Subpopulations among Single Embryonic Cardiac Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting from Stanford, California, by NewsRx journalists, research stated, "Embryonic gene expression intricately reflects anatomical context, developmental stage, and cell type. To address whether the precise spatial origins of cardiac cells can be deduced solely from their transcriptional profiles, we established a genomewide expression database from 118, 949, and 1,166 single murine heart cells at embryonic day 8.5 (e8.5), e9.5, and e10.5, respectively."

Financial supporters for this research include NIH, American Heart Association Grant-in-Aid, Stanford Cardiovascular Institute, Institute for Stem Cell Biology and Regenerative Medicine.

The news correspondents obtained a quote from the research from Stanford University, "We segregated these cells by type using unsupervised bioinformatics analysis and identified chamber-specific genes. Using a random forest algorithm, we reconstructed the spatial origin of single e9.5 and e10.5 cardiomyocytes with 92.0% +/- 3.2% and 91.2% +/- 2.8% accuracy, respectively (99.4% +/- 1.0% and 99.1% +/- 1.1% if a +/- 1 zone margin is permitted) and predicted the second heart field distribution of Is1-1-lineage descendants. When applied to Nkx2-5(-/-) cardiomyocytes from murine e9.5 hearts, we showed their transcriptional alteration and lack of ventricular phenotype."

According to the news reporters, the research concluded: "Our database and zone
classification algorithm will enable the discovery of novel mechanisms in early cardiac development and disease."

Our news journalists report that additional information may be obtained by contacting S.M. Wu, Stanford University, Dept. of Med, Sch Med, Div Cardiovac Med, Stanford, CA 94305, United States. Additional authors for this research include A. Xu, S. Sim, J.R. Priest, X.Y. Tian, T. Khan, T. Quertermous, B. Zhou, P.S. Tsao, S.R. Quake and S.M. Wu. **Drugs and Therapies - Acetylcysteine**

**Findings from State University in Acetylcysteine Reported (The Coadministration of N-Acetylcysteine Ameliorates the Effects of Arsenic Trioxide on the Male Mouse Genital System)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Acetylcysteine is now available. According to news reporting from Botucatu, Brazil, by NewsRx journalists, research stated, "Arsenic trioxide (As2O3) has shown effectiveness in treatment of leukemia but is also associated with reproductive toxicity. Since remediation with N-acetylcysteine (NAC) may mitigate the adverse effects caused by exposure, we assessed the effects of As2O3 and its potential reversibility after exposure cessation or coadministration of NAC."

Financial supporters for this research include Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior, The State of Sao Paulo Research Foundation, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico.

The news correspondents obtained a quote from the research from State University, "Animals received 0.3 or 3.0 mg/Kg/day of As2O3 subcutaneously and 40 mM of NAC in tap water. As2O3 treatment impaired spermatogenesis and sperm motility and decreased seminal vesicle weight and testosterone serum levels; after suspension of treatment, these parameters remained altered. When NAC was administered, animals showed improvement in sperm parameters and seminal vesicle weight. In vitro epididymal contractility was increased in As2O3-treated animals. We concluded that As2O3 is toxic to the male mouse genital system by compromising sperm quality and quantity; these effects persisted even after suspension of the treatment."

According to the news reporters, the research concluded: "However, the coadministration of NAC ameliorates the harmful effects of the drug on the male genital system."

Our news journalists report that additional information may be obtained by contacting R.F. da Silva, Dept. of Morphology, Institute of Biosciences, Universidade Estadual Paulista (UNESP), 18618-970 Botucatu, SP, Brazil. Additional authors for this research include C.dos S. Borges, P. Villela E Silva, G. Missassi, L.R. Kiguti, A.S. Pupo, F. Barbosa Junior, J.A. Anselmo-Franci and W.de G Kempinas.

Drugs and Therapies - Cardiovascular Agents

Findings from State University of Campinas Provide New Insights into Cardiovascular Agents [Beneficial Effect of the Nitric Oxide Donor Compound 3-(1,3-Dioxoisoindolin-2-yl)Benzyl Nitrate on Dysregulated Phosphodiesterase 5, NADPH Oxidase, and ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Cardiovascular Agents. According to news reporting originating in Campinas, Brazil, by NewsRx journalists, research stated, "Patients with sickle cell disease (SCD) display priapism, and dysregulated nitric oxide (NO) pathway may contribute to this condition. However, current therapies offered for the prevention of priapism in SCD are few."

The news reporters obtained a quote from the research from the State University of Campinas, "The 3-(1,3-dioxoisooindolin-2-yl) benzyl nitrate (compound 4C) was synthesized through molecular hybridization of hydroxyurea and thalidomide, which displays an NO-donor property. This study aimed to evaluate the effects of compound 4C on functional and molecular alterations of erectile function in murine models that display low NO bioavailability, SCD transgenic mice, and endothelial NO synthase and neuronal NO synthase double gene-deficient (dNOS(-/-)) mice, focusing on the dysregulated NO-cGMP-phosphodiesterase type 5 (PDE5) pathway and oxidative stress in erectile tissue. Wild-type, SCD, and dNOS(-/-) mice were treated with compound 4C (100 mu mol/kg/d, 3 weeks). Intracavernosal pressure in anesthetized mice was evaluated. Corpus cavernosum tissue was dissected free and mounted in organ baths. SCD and dNOS(-/-) mice displayed a priapism phenotype, which was reversed by compound 4C treatment. Increased corpus cavernosum relaxant responses to acetylcholine and electrical-field stimulation were reduced by 4C in SCD mice. Likewise, increased sodium nitroprusside-induced relaxant responses were reduced by 4C in cavernosal tissue from SCD and dNOS(-/-) mice. Compound 4C reversed PDE5 protein expression and reduced protein expressions of
reactive oxygen species markers, NADPH oxidase subunit gp91(phox), and 3-nitrotyrosine in penises from SCD and dNOS(-/-) mice."

According to the news reporters, the research concluded: "3-week therapy with the NO donor 4C reversed the priapism in murine models that display lower NO bioavailability. NO donor compounds may constitute an additional strategy to prevent priapism in SCD."

For more information on this research see: Beneficial Effect of the Nitric Oxide Donor Compound 3-(1,3-Dioxoisooindolin-2-yl)Benzyl Nitrate on Dysregulated Phosphodiesterase 5, NADPH Oxidase, and Nitrosative Stress in the Sickle Cell Mouse Penis: Implication for Priapism Treatment. *Journal of Pharmacology and Experimental Therapeutics*, 2016;359(2):230-237. *Journal of Pharmacology and Experimental Therapeutics* can be contacted at: Amer Soc Pharmacology Experimental Therapeutics, 9650 Rockville Pike, Bethesda, MD 20814-3995, USA.

**Gram-Negative Bacteria - Burkholderia**

**Findings from State University of New York in the Area of Burkholderia Reported (Burkholderia ginsengisoli bacteraemia: emergence of a novel pathogen)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Burkholderia have been presented. According to news reporting originating in Buffalo, New York, by NewsRx journalists, research stated, "Burkholderia ginsengisoli is a non-pathogenic Gram-negative bacterium that ordinarily serves as a plant endosymbiont. We report the first case of human infection with B. ginsengisoli presenting as bacteraemia in a young man with severe Crohn's disease."

The news reporters obtained a quote from the research from the State University of New York, "Definitive identification of the pathogen could not be accomplished with conventional techniques and required DNA sequencing. The bacteraemia may have been related to ingestion of organic vegetables and compromised gastrointestinal mucosa, coupled with treatment with tumor necrosis factor a inhibitors."

According to the news reporters, the research concluded: "Although there are no standard antibiotics to treat this pathogen, we devised a successful treatment regimen."
For more information on this research see: Burkholderia ginsengisoli bacteraemia: emergence of a novel pathogen. *Bmj Case Reports*, 2016;2016(). (BMJ Publishing Group - group.bmj.com/; Bmj Case Reports - casereports.bmj.com/)

Our news correspondents report that additional information may be obtained by contacting L.R. Marks, State University of New York at Buffalo, Buffalo, New York, United States. Additional authors for this research include H. Dodd, T.A. Russo and C.S Berenson.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1136/bcr-2015-213584. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Gliomas**

**Findings from State University of New York in the Area of Gliomas Described (TRPM7 channel inhibition mediates midazolam-induced proliferation loss in human malignant glioma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Gliomas is now available. According to news reporting out of Stony Brook, New York, by NewsRx editors, research stated, "The melastatin-like transient receptor potential 7 (TRPM7) has been implicated in proliferation or apoptosis of some cancers, indicating the potential of TRPM7 as an anti-anaplastic target. Here, we identified the characteristic TRPM7 channel currents in human malignant glioma MGR2 cells, which could be blocked by a pharmacologic inhibitor Gd3+.

Financial supporters for this research include Fundamental Research Funds for the Central Universities, Science and Technology Planning Project of Guangdong Province, Medical Scientific Research Foundation of Guangdong Province, China Postdoctoral Science Foundation (CN), Guangdong Natural Science Foundation.

Our news journalists obtained a quote from the research from the State University of New York, "We mined the clinical sample data from Oncomine Database and found that human malignant glioma tissues expressed higher TRPM7 mRNA than normal brain ones. Importantly, we identified a widely used clinical anesthetic midazolam as a TRPM7 inhibitor. Midazolam treatment for seconds suppressed the TRPM7 currents and calcium influx, and treatment for 48 h inhibited the TRPM7 expression. The inhibitory effect on TRPM7 accounts for the proliferation loss and G(0)/G(1) phase cell cycle arrest induced by midazolam. Our data demonstrates that midazolam represses proliferation of human malignant glioma cells through inhibiting TRPM7 currents, which may be further potentiated by suppressing the expression of TRPM7."

According to the news editors, the research concluded: "Our result indicates midazolam as a pharmacologic lead compound with brain-blood barrier permeability for targeting TRPM7 in the glioma."

For more information on this research see: TRPM7 channel inhibition mediates midazolam-induced proliferation loss in human malignant glioma. *Tumor Biology*, 2016;37

Oncology - Breast Cancer

Findings from Sun Yat Sen University Yields New Data on Breast Cancer (Allelic expression imbalance polymorphisms in susceptibility chromosome regions and the risk and survival of breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Allelic expression imbalance (AEI) has been applied to indicate potential function of genetic variants. Combining earlier results from global differential allele-specific expression analysis and genome wide association studies (GWASs), we select the single nuclear polymorphisms (SNPs) exhibiting AEI phenomenon located in breast cancer susceptibility chromosome regions, and evaluate their associations with breast cancer risk and survival."

Our news journalists obtained a quote from the research from Sun Yat Sen University, "We examined the genotypes of 10 AEI SNPs in 1551 incident breast cancer cases and 1605 age-frequency matched controls from Guangzhou, China. In total, 1168 cases were followed up. MUC16 rs2591592 (AT/AA vs. TT) was associated with an increased risk of premenopausal breast cancer (OR [95%CI]: 1.30 [1.07, 1.57]); SLAMF1 rs1061217 (CT/TT vs. CC) decreased the risk of breast cancer among overweight women (OR [95%CI]: 0.74 [0.57, 0.96]) but increased the risk among normal-weight women (OR [95%CI]: 1.15 [1.01, 1.39]); ZNF331 rs8109631 (AG/AA vs. GG) and CHRAC1 rs10216653 (GC/GG vs. CC) were associated with progression free survival among breast cancer patients with negative ER/PR status and higher clinical stage (HRs [95%CIs]: 2.39 [1.14, 5.00], 1.85 [1.03, 3.32], and 0.49 [0.30, 0.80], respectively). ZNF331 rs8109631 and CHRAC1 rs10216653 were further found to represent several functional SNPs through bioinformatic analysis."

According to the news editors, the research concluded: "Our findings demonstrated suggestive associations of AEI polymorphisms with breast cancer risk (MUC16 rs2591592 and
SLAMF1 rs1061217) and prognosis (ZNF331 rs8109631 and CHRAC1 rs10216653).”

Oncology - Lung Cancer

Findings from Sungkyunkwan University Broaden Understanding of Lung Cancer (Do New pN Subclassifications Proposed by IASLC’s Lung Cancer Staging Project Agree with ypN Categories after Trimodality Therapy for Initial N2 Disease?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lung Cancer. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The International Association for the Study of Lung Cancer's lung cancer staging project has recently proposed a new subclassification of pN1-2 based on multiplicity of involved nodal stations and presence of skip metastasis. The authors investigated whether this new subclassification agrees with the ypN categories after trimodality therapy for initially N2 disease."

Our news journalists obtained a quote from the research from Sungkyunkwan University, "From March 2001 until June 2014, trimodality therapy consisting of preoperative thoracic radiation therapy concurrent with weekly platinum-based doublet chemotherapy and surgical resection was successfully undertaken in 508 patients after histopathologic confirmation of N2 disease. Data on 481 patients were analyzed and compared with special focus on the current and new pN classification. The median duration of overall survival (OS) was 58 months, and the 5-year OS rate of all patients was 48.8%: 62.6% in ypN0; 45.5% in ypN1; 37.6% in ypN2; and 0% in ypN3. Comparisons between neighboring ypN categories showed significant difference between ypNO and ypN1 (p = 0.028) but not between other categories. The 5-year OS rates according to new ypN subclassification were 48.2% in ypN1a, 39.0% in ypN1b, 52.8% in ypN2a1, 37.9% in ypN2a2, and 32.1% in ypN2b. Although the OS rate of ypN2a1 was numerically higher than those of ypN1b and ypN2b, comparisons between neighboring ypN categories revealed no significant difference. The current study was specifically intended to investigate whether ypN categories after trimodality therapy agree with International Association for the Study of Lung Cancer's new pN subclassification."
According to the news editors, the research concluded: "Through the current study, the authors have confirmed that ypN down staging to ypNO-1 from initial N2 stage is a favorable factor with respect to OS and raised the need for refinement of ypN subcategorization after trimodality therapy."

The news correspondents report that additional information may be obtained from Y.C. Ahn, Sungkyunkwan UniversitySch Med, Samsung Med Center, Dept. of Radiat Oncol, Seoul 135710, South Korea. Additional authors for this research include Y.C. Ahn, H. Pyo, D. Oh, J.M. Noh, J.M. Sun, J.S. Ahn, M.J. Ahn, K. Park, Y.S. Choi, J. Kim, J.I. Zo, Y.M. Shim, M. Lee and J. Han.

**Oncology - Liver Cancer**

**Findings from Sungkyunkwan University Provides New Data about Liver Cancer (Aggressive Inrasegmental Recurrence of Hepatocellular Carcinoma After Combined Transarterial Chemoembolization and Radiofrequency Ablation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "The goal of this study is to evaluate the outcomes of combined transarterial chemoembolization (TACE) and radiofrequency ablation (RFA) for hepatocellular carcinoma (HCC) in terms of the frequency of aggressive intrasegmental recurrence. Sixty-one patients (43 men and 18 women; mean [+/- SD] age, 65.8 +/- 8.6 years; age range, 44-82 years) with 71 HCCs (mean [+/- SD] size, 2.8 +/- 0.9 cm; range, 0.7-4.2 cm) underwent combined TACE and RFA."

The news correspondents obtained a quote from the research from Sungkyunkwan University, "Aggressive intrasegmental recurrence was defined as initial tumor recurrence at least 6 months after treatment and the simultaneous development of recurrence of multiple (at least three) nodular or infiltrative tumors in the treated segment. Tumor contact with a thick (diameter, >= 3 mm) portal vein (i.e., periportal HCC) was evaluated. The frequency of aggressive intrasegmental recurrence, the local tumor progression (LTP) rate, and the complication rate were assessed. The median follow-up period was 25.6 months (range, 6.1-75.5 months). Twenty-two HCCs (31%) were in contact with a thick portal vein. Aggressive intrasegmental recurrence was observed in one patient (representing 1.4% of all treated HCCs and 4.5% of periportal HCCs) after treatment of a 4.0-cm periportal HCC. The cumulative LTP rates at 1, 3, and 5 years were 6.7%, 21.0%, and 30.5%, respectively. The rate of major..."
complications was 6.6%.

According to the news reporters, the research concluded: "The frequency of aggressive intrasegmental recurrence after combined TACE and RFA for HCCs was very low."

For more information on this research see: Aggressive Intrasegmental Recurrence of Hepatocellular Carcinoma After Combined Transarterial Chemoembolization and Radiofrequency Ablation. American Journal of Roentgenology, 2016;207(5):1122-1127. American Journal of Roentgenology can be contacted at: Amer Roentgen Ray Soc, 1891 Preston White Dr, Subscription Fulfillment, Reston, VA 22091, USA.

Our news journalists report that additional information may be obtained by contacting M.W. Lee, Sungkyunkwan University Sch Med, Samsung Med Center, Center Imaging Sci, Seoul 135710, South Korea. Oncology - Breast Cancer

Findings from Sungkyunkwan University School of Medicine Broadens Understanding of Breast Cancer (Zerumbone suppresses the motility and tumorigenecity of triple negative breast cancer cells via the inhibition of TGF-b1 signaling pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Aberrant transforming growth factor-b (TGF-b) plays an important role in the development of cancer such as tumor metastasis and invasion. TGF-b-responsive gene signature is highly activated in chemotherapy-treated triple negative breast cancer (TNBC)."

Our news journalists obtained a quote from the research from the Sungkyunkwan University School of Medicine, "Here, we investigated the effect of zerumbone (ZER) on TGF-b1 signaling pathway and tumorigenecity of TNBC cells. Our results showed that the level of TGF-b1 mRNA expression and cell invasiveness were higher in TNBC cells than in non-TNBC cells. On the other hand, the cell motility of TNBC cells was completely suppressed by LY2109761, a novel selective TGF-b receptor type I/II (TbRI/II) dual inhibitor. In addition, FN and MMP-2 expression, which play an important role on cell motility in various cancer cells, were dose-dependently decreased by LY2109761. TGF-b1 increased FN, MMP-2 and MMP-9 expression in HCC1806 TNBC cells. TGF-b1-induced MMP-9 expression was decreased by both a MEK inhibitor, UO126, and a smad3 inhibitor, SIS3. Induction of FN and MMP-2 by TGF-b1 was just decreased by SIS3. Overexpression of smad3 significantly increased FN, MMP-2, and MMP-9 expression. Interestingly, ZER significantly suppressed TGF-b1-induced FN, MMP-2, and MMP-9 expression in HCC1806 cells. In addition, ZER completely decreased..."
TGF-b1-induced the phosphorylation of smad3. Finally, we observed that ZER suppressed the tumorigenecity such as tumor volume, weight, Ki67 expression, and metastasis in TNBC cells xenograft models. Taken together, we demonstrated that ZER suppresses TGF-b1-induced FN, MMP-2, and MMP-9 expression through the inactivation of smad3 and inhibits the tumorigenecity of TNBC cells.

According to the news editors, the research concluded: "Therefore, we suggest that ZER may act as a promising drug for treatment of TNBC."

For more information on this research see: Zerumbone suppresses the motility and tumorigenecity of triple negative breast cancer cells via the inhibition of TGF-b1 signaling pathway. Oncotarget, 2016;7(2):1544-58.

Our news journalists report that additional information may be obtained by contacting S. Kim, Dept. of Surgery, Samsung Medical Center, Sungkyunkwan University School of Medicine, Gangnam-gu, Seoul, South Korea. Additional authors for this research include J. Lee, M. Jeon, J.E. Lee and S.J Nam.

Cardiology

Findings from Sungkyunkwan University in the Area of Cardiology Described (Association Between Presence of a Cardiac Intensivist and Mortality in an Adult Cardiac Care Unit)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Dedicated intensive care unit (ICU) physician staffing is associated with a reduction in ICU mortality rates in general medical and surgical ICUs. However, limited data are available on the role of a cardiac intensivist in the cardiac intensive care unit (CICU)."

The news correspondents obtained a quote from the research from Sungkyunkwan University, "This study investigated the association of cardiac intensivist-directed care with clinical outcomes in adult patients admitted to the CICU. This study analyzed 2,431 patients admitted to the CICU at Samsung Medical Center in Seoul, South Korea, from January 2012 to December 2015. In January 2013 the CICU was changed from a low-intensity staffing model to a high-intensity staffing model managed by a dedicated cardiac intensivist. Eligible patients were divided into either a low-intensity management group (n = 616) or a high-intensity management group (n = 1,815). One-to-many (1:N) propensity score matching with variable matching ratios was also performed. The primary outcome was death in the CICU. Death in the CICU occurred in 55 patients (8.9%) in the low-intensity group versus 74 patients (4.1%) in the high-intensity group (p < 0.001). Of 135 patients who underwent extracorporeal membrane oxygenation, the CICU mortality rate in the high-intensity group was also lower than that in the low-intensity group (54.5% vs. 22.5%; p = 0.001). On propensity score matching, high-intensity
staffing was found associated with a lower CICU mortality rate in the matched cohort of patients (7.5% vs. 3.7%; adjusted odds ratio: 0.53; 95% confidence interval: 0.32 to 0.86; p = 0.010). In overall and propensity-matched patients, there were no substantive differences in either median length of CICU stay or readmission rates between the 2 groups."

According to the news reporters, the research concluded: "The presence of a dedicated cardiac intensivist was associated with a reduction in CICU mortality rates in patients with cardiovascular disease who required critical care."

For more information on this research see: Association Between Presence of a Cardiac Intensivist and Mortality in an Adult Cardiac Care Unit. *Journal of the American College of Cardiology*, 2016;68(24):2637-2648. *Journal of the American College of Cardiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.

**Immunology - Immunoglobulins**

**Findings from Swiss Federal Institute of Technology Broaden Understanding of Immunoglobulins (Immunocytokines and bispecific antibodies: two complementary strategies for the selective activation of immune cells at the tumor site)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immunoglobulins have been published. According to news originating from Zurich, Switzerland, by NewsRx correspondents, research stated, "The activation of the immune system for a selective removal of tumor cells represents an attractive strategy for the treatment of metastatic malignancies, which cannot be cured by existing methodologies. In this review, we examine the design and therapeutic potential of immunocytokines and bispecific antibodies, two classes of bifunctional products which can selectively activate the immune system at the tumor site."

Funders for this research include Eidgenossische Technische Hochschule Zurich, European Research Council, Schweizerischer Nationalfonds zur Forderung der Wissenschaftlichen Forschung, Bovena Stiftung.

Our news journalists obtained a quote from the research from the Swiss Federal Institute of Technology, "Certain protein engineering aspects, such as the choice of the antibody format, are common to both classes of therapeutic agents and can have a profound impact on tumor homing performance in vivo of individual products. However, immunocytokines and
bispecific antibodies display different mechanisms of action."

According to the news editors, the research concluded: "Future research activities will reveal whether an additive of even synergistic benefit can be obtained from the judicious combination of these two types of biopharmaceutical agents."

The news correspondents report that additional information may be obtained from J.D. Kiefer, Dept. of Chemistry and Applied Biosciences, Swiss Federal Institute of Technology (ETH Zurich), Zurich, Switzerland.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/imr.12391. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Diseases and Conditions...**

**Findings from T.J. Milling and Co-Authors in the Area of Thromboembolism Reported (Re-initiation of dabigatran and direct factor Xa antagonists after a major bleed)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Thromboembolism. According to news originating from Austin, Texas, by NewsRx correspondents, research stated, "Direct oral anticoagulants (DOACs) are a relatively recent addition to the oral anticoagulant armamentarium, and provide an alternative to the use of vitamin K antagonists such as warfarin."

Our news journalists obtained a quote from the research, "Regardless of the type of agent used, bleeding is the major complication of anticoagulant therapy. The decision to restart oral anticoagulation following a major hemorrhage in a previously anticoagulated patient is supported largely by retrospective studies rather than randomized clinical trials (mostly with vitamin K antagonists), and remains an issue of individualized clinical assessment: the patient's risk of thromboembolism must be balanced with the risk of recurrent major bleeding."

According to the news editors, the research concluded: "This review provides guidance for clinicians regarding if and when a patient should be re-initiated on DOAC therapy following a major hemorrhage, based on the existing evidence."

The news correspondents report that additional information may be obtained from T.J. Milling, Seton Dell Med Sch, Stroke Inst, Dept. of Surg & Perioperat Care, Austin, TX, United States.

Oncology - Prostate Cancer

Findings from Taipei Medical University Update Knowledge of Prostate Cancer (Obstructive sleep apnea and urological comorbidities in males: a population-based study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "This study aimed to investigate associations between obstructive sleep apnea (OSA) and urological comorbidities using a large population-based dataset. This cross-sectional study used the Taiwan Longitudinal Health Insurance Database 2005."

The news reporters obtained a quote from the research from Taipei Medical University, "We included 1236 males with OSA in the study group and 4944 males without OSA in the comparison group. Conditional logistic regressions were performed to examine relationships between OSA and urological comorbidities. We found that patients with OSA had significantly greater prevalences of hypertrophy of the prostate (15.13 vs. 7.28 %), chronic prostatitis (4.37 vs. 2.16 %), urinary incontinence (3.32 vs. 0.87 %), nocturia (2.02 vs. 0.61 %), erectile dysfunction (2.91 vs. 0.97 %), urinary calculi (12.06 vs. 6.80 %), and prostate cancer (0.97 vs. 0.40 %) than the comparison group. Additionally, the adjusted odds ratios in males with OSA for hypertrophy of prostate, chronic prostatitis, urinary incontinence, nocturia, erectile dysfunction, urinary calculi, and prostate cancer were 2.54 (95 % confidence interval (CI) 2.05 similar to 3.15), 1.95 (95 % CI 1.38 similar to 2.74), 4.13 (95 % CI 2.63 similar to 6.50), 3.54 (95 % CI 2.03 similar to 6.18), 2.95 (95 % CI 1.89 similar to 4.61), 1.89 (95 % CI 1.53 similar to 2.33), and 2.14 (95 % CI 1.03 similar to 4.43) than those without OSA, respectively."

According to the news reporters, the research concluded: "This study concluded that males with OSA had higher odds ratios of hypertrophy of the prostate, chronic prostatitis, urinary incontinence, nocturia, erectile dysfunction, urinary calculi, and prostate cancer than comparison group."

**Life Science Research - Cell Biology**

**Findings from Technical University Broaden Understanding of Cell Biology (Rare phenotypes in the understanding of autoimmunity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Cell Biology. According to news reporting from Dresden, Germany, by NewsRx journalists, research stated, "The study of rare phenotypes has a long history in the description of autoimmune disorders. First Mendelian syndromes of idiopathic tissue destruction were defined more than 100 years ago and were later revealed to result from immune-mediated reactivity against self."

The news correspondents obtained a quote from the research from Technical University, "In the past two decades, continuous advances in sequencing technology and particularly the advent of next-generation sequencing have allowed to define the genetic basis of an ever-growing number of Mendelian forms of autoimmunity. This has provided unique insight into the molecular pathways that govern immunological homeostasis and that are indispensable for the prevention of self-reactive immune-mediated tissue damage and 'horror autotoxicus'. Here we will discuss selected examples of past and recent investigations into rare phenotypes of autoimmunity that have delineated pathways critical for central and peripheral control of the adaptive immune system. We will outline the implications of these findings for rare and common forms of autoimmunity and will discuss the benefits and potential pitfalls of the integration of next-generation sequencing into algorithms for clinical diagnostics."

According to the news reporters, the research concluded: "Because of the concise nature of this review, we will focus on syndromes caused by defects in the control of adaptive immunity as innate immune-mediated autoinflammatory disorders have been covered in excellent recent reviews on Mendelian and polygenic forms of autoimmunity."

For more information on this research see: Rare phenotypes in the understanding of autoimmunity. *Immunology and Cell Biology*, 2016;94(10):943-948. *Immunology and Cell Biology* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. Oncology - Breast Cancer

Findings from Technical University Has Provided New Data on Breast Cancer (Changes in apoptosis-related gene expression and cytokine release in breast cancer cells treated with CpG-loaded magnetic PAMAM nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting originating from Ankara, Turkey, by NewsRx correspondents, research stated, "CpG-oligodeoxynucleotide (CpG-ODN) can function as an immune adjuvant. Previously, we showed that stimulation of breast cancer cells with CpG-ODN conjugated with PAMAM dendrimer-coated magnetic nanoparticles (DcMNPs) has induced apoptosis."

Our news editors obtained a quote from the research from Technical University, "The aim of the current study was to evaluate the expression levels of some apoptosis-regulating genes in several human breast cancer cells treated with CpG/DcMNPs. Treated MDA-MB231 cells showed an increase in Noxa and Bax gene expression levels, whereas the expression level of Survivin decreased. Similarly, Noxa gene was overexpressed in treated MCF7 cells. In treated SKBR3 cells, a decline in the c-Flip mRNA level was determined. Furthermore, release of cytokines, IL-6, IL-10, and TNF-alpha, was determined in cell culture supernatants. CpG/DcMNP treatment leads to an increase in the release of IL-6 in MDA-MB231 and SKBR3 cells, whereas release of IL-10 and TNF-alpha did not change significantly."

According to the news editors, the research concluded: "It is indicated that CpG-ODN may show its cytotoxic effect by regulating the expression of apoptosis-related genes and the release of cytokine in breast cancer cells."

The news editors report that additional information may be obtained by contacting N.T. Pourianazar, Middle East Technical Univ, Dept. of Biotechnol, TR-06800 Ankara, Turkey.

Findings from Technical University Provide New Insights into Statistical Mechanics (Some thermodynamic considerations on low frequency electromagnetic waves effects on cancer invasion and metastasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Statistical Mechanics. According to news reporting originating in Turin, Italy, by NewsRx journalists, research stated, "Cell membranes are the reason of the cell energy transfer. In cells energy transfer, thermoelectro-chemical processes and transports phenomena occur through their membranes."

The news reporters obtained a quote from the research from Technical University, "Cells can actively modify their behaviours in relation to any change of their environment. They waste heat into their environment. The analysis of irreversibility related to this wasted heat, to the ions transport and the related cell-environment pH changes represents a new useful approach to the study of the cells behaviour."

According to the news reporters, the research concluded: "This analysis allows also the explanation of the effects of electromagnetic fields on the cell behaviour, and to suggest how low intensity electromagnetic fields could represent a useful support to the present anticancer therapies."

For more information on this research see: Some thermodynamic considerations on low frequency electromagnetic waves effects on cancer invasion and metastasis. Physica A-Statistical Mechanics and Its Applications, 2017;467():289-295. Physica A-Statistical Mechanics and Its Applications can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands.

Our news correspondents report that additional information may be obtained by contacting U. Lucia, Politecn Torino, Dipartimento Energia, I-10129 Turin, Italy.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.physa.2016.10.043. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Prostate Cancer

Findings from Technical University Provides New Data on Prostate Cancer (Current use of PSMA-PET in prostate cancer management)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting out of Munich, Germany, by NewsRx editors, research stated, "Currently, the findings of imaging procedures used for detection or staging of prostate cancer depend on morphology of lymph nodes or bone metabolism and do not always meet diagnostic needs. Prostate-specific membrane antigen (PSMA), a transmembrane protein that has considerable overexpression on most prostate cancer cells, has gained increasing interest as a target molecule for imaging."

Our news journalists obtained a quote from the research from Technical University, "To date, several small compounds for labelling PSMA have been developed and are currently being investigated as imaging probes for PET with the (68)Ga-labelled PSMA inhibitor Glu-NH-CO-NH-Lys(Ahx)-HBED-CC being the most widely studied agent. (68)Ga-PSMA-PET imaging in combination with multiparametric MRI (mpMRI) might provide additional molecular information on cancer localization within the prostate. In patients with primary prostate cancer of intermediate-risk to high-risk, PSMA-based imaging has been reported to improve detection of metastatic disease compared with CT or mpMRI, rendering additional cross-sectional imaging or bone scintigraphy unnecessary. Furthermore, in patients with biochemically recurrent prostate cancer, use of (68)Ga-PSMA-PET imaging has been shown to increase detection of metastatic sites, even at low serum PSA values, compared with conventional imaging or PET examination with different tracers."

According to the news editors, the research concluded: "Thus, although current knowledge is still limited and derived mostly from retrospective series, PSMA-based imaging holds great promise to improve prostate cancer management."

Our news journalists report that additional information may be obtained by contacting T. Maurer, Dept. of Urology, Technische Universitat Munchen, Klinikum rechts der Isar, Ismaninger Strasse 22, 81671 Munich, Germany. Additional authors for this research include M. Eiber, M. Schwaiger and J.E Gschwend.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrurol.2016.26. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from Technical University Update Knowledge of Aggressive Periodontitis (Differentiation of Chronic and Aggressive Periodontitis by FTIR Spectroscopy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Periodontal Diseases and Conditions - Aggressive Periodontitis. According to news reporting originating from Ankara, Turkey, by NewsRx correspondents, research stated, "Without longitudinal clinical data, it is difficult to differentiate some cases of chronic periodontitis (CP) and aggressive periodontitis (AgP). Furthermore, both forms of disease are exacerbated by tobacco use."

Our news editors obtained a quote from the research from Technical University, "Therefore, this cross-sectional study was planned, primarily, to determine the ability of Fourier-transform infrared (FTIR) spectroscopy to distinguish CP and AgP patients by analysis of human saliva samples and, secondarily, to assess the potential confounding influence of smoking on discriminating disease-specific spectral signatures. FTIR spectra were collected from patients with a clinical diagnosis of CP (n = 18; 7 smokers) or AgP (n = 23; 9 smokers). Self-reported smoking status, which may be unreliable, was confirmed by salivary cotinine analysis. Spectral band area analysis and hierarchical cluster analyses were performed to clarify if the 2 periodontitis groups as well as smoker and nonsmoker patients could be differentiated from each other. Significant variations in lipid, amino acid, lactic acid, and nucleic acid content were found between nonsmoker CP and AgP groups. Although significantly lower lipid, phospholipid, protein, amino acid, lactic acid, and nucleic acid content was noted in the smoker AgP group compared with the nonsmoker AgP group, in the CP group, phospholipid, protein, amino acid, lactic acid, and nucleic acid content was noted in the smoker AgP group compared with the nonsmoker AgP group. Based on these variations, nonsmoker CP and AgP patients were discriminated from each other with high sensitivity and specificity. Successful differentiation was also obtained for the smoker CP and AgP groups. Thiocyanate levels successfully differentiated smokers from nonsmokers, irrespective of periodontal status, with 100% accuracy."

According to the news editors, the research concluded: "Differentiation of AgP and CP forms, concomitant with determination of smoking status, may allow the dental health professional to tailor treatment accordingly."

The news editors report that additional information may be obtained by contacting F. Severcan, Middle East Technical Univ, Dept. of Biol Sci, TR-06800 Ankara, Turkey. Additional authors for this research include I. Zeller, D.E. Renaud, P. Gumus, N. Nizam, F. Severcan, N. Buduneli and D.A. Scott.

Cardiology

Findings from Tel Aviv University Has Provided New Data on Cardiology (Left atrial appendage and pulmonary artery anatomic relationship by cardiac-gated computed tomography: Implications for late pulmonary artery perforation by left atrial ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiology is now available. According to news reporting out of Tel Aviv, Israel, by NewsRx editors, research stated, "Delayed pulmonary artery (PA) perforation and tamponade caused by implantable left atrial appendage (LAA) closure devices has been reported in patients with dose proximity between these structures. The LAA and PA anatomic relationship (LAA-PA(ar)) has not been analyzed systematically."

Our news journalists obtained a quote from the research from Tel Aviv University, "The purpose of this study was to identify LAA-PA(ar) variants potentially susceptible to this complication using cardiac gated computed tomography angiography. We studied 100 consecutive patients with atrial fibrillation undergoing cardiac-gated computed tomography angiography of the left atrium. The LAA-PA(ar) was classified into 3 types on the basis of the location, length, and thickness of the segment of contact between the PA and/or its branches and the LAA: type 1, no contact; type 2, contact involving the proximal LAA (defined as the proximal 15 mm extending into the LAA from its ostium, or the LAA proximal to the first major bend arising <15 mm from the ostium); and type 3, contact limited to the distal LAA. LAA-PA(ar) types 1, 2, and 3 were present in 7 (7%), 28 (28%), and 65 (65%) patients, respectively. For LAA-PA(ar) type 2, the mean contact segment thickness and length were 0.6 +/- 0.3 and 18.1 +/- 10.6 mm, respectively. For LAA-PA(ar) type 3, the distance between the LAA orifice and the segment of contact was <30 mm in 52 patients (80%). In this series, the LAA came in direct contact with the main PA in the majority of patients."

According to the news editors, the research concluded: "Contact involved the proximal LAA (where the fixation components of most LAA closure devices are positioned) in 28% of patients, posing potential vulnerability to PA perforation."

Our news journalists report that additional information may be obtained by contacting A. Halkin, Tel Aviv University, Sackler Fac Med, Tel Aviv, Israel. Additional authors for this research include C. Cohen, R. Rosso, E. Chorin, M. Schnapper, S. Biner, Y. Topilsky, A. Shiran, H. Shmilovich, D. Cohen, G. Keren, S. Banai and G. Aviram.

Oncology - Breast Cancer

Findings from Tel Aviv University Reveals New Findings on Breast Cancer (First trimester human placenta prevents breast cancer cell attachment to the matrix: The role of extracellular matrix)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting out of Tel Aviv, Israel, by NewsRx editors, research stated, "The extracellular matrix (ECM) affects cancer cell characteristics. Its detachment from the ECM induces cell apoptosis, termed anoikis."

Our news journalists obtained a quote from the research from Tel Aviv University, "Cancer cells can develop anoikis resistance, a necessary step for metastasis, by switching integrins, over-expressing growth factor receptors, and inducing epithelial mesenchymal transition (EMT). The placenta is a non-supportive microenvironment for cancer cells. We showed that breast cancer cells (BCCL) were eliminated from placental implantation sites. During implantation, the placenta manipulates its surrounding matrix, which may induce BCCL elimination. Here, we explored the effect of placenta-induced ECM manipulations on BCCL. During experiments, BCCL (MCF-7/T47D) were cultured on placenta/BCCL-conditioned ECM (Matrigel used for first trimester placenta/BCCL culture and cleared by NH4OH). After culturing the cells, we analyzed cancer cell phenotype (death, count, aggregation, MMP) and signaling (microarray analysis and pathway validation). We found that the BCCL did not attach to previous placental implantation sites and instead, similarly to anoikis-resistant cells, migrated away, displayed increased MMP levels/activity, and formed aggregates in distant areas. T47D were less affected than the MCF-7 cells, since MCF-7 also showed modest increases in cell death, EMT, and increased proliferation. Microarray analysis of the MCF-7 highlighted changes in the integrin, estrogen, EGFR, and TGF pathways. Indeed, placental ECM reduced ER, induced Smad3/JNK phosphorylation and increased integrin-5 expression (RGD-dependent integrin) in the BCCL. Addition of RGD or TGFR/JNK inhibitors reversed the phenotypic changes."

According to the news editors, the research concluded: "This study helps explain the absence of metastases to the placenta and why advanced cancer is found in pregnancy, and provides possible therapeutic targets for anoikis-resistant cells."

Our news journalists report that additional information may be obtained by
Oncology - Endometrial Cancer

Findings from Temple University Hospital Provides New Data about Endometrial Cancer (The obese endometrial cancer patient: how do we effectively improve morbidity and mortality in this patient population?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Endometrial Cancer have been presented. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Endometrial cancer patients have increased mortality from obesity-related comorbidities. Gynecologic oncologists should regularly incorporate screening and treatment methods to address this risk. The relationship between obesity, metabolic syndrome, and endometrial cancer has been established and accepted for decades."

Our news editors obtained a quote from the research from Temple University Hospital, "However, despite this understanding, endometrial cancer patients continue to die of their obesity-related comorbidities such as cardiovascular disease and diabetes. Furthermore, studies show that gynecologic oncologists, general obstetrician/gynecologists, and bariatric specialists do not appropriately address obesity as a risk factor for cancer and also do not provide appropriate counseling on weight loss and lifestyle modification during screening, diagnosis, and follow-up for endometrial cancer. Given the increasing numbers of obese women both in the United States as well as globally, it is imperative that this risk be addressed and mitigated during patient interactions. Therefore, this article reviews the literature on obesity, metabolic syndrome, and endometrial cancer, as well as the literature on causes of death in endometrial cancer patients. Given the increased cardiovascular and all-cause mortality, we provide a number of methods to address obesity as a risk factor for cancer during patient visits. These methods include self-directed diet and exercise, supervised diet and exercise programs, medical management with insulin-sensitizing agents and statins, as well as bariatric surgery in extreme cases."

According to the news editors, the research concluded: "Furthermore, we also encourage collaboration between general obstetrician/gynecologists, gynecologic oncologists, and bariatric specialists in the care of obese endometrial cancer patients to ensure that they not only survive their diagnosis, but also go on to live long, healthy lives."

The news editors report that additional information may be obtained by contacting K.
Lymphatic Diseases and Conditions –...

Findings from Thomas Jefferson University Update Understanding of Hemophagocytic Lymphohistiocytosis (Hemophagocytic lymphohistiocytosis in the ED)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lymphatic Diseases and Conditions - Hemophagocytic Lymphohistiocytosis. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Hemophagocytic lymphohistiocytosis (HLH) is a hyperinflammatory syndrome characterized by tissue invasion of liver, spleen, and lymph nodes by benign lymphocytes and hemophagocytosing macrophages with marked release of inflammatory cytokines. The result is a cytokine storm with systemic inflammatory response syndrome, multiorgan dysfunction, and often death."

Our news editors obtained a quote from the research from Thomas Jefferson University, "Patients present with fever, hepatosplenomegaly, unexplained cytopenias, marked hyperferetinemia, liver dysfunction, coagulopathy, central nervous system dysfunction, and/or renal dysfunction. An infectious or malignant trigger is often found. We describe here a case that presented to the emergency department with fever, jaundice, a change in mental status, acute kidney injury, and severe pancytopenia. The patient was admitted to the intensive care unit, and hemophagocytic lymphohistiocytosis was diagnosed. Recovery occurred with supportive therapy. Emergency medicine physicians need to be aware of this syndrome to obtain confirmatory testing and appropriate subspecialty consultation in a timely manner and to initiate the search for triggering infections. Chemoimmunotherapy of the hyperinflammatory state and specific treatment of triggering infections may be lifesaving. Hemophagocytic lymphohistiocytosis (HLH) is a frequently fatal, hyperinflammatory syndrome resulting from exuberant proliferation of CD8+ cytotoxic T-lymphocytes (CTL) and benign macrophages with tissue invasion involving lymph nodes, liver, and spleen [1]. There is marked release of proinflammatory cytokines, resulting in a 'cytokine storm,' with severe systemic inflammatory response syndrome, multiorgan dysfunction syndrome, and often death. Autosomal recessive, primary familial HLH (FHL) as well as X-linked forms usually present in infancy or early childhood [2]. Secondary HLH (sHLH) can occur at any age, triggered by infection, malignancy, immunosuppression, or flare of rheumatologic disease (known as macrophage activation syndrome) [3]. Cases of sHLH not uncommonly also have an underlying genetic predisposition.
Clinical manifestations include unremitting fever; rash; lymphadenopathy; hepatosplenomegaly; and dysfunction of liver, kidney, lung, and/or central nervous system. Bicytopenia or pancytopenia is characteristic along with markedly elevated ferritin, abnormal liver function tests, coagulopathy, hypofibrinogenemia, hypertriglyceridemia, and hyponatremia."

According to the news editors, the research concluded: "Bone marrow aspiration (BMA) usually, but not always, reveals hemophagocytes (HPCs), macrophages that have phagocytosed red cells, leukocytes, and/or platelets, and their precursors."

The news editors report that additional information may be obtained by contacting E.J. Filippone, Thomas Jefferson University, Div Nephrol, Dept. of Med, Sydney Kimmel Med College, Philadelphia, PA 19107, United States. Additional authors for this research include L.M. Filippone and E.J. Filippone.

**Pharmacology**

**Findings from Tianjin University Yields New Findings on Pharmacology (Phytochemical and Pharmacological Studies on the Genus Psoralea: A Mini Review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pharmacology have been published. According to news originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "The genus Psoralea, which belongs to the family Fabaceae, comprises ca. 130 species distributed all over the world, and some of the plants are used as folk medicine to treat various diseases."

Financial supporters for this research include National Natural Science Foundation of China, Tianjin Science and Technology Commissioner Project, National Science and Technology Major Projects.

Our news journalists obtained a quote from the research from Tianjin University, "Psoralea corylifolia is a typical example, whose seeds have been widely used in many traditional Chinese medicine formulas for the treatment of various diseases such as leucoderma and other skin diseases, cardiovascular diseases, nephritis, osteoporosis, and cancer. So, the chemical and pharmacological studies on this genus were performed in the past decades."

According to the news editors, the research concluded: "Here, we give a mini review on this genus about its phytochemical and pharmacological studies from 1910 to 2015."

The news correspondents report that additional information may be obtained from X. Chai, Tianjin University for Traditional Chinese Medicine, Tianjin Key Lab Modern Chinese Med, Tianjin 300193, People's Republic of China. Additional authors for this research include T.L. Wang, Z.Q. Zhang, W.Q. Yang, Y.F. Wang, X. Chai, C.H. Wang and Z. Li.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1155/2016/8108643. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Pharmacology**

**Findings from Tohoku University Update Knowledge of Pharmacology (Effects of ZD0947, a novel and potent ATP-sensitive K+ channel opener, on smooth muscle-type ATP-sensitive K+ channels)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Pharmacology have been published. According to news reporting originating in Miyagi, Japan, by NewsRx journalists, research stated, "The effects of ZD0947, a novel ATP-sensitive K+ channel (K-ATP channel) opener, on the activity of reconstituted KATP channels were investigated using cell-attached recordings. KATP channels were studied in HEK 293 cells by co-expression of inwardly rectifying-6 family K+ channel subunits (Kir6.x: Kir6.1 and Kir6.2) with 3 different types of sulphonylurea receptors (SUR.x: SUR1, SUR2A and SUR2B)."

The news reporters obtained a quote from the research from Tohoku University, "ZD0947 (100 mu M) activated SUR2B/Kir6.2 channels in a concentration-dependent manner, but caused only weak activation of SUR1/Kir6.2 channels and SUR2A/Kir6.2 channels expressed in HEK 293 cells. ZD0947 reversibly suppressed diazoxide-elicited SUR1/Kir6.2 channels activity and pinacidil-elicited SUR2A/Kir6.2 channel activity. However, ZD0947 did not affect SUR2B/Kir6.2 channels fully activated by 100 mu M pinacidil. ZD0947 had little inhibitory effects on the activity of Kir6.2 Delta C26 channels (a truncated isoform of Kir6.2) or its mutant channels (i.e. Kir6.2 Delta C26C166A) expressed in HEK 293 cells. ZD0947 also elicited activity in SUR2B/Kir6.1 channels expressed in HEK 293 cells, in a concentration-dependent manner. Therefore, ZD0947 is a relatively effective activator of smooth muscle-type KATP channels (SUR2B/Kir6.1 and SUR2B/Kir6.2) but is a partial antagonist of pancreatic-type KATP channels (i.e. SUR1/Kir6.2) and cardiac-type KATP channels (i.e. SUR2A/Kir6.2)."

