Study Findings from International Center for Genetic Engineering and Biotechnology Provide New Insights into Science (Stabilization of SIRT7 deacetylase by viral oncoprotein HBx leads to inhibition of growth restrictive RPS7 gene and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Science. According to news reporting originating from New Delhi, India, by NewsRx correspondents, research stated, "Sirtuin-7 (SIRT7) deacetylase exhibits a high selectivity for acetylated H3K18 and has been implicated in the maintenance of malignant phenotype. However, it remains unclear if SIRT7 and H3K18ac play a role in the tumorigenic program driven by oncogenic viruses."

Our news editors obtained a quote from the research from International Center for Genetic Engineering and Biotechnology, "We show that ectopically expressed HBx oncoprotein of hepatitis B virus promoted intracellular stability of SIRT7 by salvaging it from ubiquitin-mediated proteasomal degradation. HBx-dependent accumulation of SIRT7 favored H3K18 deacetylation and down-regulated the small ribosomal protein gene, RPS7, involved in cell death and DNA damage response. HBx facilitated the recruitment of SIRT7 to RPS7 promoter thus impeding H3K18ac occupancy and hindering RPS7 transcription. The antagonistic relationship between SIRT7 and RPS7 was also observed in the HBx transgenic mice, where elevated levels of SIRT7 protein were coincident with low levels of H3K18ac and RPS7. Strikingly, inhibition of cellular deubiquitinase activity restored RPS7 gene transcription. Further, depletion of endogenous SIRT7 led to decreased cell viability and transformation. The biological relevance of RPS7 suppression by HBx-SIRT7 axis was evident from ectopic expression of RPS7 which attenuated clonogenicity of cells."

According to the news editors, the research concluded: "Thus, our findings suggest that SIRT7 is a critical regulator of HBx-driven oncogenic program, through its antagonistic impact on growth restrictive ribosomal protein RPS7."

For more information on this research see: Stabilization of SIRT7 deacetylase by viral oncoprotein HBx leads to inhibition of growth restrictive RPS7 gene and facilitates cellular transformation. Scientific Reports, 2015;5():14806. (Nature Publishing Group -

Gram-Positive Bacteria - Streptococcus

Study Findings from Islamic Azad University Broaden Understanding of Streptococcus (Effect of photodynamic therapy with two photosensitizers on Streptococcus mutants: In vitro study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Gram-Positive Bacteria - Streptococcus is the subject of a report. According to news reporting from Tehran, Iran, by NewsRx journalists, research stated, "Streptococcus mutans (S. mutans) colonizes the oral cavity and causes dental caries and periodontal diseases. Considering the importance of the treatments that decrease pathogenic microorganisms, the aim of the present research was the assessment of the antimicrobial effect of Photodynamic Therapy (PDT) with Methylene Blue (MB) and Indocyanine Green (IG) photosensitizers on S. mutans."

The news correspondents obtained a quote from the research from Islamic Azad University, "In this In vitro experimental study, Sixty four caries-free first premolars were contaminated with 0.5 McFarland S.mutans suspension and were randomly assigned to 4 groups. The teeth in the first group were impregnated with 2% MB while the teeth in the second group were impregnated with 0.2% IG. The teeth in the first group were irradiated with continuous-wave 660 nm diode laser with 40 mw output power, energy density of 2.4 J/cm(2) and 100% duty cycle for 60 s, while the teeth in the second group were irradiated with continuous-wave 810 nm diode laser with 100 mw out power, density energy of 6 J/cm(2) and 100% duty cycle for 60s in contact mode. In the third group, the teeth were suspended in 0.2% Chlorhexidine for 30 s. The fourth group was considered as the control. The teeth were sampled before and after the interventions and the samples were incubated in Blood Agar for 24 h. Afterwards, the number of S. mutans colonies were counted. Data were statistically analyzed by Kruskal-Wallis, Dunn's and Friedman tests. In the groups treated with a combination of MB and IG and laser irradiation and also in the Chlorhexidine group, the final number of S. mutans colonies equaled zero. In 'MB and IG groups without laser irradiation', although the amount of microorganisms decreased, but the number of colonies did not reach zero. Pair comparisons by Dunn's test showed that there was a significant difference between 'MB and IG groups without laser irradiation' and the other experimental groups p = 0.03)."