According to the news reporters, the research concluded: "These results suggest that a pharmacological agent can possess either agonist or antagonist actions on the activity of KATP channels, depending on the subtype of SUR.x."

Our news correspondents report that additional information may be obtained by contacting N. Teramoto, Tohoku University, Grad Sch Biomed Engn, Biomed Engn Lab, Sendai, Miyagi 9808575, Japan. Additional authors for this research include Y. Yamashita and N. Teramoto.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejphar.2016.09.038. This DOI is a link to an online electronic document that is either free or for purchase.

**Necroptosis**

**Findings from Tokyo Medical and Dental University Broaden Understanding of Necroptosis (Necroptosis-like Neuronal Cell Death Caused by Cellular Cholesterol Accumulation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Necroptosis have been published. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Aberrant cellular accumulation of cholesterol is associated with neuronal lysosomal storage disorders such as Niemann-Pick disease Type C (NPC). We have shown previously that L-norephedrine (L-Nor), a sympathomimetic amine, induces necrotic cell death associated with massive cytoplasmic vacuolation in SH-SY5Y human neuroblastoma cells."

Financial support for this research came from Japan Society for the Promotion of Science.

Our news journalists obtained a quote from the research from Tokyo Medical and Dental University, "To reveal the molecular mechanism underling necrotic neuronal cell death caused by L-Nor, we examined alterations in the gene expression profile of cells during L-Nor exposure. DNA microarray analysis revealed that the gene levels for cholesterol transport (LDL receptor and NPC2) as well as cholesterol biosynthesis (mevalonate pathway enzymes) are increased after exposure to 3 mM L-Nor for similar to 6 h. Concomitant with this observation, the master transcriptional regulator of cholesterol homeostasis, SREBP-2, is activated by L-Nor. The increase in cholesterol uptake as well as biosynthesis is not accompanied by an increase in cholesterol in the plasma membrane, but rather by aberrant accumulation in cytoplasmic compartments. We also found that cell death by L-Nor can be suppressed by nec-1s, an inhibitor of a regulated form of necrosis, necroptosis. Abrogation of SREBP-2 activation by the small molecule inhibitor betulin or by overexpression of dominant-negative SREBP-2 efficiently reduces cell death by L-Nor. The mobilization of cellular cholesterol in the presence of cyclodextrin also suppresses cell death. These results were also observed in primary culture of..."
striatum neurons."

According to the news editors, the research concluded: "Taken together, our results indicate that the excessive uptake as well as synthesis of cholesterol should underlie neuronal cell death by L-Nor exposure, and suggest a possible link between lysosomal cholesterol storage disorders and the regulated form of necrosis in neuronal cells."

The news correspondents report that additional information may be obtained from T. Aki, Tokyo Medical & Dental University, Grad Sch Med & Dental Sci, Dept. of Forens Med, Tokyo 1138519, Japan. Additional authors for this research include T. Aki, M. Tajiri, K. Unuma and K. Uemura.

**Drugs and Therapies - Antibiotics**

**Findings from Tongji University Update Knowledge of Antibiotics (Preparation and Antibacterial Mechanism Insight of Polypeptide-Based Micelles with Excellent Antibacterial Activities)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a new report. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Traditional antibiotics usually sterilize in chemical ways, which may lead to serious drug resistance. By contrast, peptide-based antibacterial materials are less susceptible to drug resistance."

Funders for this research include Ministry of Education of the People's Republic of China, National Natural Science Foundation of China, Shanghai 1000 Talents Plan, Beijing National Laboratory for Molecular Sciences, Shanghai International Scientific Collaboration Fund.

Our news journalists obtained a quote from the research from Tongji University, "Herein we report the preparation of an antibacterial peptide-based copolymer micelle and the investigation of its membrane-penetration antibacterial mechanism by transmission electron microscopy (TEM). The copolymer is poly(L-lactide)-block-poly(phenylalanine-stat-lysine) [PLLA(31)-b-poly(Phe(24)-stat-Lys(36))], which is synthesized by ring-opening polymerization. The PLLA chains form the core, whereas the polypeptide chains form the coronas of the micelle in aqueous solution. This micelle boasts excellent antibacterial efficacy against both Gram-positive and Gram-negative bacteria. Furthermore, TEM studies clearly reveal that the micelles
pierce and then destroy the cell membrane of the bacteria. We also compared the advantages and disadvantages of two general methods for measuring the Minimal Inhibitory Concentration (MIC) values of antibacterial micelles."

According to the news editors, the research concluded: "Overall, this study provides us with direct evidence for the antibacterial mechanism of polypeptide-based micelles and a strategy for synthesizing biodegradable antibacterial nano materials without antibiotic resistance."

For more information on this research see: Preparation and Antibacterial Mechanism Insight of Polypeptide-Based Micelles with Excellent Antibacterial Activities. *Biomacromolecules*, 2016;17(12):3922-3930. *Biomacromolecules* can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. fistula type. We identified a total of 84 patients: 45 had a BCAVF, and 39 had an mNT-BBAVF. The two groups were well matched for baseline characteristics. Maturation rates at 1 month were 97% for mNT-BBAVF and 96% for BCAVF. The 1-year primary unassisted patency was significantly higher in the NT-BBAVF group than that in the BCAVF group (87% vs 67%; hazard ratio, 2.86; 95% confidence interval, 1.11-6.40; P =.03), although cumulative patency did not differ (90% vs 73%; hazard ratio, 2.80; 95% confidence interval, 0.98-6.96; P =.06). There were no differences in thrombosis, failure of maturation, bleeding, steal syndrome, arm swelling, aneurysm, and stenosis between the two groups during the 12-month study. Importantly, diameters and blood flow volumes of the proximal cephalic vein, distal cephalic vein, and distal basilic vein in patients who received an mNT-BBAVF increased significantly after 12 months. All three vessels met the Kidney Disease Outcomes Quality Initiative (KDOQI) criteria for fistula maturation and were available for dialysis cannulation, whereas only the proximal cephalic vein in the BCAVF group met the maturation criteria and could be used for cannulation."

According to the news editors, the research concluded: "MNT-BBAVF appeared to be an effective alternative to BCAVF for upper arm hemodialysis access."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jvs.2016.03.450. This DOI is a link to an online electronic document that is either free or for purchase.

**Autoimmune Diseases and Conditions – Psoriatic…**

**Findings from Toronto Western Hospital Yields New Data on Psoriatic Arthritis (CXCL10 Is a Possible Biomarker for the Development of Psoriatic Arthritis Among Patients With Psoriasis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Autoimmune Diseases and Conditions - Psoriatic Arthritis are discussed in a new report. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "Biomarkers that can predict the
development of psoriatic arthritis (PsA) in patients with psoriasis would be useful in clinical practice. The aim of this study was to assess whether CXCL10 could be a predictive biomarker of PsA prior to its onset."

Our news editors obtained a quote from the research from Toronto Western Hospital, "Psoriasis patients without arthritis were followed up prospectively and assessed annually for development of PsA by a rheumatologist. Patients in whom PsA developed were designated as converters, while those in whom PsA did not develop were termed nonconverters. Baseline serum concentrations of CXCL10 were measured by Luminox assay in 46 converters and 45 nonconverters. The level of CXCL10 was significantly higher in converters (median 493 pg/ml [interquartile range (IQR) 356-984]) than in nonconverters (median 371 pg/ml [IQR 263-578]; P=0.005). In contrast, C-reactive protein (CRP) levels were not significantly different between converters and nonconverters at baseline. CXCL10 was associated with conversion status after adjustment for age, sex, duration of psoriasis, and duration of follow-up (odds ratio 1.3, 95% confidence interval 1.1-1.5, P=0.004). In a subset of converters, the CXCL10 level was significantly higher at baseline (median 927.4 pg/ml [IQR 547.6-1,243]) than after PsA diagnosis (491.5 pg/ml [IQR 323.2-607]; P<0.0001), while CRP levels were lower at baseline (26.6 mu g/ml [IQR 16.37-62.75]) than after PsA diagnosis (36.1 mu g/ml [IQR 14.74-101.7]; P=0.003). CXCL10 gene expression was increased 17.3-fold in synovial fluid (SF) compared with blood from PsA patients (P=0.01) and 44.3-fold in the SF of PsA patients compared with the SF of patients with gout (P=0.001)."

According to the news editors, the research concluded: "CXCL10 may be involved in PsA pathogenesis and is a candidate predictive biomarker for PsA in patients with psoriasis."

For more information on this research see: CXCL10 Is a Possible Biomarker for the Development of Psoriatic Arthritis Among Patients With Psoriasis. *Arthritis & Rheumatology*, 2016;68(12):2911-2916. *Arthritis & Rheumatology* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

**Choline**

**Findings from Tottori University Broaden Understanding of Choline (M3 Muscarinic Receptor Signaling Stabilizes a Novel Mutant Human Ether-Go-Go-Related Gene Channel Protein via Phosphorylation of Heat Shock Factor 1 in Transfected Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Choline have been published. According to news reporting out of Tottori, Japan, by NewsRx editors, research stated, "Long QT syndrome 2
(LQT2) is caused by mutations in the human ether-a-go-go-related gene (hERG). Most of its mutations give rise to unstable hERG proteins degraded by the proteasome."

Our news journalists obtained a quote from the research from Tottori University, "Recently, carbachol was reported to stabilize the wild-type hERG-FLAG via activation of the muscarinic type 3 receptor (M3-mAChR). Its action on mutant hERG-FLAG, however, remains uninvestigated. A novel mutant hERG-FLAG carried 2 mutations: an amino acid substitution G572S and an in-frame insertion D1037_V1038insGD. When expressed in HEK293 cells, this mutant hERG-FLAG was degraded by the proteasome and failed to be transported to the cell surface. Carbachol restored stability of the mutant hERG-FLAG and facilitated cell-surface expression. Carbachol activated PKC, augmented phosphorylation of heat shock factor 1 (HSF1) and enhanced expression of heat shock proteins (hsp70 and hsp90. Both a M3-mAChR antagonist, 4-DAMP, and a PKC inhibitor, bisindolylmaleimide, abolished carbachol-induced stabilization of the mutant hERG-FLAG. M3-mAChR activation leads to enhancement of hsp expression via PKC-dependent phosphorylation of HSF1, thereby stabilizing the mutant hERG-FLAG protein."

According to the news editors, the research concluded: "Thus, M3-mAChR activators may have a therapeutic value for patients with LQT2."

Immune System Diseases and Conditions - Graft-…

Findings from Toulouse University Hospital Reveals New Findings on Graft-Versus-Host Disease (Photo-induced graft-versus-host disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immune System Diseases and Conditions - Graft-Versus-Host Disease is now available. According to news originating from Toulouse, France, by
NewsRx correspondents, research stated, "Overlap chronic graft-versus-host disease (GVHD) associates both features of acute and chronic GVHD. Trigger factors for chronic GVHD are unclear."

Our news journalists obtained a quote from the research from Toulouse University Hospital, "We describe two patients who received allogenic haematopoietic stem-cell transplantation, and who later developed overlap chronic GVHD after sun exposure. Available data from in vivo investigations suggest ultraviolet B radiation (UVB) has a beneficial effect on acute and chronic GVHD. The role of sun irradiation as a trigger for isomorphic cutaneous GVHD has been rarely reported in the literature."

According to the news editors, the research concluded: "Herein, we demonstrate for the first time, using repetitive broadband phototesting, that UVB triggers chronic GVHD."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/phpp.12273. This DOI is a link to an online electronic document that is either free or for purchase.

Immunology - Immune System

Findings from Trinity College in Immune System Provides New Insights (The Role of the Oxysterol/EBI2 Pathway in the Immune and Central Nervous Systems)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunology - Immune System. According to news originating from Dublin, Ireland, by NewsRx correspondents, research stated, "Oxysterols are pleiotropic messengers interacting with multiple receptor systems. One of the cognate receptors for oxysterols is EBI2, a G protein-coupled receptor highly expressed in the cells of the immune system."

Our news journalists obtained a quote from the research from Trinity College, "Here we discuss the receptor's role in the adapted immunity and inflammation as well as the receptor's expression and function in the CNS with the focus on astrocytes. We also discuss expression and signalling of oxysterol-producing enzymes such as CH25H and CYP7B1 in the CNS and the immune system."

According to the news editors, the research concluded: "These steps will help to elucidate a possible role for this pathway in the physiology of the central and peripheral nervous
system and its possible link to human disease."

The news correspondents report that additional information may be obtained from A. Rutkowska, School of Medicine, Dept. of Physiology, Trinity College Dublin, Dublin 152 - 160 Pearse Street, Ireland. Additional authors for this research include K.K. Dev and A.W Sailer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2174/1389450117666160217123042. This DOI is a link to an online electronic document that is either free or for purchase.

**Findings from Triserv General Hospital Yields New Findings on Stroke (Differentiating contrast staining after acute ischemic stroke from hemorrhagic transformation during emergency evaluation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Stroke is now available. According to news originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "A hyperdense lesion observed in a computed tomographic (CT) image of the brain is usually suspected to be a hemorrhage during an emergency evaluation. Other rare differential diagnoses include contrast-induced encephalopathy (CIN) and acute cerebral infarction with contrast staining (CS)."

Our news journalists obtained a quote from the research from Triserv General Hospital, "Recent contrast administration is a common risk factor for both CIN and CS. The former has been associated with favorable neurologic outcomes, whereas CS might have complications, such as hemorrhagic transformation (HT). Contrast staining on brain CT scans was most often reported in acute ischemic stroke patients receiving thrombolytic therapy and being administered contrast; the incidence of CS was 31% to 60% among these patients. Differentiating CS from HT after acute ischemic stroke was dependent on the presence of anatomical boundaries and on the absence of a significant mass effect and surrounding edema. The Hounsfield unit scale was also used to differentiate contrast or hemorrhage alone from mixed contrast and hemorrhage on brain CT scans. Clarifying the properties of a hyperdense lesion on a brain CT scan is essential because the therapeutic strategies for treating CS vs HT are completely different, including differences in the therapeutic goal of controlling blood pressure and in the use of antiplatelet agents. We report a rare condition in which CS developed in an elderly patient because of end-stage renal disease, but the patient was not receiving thrombolytic therapy."

According to the news editors, the research concluded: "An urgent brain magnetic resonance imaging scan was used to confirm the diagnosis of CS, which further guided the treatment of this patient."

For more information on this research see: Differentiating contrast staining after

The news correspondents report that additional information may be obtained from C.W. Liu, Natl Def Med Center, Triserv Gen Hosp, Div Cardiol, Dept. of Internal MedSongslian Branch, Taipei, Taiwan. Additional authors for this research include J.K. Lee, Y.J. Lai, T.C. Lin and C.W. Liu.

**Membrane Proteins - Arrestins**

**Findings from Tufts University Update Understanding of Arrestins (Mutation-Induced Functional Alterations of CCR6)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Membrane Proteins - Arrestins are discussed in a new report. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "The Cys-Cys chemokine receptor 6 (CCR6) is a well-established modulator of inflammation. Although several genetic associations have been identified between CCR6 polymorphisms and immune system disorders (e.g., rheumatoid arthritis and Crohn's disease), the pharmacological effects of naturally occurring missense mutations in this receptor have yet to be characterized."

The news correspondents obtained a quote from the research from Tufts University, "In this study, we initially assessed G protein-mediated signaling and observed that wild-type (WT) CCR6 exhibited ligand-independent activity. In addition, we found that the five most frequent CCR6 missense variants (A89T, A150V, R155W, G345S, and A369V) exhibited decreased basal and/or ligand induced G alpha i protein signaling. To complement the study of these loss-of-function variants, we engineered a set of constitutively active CCR6 receptors. Selected mutations enhanced basal Gprotein-mediated signaling up to 3-fold relative to the WT value. Using a bioluminescence resonance energy transfer assay we investigated the ability of each naturally occurring and engineered CCR6 receptor mutant to recruit beta-arrestin. In contrast to G protein-mediated signaling, beta-arrestin mobilization was largely unperturbed by the naturally occurring loss-of-function CCR6 variants. Elevated recruitment of b-arrestin was observed in one of the engineered constitutively active mutants (T98P). Our results demonstrate that point mutations in CCR6 can result in either a gain or loss of receptor function."

According to the news reporters, the research concluded: “These observations underscore the need to explore how CCR6 natural variants may influence immune cell physiology and human disease."

Heart Disorders and Diseases - Atrial Fibrillation

Findings from Turgut Ozal University Yields New Data on Atrial Fibrillation (Galectin-3: A biochemical marker to detect paroxysmal atrial fibrillation?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting originating in Ankara, Turkey, by NewsRx journalists, research stated, "Atrial fibrillation (AF) is the most common form of arrhythmia. AF leads to electrical remodelling and fibrosis of the atria; however, the mechanism(s) remain poorly understood."

The news reporters obtained a quote from the research from Turgut Ozal University, "Galectin-3 is a potential mediator of cardiac fibrosis. The present study aimed to examine the relationship between serum galectin-3 levels and paroxysmal AF. Forty-six patients with paroxysmal AF and preserved left ventricular systolic function, and 38 age-and gender-matched control subjects, were involved in the study. Serum galectin-3 levels were analyzed with an enzyme-linked immunosorbent assay (ELISA). Serum galectin-3 levels (median 1.38 ng/mL; 1.21 ng/mL-1.87 ng/mL; p< 0.001) were significantly elevated in patients with paroxysmal AF compared with the control. Left atrial diameter was significantly higher in patients with paroxysmal AF (41.2 +/- 3.0 mm vs. 39.6 +/- 3.3 mm). Left atrial diameter was found to be significantly correlated with serum galectin-3 levels in patients with paroxysmal AF (r= 0.378, p = 0.001)."

According to the news reporters, the research concluded: "Serum galectin-3 levels are significantly elevated and significantly correlated with left atrial diameter in patients with paroxysmal AF."

For more information on this research see: Galectin-3: A biochemical marker to detect paroxysmal atrial fibrillation? *Clinical and Investigative Medicine*, 2016;39(6):S197-S202. *Clinical and Investigative Medicine* can be contacted at: Canadian Soc Clinical Investigation, Csci Head Office, 774 Echo Drive, Ottawa, On K1S 5N8, Canada.

Findings from Umea University Broaden Understanding of Endocarditis
(High incidence of infective endocarditis in adults with congenital ventricular septal defect)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Endocarditis have been published. According to news reporting from Umea, Sweden, by NewsRx journalists, research stated, "Ventricular septal defects (VSDs), if haemodynamically important, are closed whereas small shunts are left without intervention. The long-term prognosis in congenital VSD is good but patients are still at risk for long-term complications."

The news correspondents obtained a quote from the research from Umea University, "The aim of this study was to clarify the incidence of infective endocarditis (IE) in adults with VSD. The Swedish registry for congenital heart disease (SWEDCON) was searched for adults with VSD. 779 patients were identified, 531 with small shunts and 248 who had the VSD previously closed. The National Patient Register was then searched for hospitalisations due to IE in adults during a 10-year period. Sixteen (2%) patients were treated for IE, 6 men and 10 women, with a mean age of 46.3 +/- 12.2 years. The incidence of IE was 1.7-2.7/1000 years in patients without previous intervention, 20-30 times the risk in the general population. Thirteen had small shunts without previous intervention. There was no mortality in these 13 cases. Two patients had undergone repair of their VSD and also aortic valve replacement before the episode of endocarditis and a third patient with repaired VSD had a bicuspid aortic valve, all of these three patients needed reoperation because of their IE and one patient died. No patient with isolated and operated VSD was diagnosed with IE."

According to the news reporters, the research concluded: "A small unoperated VSD in adults carries a substantially increased risk of IE but is associated with a low risk of mortality."

For more information on this research see: High incidence of infective endocarditis in adults with congenital ventricular septal defect. Heart, 2016;102(22):1835-1838,104. Heart can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. (BMJ Publishing Group - group.bmj.com/; Heart - heart.bmj.com/)

Autoinflammatory Diseases and Conditions - Familial...

Findings from University Children's Hospital Broaden Understanding of Familial Mediterranean Fever (Correlation of Secretory Activity of Neutrophils With Genotype in Patients With Familial Mediterranean Fever)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Autoinflammatory Diseases and Conditions - Familial Mediterranean Fever are discussed in a new report. According to news reporting out of Munster, Germany, by NewsRx editors, research stated, "Familial Mediterranean fever (FMF) is an autoinflammatory disorder caused by pyrin-encoding MEFV mutations. Patients present with recurrent but self-limiting episodes of acute inflammation and often have persistent subclinical inflammation."

Our news journalists obtained a quote from the research from University Children's Hospital, "The pathophysiology is only partially understood, but neutrophil overactivation is a hallmark of the disease. S100A12 is a neutrophil-derived proinflammatory danger signal that is strongly elevated in active FMF. This study was undertaken to characterize the secretory activity of neutrophils in vitro and investigate the association of S100A12 with disease activity and genotype in patients with FMF. Neutrophils from FMF patients carrying the p.M694V mutation (1 compound heterozygous and 5 homozygous) and neutrophils from 4 healthy control subjects were purified and stimulated in vitro. Neutrophil secretion of S100A12, interleukin-18 (IL-18), IL-1 beta, and caspase 1 was determined. Based on these in vitro analyses, serum concentrations of S100A12, IL-18, and IL-1 beta were also analyzed in 128 clinically and genetically characterized patients with FMF. In vitro, unstimulated neutrophils from p.M694V-positive patients spontaneously secreted more S100A12, IL-18, and caspase 1 compared to neutrophils from healthy controls. Serum concentrations of S100A12 correlated with disease activity and genotype, with the levels being highest in homozygous patients and with compound heterozygotes displaying higher levels than heterozygotes. Compared to individuals negative for the p.M694V mutation, heterozygous, compound heterozygous, or homozygous p.M694V-positive patients had higher serum levels of S100A12 and IL-18 during inactive and subclinical disease. The FMF phenotype is known to be more severe in patients carrying the p.M694V mutation. This report describes 2 molecules secreted by unconventional secretory pathways, S100A12 and IL-18, whose concentrations correlated with clinical disease activity and genotype in patients with FMF."

According to the news editors, the research concluded: "In this clinically and genetically heterogeneous disease, management of these surrogate markers might help to improve patient care and outcomes."

For more information on this research see: Correlation of Secretory Activity of Neutrophils With Genotype in Patients With Familial Mediterranean Fever. *Arthritis & Rheumatology*, 2016;68(12):3010-3022. *Arthritis & Rheumatology* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by
Sexually Transmitted Diseases and Conditions (STDs)

Findings from University College Broaden Understanding of Sexually Transmitted Diseases and Conditions (STDs) (Men who have sex with men in Great Britain: comparing methods and estimates from probability and convenience sample surveys)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Sexually Transmitted Diseases and Conditions (STDs). According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "To examine sociodemographic and behavioural differences between men who have sex with men (MSM) participating in recent UK convenience surveys and a national probability sample survey. We compared 148 MSM aged 18-64 years interviewed for Britain's third National Survey of Sexual Attitudes and Lifestyles (Natsal-3) undertaken in 2010-2012, with men in the same age range participating in contemporaneous convenience surveys of MSM: 15 500 British resident men in the European MSM Internet Survey (EMIS); 797 in the London Gay Men's Sexual Health Survey; and 1234 in Scotland's Gay Men's Sexual Health Survey."

Our news journalists obtained a quote from the research from University College, "Analyses compared men reporting at least one male sexual partner (past year) on similarly worded questions and multivariable analyses accounted for sociodemographic differences between the surveys. MSM in convenience surveys were younger and better educated than MSM in Natsal-3, and a larger proportion identified as gay (85%-95% vs 62%). Partner numbers were higher and same-sex anal sex more common in convenience surveys. Unprotected anal intercourse was more commonly reported in EMIS. Compared with Natsal-3, MSM in convenience surveys were more likely to report gonorrhoea diagnoses and HIV testing (both past year). Differences between the samples were reduced when restricting analysis to gay-identifying MSM. National probability surveys better reflect the population of MSM but are limited by their smaller samples of MSM. Convenience surveys recruit larger samples of MSM but tend to over-represent MSM identifying as gay and reporting more sexual risk behaviours."

According to the news editors, the research concluded: "Because both sampling strategies have strengths and weaknesses, methods are needed to triangulate data from probability and convenience surveys."

For more information on this research see: Men who have sex with men in Great Britain: comparing methods and estimates from probability and convenience sample surveys. Sexually Transmitted Infections, 2016;92(6):455-463. Sexually Transmitted Infections can be
Findings from University College Yields New Findings on Regenerative Medicine (Liver resection for cancer: New developments in prediction, prevention and management of postresectional liver failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Biomedical Engineering - Regenerative Medicine. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Hepatic failure is a feared complication that accounts for up to 75% of mortality after extensive liver resection. Despite improved perioperative care, the increasing complexity and extensiveness of surgical interventions, in combination with an expanding number of resections in patients with compromised liver function, still results in an incidence of postresectional liver failure (PLF) of 1-9%.

Our news editors obtained a quote from the research from University College, "Preventive measures aim to enhance future remnant liver size and function. Numerous non-invasive techniques to assess liver function and predict remnant liver volume are being developed, along with introduction of novel surgical strategies that augment growth of the future remnant liver. Detection of PLF is often too late and treatment is primarily symptomatic. Current therapeutic research focuses on ([bio]artificial) liver function support and regenerative medicine. In this review we discuss the current state and new developments in prediction, prevention and management of PLF, in light of novel insights into the aetiology of this complex syndrome. Lay summary: Liver failure is the main cause of death after partial liver resection for cancer, and is presumably caused by an insufficient quantity and function of the liver remnant. Detection of liver failure is often too late, and current treatment focuses on relieve of symptoms."

According to the news editors, the research concluded: "New research initiatives explore artificial support of liver function and stimulation of regrowth of the remnant liver."

For more information on this research see: Liver resection for cancer: New developments in prediction, prevention and management of postresectional liver failure. Journal of Hepatology, 2016;65(6):1217-1231. Journal of Hepatology can be contacted at:
Cardiology

Findings from University Health Network Broadens Understanding of Cardiology (The cardiac repair benefits of inflammation do not persist: evidence from mast cell implantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiology have been presented. According to news reporting originating in Toronto, Canada, by NewsRx journalists, research stated, "Multiple mechanisms contribute to progressive cardiac dysfunction after myocardial infarction (MI) and inflammation is an important mediator. Mast cells (MCs) trigger inflammation after MI by releasing bio-active factors that contribute to healing. c-Kit-deficient (Kit(W/W-v)) mice have dysfunctional MCs and develop severe ventricular dilatation post-MI."

Financial support for this research came from Canadian Institutes of Health Research.

The news reporters obtained a quote from the research from University Health Network, "We explored the role of MCs in post-MI repair. Mouse wild-type (WT) and Kit (W/W-v) MCs were obtained from bone marrow (BM). MC effects on fibroblasts were examined in vitro by proliferation and gel contraction assays. MCs were implanted into infarcted mouse hearts and their effects were evaluated using molecular, cellular and cardiac functional analyses. In contrast to WT, Kit(W/W-v) MC transplantation into Kit(W/W-v) mice did not improve cardiac function or scar size post-MI. Kit(W/W-v) MCs induced significantly reduced fibroblast proliferation and contraction compared to WT MCs. MC influence on fibroblast proliferation was Basic fibroblast growth factor (bFGF)-dependent and MC-induced fibroblast contractility functioned through transforming growth factor (TGF)-b. WT MCs transiently rescue cardiac function early post-MI, but the benefits of BM cell implantation lasted longer. MCs induced increased inflammation compared to the BM-injected mice, with increased neutrophil infiltration and infarct tumor necrosis factor-a (TNF-a) concentration. This augmented inflammation was followed by increased angiogenesis and myofibroblast formation and reduced scar size at early time-points. Similar to the functional data, these beneficial effects..."
were transient, largely vanishing by day 28. Dysfunctional Kit(W/W-v) MCs were unable to rescue cardiac function post-MI. WT MC implantation transiently enhanced angiogenesis and cardiac function.

According to the news reporters, the research concluded: "These data suggest that increased inflammation is beneficial to cardiac repair, but these effects are not persistent."

Our news correspondents report that additional information may be obtained by contacting Z. Shao, Division of Cardiovascular Surgery, Toronto General Research Institute, University Health Network, Toronto, ON, Canada. Additional authors for this research include M. Nazari, L. Guo, S.H. Li, J. Sun, S.M. Liu, H.P. Yuan, R.D. Weisel and R.K Li.

### Findings from University Hospital Broaden Understanding of Type 2 Diabetes (Development of an Interleukin-1b Vaccine in Patients with Type 2 Diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is the subject of a report. According to news reporting out of Basel, Switzerland, by NewsRx editors, research stated, "Interleukin-1b (IL-1b) is a key cytokine involved in inflammatory illnesses including rare hereditary diseases and common chronic inflammatory conditions as gout, rheumatoid arthritis, and type 2 diabetes mellitus, suggesting reduction of IL-1b activity as new treatment strategy. The objective of our study was to assess safety, antibody response, and preliminary efficacy of a novel vaccine against IL-1b."

Our news journalists obtained a quote from the research from University Hospital, "The vaccine hIL1bQb consisting of full-length, recombinant IL-1b coupled to virus-like particles was tested in a preclinical and clinical, randomized, placebo-controlled, double-blind study in patients with type 2 diabetes. The preclinical simian study showed prompt induction of IL-1b-specific antibodies upon vaccination, while neutralizing antibodies appeared with delay. In the clinical study with 48 type 2 diabetic patients, neutralizing IL-1b-specific antibody responses were detectable after six injections with doses of 900 µg. The development of
neutralizing antibodies was associated with higher number of study drug injections, lower baseline body mass index, improvement of glycemia, and C-reactive protein (CRP). The vaccine hIL1bQb was safe and well-tolerated with no differences regarding adverse events between patients receiving hIL1bQb compared to placebo.

According to the news editors, the research concluded: "This is the first description of a vaccine against IL-1b and represents a new treatment option for IL-1b-dependent diseases such as type 2 diabetes mellitus (ClinicalTrials)."

For more information on this research see: Development of an Interleukin-1b Vaccine in Patients with Type 2 Diabetes. Molecular Therapy, 2015;24(5):1003-12. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

Cardiovascular Diseases and Conditions - Abdominal...

Findings from University Hospital Has Provided New Data on Abdominal Aortic Aneurysm (Three-dimensional Ultrasound in the Management of Abdominal Aortic Aneurysms: A Topical Review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm. According to news reporting from Manchester, United Kingdom, by NewsRx journalists, research stated, "Three-dimensional (3D) ultrasound is an evolving modality that may have numerous applications in the management of abdominal aortic aneurysms."

The news correspondents obtained a quote from the research from University Hospital, "Many vascular specialists will not be familiar with the different ways in which 3D vascular ultrasound data can be acquired nor how potential applications are being explored by researchers. Most of the current literature consists of small series and single-centre experience, although clinical themes such as measurement of abdominal aortic aneurysm volume and surveillance following endovascular repair are emerging."

According to the news reporters, the research concluded: "The aim of this topical review is to introduce clinicians to the current concepts of 3D ultrasound, review the current literature, and highlight avenues for further research in this new and exciting field of vascular..."
imaging."

Our news journalists report that additional information may be obtained by contacting C. Lowe, Univ Hosp South Manchester, Dept. of Vasc & Endovasc Surg, Manchester, Lancs, United Kingdom. Transplant Medicine - Liver Transplants

Findings from University Hospital Provide New Insights into Liver Transplants (Effects of the Hypnotic Agent on Primary Graft Dysfunction After Liver Transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Transplant Medicine - Liver Transplants have been presented. According to news originating from Madrid, Spain, by NewsRx correspondents, research stated, "Morbidity and mortality rates in orthotopic liver transplantation have decreased in the past few years. Risk factors related to severe postoperative complications, such as primary graft dysfunction, still need to be analyzed."

Our news journalists obtained a quote from the research from University Hospital, "We evaluated the influence of the hypnotic agent used during anesthesia on primary graft dysfunction. We performed a retrospective analysis of 419 consecutive patients who received a liver transplant between 2005 and 2013 in a single center. We analyzed the incidence of primary graft dysfunction (defined as alanine aminotransferase or aspartate aminotransferase levels higher than 1500 IU/L on the first 3 days after surgery) and if the hypnotic agent was associated with this event. The incidence of primary graft dysfunction was 42.2% (114 patients), similar in both groups (propofol group, 89 patients, 43.2% and sevoflurane group, 25 patients, 39.1%). In the multivariate analysis, we did not find any relationship between the hypnotic agent (propofol or sevoflurane) and early graft dysfunction. In our patients, we found no differences in the incidence of liver graft dysfunction according to the hypnotic used during transplantation."

According to the news editors, the research concluded: "We can suggest that both drugs (sevoflurane and propofol) are equally safe in orthotopic liver transplantation."

The news correspondents report that additional information may be obtained from L.G. Martin, Ramon & Cajal Univ Hosp, Dept. of Anesthesiol & Intens Care, Madrid 28034, Spain. Additional authors for this research include C. Gonzalez, I.R. Torres, C.F. Martin, A.M. Grande, E.E. Martin, D.P. Roux and J.M.D. Sanchez.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.transproceed.2016.08.048. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Rectal Cancer**

**Findings from University Hospital Yields New Data on Rectal Cancer (Primary squamous cell carcinoma of the rectum: an atypical histology)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Rectal Cancer have been published. According to news originating from Madrid, Spain, by NewsRx correspondents, research stated, "Squamous cell carcinoma of the rectum is one of the differential diagnoses of rectal tumors. It represents a low incidence in the population."

Our news journalists obtained a quote from the research from University Hospital, "The etiopathogenesis and the biology of these tumors are unclear, for this reason the gold standard treatment is difficult to establish. We present a 47-years-old woman who had a squamous cell carcinoma in medium rectum."

According to the news editors, the research concluded: "She was treated with radiation therapy and chemotherapy and the treatment was followed by surgical excision."

The news correspondents report that additional information may be obtained from A. Ballestero-Perez, Hosp Univ Ramon y Cajal, Dept. of Gen Surg & Digest Diseases, Madrid 28034, Spain. Additional authors for this research include P. Abadia-Barno, F. Garcia-Moreno-Nisa, J. Die-Trill and J. Galindo-Alvarez.

Oncology - Prostate Cancer

Findings from University Hospital in the Area of Prostate Cancer Reported (Current Status of Lymph Node Imaging in Bladder and Prostate Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting from Bern, Switzerland, by NewsRx journalists, research stated, "The bladder and the prostate have a multitude of primary lymphatic landing sites, making the sentinel node concept inapplicable in patients with bladder or prostate cancer."

The news correspondents obtained a quote from the research from University Hospital, "However, some imaging techniques may be helpful in guiding surgeons for the removal of suspicious nodes that would not have been resected in a standardized template."

According to the news reporters, the research concluded: "Despite the multitude of new imaging techniques available today, a meticulous histologic workup of lymph nodes retrieved by an extended pelvic lymph node dissection still has the highest accuracy for detection of lymph node metastases in bladder or prostate cancer."

Our news journalists report that additional information may be obtained by contacting U.E. Studer, University Hospital Bern, Dept. of Urol, CH-3010 Bern, Switzerland. Additional authors for this research include H.C. Thoeny and U.E. Studer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.urology.2016.02.014. This DOI is a link to an online electronic document that is either free or for purchase.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lung Diseases and Conditions - Pulmonary Sarcoidosis are presented in a new report. According to news reporting originating in Gottingen, Germany, by NewsRx journalists, research stated, "Patients with sarcoidosis undergo spontaneous remission or may be effectively controlled with glucocorticoids alone in many cases. Progressive and refractory pulmonary sarcoidosis constitute more than 10% of patients seen at specialized centers."

The news reporters obtained a quote from the research from University Medical Center, "Pulmonary fibrosis and associated complications, such as infections and pulmonary hypertension are leading causes of mortality. No universal definition of refractoriness exists, we therefore propose classifying patients as having refractory disease when the following criteria are fulfilled: (1) progressive disease despite at least 10 mg of prednisolone or equivalent for at least three months and need for additional disease-modifying anti-sarcoid drugs due to lack of efficacy, drug toxicity or intolerability and (2) treatment started for significant impairment of life due to progressive pulmonary symptoms. Both criteria should be fulfilled. Treatment options in addition to or instead of glucocorticoids for these patients include second- (methotrexate, azathioprine, leflunomide) and third-line agents (infliximab, adalimumab). Other immunomodulating agents can be used, but the evidence is very limited. Newer agents with anti-fibrotic properties, such as pirfenidone or nintedanib, might hold promise also for the pulmonary fibrosis seen in sarcoidosis. Treating physicians have to actively look for potentially treatable complications, such as pulmonary hypertension, cardiac disease or infections before patients should be classified as treatment-refractory. Ultimately, lung transplantation has to be considered as treatment option for patients not responding to medical therapy."

According to the news reporters, the research concluded: "In this review, we aim to propose a new definition of refractoriness, describe the associated clinical features and suggest the therapeutic approach."

For more information on this research see: Refractory pulmonary sarcoidosis - proposal of a definition and recommendations for the diagnostic and therapeutic approach. Clinical Pulmonary Medicine, 2016;23(2):67-75. (Lippincott Williams and Wilkins - www.lww.com; Clinical Pulmonary Medicine - journals.lww.com/clinpulm/pages/default.aspx)

Our news correspondents report that additional information may be obtained by contacting P. Korsten, Dept. of Nephrology and Rheumatology, University Medical Center Gottingen, Gottingen, Germany. Additional authors for this research include K. Strohmayer, R.P. Baughman and N.J Sweiss.

Investigators discuss new findings in Digestive System Diseases and Conditions - Inflammatory Bowel Disease. According to news reporting originating from Utrecht, Netherlands, by NewsRx correspondents, research stated, "Genome-wide association studies (GWAS) have revealed many susceptibility loci for complex genetic diseases. For most loci, the causal genes have not been identified."

Our news editors obtained a quote from the research from University Medical Center, "Currently, the identification of candidate genes is predominantly based on genes that localize close to or within identified loci. We have recently shown that 92 of the 163 inflammatory bowel disease (IBD)-loci co-localize with non-coding DNA regulatory elements (DREs). Mutations in DREs can contribute to IBD pathogenesis through dysregulation of gene expression. Consequently, genes that are regulated by these 92 DREs are to be considered as candidate genes. This study uses circular chromosome conformation capture-sequencing (4C-seq) to systematically analyze chromatin-interactions at IBD susceptibility loci that localize to regulatory DNA. Using 4C-seq, we identify genomic regions that physically interact with the 92 DRE that were found at IBD susceptibility loci. Since the activity of regulatory elements is cell-type specific, 4C-seq was performed in monocytes, lymphocytes, and intestinal epithelial cells. Altogether, we identified 902 novel IBD candidate genes. These include genes specific for IBD-subtypes and many noteworthy genes including ATG9A and IL10RA. We show that expression of many novel candidate genes is genotype-dependent and that these genes are upregulated during intestinal inflammation in IBD. Furthermore, we identify HNF4 alpha as a potential key upstream regulator of IBD candidate genes. We reveal many novel and relevant IBD candidate genes, pathways, and regulators."

According to the news editors, the research concluded: "Our approach complements classical candidate gene identification, links novel genes to IBD and can be applied to any existing GWAS data."

The news editors report that additional information may be obtained by contacting M. Mokry, Univ Med Center Utrecht, Wilhelmina Childrens Hosp, Dept. of Pediat Gastroenterol, NL-3508 AB Utrecht, Netherlands. Additional authors for this research include M. Harakalova, N.A.M. van den Dungen, H.F. Asl, H.J. Hijma, E. Cuppen, J.L.M. Bjorkegren, F.W. Asselbergs, E.E.S. Nieuwenhuis and M. Mokry.

Nutritional and Metabolic Diseases and Conditions —

Findings from University Medical Center, Erlangen Provides New Data on Type 2 Diabetes (Benefits and Risks of Aliskiren Treatment in Patients With Type 2 Diabetes: Analyses of the 3A Registry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting out of Erlangen, Germany, by NewsRx editors, research stated, "The authors sought to retrospectively analyze the real-world evidence on aliskiren in diabetic patients with or without concomitant renin-angiotensin system (RAS) blocker use based on the Registry for Ambulant Therapy With RAS Inhibitors in Hypertension Patients in Germany (3A). Of 14,986 patients included, 3772 patients had diabetes and 28.5% received aliskiren, 14.3% received angiotensin-converting enzyme (ACE) inhibitors/angiotensin receptor blockers (ARBs), 35.4% received aliskiren plus an ACE inhibitor/ARB, and 10.5% received other drugs."

Financial support for this research came from Novartis Pharma.

Our news journalists obtained a quote from the research from University Medical Center, Erlangen, "Ambulatory blood pressure (BP) monitoring (baseline BP 148 +/- 15.8/84.0 +/- 10.9 mm Hg) revealed stronger diastolic BP reduction for aliskiren plus ACE inhibitor/ARB than aliskiren alone in the low (2.8 +/- 0.5 vs 0.6 +/- 0.6; P=.004) and intermediate (5.9 +/- 0.5 vs 4.5 +/- 0.5; P=.04) baseline BP groups. There was a lesser ambulatory BP reduction observed for patients receiving non-RAS in the high baseline category for both systolic (12.5 +/- 1.8 vs 17.1 +/- 1.0; P=.02) and diastolic (6.9 +/- 1.0 vs 9.8 +/- 0.6; P=.01) BP."

According to the news editors, the research concluded: "In patients with hypertension and type 2 diabetes, aliskiren was beneficial in lowering BP, with no observed increases in major adverse effects compared with RAS-blocking therapy alone."

Our news journalists report that additional information may be obtained by contacting R.E. Schmieder, Univ Klinikum Erlangen, Nephrol & Hypertensiol, Erlangen, Germany. Additional authors for this research include U. Zeymer, R. Dechend, I. Hagedorn, T. Riemer, P. Bramlage, D. Pittrow, J. Senges and R.E. Schmieder.

Findings from University do Estado da Bahia Broadens Understanding of Heart Transplants (Use of venoarterial extracorporeal membrane oxygenation in fulminant chagasic myocarditis as a bridge to heart transplant)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Heart Transplants have been published. According to news reporting originating from Salvador, Brazil, by NewsRx correspondents, research stated, "A 17-year-old Brazilian male presented with progressive dyspnea for 15 days, worsening in the last 24 hours, and was admitted in respiratory failure and cardiogenic shock, with multiple organ dysfunctions. Echocardiography showed a left ventricle ejection fraction of 11%, severe diffuse hypokinesia, and a systolic pulmonary artery pressure of 50mmHg, resulting in the need for hemodynamic support with dobutamine (20mcg/kg/min) and noradrenaline (1.7mcg/kg/min)."

Our news editors obtained a quote from the research from University do Estado da Bahia, "After 48 hours with no clinical or hemodynamic improvement, an extracorporeal membrane oxygenation was implanted. The patient presented with hemodynamic, systemic perfusion and renal and liver function improvements; however, his cardiac function did not recover after 72 hours, and he was transfer to another hospital. Air transport was conducted from Salvador to Recife in Brazil. A heart transplant was performed with rapid recovery of both liver and kidney functions, as well as good graft function. Histopathology of the explanted heart showed chronic active myocarditis and amastigotes of Trypanosoma cruzi. The estimated global prevalence of T. cruzi infections declined from 18 million in 1991, when the first regional control initiative began, to 5.7 million in 2010. Myocarditis is an inflammatory disease due to infectious or non-infectious conditions. Clinical manifestation is variable, ranging from subclinical presentation to refractory heart failure and cardiogenic shock. Several reports suggest that the use of extracorporeal membrane oxygenation in patients presenting with severe refractory myocarditis is a potential bridging therapy to heart transplant when there is no spontaneous recovery of ventricular function."

According to the news editors, the research concluded: "In a 6-month follow-up outpatient consult, the patient presented well and was asymptomatic."

For more information on this research see: Use of venoarterial extracorporeal membrane oxygenation in fulminant chagasic myocarditis as a bridge to heart transplant. Revista Brasileira De Terapia Intensiva, 2015;27(4):397-401.

The news editors report that additional information may be obtained by contacting A.R. Duraes, Universidade do Estado da Bahia, Salvador, BA, Brazil. Additional authors for this research include F.A. Figueira, A.R. Lafayette, J.de C. Martins and J.C de Sa.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.5935/0103-507X.20150066. This DOI is a link to an online electronic document that is either free or for purchase.

Neurodegenerative Diseases and Conditions

Findings from University of Aberdeen Broaden Understanding of Alzheimer Disease (Efficacy and safety of tau-aggregation inhibitor therapy in patients with mild or moderate Alzheimer’s disease: a randomised, controlled, double-blind, ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurodegenerative Diseases and Conditions - Alzheimer Disease are presented in a new report. According to news originating from Aberdeen, United Kingdom, by NewsRx correspondents, research stated, "Leuco-methylthioninium bis (hydromethanesulfonate; LMTM), a stable reduced form of the methylthioninium moiety, acts as a selective inhibitor of tau protein aggregation both in vitro and in transgenic mouse models. Methylthioninium chloride has previously shown potential efficacy as monotherapy in patients with Alzheimer's disease."

Our news journalists obtained a quote from the research from the University of Aberdeen, "We aimed to determine whether LMTM was safe and effective in modifying disease progression in patients with mild to moderate Alzheimer's disease. We did a 15-month, randomised, controlled double-blind, parallel-group trial at 115 academic centres and private research clinics in 16 countries in Europe, North America, Asia, and Russia with patients younger than 90 years with mild to moderate Alzheimer's disease. Patients concomitantly using other medicines for Alzheimer's disease were permitted to be included because we considered it infeasible not to allow their inclusion; however, patients using medicines carrying warnings of methaemoglobinaemia were excluded because the oxidised form of methylthioninium in high doses has been shown to induce this condition. We randomly assigned participants (3: 3: 4) to 75 mg LMTM twice a day, 125 mg LMTM twice a day, or control (4 mg LMTM twice a day to maintain blinding with respect to urine or faecal discolouration) administered as oral tablets. We did the randomisation with an interactive web response system using 600 blocks of length ten, and stratified patients by severity of disease, global region, whether they were concomitantly using Alzheimer's disease-labelled medications, and site PET capability. their study partners (generally carers), and all assessors were masked to treatment assignment throughout the study.