According to the news reporters, the research concluded: "PDT with MB and IG photosensitizers and also Chlorhexidine mouthwash, have the ability to completely eradicate S. mutans bacterial colonies."
For more information on this research see: Effect of photodynamic therapy with two photosensitizers on Streptococcus mutants: In vitro study. Photodiagnosis and Photodynamic Therapy, 2016;16():66-71. Photodiagnosis and Photodynamic Therapy can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Bone Research

Study Findings from J. Plummer et al Provide New Insights into Bone Research (Methionine-Restricted Diet Increases miRNAs That Can Target RUNX2 Expression and Alters Bone Structure in Young Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Bone Research is now available. According to news reporting originating in Cold Spring on Hudson, New York, by NewsRx journalists, research stated, "Dietary methionine restriction (MR) increases longevity and improves healthspan in rodent models. Young male C57BL/6J mice were placed on MR to assess effects on bone structure and formation."

The news reporters obtained a quote from the research, "Mice were fed diets containing 0.86% or 0.12% methionine for 5 weeks. Fasting blood plasma was analyzed for metabolic and bone-related biomarkers. Tibiae were analyzed by histomorphometry, while femurs were analyzed by micro-CT and biomechanically using 4-point bending. MR mice had reduced plasma glucose and insulin, while FGF21 and FGF23 increased. Plasma levels of osteocalcin and osteoprotegerin were unaffected, but sclerostin and procollagen I decreased. MR induced bone marrow fat accretion, antithetical to the reduced fat depots seen throughout the body. Cortical bone showed significant decreases in Bone Tissue Density (BTD). In trabecular bone, mice had decreased BTD, bone surface, trabecula and bone volume, and trabecular thickness. Biomechanical testing showed that on MR, bones were significantly less stiff and had reduced maximum load and total work, suggesting greater fragility. Reduced expression of RUNX2 occurred in bone marrow of MR mice. These results suggest that MR alters bone remodeling and apposition. In MR mice, miR-31 in plasma and liver, and miR-133a, miR-335-5p, and miR-204 in the bone marrow was elevated. These miRNAs were shown previously to target and regulate Osterix and RUNX2 in bone, which could inhibit osteoblast differentiation and function."
According to the news reporters, the research concluded: "Therefore, dietary MR in young animals alters bone structure by increasing miRNAs in bone and liver that can target RUNX2. J. Cell. Biochem. 118: 31-42, 2017."

Our news correspondents report that additional information may be obtained by contacting J.R. Hens, Orentreich Fdn Adv Sci Inc, Cold Spring on Hudson, NY 10516, United States. Additional authors for this research include M. Park, F. Perodin, M.C. Horowitz and J.R. Hens.

Diarylheptanoids

Study Findings from Jamia Millia Islamia Provide New Insights into Diarylheptanoids (Characterization and anti-proliferative activity of curcumin loaded chitosan nanoparticles in cervical cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Diarylheptanoids are presented in a new report. According to news reporting from New Delhi, India, by NewsRx journalists, research stated, "In the present study the chitosan nanoparticles (CsNPs) and curcumin loaded chitosan nanoparticles (CLCsNPs) were synthesized by tripolyphosphate (TPP) cross-linking method. The nanoparticles were prepared within a zone of appropriate chitosan and TPP concentrations."

Financial support for this research came from Department of Science and Technology.