The coprimary outcomes were progression on the Alzheimer's Disease Assessment Scale-Cognitive Subscale (ADAS-Cog) and the Alzheimer's Disease Co-operative Study-Activities of Daily Living Inventory (ADCS-ADL) scales from baseline assessed at week 65 in the modified intention-to-treat population. This trial is registered with Clinicaltrials.gov (NCT01689246) and the European Union Clinical Trials Registry (2012-002866-11). Between Jan 29, 2013, and June 26, 2014, we recruited and randomly assigned 891 participants to treatment (357 to control, 268 to 75 mg LMTM twice a day, and 266 to 125 mg LMTM twice a day). The prespecified primary analyses did not show any treatment benefit at either of the doses tested for the coprimary outcomes (change in ADAS-Cog score compared with control [ n= 354, 6.32, 95% CI 5.31-7.34]: 75 mg LMTM twice a day [n= 257] -0.02, -1.60 to 1.56, p= 0.9834, 125 mg LMTM twice a day [n= 250] -0.43, -2.06 to 1.20, p= 0.9323; change in ADCS-ADL score compared with control [ -8. 22, 95% CI -9. 63 to -6. 82]: 75 mg LMTM twice a day -0.93, -3.12 to 1.26, p=...
0.8659; 125 mg LMTM twice a day -0.34, -2.61 to 1.93, p= 0.9479). Gastrointestinal and urinary effects were the most common adverse events with both high doses of LMTM, and the most common causes for discontinuation. Non-clinically significant dose-dependent reductions in haemoglobin concentrations were the most common laboratory abnormality. Amyloid-related imaging abnormalities were noted in less than 1% (8/885) of participants. The primary analysis for this study was negative, and the results do not suggest benefit of LMTM as an add-on treatment for patients with mild to moderate Alzheimer's disease."

According to the news editors, the research concluded: "Findings from a recently completed 18-month trial of patients with mild Alzheimer's disease will be reported soon."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/S0140-6736%2816%2931275-2. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Monoclonal Antibodies**

**Findings from University of Adelaide Broaden Understanding of Monoclonal Antibodies (What are we paying for? A cost-effectiveness analysis of patented denosumab and generic alendronate for postmenopausal osteoporotic women in Australia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Monoclonal Antibodies are presented in a new report. According to news reporting originating in Adelaide, Australia, by NewsRx journalists, research stated, "Zoledronic acid and denosumab were funded by the Australian government for the management of osteoporosis at an equivalent price to alendronate. The price of alendronate has declined by around 65%, but the price of the other two therapies has remained stable."

The news reporters obtained a quote from the research from the University of Adelaide, "Using data published since the listing, this paper reports current estimates of the value of denosumab compared to alendronate from an Australian health system perspective. A
A cohort-based state transition model was developed that predicted changes in bone mineral density (BMD), and calibrated fracture probabilities as a function of BMD, age and previous fracture to estimate differences in costs and QALYs gained over a 10-year time horizon. The base-case incremental cost per QALY gained for denosumab versus alendronate was $246,749. There is a near zero probability that denosumab is cost-effective at a threshold value of $100,000 per QALY gained. If the price of denosumab was reduced by 50%, the incremental cost per QALY gained falls to $50,068. Current Australian legislation precludes price reviews when comparator therapies come off patent."

According to the news reporters, the research concluded: "The presented analysis illustrates a review process, incorporating clinical data collected since the original submission to inform a price at which denosumab would provide value for money."

Our news correspondents report that additional information may be obtained by contacting J. Karnon, University of Adelaide, Sch Public Hlth, Adelaide, SA 5005, Australia. Additional authors for this research include A.S. Shafie, N. Orji and S.K. Usman.

Our news journalists obtained a quote from the research from the University of Adelaide, "Treating resistant breast cancer requires co-targeting of ER and alternate signalling pathways that contribute to resistance to improve the efficacy and benefit of currently available treatments. Emerging data have shown that other SSRs may regulate the sites at which ER binds to DNA in ways that can powerfully suppress the oncogenic activity of ER in breast cancer. This includes the progesterone receptor (PR) that was recently shown to reprogram the ER DNA binding landscape towards genes associated with a favourable outcome. Another attractive candidate is the androgen receptor (AR), which is expressed in the majority of breast cancers.
and inhibits growth of the normal breast and ER-positive tumours when activated by ligand. These findings have led to the initiation of breast cancer clinical trials evaluating therapies that selectively harness the ability of SSRs to 'push' ER towards anti-tumorigenic activity."

According to the news editors, the research concluded: "Our review will focus on the established and emerging clinical evidence for activating PR or AR in ER-positive breast cancer to inhibit the tumour growth-promoting functions of ER."

Heart Disorders and Diseases - Heart Disease

Findings from University of Alabama Provide New Insights into Heart Disease (Idiopathic ventricular arrhythmias Relevance to the anatomy, diagnosis and treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Disease is the subject of a report. According to news reporting originating from Birmingham, Alabama, by NewsRx editors, the research stated, "Idiopathic ventricular arrhythmias (VAs) are ventricular tachycardias (VTs) or premature ventricular contractions (PVCs) whose mechanisms are not related to myocardial scar. Idiopathic VAs occur most commonly without structural heart disease, but can occur with structural heart disease."

Our news editors obtained a quote from the research from the University of Alabama, "Imaging tests, such as echocardiography, nuclear test, and cardiac magnetic resonance imaging, are helpful for excluding any association of an idiopathic VA occurrence with myocardial scar. Since catheter ablation emerged, the sites of idiopathic VA origins, commonly endocardial but sometimes epicardial, have been increasingly recognized. Idiopathic VAs usually originate from specific anatomical structures, and exhibit characteristic electrocardiograms based on their anatomical background. Idiopathic VAs are basically benign, but they require medical treatment or catheter ablation when idiopathic VAs are symptomatic, incessant, or produce left ventricular dysfunction."

According to the news editors, the research concluded: "This review describes the
up-to-date information on the prevalence of idiopathic VA origins relevant to the anatomy, and diagnosis, and treatment of idiopathic VAs."

For more information on this research see: Idiopathic ventricular arrhythmias: Relevance to the anatomy, diagnosis and treatment. *Journal of Cardiology*, 2016;68(5-6):463-471. **Musculoskeletal Manipulations**

**Findings from University of Alberta Update Understanding of Musculoskeletal Manipulations (Tissue loading created during spinal manipulation in comparison to loading created by passive spinal movements)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Musculoskeletal Manipulations have been presented. According to news reporting from Edmonton, Canada, by NewsRx journalists, research stated, "Spinal manipulative therapy (SMT) creates health benefits for some while for others, no benefit or even adverse events. Understanding these differential responses is important to optimize patient care and safety."

The news correspondents obtained a quote from the research from the University of Alberta, "Toward this, characterizing how loads created by SMT relate to those created by typical motions is fundamental. Using robotic testing, it is now possible to make these comparisons to determine if SMT generates unique loading scenarios. In 12 porcine cadavers, SMT and passive motions were applied to the L3/L4 segment and the resulting kinematics tracked. The L3/L4 segment was removed, mounted in a parallel robot and kinematics of SMT and passive movements replayed robotically. The resulting forces experienced by L3/L4 were collected. Overall, SMT created both significantly greater and smaller loads compared to passive motions, with SMT generating greater anterioposterior peak force (the direction of force application) compared to all passive motions. In some comparisons, SMT did not create significantly different loads in the intact specimen, but did so in specific spinal tissues. Despite methodological differences between studies, SMT forces and loading rates fell below published injury values."

According to the news reporters, the research concluded: "Future studies are warranted to understand if loading scenarios unique to SMT confer its differential therapeutic effects."

For more information on this research see: Tissue loading created during spinal

Our news journalists report that additional information may be obtained by contacting G.N. Kawchuk, University of Alberta, Dept. of Phys Therapy, Edmonton, AB, Canada. Additional authors for this research include G.N. Kawchuk, A.H. Vette, P. Goldsmith and N. Prasad.

**Developmental Diseases and Conditions - Autism**

**Findings from University of Antwerp Broaden Understanding of Autism**

*(The ethics of complexity. Genetics and autism, a literature review)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Developmental Diseases and Conditions - Autism are discussed in a new report. According to news reporting out of Antwerp, Belgium, by NewsRx editors, research stated, "It is commonly believed that the etiology of autism is at least partly explained through genetics. Given the complexity of autism and the variability of the autistic phenotype, genetic research and counseling in this field are also complex and associated with specific ethical questions."

Financial supporters for this research include “Opening the Future” Leuven University Fund, Federaal Wetenschapsbeleid, Research Foundation-Flanders (FWO).

Our news journalists obtained a quote from the research from the University of Antwerp, "Although the ethics of autism genetics, especially with regard to reproductive choices, has been widely discussed on the public fora, an in depth philosophical or bioethical reflection on all aspects of the theme seems to be missing. With this literature review we wanted to map the basic questions and answers that exist in the bioethical literature on autism genetics, research, counseling and reproduction, and provide suggestions as to how the discussion can proceed. We found 19 papers that fitted the description of 'bioethics literature focusing on autism genetics,' and analyzed their content to distill arguments and themes. We concluded that because of the complexity of autism, and the uncertainty with regard to its status, more ethical reflection is needed before definite conclusions and recommendations can be drawn. Moreover, there is a dearth of bioethical empirical studies querying the opinions of all parties, including people with autism themselves. Such empirical bioethical studies should be urgently done before bioethical conclusions regarding the aims and desirability of research into autism genes can be done."

According to the news editors, the research concluded: "Also, fundamental philosophical reflection on concepts of disease should accompany research into the etiology of autism."

Health and Medicine - Clinical Dysmorphology

Findings from University of Antwerp Broaden Understanding of Clinical Dysmorphology (Germline mosaicism in osteopathia striata with cranial sclerosis--recurrence in siblings)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Clinical Dysmorphology have been published. According to news reporting originating in Antwerp, Belgium, by NewsRx journalists, research stated, "We report recurrence of osteopathia striata with cranial sclerosis (OSCS) in two full siblings conceived by unaffected parents. Molecular confirmation of OSCS in both siblings was achieved by identification of a novel heterozygous mutation in the WTX gene."

The news reporters obtained a quote from the research from the University of Antwerp, "Neither parent had clinical features of OSCS nor was the pathogenic mutation demonstrable in DNA extracted from both peripheral blood leucocytes and buccal cells. This case demonstrates germline mosaicism in OSCS and represents the third report of mosaicism affecting the germline in families with OSCS. Previous reports were of parental gonadosomal mosaicism, with one showing recurrence in multiple children."

According to the news reporters, the research concluded: "Our observation adds to a body of evidence that suggests that germline mosaicism in OSCS may occur more frequently than believed previously and may have implications for counselling families with OSCS."

Our news correspondents report that additional information may be obtained by contacting J.J. O'Byrne, Departments of aClinical Genetics bRadiology, Our Lady's Children's Hospital Crumlin, Dublin, Ireland cDept. of Medical Genetics, University of Antwerp, Antwerp, Belgium. Additional authors for this research include E. Phelan, E. Steenackers, W. van Hul and W. Reardon.

Findings from University of Antwerp in Oncology Reported (Evaluation and consequences of heterogeneity in the circulating tumor cell compartment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology. According to news reporting originating in Antwerp, Belgium, by NewsRx journalists, research stated, "A growing understanding of the molecular biology of cancer and the identification of specific aberrations driving cancer evolution have led to the development of various targeted agents. Therapeutic decisions concerning these drugs are often guided by single biopsies of the primary tumor."

The news reporters obtained a quote from the research from the University of Antwerp, "Yet, it is well known that tumors can exhibit significant heterogeneity and change over time as a result of selective pressure. Circulating tumor cells (CTCs) are shed from various tumor sites and are thought to represent the molecular landscape of a patient's overall tumor burden. Moreover, a minimal-invasive liquid biopsy facilitates monitoring of clonal evolution during therapy pressure and disease progression in real-time. While more information becomes available regarding heterogeneity among CTCs, comparison between these studies is needed."

According to the news reporters, the research concluded: "In this review, we focus on the genomic and transcriptional heterogeneity found in the CTC compartment, and its significance for clinical decision making."

For more information on this research see: Evaluation and consequences of heterogeneity in the circulating tumor cell compartment. Oncotarget, 2016;7(30):48625-48643.

Our news correspondents report that additional information may be obtained by contacting A. Brouwer, Center for Oncological Research (CORE), University of Antwerp, Antwerp, Belgium. Additional authors for this research include B. De Laere, D. Peeters, M. Peeters, R. Salgado, L. Dirix and S. Van Laere.

Gram-Positive Bacteria - Staphylococcus aureus

Findings from University of Arkansas Broaden Understanding of Staphylococcus aureus (Evaluation of Antibiotics Active against Methicillin-Resistant Staphylococcus aureus Based on Activity in an
Established Biofilm

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Positive Bacteria - Staphylococcus aureus have been published. According to news originating from Little Rock, Arkansas, by NewsRx correspondents, research stated, "We used in vitro and in vivo models of catheter-associated biofilm formation to compare the relative activity of antibiotics effective against methicillin-resistant Staphylococcus aureus (MRSA) in the specific context of an established biofilm. The results demonstrated that, under in vitro conditions, daptomycin and ceftaroline exhibited comparable activity relative to each other and greater activity than vancomycin, telavancin, oritavancin, dalbavancin, or tigecycline."

Funders for this research include HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID), HHS | NIH | National Center for Research Resources (NCRR), HHS | NIH | National Institute of General Medical Sciences (NIGMS), DOD | United States Army | Congressionally Directed Medical Research Programs (CDMRP).

Our news journalists obtained a quote from the research from the University of Arkansas, "This was true when assessed using established biofilms formed by the USA300 methicillin-resistant strain LAC and the USA200 methicillin-sensitive strain UAMS-1. Oxacillin exhibited greater activity against UAMS-1 than LAC, as would be expected, since LAC is an MRSA strain. However, the activity of oxacillin was less than that of daptomycin and ceftaroline even against UAMS-1. Among the lipoglycopeptides, telavancin exhibited the greatest overall activity. Specifically, telavancin exhibited greater activity than oritavancin or dalbavancin when tested against biofilms formed by LAC and was the only lipoglycopeptide capable of reducing the number of viable bacteria below the limit of detection. With biofilms formed by UAMS-1, telavancin and dalbavancin exhibited comparable activity relative to each other and greater activity than oritavancin. Importantly, ceftaroline was the only antibiotic that exhibited greater activity than vancomycin when tested in vivo in a murine model of catheter-associated biofilm formation."

According to the news editors, the research concluded: "These results emphasize the need to consider antibiotics other than vancomycin, most notably, ceftaroline, for the treatment of biofilm-associated S. aureus infections, including by the matrix-based antibiotic delivery methods often employed for local antibiotic delivery in the treatment of these infections."

For more information on this research see: Evaluation of Antibiotics Active against Methicillin-Resistant Staphylococcus aureus Based on Activity in an Established Biofilm. Antimicrobial Agents and Chemotherapy, 2016;60(10):5688-5694. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news correspondents report that additional information may be obtained from M.S. Smeltzer, University of Arkansas, Dept. of Microbiol & Immunol, Little Rock, AR 72205, United States. Additional authors for this research include K.E. Beenken, W.B. Mills, A.J. Loughran, H.J. Spencer, W.B. Lynn and M.S. Smeltzer.

Cardiology

Findings from University of Arkansas Reveals New Findings on Cardiology (Effects of registered nurse staffing level on hospital-acquired conditions in cardiac surgery patients: A propensity score matching analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting from Little Rock, Arkansas, by NewsRx journalists, research stated, "The ramifications of inadequate nurse staffing may have serious consequences due to reimbursement policies. To determine the effects of registered nurse staffing on hospital-acquired conditions in cardiac surgery patients."

The news correspondents obtained a quote from the research from the University of Arkansas, "Data from the 2009 to 2011 Nationwide Inpatient Sample were used to construct a propensity score-matched cohort. Multivariate regressions were performed to compare the probability, length of stay, mortality, and costs of three common hospital-acquired conditions between low- and high-staffing hospitals. A total of 439,365 patients in low-staffing hospitals were 1:1 matched to patients in high-staffing hospitals. High-staffing hospitals had 10% to 25% fewer cases (adjusted odds ratio [AOR] 0.75-0.90, p<.0001), 5% to 20% lower mortality (AOR 0.80-0.95, p<.0001), and 4% to 6% shorter length of stay (coefficient -0.06 to -0.04, p<.0001). The costs for patients with hospital-acquired conditions were 13% to 17% greater in high-staffing hospitals (coefficient 0.13-0.17, p<.0001)."

According to the news reporters, the research concluded: "Alternatives to the current staffing and reimbursement policies should be considered to reduce hospital-acquired conditions."

Our news journalists report that additional information may be obtained by contacting X.C. Li, University of Arkansas, Fay W Boozman Coll Public Hlth, Dept. of Hlth Policy & Management, Little Rock, AR 72205, United States. Additional authors for this research include S.M. Bowman and T.C. Smith.

Keywords for this news article include: Little Rock, Arkansas, United States, North and Central America, Cardiac Surgery, Cardiology, Hospital, University of Arkansas.
Findings from University of Auckland in the Area of Endometrial Hyperplasia Reported (Body mass index trumps age in decision for endometrial biopsy: cohort study of symptomatic premenopausal women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Uterine Diseases and Conditions - Endometrial Hyperplasia is now available. According to news reporting originating from Auckland, New Zealand, by NewsRx correspondents, research stated, "Clinical guidelines recommend that women with abnormal uterine bleeding with risk factors have an endometrial biopsy to exclude hyperplasia or cancer. Given the majority of endometrial cancer occurs in postmenopausal women, it has not been widely recognized that obesity is a significant risk factor for endometrial hyperplasia and cancer in young, symptomatic, premenopausal women."

Our news editors obtained a quote from the research from the University of Auckland, "We sought to evaluate the effect of body mass index on risk of endometrial hyperplasia or cancer in premenopausal women with abnormal uterine bleeding. This was a retrospective cohort study in a single large urban secondary women's health service. Participants were 916 premenopausal women referred for abnormal uterine bleeding of any cause and had an endometrial biopsy from 2008 through 2014. The primary outcome was complex endometrial hyperplasia (with or without atypia) or endometrial cancer. Almost 5% of participants had complex endometrial hyperplasia or cancer. After adjusting for clinical and demographic factors, women with a measured body mass index >= 30 kg/m(2) were 4 times more likely to develop complex hyperplasia or cancer (95% confidence interval, 1.36-11.74). Other risk factors were nulliparity (adjusted odds ratio, 3.08; 95% confidence interval, 1.43-6.64) and anemia (adjusted odds ratio, 2.23; 95% confidence interval, 1.14-4.35). Age, diabetes, and menstrual history were not significant. Obesity is an important risk factor for complex endometrial hyperplasia or cancer in premenopausal women with abnormal uterine bleeding who had an endometrial biopsy in a secondary gynecology service. As over half of women with the outcome in this study were age <45 years, deciding to biopsy primarily based on age, as currently recommended in national guidelines, potentially misses many cases or delays diagnosis."

According to the news editors, the research concluded: "Body mass index should be the first stratification in the decision to perform endometrial biopsy and/or to refer secondary gynecology services."

The news editors report that additional information may be obtained by contacting M.R. Wise, University of Auckland, Fac Med & Hlth Sci, Dept. of Obst & Gynecol, Auckland, New Zealand. Additional authors for this research include P. Gill, S. Lensen, J.M.D. Thompson and C.M. Farquhar.

Keywords for this news article include: Auckland, New Zealand, Australia and New Zealand, Uterine Diseases and Conditions, Endometrial Hyperplasia, Cancer, Epidemiology,
Findings from University of Aveiro in the Area of Antibiotics Described (Potential of Constructed Wetlands for Removal of Antibiotics from Saline Aquaculture Effluents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antibiotics. According to news reporting from Aveiro, Portugal, by NewsRx journalists, research stated, "This work aimed to evaluate the potential of constructed wetlands (CWs) for removal of antibiotics (enrofloxacin and oxytetracycline) and antibiotic resistant bacteria from saline aquaculture wastewaters. Removal of other contaminants (nutrients, organic matter and metals) and toxicity reduction and the influence of antibiotics with these processes were evaluated."

The news correspondents obtained a quote from the research from the University of Aveiro, "Thus, nine CWs microcosms, divided into three treatments, were assembled and used to treat wastewater (doped or not with the selected antibiotics) between October and December of 2015. Each week treated wastewater was removed and new wastewater (doped or not) was introduced in CWs. Results showed >99% of each antibiotic was removed in CWs. After three weeks of adaptation, removal percentages >95% were also obtained for total bacteria and for antibiotic resistant bacteria. Nutrients, organic matter and metal removal percentages in CWs treated wastewater were identical in the absence and in the presence of each antibiotic. Toxicity in treated wastewaters was significantly lower than in initial wastewaters, independently of antibiotics presence. Results showed CWs have a high efficiency for removing enrofloxacin or oxytetracycline as well as antibiotic resistant bacteria from saline aquaculture wastewaters."

According to the news reporters, the research concluded: "CWs can also remove other contaminants independently of drug presence, making the aquaculture wastewater possible to be reutilized and/or recirculated."

Our news journalists report that additional information may be obtained by contacting M. Boto, University of Aveiro, Dept. of Biol, P-3810193 Aveiro, Portugal. Additional authors for this research include C.M.R. Almeida and A.P. Mucha.

Keywords for this news article include: Aveiro, Portugal, Europe, Antibacterial Agents, Drugs and Therapies, Antimicrobials, Antibiotics, University of Aveiro.
Findings from University of Bari in the Area of Bladder Cancer Described (Celecoxib for the prevention of nonmuscle invasive bladder cancer: results from a matched control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Bladder Cancer have been published. According to news reporting originating in Bari, Italy, by NewsRx journalists, research stated, "New targets and approaches are under investigation for the treatment of nonmuscle invasive bladder cancer (NMIBC). Preclinical data suggest cyclooxygenase-2 (COX-2) as a promising target."

The news reporters obtained a quote from the research from the University of Bari, "Celecoxib, a COX-2 selective inhibitor, inhibits tumor development and enhances survival, both in vitro and in vivo models of bladder cancer. Therefore, we conducted a pilot study of celecoxib to prevent recurrence in patients with intermediate risk NMIBC. Treatment with celecoxib was administered orally for 12 months and compared with a contemporary series of patients treated with intravesical mitomycin C (MMC), given weekly for 4 weeks and then monthly for 11 months. Primary endpoints were time to first recurrence and adverse events. From 2003 through 2006, 58 patients were treated with celecoxib and compared with 66 patients receiving MMC. After a median follow up of 75 months, 49 patients were disease free, including 23 (34.85%) in the MMC group and 26 (44.8%) in the celecoxib group. Median disease-free interval was 67 months [95% confidence interval (CI) 35.8 to NA] versus 41 months (95% CI 27.1-67.1; log-rank p=0.25) for patients treated with MMC and celecoxib, respectively. In the multivariate analysis, treatment was not found to be an independent predictor for recurrence [hazard ratio (HR) 0.76, 95% CI 0.47-1.22, p=0.25). Overall, 45 AEs were recorded in 35/124 patients. There were no differences between the two groups."

According to the news reporters, the research concluded: "Our data support a clinical benefit of celecoxib and encourage future trials in which COX-2 inhibitors may be tested in selected patients with NMIBC."

For more information on this research see: Celecoxib for the prevention of nonmuscle invasive bladder cancer: results from a matched control study. Therapeutic Advances In Urology, 2015;7(6):303-11. (Sage Publications - www.sagepub.com/; Therapeutic Advances In Urology - tau.sagepub.com)

Our news correspondents report that additional information may be obtained by contacting V. Pagliarulo, Urology and Andrology Unit, Dept. of Emergency and Organ Transplantation, University of Bari, Piazza G Cesare 11, 70124 Bari, Italy. Additional authors for this research include P. Pharmacokinetics

Findings from University of Basel in the Area of Pharmacokinetics Reported (Population Pharmacokinetic Modeling of Tribendimidine Metabolites in Opisthorchis viverrini-Infected Adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Pharmacokinetics is now available. According to news reporting from Basel, Switzerland, by NewsRx journalists, research stated, "There is a pressing need for alternative treatments against the liver fluke Opisthorchis viverrini. Oral tribendimidine is a promising candidate, but its population pharmacokinetic properties are unknown."

The news correspondents obtained a quote from the research from the University of Basel, "Two phase IIA trials were conducted in Laos in O. viverrini-infected adults receiving single oral doses of 25 to 600 mg tribendimidine administered as different formulations in each study (study 1 used 200-mg tablets, and study 2 used 50-mg tablets). Venous whole blood, plasma, and capillary dried blood spots were sampled frequently from 68 adults, and concentrations of the tribendimidine metabolites dADT (deacetylated amidantel) and adADT (acetylated dADT) were measured. Population pharmacokinetics were assessed by using nonlinear mixed-effects modeling. The relationship between drug exposure and cure (assessed at 21 days posttreatment) was evaluated by using univariable logistic regression. A six-transit compartment absorption model with a one-disposition compartment for each metabolite described the data well. Compared to the 50-mg formulation (study 2), the 200-mg formulation (study 1) had a 40.1% higher mean transit absorption time, a 113% higher dADT volume of distribution, and a 364% higher adADT volume of distribution. Each 10-year increase in age was associated with a 12.7% lower dADT clearance and a 21.2% lower adADT clearance. The highest cure rates (>= 55%) were observed with doses of >= 100 mg. Higher dADT, but not adADT, peak concentrations and exposures were associated with cure (P = 0.004 and 0.003, respectively). For the first time, population pharmacokinetics of tribendimidine have been described. Known differences in the 200-mg versus 50-mg formulations were captured by covariate modeling."

According to the news reporters, the research concluded: "Further studies are needed to validate the structural model and confirm covariate relationships."

For more information on this research see: Population Pharmacokinetic Modeling of Tribendimidine Metabolites in Opisthorchis viverrini-Infected Adults. Findings from University of Birmingham Update Knowledge of Breast Cancer (Modeling Canadian Quality Control Test Program for Steroid Hormone Receptors in Breast Cancer: Diagnostic Accuracy Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating from Birmingham, United Kingdom, by NewsRx correspondents, research stated, "The Canadian Immunohistochemistry Quality Control program monitors clinical laboratory performance for estrogen receptor and progesterone receptor tests used in breast cancer treatment management in Canada. Current methods assess sensitivity and specificity at each time point, compared with a reference standard."

Our news editors obtained a quote from the research from the University of Birmingham, "We investigate alternative performance analysis methods to enhance the quality assessment. We used 3 methods of analysis: meta-analysis of sensitivity and specificity of each laboratory across all time points; sensitivity and specificity at each time point for each laboratory; and fitting models for repeated measurements to examine differences between laboratories adjusted by test and time point. Results show 88 laboratories participated in quality control at up to 13 time points using typically 37 to 54 histology samples. In meta-analysis across all time points no laboratories have sensitivity or specificity below 80%. Current methods, presenting sensitivity and specificity separately for each run, result in wide 95% confidence intervals, typically spanning 15% to 30%. Models of a single diagnostic outcome demonstrated that 82% to 100% of laboratories had no difference to reference standard for estrogen receptor and 75% to 100% for progesterone receptor, with the exception of 1 progesterone receptor run. Laboratories with significant differences to reference standard identified with Generalized Estimating Equation modeling also have reduced performance by meta-analysis across all time points."

According to the news editors, the research concluded: "The Canadian Immunohistochemistry Quality Control program has a good design, and with this modeling approach has sufficient precision to measure performance at each time point and allow laboratories with a significantly lower performance to be targeted for advice."

For more information on this research see: Modeling Canadian Quality Control Test Program for Steroid Hormone Receptors in Breast Cancer: Diagnostic Accuracy Study. Applied Immunohistochemistry & Molecular Morphology, 2016;24(10):679-687. Applied Immunohistochemistry & Molecular Morphology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Sexually Transmitted Diseases and Conditions (STDs)

Findings from University of Birmingham in the Area of Sexually Transmitted Diseases and Conditions (STDs) Described (Sexual behaviour of backpackers who visit Koh Tao and Koh Phangan, Thailand: a cross-sectional study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Sexually Transmitted Diseases and Conditions (STDs) are discussed in a new report. According to news reporting from Birmingham, United Kingdom, by NewsRx journalists, research stated, "To measure the proportion of backpackers engaging in unprotected sex while travelling in Thailand and to identify predictors of unsafe sexual behaviour. A cross-sectional study using an anonymous questionnaire was performed."

The news correspondents obtained a quote from the research from the University of Birmingham, "English-speaking backpackers, excluding US and Thai citizens, were recruited while travelling through the piers of Koh Tao and Koh Phangan between 25 January and 13 March 2013. Results 61.5% (1238/2013) respondents were travelling without a long-term sexual partner, of whom 39.1% (29.4% females; 51.9% males) reported intercourse with a new partner. 36.8% of these reported inconsistent/no condom use. Inconsistent condom use was independently associated with age <25 years, UK (vs Canadian) nationality and not bringing condoms from home. Backpackers who brought condoms from home were more likely to have sex with a new partner. Male gender and longer trip length increased the likelihood of new partner acquisition and overall risk of unsafe sex. Partner demographics demonstrate a mechanism of international sexually transmitted infection (STI) transfer. In an era of growing antibiotic resistance and continuing HIV transmission, targeting unsafe sex in backpackers has the potential to reduce STI incidence internationally. These data highlight the need for innovative public health intervention."

According to the news reporters, the research concluded: "To focus such measures, future research may elucidate why certain groups are at higher risk."

Our news journalists report that additional information may be obtained by contacting C.T. Lewis, University of Birmingham, Inst Clin Sci, Birmingham, W Midlands, United Kingdom.

Aortic Dissection

Findings from University of Bologna Provide New Insights into Aortic Dissection (Composite valve graft implantation for the treatment of aortic valve and root disease: Results in 1045 patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Aortic Dissection. According to news reporting originating in Bologna, Italy, by NewsRx journalists, research stated, "Aortic root replacement using a composite graft is the treatment of choice for a large variety of aortic root conditions with a diseased aortic valve. The objective of the current study was to evaluate the long-term results of this procedure."

The news reporters obtained a quote from the research from the University of Bologna, "Between 1978 and 2010, 1045 patients aged 58.7 +/- 13.6 years underwent aortic root composite graft replacement using the following techniques: 95 Bentall operation; 926 the "button technique;" 24 the Cabrol technique. A mechanical composite valve graft was implanted in 69.6% of the patients. Sixhundred and thirty-five patients (62.3%) had annuloaortic ectasia and 162 (15.5%) had aortic dissection. Early mortality was 5.3% (55/1045). Independent risk factors for early mortality at logistic regression analysis were age >= 70 years (P =.051; odds ratio [OR], 2.97), New York Heart Association III-IV (P =.052; OR, 1.88), reoperation (P =.021; OR, 2.36), urgency/emergency (P =.003; OR, 3.09), mitral valve replacement (P =.001; OR, 6.01), or coronary artery bypass grafting (CABG) (P <.001; OR, 4.39); while bicuspid aortic valve (BAV) (P =.013; OR, 0.21), and time of operation 2001-2011 (P =.025; OR, 0.60) were protective predictors for early mortality. Overall survival at 5, 10, and 20 years was 84.1% +/- 1.3%, 65.5% +/- 2.6%, and 40.7% +/- 4.6%, respectively. Multivariate analysis revealed chronic renal insufficiency (P =.001; hazard ratio [HR], 3.48), chronic obstructive pulmonary disease (P =.027; HR, 1.94), aortic dissection (P =.001; HR, 2.63), Cabrol technique (P =.009; HR, 15.34), and CABG (P =.016; HR, 2.02) to be significant predictors of late death, and BAV (P =.010; HR, 0.43) to be a significant protective predictor. Freedom from thromboembolism, bleeding complications, and endocarditis was 93.7% +/- 2.6%, 90.3% +/- 3.1%, and 98.4% +/- 1% at 20 years, respectively. Freedom from aortic reoperation was 91.8% +/- 2.1% at 20 years and was significantly lower in patients with aortic dissection. Within the limitations of this retrospective study, we can conclude that aortic root replacement for aortic root aneurysms can be performed with low morbidity and mortality and with satisfactory long-term results. Few late serious complications were related to the need for long-term anticoagulation or a prosthetic valve."

According to the news reporters, the research concluded: "Reoperation on the proximal or in the distal aorta was most commonly performed in patients with aortic dissection."

For more information on this research see: Composite valve graft implantation for the treatment of aortic valve and root disease: Results in 1045 patients. Journal of Thoracic

Oncology - Bladder Cancer

Findings from University of Bourgogne Broaden Understanding of Bladder Cancer (Apoptotic effect of the selective PPAR beta/delta agonist GW501516 in invasive bladder cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Bladder Cancer are presented in a new report. According to news originating from Besancon, France, by NewsRx correspondents, research stated, "GW501516 is a selective and high-affinity synthetic agonist of peroxisome proliferator-activated receptor beta/delta (PPAR beta/delta). This molecule promoted the inhibition of proliferation and apoptosis in few cancer cell line, but its anticancer action has never been investigated in bladder tumor cells."

Our news journalists obtained a quote from the research from the University of Bourgogne, "Thus, this study was undertaken to determine whether GW501516 had antiproliferative and/or apoptotic effects on RT4 and T24 urothelial cancer cells and to explore the molecular mechanisms involved. Our results indicated that, in RT4 cells (derived from a low-grade papillary tumor), GW501516 did not induce cell death. On the other hand, in T24 cells (derived from an undifferentiated high-grade carcinoma), this PPAR beta/delta agonist induced cytotoxic effects including cell morphological changes, a decrease of cell viability, a G2/M cell cycle arrest, and the cell death as evidenced by the increase of the sub-G1 cell population. Furthermore, GW501516 triggered T24 cell apoptosis in a caspase-dependent manner including both extrinsic and intrinsic apoptotic pathways through Bid cleavage. In addition, the drug led to an increase of the Bax/Bcl-2 ratio, a mitochondrial dysfunction associated with the dissipation of Delta Psi m, and the release of cytochrome c from the mitochondria to the cytosol. GW501516 induced also ROS generation which was not responsible for T24 cell death since NAC did not rescue cells upon PPAR beta/delta agonist exposure. For the first time, our data highlight the capacity of GW501516 to induce apoptosis in invasive bladder cancer cells."

According to the news editors, the research concluded: "This molecule could be
relevant as a therapeutic drug for high-grade urothelial cancers."

The news correspondents report that additional information may be obtained from I. Lascombe, Univ Bourgogne Franche Comte, SFR FED4234, EA3181, F-25030 Besancon, France. Additional authors for this research include S. Fauconnet, H. Bittard and I. Lascombe.

**Dentistry**

**Findings from University of Brescia Yields New Findings on Dentistry (Mutation analysis by direct and whole exome sequencing in familial and sporadic tooth agenesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Dentistry. According to news reporting originating from Brescia, Italy, by NewsRx correspondents, research stated, "Dental agenesis is one of the most common congenital craniofacial abnormalities. Dental agenesis can be classified, relative to the number of missing teeth (excluding third molars), as hypodontia (1 to 5 missing teeth), oligodontia (6 or more missing teeth), or anodontia (lack of all teeth)."

Our news editors obtained a quote from the research from the University of Brescia, "Tooth agenesis may occur either in association with genetic syndromes, based on the presence of other inherited abnormalities, or as a non-syndromic trait, with both familiar and sporadic cases reported. In this study, we enrolled 16 individuals affected by tooth agenesis, prevalently hypodontia, and we carried out direct Sanger sequencing of paired box 9 (PAX9) and Msh homeobox 1 (MSX1) genes in 9 subjects. Since no mutations were identified, we performed whole exome sequencing (WES) in the members of 5 families to identify causative gene mutations either novel or previously described. Three individuals carried a known homozygous disease mutation in the Wnt family member 10A (WNT10A) gene (rs121908120). Interestingly, two of these individuals were siblings and also carried a heterozygous functional variant in EDAR-associated death domain (EDARADD) (rs114632254), another disease causing gene, generating a combination of genetic variants never described until now. The analysis of exome sequencing data in the members of other 3 families highlighted new candidate genes potentially involved in tooth agenesis and considered suitable for future studies. Overall, our study confirmed the major role played by WNT10A in tooth agenesis and the genetic heterogeneity of this disease."

According to the news editors, the research concluded: "Moreover, as more genes are shown to be involved in tooth agenesis, WES analysis may be an effective approach to search for genetic variants in familiar or sporadic tooth agenesis, at least in more severe clinical manifestations."
Findings from University of Brighton Broaden Understanding of Obesity
[Weight bias, health consciousness and behavioral actions (activities)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting originating from Brighton, United Kingdom, by NewsRx correspondents, research stated, "This study examines the influence of weight bias and health consciousness on eating and dietary behavior; it also investigates the role of normative influences. A sample of adults living in South-East England (N = 498) completed anonymous questionnaires about their diet, attitudes and beliefs towards obese people, health consciousness and normative influences."

Our news editors obtained a quote from the research from the University of Brighton, "The survey included validated measures of anti-fat attitudes, and beliefs about obese people. The findings demonstrate anti-fat attitudes are positively related to self-perceived dietary behavior. Surprisingly, self-perceived dietary behavior is negatively related to health consciousness and activities designed to enable healthy eating, for example meal planning. Significant differences exist between people with, or without, obese family members. Attempts to improve eating behavior by raising health consciousness and offering related support activities may fail; promoting health eating may also contribute to weight bias in society."

According to the news editors, the research concluded: "However, interventions which focus on the negative impact of obesity itself may have a positive effect."

For more information on this research see: Weight bias, health consciousness and behavioral actions (activities). Eating Behaviors, 2016;23():200-205. Eating Behaviors can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Eating Behaviors - www.journals.elsevier.com/eating-behaviors/)

Life Science Research - Plant Biology

Findings from University of British Columbia Update Knowledge of Plant Biology (Identification of Methylosome Components as Negative Regulators of Plant Immunity Using Chemical Genetics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Plant Biology. According to news reporting out of Vancouver, Canada, by NewsRx editors, research stated, "Nucleotide-binding leucine-rich repeat (NLR) proteins serve as immune receptors in both plants and animals. To identify components required for NLR-mediated immunity, we designed and carried out a chemical genetics screen to search for small molecules that can alter immune responses in Arabidopsis thaliana."

Our news journalists obtained a quote from the research from the University of British Columbia, "From 13 600 compounds, we identified Ro 8-4304 that was able to specifically suppress the severe autoimmune phenotypes of chs3-2D (chilling sensitive 3, 2D), including the arrested growth morphology and heightened PR (Pathogenesis Related) gene expression. Further, six Ro 8-4304 insensitive mutants were uncovered from the Ro 8-4304-insensitive mutant (rim) screen using a mutagenized chs3-2D population. Positional cloning revealed that rim1 encodes an allele of AtICln (I, currents; Cl, chloride; n, nucleotide). Genetic and biochemical analysis demonstrated that AtICln is in the same protein complex with the methylosome components small nuclear ribonucleoprotein D3b (SmD3b) and protein arginine methyltransferase 5 (PRMT5), which are required for the biogenesis of small nuclear ribonucleoproteins (snRNPs) involved in mRNA splicing. Double mutant analysis revealed that SmD3b is also involved in the sensitivity to Ro 8-4304, and the prmt5-1 chs3-2D double mutant is lethal. Loss of AtICln, SmD3b, or PRMT5 function results in enhanced disease resistance against the virulent oomycete pathogen Hyaloperonospora arabidopsidis Noco2, suggesting that mRNA splicing plays a previously unknown negative role in plant immunity."

According to the news editors, the research concluded: "The successful implementation of a high-throughput chemical genetic screen and the identification of a small-molecule compound affecting plant immunity indicate that chemical genetics is a powerful tool to study whole-organism plant defense pathways."

Our news journalists report that additional information may be obtained by contacting X. Li, University of British Columbia, Dept. of Bot, Vancouver, BC V6T 1Z4, Canada. Additional authors for this research include A. Balgi, Y.P. Pan, M. Li, X.R. Zhang, L.L. Du, M. Zhou, M. Roberge and X. Li.

The direct object identifier (DOI) for that additional information is:
Biomedical Engineering - Tissue Engineering

Findings from University of British Columbia Yields New Findings on Tissue Engineering (It May Seem Inflammatory, but Some T Cells Are Innately Healing to the Bone)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Biomedical Engineering - Tissue Engineering are discussed in a new report. According to news reporting originating from Vancouver, Canada, by NewsRx editors, the research stated, "Among the most significant developments to have taken place in osteology over the last few decades is an evolution from treating and viewing bone disorders primarily through an endocrine lens to instead seeing them as metabolic disorders that interface at the molecular and cellular level with the immune system. Osteoimmunology was officially born in response to accumulating evidence that the immune system is integrally involved in bone remodeling, but much of the early work focused on the role of conventional alpha beta T cells in driving bone loss."

Our news editors obtained a quote from the research from the University of British Columbia, "There is, however, emerging data indicating that innate lymphocytes, in particular gamma delta T cells, may in fact be important for bone regeneration. We first observed that bisphosphonate-associated osteonecrosis of the jaw (ONJ), a rare but serious adverse drug effect characterized by nonhealing necrotic bone tissue of the mandible or maxilla, was linked to a deficiency in a subset of gamma delta T cells found in human peripheral blood. Patients who developed ONJ while on bisphosphonate therapy not only lacked the main subset of circulating gamma delta T cells, but they also all had underlying conditions that compromised their immune integrity. A number of recent studies have unraveled the role of gamma delta T cells (and lymphocytes sharing their characteristics) in bone regeneration-particularly for fracture healing. These findings seem to contradict the prevailing view of such 'inflammatory' T cells as being bone degenerative rather than restorative."

According to the news editors, the research concluded: "This viewpoint melds together the emerging evidence of these so-called inflammatory T cells in bone remodeling and healing-showing that they are not in fact 'all bad to the bone.."

The news editors report that additional information may be obtained by contacting S. Kalyan, University of British Columbia, Dept. of Med, CeMCOR, Vancouver, BC, Canada.

Findings from University of Cairo Broaden Understanding of Andrology

(Molecular screening of CFTR gene in Egyptian patients with congenital bilateral absence of the vas deferens: a preliminary study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Men's Health - Andrology. According to news reporting originating in Cairo, Egypt, by NewsRx journalists, research stated, "In the current study, we enrolled 14 Egyptian infertile males with isolated congenital bilateral absence of the vas deferens (CBAVD). Screening for the most commonly reported 36 CFTR mutations, and the intron 8 (T)n splice variant was performed by multiplex PCR followed by reversed hybridisation."

Financial support for this research came from Cairo University.

The news reporters obtained a quote from the research from the University of Cairo, "Samples with the 5T variant were picked for DNA sequencing of intron 8/exon 9 region to identify the number of adjacent TG repeats. The p.Phe508del and the p.Ser1251Asn mutations were detected in heterozygous state in three patients (10.7% of alleles) and in one patient (3.6% of alleles), respectively, while the 5T variant was detected in five patients (28.6% of alleles). Among those five patients, four had TG12 repeats and one had TG13 repeats confirming the pathogenic penetrance of all 5T alleles in Egyptian CBAVD patients. The allelic frequencies of the mutations p.Phe508del, p.Ser1251Asn and the 5T variant in 60 Egyptian cystic fibrosis patients were 24.2%, 3.3% and 2.5% respectively. The mutation p.Ser1251Asn was detected for the first time in isolated CBAVD patient in our study."

According to the news reporters, the research concluded: "Due to the high prevalence of p. Phe508del mutation and 5T variant in Egyptian CBAVD patients, we recommend their screening initially, ideally followed by full CFTR gene sequencing in unidentified patients."

Our news correspondents report that additional information may be obtained by contacting M.A. Elmonem, Cairo University, Fac Med, Clin & Chem Pathol Department, Cairo, Egypt. Additional authors for this research include T. Ramzy, M.A. Elmonem, M. Amer, A. Zeidan, F.A. Hassan and D.A. Mehaney.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/and.12563. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Cairo, Egypt, Africa, Andrology, Men's Health, Genetics, Genetics, University of Cairo.
Lung Diseases and Conditions - Asthma

Findings from University of Calgary Broaden Understanding of Asthma [Understanding how long-acting beta(2)-adrenoceptor agonists enhance the clinical efficacy of inhaled corticosteroids in asthma - an update]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Asthma have been published. According to news originating from Calgary, Canada, by NewsRx correspondents, research stated, "In moderate-to-severe asthma, adding an inhaled long-acting (2)-adrenoceptor agonist (LABA) to an inhaled corticosteroid (ICS) provides better disease control than simply increasing the dose of ICS. Acting on the glucocorticoid receptor (GR, gene NR3C1), ICSs promote anti-inflammatory/anti-asthma gene expression."

Our news journalists obtained a quote from the research from the University of Calgary, "In vitro, LABAs synergistically enhance the maximal expression of many glucocorticoid-induced genes. Other genes, including dual-specificity phosphatase 1(DUSP1) in human airways smooth muscle (ASM) and epithelial cells, are up-regulated additively by both drug classes. Synergy may also occur for LABA-induced genes, as illustrated by the bronchoprotective gene, regulator of G-protein signalling 2 (RGS2) in ASM. Such effects cannot be produced by either drug alone and may explain the therapeutic efficacy of ICS/LABA combination therapies. While the molecular basis of synergy remains unclear, mechanistic interpretations must accommodate gene-specific regulation. We explore the concept that each glucocorticoid-induced gene is an independent signal transducer optimally activated by a specific, ligand-directed, GR conformation. In addition to explaining partial agonism, this realization provides opportunities to identify novel GR ligands that exhibit gene expression bias. Translating this into improved therapeutic ratios requires consideration of GR density in target tissues and further understanding of gene function. Similarly, the ability of a LABA to interact with a glucocorticoid may be suboptimal due to low (2)-adrenoceptor density or biased (2)-adrenoceptor signalling. Strategies to overcome these limitations include adding-on a phosphodiesterase inhibitor and using agonists of other Gs-coupled receptors."

According to the news editors, the research concluded: "In all cases, the rational design of ICS/LABA, and derivative, combination therapies requires functional knowledge of induced (and repressed) genes for therapeutic benefit to be maximized."

The news correspondents report that additional information may be obtained from R. Newton, University of Calgary, Cumming Sch Med, Dept. of Cell Biol & Anat, Airways Inflammation Res Grp, Calgary, AB T2N 4N1, Canada.

Infectious Diseases

Findings from University of Calgary Has Provided New Data on Infectious Diseases (A Primer on Infectious Disease Bacterial Genomics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Infectious Diseases have been published. According to news reporting from Calgary, Canada, by NewsRx journalists, research stated, "The number of large-scale genomics projects is increasing due to the availability of affordable high-throughput sequencing (HTS) technologies."

The news correspondents obtained a quote from the research from the University of Calgary, "The use of HTS for bacterial infectious disease research is attractive because one whole-genome sequencing (WGS) run can replace multiple assays for bacterial typing, molecular epidemiology investigations, and more in-depth pathogenomic studies. The computational resources and bioinformatics expertise required to accommodate and analyze the large amounts of data pose new challenges for researchers embarking on genomics projects for the first time."

According to the news reporters, the research concluded: "Here, we present a comprehensive overview of a bacterial genomics projects from beginning to end, with a particular focus on the planning and computational requirements for HTS data, and provide a general understanding of the analytical concepts to develop a workflow that will meet the objectives and goals of HTS projects."

For more information on this research see: A Primer on Infectious Disease Bacterial Genomics. Clinical Microbiology Reviews, 2016;29(4):881-913. Disease Attributes - Chronic Disease

Findings from University of Calgary Update Knowledge of Chronic Disease (Finding resiliency in the face of financial barriers Development of a conceptual framework for people with cardiovascular-related chronic disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Disease Attributes - Chronic Disease have been published. According to news reporting out of Calgary, Canada, by NewsRx editors, research stated, "Patients with chronic diseases often face financial barriers to optimize their health. These financial barriers may be related to direct healthcare costs such as medications or self-monitoring supplies, or indirect costs such as transportation to medical appointments."

Our news journalists obtained a quote from the research from the University of Calgary, "No known framework exists to understand how financial barriers impact patients' lives or their health outcomes. We undertook a grounded theory study to develop such a framework. We used semistructured interviews with a purposive sample of participants with cardiovascular-related chronic disease (hypertension, diabetes, heart disease, or stroke) from Alberta, Canada. Interview transcripts were analyzed in triplicate, and interviews continued until saturation was reached. We interviewed 34 participants. We found that the confluence of 2 events contributed to the perception of having a financial barrier -onset of chronic disease and lack of income or health benefits. The impact of having a perceived financial barrier varied considerably. Protective, predisposing, or modifying of factors determined how impactful a financial barrier would be. An individual's particular set of factors is then shaped by their worldview. This combination of factors and lens determines one's degree of resiliency, which ultimately impacts how well they cope with their disease. The role of financial barriers is complex. How well an individual copes with their financial barriers is intimately tied to resiliency, which is related to the composite of a personal circumstances and their worldview."

According to the news editors, the research concluded: "Our framework for understanding the experience of financial barriers can be used by both researchers and clinicians to better understand patient behavior."

For more information on this research see: Finding resiliency in the face of financial barriers Development of a conceptual framework for people with cardiovascular-related chronic disease. Findings from University of California Broaden Understanding of Hematopoietic Stem Cells (A Transient Developmental Hematopoietic Stem Cell Gives Rise to Innate-like B and T Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Stem Cell Research - Hematopoietic Stem Cells have been presented. According to news reporting from Santa Cruz, California, by NewsRx journalists, research stated, "The generation of distinct hematopoietic cell types, including tissue-resident immune cells, distinguishes fetal from adult hematopoiesis. However, the mechanisms underlying differential cell production to generate a layered immune system during hematopoietic development are unclear."

The news correspondents obtained a quote from the research from the University of California, "Using an irreversible lineage-tracing model, we identify a definitive hematopoietic stem cell (HSC) that supports long-term multilineage reconstitution upon transplantation into adult recipients but does not persist into adulthood in situ. These HSCs are fully multipotent, yet they display both higher lymphoid cell production and greater capacity to generate innate-like B and T lymphocytes as compared to coexisting fetal HSCs and adult HSCs."

According to the news reporters, the research concluded: "Thus, these developmentally restricted HSCs (drHSCs) define the origin and generation of early lymphoid cells that play essential roles in establishing self-recognition and tolerance, with important implications for understanding autoimmune disease, allergy, and rejection of transplanted organs."

Our news journalists report that additional information may be obtained by contacting E.C. Forsberg, University of California, Inst Biol Stem Cells, Dept. of Biomol Engn, Santa Cruz, CA 95064, United States. Additional authors for this research include S.W. Boyer, J. Perez-Cunningham, G.E. Hernandez, S.C. Derderian, C. Jujjavarapu, E. Aaserude, T. MacKenzie and E.C. Forsberg.

Endocrine System Diseases and Conditions - Insulin...

Findings from University of California Has Provided New Data on Insulin Resistance (Mitochondrial quality control in insulin resistance and diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Endocrine System Diseases and Conditions - Insulin Resistance have been published. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "Diabetes is increasingly prevalent and a primary contributor to the major causes of disability and death."

Funders for this research include American Federation for Aging Research, Glenn Foundation for Medical Research, UCLA Hartford Center of Excellence, National Institute on Aging, UCLA Older Americans Independence Center, Ellison Medical Foundation, UCSD/UCLA Diabetes Research Center, UCLA Department of Medicine, UCLA Iris Cantor Women's Health Center Foundation Executive Board, Jonsson Comprehensive Cancer Center, National Institutes of Health.

Our news journalists obtained a quote from the research from the University of California, "Despite the central role of mitochondria in metabolism, the relationship between mitochondrial quality and insulin action remains unclear. An increasing number of genetically-engineered and aging rodent models are shedding additional light on the mitochondrion's role in regulating glucose metabolism and insulin sensitivity by modulating mitochondrial morphology, function and quality control pathways."

According to the news editors, the research concluded: "Clarification of the role of mitochondria in regulating key cellular processes including metabolic flux, autophagy, and apoptosis will drive the development of novel therapeutic strategies for maintaining mitochondrial quality and improving human health."

Our news journalists report that additional information may be obtained by contacting J. Wanagat, University of California, David Geffen Sch Med, Dept. of Med, Div Geriatr, Los Angeles, CA 90095, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.gde.2016.05.007. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from University of California Provide New Insights into Retinitis Pigmentosa (Establishing the involvement of the novel gene AGBL5 in retinitis pigmentosa by whole genome sequencing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Retinitis Pigmentosa. According to news originating from La Jolla, California, by NewsRx correspondents, research stated, "While more than 250 genes are known to cause inherited retinal degenerations (IRD), nearly 40-50% of families have the genetic basis for their disease unknown. In this study we sought to identify the underlying cause of IRD in a family by whole genome sequence (WGS) analysis."

Financial supporters for this research include Foundation Fighting Blindness (Foundation Fighting Blindness, Inc.), HHS | National Institutes of Health (NIH), University of California San Diego-Dept of Ophthalmology.

Our news journalists obtained a quote from the research from the University of California, "Clinical characterization including standard ophthalmic examination, fundus photography, visual field testing, electroretinography, and review of medical and family history was performed. WGS was performed on affected and unaffected family members using Illumina HiSeq X10. Sequence reads were aligned to hg19 using BWA-MEM and variant calling was performed with Genome Analysis Toolkit. The called variants were annotated with SnpEff v4.11, PolyPhen v2.2.2, and CADD v1.3. Copy number variations were called using Genome STRiP (svtoolkit 2.00.1611) and SpeedSeq software. Variants were filtered to detect rare potentially deleterious variants segregating with disease. Candidate variants were validated by dideoxy sequencing. Clinical evaluation revealed typical adolescent-onset recessive retinitis pigmentosa (arRP) in affected individuals. Two rare and potentially deleterious compound heterozygous variants p.Arg281Cys and p.Arg487* were identified in the gene ATP/GTP binding protein like 5 (AGBL5) as likely causal variants. No additional variants in IRD genes that segregated with disease were identified. Mutation analysis confirmed the segregation of these variants with the IRD in the pedigree. Homology models indicated destabilization of AGBL5 due to the p.Arg281Cys change."

According to the news editors, the research concluded: "Our findings establish the involvement of mutations in AGBL5 in RP and validate the WGS variant filtering pipeline we designed."

For more information on this research see: Establishing the involvement of the novel gene AGBL5 in retinitis pigmentosa by whole genome sequencing. Physiological Genomics, 2016;48(12):922-927. Physiological Genomics can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

**Stem Cell Research**

**Findings from University of California Provides New Data on Stem Cell Research (Regional signals in the planarian body guide stem cell fate in the presence of genomic instability)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Stem Cell Research is now available. According to news reporting originating from Merced, California, by NewsRx correspondents, research stated, "Cellular fate decisions are influenced by their topographical location in the adult body. For instance, tissue repair and neoplastic growth are greater in anterior than in posterior regions of adult animals."

Financial support for this research came from National Institutes of Health.

Our news editors obtained a quote from the research from the University of California, "However, the molecular underpinnings of these regional differences are unknown. We identified a regional switch in the adult planarian body upon systemic disruption of homologous recombination with RNA-interference of Rad51. Rad51 knockdown increases DNA double-strand breaks (DSBs) throughout the body, but stem cells react differently depending on their location along the anteroposterior axis. In the presence of extensive DSBs, cells in the anterior part of the body resist death, whereas cells in the posterior region undergo apoptosis. Furthermore, we found that proliferation of cells with DNA damage is induced in the presence of brain tissue and that the retinoblastoma pathway enables overproliferation of cells with DSBs while attending to the demands of tissue growth and repair."

According to the news editors, the research concluded: "Our results implicate both autonomous and non-autonomous mechanisms as key mediators of regional cell behavior and cellular transformation in the adult body."

The news editors report that additional information may be obtained by contacting N.J. Oviedo, Univ Calif Merced, Hlth Sci Res Inst, Merced, CA 95343, United States. Additional authors for this research include D. Ramirez, P.G. Barghouth, U. Ofoha, D. Davidian, F. Weckerle and N.J. Oviedo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1242/dev.131318. This DOI is a link to an online electronic document that is either free or for purchase.
Biomedical Engineering - Tissue Engineering

Findings from University of California Provides New Data on Tissue Engineering (Transforming Growth Factor-b-Induced KDM4B Promotes Chondrogenic Differentiation of Human Mesenchymal Stem Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biomedical Engineering - Tissue Engineering. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "The high prevalence of cartilage diseases and limited treatment options create a significant biomedical burden. Due to the inability of cartilage to regenerate itself, introducing chondrocyte progenitor cells to the affected site is of significant interest in cartilage regenerative therapies."

Financial support for this research came from NIH/NIDCR.

Our news journalists obtained a quote from the research from the University of California, "Tissue engineering approaches using human mesenchymal stem cells (MSCs) are promising due to their chondrogenic potential, but a comprehensive understanding of the mechanisms governing the fate of MSCs is required for precise therapeutic applications in cartilage regeneration. TGF-b is known to induce chondrogenesis by activating SMAD signaling pathway and upregulating chondrogenic genes such as SOX9; however, the epigenetic regulation of TGF-b-mediated chondrogenesis is not understood. In this report, we found that TGF-b dramatically induced the expression of KDM4B in MSCs. When KDM4B was overexpressed, chondrogenic differentiation was significantly enhanced while KDM4B depletion by shRNA led to a significant reduction in chondrogenic potential. Mechanistically, upon TGF-b stimulation, KDM4B was recruited to the SOX9 promoter, removed the silencing H3K9me3 marks, and activated the transcription of SOX9. Furthermore, KDM4B depletion reduced the occupancy of SMAD3 in the SOX9 promoter, suggesting that KDM4B is required for SMAD-dependent coactivation of SOX9. Our results demonstrate the critical role of KDM4B in the epigenetic regulation of TGF-b-mediated chondrogenic differentiation of MSCs."

According to the news editors, the research concluded: "Since histone demethylases are chemically modifiable, KDM4B may be a novel therapeutic target in cartilage regenerative therapy."

Our news journalists report that additional information may be obtained by contacting H.L. Lee, Laboratory of Molecular Signaling, Division of Oral Biology and Medicine, School of Dentistry and Broad Stem Cell Research Center, University of California, Los Angeles, Los Angeles, California, United States. Additional authors for this research include B. Yu, P. Deng, C.Y. Wang and C. Hong.

Findings from University of California Yields New Findings on Surgical Technologies (Compatibility of Radiofrequency Surgical Sponge Detection Technology with Cardiac Implantable Electronic Devices and Temporary Pacemakers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Surgery - Surgical Technologies have been published. According to news reporting originating from La Jolla, California, by NewsRx correspondents, research stated, "Radiofrequency (RF) technology has improved detection of retained surgical sponges with a reported 100% sensitivity and specificity. However, the potential for interactions of the RF signals emitted by the detection system with cardiac implantable electronic devices (CIEDs) or temporary pacemakers may limit its use in those patients with these devices."

Our news editors obtained a quote from the research from the University of California, "This study investigated whether RF detection technology causes interference or clinically significant changes in the programmed settings of implanted pacemakers and defibrillators or temporary epicardial pacemakers. Fifty patients who were scheduled either for CIED removal or placement of a temporary epicardial pacemaker (at the time of open heart surgery) were recruited for this study. Device settings and measurements from separate interrogations before and after scanning with the RF detection system were compared. For the temporary pacemakers, we observed for any changes in hemodynamics or signs of pacing interference. Twenty (40%) pacemakers, 20 (40%) implantable cardioverter defibrillators, and 10 (20%) temporary pacemakers were analyzed in this study. During scanning, no signal interference was detected in any permanent device, and there were no significant changes in programmed settings after scanning with the RF detection system. However, pacing inhibition was detected with temporary pacing systems when programmed to a synchronous mode (DDD)."

According to the news editors, the research concluded: "RF detection technology can be safely used to scan for retained surgical sponges in patients with permanent CIEDs and temporary pacemakers set to asynchronous mode."

For more information on this research see: Compatibility of Radiofrequency Surgical Sponge Detection Technology with Cardiac Implantable Electronic Devices and Temporary Pacemakers. PACE-Pacing and Clinical Electrophysiology, 2016;39(11):1254-1260. PACE-Pacing and Clinical Electrophysiology can be contacted at: Wiley-Blackwell, 111...

Drugs and Therapies - Antibiotics

Findings from University of California in Antibiotics Provides New Insights (Exploring Synergy between Classic Mutagens and Antibiotics To Examine Mechanisms of Synergy and Antibiotic Action)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antibiotics have been presented. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "We used classical mutagens in Gram-negative *Escherichia coli* to study synergies with different classes of antibiotics, test models of antibiotic mechanisms of action, and examine the basis of synergy. We used 4-nitroquinoline 1-oxide (4NQO), zebularine (ZEB), 5-azacytidine (5AZ), 2-aminopurine (2AP), and 5-bromodeoxyuridine (5BrdU) as mutagens (with bactericidal potency of 4NQO >ZEB >5AZ >2Ap >5BrdU) and vancomycin (VAN), ciprofloxacin (CPR), trimethoprim (TMP), gentamicin (GEN), tetracycline (TET), erythromycin (ERY), and chloramphenicol (CHL) as antibiotics."

Our news journalists obtained a quote from the research from the University of California, "We detected the strongest synergies with 4NQO, an agent that oxidizes guanines and ultimately results in double-strand breaks when paired with the bactericidal antibiotics VAN, TMP, CPR, and GEN, but no synergies with the bacteriostatic antibiotics TET, ERY, and CHL. Each of the other mutagens displays synergies with the bactericidal antibiotics to various degrees that reflect their potencies, as well as with some of the other mutagens. The results support recent models showing that bactericidal antibiotics kill bacteria principally by ultimately generating more double-strand breaks than can be repaired. We discuss the synergies seen here and elsewhere as representing dose effects of not the proximal target damage but rather the ultimate resulting double-strand breaks."

According to the news editors, the research concluded: "We also used the results of pairwise tests to place the classic mutagens into functional antibacterial categories within a previously defined drug interaction network."

Our news journalists report that additional information may be obtained by contacting P. Yeh, Dept. of Ecology and Evolutionary Biology, University of California, Los
Los Angeles, California, United States. Additional authors for this research include S. D'Souza, K. Lam, T.M. Kang, P. Yeh and J.H Miller.

**Chemistry - Biochemistry**

**Findings from University of California in the Area of Biochemistry Reported (Effect of site-directed mutations in multidrug efflux pump AcrB examined by quantitative efflux assays)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Chemistry - Biochemistry is now available. According to news reporting originating from Berkeley, California, by NewsRx correspondents, research stated, "The Resistance-Nodulation-Division (RND) family transporter AcrB plays a major role in the intrinsic and increased resistance of Escherichia coli to a large number of antibiotics. The distal binding pocket within this multidrug efflux transporter is very large, but the effort to define the roles of various residues facing this pocket through site-directed mutagenesis so far involved only the determination of minimal inhibitory concentrations of drugs in mutants."

Our news editors obtained a quote from the research from the University of California, "We measured in intact E. coli cells the kinetics of efflux of two substrates, nitrocefin (a cephalosporin) that is predicted mainly to bind to the upper, 'groove' domain of the pocket, and L-alanyl-beta-naphthylamide (Ala-Naph) that is likely to bind to the lower, 'cave' domain, in a number of site directed mutants of AcrB, where a hydrophobic or aromatic residue was changed into alanine. The efflux of nitrocefin became attenuated by some mutations in the groove domain, such as I278A and F178A, but in some experiments a mutation in the cave domain, F628A produced a similar result. In some cases an increased value of KM was detected. The efflux of Ala-Naph was increased by mutations in the cave domain, such as F136A and I626A, but also by those in the groove domain (I277A, I278A, F178A). In most cases the increased V-max values appeared to be responsible. F610A mutation had a profound effect on the efflux of both substrates, as reported earlier. Our data show for the first time effects of various substrate-binding pocket mutations on the kinetics of efflux of two substrates by the AcrB pump."

According to the news editors, the research concluded: "They also confirm interactions between substrates and drugs predicted by MD simulation studies, and also reveal areas that need future research."

For more information on this research see: Effect of site-directed mutations in multidrug efflux pump AcrB examined by quantitative efflux assays. Biochemical and Biophysical Research Communications, 2016;480(4):552-557. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Blood Pressure**

**Findings from University of Cambridge Provides New Data about Blood Pressure (Clinical relevance of central blood pressure - a critical review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Blood Pressure. According to news reporting originating in Cambridge, United Kingdom, by NewsRx journalists, research stated, "Vital organs are exposed to the central rather than the brachial blood pressure. To date, central blood pressure can be assessed noninvasively through the use of several devices."

The news reporters obtained a quote from the research from the University of Cambridge, "In this review, we critically discuss the clinical relevance of central blood pressure assessment. Considerable evidence suggests that central blood pressure is a better predictor of end-organ damage than brachial blood pressure. However, there is still uncertainty concerning the value of central pressure for predicting cardiovascular outcomes, as the existing studies are underpowered to address this issue. A full synthesis of the available data is needed in this regard. Among the different antihypertensive drug classes, beta-blockers appear to lower central blood pressure less than brachial blood pressure. This difference may, at least in part, explain the reduced efficacy of beta-blockers in the prevention of cardiovascular outcomes compared with the other antihypertensive drug classes, which may lower central and brachial blood pressure to a similar extent Nevertheless, this differential effect might not be relevant to the newer beta-blockers with vasodilating properties, including nebivolol, celliprolol and carvedilol. However, whether a preferential reduction of central blood pressure results in better outcomes should be further assessed by appropriately powered clinical trials."

According to the news reporters, the research concluded: "Other emerging challenges include the assessment of the potential predictive value of central blood pressure variability and the development of new antihypertensive medications based on central blood pressure rather than brachial blood pressure."

Immune System Diseases and Conditions - HIV/AIDS

Findings from University of Cape Town Update Knowledge of HIV/AIDS (HIV-1 Coinfection Does Not Reduce Exposure to Rifampin, Isoniazid, and Pyrazinamide in South African Tuberculosis Outpatients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news reporting originating from Cape Town, South Africa, by NewsRx correspondents, research stated, "There are contrasting data in the literature about antituberculosis plasma drug concentrations in HIV-1-coinfected patients. We report the pharmacokinetics of rifampin, isoniazid, and pyrazinamide in a cohort of patients being treated for active tuberculosis, the majority of whom were coinfected with HIV-1 and had commenced antiretroviral therapy within 2 months of starting antituberculosis treatment."

Funders for this research include Wellcome Trust, Medical Research Council (MRC), National Research Foundation (NRF).

Our news editors obtained a quote from the research from the University of Cape Town, "We also examined the association between antituberculosis drug concentrations and reported drug side effects at the 2-month clinical review. One hundred patients with pulmonary tuberculosis (65% coinfected with HIV-1) were intensively sampled to determine rifampin, isoniazid, and pyrazinamide plasma concentrations after 7 to 8 weeks of a daily quadruple-therapy regimen dosed according to World Health Organization (WHO) weight bands. Pharmacokinetic parameters were determined for each patient by using nonlinear mixed-effects models. HIV-1-coinfected patients had lower clearance rates for rifampin (21% decrease) and isoniazid (23% decrease) than HIV-1-uninfected patients, with resulting higher areas under the concentration-time curve from 0 to 24 h (AUC(0-24)) and maximum concentrations of drug in serum (C-max). Antiretroviral therapy (ART) that included double-standard-dose lopinavir/ritonavir further lowered rifampin clearance, by 46%, and increased the AUC(0-24). The current uniform dosing (per kilogram of body weight) across WHO weight bands was associated with a trend of decreased pharmacokinetic exposures for the lowest weight band. Use of fat-free mass as opposed to total body weight for allometric scaling of clearance significantly improved the model."

According to the news editors, the research concluded: "Ambulant HIV-1-coinfected patients, the majority of whom were coprescribed ART, did not have reduced antituberculosis drug concentrations compared to HIV-1-uninfected patients."

The news editors report that additional information may be obtained by contacting P. Denti, University of Cape Town, Dept. of Med, Div Clin Pharmacol, Cape Town, South Africa. Additional authors for this research include G. Meintjes, M. Chirehwa, L. Wiesner, H. McIlleron, R.J. Wilkinson and P. Denti.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AAC.00480-16. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiology**

**Findings from University of Central Florida Broadens Understanding of Cardiology (SOD1 Overexpression Preserves Baroreflex Control of Heart Rate with an Increase of Aortic Depressor Nerve Function)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiology is now available. According to news originating from Orlando, Florida, by NewsRx correspondents, research stated, "Overproduction of reactive oxygen species (ROS), such as the superoxide radical (O2 (&#8729;)), is associated with diseases which compromise cardiac autonomic function. Overexpression of SOD1 may offer protection against ROS damage to the cardiac autonomic nervous system, but reductions of O2 (&#8729;) may interfere with normal cellular functions."

Our news journalists obtained a quote from the research from the University of Central Florida, "We have selected the C57B6SJL-Tg (SOD1)2 Gur/J mouse as a model to determine whether SOD1 overexpression alters cardiac autonomic function, as measured by baroreflex sensitivity (BRS) and aortic depressor nerve (ADN) recordings, as well as evaluation of baseline heart rate (HR) and mean arterial pressure (MAP). Under isoflurane anesthesia, C57 wild-type and SOD1 mice were catheterized with an arterial pressure transducer and measurements of HR and MAP were taken. After establishing a baseline, hypotension and hypertension were induced by injection of sodium nitroprusside (SNP) and phenylephrine (PE), respectively, and DHR versus DMAP were recorded as a measure of baroreflex sensitivity (BRS). SNP and PE treatment were administered sequentially after a recovery period to measure
arterial baroreceptor activation by recording aortic depressor nerve activity."

According to the news editors, the research concluded: "Our findings show that overexpression of SOD1 in C57B6SJL-Tg (SOD1)2 Gur/J mouse preserved the normal HR, MAP, and BRS but enhanced aortic depressor nerve function."

The news correspondents report that additional information may be obtained from J. Hatcher, Biomolecular Science Center, Burnett School of Biomedical Sciences, College of Medicine, University of Central Florida, Orlando, FL 32816, United States. Additional authors for this research include H. Gu and Z.J Cheng.

**Evolution**

**Findings from University of Chester in the Area of Evolution Described (Consequences of mating and predation risk for longevity in a freshwater snail: abstinence makes the heart beat longer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Evolution. According to news reporting out of West Chester, Pennsylvania, by NewsRx editors, research stated, "Senescence is not a static property of an individual or population, but rather it is a dynamic process that may be influenced by environmental conditions. This can occur in at least two ways: in the long-term across multiple generations, and in the short-term via phenotypic plasticity."

Financial supporters for this research include Andrew W. Mellon Foundation, National Science Foundation.

Our news journalists obtained a quote from the research from the University of Chester, "The former has attracted a lot of attention, both theoretically and empirically; the latter has lagged behind. To determine whether two important environmental variables (predation risk and mate availability) affect the pattern of actuarial senescence (i.e. the increase in mortality with age), we reared 30 full-sib families of the simultaneously hermaphroditic freshwater snail Physa acuta under four different environmental conditions and tracked individuals until death. Individuals were reared in a 292 factorial experiment that manipulated the nonlethal presence of chemical cues from predatory crayfish (presence/absence) and the opportunity to mate with an unrelated partner (mated/not mated). Snails that receive a partner reproduce by outcrossing, whereas those that remain in isolation can reproduce by self-fertilization. We compared the cumulative survival curves to test for an effect of predation risk and mating. The hazard ratio (HR) for the predation risk comparison was 1.042 indicating no significant difference between
the curves. However, the HR for the mating comparison was 4.021, reflecting a significant reduction in survival probability for mated snails relative to isolated snails."

According to the news editors, the research concluded: "As such, mating resulted in a much shorter lifespan, an outcome that we interpret in terms of shifting resource allocation."

Our news journalists report that additional information may be obtained by contacting J.R. Auld, West Chester Univ, Dept. of Biol, W Chester, PA 19383, United States. Additional authors for this research include A.D. Helker and A. Kolpas.

**Oncology - Pancreatic Cancer**

**Findings from University of Chicago Has Provided New Data on Pancreatic Cancer (External radiation is associated with limited improvement in overall survival in resected margin-negative stage IIB pancreatic adenocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Pancreatic Cancer are presented in a new report. According to news originating from Chicago, Illinois, by NewsRx correspondents, research stated, "The absolute benefit of adjuvant external beam radiation therapy iffer a margin-negative resection in early stage pancreatic cancer has not been determined. We queried the National Cancer Data Base for patients with pathologic stage I-II pancreatic adenocarcinoma who underwent operative resection between 2004 and 2012."

Our news journalists obtained a quote from the research from the University of Chicago, "Multivariate Cox regression adjusted for age, race, comorbidities, facility type, location and volume, type of pancreatectomy, and tumor grade was used to estimate stage-specific survival. A total of 15,966 patients with stage I-II pancreatic adenocarcinoma underwent up front operative therapy (no neoadjuvant treatment) and had a margin-negative resection during the study period. A total of 835 (5.2%) patients were pathologic stage IA, 1,539 (9.5 %) were stage IB, 3,378 (20.9%) were stage IIA, and 10,214 (63.1%) were stage IIB. Chemoradiation utilization increased with increasing stage (22.8% in stage IA vs 39.6% in stage IIB, P< .01). Chemoradiation was more common at low-volume centers (39.0% vs 31.7% at high-volume centers, P< .01) and with younger age (43.3% of patients <70 years old compared to 25.0% >= 70 years old, P< .01). Treatment at a high-volume center was associated with decreased mortality (hazard ratio 0.80-0.89) across all stages. Age >= 70 years old (hazard ratio
Chemotherapy alone for stage IIB disease (21.8 months vs 19.5 months, P< .01). Chemoradiation was not associated with a significant benefit in median overall survival for stage IA, IB, or IIA disease (P > .30).

According to the news editors, the research concluded: "Addition of radiation to adjuvant chemotherapy after margin-negative resection of pancreatic adenocarcinoma is associated with a limited survival benefit in patients with pathologic stage JIB disease and should be weighed against its associated risks in these patient groups.

Drugs and Therapies - Antibiotics

Findings from University of Cincinnati Update Knowledge of Antibiotics

[MDMA decreases glutamic acid decarboxylase (GAD) 67-immunoreactive neurons in the hippocampus and increases seizure susceptibility: Role for glutamate]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a new report. According to news reporting originating from Cincinnati, Ohio, by NewsRx correspondents, research stated, "3,4-Methylenedioxy-methamphetamine (MDMA) is a unique psychostimulant that continues to be a popular drug of abuse. It has been well documented that MDMA reduces markers of 5-HT axon terminals in rodents, as well as humans."

Our news editors obtained a quote from the research from the University of Cincinnati, "A loss of parvalbumin-immunoreactive (IR) interneurons in the hippocampus following MDMA treatment has only been documented recently. In the present study, we tested the hypothesis that MDMA reduces glutamic acid decarboxylase (GAD) 67-IR, another biochemical marker of GABA neurons, in the hippocampus and that this reduction in GAD67-IR neurons and an accompanying increase in seizure susceptibility involve glutamate receptor activation. Repeated exposure to MDMA (3 x 10 mg/kg, ip) resulted in a reduction of 37-58%
of GAD67-IR cells in the dentate gyrus (DG), CA1, and CA3 regions, as well as an increased susceptibility to kainic acid-induced seizures, both of which persisted for at least 30 days following MDMA treatment. Administration of the NMDA antagonist MK-801 or the glutamate transporter type 1 (GLT-1) inducer ceftriaxone prevented both the MDMA-induced loss of GAD67-IR neurons and the increased vulnerability to kainic acid-induced seizures. The MDMA-induced increase in the extracellular concentration of glutamate in the hippocampus was significantly diminished in rats treated with ceftriaxone, thereby implicating a glutamatergic mechanism in the neuroprotective effects of ceftriaxone.

According to the news editors, the research concluded: "In summary, the present findings support a role for increased extracellular glutamate and NMDA receptor activation in the MDMA-induced loss of hippocampal GAD67-IR neurons and the subsequent increased susceptibility to evoked seizures."

For more information on this research see: MDMA decreases glutamic acid decarboxylase (GAD) 67-immunoreactive neurons in the hippocampus and increases seizure susceptibility: Role for glutamate. Oncology - Cervical Cancer

Findings from University of Colorado Broaden Understanding of Cervical Cancer (Disparities in standard of care treatment and associated survival decrement in patients with locally advanced cervical cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Cervical Cancer is now available. According to news originating from Aurora, Colorado, by NewsRx correspondents, research stated, "Standard of care (SOC) treatment for locally advanced cervical cancer includes pelvic external beam radiation (EBRT) with chemotherapy and interdigitated brachytherapy. We evaluated national utilization trends and factors associated with receiving SOC therapy."

Our news journalists obtained a quote from the research from the University of
Colorado, "We utilized the National Cancer Database (NCDB) to identify women with locally advanced cervical cancer treated with definitive radiation or chemoradiation therapy and stratified these patients by treatment received. We identified 15,194 patients. Only 44.3% of patients received SOC treatment and this group had significantly improved OS. High volume centers, academic centers, comprehensive community cancer centers, private insurance, and higher income, were all associated with an increased likelihood of receiving SOC, whereas Black patients were less likely to receive SOC. We found 26.8% of patients received no radiation boost, 23.8% received an EBRT boost only, and 49.5% of patients received EBRT with brachytherapy. Although an EBRT boost was advantageous over no boost at all (HR 0.720, p<0.001), OS was superior in patients who received brachytherapy (HR 0.554, p<0.001). Patients were more likely to receive no radiotherapy boost if they had lower incomes, Medicaid, were treated at low volume centers, or were treated at non-comprehensive community cancer centers. SOC for locally advanced cervical cancer offers superior outcomes, yet less than half of patients receive SOC and there are disparities in which patients receive SOC treatment."

According to the news editors, the research concluded: "No additional treatment, including sophisticated EBRT techniques including IMRT or SBRT, can make up for the survival decrement from lack of brachytherapy as a component of definitive care."

For more information on this research see: Disparities in standard of care treatment and associated survival decrement in patients with locally advanced cervical cancer. Gynecologic Oncology, 2016;143(2):319-325. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Oncology - Medulloblastomas

Findings from University of Colorado Broadens Understanding of Medulloblastomas (A WEE1 Inhibitor Analog of AZD1775 Maintains Synergy with Cisplatin and Demonstrates Reduced Single-Agent Cytotoxicity in Medulloblastoma Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Medulloblastomas. According to news originating from Aurora, Colorado, by NewsRx correspondents, research stated, "The current treatment for medulloblastoma includes surgical resection, radiation, and
cytotoxic chemotherapy. Although this approach has improved survival rates, the high doses of chemotherapy required for clinical efficacy often result in lasting neurocognitive defects and other adverse events."

Funders for this research include National Center for Advancing Translational Sciences, National Institute of Neurological Disorders and Stroke.

Our news journalists obtained a quote from the research from the University of Colorado, "Therefore, the development of chemosensitizing agents that allow dose reductions of cytotoxic agents, limiting their adverse effects but maintaining their clinical efficacy, would be an attractive approach to treat medulloblastoma. We previously identified WEE1 kinase as a new molecular target for medulloblastoma from an integrated genomic analysis of gene expression and a kinome-wide siRNA screen of medulloblastoma cells and tissue. In addition, we demonstrated that WEE1 prevents DNA damage-induced cell death by cisplatin and that the WEE1 inhibitor AZD1775 displays synergistic activity with cisplatin. AZD1775 was developed as a WEE1 inhibitor from an initial hit from a high-throughput screen. However, given the lack of structure-activity data for AZD1775, we developed a small series of analogs to determine the requirements for WEE1 inhibition and further examine the effects of WEE1 inhibition in medulloblastoma. Interestingly, the compounds that inhibited WEE1 in the same nanomolar range as AZD1775 had significantly reduced single-agent cytotoxicity compared with AZD1775 and displayed synergistic activity with cisplatin in medulloblastoma cells."

According to the news editors, the research concluded: "The potent cytotoxicity of AZD1775, unrelated to WEE1 inhibition, may result in dose-limiting toxicities and exacerbate adverse effects; therefore, WEE1 inhibitors that demonstrate low cytotoxicity could be dosed at higher concentrations to chemosensitize the tumor and potentiate the effect of DNA-damaging agents such as cisplatin."

For more information on this research see: A WEE1 Inhibitor Analog of AZD1775 Maintains Synergy with Cisplatin and Demonstrates Reduced Single-Agent Cytotoxicity in Medulloblastoma Cells. Acs Chemical Biology, 2016;11(4):921-30. (American Chemical Society - www.acs.org; Acs Chemical Biology - www.pubs.acs.org/journal/acbcct)

The news correspondents report that additional information may be obtained from C.J. Matheson, Dept. of Pharmaceutical Sciences, Skaggs School of Pharmacy and Pharmaceutical Sciences, University of Colorado Anschutz Medical Campus, 12850 East Montview Boulevard, V20-2102, Aurora, Colorado 80045, United States. Findings from University of Colorado Has Provided New Data on Cell Biology (Diverse Intestinal Bacteria Contain Putative Zwitterionic Capsular Polysaccharides with Anti-inflammatory Properties)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Life Science Research - Cell Biology are discussed in a new report. According to news originating from Aurora, Colorado, by NewsRx correspondents, research stated, "Zwitterionic capsular polysaccharides (ZPSs) are bacterial products that modulate T cells, including inducing anti-inflammatory IL-10-secreting T regulatory cells (Tregs). However, only a few diverse bacteria are known to modulate the host immune system via ZPS."

Our news journalists obtained a quote from the research from the University of Colorado, "We present a genomic screen for bacteria encoding ZPS molecules. We identify diverse host-associated bacteria, including commensals and pathogens with known anti-inflammatory properties, with the capacity to produce ZPSs. Human mononuclear cells stimulated with lysates from putative ZPS-producing bacteria induce significantly greater IL-10 production and higher proportions of Tregs than lysates from non-ZPS-encoding relatives or a commensal strain of Bacteroides cellulosilyticus in which a putative ZPS biosynthetic operon was genetically disrupted. Similarly, wild-type B. cellulosilyticus DSM 14838, but not a close relative lacking a putative ZPS, attenuated experimental colitis in mice."

According to the news editors, the research concluded: "Collectively, this screen identifies bacterial strains that may use ZPSs to interact with the host as well as those with potential probiotic properties."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.chom.2016.09.002. This DOI is a link to an online electronic document that is either free or for purchase.

Hematologic Diseases and Conditions - Anemia

Findings from University of Colorado School of Medicine Provide New Insights into Anemia (Twin-twin transfusion and laser therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematologic Diseases and Conditions - Anemia. According to news reporting originating from Aurora, Colorado, by NewsRx correspondents, research stated, "Twin-to-twin transfusion syndrome (TTTS) is an uncommon, but dangerous, complication of monochorionic diamniotic twin gestations. The purpose of this review is to provide an update on the evolving treatments in TTTS as it pertains primarily to laser photocoagulation, as well as to provide recently published information on outcomes."

Our news editors obtained a quote from the research from the University of Colorado School of Medicine, "The Solomon laser technique, in which selective fetoscopic laser photocoagulation is first performed and then followed by laser of the vascular equator from one side of the placenta to the other, reduces TTTS complications of twin anemia-polycythemia syndrome and recurrent TTTS. The addition of fetal echocardiography to the historical staging of TTTS adds important information that may guide future therapies. The postlaser ablation rate of neurodevelopmental delay in TTTS has recently been reported to be 14%. Cotwin demise is a significant complication of untreated TTTS and survival carries a 25% risk of cystic periventricular leukomalacia, middle cerebral artery infarction, and injury to other central nervous system structures as noted by neuroimaging. Laser therapy for TTTS is clearly the only therapy that halts the disease process, allows both fetuses an opportunity to survive and protects a surviving cotwin in the event of the demise of one twin. Laser techniques have evolved greatly over the last 25 years and recent reports with the addition of the Solomon technique appearing to reduce some postlaser complications (twin anemia-polycythemia sequence and recurrent TTTS)."

According to the news editors, the research concluded: "Future focus of TTTS therapy should be centered on understanding the pathophysiology of the disease better with improvement in staging of the disease and on comparison of different laser techniques with the overall goal of not only increasing twin survival rates but also reducing long term neurodevelopmental morbidity."

For more information on this research see: Twin-twin transfusion and laser therapy. Current Opinion In Obstetrics & Gynecology, 2016;28(2):79-85. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Obstetrics & Gynecology - journals.lww.com/co-obgyn/pages/default.aspx)

The news editors report that additional information may be obtained by contacting N. Behrendt, Division of Maternal-Fetal Medicine, Dept. of Obstetrics and Gynecology, University of Colorado School of Medicine, Colorado Institute for Maternal and Fetal Health, Aurora, Colorado, United States.

Our reports deliver fact-based news of research and discoveries from around the
Thyroid Diseases and Conditions - Hypothyroidism

Findings from University of Colorado in Hypothyroidism Reported (Clinical significance of sunitinib-associated macrocytosis in metastatic renal cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Thyroid Diseases and Conditions - Hypothyroidism. According to news originating from Aurora, Colorado, by NewsRx correspondents, research stated, "Increases in the mean corpuscular volume (MCV) have been observed in patients with metastatic renal cell carcinoma (mRCC) on tyrosine kinase inhibitor (TKI) treatment; however, its association with progression-free-survival (PFS) is unknown. We aimed to characterize TKI-associated macrocytosis in mRCC and its relationship with PFS."

Financial supporters for this research include Paul Calabresi Career Development Award for Clinical Oncology (K12), National Institutes of Health, Cancer Center Biostatistic Resource, National Cancer Institute.

Our news journalists obtained a quote from the research from the University of Colorado, "Retrospective review of data on macrocytosis and thyroid dysfunction on mRCC patients treated with sunitinib and/or sorafenib. These results are evaluated in the context of our previous report on the association of hypothyroidism in this setting. We assessed PFS as clinically defined by the treating physician. Seventy-four patients, 29 of whom received both drugs, were included. A treatment period was defined as time from initiation to discontinuation of either sunitinib or sorafenib; 103 treatment periods [sorafenib (47), sunitinib (56)] were analyzed. Macrocytosis was found in 55 and 8% of sunitinib- and sorafenib-treated patients, respectively, P< 0.001. The median time to developing macrocytosis was 3 months (m, range 1-7). Median PFS in sunitinib-treated patients was 11 m (95% CI: 6-19). Median PFS was higher among those with macrocytosis compared to normocytosis (21 m [95% CI: 11-25] vs. 4 m [95% CI: 3-8] P = 0.0001). Macrocytosis and hypothyroidism were two significant predictors of PFS. The greatest difference in PFS among all patients was observed in patients with both macrocytosis and hypothyroidism (25 m), compared to the normocytic and euthyroid patients (5 m) (P < 0.0001). Sunitinib-related macrocytosis was associated with prolonged PFS, and concurrent development of hypothyroidism and macrocytosis further prolonged PFS. Increased MCV may have a role as a predictive biomarker for sunitinib."

According to the news editors, the research concluded: "Prospective studies accounting for other known prognostic factors are needed to confirm this finding."

The news correspondents report that additional information may be obtained from T.W. Flaig, University of Colorado, Center Canc, Aurora, CO, United States. Additional authors for this research include D.X. Gao, S. Trigero, J.E. Clemons, K. Breaker, E.T. Lam and T.W. Flaig.

Findings from University of Concepcion Has Provided New Data on Piscirickettsia [Novel insights into the response of Atlantic salmon (Salmo salar) to Piscirickettsia salmonis: Interplay of coding genes and IncRNAs during bacterial infection]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Piscirickettsia are discussed in a new report. According to news reporting originating from Concepcion, Chile, by NewsRx correspondents, research stated, "Despite the high prevalence and impact to Chilean salmon aquaculture of the intracellular bacterium Piscirickettsia salmonis, the molecular underpinnings of host-pathogen interactions remain unclear. Herein, the interplay of coding and non-coding transcripts has been proposed as a key mechanism involved in immune response."

Financial support for this research came from PhD Program in Renewable Resources Management of the University of Concepcion, Chile.

Our news editors obtained a quote from the research from the University of Concepcion, "Therefore, the aim of this study was to evidence how coding and non coding transcripts are modulated during the infection process of Atlantic salmon with P. salmonis. For this, RNA-seq was conducted in brain, spleen, and head kidney samples, revealing different transcriptional profiles according to bacterial load. Additionally, while most of the regulated genes annotated for diverse biological processes during infection, a common response associated with clathrin-mediated endocytosis and iron homeostasis was present in all tissues. Interestingly, while endocytosis-promoting factors and clathrin inductions were upregulated, endocytic receptors were mainly down-regulated. Furthermore, the regulation of genes related to iron homeostasis suggested an intracellular accumulation of iron, a process in which heme biosynthesis/degradation pathways might play an important role. Regarding the non-coding response, 918 putative long non-coding RNAs were identified, where 425 were newly characterized for S. salar. Finally, co-localization and co-expression analyses revealed a strong correlation between the modulations of long non-coding RNAs and genes associated with endocytosis and iron homeostasis."

According to the news editors, the research concluded: "These results represent the first comprehensive study of putative interplaying mechanisms of coding and non-coding RNAs during bacterial infection in salmonids."

For more information on this research see: Novel insights into the response of Atlantic salmon (Salmo salar) to Piscirickettsia salmonis: Interplay of coding genes and

The news editors report that additional information may be obtained by contacting C. Gallardo-Escarate, Univ Concepcion, Interdisciplinary Center Aquaculture Res INCAR, Lab Biotechnol & Aquat Genom, Concepcion, Chile.

Nitrofurans

**Findings from University of Copenhagen Broaden Understanding of Nitrofurans [Near-infrared chemical imaging (NIR-CI) of 3D printed pharmaceuticals]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nitrofurans have been presented. According to news originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "Hot-melt extrusion and 3D printing are enabling manufacturing approaches for patient-centred medicinal products. Hot-melt extrusion is a flexible and continuously operating technique which is a crucial part of a typical processing cycle of printed medicines."

Funders for this research include Drug Research Academy (University of Copenhagen), Takeda Pharma, Danish Council for Independent Research (DFF), Technology and Production Sciences (FTP).

Our news journalists obtained a quote from the research from the University of Copenhagen, "In this work we use hot-melt extrusion for manufacturing of medicinal films containing indomethacin (IND) and polycaprolactone (PCL), extruded strands with nitrofurantoin monohydrate (NFMH) and poly (ethylene oxide) (PEO), and feedstocks for 3D printed dosage forms with nitrofurantoin anhydrate (NFAH), hydroxyapatite (HA) and poly (lactic acid) (PLA). These feedstocks were printed into a prototype solid dosage form using a desktop 3D printer. These model formulations were characterized using near-infrared chemical imaging (NIR-CI) and, more specifically, the image analytical data were analysed using multivariate curve resolution-alternating least squares (MCR-ALS). The MCR-ALS algorithm predicted the spatial distribution of IND and PCL in the films with reasonable accuracy. In the extruded strands both the chemical mapping of the components in the formulation as well as the solid form of the active compound could be visualized. Based on the image information the total nitrofurantoin and PEO contents could be estimated. The dehydration of NFMH to NFAH, a process-induced solid form change, could be visualized as well. It was observed that the level of dehydration increased with increasing processing time (recirculation during the mixing phase of molten PEO and nitrofurantoin). Similar results were achieved in the 3D printed solid dosage
forms produced from the extruded feedstocks. The results presented in this work clearly demonstrate that NIR-CI in combination with MCR-ALS can be used for chemical mapping of both active compound and excipients, as well as for visualization of solid form variation in the final product."

According to the news editors, the research concluded: "The suggested NIR-CI approach is a promising process control tool for characterization of innovative patient-centred medicinal products."

The news correspondents report that additional information may be obtained from J. Rantanen, University of Copenhagen, Dept. of Pharm, Fac Hlth & Med Sci, DK-2100 Copenhagen, Denmark. Additional authors for this research include M. Edinger, D. Raijada, J. Botker, J. Aho and J. Rantanen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.09.075. This DOI is a link to an online electronic document that is either free or for purchase.

**Gastroenterology - Colorectal Research**

**Findings from University of Copenhagen Provide New Insights into Colorectal Research (Phosphodiesterases in non-neoplastic appearing colonic mucosa from patients with colorectal neoplasia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gastroenterology - Colorectal Research. According to news reporting out of Copenhagen, Denmark, by NewsRx editors, research stated, "Intracellular signaling through cyclic nucleotides, both cyclic AMP and cyclic GMP, is altered in colorectal cancer. Accordingly, it is hypothesized that an underlying mechanism for colorectal neoplasia involves altered function of phosphodiesterases (PDEs), which affects cyclic nucleotide degradation."

Our news journalists obtained a quote from the research from the University of Copenhagen, "Here we present an approach to evaluate the function of selected cyclic nucleotide-PDEs in colonic endoscopic biopsies from non-neoplastic appearing mucosa. Biopsies were obtained from patients with and without colorectal neoplasia. Activities of PDEs were characterized functionally by measurements of transepithelial ion transport and their expression and localization by employing real-time qPCR and immunohistochemistry. In functional studies PDE subtype-4 displayed lower activity in colorectal neoplasia patients (p = 0.006). Furthermore, real-time qPCR analysis showed overexpression of subtype PDE4B (p = 0.002) and subtype PDE5A (p = 0.02) in colorectal neoplasia patients. Finally, immunohistochemistry for 7 PDE isozymes demonstrated the presence of all 7 isozymes, albeit..."
with weak reactions, and with no differences in localization between colorectal neoplasia and control patients. Of note, quantification of PDE subtype immunostaining revealed a lower amount of PDE3A (p = 0.04) and a higher amount of PDE4B (p = 0.02) in samples from colorectal neoplasia patients. In conclusion, functional data indicated lower activity of PDE4 subtypes while expression and abundance data indicated a higher expression of PDE4B in patients with colorectal neoplasia. We suggest that cyclic nucleotide-PDE4B is overexpressed as a malfunctioning protein in non-neoplastic appearing colonic mucosa from patients with colorectal neoplasia."

According to the news editors, the research concluded: "If a predisposition of reduced PDE4B activity in colonic mucosa from colorectal neoplasia patients is substantiated further, this subtype could be a potential novel early diagnostic risk marker and may even be a target for future medical preventive treatment of colorectal cancer."