The news correspondents obtained a quote from the research from Jamia Millia Islamia, "The average size of CsNPs and CLCsNPs were approximately 189 +/- 11.8 nm and 197 +/- 16.8 nm, exhibited a zeta potential of +76 +/- 5.6 mV and +71 +/- 6.4 mV respectively and drug entrapment efficiency was approximate to 85%. The CLCsNPs and CsNPs were further characterized by different physicochemical methods like transmission electron microscopy (TEM), dynamic light scattering (DLS), HPLC, MALDI-TOF, FT-IR, XRD and UV-vis Spectroscopy. In vitro studies revealed a fast release of approximate to 35% at pH 5 and approximate to 25% at pH 7.4 of the drug during the first 3 h, followed by controlled release of curcumin over a period of 120 h and sustained anti-proliferative activity of the drug in a dose and time dependent manner of CLCsNPs and combination with methyl jasmonate. The higher cytotoxicity effect of CLCsNPs may be due to their higher cellular uptake as compared to curcumin. Chitosan nanoparticles were not only stable but also a nontoxic."

According to the news reporters, the research concluded: "Our data suggested that
curcumin loaded nanoformulations, therefore, might be promising candidates in cancer therapy."

Our news journalists report that additional information may be obtained by contacting M.A. Khan, Jamia Millia Islamia, Dept. of Biosci, Genome Biol Lab, New Delhi 110025, India. Additional authors for this research include M. Zafaryab, S.H. Mehdi, I. Ahmad and M.M.A. Rizvi.

**Blood Pressure**

**Study Findings from Jena University Hospital Broaden Understanding of Blood Pressure (Dysautonomia in prodromal a-synucleinopathy: peripheral versus central autonomic degeneration)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Blood Pressure. According to news reporting originating from Jena, Germany, by NewsRx correspondents, research stated, "There is an urgent need for early predictive markers for the course of disease in prodromal a-synucleinopathies such as idiopathic rapid eye movement (REM) sleep behaviour disorder. Autonomic cardiac/vascular dysfunction is a prominent feature in advanced a-synucleinopathies, but its diagnostic value as an early neurodegenerative marker remains unclear."

Our news editors obtained a quote from the research from Jena University Hospital, "The latter may be complicated since synuclein-mediated neurodegeneration may involve central and peripheral components of the autonomic nervous system. The diagnostic value of autonomic symptoms and central and peripheral autonomic markers of blood pressure and heart rate regulation were prospectively evaluated in 20 subjects with idiopathic REM sleep behaviour disorder and 20 age-matched healthy controls. Although subjects with REM sleep behaviour disorder showed no clinical autonomic symptoms, blood pressure (P (<=) 0.035) and heart rate response (P (<=) 0.065) were slightly diminished during orthostatic challenge. Autonomic dysregulation was distinctively reflected in lower resting heart rate (all components, P (<=) 0.05) and blood pressure variability (low frequency component, P (<=) 0.024) indicating peripheral cardiac/vascular denervation. In contrast, baroreflex sensitivity and central cardiac autonomic outflow (sympathovagal balance) were well preserved indicating intact central autonomic regulation. Heart rate variability [very low frequency component, receiver operating
characteristic (ROC) area under the curve (AUC) 0.80, P (<=) 0.001] and blood pressure variability (low frequency component ROC AUC 0.73, P (<=) 0.01) but not baroreflex sensitivity and sympathovagal balance showed an excellent diagnostic accuracy in identifying subjects with REM sleep behaviour disorder and healthy controls. Cardiac/vascular dysfunction in prodromal a-synucleinopathy arises from peripheral rather than from central autonomic degeneration."

According to the news editors, the research concluded: "Autonomic indices encoded in heart rate and blood pressure variability are precise functional markers of early synuclein-mediated neurodegeneration."

The news editors report that additional information may be obtained by contacting C. Dahms, Hans Berger Dept. of Neurology, Jena University Hospital, Jena, Germany. Additional authors for this research include A. Guenther, M. Schwab, T. Schultze, S. Nowack, D. Hoyer, J. Ehrhardt, O.W. Witte, G. Mayer and S. Rupprecht.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ene.12957. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Jena, Europe, Germany, Cardiology, Synucleins, Mental Health, Blood Pressure, Neurodegenerative, Nerve Tissue Proteins, Diagnostics and Screening, Autonomic Nervous System Diseases and Conditions.