Our news journalists report that additional information may be obtained by contacting B. Mahmood, University of Copenhagen, Dept. of Biomed Sci, Fac Hlth Sci, DK-2200 Copenhagen, Denmark. **Endocrine System Diseases and Conditions - Insulin...**

**Findings from University of Copenhagen Provide New Insights into Insulin Resistance (Increasing insulin resistance accentuates the effect of triglyceride-associated loci on serum triglycerides during 5 years)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Endocrine System Diseases and Conditions - Insulin Resistance have been presented. According to news reporting from Copenhagen, Denmark, by NewsRx journalists, research stated, "Blood concentrations of triglycerides are influenced by genetic factors as well as a number of environmental factors, including adiposity and glucose homeostasis. The aim was to investigate the association between a serum triglyceride weighted genetic risk score (wGRS) and changes in fasting serum triglyceride level over 5 years and to test whether the effect of the wGRS was modified by 5 year changes of adiposity, insulin resistance, and lifestyle factors."

Financial supporters for this research include Novo Nordisk Foundation, Danish Council for Independent Research, Medical Sciences.

The news correspondents obtained a quote from the research from the University of Copenhagen, "A total of 3,474 nondiabetic individuals from the Danish Inter99 cohort participated in both the baseline and 5 year follow-up physical examinations and had
information on the wGRS comprising 39 genetic variants. In a linear regression model adjusted for age, sex, and baseline serum triglyceride, the wGRS was associated with increased serum triglyceride levels over 5 years [per allele effect = 1.3% (1.0-1.6%); P = 1.0 x 10(-17)]. This triglyceride-increasing effect of the wGRS interacted with changes in insulin resistance (P-interaction = 1.5 x 10(-6)). This interaction indicated that the effect of the wGRS was stronger in individuals who became more insulin resistant over 5 years."

According to the news reporters, the research concluded: "Our findings suggest that increased genetic risk load is associated with a larger increase in fasting serum triglyceride levels in nondiabetic individuals during 5 years of follow-up. This effect of the wGRS is accentuated by increasing insulin resistance."

Our news journalists report that additional information may be obtained by contacting E.A. Andersson, University of Copenhagen, Novo Nordisk Fdn Center Basic Metab Res, Sect Metab Genet, Fac Hlth & Med Sci, Copenhagen, Denmark. Additional authors for this research include E.A. Andersson, K.H. Allin, C.H. Sandholt, T. Jorgensen, A. Linneberg, M.E. Jorgensen, T. Hansen, O. Pedersen and N. Grarup.

Gram-Negative Bacteria - Pseudomonas fluorescens

Findings from University of Copenhagen Update Knowledge of Pseudomonas fluorescens (Lipopeptide biosurfactant viscosin enhances dispersal of Pseudomonas fluorescens SBW25 biofilms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Pseudomonas fluorescens are discussed in a new report. According to news reporting out of Copenhagen, Denmark, by NewsRx editors, research stated, "Pseudomonads produce several lipopeptide biosurfactants that have antimicrobial properties but that also facilitate surface motility and influence biofilm formation. Detailed studies addressing the significance of lipopeptides for biofilm formation and architecture are rare."

Our news journalists obtained a quote from the research from the University of Copenhagen, "Hence, the present study sets out to determine the specific role of the lipopeptide
viscosin in Pseudomonas fluorescens SBW25 biofilm formation, architecture and dispersal, and to relate viscA gene expression to viscosin production and effect. Initially, we compared biofilm formation of SBW25 and the viscosin-deficient mutant strain SBW25 Delta viscA in static microtitre assays. These experiments demonstrated that viscosin had little influence on the amount of biofilm formed by SBW25 during the early stages of biofilm development. Later, however, SBW25 formed significantly less biofilm than SBW25DviscA. The indication that viscosin is involved in biofilm dispersal was confirmed by chemical complementation of the mutant biofilm. Furthermore, a fluorescent bioreporter showed that viscA expression was induced in biofilms 4 h prior to dispersal. Subsequent detailed studies of biofilms formed in flow cells for up to 5 days revealed that SBW25 and SBW25DviscA developed comparable biofilms dominated by well-defined, mushroom-shaped structures. Carbon starvation was required to obtain biofilm dispersal in this system. Dispersal of SBW25 biofilms was significantly greater than of SBW25DviscA biofilms after 3 h and, importantly, carbon starvation strongly induced viscA expression, in particular for cells that were apparently leaving the biofilm.

According to the news editors, the research concluded: "Thus, the present study points to a role for viscosin-facilitated motility in dispersal of SBW25 biofilms."

Our news journalists report that additional information may be obtained by contacting L. Bonnichsen, University of Copenhagen, Dept. of Plant & Environm Sci, Fac Sci, Sect Microbial Ecol & Biotechnol, Copenhagen, Denmark. Additional authors for this research include N.B. Svenningsen, M. Rybtke, I. de Bruijn, J.M. Raaijmakers, T. Tolker-Nielsen and O. Nybroe.

### Nutritional and Metabolic Diseases and Conditions - ...

#### Findings from University of Copenhagen in Type 2 Diabetes Reported

(Metformin-associated risk of acute dialysis in patients with type 2 diabetes: A nationwide cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news originating from Herlev, Denmark, by NewsRx correspondents, research stated, "Recent guidelines governing anti-diabetic medications increasingly advocate metformin as first-line therapy in all patients with
type 2 diabetes. However, metformin could be associated with increased risk of acute kidney injury (AKI), acute dialysis and lactate acidosis in marginal patients."

Our news journalists obtained a quote from the research from the University of Copenhagen, "In a retrospective nationwide cohort study, a total of 168 443 drug-naive patients with type 2 diabetes 50 years, initiating treatment with either metformin or sulphonyl in Denmark between 2000 and 2012 were included in this study (70.7% initiated treatment with metformin); calculation of 1-year risk of acute dialysis was based on g-standardization of cause-specific Cox regression models for acute dialysis, end-stage renal disease and death. One-year risks of acute dialysis were 92.4 per 100 000 (95% CI, 67.1-121.3) and 142.7 per 100 000 (95% CI, 118.3-168.0) for sulphonylurea and metformin, respectively."

According to the news editors, the research concluded: "The metformin-associated 1-year risk of acute dialysis was increased by 50.3 per 100 000 (95% CI, 7.9-88.6), corresponding to a risk ratio of 1.53 (95% CI, 1.06-2.23), and a number needed to harm of 1988, thus providing evidence of potential concerns pertaining to the increasing use of metformin."

The news correspondents report that additional information may be obtained from N. Carlson, University of Copenhagen, Herlev Hosp, Dept. of Nephrol, Herlev, Denmark. Additional authors for this research include K. Hommel, J.B. Olesen, T.A. Gerds, A.M. Soja, T. Vilsboll, A.L. Kamper, C. Torp-Pedersen and G. Gislason.

Cardiovascular Diseases and Conditions -...

Findings from University of Copenhagen in the Area of Hypertension Reported (Causes of Death Data in the Global Burden of Disease Estimates for Ischemic and Hemorrhagic Stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "Stroke mortality estimates in the Global Burden of Disease (GBD) study are based on routine mortality statistics and redistribution of ill-defined codes that cannot be a cause of death, the so-called 'garbage codes' (GCs). This study describes the contribution of these codes to stroke mortality estimates."

Our news journalists obtained a quote from the research from the University of Copenhagen, "All available mortality data were compiled and non-specific cause codes were redistributed based on literature review and statistical methods. Ill-defined codes were redistributed to their specific cause of disease by age, sex, country and year. The reassignment was done based on the International Classification of Diseases and the pathology behind each
code by checking multiple causes of death and literature review. Unspecified stroke and primary and secondary hypertension are leading contributing 'GCs' to stroke mortality estimates for hemorrhagic stroke (HS) and ischemic stroke (IS). There were marked differences in the fraction of death assigned to IS and HS for unspecified stroke and hypertension between GBD regions and between age groups. A large proportion of stroke fatalities are derived from the redistribution of 'unspecified stroke' and 'hypertension' with marked regional differences."

According to the news editors, the research concluded: "Future advancements in stroke certification, data collections and statistical analyses may improve the estimation of the global stroke burden."

The news correspondents report that additional information may be obtained from T. Truelsen, Dept. of Neurology, University of Copenhagen Rigshospitalet, Copenhagen, Denmark. Additional authors for this research include L.H. Krarup, H.K. Iversen, G.A. Mensah, V.L. Feigin, L.A. Sposato and M. Naghavi.

Cardiovascular Diseases and Conditions - Thrombosis

Findings from University of Cordoba in the Area of Thrombosis Reported (Partial thrombosis of the corpus cavernosum: should we dig deeper into coagulopathy disorders?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Thrombosis. According to news reporting originating from Cordoba, Spain, by NewsRx correspondents, research stated, "Partial thrombosis of the corpus cavernosum, also known as partial priapism is a rare condition. The condition is known to be unilateral, and its aetiology is not well known."

Our news editors obtained a quote from the research from the University of Cordoba, "Usually, symptoms are pain and perineal mass and Magnetic Resonance is needed to confirm the diagnosis. In most cases the treatment is conservative with anticoagulation therapy."

According to the news editors, the research concluded: "We present a case of partial thrombosis of the corpus cavernosum with a Factor V Leyden mutation."

For more information on this research see: Partial thrombosis of the corpus cavernosum: should we dig deeper into coagulopathy disorders? Andrologia, 2016;48 (10):1313-1316. Andrologia can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com/; Andrologia -
Heart Disorders and Diseases - Atrial Fibrillation

Findings from University of Eastern Finland Has Provided New Data on Atrial Fibrillation (Reduced kidney function is a risk factor for atrial fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting originating in Kuopio, Finland, by NewsRx journalists, research stated, "There is limited knowledge on the relationship between kidney function and incidence of atrial fibrillation. Thus, this prospective study was designed to evaluate whether various biomarkers of kidney function are associated to the risk of atrial fibrillation."

The news reporters obtained a quote from the research from the University of Eastern Finland, "The study population consisted of 1840 subjects (615 women and 1225 men) aged 61-82 years. Cystatin C-and creatinine-based estimation of glomerular filtration rate (eGFRcys and eGRFcreat, respectively) and urinary albumin/creatinine ratio (ACR) were assessed to investigate their relationship with the risk of atrial fibrillation. During a median follow-up of 3.7 years, a total of 159 incident atrial fibrillation cases occurred. After adjustment for potential confounders, the risk of atrial fibrillation was increased (hazard ratio 2.74, 95% confidence interval (CI) 1.56-4.81, P>0.001) in subjects with reduced kidney function (eGFRcys, 15-59 mL/min per 1.73 m(2)) compared to subjects with normal kidney function (>= 90 mL/min per 1.73 m(2)). Similar results were also found when comparing the respective groups of subjects defined by their eGRFcreat levels (hazard ratio 2.41, CI 1.09-5.30, P=0.029). Consistently, subjects with ACR >= 300 mg/g had an increased risk of incident atrial fibrillation (hazard ratio 2.16, CI 1.35-2.82, P>0.001) compared to those with ACR >30 mg/g."

According to the news reporters, the research concluded: "Reduced eGFR and albuminuria were associated with an increased risk of atrial fibrillation."

Our news correspondents report that additional information may be obtained by
contacting J.A. Laukkanen, Univ Eastern Finland, Dept. of Med, Inst Public Hlth & Clin Nutr, Kuopio, Finland. Additional authors for this research include F. Zaccardi, J. Karppi, K. Ronkainen and S. Kurl. Keywords for this news article include: Kuopio, Finland, Europe, Heart Disorders and Diseases, Risk and Prevention, Atrial Fibrillation, Cardiac Arrhythmias, Heart Disease, University of Eastern Finland.

**Oncology - Glioblastomas**

**Findings from University of Edinburgh Provides New Data on Glioblastomas (A Zebrafish Live Imaging Model Reveals Differential Responses of Microglia Toward Glioblastoma Cells In Vivo)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Glioblastomas have been presented. According to news reporting out of Edinburgh, United Kingdom, by NewsRx editors, research stated, "Glioblastoma multiforme is the most common and deadliest form of brain cancer. Glioblastomas are infiltrated by a high number of microglia, which promote tumor growth and surrounding tissue invasion."

Our news journalists obtained a quote from the research from the University of Edinburgh, "However, it is unclear how microglia and glioma cells physically interact and if there are differences, depending on glioma cell type. Hence, we have developed a novel live imaging assay to study microglia-glioma interactions in vivo in the zebrafish brain. We transplanted well-established human glioblastoma cell lines, U87 and U251, into transgenic zebrafish lines with labelled macrophages/microglia. Our confocal live imaging results show distinct interactions between microglia and U87, as well as U251 glioblastoma cells that differ in number and nature. Importantly these interactions do not appear to be antitumoral as zebrafish microglia do not engulf and phagocytose the human glioblastoma cells. Finally, xenotransplants into the irf8(-/-) zebrafish mutant that lacks microglia, as well as pharmacological inhibition of the CSF-1 receptor (CSF-1R) on microglia, confirm a prominent role for zebrafish microglia in promoting human glioblastoma cell growth."

According to the news editors, the research concluded: "This new model will be an important tool for drug screening and the development of future immunotherapeutics targeting microglia within glioma."

For more information on this research see: A Zebrafish Live Imaging Model Reveals Differential Responses of Microglia Toward Glioblastoma Cells In Vivo. *Zebrafish*. 2016;13 (6):523-534. *Zebrafish* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. **Cardiovascular Diseases and Conditions**

**Findings from University of Florida Broaden Understanding of Hypertension (Interaction of Alu Polymorphisms and Novel Measures of Discrimination in Association with Blood Pressure in African Americans Living in Tallahassee, Florida)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Hypertension. According to news reporting from Gainesville, Florida, by NewsRx journalists, research stated, "African Americans are 40% more likely to be afflicted with hypertension than are non-Hispanic, white Americans, resulting in a 30% higher instance of mortality due to cardiovascular disease. There is debate about the relative contributions of genetic and sociocultural risk factors to the racial disparity in hypertension."

The news correspondents obtained a quote from the research from the University of Florida, "We assayed three Alu insertion polymorphisms located in the ACE (angiotensin I converting enzyme), PLAT (plasminogen activator, tissue), and WNK1 (lysine deficient protein kinase 1) genes. We also estimated West African genetic ancestry and developed novel measures of perceived discrimination to create a biocultural model of blood pressure among African American adults in Tallahassee, Florida (n = 158). When tested separately, the ACE Alu noninsertion allele was significantly associated with higher systolic and diastolic blood pressure. In multiple regression analyses, West African genetic ancestry was not associated with blood pressure and reduced the strength of all blood pressure models tested. A gene x environment interaction was identified between the ACE Alu genotype and a new measure of unfair treatment that includes experiences by individuals close to the study participant. Inclusion of the WNK1 Alu genotype further improved this model of blood pressure variation. Our results suggest an association of the ACE and WNK1 genotypes with blood pressure that is consistent with their proposed gene functions. Measures of perceived unfair treatment of others show a threshold effect, with increased blood pressure occurring at higher values."

According to the news reporters, the research concluded: "The interaction between the ACE genotype and unfair treatment highlights the benefits of including both genetic and cultural data to investigate complex disease."

Our news journalists report that additional information may be obtained by contacting C.J. Mulligan, University of Florida, Gainesville, FL 32610, United States. Additional authors for this research include J. Quinlan, A.T. Miro-Herrans, L.N. Pearson, N.L. Todd, C.C. Gravlee and C.J. Mulligan.
Findings from University of Florida Provides New Data about Cytokines
(Sexual dimorphic function of IL-17 in salivary gland dysfunction of the C57BL/6.NOD-Aec1Aec2 model of Sjoren's syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cytokines is now available. According to news reporting originating from Gainesville, Florida, by NewsRx correspondents, research stated, "Interleukin (IL)-17 is one of the critical inflammatory cytokines that plays a direct role in development of Sjogren's syndrome (SjS), a systemic autoimmune disease characterized by a progressive chronic attack against the exocrine glands. The expression levels of IL-17 are correlated with a number of essential clinical parameters such as focus score and disease duration in human patients."

Our news editors obtained a quote from the research from the University of Florida, "Significantly immunological differences of Th17 cells were detected at the onset of clinical disease in female SjS mice compared to males. To further define the role of IL-17 in SjS and elucidate its involvement in the sexual dimorphism, we examined the systemic effect of IL-17 by genetically ablating IL-17 in the C57BL/6. NOD-Aec1Aec2, spontaneous SjS murine model. The results indicate that IL-17 is a potent inflammatory molecule in the induction of chemoattractants, cytokines, and glandular apoptosis in males and females. Elimination of IL-17 reduced sialadenitis more drastically in females than males. IL-17 is highly involved in modulating Th2 cytokines and altering autoantibody profiles which has a greater impact on changing plasma cells and germinal center B cell populations in females than males."

According to the news editors, the research concluded: "The result supports a much more important role for IL-17 and demonstrates the sexual dimorphic function of IL-17 in SjS."

For more information on this research see: Scientific Reports, 2016;6():1-14. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Nutritional and Metabolic Diseases and Conditions —

Findings from University of Florida Provides New Data about Obesity (Accuracy of Weight Loss Information in Spanish Search Engine Results on the Internet)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news originating from Gainesville, Florida, by NewsRx correspondents, research stated, "To systematically assess the quality of online information related to weight loss that Spanish speakers in the U.S. are likely to access. This study evaluated the accessibility and quality of information for websites that were identified from weight loss queries in Spanish and compared this with previously published results in English."

Our news journalists obtained a quote from the research from the University of Florida, "The content was scored with respect to five dimensions: nutrition, physical activity, behavior, pharmacotherapy, and surgical recommendations. Sixty-six websites met eligibility criteria (21 commercial, 24 news/media, 10 blogs, 0 medical/government/university, 11 unclassified sites). Of 16 possible points, mean content quality score was 3.4 (SD=2.0). Approximately 1.5% of sites scored greater than 8 (out of 12) on nutrition, physical activity, and behavior. Unsubstantiated claims were made on 94% of the websites. Content quality scores varied significantly by type of website (P <0.0001) with unclassified websites scoring the highest (mean=6.3, SD=1.4) and blogs scoring the lowest (mean=2.2, SD=1.2). All content quality scores were lower for Spanish websites relative to English websites. Weight loss information accessed in Spanish Web searches is suboptimal and relatively worse than weight loss information accessed in English, suggesting that U.S."

According to the news editors, the research concluded: "Spanish speakers accessing weight loss information online may be provided with incomplete and inaccurate information."

The news correspondents report that additional information may be obtained from M.I. Cardel, University of Florida, Coll Med, Dept. of Hlth Outcomes & Policy, Gainesville, FL 32610, United States. Additional authors for this research include S. Chavez, J. Bian, E. Penaranda, D.R. Miller, T. Huo and F. Modave.

Biotechnology - Cellular and Molecular Medicine

Findings from University of Fudan in the Area of Cellular and Molecular Medicine Described (Gene mutation-based and specific therapies in precision medicine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biotechnology - Cellular and Molecular Medicine have been presented. According to news reporting from Shanghai, People's Republic of China, by NewsRx editors, the research stated, "Precision medicine has been initiated and gains more and more attention from preclinical and clinical scientists. A number of key elements or critical parts in precision medicine have been described and emphasized to establish a systems understanding of precision medicine."

The news correspondents obtained a quote from the research from the University of Fudan, "The principle of precision medicine is to treat patients on the basis of genetic alterations after gene mutations are identified, although questions and challenges still remain before clinical application. Therapeutic strategies of precision medicine should be considered according to gene mutation, after biological and functional mechanisms of mutated gene expression or epigenetics, or the correspondent protein, are clearly validated. It is time to explore and develop a strategy to target and correct mutated genes by direct elimination, restoration, correction or repair of mutated sequences/genes. Nevertheless, there are still numerous challenges to integrating widespread genomic testing into individual cancer therapies and into decision making for one or another treatment. There are wide-ranging and complex issues to be solved before precision medicine becomes clinical reality."

According to the news reporters, the research concluded: "Thus, the precision medicine can be considered as an extension and part of clinical and translational medicine, a new alternative of clinical therapies and strategies, and have an important impact on disease cures and patient prognoses."

Our news journalists report that additional information may be obtained by contacting X. Wang, Zhongshan Hospital Biomedical Research Center, Fudan University Medical School, Fudan University Center for Clinical Bioinformatics, Shanghai Institute of Clinical Bioinformatics, Shanghai, People's Republic of China.

Pharmacogenetics

Findings from University of Geneva in the Area of Pharmacogenetics Described (Pharmacogenetic comparison of CYP2D6 predictive and measured phenotypes in a South African cohort)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacogenetics. According to news originating from Geneva, Switzerland, by NewsRx correspondents, research stated, "The relationship between genetic variation in CYP2D6 and variable drug response represents a potentially powerful pharmacogenetic tool. However, little is known regarding this relationship in the genetically diverse South African population."

Our news journalists obtained a quote from the research from the University of Geneva, "The aim was therefore to evaluate the relationship between predicted and measured CYP2D6 phenotype. An XL-PCR+ Sequencing approach was used to determine CYP2D6 genotype in 100 healthy volunteers and phenotype was predicted using activity scores. With dextromethorphan as the probe drug, metabolic ratios served as a surrogate measure of in vivo CYP2D6 activity. Three-hour plasma metabolic ratios of dextrorphan/dextromethorphan were measured simultaneously using semi-automated online solid phase extraction coupled with tandem mass spectrometry. Partial adaptation of the activity score system demonstrated a strong association between genotype and phenotype, as illustrated by a kappa value of 0.792, inter-rater discrepancy of 0.051 and sensitivity of 72.7%. Predicted phenotype frequencies using the modified activity score were 1.3% for poor metabolisers (PM), 7.6% for intermediate metabolisers (IM) and 87.3% for extensive metabolisers (EM). Measured phenotype frequencies were 1.3% for PM, 13.9% for IM and 84.8% for EM."

According to the news editors, the research concluded: "Comprehensive CYP2D6 genotyping reliably predicts CYP2D6 activity in this South African cohort and can be utilised as a valuable pharmacogenetic tool."

For more information on this research see: Pharmacogenetic comparison of CYP2D6 predictive and measured phenotypes in a South African cohort. Pharmacogenomics Journal, 2016;16(6):566-572. Heart Disorders and Diseases - Heart Failure

Findings from University of Genoa Provides New Data about Heart Failure (Update on cardiotoxicity of anti-cancer treatments)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting out of Genoa, Italy, by NewsRx editors, research stated, "Anti-cancer treatments markedly improved the prognosis of patients, but unfortunately might be hampered by cardiotoxicity. Both symptomatic and asymptomatic clinical forms of heart failure have been reported, which may be reversible or irreversible."

Financial support for this research came from Schweizerischer Nationalfonds zur Forderung der Wissenschaftlichen Forschung.

Our news journalists obtained a quote from the research from the University of Genoa, "The aim of this review is to provide an overview of the antineoplastic agents associated with cardiac toxicity and of the available diagnostic techniques. This narrative review is based on material from MEDLINE and PUBMED up to November 2015. We looked at the terms antineoplastic drugs and cardiac toxicity in combination with echocardiography, troponins, cardiac magnetic resonance, and positron emission tomography. Anthracyclines, monoclonal antibodies, fluoropyrimidines, taxanes, alkylating agents, vinka alkaloids were reported to induce different clinical manifestations of cardiotoxicity. Chest radiotherapy is also associated with various forms of cardiac damage, which are indistinguishable from those found in patients with heart disease of other aetiologies and that may even appear several years after administration. Among diagnostic techniques, echocardiography is a noninvasive, cost-effective, and widely available imaging tool. Nuclear imaging and cardiac magnetic resonance may be used but are not so widely available and are more difficult to perform. Finally, some biomarkers, such as troponins, may be used to evaluate cardiac damage, but establishing the optimal timing of troponin assessment remains unclear and defining the cut-off point for positivity is still an important goal. Cardiotoxicity of anti-cancer treatments is associated with development of heart failure."

According to the news editors, the research concluded: "Novel diagnostic tools might be relevant to early recognize irreversible forms cardiac diseases."

Our news journalists report that additional information may be obtained by contacting G.M. Rosa, Division of Cardiology, Dept. of Internal Medicine, University of Genoa - IRCCS Azienda Ospedaliera Universitaria San Martino - IST Istituto Nazionale per la Ricerca sul Cancro, Genoa, Italy. Additional authors for this research include L. Gigli, M.I. Tagliasacchi, C. Di Iorio, F. Carbone, A. Nencioni, F. Montecucco and C. Brunelli.

Oncology - Prostate Cancer

Findings from University of Glasgow Provide New Insights into Prostate Cancer (Loss of Signal Transducer and Activator of Transcription 1 is Associated With Prostate Cancer Recurrence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Prostate Cancer is the subject of a report. According to news reporting from Glasgow, United Kingdom, by NewsRx journalists, research stated, "STAT1 loss has previously been implicated in cell line studies to modify prostate cancer cell growth and survival, however the clinical significance of this has not previously been established. This study investigated if STAT1 loss was associated with patient outcome measures and the phenotypic consequence of STAT1 silencing."

The news correspondents obtained a quote from the research from the University of Glasgow, "STAT1 expression was assessed in two patient cohorts with localised (n = 78) and advanced prostate cancer at initial diagnosis (n = 39) by immunohistochemistry (IHC). Impact of STAT1 silencing on prostate cancer cells lines was assessed using Cell Death detection ELISA, TLDA gene signature apoptosis arrays, WST-1 assay, xCELLigence system, clonogenic assay, and wound healing assay. In the localised patient cohort, low expression of STAT1 was associated with shorter time to disease recurrence (3.8 vs 7.3 years, P = 0.02) and disease specific survival (6.6 vs 9.3 years, P = 0.05). In the advanced patient cohort, low expression was associated with shorter time to disease recurrence (2.0 vs 3.9 years, P = 0.001). When STAT1 was silenced in PC3 cells (AR negative) and LNCaP cells (AR positive) silencing did not influence levels of apoptosis in either cell line and had little effect on cell viability in the LNCaP cells. In contrast, STAT1 silencing in the PC3 cells resulted in a pronounced increase in cell viability (WST-1 assay: mock silenced vs STAT1 silenced, P< 0.001), clonogenicity (clonogenic assay: mock silenced vs STAT1 silenced, P< 0.001), and migration (wound healing: mock silenced vs STAT1 silenced, P< 0.001)."

According to the news reporters, the research concluded: "Loss of STAT1 may promote prostate cancer recurrence in AR negative patients via increasing cell viability."

Mononuclear Leukocytes

Findings from University of Glasgow Provides New Data on Mononuclear Leukocytes (Use of neutrophil to lymphocyte ratio for predicting histopathological grade of canine mast cell tumours)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mononuclear Leukocytes. According to news reporting originating in Glasgow, United Kingdom, by NewsRx journalists, research stated, "Canine mast cell tumours (MCTs) are variable in their biological behaviour and treatment decisions depend heavily on the histopathological grade. Biomarkers such as neutrophil to lymphocyte ratio (NLR) and albumin to globulin ratio are used to predict the biological behaviour of human neoplasms, but have not been widely studied in dogs."

The news reporters obtained a quote from the research from the University of Glasgow, "A retrospective analysis identified 62 cases of gross MCT (14 high-grade, 48 low-grade tumours). Median NLR was significantly different between high-and low-grade MCT and tumours at different locations. A multivariable model identified increasing NLR (OR 2.0) and age (OR 1.7) to be associated with an increased risk of high-grade MCT. Receiver operating characteristic curve analysis identified an NLR threshold value of 5.67 (sensitivity 85.7 per cent; specificity 54.2 per cent) for predicting a high-grade MCT. An NLR threshold of 5.67 could be useful alongside existing tools (appearance, location, etc.) to help to predict the grade of MCT."

According to the news reporters, the research concluded: "With further validation, this biomarker could be used to guide clinical decisions before obtaining a histopathological diagnosis."

For more information on this research see: Use of neutrophil to lymphocyte ratio for predicting histopathological grade of canine mast cell tumours. Veterinary Record, 2016;179 (19):491,49-53. Lung Diseases and Conditions - Chronic Obstructive...

Findings from University of Groningen Provide New Insights into Chronic Obstructive Pulmonary Disease (Susceptibility for cigarette smoke-induced DAMP release and DAMP-induced inflammation in COPD)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease is the subject of a report. According to news reporting originating in Groningen, Netherlands, by NewsRx journalists, research stated, "Cigarette smoke (CS) exposure is a major risk factor for chronic obstructive pulmonary disease (COPD). We investigated whether CS-induced damage-associated molecular pattern (DAMP) release or DAMP-mediated inflammation contributes to susceptibility for COPD."

Financial supporters for this research include Netherlands Lung Foundation, Top Institute Pharma (TI Pharma), Stichting Astma Bestrijding.

The news reporters obtained a quote from the research from the University of Groningen, "Samples, including bronchial brushings, were collected from young and old individuals, susceptible and nonsusceptible for the development of COPD, before and after smoking, and used for gene profiling and airway epithelial cell (AEC) culture. AECs were exposed to CS extract (CSE) or specific DAMPs. BALB/cByJ and DBA/2J mice were intranasally exposed to LL-37 and mitochondrial (mt) DAMPs. Functional gene-set enrichment analysis showed that CS significantly increases the airway epithelial gene expression of DAMPs and DAMP receptors in COPD patients. In cultured AECs, we observed that CSE induces necrosis and DAMP release, with specifically higher galectin-3 release from COPD-derived compared with control-derived cells. Galectin-3, LL-37, and mtDAMPs increased CXCL8 secretion in AECs. LL-37 and mtDAMPs induced neutrophilic airway inflammation, exclusively in mice susceptible for CS-induced airway inflammation. Collectively, we show that in airway epithelium from COPD patients, the CS-induced expression of DAMPs and DAMP receptors in vivo and the release of galectin-3 in vitro is exaggerated."

According to the news reporters, the research concluded: "Furthermore, our studies indicate that a predisposition to release DAMPs and subsequent induction of inflammation may contribute to the development of COPD."

Our news correspondents report that additional information may be obtained by contacting S.D. Pouwels, University of Groningen, Groningen University Medical Center, GRIAC Res Inst, Groningen, Netherlands. Additional authors for this research include L. Hesse, A. Faiz, J. Lubbers, P.K. Bodha, N.H.T. ten Hacken, A.J.M. van Oosterhout, M.C. Nawijn and I.H. Heijink.

Angiology

Findings from University of Groningen Reveals New Findings on Angiology (Advanced glycation end products: An emerging biomarker for adverse outcome in patients with peripheral artery disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Angiology are presented in a new report. According to news reporting originating in Groningen, Netherlands, by NewsRx journalists, research stated, "Patients with peripheral artery disease (PAD) suffer from widespread atherosclerosis. Partly due to the growing awareness of cardiovascular disease, the incidence of PAD has increased considerably during the past decade."

The news reporters obtained a quote from the research from the University of Groningen, "It is anticipated that algorithms to identify high risk patients for cardiovascular events require being updated, making use of novel biomarkers. Advanced glycation end products (AGEs) are moieties formed non-enzymatically on long-lived proteins under influence of glycemic and oxidative stress reactions. We elaborate about the formation and effects of AGEs, and the methods to measure AGEs. Several studies have been performed with AGEs in PAD."

According to the news reporters, the research concluded: "In this review, we evaluate the emerging evidence of AGEs as a clinical biomarker for patients with PAD."

For more information on this research see: Advanced glycation end products: An emerging biomarker for adverse outcome in patients with peripheral artery disease. Atherosclerosis, 2016;254():291-299. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Heart Disorders and Diseases - Right Ventricular...

Findings from University of Groningen in the Area of Right Ventricular Dysfunction Reported (Right ventricular dysfunction in heart failure with preserved ejection fraction: a systematic review and meta-analysis)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Right Ventricular Dysfunction are discussed in a new report. According to news reporting from Groningen, Netherlands, by NewsRx journalists, research stated, "Right ventricular (RV) dysfunction and pulmonary hypertension (PH) are increasingly recognized in heart failure with preserved ejection fraction (HFpEF). The prevalence and prognostic value of RV dysfunction in HFpEF have been widely but variably reported."

The news correspondents obtained a quote from the research from the University of Groningen, "We therefore conducted a systematic review and meta-analysis according to Preferred Reporting Items for Systematic Reviews and Meta-Analyses. English literature until May 2016 was evaluated for prevalence of RV dysfunction [i.e. tricuspid annular plane systolic excursion (TAPSE) < 16 mm, fractional area change (FAC) < 35%, or tricuspid annular systolic velocity (RV S') < 9.5 cm/s] and PH [i.e. mean pulmonary artery pressure (MPAP) >= 25 mmHg or pulmonary artery systolic pressure (PASP) = 35 mmHg]. Combined hazard ratios (HRs) for outcomes were calculated. A total of 38 studies was included. In studies with stringent HFpEF criteria, prevalence of RV dysfunction was 28% for TAPSE, 18% for FAC, and 21% for RV S'. Prevalence of PH was 68% for both increased MPAP and PASP. TAPSE (HR 1.26/5mm decrease; P< 0.0001), FAC (HR 1.15/5% decrease; P< 0.0001), MPAP (HR 1.26/5 mmHg increase; P< 0.0001), and PASP (1.16/5 mmHg increase; P< 0.0001) were all univariably associated with mortality. HRs for RV S' were not reported."

According to the news reporters, the research concluded: "RV dysfunction and PH are highly prevalent and are both associated with poor outcome in patients with HFpEF."

Our news journalists report that additional information may be obtained by contacting T.M. Gorter, University of Groningen, Groningen University Medical Center, Dept. of Cardiol, NL-9700 RB Groningen, Netherlands. Additional authors for this research include E.S. Hoendermis, D.J. van Veldhuisen, A.A. Voors, C.S.P. Lam, B. Geelhoed, T.P. Willems and J.P. van Melle.

Keywords for this news article include: Groningen, Netherlands, Europe, Cardiovascular Diseases and Conditions, Right Ventricular Dysfunction, Heart Disorders and Diseases, Angiology, Article Review, Pulmonary Artery, Heart Disease, Heart Failure, Cardiology, University of Groningen.

**Oncology - Prostate Cancer**

**Findings from University of Helsinki Central Hospital Broaden Understanding of Prostate Cancer (Estimating bias in causes of death ascertainment in the Finnish Randomized Study of Screening for Prostate Cancer)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Prostate Cancer is the subject of a report. According to news reporting from Helsinki, Finland, by NewsRx journalists, research stated, "Precise cause of death (CoD) ascertainment is crucial in any cancer screening trial to avoid bias from misclassification due to excessive recording of diagnosed cancer as a CoD in death certificates instead of non-cancer disease that actually caused death. We estimated whether there was bias in CoD determination between screening (SA) and control arms (CA) in a population-based prostate cancer (PCa) screening trial."

The news correspondents obtained a quote from the research from the University of Helsinki Central Hospital, "Our trial is the largest component of the European Randomized Study of Screening for Prostate Cancer with more than 80,000 men. Randomly selected deaths in men with PCa (N = 442/2568 cases, 17.2%) were reviewed by an independent CoD committee. Median follow-up was 16.8 years in both arms. Overdiagnosis of PCa was present in the SA as the risk factor for PCa incidence was 1.19 (95% confidence interval (CI) 1.14-1.24). The hazard ratio (HR) for PCa mortality was 0.94 (95% CI 0.82-1.08) in favor of the SA. Agreement with official CoD registry was 94.6% (k = 0.88) in the SA and 95.4% (k = 0.91) in the CA. Altogether 14 PCa deaths were estimated as false-positive in both arms and exclusion of these resulted in HR 0.92 (95% CI 0.80-1.06). A small differential misclassification bias in ascertainment of CoD was present, most likely due to attribution bias (overdiagnosis in the SA). Maximum precision in CoD ascertainment can only be achieved with independent review of all deaths in the diseased population."

According to the news reporters, the research concluded: "However, this is cumbersome and expensive and may provide little benefit compared to random sampling."

For more information on this research see: Estimating bias in causes of death ascertainment in the Finnish Randomized Study of Screening for Prostate Cancer. Cancer Epidemiology, 2016;45();1-5. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Cancer Epidemiology - www.journals.elsevier.com/cancer-epidemiology/)

Our news journalists report that additional information may be obtained by contacting T.P. Kilpelainen, Helsinki Univ Hosp, FI-00029 Helsinki, Finland. Additional authors for this research include T. Makinen, P.J. Karhunen, J. Aro, J. Lahtela, K. Taari, K. Talala, T.L.J. Tammela and A. Auvinen.

Coagulation

**Findings from University of Helsinki Central Hospital in Coagulation Reported (Platelet Function Tests in Bleeding Disorders)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Coagulation. According to news
reporting out of Helsinki, Finland, by NewsRx editors, the research stated, "Functional disorders of platelets can involve any aspect of platelet physiology, with many different effects or outcomes. These include platelet numbers (thrombocytosis or thrombocytopenia); changes in platelet production or destruction, or capture to the liver (Ashwell receptor); altered adhesion to vascular injury sites and/or influence on hemostasis and wound healing; and altered activation or receptor functions, shape change, spreading and release reactions, procoagulant and antifibrinolytic activity."

Our news journalists obtained a quote from the research from the University of Helsinki Central Hospital, "Procoagulant membrane alterations, and generation of thrombin and fibrin, also affect platelet aggregation. The above parameters can all be studied, but standardization and quality control of assay methods have been limited despite several efforts. Only after a comprehensive clinical bleeding assessment, including family history, information on drug use affecting platelets, and exclusion of coagulation factor, and tissue deficits, should platelet function testing be undertaken to confirm an abnormality. Current diagnostic tools include blood cell counts, platelet characteristics according to the cell counter parameters, peripheral blood smear, exclusion of pseudothrombocytopenia, whole blood aggregometry (WBA) or light transmission aggregometry (LTA) in platelet-rich plasma, luminescence, platelet function analysis (PFA-100) for platelet adhesion and deposition to collagen cartridges under blood flow, and finally transmission electron microscopy to exclude rare structural defects leading to functional deficits. The most validated test panels are included in WBA, LTA, and PFA. Because platelets are isolated from their natural environment, many simplifications occur, as circulating blood and interaction with vascular wall are omitted in these assays. The target to reach a highly specific platelet disorder diagnosis in routine clinical management can be exhaustive, unless needed for genetic counseling."

According to the news editors, the research concluded: "The elective overall assessment of platelet function disorder primarily aims at better management of hemostasis in case of emergency surgery or other interventions and acute bleeding events."

For more information on this research see: Platelet Function Tests in Bleeding Disorders. Seminars In Thrombosis and Hemostasis, 2016;42(3):185-90. (Thieme - www.thieme.com)

Diet and Nutrition - Nutritional Biochemistry

Findings from University of Helsinki in the Area of Nutritional Biochemistry Reported (Western diet enhances intestinal tumorigenesis in Min/ plus mice, associating with mucosal metabolic and inflammatory stress and loss of Apc heterozygosity)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Diet and Nutrition - Nutritional Biochemistry have been published. According to news reporting originating from Helsinki, Finland, by NewsRx correspondents, research stated, "Western-type diet (WD) is a risk factor for colorectal cancer, but the underlying mechanisms are poorly understood. We investigated the interaction of WD and heterozygous mutation in the Apc gene on adenoma formation and metabolic and immunological changes in the histologically normal intestinal mucosa of Apc(Min+)/+(Min/+) mice."

Our news editors obtained a quote from the research from the University of Helsinki, "The diet used was high in saturated fat and low in calcium, vitamin D, fiber and folate. The number of adenomas was twofold higher in the WD mice compared to controls, but adenoma size, proliferation or apoptosis did not differ. The ratio of the MM to wild-type allele was higher in the WD mice, indicating accelerated loss of Apc heterozygosity (LOH). Densities of intraepithelial CD3 epsilon(+) T lymphocytes and of mucosal FoxP3(+) regulatory T cells were higher in the WD mice, implying inflammatory changes. Western blot analyses from the mucosa of the WD mice showed suppressed activation of the ERK and AKT pathways and a tendency for reduced activation of the mTOR pathway as measured in phosphoS6/S6 levels. The expression of pyruvate dehydrogenase kinase 4 was up-regulated in both mRNA and protein levels. Gene expression analyses showed changes in oxidation/reduction, fatty acid and monosaccharide metabolic pathways, tissue organization, cell fate and regulation of apoptosis."

According to the news editors, the research concluded: "Together, our results suggest that the high-risk Western diet primes the intestine to tumorigenesis through synergistic effects in energy metabolism, inflammation and oxidative stress, which culminate in the acceleration of LOH of the Apc gene."

The news editors report that additional information may be obtained by contacting M. Mutanen, University of Helsinki, Div Nutr, Dept. of Food & Environm Sci, FI-00014 Helsinki, Finland. Additional authors for this research include A.M. Pajari, L. Sarantaus, E. Paivarinta, M. Storvik, A. Heiman-Lindh, S. Suokas, M. Nystrom and M. Mutanen.

Drugs and Therapies - Antibiotics

Findings from University of Houston in Antibiotics Reported (Comparative Pharmacokinetic Profiling of Different Polymyxin B Components)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a
new report. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Polymyxin B is increasingly used as a treatment of last resort for multidrug-resistant Gram-negative infections."

Our news editors obtained a quote from the research from the University of Houston, "Despite being available as a mixture of several structurally related analogues, the properties are commonly reported as an aggregate of the individual components. We compared the pharmacokinetics of individual polymyxin B components in an animal model and in humans."

According to the news editors, the research concluded: "There were no considerable differences observed in the pharmacokinetics among major components of polymyxin B. Combining different components for pharmacokinetic analysis appeared reasonable."

For more information on this research see: Comparative Pharmacokinetic Profiling of Different Polymyxin B Components. Antimicrobial Agents and Chemotherapy, 2016;60 (11):6980-6982. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news editors report that additional information may be obtained by contacting V.H. Tam, University of Houston, Coll Pharm, Dept. of Pharm Practice & Translat Res, Houston, TX 77030, United States. Additional authors for this research include Y. Dubrovskaya, S. Gao and V.H. Tam.

Cardiology

Findings from University of Illinois in Cardiology Reported (Cardiac MR Elastography of the Mouse: Initial Results)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiology have been presented. According to news reporting from Chicago, Illinois, by NewsRx journalists, research stated, "Many cardiovascular diseases are associated with abnormal function of myocardial contractility or dilatability, which is related to elasticity changes of the myocardium over the cardiac cycle. The mouse is a common animal model in studies of the progression of various cardiomyopathies."

The news correspondents obtained a quote from the research from the University of Illinois, "We introduce a novel noninvasive approach using microscopic scale MR elastography (MRE) to measure the myocardium stiffness change during the cardiac cycle on a mouse model. A harmonic mechanical wave of 400 Hz was introduced into the mouse body. An electrocardiograph-gated and respiratory-gated fractional encoding cine-MRE pulse sequence was applied to encode the resulting oscillatory motion on a short-axis slice of the heart. Five healthy mice (age range, 3-13.5 mo) were examined. The weighted summation effective
stiffness of the left ventricle wall during the cardiac cycle was estimated. The ratio of stiffness at end diastole and end systole was 0.5-0.67. Additionally, variation in shear wave amplitude in the left ventricle wall throughout the cardiac cycle was measured and found to correlate with estimates of stiffness variation."

According to the news reporters, the research concluded: "This study demonstrates the feasibility of implementing cardiac MRE on a mouse model."

Our news journalists report that additional information may be obtained by contacting T.J. Royston, University of Illinois, Dept. of Bioengn, Chicago, IL, United States. Additional authors for this research include T.J. Royston, D. Klatt and E.D. Lewandowski.

Gram-Negative Bacteria - Pseudomonas aeruginosa

Findings from University of Insubria Yields New Findings on Pseudomonas aeruginosa (Pigments influence the tolerance of Pseudomonas aeruginosa PAO1 to photodynamically induced oxidative stress)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Pseudomonas aeruginosa have been published. According to news reporting from Varese, Italy, by NewsRx journalists, research stated, "Pseudomonas aeruginosa is an opportunistic pathogen known to be resistant to different classes of antibiotics and disinfectants. P. aeruginosa also displays a certain degree of tolerance to photodynamic therapy (PDT), an alternative antimicrobial approach exploiting a photo-oxidative stress induced by exogenous photosensitizers and visible light. To evaluate whether P. aeruginosa pigments can contribute to its relative tolerance to PDT, we analysed the response to this treatment of isogenic transposon mutants of P. aeruginosa PAO1 with altered pigmentation."

The news correspondents obtained a quote from the research from the University of Insubria, "In general, in the presence of pigments a higher tolerance to PDT-induced photo-oxidative stress was observed. Hyperproduction of pyomelanin makes the cells much more tolerant to stress caused by either radicals or singlet oxygen generated by different photosensitizers upon photoactivation. Phenazines, pyocyanin and phenazine-1-carboxylic acid, produced in different amounts depending on the cultural conditions, are able to counteract both types of PDT-elicited reactive oxygen species."

According to the news reporters, the research concluded: "Hyperproduction of pyoverdine, caused by a mutation in a quorum-sensing gene, rendered P. aeruginosa more tolerant to a photosensitizer that generates mainly singlet oxygen, although in this case the observed tolerance to photooxidative stress cannot be exclusively attributed to the presence of
the pigment."

For more information on this research see: Pigments influence the tolerance of Pseudomonas aeruginosa PAO1 to photodynamically induced oxidative stress. *Microbiology-Sgm*, 2015;161(12):2298-2309. *Microbiology-Sgm* can be contacted at: Microbiology Soc, Charles Darwin House, 12 Roger St, London WC1N 2JU, Erks, England.

Our news journalists report that additional information may be obtained by contacting V.T. Orlandi, University of Insubria, Dept. of Theoret & Appl Sci, Varese, Italy. Additional authors for this research include F. Bolognese, L. Chiodaroli, T. Tolker-Nielsen and P. Barbieri.

**Keto Acids**

**Findings from University of Iowa Reveals New Findings on Keto Acids (Mitochondrial pyruvate carrier function and cancer metabolism)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Keto Acids. According to news reporting originating from Iowa City, Iowa, by NewsRx correspondents, research stated, "Metabolic reprogramming in cancer supports the increased biosynthesis required for unchecked proliferation. Increased glucose utilization is a defining feature of many cancers that is accompanied by altered pyruvate partitioning and mitochondrial metabolism."

Financial support for this research came from NIH.

Our news editors obtained a quote from the research from the University of Iowa, "Cancer cells also require mitochondrial tricarboxylic acid cycle activity and electron transport chain function for biosynthetic competency and proliferation. Recent evidence demonstrates that mitochondrial pyruvate carrier (MPC) function is abnormal in some cancers and that increasing MPC activity may decrease cancer proliferation. Here we examine recent findings on MPC function and cancer metabolism."

According to the news editors, the research concluded: "Special emphasis is placed on the compartmentalization of pyruvate metabolism and the alternative routes of metabolism that maintain the cellular biosynthetic pools required for unrestrained proliferation in cancer."