Hematologic Diseases and Conditions -

Study Findings from Johannes Gutenberg-University Provide New Insights into Thrombocytopenic Purpura (Idiopathic thrombotic thrombocytopenic purpura: strongest risk factor for relapse from remission is having had a relapse)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematologic Diseases and Conditions - Thrombocytopenic Purpura is the subject of a report. According to news reporting originating in Mainz, Germany, by NewsRx journalists, research stated, "Thrombotic thrombocytopenic purpura (TTP) is a rare, episodic clinical syndrome involving the production of thrombi in the microvasculature accompanied by thrombocytopenia and symptoms of organ ischemia. Idiopathic TTP develops when a patient produces antibodies that react with the protease ADAMTS13."

The news reporters obtained a quote from the research from Johannes Gutenberg-University, "The course after an episode is unpredictable; patients may relapse frequently or never. There is no laboratory value that can reliably predict potential relapse. To assess diagnostic and predictive values for risk of relapse, plasma samples from 27 patients with idiopathic TTP in remission were analyzed for anti-ADAMTS13 immunoglobulin (Ig)G, ADAMTS13 activity, and ADAMTS13 inhibitor titer. Patients were recruited at the Department
of Hematology at the University Medical Center, Johannes Gutenberg University Mainz, Mainz, Germany. Anti-ADAMTS13 IgG was detected in 12 patients (44%); their median level of ADAMTS13 activity was nondetectable. Patients with anti-ADAMTS13 IgG had a median number of three previous relapses, whereas the 15 patients without presence of IgG (56%) had a median number of one previous relapse (p < 0.001; Mann-Whitney U test). The concentration of free anti-ADAMTS13 IgG and the levels measuring inhibitory activity (Bethesda unit) were positively correlated. A subgroup of TTP patients in remission with anti-ADAMTS13 IgG and nondetectable ADAMTS13 activity showed an increased risk for relapsing disease as demonstrated by their number of past relapses."

According to the news reporters, the research concluded: "The positive correlation we observed between anti-ADAMTS13 IgG and inhibitor levels supports the theory of ADAMTS13 inhibition as the crucial mechanism causing severe deficiency in ADAMTS13 activity in TTP."

Our correspondents report that additional information may be obtained by contacting I. Scharrer, Johannes Gutenberg Univ Mainz, Dept. of Hematol, University Medical Center, Mainz, Germany.

Keywords for this news article include: Mainz, Germany, Europe, Hematologic Diseases and Conditions, Blood Coagulation Disorders, Thrombocytopenic Purpura, Risk and Prevention, Hematology, Johannes Gutenberg-University.

Mental Health

Study Findings from Johns Hopkins School of Nursing Broaden Understanding of Mental Health (Reproductive coercion, sexual risk behaviours and mental health symptoms among young low-income behaviourally bisexual women: implications for nursing ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Mental Health are discussed in a new report. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "Aims and objectives. To describe prevalence of reproductive coercion, sexual risk behaviours and mental health symptoms among women reporting lifetime sexual experiences with men and women compared to peers reporting sex exclusively with men."

Funders for this research include National Institute of Mental Health, National Institutes of Health, Ruth L. Kirschstein NRSA Institutional Postdoctoral Fellowship, National Institute of Child Health and Human Development.

The news correspondents obtained a quote from the research from the Johns Hopkins School of Nursing, "Reproductive coercion, a global public health problem, is understudied among sexual minority women. Violence against women remains high among women who have sex with women and men. Rates of sexual and physical violence among this population are
higher than women reporting exclusive sexual partnerships with either men or women. Nurses and other healthcare providers often do not conduct comprehensive sexual histories; assumptions related to a sex partner's gender may provide indications of broader health implications. Cross-sectional survey of low-income Black women ages 18-25 recruited from six community-based sites for a parent study focused on intimate partner violence and health. We analysed survey data from participants who reported lifetime sexual experiences with men and women (N = 42) and compared their outcomes to those of women reporting sexual experiences with men only (N = 107). A greater proportion of women who have sex with women and men reported experiencing reproductive coercion. Women who have sex with women and men also reported a greater number of lifetime intimate partner physical and sexual violence experiences, traded sex for resources, and had post-traumatic stress disorder symptoms. Findings provide vital information that can inform nursing clinical practice, specifically related to history-taking, screening protocols and counselling strategies for intimate partner violence and mental health among women who have sex with women and men. Relevance to clinical practice.

According to the news reporters, the research concluded: "Strategies for addressing reproductive coercion and intimate partner violence as well as the health consequences among women who have sex with women and men in clinical and community-based settings should include a longitudinal understanding of sexual behaviour and gender of sex partners."

Our news journalists report that additional information may be obtained by contacting K.A. Alexander, Johns Hopkins Sch Nursing, Baltimore, MD 21205, United States. Additional authors for this research include E.M. Volpe, S. Abboud and J.C. Campbell.

**Drugs and Therapies - Drug Delivery Systems**

**Study Findings from Justus-Liebig-University Provide New Insights into Drug Delivery Systems [Innovative formulations for controlled drug delivery to the lungs and the technical and toxicological challenges to overcome()]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news reporting out of Giessen, Germany, by NewsRx editors, research stated, "Inhalation of therapeutic aerosols has a long tradition and is, moreover,
regarded as a safe and efficient route of drug administration to the respiratory tract. Especially, the targeting opportunities of this approach are beneficial for the treatment of numerous airway diseases."

Our news journalists obtained a quote from the research from Justus-Liebig-University, "However, the rapid decay of local drug concentration and the resulting short-term duration of action of conventional medications necessitates several daily inhalations, which is clearly in conflict with a patients' convenience and compliance. Recent progress in pharmaceutical engineering has provided promising drug delivery vehicles (e.g., liposomes, nanoparticles and thermo-responsive preparations) allowing for a sustained release of the encapsulated medication at the target site. Nevertheless, aspects such as generating tailored aerosols from these formulations (including stability during aerosolization) and the choice of biocompatible excipients remain considerable challenges, which need to be addressed in order to optimize inhalation therapy. Therefore, toxicology issues raised by these novel drug delivery vehicles with respect to physicochemical and material properties and biocompatibility are described in this review."

According to the news editors, the research concluded: "This brief overview is intended to serve as a foundation to prompt future advancement in the field of controlled drug delivery to the lungs."

Our news journalists report that additional information may be obtained by contacting M. Beck-Broichsitter, Medical Clinic II, Dept. of Internal Medicine, Justus-Liebig-Universitat, Klinikstrasse 33, D-35392 Giessen, Germany. Additional authors for this research include A. Bohr, M. Delaval, A.C. Dalla-Bona, T. Gessler, W. Seeger and M. Beck-Broichsitter.

Drugs and Therapies - Toxicology and Pharmacology

Study Findings from K. Stanton et al Broaden Understanding of Toxicology and Pharmacology (Quantifying the benefits of using read-across and in silico techniques to fulfill hazard data requirements for chemical categories)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Toxicology and Pharmacology. According to news originating from Washington, District of Columbia, by NewsRx correspondents, research stated, "Substantial benefits are realized through the use of read-across and in silico techniques to fill data gaps for structurally similar substances. Considerable experience in applying these techniques was gained under two voluntary high production volume (HPV) chemical programs - the International Council of Chemical Associations' (ICCA) Cooperative Chemicals Assessment Programme (with the cooperation of
the Organization of Economic Cooperation and Development) and the U.S."