The news editors report that additional information may be obtained by contacting
Findings from University of Karachi Broaden Understanding of Olanzapine Therapy [MALDI-MS analysis and theoretical evaluation of olanzapine as a UV laser desorption ionization (LDI) matrix]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Olanzapine Therapy. According to news reporting out of Karachi, Pakistan, by NewsRx editors, research stated, "Matrix-assisted laser desorption/ionization mass spectrometry (MALDI-MS) being soft ionization technique, has become a method of choice for high-throughput analysis of proteins and peptides. In this study, we have explored the potential of atypical anti-psychotic drug olanzapine (012) as a matrix for MALDI-MS analysis of peptides aided with the theoretical studies."

Our news journalists obtained a quote from the research from the University of Karachi, "Seven small peptides were employed as target analytes to check performance of olanzapine and compared with conventional MALDI matrix alpha-cyano-4-hydroxycinnamic acid (HCCA). All peptides were successfully detected when olanzapine was used as a matrix. Moreover, peptides angiotensin I and angiotensin II were detected with better S/N ratio and resolution with this method as compared to their analysis by HCCA."

According to the news editors, the research concluded: "Computational studies were performed to determine the thermochemical properties of olanzapine in order to further evaluate its similarity to MALDI matrices which were found in good agreement with the data of existing MALDI matrices."

For more information on this research see: MALDI-MS analysis and theoretical evaluation of olanzapine as a UV laser desorption ionization (LDI) matrix. *Journal of Pharmaceutical and Biomedical Analysis*, 2017;132():190-194. *Journal of Pharmaceutical and Biomedical Analysis* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Findings from University of Karachi Yields New Data on Oral Cancer (Metabolite Profiling of Preneoplastic and Neoplastic Lesions of Oral Cavity Tissue Samples Revealed a Biomarker Pattern)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Oral Cancer are presented in a new report. According to news reporting from Karachi, Pakistan, by NewsRx journalists, research stated, "Oral cancer is a major health challenge in the Indian subcontinent and a dreadful form of cancers worldwide. The current study is focused on the identification of distinguished metabolites of oral cancer tissue samples in comparison with precancerous and control tissue samples using gas chromatography coupled with triple quadrupole tandem mass spectrometry and chemometric analyses."

The news correspondents obtained a quote from the research from the University of Karachi, "Metabolites obtained were identified through National Institute of Standards and Technology (NIST) mass spectral (Wiley registry) library. Mass Profiler Professional (MPP) software was used for the alignment and for all the statistical analysis. 31 compounds out of 735 found distinguishing among oral cancer, precancerous and control group samples using p-value <= 0.05. Partial Least Square Discriminant Analysis (PLSDA) model was generated using statistically significant metabolites gave an overall accuracy of 90.2%. Down-regulated amino acid levels appear to be the result of enhanced energy metabolism or up-regulation of the appropriate biosynthetic pathways, and required cell proliferation in cancer tissues."

According to the news reporters, the research concluded: "These results suggest that tissue metabolic profiles have great potential in detecting oral cancer and may aid in understanding its underlying mechanisms."

For more information on this research see: Metabolite Profiling of Preneoplastic and Neoplastic Lesions of Oral Cavity Tissue Samples Revealed a Biomarker Pattern. Scientific Reports, 2016;6():1-8. Findings from University of Kebangsaan Yields New Data on Coumarins and Indandiones ( Influence of Genotype on Warfarin Maintenance Dose Predictions Produced Using a Bayesian Dose Individualization Tool)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Coumarins and Indandiones. According to news originating from Bangi, Malaysia, by NewsRx correspondents, research stated, "A previously established Bayesian dosing tool for warfarin was found to produce biased maintenance dose predictions. In this study, we aimed (1) to determine whether the biased warfarin dose predictions previously observed could be replicated in a new cohort of patients from 2 different clinical settings, (2) to explore the influence of CYP2C9 and VKORC1 genotype on predictive performance of the Bayesian dosing tool, and (3) to determine whether the previous population used to develop the kinetic-pharmacodynamic model underpinning the Bayesian dosing tool was sufficiently different from the test (posterior) population to account for the biased dose predictions."

Our news journalists obtained a quote from the research from the University of Kebangsaan, "The warfarin maintenance doses for 140 patients were predicted using the dosing tool and compared with the observed maintenance dose. The impact of genotype was assessed by predicting maintenance doses with prior parameter values known to be altered by genetic variability (eg, EC50 for VKORC1 genotype). The prior population was evaluated by fitting the published kinetic-pharmacodynamic model, which underpins the Bayesian tool, to the observed data using NONMEM and comparing the model parameter estimates with published values. The Bayesian tool produced positively biased dose predictions in the new cohort of patients (mean prediction error [95% confidence interval]; 0.32 mg/d [0.14-0.5]). The bias was only observed in patients requiring >= 7 mg/d. The direction and magnitude of the observed bias was not influenced by genotype. The prior model provided a good fit to our data, which suggests that the bias was not caused by different prior and posterior populations. Maintenance doses for patients requiring >= 7 mg/d were overpredicted. The bias was not due to the influence of genotype nor was it related to differences between the prior and posterior populations."

According to the news editors, the research concluded: "There is a need for a more mechanistic model that captures warfarin dose-response relationship at higher warfarin doses."

For more information on this research see: Influence of Genotype on Warfarin Maintenance Dose Predictions Produced Using a Bayesian Dose Individualization Tool. Therapeutic Drug Monitoring, 2016;38(6):677-683. Therapeutic Drug Monitoring can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Findings from University of KwaZulu-Natal Provides New Data about Type 1 Diabetes Mellitus (Naringin Mitigates Cardiac Hypertrophy by Reducing Oxidative Stress and Inactivating c-Jun Nuclear Kinase-1 Protein in Type I Diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus. According to news reporting originating from Durban, South Africa, by NewsRx correspondents, research stated, "Cardiac hypertrophy (CH) in type 1 diabetes mellitus is attributed to increased oxidative stress-associated activation of c-Jun Nuclear Kinase (JNK). We investigated the effects of naringin on hyperglycemia-associated oxidative stress, activation of JNK-1, and CH."

Our news editors obtained a quote from the research from the University of KwaZulu-Natal, "Male Sprague-Dawley rats (225-250 g) (n=7) were divided into 6 groups. Groups I and II were orally treated with distilled water [3.0 mL/kg body weight/day (BW)] and naringin (50 mg/kg BW), respectively. Groups III-VI were rendered diabetic by a single intraperitoneal injection of 65 mg/kg BW of streptozotocin. Groups III, IV, and V were further treated with insulin (4.0 I.U, s.c, twice daily), naringin (50 mg/kg BW), and ramipril (3.0 mg/kg BW), respectively. After 56 days, the animals were sacrificed and then plasma and cardiac tissues obtained for further analysis. Naringin treatment of diabetic rats significantly reversed oxidative stress, lipid peroxidation, proteins oxidation, CH indices, and JNK protein activation compared with untreated diabetic animals. Our results do suggest that naringin mitigates CH by inhibiting oxidative stress leading to inactivation of JNK-1."

According to the news editors, the research concluded: "Naringin supplements could therefore ameliorate CH in diabetic patients."

For more information on this research see: Naringin Mitigates Cardiac Hypertrophy by Reducing Oxidative Stress and Inactivating c-Jun Nuclear Kinase-1 Protein in Type I Diabetes. Journal of Cardiovascular Pharmacology, 2016;67(2):136-44. Oncology - Prostate Cancer

Findings from University of L'Aquila in the Area of Prostate Cancer Described (Cyclin D1 silencing suppresses tumorigenicity, impairs DNA double strand break repair and thus radiosensitizes androgen-independent prostate cancer cells to DNA ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting originating from L'Aquila, Italy, by NewsRx correspondents, research stated, "Patients with hormone-resistant prostate cancer (PCa) have higher biochemical failure rates following radiation therapy (RT). Cyclin D1 deregulated expression in PCa is associated with a more aggressive disease: however its role in radioresistance has not been determined."

Our news editors obtained a quote from the research from the University of L'Aquila, "Cyclin D1 levels in the androgen-independent PC3 and 22Rv1 PCa cells were stably inhibited by infecting with cyclin D1-shRNA. Tumorigenicity and radiosensitivity were investigated using in vitro and in vivo experimental assays. Cyclin D1 silencing interfered with PCa oncogenic phenotype by inducing growth arrest in the G1 phase of cell cycle and reducing soft agar colony formation, migration, invasion in vitro and tumor formation and neo-angiogenesis in vivo. Depletion of cyclin D1 significantly radiosensitizes PCa cells by increasing the RT-induced DNA damages by affecting the NHEJ and HR pathways responsible of the DNA double-strand break repair. Following treatment of cells with RT the abundance of a biomarker of DNA damage, g-H2AX, was dramatically increased in sh-cyclin D1 treated cells compared to shRNA control. Concordant with these observations DNA-PKcs-activation and RAD51-accumulation, part of the DNA double-strand break repair machinery, were reduced in shRNA-cyclin D1 treated cells compared to shRNA control. We further demonstrate the physical interaction between CCND1 with activated-ATM, -DNA-PKcs and RAD51 is enhanced by RT. Finally, siRNA-mediated silencing experiments indicated DNA-PKcs and RAD51 are downstream targets of CCND1-mediated PCa cells radioresistance."

According to the news editors, the research concluded: "In summary, these observations suggest that CCND1 is a key mediator of PCa radioresistance and could represent a potential target for radioresistant hormone-resistant PCa."

For more information on this research see: Cyclin D1 silencing suppresses tumorigenicity, impairs DNA double strand break repair and thus radiosensitizes androgen-independent prostate cancer cells to DNA damage. Oncotarget, 2016;7(5):5383-400.

Central Nervous System Diseases and Conditions –

Findings from University of Lausanne Hospital Reveals New Findings on Subarachnoid Hemorrhage (Intracranial pressure and outcome in critically ill patients with aneurysmal subarachnoid hemorrhage: a systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage is the subject of a report. According to news reporting from Lausanne, Switzerland, by NewsRx journalists, research stated, "Evidences supporting the use of intracranial pressure (ICP) monitoring after aneurysmal subarachnoid hemorrhage (aSAH) are limited. The aim of our paper was to examine whether elevated intracranial pressure and ICP-derived variables predict mortality and functional outcomes after aSAH."

The news correspondents obtained a quote from the research from the University of Lausanne Hospital, "EVIDENCE ACQUISITION: A systematic review of the literature was performed through PubMed and Cochrane data-bases up to June 2015. Population was restricted to aSAH patients requiring admission to the intensive care unit. ICP was included in the analysis as absolute value as well as variables derived from ICP monitoring (pressure reactivity index, ICP pulse wave amplitude, ICP-arterial blood pressure wave amplitude correlation and ICP variability). Outcomes included mortality, neurological recovery and delayed cerebral ischemia (DCI). Quality of evidence was rated using the GRADE system. EVIDENCE SYNTHESIS: Twenty-six studies were examined. Due to heterogeneity in qualifying studies, a meta-analysis could not be generated. We found a correlation between elevated ICP and mortality. However, ICP absolute values were not independent predictors of long-term functional outcomes (low quality of evidence). A variable relationship between elevated ICP and DCI was found (very low quality of evidence). ICP-derived variables had higher accuracy than ICP absolute values in predicting functional outcomes (moderate quality of evidence). Elevated ICP was associated with higher mortality however absolute ICP values per se were not independent predictors of functional recovery. Variables derived from ICP monitoring are more accurate than ICP absolute values in predicting outcome."

According to the news reporters, the research concluded: "Given the absence of good quality data, additional large studies may help to better define the prognostic value of ICP after aSAH."

Our news journalists report that additional information may be obtained by contacting G. Cossu, Univ Lausanne Hosp, Fac Biol & Med, Div Neurosurg, Dept. of Clin Neurosci, Lausanne, Switzerland. Additional authors for this research include M. Messerer, N.

Mental Health Diseases and Conditions - Schizophrenia

Findings from University of Lausanne Provides New Data about Schizophrenia (Neurons acetylate their way to migration)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mental Health Diseases and Conditions - Schizophrenia have been published. According to news reporting out of Lausanne, Switzerland, by NewsRx editors, research stated, "The centrosome is crucial for neuronal migration and polarisation, processes that are disrupted in a number of neurodevelopmental disorders including schizophrenia. Mutation of DISC1, associated with increased risk of schizophrenia and psychiatric illness, has been shown to affect the centrosome, but the mechanisms involved have not been elucidated."

Our news journalists obtained a quote from the research from the University of Lausanne, "In this issue of EMBO Reports, Fukuda and colleagues demonstrate that a DISC1-interacting protein, CAMDI, suppresses the activity of the histone deacetylase HDAC6, thereby promoting centrosome stability and consequently neuronal migration. Loss of CAMDI leads to cortical migration defects and behavioural phenotypes that model autism spectrum disorders and which can be rescued by inhibition of HDAC6."

According to the news editors, the research concluded: "The study provides novel mechanistic insight into centrosome regulation in neurodevelopment."

For more information on this research see: Neurons acetylate their way to migration. EMBO Reports, 2016;17(12):1674-1676. EMBO Reports can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; EMBO Reports - www.nature.com/embor/)

Findings from University of Lausanne Yields New Findings on Bacterial Infections (Impact of the microbial derived short chain fatty acid propionate on host susceptibility to bacterial and fungal infections in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Bacterial Infections are discussed in a new report. According to news reporting originating from Epalinges, Switzerland, by NewsRx correspondents, research stated, "Short chain fatty acids (SCFAs) produced by intestinal microbes mediate anti-inflammatory effects, but whether they impact on antimicrobial host defenses remains largely unknown. This is of particular concern in light of the attractiveness of developing SCFA-mediated therapies and considering that SCFAs work as inhibitors of histone deacetylases which are known to interfere with host defenses."

Our news editors obtained a quote from the research from the University of Lausanne, "Here we show that propionate, one of the main SCFAs, dampens the response of innate immune cells to microbial stimulation, inhibiting cytokine and NO production by mouse or human monocytes/macrophages, splenocytes, whole blood and, less efficiently, dendritic cells. In proof of concept studies, propionate neither improved nor worsened morbidity and mortality parameters in models of endotoxemia and infections induced by gram-negative bacteria (Escherichia coli, Klebsiella pneumoniae), gram-positive bacteria (Staphylococcus aureus, Streptococcus pneumoniae) and Candida albicans. Moreover, propionate did not impair the efficacy of passive immunization and natural immunization. Therefore, propionate has no significant impact on host susceptibility to infections and the establishment of protective antibacterial responses."

According to the news editors, the research concluded: "These data support the safety of propionate-based therapies, either via direct supplementation or via the diet/microbiota, to treat non-infectious inflammation-related disorders, without increasing the risk of infection."

For more information on this research see: Impact of the microbial derived short chain fatty acid propionate on host susceptibility to bacterial and fungal infections in vivo. Scientific Reports, 2016;6():1-15. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **Oncology - Colon Cancer**

**Findings from University of Leeds Update Understanding of Colon Cancer (Poor predictive value of lower gastrointestinal alarm features in the diagnosis of colorectal cancer in 1981 patients in secondary care)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting originating in Leeds, United Kingdom, by NewsRx journalists, research stated, "Clinicians are advised to refer patients with lower gastrointestinal (GI) alarm features for urgent colonoscopy to exclude colorectal cancer (CRC). However, the utility of alarm features is debated."

Financial support for this research came from Canadian Association of Gastroenterology.

The news reporters obtained a quote from the research from the University of Leeds, "To assess whether performance of alarm features is improved by using a symptom frequency threshold to trigger referral, or by combining them into composite variables, including minimum age thresholds, as recommended by the National Institute for Health and Care Excellence (NICE). We collected data prospectively from 1981 consecutive adults with lower GI symptoms. Assessors were blinded to symptom status. The reference standard to define CRC was histopathological confirmation of adenocarcinoma in biopsy specimens from a malignant-looking colorectal lesion. Controls were patients without CRC. Sensitivity, specificity, positive predictive values (PPVs) and negative predictive values were calculated for individual alarm features, as well as combinations of these. In identifying 47 (2.4%) patients with CRC, individual alarm features had sensitivities ranging from 11.1% (family history of CRC) to 66.0% (loose stools), and specificities from 30.5% (loose stools) to 75.6% (family history of CRC). Using higher symptom frequency thresholds improved specificity, but to the detriment of sensitivity. NICE referral criteria also had higher specificities and lower sensitivity, with PPVs above 4.8%. More than 80% of those with CRC met at least one of the NICE referral criteria. Using higher symptom frequency thresholds for alarm features improved specificity, but sensitivity was low."

According to the news reporters, the research concluded: "NICE referral criteria had PPVs above 4.8%, but sensitivities ranged from 2.2% to 32.6%, meaning many cancers would be missed."

Our news correspondents report that additional information may be obtained by contacting A.C. Ford, University of Leeds, Leeds Inst Biomed & Clin Sci, Leeds, W Yorkshire, United Kingdom. Additional authors for this research include M.I. Pinto-Sanchez, P. Moayyedi, P. Bercik, D.G. Morgan, C. Bolino and A.C. Ford.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/apt.13846. This DOI is a link to an online electronic document that is either free or for purchase.
Findings from University of Leicester Provides New Data about Atherosclerosis [Gene and Protein Expression of Chemokine (C-C-Motif) Ligand 19 is Upregulated in Unstable Carotid Atherosclerotic Plaques]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Atherosclerosis have been presented. According to news reporting originating from Leicester, United Kingdom, by NewsRx correspondents, research stated, "Objective/Background: The aim was to investigate the expression of genes associated with carotid plaque instability and their protein products at a local and systemic level. Carotid plaques from 24 patients undergoing carotid endarterectomy (CEA) were classified as stable or unstable using clinical, histological, ultrasound, and transcranial Doppler criteria, and compared using whole genome microarray chips."

Our news editors obtained a quote from the research from the University of Leicester, "Initial results of differentially expressed genes were validated by quantitative reverse transcriptase polymerase chain reaction in an independent group of 96 patients undergoing CEA. The protein product of genes significantly differently expressed between patients with stable and unstable plaques were analysed by plaque immunohistochemistry and serum protein quantification by enzyme-linked immunosorbent assay on a further independent cohort. Expression of chemokine (c-c-motif) ligand 19 (CCL19) was significantly upregulated in plaques from patients with clinically unstable disease (p < .001). Cathepsin G expression was upregulated in histologically unstable plaques (p = .04). Serum concentration of CCL19 was significantly higher in patients with clinically unstable plaques (p = .02). Immunohistochemical staining for CCL19 demonstrated positive staining in histologically and clinically unstable plaques (p = .03). CCL19 also co-localised with CD3(+) T-cell lymphocytes in the core region, around where CCL19 was expressed."

According to the news editors, the research concluded: "CCL19 is significantly overexpressed in patients with unstable carotid atherosclerotic plaques and may be a possible novel biomarker for identifying high-risk patients in whom more urgent intervention may be indicated."

The news editors report that additional information may be obtained by contacting M.K. Salem, University of Leicester, Dept. of Cardiovasc Sci, Vasc Surg Grp, Leicester LE2 7LX, Leics, United Kingdom. Additional authors for this research include H.Z. Butt, E. Choke,
Gram-Negative Bacteria - Pseudomonas aeruginosa

Findings from University of Lethbridge Broaden Understanding of Pseudomonas aeruginosa (The C-terminal Helix of Pseudomonas aeruginosa Elongation Factor Ts Tunes EF-Tu Dynamics to Modulate Nucleotide Exchange)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Pseudomonas aeruginosa have been published. According to news reporting from Lethbridge, Canada, by NewsRx journalists, research stated, "Little is known about the conservation of critical kinetic parameters and the mechanistic strategies of elongation factor (EF) Ts-catalyzed nucleotide exchange in EF-Tu in bacteria and particularly in clinically relevant pathogens. EF-Tu from the clinically relevant pathogen Pseudomonas aeruginosa shares over 84% sequence identity with the corresponding elongation factor from Escherichia coli."

The news correspondents obtained a quote from the research from the University of Lethbridge, "Interestingly, the functionally closely linked EF-Ts only shares 55% sequence identity. To identify any differences in the nucleotide binding properties, as well as in the EF-Ts-mediated nucleotide exchange reaction, we performed a comparative rapid kinetics and mutagenesis analysis of the nucleotide exchange mechanism for both the E. coli and P. aeruginosa systems, identifying helix 13 of EF-Ts as a previously unnoticed regulatory element in the nucleotide exchange mechanism with species-specific elements."

According to the news reporters, the research concluded: "Our findings support the base side-first entry of the nucleotide into the binding pocket of the EF-Tu.EF-Ts binary complex, followed by displacement of helix 13 and rapid binding of the phosphate side of the nucleotide, ultimately leading to the release of EF-Ts."

Our news journalists report that additional information may be obtained by contacting H.J. Wieden, University of Lethbridge, Alberta RNA Res & Training Inst, Dept. of
Musculoskeletal Diseases and Conditions –

Findings from University of London in the Area of Osteoarthritis Reported (Endochondral Growth Defect and Deployment of Transient Chondrocyte Behaviors Underlie Osteoarthritis Onset in a Natural Murine Model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Musculoskeletal Diseases and Conditions - Osteoarthritis are presented in a new report. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "To explore whether aberrant transient chondrocyte behaviors occur in the joints of STR/Ort mice (which spontaneously develop osteoarthritis [OA]) and whether they are attributable to an endochondral growth defect. Knee joints from STR/Ort mice with advanced OA and age-matched CBA (control) mice were examined by Affymetrix microarray profiling, multiplex polymerase chain reaction (PCR) analysis, and immunohistochemical labeling of endochondral markers, including sclerostin and MEPE."

Financial supporters for this research include Arthritis Research UK, Engineering and Physical Sciences Research Council.

Our news journalists obtained a quote from the research from the University of London, "The endochondral phenotype of STR/Ort mice was analyzed by histologic examination, micro-computed tomography, and ex vivo organ culture. A novel protocol for quantifying bony bridges across the murine epiphysis (growth plate fusion) using synchrotron x-ray computed microtomography was developed and applied. Meta-analysis of transcription profiles showed significant elevation in functions linked with endochondral ossification in STR/Ort mice (compared to CBA mice; p<0.05). Consistent with this, immunolabeling revealed increased matrix metalloproteinase 13 (MMP-13) and type X collagen expression in STR/Ort mouse joints, and multiplex quantitative reverse transcriptase-PCR showed differential expression of known mineralization regulators, suggesting an inherent chondrocyte defect. Support for the notion of an endochondral defect included accelerated growth, increased zone of growth plate proliferative chondrocytes (p <0.05), and widespread type X collagen/MMP-13 labeling beyond the expected hypertrophic zone distribution. OA development involved concomitant focal suppression of sclerostin/MEPE in STR/Ort mice. Our novel synchrotron radiation microtomography method showed increased numbers (p <0.001) and mean areal growth plate bridge densities (p <0.01) in young and aged STR/Ort mice compared to age-matched CBA mice."

According to the news editors, the research concluded: "Taken together, our data support the notion of an inherent endochondral defect that is linked to growth dynamics and subject to regulation by the MEPE/sclerostin axis and may represent an underlying mechanism
of pathologic ossification in OA."

The news correspondents report that additional information may be obtained from K.A. Staines, Royal Veterinary College, University of London, London, UK and Roslin Institute and Royal (Dick) School of Veterinary Studies, University of Edinburgh, Easter Bush, UK. **Gram-Positive Bacteria - Staphylococcus aureus**

**Findings from University of Lyon Yields New Findings on Staphylococcus aureus (Disk Diffusion Testing for Detection of Methicillin-Resistant Staphylococci: Does Moxalactam Improve upon Cefoxitin?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Positive Bacteria - Staphylococcus aureus have been presented. According to news reporting originating in Lyon, France, by NewsRx journalists, research stated, "Disk diffusion testing is widely used to detect methicillin resistance in staphylococci, and cefoxitin is currently considered the best marker for mecA-mediated methicillin resistance. In low-inoculum diffusion testing (colony suspension at 10(6) CFU/ml), the addition of moxalactam in combination with cefoxitin has been reported to improve on cefoxitin alone for the detection of methicillin-heteroresistant staphylococci."

The news reporters obtained a quote from the research from the University of Lyon, "However, moxalactam is absent from EUCAST and CLSI guidelines, which use high-inoculum diffusion testing (colony suspension at 10(8) CFU/ml), calling into question the potential interest of including moxalactam in their recommendations. The inhibition zone diameters of cefoxitin and moxalactam, alone and in combination, were evaluated for concordance with mecA and mecC positivity in a large collection of clinical Staphylococcus isolates (611 Staphylococcus aureus, Staphylococcus lugdunensis, and Staphylococcus saprophyticus isolates and 307 coagulase-negative staphylococci other than S. lugdunensis and S. saprophyticus isolates, of which 22% and 53% were mecA-positive, respectively) and in 25 mecC-positive S. aureus isolates using high-inoculum diffusion testing. Receiver operating characteristic, sensitivity, and specificity analyses indicated that the detection of mecA- and mecC-positive and negative isolates did not improve with moxalactam, either alone or in combination with cefoxitin, compared to cefoxitin alone. These findings were similar in both the S. aureus/S. lugdunensis/S. saprophyticus group and in the coagulase-negative staphylococci group."
According to the news reporters, the research concluded: "Our results do not support the use of moxalactam as an additional marker of methicillin resistance when testing with high-inoculum disk diffusion."

Our news correspondents report that additional information may be obtained by contacting G. Lina, University of Lyon, INserm U1111, Ecole Normale Super Lyon, CNRS UMR5308, Lyon, France. Additional authors for this research include E. Hodille, O. Dumitrescu, C. Dupieux, C. N. Mongo, C. Allam, M. Béghin, M. Paris, O. Borrel, H. Chardon, F. Laurent, J. P. Rasigade and G. Lina.

Hematologic Diseases and Conditions - Anemia

Findings from University of Malaysia Update Understanding of Anemia (Effects of various microalgae on fatty acid composition and survival rate of the blue swimming crab Portunus pelagicus larvae)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hematologic Diseases and Conditions - Anemia. According to news originating from Kuala Terengganu, Malaysia, by NewsRx correspondents, research stated, "Present study is to examine effect of various microalgae on Fatty Acid (FA) of Portunus pelagicus larvae. Larvae were subjected to five different treatments; T1, T2, T3, T4 and T5."

Our news journalists obtained a quote from the research from the University of Malaysia, "T1: rotifer and Artemia only; T2: rotifer, Artemia and Chaetoceros sp.; T3: rotifer, Anemia and Chlorella sp.; T4: rotifer, Anemia and Isochrysina sp. and T5: rotifer, Anemia and Nannochloropsis sp. Highest FA component in Zoea 3 was saturated FA group of T2 with concentration 26.06 +/- 26.23mg/g. For monounsaturated FA group, highest FA component in Zoea 1 was T5 with concentration 9.88 +/- 0.34mg/g, FA component in polyunsaturated FA group in Zoea 4, T4 with concentration 9.33 +/- 0.45mg/g was highest. For survival rate, highest survival rate obtained from T4 with 10.21% +/- 0.45. In this study, essential FA requirement in each stage of P. pelagicus larvae can be reveal."

According to the news editors, the research concluded: "Species of microalgae suitable for larvae can be characterized and selected for hatchery purpose."
For more information on this research see: Effects of various microalgae on fatty acid composition and survival rate of the blue swimming crab Portunus pelagicus larvae. *Indian Journal of Geo-Marine Sciences*, 2016;45(11):1512-1521. *Indian Journal of Geo-Marine Sciences* can be contacted at: Natl Inst Science Communication-Niscair, Dr K S Krishnan Marg, Pusa Campus, New Delhi 110 012, India.

**Findings from University of Manchester in the Area of Epilepsy**

**Reported (Monotherapy treatment of epilepsy in pregnancy: congenital malformation outcomes in the child)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting out of Manchester, United Kingdom, by NewsRx editors, research stated, "There is evidence that certain antiepileptic drugs (AEDs) are teratogenic and are associated with an increased risk of congenital malformation. The majority of women with epilepsy continue taking AEDs throughout pregnancy; therefore it is important that comprehensive information on the potential risks associated with AED treatment is available."

Our news journalists obtained a quote from the research from the University of Manchester, "To assess the effects of prenatal exposure to AEDs on the prevalence of congenital malformations in the child. Search methods We searched the Cochrane Epilepsy Group Specialized Register (September 2015), Cochrane Central Register of Controlled Trials (CENTRAL) (2015, Issue 11), MEDLINE (via Ovid) (1946 to September 2015), EMBASE (1974 to September 2015), Pharmline (1978 to September 2015), Reprotox (1983 to September 2015) and conference abstracts (2010-2015) without language restriction. Selection criteria We included prospective cohort controlled studies, cohort studies set within pregnancy registries and randomised controlled trials. Participants were women with epilepsy taking AEDs; the two control groups were women without epilepsy and women with epilepsy who were not taking AEDs during pregnancy. Data collection and analysis Three authors independently selected studies for inclusion. Five authors completed data extraction and risk of bias assessments. The primary outcome was the presence of a major congenital malformation. Secondary outcomes included specific types of major congenital malformations. Where meta-analysis was not possible, we reviewed included studies narratively. We included 50 studies, with 31 contributing to meta-analysis. Study quality varied, and given the observational design, all were at high risk of certain biases. However, biases were balanced across the AEDs investigated and we believe that the results are not explained by these biases. Children exposed to carbamazepine (CBZ) were at a higher risk of malformation than children born to women without epilepsy (N = 1367..."
vs 2146, risk ratio (RR) 2.01, 95% confidence interval (CI) 1.20 to 3.36) and women with untreated epilepsy (N = 3058 vs 1287, RR 1.50, 95% CI 1.03 to 2.19). Children exposed to phenobarbital (PB) were at a higher risk of malformation than children born to women without epilepsy (N = 345 vs 1591, RR 2.84, 95% CI 1.57 to 5.13). Children exposed to phenytoin (PHT) were at an increased risk of malformation compared with children born to women without epilepsy (N = 477 vs 987, RR 2.38, 95% CI 1.12 to 5.03) and to women with untreated epilepsy (N = 640 vs 1256, RR 2.40, 95% CI 1.42 to 4.08). Children exposed to topiramate (TPM) were at an increased risk of malformation compared with children born to women without epilepsy (N = 359 vs 442, RR 3.69, 95% CI 1.36 to 10.07). The children exposed to valproate (VPA) were at a higher risk of malformation compared with children born to women without epilepsy (N = 467 vs 1936, RR 5.69, 95% CI 3.33 to 9.73) and to women with untreated epilepsy (N = 1923 vs 1259, RR 3.13, 95% CI 2.16 to 4.54). There was no increased risk for major malformation for lamotrigine (LTG). Gabapentin, levetiracetam (LEV), oxcarbazepine (OXC), primidone (PRM) or zonisamide (ZNS) were not associated with an increased risk, however, there were substantially fewer data for these medications. For AED comparisons, children exposed to VPA had the greatest risk of malformation (10.93%, 95% CI 8.91 to 13.13). Children exposed to VPA were at an increased risk of malformation compared with children exposed to CBZ (N = 2529 vs 4549, RR 2.44, 95% CI 2.00 to 2.94), GBP (N = 1814 vs 190, RR 6.21, 95% CI 1.91 to 20.23), LEV (N = 1814 vs 817, RR 5.82, 95% CI 3.13 to 10.81), LTG (N = 2021 vs 4164, RR 3.56, 95% CI 2.77 to 4.58), TPM (N = 1814 vs 473, RR 2.35, 95% CI 1.40 to 3.95), OXC (N = 676 vs 238, RR 3.71, 95% CI 1.65 to 8.33), PB (N = 1137 vs 626, RR 1.59, 95% CI 1.11 to 2.29), PHT (N = 2319 vs 1137, RR 2.00, 95% CI 1.48 to 2.71) or ZNS (N = 323 vs 90, RR 17.13, 95% CI 1.06 to 277.48). Children exposed to CBZ were at a higher risk of malformation than those exposed to LEV (N = 3051 vs 817, RR 1.84, 95% CI 1.03 to 3.29) and children exposed to LTG (N = 3385 vs 4164, RR 1.34, 95% CI 1.01 to 1.76). Children exposed to PB were at a higher risk of malformation compared with children exposed to GBP (N = 204 vs 159, RR 8.33, 95% CI 1.04 to 50.00), LEV (N = 204 vs 513, RR 2.33, 95% CI 1.04 to 5.00) or LTG (N = 282 vs 1959, RR 3.13, 95% CI 1.64 to 5.88). Children exposed to PHT had a higher risk of malformation than children exposed to LTG (N = 624 vs 4082, RR 1.89, 95% CI 1.19 to 2.94) or to LEV (N = 566 vs 817, RR 2.04, 95% CI 1.09 to 3.85); however, the comparison to LEV was not significant in the random-effects model. Children exposed to TPM were at a higher risk of malformation than children exposed to LEV (N = 473 vs 817, RR 2.00, 95% CI 1.03 to 3.85) or LTG (N = 473 vs 3975, RR 1.79, 95% CI 1.06 to 2.94). There were no other significant differences, or comparisons were limited to a single study. We found significantly higher rates of specific malformations associating PB exposure with cardiac malformations and VPA exposure with neural tube, cardiac, oro-facial/craniofacial, and skeletal and limb malformations in comparison to other AEDs. Dose of exposure mediated the risk of malformation following VPA exposure; a potential dose-response association for the other AEDs remained less clear. Authors’ conclusions Exposure in the womb to certain AEDs carried an increased risk of malformation in the foetus and may be associated with specific patterns of malformation. Based on current evidence, LEV and LTG exposure carried the lowest risk of overall malformation; however, data pertaining to specific malformations are lacking.”

According to the news editors, the research concluded: "Physicians should discuss both the risks and treatment efficacy with the patient prior to commencing treatment.”

For more information on this research see: Monotherapy treatment of epilepsy in pregnancy: congenital malformation outcomes in the child. Cochrane Database of Systematic Reviews, 2016;(11):687-1040. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by
Immune System Diseases and Conditions - HIV/AIDS

Findings from University of Maryland Update Understanding of HIV/AIDS (Prevalence of transmitted HIV-1 drug resistance among young adults attending HIV counselling and testing clinics in Kigali, Rwanda)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - HIV/AIDS are presented in a new report. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Scaling-up antiretroviral therapy (ART) in resource-limited settings has raised concerns of emerging HIV drug resistance (DR) and its transmission to newly infected individuals. To assess the prevalence of transmitted drug resistance (TDR) in recently HIV-infected individuals, a WHO TDR threshold survey was conducted among young adults in Kigali, Rwanda."

Our news journalists obtained a quote from the research from the University of Maryland, "Between May and July 2011, HIV subtype and genotyping were performed on dried blood spots (DBS) prepared from blood specimens collected from newly HIV-diagnosed and ART-naive individuals aged 15 to 21 years in eight HIV voluntary counselling and testing (VCT) sites in Kigali. In total, 57 of the 68 DBS collected from eligible participants were successfully amplified. The median age of participants was 20 years and 86% were female. Most participants (96%) were infected with subtype A1 virus. Two participants (4%) had the K103N non-nucleoside reverse transcriptase inhibitor (NNRTI) mutation and one (2%) had the M46L protease inhibitor (PI) mutation. The TDR prevalence was 3.5% (95% CI 0.4, 12.1) for NNRTI and 1.8% (95% CI 0.0, 9.4) for PI. The prevalence of HIV TDR in VCT attendees in Kigali was characterized as low (<5%) for all drug classes according to the WHO HIV DR threshold survey methodology. Despite a decade of widespread ART in Rwanda, TDR prevalence remains low, and so the current first-line ART regimens should continue to be effective."

According to the news editors, the research concluded: "However, as scale-up of ART continues, frequent HIV DR surveillance is needed to monitor the effectiveness of available ART regimens at the population level."

Our news journalists report that additional information may be obtained by contacting D.J. Riedel, University of Maryland, Sch Med, Div Infect Dis, Baltimore, MD 21201,
Myeloid Cells

Findings from University of Massachusetts School of Medicine in Myeloid Cells Reported (Peptide- and Amine-Modified Glucan Particles for the Delivery of Therapeutic siRNA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Myeloid Cells have been published. According to news reporting from Worcester, Massachusetts, by NewsRx journalists, research stated, "Translation of siRNA technology into the clinic is limited by the need for improved delivery systems that target specific cell types. Macrophages are particularly attractive targets for RNAi therapy because they promote pathogenic inflammatory responses in a number of important human diseases."

Financial supporters for this research include Novo Nordisk, U.S. Department of Health and Human Services, U.S. Department of Defense, Juvenile Diabetes Research Foundation International.

The news correspondents obtained a quote from the research from the University of Massachusetts School of Medicine, "We previously demonstrated that a multicomponent formulation of b-1,3-d-glucan-encapsulated siRNA particles (GeRPs) can specifically and potently silence genes in mouse macrophages. A major advance would be to simplify the GeRP system by reducing the number of delivery components, thus enabling more facile manufacturing and future commercialization. Here we report the synthesis and evaluation of a simplified glucan-based particle (GP) capable of delivering siRNA in vivo to selectively silence macrophage genes. Covalent attachment of small-molecule amines and short peptides containing weak bases to GPs facilitated electrostatic interaction of the particles with siRNA and aided in the endosomal release of siRNA by the proton-sponge effect. Modified GPs were nontoxic and were efficiently internalized by macrophages in vitro. When injected intraperitoneally (i.p.), several of the new peptide-modified GPs were found to efficiently deliver siRNA to peritoneal macrophages in lean, healthy mice. In an animal model of obesity-induced inflammation, i.p. administration of one of the peptide-modified GPs (GP-EP14) bound to siRNA selectively reduced the expression of target inflammatory cytokines in the visceral adipose tissue macrophages. Decreasing adipose tissue inflammation resulted in an improvement of glucose metabolism in these metabolically challenged animals."

According to the news reporters, the research concluded: "Thus, modified GPs represent a promising new simplified system for the efficient delivery of therapeutic siRNAs specifically to phagocytic cells in vivo for modulation of inflammation responses."
Findings from University of Massachusetts Yields New Findings on Transcultural Nursing (A Culturally Adapted Smoking Cessation Intervention for Korean Americans: Preliminary Findings)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nursing - Transcultural Nursing are discussed in a new report. According to news reporting from Boston, Massachusetts, by NewsRx editors, the research stated, "Korean Americans have the highest smoking rate within the Asian American population. This study examined the feasibility and acceptability of a culturally adapted telephone cessation intervention for Korean Americans."

The news correspondents obtained a quote from the research from the University of Massachusetts, "Participants were recruited from advertisements on a Korean radio station channel in New York City. All received a combination of telephone cessation counseling and nicotine patches. Thirty-one (2 women and 29 men) participated in the study. At 3-month follow-up, 14 (45.2%) reported 7-day point prevalence abstinence and 13 (41.9%) achieved 3-month prolonged abstinence. Except for two who lived alone, self-reported abstinence was corroborated by a family member. The findings point to the direction that a nationally centralized Korean-language quitline service should be established to help Korean Americans quit smoking."

According to the news reporters, the research concluded: "Furthermore, the service should be adapted at a deep level of the culture."

Our news journalists report that additional information may be obtained by contacting S.S. Kim, University of Massachusetts, Boston, MA, United States.

Cardiovascular Diseases and Conditions - Aneurysm

Findings from University of Massachusetts in the Area of Aneurysm Reported (Endovascular management of radiation-induced subclavian and axillary artery aneurysms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurysm. According to news reporting originating from Worcester, Massachusetts, by NewsRx correspondents, research stated, "Subclavian and axillary artery aneurysms are rare occurrences and are associated with serious sequelae if they are untreated. Little is known about these aneurysms, and best practice guidelines are lacking."

Our news editors obtained a quote from the research from the University of Massachusetts, "We describe an 87-year-old man with a history of chest irradiation who presented with radiation-induced subclavian and axillary aneurysms and acute upper extremity ischemia. An endovascular stent graft procedure was undertaken because of his prohibitive high risk for open surgical treatment. Follow-up duplex ultrasound revealed patent stent grafts with complete exclusion of aneurysm sacs."

According to the news editors, the research concluded: "Endovascular therapy is a viable option for upper extremity aneurysms in patients at high risk for open surgical repair."

The news editors report that additional information may be obtained by contacting S. Mohan, University of Massachusetts, Sch Med, Div Vasc Surg, Worcester, MA 01655, United States. Additional authors for this research include A. Schanzer, W.P. Robinson and F.A. Aiello.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jvs.2015.08.073. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Heart Attack

Findings from University of Massachusetts in the Area of Heart Attack Described (Emergency department point-of-care ultrasound in out-of-hospital and in-ED cardiac arrest)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Attack are presented in a new report. According to news reporting out of Worcester, Massachusetts, by NewsRx editors, research stated, "Point-of-care ultrasound has been suggested to improve outcomes from advanced cardiac life support (ACLS), but no large studies have explored how it should be incorporated into ACLS. Our aim was to determine whether cardiac activity on ultrasound during ACLS is associated with improved survival."

Our news journalists obtained a quote from the research from the University of Massachusetts, "We conducted a non-randomized, prospective, protocol-driven observational study at 20 hospitals across United States and Canada. Patients presenting with out-of-hospital arrest or in-ED arrest with pulseless electrical activity or asystole were included. An ultrasound was performed at the beginning and end of ACLS. The primary outcome was survival to hospital admission. Secondary outcomes included survival to hospital discharge and return of spontaneous circulation. 793 patients were enrolled, 208 (26.2%) survived the initial resuscitation, 114 (14.4%) survived to hospital admission, and 13 (1.6%) survived to hospital discharge. Cardiac activity on US was the variable most associated with survival at all time points. On multivariate regression modeling, cardiac activity was associated with increased survival to hospital admission (OR 3.6, 2.2-5.9) and hospital discharge (OR 5.7, 1.5-21.9). No cardiac activity on US was associated with non-survival, but 0.6% (95% CI 0.3-2.3) survived to discharge. Ultrasound identified findings that responded to non-ACLS interventions. Patients with pericardial effusion and pericardiocentesis demonstrated higher survival rates (15.4%) compared to all others (1.3%). Cardiac activity on ultrasound was the variable most associated with survival following cardiac arrest."

According to the news editors, the research concluded: "Ultrasound during cardiac arrest identifies interventions outside of the standard ACLS algorithm."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.resuscitation.2016.09.018. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from University of Melbourne Provides New Data on Dental Cavities (Breastfeeding and the risk of dental caries: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Dental Cavities. According to news reporting originating from Carlton, Australia, by NewsRx correspondents, research stated, "To synthesise the current evidence for the associations between breastfeeding and dental caries, with respect to specific windows of early childhood caries risk. Systematic review, meta-analyses and narrative synthesis following searches of PubMed, CINAHL and EMBASE databases. Sixty-three papers included."

Financial support for this research came from World Health Organization.

Our news editors obtained a quote from the research from the University of Melbourne, "Children exposed to longer versus shorter duration of breastfeeding up to age 12 months (more versus less breastfeeding), had a reduced risk of caries (OR 0.50; 95%CI 0.25, 0.99, I(2) 86.8%). Children breastfed >12 months had an increased risk of caries when compared with children breastfed <12 months (seven studies (OR 1.99; 1.35, 2.95, I(2) 69.3%). Amongst children breastfed >12 months, those fed nocturnally or more frequently had a further increased caries risk (five studies, OR 7.14; 3.14, 16.23, I(2) 77.1%). There was a lack of studies on children aged >12 months simultaneously assessing caries risk in breastfed, bottle-fed and children not bottle or breastfed, alongside specific breastfeeding practices, consuming sweet drinks and foods, and oral hygiene practices limiting our ability to tease out the risks attributable to each. Breastfeeding in infancy may protect against dental caries."

According to the news editors, the research concluded: "Further research needed to understand the increased risk of caries in children breastfed after 12 months."

The news editors report that additional information may be obtained by contacting R. Tham, Allergy and Lung Health Unit, Centre for Epidemiology and Biostatistics, Melbourne School of Population and Global Health, The University of Melbourne, Carlton, Vic, Australia. Additional authors for this research include G. Bowatte, S.C. Dharmage, D.J. Tan, M.X. Lau, X. Dai, K.J. Allen and C.J Lodge.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/apa.13118. This DOI is a link to an online electronic document that is either free or for purchase.

Eye Diseases and Conditions - Retinoblastoma

Findings from University of Miami Provides New Data on Retinoblastoma (Antagonists of growth hormone-releasing hormone receptor induce apoptosis specifically in retinoblastoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Eye Diseases and Conditions - Retinoblastoma is the subject of a report. According to news originating from Miami, Florida, by NewsRx correspondents, research stated, "Retinoblastoma (RB) is the most common intraocular cancer in children worldwide. Current treatments mainly involve combinations of chemotherapies, cryotherapies, and laser-based therapies."

Our news journalists obtained a quote from the research from the University of Miami, "Severe or late-stage disease may require enucleation or lead to fatality. Recently, RB has been shown to arise from cone precursor cells, which have high MDM2 levels to suppress p53-mediated apoptosis. This finding leads to the hypothesis that restoring apoptosis mechanisms in RBs could specifically kill the cancer cells without affecting other retinal cells. We have previously reported involvement of an extrapituitary signaling pathway of the growth hormone-releasing hormone (GHRH) in the retina. Here we show that the GHRH receptor (GHRH-R) is highly expressed in RB cells but not in other retinal cells. We induced specific apoptosis with two different GHRH-R antagonists, MIA-602 and MIA-690. Importantly, these GHRH-R antagonists do not trigger apoptosis in other retinal cells such as retinal pigmented epithelial cells. We delineated the gene expression profiles regulated by GHRH-R antagonists and found that cell proliferation genes and apoptotic genes are down-and up-regulated, respectively."

According to the news editors, the research concluded: "Our results reveal the involvement of GHRH-R in survival and proliferation of RB and demonstrate that GHRH-R antagonists can specifically kill the RB cells."

The news correspondents report that additional information may be obtained from A.V. Schally, University of Miami, Sch Med, Sylvester Comprehens Canc Center, Miami, FL 33136, United States. Additional authors for this research include K.S. Law, S.O. Chan, J.C.S. Yam, L.J. Chen, H. Zhang, H.S. Cheung, N.L. Block, A.V. Schally and C.P. Pang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1073/pnas.1617427113. This DOI is a link to an online electronic document.

Proteomics

Findings from University of Michigan Broaden Understanding of Proteomics (ESR1 and PGR polymorphisms are associated with estrogen and progesterone receptor expression in breast tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteomics. According to news reporting out of Ann Arbor, Michigan, by NewsRx editors, research stated, "Hormone receptor-positive (HR+) breast cancers express the estrogen (ER alpha) and/or progesterone (PgR) receptors. Inherited single nucleotide polymorphisms (SNPs) in ESR1, the gene encoding ER alpha, have been reported to predict tamoxifen effectiveness."

Financial supporters for this research include HHS | NIH | National Cancer Institute (NCI), HHS | NIH | National Institute of General Medical Sciences (NIGMS), HHS | NIH | National Center for Research Resources (NCRR).