Our news journalists obtained a quote from the research, "Environmental Protection Agency's HPV Challenge Program. These programs led to the compilation and public availability of baseline sets of health and environmental effects data for thousands of chemicals. The American Cleaning Institute's (ACI) contribution to these national and global efforts included the compilation of these datasets for 261 substances. Chemicals that have structural similarities are likely to have similar environmental fate, physical-chemical and toxicological properties, which was confirmed by examining available data from across the range of substances within categories of structurally similar HPV chemicals. These similarities allowed the utilization of read-across, trend analysis techniques and qualitative structure activity relationship ((Q)SAR) tools to fill data gaps. This paper presents the first quantification of actual benefits resulting from avoided testing through the use of read-across and in silico tools."

According to the news editors, the research concluded: "Specifically, in the evaluation of these 261 noted substances, the use of 100,000-150,000 test animals and the expenditures of $50,000,000 to $70,000,000 (US) were avoided."

For more information on this research see: Quantifying the benefits of using read-across and in silico techniques to fulfill hazard data requirements for chemical categories. Regulatory Toxicology and Pharmacology, 2016;81():250-259. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Regulatory Toxicology and Pharmacology - www.journals.elsevier.com/regulatory-toxicology-and-pharmacology/)

Adrenal Gland Diseases and Conditions - ...

Study Findings from Kanazawa University Broaden Understanding of Hyperaldosteronism (Comparison of eplerenone and spironolactone for the treatment of primary aldosteronism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Adrenal Gland Diseases and Conditions - Hyperaldosteronism. According to news originating from Kanazawa, Japan, by NewsRx correspondents, research stated, "The mineralocorticoid receptor (MR) is expressed in the kidneys and in adipose tissue, and primary aldosteronism (PA) is associated with metabolic syndrome. This study assessed the effects of MR blockade by eplerenone (EPL) and spironolactone (SPL) on blood pressure (BP) and metabolic factors in patients with PA."

Our news journalists obtained a quote from the research from Kanazawa University, "Fifty-four patients with PA were treated with one of two MRAs, EPL (25-100 mg daily, n=27)
or SPL (12.5-100 mg daily, n=27) for 12 months. Visceral (VAT) and subcutaneous adipose tissue were quantified using CT and FatScan imaging analysis software. Body mass index, homeostasis model assessment-insulin resistance (HOMA-IR), serum creatinine, potassium and lipids, urinary albumin excretion (UAE) and plasma aldosterone concentration (PAC) and plasma renin activity (PRA) were measured before and after treatment. EPL and SPL decreased BP and increased serum potassium levels to similar degrees. PAC and PRA did not differ between the two groups. Although treatment with the MRAs did not change HOMA-IR or serum lipids, they significantly decreased UAE and VAT (p <0.05). These results suggest that EPL and SPL are effective and safe for the treatment of PA."

According to the news editors, the research concluded: "The long-term metabolic and renal effects of these MRAs should be further investigated."

For more information on this research see: Comparison of eplerenone and spironolactone for the treatment of primary aldosteronism. *Hypertension Research*, 2015;39 (3):133-7. (Nature Publishing Group - www.nature.com/; Hypertension Research - www.nature.com/hr/)

The news correspondents report that additional information may be obtained from S. Karashima, Dept. of Internal Medicine, Graduate School of Medical Science, Kanazawa University, Kanazawa, Japan. Additional authors for this research include T. Yoneda, M. Kometani, M. Ohe, S. Mori, T. Sawamura, K. Furukawa, T. Seta, M. Yamagishi and Y. Takeda.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/hr.2015.129. This DOI is a link to an online electronic document that is either free or for purchase.

Skin Diseases and Conditions - Erythema Multiforme

**Study Findings from Kinki University School of Medicine Provide New Insights into Erythema Multiforme (Phase I/II Study of Sorafenib in Combination with Hepatic Arterial Infusion Chemotherapy Using Low-Dose Cisplatin and 5-Fluorouracil)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Skin Diseases and Conditions - Erythema Multiforme is now available. According to news reporting out of Osaka, Japan, by NewsRx editors, research stated, "We conducted a phase I/II study in patients with advanced hepatocellular carcinoma (HCC) to determine the recommended dose, as well as the safety and efficacy, of combination therapy of sorafenib with hepatic arterial infusion chemotherapy (HAIC) using low dose cisplatin (CDDP) and 5-fluorouracil (5FU). Cohorts consisting of 3-6 patients with HCC received an escalated dose of CDDP and 5-FU until a maximum-tolerated dose was achieved."