Our news journalists obtained a quote from the research from the University of Michigan, "We hypothesized that these associations could be attributed to altered tumor gene/protein expression of ESR1/ER alpha and that SNPs in the PGR gene predict tumor PGR/PgR expression. Formalin-fixed paraffin-embedded breast cancer tumor specimens were analyzed for ESR1 and PGR gene transcript expression by the reverse transcription polymerase chain reaction based Oncotype DX assay and for ER alpha and PgR protein expression by immunohistochemistry (IHC) and an automated quantitative immunofluorescence assay (AQUA). Germline genotypes for SNPs in ESR1 (n = 41) and PGR (n = 8) were determined by allele-specific TaqMan assays. One SNP in ESR1 (rs9322336) was significantly associated with ESR1 gene transcript expression (P = 0.006) but not ER alpha protein expression (P > 0.05). A PGR SNP (rs518162) was associated with decreased PGR gene transcript expression (P = 0.003) and PgR protein expression measured by IHC (P = 0.016), but not AQUA (P = 0.054). There were modest, but statistically significant correlations between gene and protein expression for ESR1/ER alpha and PGR/PgR and for protein expression measured by IHC and AQUA (Pearson correlation = 0.32-0.64, all P< 0.001). Inherited ESR1 and PGR genotypes may affect tumor ESR1/ER alpha and PGR/PgR expression, respectively, which are moderately correlated."

According to the news editors, the research concluded: "This work supports further research into germline predictors of tumor characteristics and treatment effectiveness, which may someday inform selection of hormonal treatments for patients with HR+ breast cancer."

For more information on this research see: ESR1 and PGR polymorphisms are associated with estrogen and progesterone receptor expression in breast tumors. *Physiological*
Heart Disorders and Diseases - Heart Failure

Findings from University of Michigan Has Provided New Information about Heart Failure (Refusal to participate in heart failure studies: do age and gender matter?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "The objective of this retrospective study was to evaluate reasons heart failure patients decline study participation, to inform interventions to improve enrollment. Failure to enrol older heart failure patients (age >65) and women in studies may lead to sampling bias, threatening study validity."

Funders for this research include National Institutes of Health, National Institute of Nursing Research, General Clinical Research Centers at University of Kentucky, Emory University, Presbyterian Historical Society, Clinical and Translational Science Award program, National Center for Research Resources, Atlanta Veterans Administration Medical Center, Indiana University, MCubed Project of the University of Michigan, Michigan Institute for Clinical and Health Research.

Our news editors obtained a quote from the research from the University of Michigan, "This study was a retrospective analysis of refusal data from four heart failure studies that enrolled 788 patients in four states. Chi-Square and a pooled t-test were computed to analyse refusal data (n=300) obtained from heart failure patients who were invited to participate in one of the four studies but declined. Refusal reasons from 300 patients (66% men, mean age 65?33) included: not interested (n=163), too busy (n=64), travel burden (n=50), too sick (n=38), family problems (n=14), too much commitment (n=13) and privacy concerns (n=4). Chi-Square analyses showed no differences in frequency of reasons (p >0?05) between men and women. Patients who refused were older, on average, than study participants. Some reasons were patient-dependent; others were study-dependent. With 'not interested' as the most common reason, cited by over 50% of patients who declined, recruitment measures should be targeted at
stimulating patients' interest. Additional efforts may be needed to recruit older participants. However, reasons for refusal were consistent regardless of gender. Heart failure researchers should proactively approach a greater proportion of women and patients over age 65. With no gender differences in type of reasons for refusal, similar recruitment strategies can be used for men and women. However, enrolment of a representative proportion of women in heart failure studies has proven elusive and may require significant effort from researchers."

According to the news editors, the research concluded: "Employing strategies to stimulate interest in studies is essential for recruiting heart failure patients, who overwhelmingly cited lack of interest as the top reason for refusal."

The news editors report that additional information may be obtained by contacting J.M. Harrison, School of Nursing, University of Michigan, Ann Arbor, MI, United States. Additional authors for this research include M. Jung, T.A. Lennie, D.K. Moser, D.G. Smith, S.B. Dunbar, D.L. Ronis, T.M. Koelling, B. Giordani, P.L. Riley and S.J Pressler.

**Oncology - Prostate Cancer**

**Findings from University of Michigan Reveals New Findings on Prostate Cancer (Health Care Integration and Quality among Men with Prostate Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to news reporting originating in Ann Arbor, Michigan, by NewsRx journalists, research stated, "The delivery of high quality prostate cancer care is increasingly important for health systems, physicians and patients. Integrated delivery systems may have the greatest ability to deliver high quality, efficient care."

The news reporters obtained a quote from the research from the University of Michigan, "We sought to understand the association between health care integration and quality of prostate cancer care. We used SEER-Medicare data to perform a retrospective cohort study of men older than age 65 with prostate cancer diagnosed between 2007 and 2011. We defined integration within a health care market based on the number of discharges from a top 100 integrated delivery system, and compared rates of adherence to well accepted prostate cancer quality measures in markets with no integration vs full integration (greater than 90% of discharges from an integrated system). The average man treated in a fully integrated market was more likely to receive pretreatment counseling by a urologist and radiation oncologist (62.6% vs
60.3%, \( p = 0.03 \)), avoid inappropriate imaging (72.2% avoided vs 60.6%, \( p < 0.001 \)), avoid treatment when life expectancy was less than 10 years (23.7% vs 17.3%, \( p < 0.001 \)) and avoid multiple hospitalizations in the last 30 days of life (50.2% vs 43.6%, \( p = 0.001 \)) than when treated in markets with no integration. Additionally, patients treated in fully integrated markets were more likely to have complete adherence to all eligible quality measures (OR 1.38, 95% CI 1.27-1.50). Integrated systems are associated with improved adherence to several prostate cancer quality measures."

According to the news reporters, the research concluded: "Expansion of the integrated health care model may facilitate greater delivery of high quality prostate cancer care."

Our news correspondents report that additional information may be obtained by contacting B.K. Hollenbeck, University of Michigan, Dept. of Urol, Dow Div Urol Hlth Serv Res, Ann Arbor, MI 48109, United States. Additional authors for this research include S.R. Kaufman, P. Yan, D.C. Miller, F.R. Schroek, T.A. Skolarus, V.B. Shahinian and B.K. Hollenbeck.

### Mononuclear Leukocytes

**Findings from University of Milan Broaden Understanding of Mononuclear Leukocytes (Transcriptional Landscape of Human Tissue Lymphocytes Unveils Uniqueness of Tumor-Infiltrating T Regulatory Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mononuclear Leukocytes. According to news reporting originating from Milan, Italy, by NewsRx correspondents, research stated, "Tumor-infiltrating regulatory T lymphocytes (Treg) can suppress effector T cells specific for tumor antigens. Deepermolecular definitions of tumor-infiltrating-lymphocytes could thus offer therapeutic opportunities."

Our news editors obtained a quote from the research from the University of Milan, "Transcriptomes of T helper 1 (Th1), Th17, and Treg cells infiltrating colorectal or non-small-cell lung cancers were compared to transcriptomes of the same subsets from normal tissues and validated at the single-cell level. We found that tumor-infiltrating Treg cells were highly suppressive, upregulated several immune-checkpoints, and expressed on the cell surfaces specific signature molecules such as interleukin-1 receptor 2 (IL1R2), programmed death (PD)-1
Ligand1, PD-1 Ligand2, and CCR8 chemokine, which were not previously described on Treg cells. Remarkably, high expression in whole-tumor samples of Treg cell signature genes, such as LAYN, MAGEH1, or CCR8, correlated with poor prognosis."

According to the news editors, the research concluded: "Our findings provide insights into the molecular identity and functions of human tumor-infiltrating Treg cells and define potential targets for tumor immunotherapy."

For more information on this research see: Transcriptional Landscape of Human Tissue Lymphocytes Unveils Uniqueness of Tumor-Infiltrating T Regulatory Cells. Immunity, 2016;45(5):1135-1147. Immunity can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Immunity - www.journals.elsevier.com/immunity/)

The news editors report that additional information may be obtained by contacting S. Abrignani, University of Milan, Dept. of Clin Sci & Community Hlth, I-20122 Milan, Italy. Metabolic Diseases

Findings from University of Minnesota Broaden Understanding of Metabolic Diseases (Gut microbiota from metabolic disease-resistant, macrophagespecific RIP140 knockdown mice improves metabolic phenotype and gastrointestinal integrity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Metabolic Diseases are discussed in a new report. According to news reporting originating in Minneapolis, Minnesota, by NewsRx journalists, research stated, "While fecal microbiota transplantation (FMT) presents an attractive therapeutic strategy, it remains unclear how to choose the microbiota repertoire that most effectively transfers benefit to recipients."

The news reporters obtained a quote from the research from the University of Minnesota, "We identified a beneficial taxonomic repertoire in a transgenic mouse model (RIP140m phi KD) which resists the development of high fat diet (HFD)-induced metabolic diseases due to enhanced anti-inflammation engineered by lowering receptor interacting protein (RIP140) expression in macrophage. We confirmed using FMT from HFD-fed RIP140m phi KD to wild type (WT) mice that recipient mice acquired the microbiota repertoire of donor mice. Importantly, FMT from RIP140m phi KD to WT not only effectively transferred the beneficial taxonomic repertoire to WT recipients, but also enabled recipient animals acquiring the anti-inflammatory status of RIP140m phi KD donor animals and avoid HFD-induced insulin
resistance, which is associated with significantly improved intestinal integrity."

According to the news reporters, the research concluded: "FMT can transfer not only microbiota but also the donors' intestinal innate immune status and improved intestinal integrity."

For more information on this research see: Gut microbiota from metabolic disease-resistant, macrophage-specific RIP140 knockdown mice improves metabolic phenotype and gastrointestinal integrity. *Scientific Reports, 2016;6():1-10.* *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Thiazoles

**Findings from University of Minnesota Broadens Understanding of Thiazoles (Cocaine-induced reward enhancement measured with intracranial self-stimulation in rats bred for low versus high saccharin intake)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Thiazoles. According to news reporting from Minneapolis, Minnesota, by NewsRx journalists, research stated, "Rats selectively bred for high (HiS) or low (LoS) saccharin intake are a well-established model of drug-abuse vulnerability, with HiS rats being more likely to consume sweets and cocaine than LoS rats. Still, the nature of these differences is poorly understood."

The news correspondents obtained a quote from the research from the University of Minnesota, "This study examined whether the motivational consequences of cocaine exposure are differentially expressed in HiS and LoS rats by measuring intracranial self-stimulation (ICSS) thresholds following acute injections of cocaine (10 mg/kg). Reductions in ICSS thresholds following cocaine injection were greater in HiS rats than in LoS rats, suggesting that the reward-enhancing effects of cocaine are greater in the drug-vulnerable HiS than LoS rats."

According to the news reporters, the research concluded: "Higher cocaine-induced reward, indicated by lower ICSS thresholds, may explain the higher rates of drug consumption in sweet-preferring animal models, providing a clue to the etiology of cocaine addiction in vulnerable populations."

For more information on this research see: Cocaine-induced reward enhancement measured with intracranial self-stimulation in rats bred for low versus high saccharin intake. *Behavioural Pharmacology, 2016;27(2-3 Spec I):133-6.* (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology -

Drugs and Therapies - Pharmacy Practice

Findings from University of Minnesota Provides New Data on Pharmacy Practice (Strategies and steps fostering the success of medication management services in community pharmacies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Pharmacy Practice. According to news originating from Minneapolis, Minnesota, by NewsRx correspondents, research stated, "To identify and describe the steps and strategies that community pharmacies with established medication management services have used to integrate medication management services into their practice settings. Qualitative case study with semistructured interviews and focus groups."

Our news journalists obtained a quote from the research from the University of Minnesota, "Community pharmacy organizations in Minnesota. Pharmacists and pharmacy leadership from 4 different pharmacy organizations including independent, chain, and health system pharmacies. Not applicable. Qualitative case study analysis of community pharmacy management and pharmacists' perceptions of the factors that led to the establishment and sustainability of their medication management programs. Focus groups and interviews were undertaken with 25 pharmacists and pharmacy leaders from 4 distinct community pharmacy organizations from April to June 2015. Five themes emerged, representing specific implementation and continuation stages of medication management services in community practice: Deciding to Act, Setting the Stage, Executing the Service, Sticking to It, and Continuing to Grow. This study sheds light on key stages that have commonly occurred across community pharmacies that are delivering medication management services."

According to the news editors, the research concluded: "The results of this work may serve as a road map for other community pharmacies looking to integrate medication management services into their own practice settings."

For more information on this research see: Strategies and steps fostering the success of medication management services in community pharmacies. Journal of the American Pharmacists Association, 2016;56(5):504-512,34. Journal of the American Pharmacists Association can be contacted at: Amer Pharmaceutical Assoc, 2215 Constitution Ave NW, Washington, DC 20037, USA.

The news correspondents report that additional information may be obtained from
Microcystis

Findings from University of Minnesota in the Area of Microcystis Reported (Influence of fluid motion on growth and vertical distribution of cyanobacterium Microcystis aeruginosa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Microcystis. According to news originating from Minneapolis, Minnesota, by NewsRx correspondents, research stated, "Cyanobacterium Microcystis aeruginosa (M. aeruginosa) is one of the dominant algae in lakes surrounded by urban and agriculture-dominated landscapes. Microcystis blooms pose ecological, economical, and human health risk, and there is a need to identify the forcing factors that influence Microcystis growth and blooms."

Financial support for this research came from Environment and Natural Resources Trust Fund.

Our news journalists obtained a quote from the research from the University of Minnesota, "We hypothesize that fluid motion has an influence on the growth and the vertical variability of M. aeruginosa, and its influence can be quantified by measuring the corresponding rate of energy dissipation levels of fluid motion. We conducted laboratory experiment measuring the population growth and vertical distribution of M. aeruginosa in a dual tower bioreactor with one tower used as experimental control. Fluid velocities were measured using a two-dimensional particle image velocimetry allowing the estimate of turbulence statistics that were related to measured M. aeruginosa growth rates and vertical cell concentration profiles. The effects of turbulence on M. aeruginosa physiology was evident by a 22% increase in growth rate at depth-averaged energy dissipation rate (ε) of 8.5 x 10(-5) m(2) s(-3), suppressed growth rate at > 2.8 x 10(-4) m(2) s(-3), and no impact for < 4 x 10(-6) m(2) s(-3). A similar trend was observed by analyzing the depth-dependent M. aeruginosa concentration versus the corresponding time-averaged local turbulent kinetic energy dissipation rate. A maximum cell biomass was discovered at ε similar to 8.0 x 10(-5) m(2) s(-3). Findings from this study can facilitate a greater understanding of physiology and spatial distribution of M. aeruginosa in aquatic ecosystems."

According to the news editors, the research concluded: "The results will be instrumental in developing mechanistic models of the spatial and temporal distribution of M. aeruginosa that can improve management of aquatic ecosystems."

For more information on this research see: Influence of fluid motion on growth and vertical distribution of cyanobacterium Microcystis aeruginosa. Aquatic Ecology, 2016;50
Hormones - Corpus Luteum Hormones

Findings from University of Mississippi Provides New Data on Corpus Luteum Hormones (Serelaxin improves the pathophysiology of placental ischemia in the reduced uterine perfusion pressure rat model of preeclampsia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hormones - Corpus Luteum Hormones. According to news reporting out of Jackson, Mississippi, by NewsRx editors, research stated, "Preeclampsia is a hypertensive disorder of pregnancy that has limited therapeutic options. In healthy pregnancy, relaxin plays an important vasodilatory role to maintain vascular compliance; however, currently, there is no preclinical evidence to support the use of relaxin during preeclampsia."

Financial support for this research came from NIH.

Our news journalists obtained a quote from the research from the University of Mississippi, "Therefore, the goal of this study was to test the hypothesis that recombinant human relaxin-2 (Serelaxin, Novartis; RLX) could reduce mean arterial pressure (MAP) and improve uterine artery resistance index (UARI) and nitric oxide bioavailability, and/or decrease prepro-endothelin-1 (PPET-1), soluble fms-like tyrosine kinase-1 (sFlt-1), and TNF-alpha in the reduced uterine perfusion pressure (RUPP) model of preeclampsia. On day 14 of gestation (GD14), pregnant rats were assigned to normal pregnant (NP), RUPP, RUPP + RLX, or NP + RLX groups. Treated rats received RLX at 0.4 μg/h or RLX2 4 μg/h RLX via minipump implanted on GD14. On GD18, carotid arterial catheters were inserted, and on GD19, MAP and tissues were collected. MAP was increased in RUPP rats compared with NP but was lowered with either dose of RLX. UARI and sFlt-1 were significantly improved in both treated RUPP groups. Total circulating nitrate-nitrite improved and placental PPET-1 and TNF-alpha were significantly decreased with the higher dose of RLX. Renal cortex PPET-1 was reduced with both doses of RLX."

According to the news editors, the research concluded: "Serelaxin improved blood pressure, sFlt-1, TNF-alpha, UARI, and nitric oxide bioavailability and PPET-1 in a rat model..."
of preeclampsia, thereby suggesting a potential therapeutic role for RLX in maintaining maternal health and prolonging pregnancy in the face of placental ischemia."

For more information on this research see: Serelaxin improves the pathophysiology of placental ischemia in the reduced uterine perfusion pressure rat model of preeclampsia. American Journal of Physiology-Regulatory Integrative and Comparative Physiology, 2016;311 (6):R1158-R1163. Blood Diseases and Conditions - Sepsis

Findings from University of Miyazaki in the Area of Sepsis Described (Preterm labor and neonatal sepsis caused by intrauterine Helicobacter cinaedi infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Blood Diseases and Conditions - Sepsis. According to news reporting from Miyazaki, Japan, by NewsRx journalists, research stated, "Helicobacter cinaedi is a rare pathogen but known to cause bacteremia, cellulitis and enterocolitis. Recently, cases of involving various organs are increasingly reported such as endocarditis, meningitis, and kidney cyst infection."

The news correspondents obtained a quote from the research from the University of Miyazaki, "We report a case of intrauterine H. cinaedi infection leading preterm birth and neonatal sepsis. A 29-year-old pregnant women who was no underlying disease hospitalized due to threatened preterm labor at 22 weeks of gestation. Clinical findings showed uterine tenderness, fever, leukocytosis and elevated C-reactive protein. H. cinaedi was isolated from amniotic fluid obtained by transabdominal amniocentesis. We diagnosed as intrauterine H. cinaedi infection and administered intravenous ampicillin followed by oxytocin to terminate pregnancy. A live 446 g male infant was delivered. The patient was no signs of infection throughout postpartum course and discharged on post-deley day 5. The neonate was admitted in neonatal intensive care unit and administered ampicillin and amikacin. H. cinaedi was isolated from umbilical cord blood culture."

According to the news reporters, the research concluded: "He has no signs of infection on day 5 but died from uncontrollable hyperglycemia and ketoacidosis on 15 days of age. H. cinaedi can cause intrauterine infection during pregnancy and lead preterm labor and
neonatal sepsis."

For more information on this research see: Preterm labor and neonatal sepsis caused by intrauterine Helicobacter cinaedi infection. *Journal of Infection and Chemotherapy*, 2016;22 (6):414-416. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Cell Research - Bone Marrow Cells**

**Findings from University of Munster Yields New Data on Bone Marrow Cells [Increased intermediate CD14(++)CD16(++) monocyte subset levels associate with restenosis after peripheral percutaneous transluminal angioplasty]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cell Research - Bone Marrow Cells have been presented. According to news reporting originating in Munster, Germany, by NewsRx journalists, research stated, "We aimed at studying the association of three major human monocyte subsets after percutaneous transluminal angioplasty (PTA) in patients with femoropopliteal disease. We prospectively studied 67 sequential patients (40 male, 27 female; mean age 71 +/- 11 years) treated with femoropopliteal angioplasty."

The news reporters obtained a quote from the research from the University of Munster, "Multi-color flow cytometry characterized monocyte subsets from venous blood for expression of CD14 and CD16 and intracellular myeloperoxidase (MPO) prior to, and 3, 6 and 12 months post PTA. Analyses tested associations between monocyte subsets and risk for restenosis. 16/67 patients (24%) developed restenosis within 12 months after PTA. Patients with hyperlipidemia had increased risk for restenosis (HR = 1.7, 95% CI 0.7-2.9, p = 0.001). Increased baseline monocytes associated with an increased risk of late restenosis (HR = 4.9, 95% CI: 1.3-18.6, p = 0.047). CD14(++)CD16(++) 'intermediate' monocytes assessed at baseline, and after 3, 6, and 12 months significantly associated with the risk for subsequent restenosis: HR = 3.9 (95% CI: 2.4-6.5, p = 0.029), HR = 5.7 (95% CI - 0.7-44.7, p = 0.013), HR - 6.5 (95% CI: 2.5-16.9, p = 0.001) and HR - 1.5 (95% CI - 1.4-15.5 p = 0.001), respectively. Moreover, the probability for freedom of restenosis decreased with increased levels of intermediate subsets at 12 months after PTA. Additionally, intracellular MPO expression in CD14(++)CD16(++) measured at 3, 6 and 12 months associated with an increased restenosis
risk (HR similar to 1.5, 95% CI: 0.8-2.1, p = 0.214, HR = 1.9, 95% CI: 1.0-2.3 p = 0.051 and HR = 1.4, 95% CI: 1.0-1.8, p = 0.052). Our results imply altered innate immunity after angioplasty."

According to the news reporters, the research concluded: "Elevated CD14(++)CD16(++) intermediate monocyte frequencies and increased MPO expression may identify individuals at heightened risk for restenosis."

For more information on this research see: Increased intermediate CD14(++)CD16(++) monocyte subset levels associate with restenosis after peripheral percutaneous transluminal angioplasty. *Atherosclerosis*, 2016;253():128-134. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Cardiovascular Diseases and Conditions - Vasculitis**

**Findings from University of Nantes Has Provided New Data on Vasculitis (Exercise-Induced Vasculitis: A Review with Illustrated Cases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Vasculitis. According to news reporting originating in Nantes, France, by NewsRx journalists, research stated, "Although exercise-induced vasculitis (EIV) is usually misdiagnosed, it is not uncommon. Occurring mostly after prolonged exercise, especially in hot weather, EIV is an isolated cutaneous vasculitis with stereotypical presentation."

The news reporters obtained a quote from the research from the University of Nantes, “This article reviews the clinical characteristics, treatments, and outcomes of EIV based on the published literature. We report 99 patients who developed EIV after walking, dancing, swimming, or hiking especially during hot weather, including the records of 16 patients with EIV treated at our hospital from 2007 to 2015. Erythematous or purpuric plaques arise on the lower legs, without the involvement of compression socks or stockings. Symptoms include itch, pain, and a burning sensation. EIV is an isolated cutaneous vasculitis. Lesions resolve spontaneously after 10 days. When triggering conditions persist, relapses are frequent (77.5%). Histopathology demonstrates leukocytoclastic vasculitis in 95% of cases with C3 or
immunoglobulin M deposits in 88 and 46% of cases, respectively. Blood investigations are negative. EIV appears to be a consequence of venous stasis induced by an acute failure of the muscle pump of the calf and thermoregulation decompensation. Both appear after prolonged and unusual exercise in hot weather."

According to the news reporters, the research concluded: "Treatment is not codified; topical corticosteroids may reduce symptoms and wearing light clothes might limit lesion occurrence."

Our news correspondents report that additional information may be obtained by contacting O. Espitia, Univ Nantes, Dept. of Internal Med, Hotel Dieu, Center Hosp, F-44093 Nantes, France. Oncology - Breast Cancer

Findings from University of Naples Federico II Update Understanding of Breast Cancer (Tumor characteristics and prognosis in familial breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news originating from Naples, Italy, by NewsRx correspondents, research stated, "Approximately 5-10% of breast cancers are hereditary and their biology and prognosis appear to differ from those of sporadic breast cancers. In this study we compared the biological features and clinical characteristics of non metastatic breast cancer in patients with BRCA mutations versus patients with a family history suggesting hereditary breast cancer but without BRCA mutations (BRCA wild type) versus patients with sporadic disease, and correlated these findings with clinical outcome."

Our news journalists obtained a quote from the research from the University of Naples Federico II, "We retrieved the clinical and biological data of 33 BRCA-positive, 66 BRCA-wild type and 1826 sporadic breast cancer patients contained in a single institution clinical database between 1980 and 2012. Specifically, we recorded age, tumor size, nodal status, treatment type, pattern of relapse, second primary incidence, outcome (disease-free survival and overall survival), and biological features (estrogen receptor [ER], progesterone receptor [PgR], tumor grade, proliferation and c-erbB2 status). Median follow-up was 70 months. BRCA-positive patients were significantly younger than sporadic breast cancer patients, and less likely to be ER-, PgR- or c-erbB2-positive than women with BRCA-wild type or
sporadic breast cancer. Tumor size and grade, nodal status and proliferation did not differ among the three groups. Rates of radical mastectomy were 58, 42 and 37%, and those of conservative surgery were 42, 58 and 63% in women with BRCA-positive, BRCA-wild type and sporadic breast cancer (p = 0.03), respectively. The incidence of contralateral breast cancer was 12, 14 and 0% (p < 0.0001) and the incidence of second primary tumors (non breast) was 9, 1 and 2% (p < 0.0001) in BRCA-positive, BRCA-wild type and sporadic breast cancer, respectively. Median disease-free survival in years was 29 in BRCA-wild type, 19 in BRCA-positive and 14 in sporadic breast cancer patients (log-rank = 0.007). Median overall survival in years was not reached for BRCA-wild type, 19 for BRCA-positive and 13 for sporadic breast cancer patients (log-rank < 0.0001). At multivariate analyses only BRCA-wild type status was related to a significant improvement in overall survival versus the sporadic breast cancer group (HR = 0.51; 95% CI (0.28-0.93) p = 0.028)."

According to the news editors, the research concluded: "The biology and outcome of breast cancer differ between patients with BRCA mutations, patients with a family history but no BRCA mutations and patients with sporadic breast cancer."

situation. Boolean networks models are less demanding on the required data to be implemented and can provide insights into the dynamics of biological networks. This methodology allows the integration of all the available knowledge into a single framework to evaluate the behavior of the system under different conditions and test hypotheses about unknown aspects of the disease. In this proof-of-concept study, we explored the potential of a systems pharmacology model based on Boolean networks to support drug development in SLE. We focused the analysis on the antigen presentation by the antigen presenting cells (APC) to the T-cells to evaluate the scope of this methodology in a medium size network before full implementation of the whole SLE pathway. The heterogeneity of SLE patients was replicated using this methodology simulating subjects with distinct pathway alterations. A perturbation analysis of the network coupled with clustering analysis showed potential to identify drug targets, optimal combinatorial regimens and subpopulations of responders and non-responders to drug treatment.

According to the news editors, the research concluded: "We propose this approach as a first step towards the development of more quantitative platforms to address the current challenges in drug development for complex diseases."

The news correspondents report that additional information may be obtained from I.F. Troconiz, University of Navarra, Pharmacometr & Syst Pharmacol, Dept. of Pharm & Pharmaceut Technol, Sch Pharm, Pamplona 310890, Spain. Additional authors for this research include I. consecutive Phase II protocols of high-dose-rate (HDR) brachytherapy used at the authors institution from 2001 to 2012. Patients with National Comprehensive Cancer Network high risk and very high risk prostate cancer enrolled in studies HDR4 (2001-2007, n = 183) and HDR2 (2007-2012, n = 56) were analyzed."

The news reporters obtained a quote from the research from the University of Navarra, "Patients received minipelvis external beam radiation therapy/intensity-modulated external radiotherapy to 54 Gy and 2 years of androgen blockade along with HDR brachytherapy. HDR4 protocol consisted of four 4.75 Gy fractions delivered in 48 hours; the HDR2 protocol delivered two 9.5 Gy fractions in 24 hours. Average 2-Gy equivalent dose (alpha/beta = 1.2) prostate D-90 doses for the HDR4 and HDR2 groups were 89.8 Gy and 110.5 Gy, respectively (p = 0.0001). Both groups were well balanced regarding risk factors. Prior transurethral resection of the prostate was more frequent in the HDR2 group (p = 0.001). After a median followup of 7.4 years (range, 2-11.2), there was no difference in adverse grade >= 2 rectal events (HDR4 = 10.4% vs. HDR2 = 12.5%; p = ns) or grade (HDR4 = 2.2% vs. HDR2 = 3.6%; p = ns). No differences in urinary grade adverse events (HDR4 = 23% vs. HDR2 = 26.8%; p = ns) or grade >=3 (HDR4 = 7.7% vs. HDR2 = 8.9%; p = ns) were detected. The 7-year bRFS for HDR4 and HDR2 protocols was 88.7% and 87.8%, respectively (p = ns)."

According to the news reporters, the research concluded: "HDR4 and HDR2 protocols produce similar results in terms of toxicity and bRFS at the intermediate time point of 7 years."

Our news correspondents report that additional information may be obtained by contacting R. Martinez-Monge, University of Navarra, Univ Navarra Clin, Dept. of Radiat Oncol, E-31080 Pamplona, Navarre, Spain. Additional authors for this research include M. Cambeiro, M. Moreno-Jimenez, L. Cardiovascular Diseases and Conditions - Abdominal…
Findings from University of Navarra Update Understanding of Abdominal Aortic Aneurysm (Anisotropic abdominal aortic aneurysm replicas with biaxial material characterization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm are discussed in a new report. According to news reporting from San Sebastian, Spain, by NewsRx journalists, research stated, "An Abdominal Aortic Aneurysm (AAA) is a permanent focal dilatation of the abdominal aorta at least 1.5 times its normal diameter. The criterion of maximum diameter is still used in clinical practice, although numerical studies have demonstrated the importance of other biomechanical factors."

The news correspondents obtained a quote from the research from the University of Navarra, "Numerical studies, however, must be validated experimentally before they can be clinically implemented. We have developed a methodology for manufacturing anisotropic AAA replicas with non-uniform wall thickness. Different composites were fabricated and tested, and one was selected in order to manufacture a phantom with the same properties. The composites and the phantom were characterized by biaxial tensile tests and a material model was fit to the experimental data. The experimental results were compared with data from the literature, and similar responses were obtained. The anisotropic AAA replicas with non-uniform wall thickness can be used in benchtop experiments to validate deformations obtained with numerical simulations or for pre-intervention testing of endovascular grafts."

According to the news reporters, the research concluded: "This is a significant step forward considering the importance of anisotropy in numerical simulations."

Our news journalists report that additional information may be obtained by contacting R. Anton, University of Navarra, Dept. of Mech Engn, Tecnun, San Sebastian 20018, Spain. Additional authors for this research include R. Anton, A. Cazon, G.S. Larraona and E.A. Finol.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.medengphy.2016.09.010. This DOI is a link to an online electronic document that is either free or for purchase.

stated, "Pancreatic ductal adenocarcinomas are highly malignant cancers characterized by extensive invasion into surrounding tissues, metastasis to distant organs, and a limited response to therapy. A main feature of pancreatic ductal adenocarcinomas is desmoplasia, which leads to extensive deposition of collagen I. We have demonstrated that collagen I can induce epithelialmesenchymal transition (EMT) in pancreatic cancer cells."

Financial supporters for this research include National Cancer Institute, National Institute of General Medical Sciences.

The news reporters obtained a quote from the research from the University of Nebraska, "A hallmark of EMT is an increase in the expression of the mesenchymal cadherin N-cadherin. Previously we showed up-regulation of N-cadherin promotes tumor cell invasion and that collagen I-induced EMT is mediated by two collagen receptors, alpha 2 beta 1-integrin and discoidin domain receptor 1 (DDR1). DDR1 is a receptor-tyrosine kinase widely expressed during embryonic development and in many adult tissues and is also highly expressed in many different cancers. In the signaling pathway initiated by collagen, we have shown proline-rich tyrosine kinase 2 (Pyk2) is downstream of DDR1. In this study we found isoform b of DDR1 is responsible for collagen I-induced up-regulation of N-cadherin and tyrosine 513 of DDR1b is necessary. Knocking down Shc1, which binds to tyrosine 513 of DDR1b via its PTB (phosphotyrosine binding) domain, eliminates the upregulation of N-cadherin. The signaling does not require a functional SH2 domain or the tyrosine residues commonly phosphorylated in Shc1 but is mediated by the interaction between a short segment of the central domain of Shc1 and the proline-rich region of Pyk2."

According to the news reporters, the research concluded: "Taken together, these data illustrate DDR1b, but not DDR1a, mediates collagen I-induced N-cadherin up-regulation, and Shc1 is involved in this process by coupling to both DDR1 and Pyk2."

Our news correspondents report that additional information may be obtained by contacting K.R. Johnson, Univ Nebraska Med Center, Fred & Pamela Buffett Canc Center, Omaha, NE 68198, United States. **Blood Diseases and Conditions - Sepsis**

**Findings from University of North Carolina Yields New Data on Sepsis (Vancomycin-resistant Enterococcal Bloodstream Infections in Hematopoietic Stem Cell Transplant Recipients and Patients with Hematologic Malignancies: Impact of Daptomycin ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Blood Diseases and Conditions - Sepsis. According to news reporting out of Chapel Hill, North Carolina, by NewsRx editors, research stated, "Case reports of treatment failure with standard-dose daptomycin (6 mg/kg) have recently surfaced in vancomycin-resistant Enterococcus (VRE) bloodstream infection (BSI) episodes with daptomycin MICs of 3 to 4 mg/L. The clinical implications of daptomycin MICs of 3 to 4 mg/L in VRE BSIs have not been elucidated."

Our news journalists obtained a quote from the research from the University of North Carolina, "We performed a single institutional retrospective analysis of adult stem cell transplant recipients and patients with hematologic malignancies diagnosed with VRE BSI from 2006 to 2014 and compared outcomes between those with daptomycin MICs of 3 to 4 mg/L those with 2 mg/L, as determined by Etest. Forty-two daptomycin-treated VRE BSI episodes, all due to Enterococcus faecium were identified; 19 episodes with daptomycin MICs of 3 to 4 mg/L and 23 episodes with a daptomycin MIC of 2 mg/L. Patients in the higher daptomycin MIC group were more likely to be male, to be stem cell transplant recipients, and to have received high-dose daptomycin treatment (> 6 mg/kg). In unadjusted analyses, microbiological failure in the daptomycin MICs 3 to 4 mg/L versus 2 mg/L groups (odds ratio = 1.79, 95% CI, 0.52-6.11; P = 0.35), the median duration of bacteremia (4 days in daptomycin MICs 3-4 mg/L vs 3 days in daptomycin MIC 2 mg/L; P = 0.18) and all-cause 30-day mortality (21% in daptomycin MICs 3-4 mg/L vs 35% in daptomycin MIC 2 mg/L group; P = 0.49) were not different. In adjusted analyses, the association between higher Pitt bacteremia scores and all-cause 30-day mortality was statistically significant (P = 0.0006), whereas the association between daptomycin MICs of 3 to 4 mg/L and all-cause 30-day mortality approached statistical significance (P = 0.06). Duration of bacteremia and microbiological failure rates did not differ by daptomycin MICs in VRE BSI episodes in our patients, composed of adult stem cell transplant recipients and patients with hematologic malignancies."

According to the news editors, the research concluded: "There was a nonsignificant trend in multivariable analysis suggesting that all cause 30-day mortality was lower in patients whose VRE bloodstream isolates were with daptomycin MICs of 3 to 4 mg/L."

For more information on this research see: Vancomycin-resistant Enterococcal Bloodstream Infections in Hematopoietic Stem Cell Transplant Recipients and Patients with Hematologic Malignancies: Impact of Daptomycin MICs of 3 to 4 mg/L. *Clinical Therapeutics*, 2016;37(11):2468-2476. *Clinical Therapeutics* can be contacted at: Elsevier, 685 Route 202-206, Bridgewater, NJ 08807, USA. (Elsevier - www.elsevier.com; Clinical Therapeutics - www.journals.elsevier.com/clinical-therapeutics/)

Oncology - Lung Cancer

Findings from University of Oklahoma Reveals New Findings on Lung Cancer (Nanosomes carrying doxorubicin exhibit potent anticancer activity against human lung cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Lung Cancer is the subject of a report. According to news reporting originating in Oklahoma City, Oklahoma, by NewsRx journalists, research stated, "Successful chemotherapeutic intervention for management of lung cancer requires an efficient drug delivery system. Gold nanoparticles (GNPs) can incorporate various therapeutics; however, GPNs have limitations as drug carriers."

The news reporters obtained a quote from the research from the University of Oklahoma, "Nano-sized cellular vesicles like exosomes (Exo) can ferry GNPtherapeutic complexes without causing any particle aggregation or immune response. In the present study, we describe the development and testing of a novel Exo-GNP-based therapeutic delivery system -'nanosomes'--for lung cancer therapy. This system consists of GNPs conjugated to anticancer drug doxorubicin (Dox) by a pH-cleavable bond that is physically loaded onto the exosomes (Exo-GNP-Dox). The therapeutic efficacy of Dox in nanosomes was assessed in H1299 and A549 non-small cell lung cancer cells, normal MRC9 lung fibroblasts, and Dox-sensitive human coronary artery smooth muscle cells (HCASM). The enhanced rate of drug release under acidic conditions, successful uptake of the nanosomes by the recipient cells and the cell viability assays demonstrated that nanosomes exhibit preferential cytotoxicity towards cancer cells and have minimal activity on non-cancerous cells. Finally, the underlying mechanism of cytotoxicity involved ROS-mediated DNA damage."

According to the news reporters, the research concluded: "Results from this study mark the establishment of an amenable drug delivery vehicle and highlight the advantages of a natural drug carrier that demonstrates reduced cellular toxicity and efficient delivery of therapeutics to cancer cells."

Our news correspondents report that additional information may be obtained by contacting R. Ramesh, University of Oklahoma, Hlth Sci Center, Grad Program Biomed Sci,
Findings from University of Ottawa in the Area of Carcinoid Tumor
Reported (Recurrence of a Thymic Carcinoid Tumour 15 Years After Resection With Multiple Myopericardial Cardiac Metastases: The Role of Multimodality Imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Carcinoid Tumor is the subject of a report. According to news originating from Ottawa, Canada, by NewsRx correspondents, research stated, "Carcinoid tumours arising from the thymus are exceedingly rare, and cardiac metastases have not previously been described in the setting of a primary thymic carcinoid tumour. We present a patient with recurrence of a carcinoid tumour initially resected from the thymus 15 years earlier, with multiple cardiac metastases."

Our news journalists obtained a quote from the research from the University of Ottawa, "These metastatic tumours were visualized using multiple imaging modalities, including computed tomography, transthoracic echocardiogram, magnetic resonance imaging, and octreotide scan. A subsequent biopsy confirmed recurrence of his carcinoid tumour."

According to the news editors, the research concluded: "This case highlights the role of multimodality imaging for diagnosis and the need for continued long-term surveillance in these patients."

The news correspondents report that additional information may be obtained from G. Dwivedi, University of Ottawa, Inst Heart, Dept. of Med, Div Cardiol, Ottawa, ON, Canada. Additional authors for this research include A. Dick, A. Alzahrani, H.S. Sekhon, I.G. Burwash and G. Dwivedi.

Findings from University of Ottawa in the Area of Hepatitis C Virus Described (Influence of female sex on hepatitis C virus infection progression and treatment outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Hepatitis C Virus have been presented. According to news reporting from Ottawa, Canada, by NewsRx journalists, research stated, "The influence of sex on hepatitis C virus (HCV)-related outcomes is often neglected. The effects of sex on liver fibrosis progression and the effect of socioeconomic status on management are unclear."

The news correspondents obtained a quote from the research from the University of Ottawa, "Data were evaluated from patients followed at The Ottawa Hospital and Regional Viral Hepatitis Program. Of 1978 chronic HCV-infected patients, 630 (32%) were women. Women had lower liver enzyme levels, HCV RNA levels, and weight compared with men. Women were more likely to be non-genotype-1 infected, Black or Asian, and immigrants from Africa and Asia (all p<0.01). Under 50 years of age, women on average had lower fibrosis scores than men. Beyond the age of 50 years, the mean fibrosis scores were similar, suggesting a 'catch-up' phase. Women were less likely to have initiated interferon-based HCV antiviral therapy (35.3 vs. 43.3%, p=0.01). Crude sustained virological responses were higher in women (65.3 vs. 56.3%, p=0.03), but were similar to men as determined by multivariable analysis (odds ratio: 0.92, 95% confidence interval: 0.58-1.46). Women of low socioeconomic status were more likely to be HIV coinfected and had higher rates of fibrosis progression. Women living in low-income neighborhoods were less likely to achieve sustained virological response (odds ratio: 0.50, 95% confidence interval: 0.34-0.75, p=0.01) compared with women in higher income regions. Sex differences have been identified as a potential barrier to overcome when managing viral infections."

According to the news reporters, the research concluded: "Our analysis suggests that sex influences fibrosis progression, likelihood of initiating HCV antiviral therapy, and treatment outcomes."

Our news journalists report that additional information may be obtained by contacting D.J. Corsi, aThe Ottawa Hospital Research Institute bThe Ottawa Hospital and Regional Viral Hepatitis Program Ottawa cThe University of Ottawa, Ottawa, Ontario, Canada. Findings from University of Oxford Has Provided New Data on Genetics
(53BP1 Integrates DNA Repair and p53-Dependent Cell Fate Decisions via Distinct Mechanisms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genetics have been published. According to news reporting originating in Oxford, United Kingdom, by NewsRx journalists, research stated, "The tumor suppressor protein 53BP1, a pivotal regulator of DNA double-strand break (DSB) repair, was first identified as a p53-interacting protein over two decades ago. However, its direct contributions to p53-dependent cellular activities remain undefined."

The news reporters obtained a quote from the research from the University of Oxford, "Here, we reveal that 53BP1 stimulates genome-wide p53-dependent gene transactivation and repression events in response to ionizing radiation (IR) and synthetic p53 activation. 53BP1-dependent p53 modulation requires both auto-oligomerization and tandem-BRCT domain-mediated bivalent interactions with p53 and the ubiquitin-specific protease USP28. Loss of these activities results in inefficient p53-dependent cell-cycle checkpoint and exit responses. Furthermore, we demonstrate 53BP1-USP28 cooperation to be essential for normal p53-promoter element interactions and gene transactivation-associated events, yet dispensable for 53BP1-dependent DSB repair regulation."

According to the news reporters, the research concluded: "Collectively, our data provide a mechanistic explanation for 53BP1-p53 cooperation in controlling anti-tumorigenic cell-fate decisions and reveal these activities to be distinct and separable from 53BP1's regulation of DNA double-strand break repair pathway choice."

Our news correspondents report that additional information may be obtained by contacting J.R. Chapman, University of Oxford, Chromatin & Genome Integr Lab, Wellcome Trust Center Human Genet, Oxford OX3 7BN, United Kingdom. Additional authors for this research include C. Oliveira, H.E. Lockstone, S. Snellenberg, N. Grolmusova and J.R. Chapman.

Ankylosing Spondylitis

Findings from University of Oxford Update Understanding of Ankylosing Spondylitis (An ankylosing spondylitis-associated genetic variant in the IL23R-IL12RB2 intergenic region modulates enhancer activity and is associated with increased Th1-cell ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Ankylosing Spondylitis have been published. According to news reporting out of Oxford, United Kingdom, by NewsRx editors, research stated, "To explore the functional basis for the association between ankylosing spondylitis (AS) and single-nucleotide polymorphisms (SNPs) in the IL23R-IL12RB2 intergenic region. We performed conditional analysis on genetic association data and used epigenetic data on chromatin remodelling and transcription factor (TF) binding to identify the primary AS-associated IL23R-IL12RB2 intergenic SNP."

Our news journalists obtained a quote from the research from the University of Oxford, "Functional effects were tested in luciferase reporter assays in HEK293T cells and allele-specific TF binding was investigated by electrophoretic mobility gel shift assays. IL23R and IL12RB2 mRNA levels in CD4+ T cells were compared between cases homozygous for the AS-risk 'A' allele and the protective 'G' allele. The proportions of interleukin (IL)-17A+ and interferon (IFN)-g+ CD4+ T-cells were measured by fluorescence-activated cell sorting and compared between these AS-risk and protective genotypes. Conditional analysis identified rs11209032 as the probable causal SNP within a 1.14 kb putative enhancer between IL23R and IL12RB2. Reduced luciferase activity was seen for the risk allele (p <0.001) and reduced H3K4me1 methylation observed in CD4+ T-cells from 'A/A' homozygotes (p=0.02). The binding of nuclear extract to the risk allele was decreased ∼3.5-fold compared with the protective allele (p <0.001). The proportion of IFN-g+ CD4+ T-cells was increased in 'A/A' homozygotes (p=0.004), but neither IL23R nor IL12RB2 mRNA was affected. The rs11209032 SNP downstream of IL23R forms part of an enhancer, allelic variation of which may influence Th1-cell numbers. Homozygosity for the risk 'A' allele is associated with more IFN-g-secreting (Th1) cells."

According to the news editors, the research concluded: "Further work is necessary to explain the mechanisms for these important observations."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1136/annrheumdis-2015-208640. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from University of Oxford Yields New Data on Pulmonary Hypertension (Elevation of iron storage in humans attenuates the pulmonary vascular response to hypoxia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Pulmonary Hypertension is now available. According to news reporting from Oxford, United Kingdom, by NewsRx journalists, research stated, "Sustained hypoxia over several hours induces a progressive rise in pulmonary artery systolic pressure (PASP). Administration of intravenous iron immediately prior to the hypoxia exposure abrogates this effect, suggesting that manipulation of iron stores may modify hypoxia-induced pulmonary hypertension."

Financial supporters for this research include Sir John Monash Scholarship, Avant Scholarship, NIHR Clinical Lectureship, DH | National Institute for Health Research (NIHR) Biomedical Research Centre Programme.

The news correspondents obtained a quote from the research from the University of Oxford, "Iron (ferric carboxymaltose) administered intravenously has a plasma half-life of 7-12 h. Thus any therapeutic use of intravenous iron would require its effect on PASP to persist long after the iron-sugar complex has been cleared from the blood. To examine this, we studied PASP during sustained (6 h) hypoxia on 4 separate days (days 0, 1, 8, and 43) in 22 participants. On day 0, the rise in PASP with hypoxia was well matched between the iron and saline groups. On day 1, each participant received either 1 g of ferric carboxymaltose or saline in a double-blind manner. After administration of intravenous iron, the rise in PASP with hypoxia was attenuated by similar to 50%, and this response remained suppressed on both days 8 and 43 (P < 0.001). Following administration of intravenous iron, values for ferritin concentration, transferrin saturation, and hepcidin concentration rose significantly (P < 0.001, P< 0.005, and P < 0.001, respectively), and values for transferrin concentration fell significantly (P < 0.001). These changes remained significant at day 43. We conclude that the attenuation of the pulmonary vascular response to hypoxia by elevation of iron stores persists long after the artificial iron-sugar complex has been eliminated from the blood."

According to the news reporters, the research concluded: "The persistence of this effect suggests that intravenous iron may be of benefit in some forms of pulmonary hypertension."

For more information on this research see: Elevation of iron storage in humans attenuates the pulmonary vascular response to hypoxia. Journal of Applied Physiology, 2016;121(2):537-544. Journal of Applied Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Our news journalists report that additional information may be obtained by contacting P.A. Robbins, University of Oxford, Dept. of Physiol Anat & Genet, Oxford OX1 3PT, United Kingdom. Additional authors for this research include M.K. Curtis, H.Y. Cheng,
Genetic Diseases and Conditions - Floating-Harbor…

Findings from University of Oxford Yields New Findings on Floating-Harbor Syndrome (Chiari I malformation as part of the Floating-Harbor syndrome?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Genetic Diseases and Conditions - Floating-Harbor Syndrome. According to news reporting out of Oxford, United Kingdom, by NewsRx editors, research stated, "We report the first case of a patient diagnosed with Floating-Harbor syndrome (FHS) and Chiari I malformation."

Our news journalists obtained a quote from the research from the University of Oxford, "The 3-year-old girl was of proportional short stature, had delay of language development, conductive hearing loss and a high threshold of pain. Diagnosis of Chiari I malformation may be difficult in FHS patients who present with communication problems."

According to the news editors, the research concluded: "Clinicians following patients with FHS should be aware of a possible relation between FHS and Chiari I malformation."

For more information on this research see: Chiari I malformation as part of the Floating-Harbor syndrome? European Journal of Medical Genetics, 2016;59(12):615-617. European Journal of Medical Genetics can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; European Journal of Medical Genetics - www.journals.elsevier.com/european-journal-of-medical-genetics/)

Findings from University of Oxford in Prostate Cancer Reported
[Lifestyle factors and prostate-specific antigen (PSA) testing in UK Biobank: Implications for epidemiological research]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "The central role of prostate-specific antigen (PSA) testing in the diagnosis of prostate cancer leads to the possibility that observational studies that report associations between risk factors and prostate cancer could be affected by detection bias. This study aims to investigate whether reported risk factors for prostate cancer are associated with PSA testing in a large middle-aged population-based cohort in the UK."

Our news journalists obtained a quote from the research from the University of Oxford, "The cross-sectional association between a wide range of sociodemographic, lifestyle, dietary and health characteristics with PSA testing was examined in 212,039 men aged 40-69 years in UK Biobank. A total of 62,022 (29%) men reported they had ever had a PSA test. A wide range of factors was associated with a higher likelihood of PSA testing including age, height, education level, family history of prostate cancer, black ethnic origin, not being in paid/self-employment, living with a wife or partner, having had a vasectomy, being diagnosed with cancer or hypertension and having a high dietary intake of cereal, cooked and salad/raw vegetables, fresh fruit and tea. Conversely, socioeconomic deprivation, Asian ethnic origin, current smoking, low alcohol intake, high body-mass index, high coffee consumption and being diagnosed with diabetes, heart disease or stroke were associated with a lower likelihood of PSA testing."

According to the news editors, the research concluded: "A variety of sociodemographic, lifestyle and health-related characteristics are associated with PSA testing, suggesting that observed associations of some of these traits with risk for prostate cancer in epidemiological studies may be, at least partially, due to detection bias."

For more information on this research see: Lifestyle factors and prostate-specific antigen (PSA) testing in UK Biobank: Implications for epidemiological research. Cancer Epidemiology, 2016;45():40-46. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Cancer Epidemiology - www.journals.elsevier.com/cancer-epidemiology/)

The news correspondents report that additional information may be obtained from T.J. Littlejohns, University of Oxford, Epidemiol Studies Unit, Nuffield Dept. of Populat Hlth, Oxford OX3 7LF, United Kingdom. Additional authors for this research include R.C. Travis, T.J. Key and N.E. Allen.

Findings from University of Paris Has Provided New Information about Antiretrovirals (A Predictive Model for Selecting Patients with HCV Genotype 3 Chronic Infection with a High Probability of Sustained Virological Response to Peginterferon ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antiretrovirals is the subject of a report. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "Access to direct-acting antiviral agents (DAAs) is restricted in some settings; thus, the European Association for the Study of the Liver recommends dual peginterferon/ribavirin (PegIFN/RBV) therapy wherever DAAs are unavailable. HCV genotype (GT) 3 infection is now the most difficult genotype to eradicate and PegIFN/RBV remains an effective option."

The news reporters obtained a quote from the research from the University of Paris, "The goal of this study was to devise a simple predictive score to identify GT3 patients with a high probability of achieving a sustained virologic response (SVR) with PegIFN alfa-2a/RBV therapy. Relationships between baseline characteristics and SVR were explored by multiple logistic regression models and used to develop a simple scoring system to predict SVR using data from 1239 treatment-naive GT3 patients who received PegIFN alfa-2a/RBV for 24 weeks in two large observational cohort studies. The score was validated using a database of 473 patients. Scores were assigned for six factors as follows: age (years) (<=)40: 2 points; >40 but <=55: 1; bodyweight (kg) (<70: 2; (>=)70 but <90: 1); no cirrhosis/transition to cirrhosis (2); ALT (<=)2.5 x ULN (1); platelets (109/L) (>200: 2; (>=)100 but <200: 1); HCV RNA (<400,000 IU/mL: 1). The points are summed to arrive at a score ranging from 0-10 where higher scores indicate higher chances of SVR; 141, 123, 203, 249, 232, and 218 patients had total scores of 0-4, 5, 6, 7, 8, and 9-10, respectively, among whom SVR rates were 45%, 62%, 72%, 76%, 84%, and 89%. Among 622 patients who had scores of 6-10 and HCV RNA <50 IU/mL by treatment week 4 the SVR rate was 86% (532/622)."

According to the news reporters, the research concluded: "A simple baseline scoring system involving age, bodyweight, cirrhosis status, ALT level, platelet count and HCV RNA level can be used to identify treatment-naive Caucasian patients with HCV GT3 infection with a high probability of SVR with PegIFN alfa-2a/RBV therapy."

For more information on this research see: A Predictive Model for Selecting Patients with HCV Genotype 3 Chronic Infection with a High Probability of Sustained Virological Response to Peginterferon Alfa-2a/Ribavirin. Plos One, 2016;11(3):e0150569. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Gram-Negative Bacteria - Acinetobacter baumannii

Findings from University of Paris-Sud Provide New Insights into Acinetobacter baumannii (First Occurrence of OXA-72-Producing Acinetobacter baumannii in Serbia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Acinetobacter baumannii have been published. According to news reporting from Le Kremlin Bicetre, France, by NewsRx journalists, research stated, "Here, we characterized the first OXA-72-producing Acinetobacter baumannii isolate (designated MAL) recovered from a urine sample from a Serbian patient. Antimicrobial susceptibility testing, plasmid analysis, and whole-genome sequencing (WGS) were performed to fully characterize the resistome of the A. baumannii MAL clinical isolate."

Funders for this research include Joint Program Initiative on Antimicrobial Resistance, European Community.

The news correspondents obtained a quote from the research from the University of Paris-Sud, "The isolate was multidrug resistant and remained susceptible only to colistin and tigecycline. PCR analysis revealed the presence of the carbapenemase OXA-72, an OXA-40 variant. Extraction by the Kieser method revealed the presence of two plasmids, and one of these, a ca. 10-kb plasmid, harbored the bla(OXA-72) gene. WGS revealed 206 contigs corresponding to a genome of 3.9 Mbp in size with a G + C content of 38.8%. The isolate belonged to sequence type 492 and to worldwide clone II (WWCII). Naturally occurring beta-lactamase-encoding genes (bla(ADC-25) and bla(OXA-66)) were also identified. Aminoglycoside resistance genes encoding one aminoglycoside adenyltransferase (aadA2), three aminoglycoside phosphatases (strA, strB, aphA6), and one 16S RNA methylase (armA) conferring resistance to all aminoglycosides were identified. Resistance to fluoroquinolones was likely due to mutations in gyrA, parC, and parE."

According to the news reporters, the research concluded: "Of note, the resistome matched perfectly with the antibiotic susceptibility testing results."

For more information on this research see: First Occurrence of OXA-72-Producing Acinetobacter baumannii in Serbia. Antimicrobial Agents and Chemotherapy, 2016;60 (10):5724-5730. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Oncology - Melanoma

Findings from University of Paris-Sud Provide New Insights into Melanoma (Adjuvant ipilimumab in stage III melanoma: New landscape, new questions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Melanoma. According to news reporting from Le Kremlin Bicetre, France, by NewsRx editors, the research stated, "The recently reported significant prolongation of overall survival with ipilimumab as adjuvant in high-risk stage III melanoma patients represents an important event in the adjuvant treatment landscape. The European Organisation for Research and Treatment of Cancer 18071 trial demonstrated a 28% reduction in risk of death in patients treated with ipilimumab at 10 mg/kg (hazard ratio for death, 0.72; 95.1% CI, 0.58-0.88; P = 0.001) compared with placebo."

The news correspondents obtained a quote from the research from the University of Paris-Sud, "All end-points-recurrence-free survival (RFS), distant-metastasis-free survival (DMFS) and overall survival (OS)-showed similar benefits. Survival rates at 5 years in ipilimumab-treated patients were OS 11%, DMFS 9% and RFS 11% higher than in placebo-treated patients. Global Health quality-of-life scores were not significantly different between treatment arms, in spite of significant adverse event rates that resulted in only 42% of patients receiving more than four doses of ipilimumab and only 28.9% of patients going beyond 1 year of treatment. Grades 3-4 immune-related adverse events occurred in 41.6% of ipilimumab-treated patients and in 2.7% of placebo-treated patients. One can speculate on dose and duration of treatment, as well as on the requirement for complete lymph-node dissection in sentinel-node-positive patients. The remaining role of interferons will be discussed regarding differences in sensitivity profiles-such as in ulcerated melanoma versus non-ulcerated melanoma-and access to new drugs. Ongoing trials with targeted agents and with anti programmed cell death protein 1 (anti-PD-1) agents may bring significant additional results in the next few years that will redefine how we treat stage III patients."

According to the news reporters, the research concluded: "Overall, pricing of new treatments will determine access and whether patients will actually benefit from new treatment options."

For more information on this research see: Adjuvant ipilimumab in stage III melanoma: New landscape, new questions. European Journal of Cancer, 2016;69():39-42.
Liver Diseases and Conditions - Hepatitis C Virus

Findings from University of Parma Has Provided New Information about Hepatitis C Virus (Are Anti-TNF-a Agents Safe for Treating Psoriasis in Hepatitis C Virus Patients with Advanced Liver Disease? Case Reports and Review of the Literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Liver Diseases and Conditions - Hepatitis C Virus. According to news originating from Parma, Italy, by NewsRx correspondents, research stated, "Tumor necrosis factor-alpha (TNF-a) inhibitors represent an effective treatment for severe psoriasis in hepatitis C virus (HCV) patients. The literature reports mainly on short-term treatment in patients with chronic hepatitis with minimum-to-moderate activity with an acceptable safety profile."

Our news journalists obtained a quote from the research from the University of Parma, "We report the first 2 cases of hepatocellular carcinoma (HCC) arising in HCV psoriatic patients with advanced liver disease during long-term treatment with etanercept. Our first patient, known to have had HCV infection for 41 years, developed an HCC after 21 months of therapy with etanercept (50 mg/week). The second patient, HCV+ for 20 years, was treated for 58 months with the same therapy, and despite no signs of liver function impairment was diagnosed with HCC. Both of them presented with cirrhosis, which was diagnosed 9 and 5 years earlier, respectively. It remains to be clarified whether there is any connection between psoriasis treatment with anti-TNF-a agents and the development of HCC in HCV-infected patients."

According to the news editors, the research concluded: "Further long-term, follow-up studies and registries of HCV patients with mild/moderate activity may contribute to clarify this issue."

The news correspondents report that additional information may be obtained from S. Di Nuzzo, Section of Dermatology, Dept. of Clinical and Experimental Medicine, University of Parma, Parma, Italy. Additional authors for this research include V. Boccaletti, C. Fantini, C.
Cortelazzi, G. Missale, G. Fabrizi, T. Lotti, J. Hercogova and C. Pagliarello.

Terpenes

Findings from University of Pennsylvania Provides New Data on Terpenes (Structure and Function of Fusicoccadiene Synthase, a Hexameric Bifunctional Diterpene Synthase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Terpenes. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "Fusicoccin A is a diterpene glucoside phytotoxin generated by the fungal pathogen Phomopsis amygdali that causes the plant disease constriction canker, first discovered in New Jersey peach orchards in the 1930s. Fusicoccin A is also an emerging new lead in cancer chemotherapy."

Financial supporters for this research include Radcliffe Institute for Advanced Study, Harvard University, Office of Science, National Institute of General Medical Sciences.

Our news journalists obtained a quote from the research from the University of Pennsylvania, "The hydrocarbon precursor of fusicoccin A is the tricyclic diterpene fusicoccadiene, which is generated by a bifunctional terpenoid synthase. Here, we report X-ray crystal structures of the individual catalytic domains of fusicoccadiene synthase: the C-terminal domain is a chain elongation enzyme that generates geranylgeranyl diphosphate, and the N-terminal domain catalyzes the cyclization of geranylgeranyl diphosphate to form fusicoccadiene. Crystal structures of each domain complexed with bisphosphonate substrate analogues suggest that three metal ions and three positively charged amino acid side chains trigger substrate ionization in each active site. While in vitro incubations reveal that the cyclase domain can utilize farnesyl diphosphate and geranyl diphosphate as surrogate substrates, these shorter isoprenoid diphosphates are mainly converted into acyclic alcohol or hydrocarbon products."

According to the news editors, the research concluded: "Gel filtration chromatography and analytical ultracentrifugation experiments indicate that full-length fusicoccadiene synthase adopts hexameric quaternary structure, and small-angle X-ray scattering data yield a well-defined molecular envelope illustrating a plausible model for hexamer assembly."

Our news journalists report that additional information may be obtained by contacting M. Chen, Roy and Diana Vagelos Laboratories, Dept. of Chemistry, University of
Pennsylvania, Philadelphia, Pennsylvania 19104-6323, United States. Additional authors for this research include W.K. Chou, T. Toyomasu, D.E. Cane and D.W Christianson.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acschembio.5b00960. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Atrial Fibrillation

Findings from University of Pennsylvania Yields New Findings on Atrial Fibrillation (Mechanistic insights into mitral regurgitation due to atrial fibrillation: "Atrial functional mitral. regurgitation.")

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Atrial Fibrillation are presented in a new report. According to news reporting originating in Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Mitral regurgitation (MR) is common, and definitive management of significant MR often requires percutaneous or surgical correction. Lone atrial fibrillation has been proposed to result in 'atrial functional mitral regurgitation (AFMR)' via left atrial enlargement and mitral annular dilation."

The news reporters obtained a quote from the research from the University of Pennsylvania, "Patients with AFMR may represent a subgroup in which a rhythm control strategy may be preferred and catheter ablation is a promising nonsurgical therapy. This review discusses the anatomy of the mitral valve apparatus and MR classification schemes."

According to the news reporters, the research concluded: "Potential mechanisms in the pathogenesis of AFMR the implications for treatment will be discussed in detail."

Our news correspondents report that additional information may be obtained by contacting J.J. Liang, University of Pennsylvania, University of Pennsylvania Hospital, Perelman Sch Med, Div Cardiovasc, Philadelphia, PA 19104, United States.

Digestive System Diseases and Conditions - Acid Reflux Disease

Findings from University of Pennsylvania in the Area of Acid Reflux Disease Described (Autophagy Levels Are Elevated in Barrett's Esophagus and Promote Cell Survival From Acid and Oxidative Stress)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Digestive System Diseases and Conditions - Acid Reflux Disease is the subject of a report. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "Autophagy is a highly conserved mechanism that is activated during cellular stress. We hypothesized that autophagy may be induced by acid reflux, which causes injury, and inflammation, and therefore, contributes to the pathogenesis of Barrett's esophagus (BE) and esophageal adenocarcinoma (EAC)."

Our news journalists obtained a quote from the research from the University of Pennsylvania, "Currently, the role of autophagy in BE and EAC is poorly studied. We quantitatively define autophagy levels in human BE cell lines, a transgenic mouse model of BE, and human BE, and EAC biopsies. Human non-dysplastic BE had the highest basal number of autophagic vesicles (AVs), while AVs were reduced in normal squamous cells and dysplastic BE cells, and nearly absent in EAC. To demonstrate a functional role for autophagy in BE pathogenesis, normal squamous (STR), non-dysplastic BE (CPA), dysplastic BE (CPD), and EAC (OE19) cell lines were exposed to an acid pulse (pH 3.5) followed by incubation in the presence or absence of chloroquine, an autophagy inhibitor. Acid exposure increased reactive oxygen species (ROS) levels in STR and CPA cells. Chloroquine alone had a small impact on intracellular ROS or cell survival. However, combination of chloroquine with the acid pulse resulted in a significant increase in ROS levels at 6 h in STR and CPA cells, and increased cell death in all cell lines. These findings establish increased numbers of AVs in human BE compared to normal squamous or EAC, and suggest that autophagy functions to improve cell survival after acid reflux injury."

According to the news editors, the research concluded: "Autophagy may thus play a critical role in BE pathogenesis and progression."

Keywords for this news article include: Philadelphia, Pennsylvania, United States, North and Central America, Digestive System Diseases and Conditions, Gastrointestinal Diseases and Conditions, Esophageal Diseases and Conditions, Digestive System Abnormalities, Acid Reflux Disease, Barrett Esophagus, Barrett Syndrome, Gastroenterology, Cell Line, Genetics, University of Pennsylvania.

Findings from University of Pisa in the Area of Malaria Described (Ethnopharmacology in the fight against Plasmodium parasites and brain disorders: In memoriam of Philippe Rasoanaivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mosquito-Borne Diseases - Malaria is the subject of a report. According to news reporting originating from Pisa, Italy, by NewsRx correspondents, research stated, "Prof. Philippe Rasoanaivo was a highly dedicated and brilliant scientist in the field of ethnopharmacology."

Our news editors obtained a quote from the research from the University of Pisa, "He worked for the Institut Malgache de Recherches Appliquees and the University of Antananarivo, Madagascar. His research was mainly focused on the endemic medicinal and aromatic plants used by traditional healers in Madagascar against a range of parasites, with special reference to Plasmodium spp."

According to the news editors, the research concluded: "In this Editorial, we resumed the key findings of his research activity, with special reference to the discovery of alkaloids that markedly enhance the action of chloroquine against malaria parasites."

The news editors report that additional information may be obtained by contacting G. Benelli, University of Pisa, Dept. of Agr Food & Environm, I-56124 Pisa, Italy. Additional authors for this research include F. Maggi and M. Nicoletti.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jep.2016.07.077. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from University of Pompeu Fabra Update Knowledge of Antibiotics (Validation of a colistin plasma concentration breakpoint as a predictor of nephrotoxicity in patients treated with colistin methanesulfonate)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news reporting out of Barcelona, Spain, by NewsRx editors, research stated, "Nephrotoxicity limits the effective use of colistin for the treatment of multidrug-resistant Gram-negative bacteria (MDR-GNB) infections. We previously defined a steady-state colistin plasma concentration (C-ss) of 2.42 mg/L that predicted nephrotoxicity at end of treatment (EOT)."

Our news journalists obtained a quote from the research from the University of Pompeu Fabra, "The objective of this study was to validate this breakpoint in a prospective cohort. This was a multicentre, prospective, observational study conducted at three hospitals with a cohort of patients treated for MDR-GNB infection with colistin methanesulfonate from September 2011 until January 2015. Nephrotoxicity was evaluated at Day 7 and at EOT using the RIFLE criteria. C-ss values were measured and analysed using HPLC. Taking the previously defined breakpoint for colistin concentration as a criterion, patients were divided into two groups (C-ss, <= 2.42 mg/L vs. > 2.42 mg/L). Sixty-four patients were included. Seven patients (10.9%) had a C-ss > 2.42 mg/L and were compared with the remaining patients. Bivariate analysis showed that patients with a C-ss > 2.42 mg/L were older and had a significantly higher incidence of nephrotoxicity at Day 7 and EOT. Although not statistically significant, nephrotoxicity occurred earlier in these patients (6.2 days vs. 9.2 days in patients with lower C-ss; P = 0.091). Multivariate analysis of nephrotoxicity showed that C-ss > 2.42 mg/L was the only predictive factor. Nephrotoxicity was more frequent and occurred earlier in patients with colistin plasma concentrations higher than the previously defined breakpoint (2.42 mg/L)."

According to the news editors, the research concluded: "Colistin therapeutic drug monitoring should be routinely considered to avoid reaching this toxicity threshold and potential clinical consequences."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijantimicag.2016.08.020. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from University of Porto Reveals New Findings on Hypertension (Pulmonary arterial hypertension: Basic knowledge for clinicians)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Hypertension. According to news originating from Oporto, Portugal, by NewsRx correspondents, research stated, "Pulmonary arterial hypertension is a progressive syndrome based on diverse aetiologies, which is characterized by a persistent increase in pulmonary vascular resistance and overload of the right ventricle, leading to heart failure and death."

Our news journalists obtained a quote from the research from the University of Porto, "Currently, none of the available treatments is able to cure pulmonary arterial hypertension; additional research is therefore needed to unravel the associated pathophysiological mechanisms."

According to the news editors, the research concluded: "This review summarizes current knowledge related to this disorder, and the several experimental animal models that can mimic pulmonary arterial hypertension and are available for translational research."

For more information on this research see: Pulmonary arterial hypertension: Basic knowledge for clinicians. Archives of Cardiovascular Diseases, 2016;109(10):550-561. Archives of Cardiovascular Diseases can be contacted at: Elsevier Masson, Via Paleocapa 7, 20121 Milano, Italy. (Elsevier - www.elsevier.com; Archives of Cardiovascular Diseases - www.journals.elsevier.com/archives-of-cardiovascular-diseases/)

The news correspondents report that additional information may be obtained from C. Bras-Silva, University of Porto, Fac Nutr & Food Sci, P-4200465 Oporto, Portugal. Additional authors for this research include P. Mendes-Ferreira, C. Maia-Rocha, R. Adao, A.F. Leite-Moreira and C. Bras-Silva.

Findings from University of Quebec Provide New Insights into Human Coronavirus Oc43 (Safe and Sensitive Antiviral Screening Platform Based on Recombinant Human Coronavirus OC43 Expressing the Luciferase Reporter Gene)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Human Coronavirus Oc43 are presented in a new report. According to news reporting originating in Laval, Canada, by NewsRx journalists, research
stated, "Human coronaviruses (HCoVs) cause 15 to 30% of mild upper respiratory tract infections. However, no specific antiviral drugs are available to prevent or treat HCoV infections to date."

The news reporters obtained a quote from the research from the University of Quebec, "Here, we developed four infectious recombinant HCoVs-OC43 (rHCoVs-OC43) which express the Renilla luciferase (Rluc) reporter gene. Among these four rHCoVs-OC43, rOC43-ns2DelRluc (generated by replacing ns2 with the Rluc gene) showed robust luciferase activity with only a slight impact on its growth characteristics. Additionally, this recombinant virus remained stable for at least 10 passages in BHK-21 cells. rOC43-ns2DelRluc was comparable to its parental wild-type virus (HCoV-OC43-WT) with respect to the quantity of the antiviral activity of chloroquine and ribavirin. We showed that chloroquine strongly inhibited HCoV-OC43 replication in vitro, with a 50% inhibitory concentration (IC50) of 0.33 μM. However, ribavirin showed inhibition of HCoV-OC43 replication only at high concentrations which may not be applicable to humans in clinical treatment, with an IC50 of 10 μM. Furthermore, using a luciferase-based small interfering RNA (siRNA) screening assay, we identified double-stranded-RNA-activated protein kinase (PKR) and DEAD box RNA helicases (DDX3X) that exhibited antiviral activities, which were further verified by the use of HCoV-OC43-WT."

According to the news reporters, the research concluded: "Therefore, rOC43-ns2DelRluc represents a promising safe and sensitive platform for high-throughput antiviral screening and quantitative analysis of viral replication."

For more information on this research see: Safe and Sensitive Antiviral Screening Platform Based on Recombinant Human Coronavirus OC43 Expressing the Luciferase Reporter Gene. Antimicrobial Agents and Chemotherapy, 2016;60(9):5492-5503. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Cardiovascular Research

Findings from University of Queensland Broaden Understanding of Cardiovascular Research (Sedentary Time, Cardiorespiratory Fitness, and Cardiovascular Risk Factor Clustering in Older Adults-the Generation 100 Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Research. According to news originating from Brisbane, Australia, by NewsRx correspondents, research stated, "To determine whether meeting physical activity (PA) recommendations and/or having high age-specific cardiorespiratory fitness (CRF) attenuate the adverse effect of prolonged sedentary time on cardiovascular risk factor (CV-RF) clustering in older adults. We conducted a cross-sectional study of Norwegian women (495) and men (379) aged 70 to 77 years from August 22, 2012, through June 30, 2013."

Our news journalists obtained a quote from the research from the University of Queensland, "Sedentary time and PA were assessed by accelerometers and CRF by directly measured peak oxygen uptake (VO2peak). Logistic regression was used to estimate adjusted odds ratios (ORs) and CIs for the association between sedentary time and prevalence of CV-RF clustering (≥ 3 of the following: hypertension, high blood glucose level, high waist circumference, low high-density lipoprotein cholesterol level, or high triglyceride level) and for the modifying effect of PA and CRF. Overall, 163 of the 495 women (32.9%) and 140 of the 379 men (36.9%) had CV-RF clustering. Each additional hour of sedentary time was associated with 22% (OR, 1.22; 95% CI, 1.02-1.45) and 27% (OR, 1.27; 95% CI, 1.04-1.55) higher likelihood of having CV-RF clustering in women and men, respectively, whereas a 1-metabolic equivalent decrement in VO2peak corresponded to 57% (OR, 1.57; 95% CI, 1.34-1.84) and 67% (OR, 1.67; 95% CI, 1.44-1.95) higher likelihood of CV-RF clustering in women and men, respectively. High CRF (VO2peak >27.5 mL/kg per minute in women and >34.4 mL/kg per minute in men) attenuated the adverse effects of high sedentary time on CV-RF clustering, even among individuals not meeting recommendations for PA."

According to the news editors, the research concluded: "High age-specific CRF fully attenuates the adverse effect of prolonged sedentary time on CV-RF clustering, independent of meeting the PA consensus recommendation in older adults."

The news correspondents report that additional information may be obtained from U. Wisloff, University of Queensland, Sch Human Movement & Nutr Sci, Brisbane, Qld, Australia. Additional authors for this research include J. Nauman, N. Zisko, O. Sandbakk, N.P. Aspvik, D. Stensvold and U. Wisloff.

Findings from University of Queensland Yields New Data on Pancreatic Cancer (Association between family cancer history and risk of pancreatic cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Pancreatic Cancer.

According to news reporting out of Herston, Australia, by NewsRx editors, research stated, "Family history of pancreatic adenocarcinoma is an established risk factor for the disease. However, associations of pancreatic cancer with other familial cancers are less clear."

Funders for this research include National Health and Medical Research Council Australia, NHMRC Senior Research Fellowships and N Pandeya by an NHMRC postdoctoral fellowship, Australian Research Council Future fellowship.

Our news journalists obtained a quote from the research from the University of Queensland, "We analyzed data from the Queensland Pancreatic Cancer Study (QPCS), an Australian population-based case-control study, to investigate associations between family history of various cancer types and risk of pancreatic cancer. Our study included 591 pancreatic cancer patients and 646 controls, all of whom self-reported the histories of cancer in their first-degree relatives. We used logistic regression to estimate adjusted odds ratios (ORs) and their 95% confidence intervals (CIs). Based on our results, we conducted a systematic literature review using the Medline (OVID) database to identify articles pertaining to the association between family history of melanoma and risk of pancreatic cancer. A meta-analysis including associations in five published studies, unpublished results from a study co-author and the QPCS results was then performed using the DerSimonian and Laird random-effects model. Cases were more likely than controls to report a family history of pancreatic cancer (OR 2.20, 95% CI 1.16-4.19) and melanoma (OR 1.74, 95% CI 1.03-2.95), but not of breast, ovarian, respiratory, other gastrointestinal or prostate cancer. Meta-analysis of melanoma family history and pancreatic cancer risk yielded an OR of 1.22 (95% CI 1.00-1.51). Our results yield further evidence of increased risk of pancreatic cancer in those with family histories of the disease."

According to the news editors, the research concluded: "We also provide suggestive evidence of an association between family history of melanoma and risk of pancreatic cancer."

For more information on this research see: Association between family cancer history and risk of pancreatic cancer. Cancer Epidemiology, 2016;45():145-150. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Cancer Epidemiology - www.journals.elsevier.com/cancer-epidemiology/)

Our news journalists report that additional information may be obtained by contacting A. Schulte, University of Queensland, Sch Med, Herston, Qld 4006, Australia. Additional authors for this research include N. Pandeya, J. Fawcett, L. Fritschi, K. Klein, H.A. Risch, P.M. Webb, D.C. Whiteman and R.E. Neale.

Nanotechnology and Microtechnology

Findings from University of Queensland in the Area of Nanotechnology and Microtechnology Described (Toward Precision Medicine: A Cancer Molecular Subtyping Nano-Strategy for RNA Biomarkers in Tumor and Urine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nanotechnology and Microtechnology. According to news reporting originating in Brisbane, Australia, by NewsRx journalists, research stated, "Cancer is a heterogeneous disease which manifests as different molecular subtypes due to the complex nature of tumor initiation, progression, and metastasis. The concept of precision medicine aims to exploit this cancer heterogeneity by incorporating diagnostic technology to characterize each cancer patient's molecular subtype for tailored treatments."

Financial supporters for this research include Australian Research Council, National Breast Cancer Foundation.

The news reporters obtained a quote from the research from the University of Queensland, "To characterize cancer molecular subtypes accurately, a suite of multiplexed bioassays have currently been developed to detect multiple oncogenic biomarkers. Despite the reliability of current multiplexed detection techniques, novel strategies are still needed to resolve limitations such as long assay time, complex protocols, and difficulty in interpreting broad overlapping spectral peaks of conventional fluorescence readouts. Herein a rapid (80 min) multiplexed platform strategy for subtyping prostate cancer tumor and urine samples based on their RNA biomarker profiles is presented. This is achieved by combining rapid multiplexed isothermal reverse transcription-recombinase polymerase amplification (RT-RPA) of target RNA biomarkers with surface-enhanced Raman spectroscopy (SERS) nanotags for 'one-pot' readout. This is the first translational application of a RT-RPA/SERS-based platform for multiplexed cancer biomarker detection to address a clinical need."

According to the news reporters, the research concluded: "With excellent sensitivity of 200 zmol (100 copies) and specificity, we believed that this platform methodology could be a useful tool for rapid multiplexed subtyping of cancers."

Our news correspondents report that additional information may be obtained by contacting E.J.H. Wee, University of Queensland, AI BN, Center Personalized Nanomed, Brisbane, Qld 4072, Australia. Additional authors for this research include E.J.H. Wee, P.N. Mainwaring, Y.L. Wang and M. Trau.

Oncology - Breast Cancer

Findings from University of Reims Update Knowledge of Breast Cancer (Costs associated with Eribulin treatment for patients with metastatic breast cancer in a comprehensive cancer center in France)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting originating in Reims, France, by NewsRx journalists, research stated, "There is no standard recommendation for metastatic breast cancer treatment (MBC) after two chemotherapy regimens. Eribulin (Halaven ®) has shown a significant improvement in overall survival (OS) in this setting."

The news reporters obtained a quote from the research from the University of Reims, "Its use may however be hampered by its cost, which is up to three times the cost of other standard drugs. We report the clinical outcomes and health care costs of a large series of consecutive MBC patients treated with Eribulin. A monocentric retrospective study was conducted at Institut Curie over 1 year (August 2012 to August 2013). Data from patient’s medical records were extracted to estimate treatment and outcome patterns, and direct medical costs until the end of treatment were measured. Factors affecting cost variability were identified by multiple linear regressions and factors linked to OS by a multivariate Cox model. We included 87 MBC patients. The median OS was 10.7 months (95%CI = 8.0-13.3). By multivariate Cox analysis, independent factors of poor prognosis were an Eastern Cooperative Oncology Group (ECOG) performance status of 3, a number of metastatic sites >= 4 and the need for hospitalization. Per patient costs during whole treatment were 18,694 [CI 95%: 16,028-21,360], and 2581 [CI 95%: 2226 3038] per month. Eribulin administration contributed to 79% of per-patient costs. Innovative and expensive drugs often appear to be the main cost drivers in cancer treatment, particularly for MBC."

According to the news reporters, the research concluded: "There is an urgent need to assess clinical practice benefits."

Our news correspondents report that additional information may be obtained by contacting A. Hurtaud, University of Reims, Dept. of Gen Practice, Fac Med, F-51100 Reims, France. Additional authors for this research include A. Donnadieu, L. Escalup, P.H. Cottu and S. Baffert.

Drugs and Therapies - Metabolic Agents

Findings from University of Rostock Has Provided New Data on Metabolic Agents (Pharmacologic Treatment Assigned for Niemann Pick Type C1 Disease Partly Changes Behavioral Traits in Wild-Type Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Metabolic Agents. According to news originating from Rostock, Germany, by NewsRx correspondents, research stated, "Niemann-Pick Type C1 (NPC1) is an autosomal recessive inherited disorder characterized by accumulation of cholesterol and glycosphingolipids. Previously, we demonstrated that BALB/c-npc1(nih)Npc1(-/-) mice treated with miglustat, cyclodextrin and allopregnanolone generally performed better than untreated Npc1(-/-) animals."

Our news journalists obtained a quote from the research from the University of Rostock, "Unexpectedly, they also seemed to accomplish motor tests better than their sham-treated wild-type littermates. However, combination-treated mutant mice displayed worse cognition performance compared to sham-treated ones. To evaluate effects of these drugs in healthy BALB/c mice, we here analyzed pharmacologic effects on motor and cognitive behavior of wild-type mice. For combination treatment mice were injected with allopregnanolone/cyclodextrin weekly, starting at P7. Miglustat injections were performed daily from P10 till P23. Starting at P23, miglustat was embedded in the chow. Other mice were treated with miglustat only, or sham-treated. The battery of behavioral tests consisted of accelerod, Morris water maze, elevated plus maze, open field and hot-plate tests. Motor capabilities and spontaneous motor behavior were unaltered in both drug-treated groups. Miglustat-treated wild-type mice displayed impaired spatial learning compared to sham-and combination-treated mice. Both combination-and miglustat-treated mice showed enhanced anxiety in the elevated plus maze compared to sham-treated mice. Additionally, combination treatment as well as miglustat alone significantly reduced brain weight, whereas only combination treatment reduced body weight significantly."

According to the news editors, the research concluded: "Our results suggest that allopregnanolone/cyclodextrin ameliorate most side effects of miglustat in wild-type mice."

For more information on this research see: Pharmacologic Treatment Assigned for Niemann Pick Type C1 Disease Partly Changes Behavioral Traits in Wild-Type Mice. *International Journal of Molecular Sciences*, 2016;17(11):1551-1567. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news correspondents report that additional information may be obtained from V. Schlegel, University of Rostock, Inst Anat, D-18055 Rostock, Germany. Additional authors for this research include M. Thieme, C. Holzmann, M. Witt, U. Grittner, A. Rolfs and A. Wree.

Oncology - Colon Cancer

Findings from University of Sannio Provides New Data about Colon Cancer (Proteomic screening identifies calreticulin as a miR-27a direct target repressing MHC class I cell surface exposure in colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting from Benevento, Italy, by NewsRx journalists, research stated, "Impairment of the immune response and aberrant expression of microRNAs are emerging hallmarks of tumor initiation/progression, in addition to driver gene mutations and epigenetic modifications. We performed a preliminary survey of independent adenoma and colorectal cancer (CRC) miRnoma data sets and, among the most dysregulated miRNAs, we selected miR-27a and disclosed that it is already upregulated in adenoma and further increases during the evolution to adenocarcinoma."

The news correspondents obtained a quote from the research from the University of Sannio, "To identify novel genes and pathways regulated by this miRNA, we employed a differential 2DE-DIGE proteome analysis. We showed that miR-27a modulates a group of proteins involved in MHC class I cell surface exposure and, mechanistically, demonstrated that calreticulin is a miR-27a direct target responsible for most downstream effects in epistasis experiments. In vitro miR-27a affected cell proliferation and angiogenesis; mouse xenografts of human CRC cell lines expressing different miR-27a levels confirmed the protein variations and recapitulated the cell growth and apoptosis effects. In vivo miR-27a inversely correlated with MHC class I molecules and calreticulin expression, CD8(+) T cells infiltration and cytotoxic activity (LAMP-I exposure and perforin release). Tumours with high miR-27a, low calreticulin and CD8(+) T cells' infiltration were associated with distant metastasis and poor prognosis. Our data demonstrate that miR-27a acts as an oncomiRNA, represses MHC class I expression through calreticulin downregulation and affects tumor progression."

According to the news reporters, the research concluded: "These results may pave the way for better diagnosis, patient stratification and novel therapeutic approaches."

For more information on this research see: Proteomic screening identifies calreticulin as a miR-27a direct target repressing MHC class I cell surface exposure in colorectal cancer. *Cell Death & Disease, 2016;7():e2120. (Nature Publishing Group - www.nature.com/cddis/)

Liver Diseases and Conditions - Non-Alcoholic...

Findings from University of Seville Has Provided New Data on Non-Alcoholic Steatohepatitis (Improvement in liver histology due to lifestyle modification is independently associated with improved kidney function in patients with non-alcoholic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Liver Diseases and Conditions - Non-Alcoholic Steatohepatitis is the subject of a report. According to news originating from Seville, Spain, by NewsRx correspondents, research stated, "Several recent studies have shown a strong association between non-alcoholic steatohepatitis (NASH) and chronic kidney disease. To examine the relationship between changes in liver histology and renal function in patients with NASH."

Financial support for this research came from National Institute of Gastroenterology and Ministry of Health.

Our news journalists obtained a quote from the research from the University of Seville, "The present analysis represents a post hoc analysis of a recently published trial that included 261 patients with NASH who were treated with lifestyle modifications during 52 weeks. Kidney function was evaluated through Chronic Kidney Disease Epidemiology Collaboration estimated glomerular filtration rates (eGFR, mL/min/1.73 m(2)) overtime. We explored correlations between the kidney function and improvement in histological outcomes at 52 weeks. Interestingly, a one-stage reduction in fibrosis (r = 0.20, P< 0.01) and resolution of NASH (r = 0.17, P< 0.01) were significantly correlated with an improvement in the kidney function. The eGFR values significantly increased in patients with fibrosis improvement (+7.6 +/- 6.5 mL/min/1.73 m(2)), compared to those without fibrosis improvement (-1.98 +/- 6.4 mL/min/1.73 m(2)) (P < 0.01) at end of treatment (EOT). Likewise, NASH resolution was associated with an increase in eGFR compared with patients without NASH resolution (2.32 +/- 7.8 mL/min/1.73 m(2) vs. -1.04 +/- 5.9 mL/min/1.73 m(2), P = 0.04) at EOT. After controlling for the confounders, the association between fibrosis improvement, NASH resolution and eGFR change remained significant (P < 0.05 for both). Improvement in liver histology due to lifestyle modification is independently associated with improved kidney function in patients with NASH."

According to the news editors, the research concluded: "As new drugs for NASH emerge, studies should address whether improvement in histology in response to pharmacotherapies yield the same improvement in kidney function as weight loss."

For more information on this research see: Improvement in liver histology due to lifestyle modification is independently associated with improved kidney function in patients with non-alcoholic steatohepatitis. *Alimentary Pharmacology & Therapeutics*, 2017;45(2):332-344. *Alimentary Pharmacology & Therapeutics* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Nutritional and Metabolic Diseases and Conditions ...

Findings from University of Sherbrooke Provides New Data about Hyperglycemia (Persistent Insulin Resistance in Podocytes Caused by Epigenetic Changes of SHP-1 in Diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Hyperglycemia have been presented. According to news reporting originating in Sherbrooke, Canada, by NewsRx journalists, research stated, "Poor glycemic control profoundly affects protein expression and the cell signaling action that contributes to glycemic memory and irreversible progression of diabetic nephropathy (DN). We demonstrate that SHP-1 is elevated in podocytes of diabetic mice, causing insulin unresponsiveness and DN."

Funders for this research include Canadian Institute of Health Research, JDRF International, Diabete Estrie.

The news reporters obtained a quote from the research from the University of Sherbrooke, "Thus, sustained SHP-1 expression caused by hyperglycemia despite systemic glucose normalization could contribute to the glycemic memory effect in DN. Microalbuminuria, glomerular filtration rate, mesangial cell expansion, and collagen type IV and transforming growth factor-beta expression were significantly increased in diabetic Ins2 (+/c96Y) mice compared with nondiabetic Ins2(+/+) mice and remained elevated despite glucose normalization with insulin implants. A persistent increase of SHP-1 expression in podocytes despite normalization of systemic glucose levels was associated with sustained inhibition of the insulin signaling pathways. In cultured podocytes, high glucose levels increased mRNA, protein expression, and phosphatase activity of SHP-1, which remained elevated despite glucose concentration returning to normal, causing persistent insulin receptor-beta inhibition. Histone posttranslational modification analysis showed that the promoter region of SHP-1 was enriched with H3K4me1 and H3K9/14ac in diabetic glomeruli and podocytes, which remained elevated despite glucose level normalization."

According to the news reporters, the research concluded: "Hyperglycemia induces SHP-1 promoter epigenetic modifications, causing its persistent expression and activity and leading to insulin resistance, podocyte dysfunction, and DN."
For more information on this research see: Persistent Insulin Resistance in Podocytes Caused by Epigenetic Changes of SHP-1 in Diabetes. *Diabetes*, 2016;65(12):3705-3717. *Diabetes* can be contacted at: Amer Diabetes Assoc, 1701 N Beauregard St, Alexandria, VA 22311-1717, USA. **Nanotechnology - Nanoparticles**

**Findings from University of Sonora Update Understanding of Nanoparticles (Folate Functionalized PLGA Nanoparticles Loaded with Plasmid pVAX1-NH36: Mathematical Analysis of Release)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nanotechnology - Nanoparticles. According to news reporting originating in Hermosillo, Mexico, by NewsRx journalists, research stated, "Plasmid DNA (pVAX1-NH36) was encapsulated in nanoparticles of poly-dL-lactic-coglycolic (PLGA) functionalized with polyethylene glycol (PEG) and folic acid (PLGA-PEG-FA) without losing integrity. PLGA-PEG-FA nanoparticles loaded with pVAX1-NH36 (pDNA-NPs) were prepared by using a double emulsification-solvent evaporation technique."

The news reporters obtained a quote from the research from the University of Sonora, "PLGA-PEG-FA synthesis was verified by FT-IR and spectrophotometry methods. pVAX1-NH36 was replicated in Escherichia coli (E. coli) cell cultures. Atomic force microscopy (AFM) analysis confirmed pDNA-NPs size with an average diameter of 177-229 nm, depending on pVAX1-NH36 loading and zeta potentials were below 24 mV for all preparations. In vitro release studies confirmed a multiphase release profile for the duration of more than 30-days. Plasmid release kinetics were analyzed with a release model that considered simultaneous contributions of initial burst and degradation-relaxation of nanoparticles. Fitting of release model against experimental data presented excellent correlation."

According to the news reporters, the research concluded: "This mathematical analysis presents a novel approach to describe and predict the release of plasmid DNA from biodegradable nanoparticles."

Our news correspondents report that additional information may be obtained by contacting C.A. Gutierrez-Valenzuela, Univ Sonora, Nanotechnol Grad Program, Dept. of Phys, Hermosillo 83000, Sonora, Mexico. Additional authors for this research include P. Guerrero-German, A. Tejeda-Mansir, R. Esquivel, R. Guzman-Z and A. Lucero-Acuna.

Proteins - Heme Proteins

**Findings from University of Stellenbosch in the Area of Heme Proteins Reported [Inhibitory Interactions of Aspalathus linearis (Rooibos) Extracts and Compounds, Aspalathin and Z-2-(beta-D-Glucopyranosyloxy)-3-phenylpropenoic Acid, on Cytochromes ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Heme Proteins. According to news reporting out of Cape Town, South Africa, by NewsRx editors, research stated, "Rooibos extract, due to its glucose and lipid lowering effects, has potential as a nutraceutical for improvement of metabolic dysfunction. Potential herb-drug interactions as a result of the use of natural products are of increasing concern."

Our news journalists obtained a quote from the research from the University of Stellenbosch, "Cytochrome P450 enzymes, CYP2C8, CYP2C9, and CYP3A4, are important in the metabolism of hypoglycemic drugs, such as thiazolidinediones (TZDs) and sulfonylureas, and hypocholesterolemic drugs, such as atorvastatin. This study investigated the effects of rooibos extracts, prepared from 'unfermented' and 'fermented' rooibos plant material and two of the major bioactive compounds, Z-2-(beta-D-glucopyranosyloxy)-3-phenylpropenoic acid (PPAG) and aspalathin (ASP), on Vivid r recombinant CYP450 enzymes. Unfermented (GRT) and fermented (FRE) rooibos extracts inhibited the activity of CYP2C8 (7.69 +/- 8.85 mu g/mL and 8.93 +/- 8.88 mu g/mL, respectively) and CYP3A4 (31.33 +/- 4.69 mu g/mL and 51.44 +/- 4.31 mu g/mL, respectively) based on their respective IC50 concentrations. Both extracts dose- and time-dependently inhibited CYP2C8 activity, but only time-dependently inhibited CYP2C9. CYP3A4 showed concentration-dependent inhibition by ASP, GRT, and FRE at 25, 50, and 100 mu g/mL concentrations. ASP, GRT, and FRE time-dependently inhibited CYP3A4 activity with GRT and FRE showing a more potent time-dependent inhibition, comparable to erythromycin."

According to the news editors, the research concluded: "These findings suggest that herb-drug interactions may occur when nutraceuticals containing rooibos extracts are co-administered with hypoglycemic drugs such as TZDs, sulfonylureas, and dyslipidemic drug, atorvastatin."

**Oncology - Cancer Care**

**Findings from University of Sussex Provides New Data about Cancer Care (Therapeutic aims of drugs offering only progression-free survival are misunderstood by patients, and oncologists may be overly optimistic about likely benefits)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Cancer Care is the subject of a report. According to news reporting originating from Brighton, United Kingdom, by NewsRx correspondents, research stated, "The use of novel and often expensive drugs offering limited survival benefit in advanced disease is controversial. Treatment recommendations are influenced by patient characteristics and trial data showing overall response rates (ORR), progression-free survival (PFS) and overall survival (OS)."

Financial support for this research came from Boehringer Ingelheim International GmbH.