Our news journalists obtained a quote from the research from the Kinki University School of Medicine, "The treatment regimen was as follows: oral administration of sorafenib (400 mg twice daily for 28 days) combined with HAIC using CDDP (14-20 mg/m(2), on days 1 and 8) and 5-FU (170-330 mg/m(2), continuously on days 1-5 and 8-12) via an implanted
Each treatment cycle consisted of 28 days and three cycles of combination therapy. At the end of the first cycle, adverse events were evaluated and future dose escalation was determined. Eighteen patients with advanced HCC were enrolled. Dose-limiting toxicity was observed in two patients from cohort 1 (erythema multiforme and grade 4 thrombocytopenia) and in one patient from cohort 2 (erythema multiforme). Seven of the 18 patients achieved a partial response, seven showed stable disease, two were diagnosed as progressive disease, and two were not assessable. The response rate was 38.9% and the disease control rate was 77.8%. The time-to-progression was 9.7 months and the 1-year survival rate was 88.2%. Oral administration of 400 mg of sorafenib twice daily, 20 mg/m(2) of intra-arterial infusion of CDDP, and 5-FU at 330 mg/m(2) are the recommended doses for combination therapy, which was well tolerated and efficacious. This combination therapy may be a promising treatment for patients with advanced HCC.

According to the news editors, the research concluded: "A large prospective randomized multicenter study (ClinicalTrials.gov Identifier NCT01214343) is ongoing."

Our news journalists report that additional information may be obtained by contacting K. Ueshima, Dept. of Gastroenterology and Hepatology, Kinki University School of Medicine, Osaka, Japan. Neurodegenerative Diseases and Conditions...

Study Findings from Ludwig-Maximilians-University Provide New Insights into Alzheimer Disease (sTREM2 cerebrospinal fluid levels are a potential biomarker for microglia activity in early-stage Alzheimer's disease and associate with neuronal ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Alzheimer Disease have been published. According to news reporting originating from Munich, Germany, by NewsRx correspondents, research stated, "TREM2 is an innate immune receptor expressed on the surface of microglia. Loss-of-function mutations of TREM2 are associated with increased risk of Alzheimer's disease (AD)."

Our news editors obtained a quote from the research from Ludwig-Maximilians-University, "TREM2 is a type-1 protein with an ectodomain that is proteolytically cleaved and released into the extracellular space as a soluble variant (sTREM2), which can be measured in the cerebrospinal fluid (CSF). In this cross-sectional multicenter study, we investigated whether CSF levels of sTREM2 are changed during the clinical course of AD, and in cognitively normal individuals with suspected non-AD pathology (SNAP). CSF sTREM2 levels were higher in mild cognitive impairment due to AD than in all other AD groups and controls. SNAP individuals also had significantly increased CSF sTREM2 compared to controls. Moreover, increased CSF sTREM2 levels were associated with higher CSF total tau and phospho-tau181P, which are markers of neuronal degeneration and tau pathology."

According to the news editors, the research concluded: "Our data demonstrate that CSF sTREM2 levels are increased in the early symptomatic phase of AD, probably reflecting a corresponding change of the microglia activation status in response to neuronal degeneration."

The news editors report that additional information may be obtained by contacting M. Ewers, Institute for Stroke and Dementia Research, Klinikum der Universitat Munchen, Ludwig-Maximilians-University Munich, Munich, Germany. Additional authors for this research include G. Kleinberger, M.A. Araque Caballero, M. Brendel, A. Rominger, D. Alcolea, J. Fortea, A. Lleo, R. Blesa, J.D. Gispert, R. Sanchez-Valle, A. Antonell, L. Rami, J.L. Molinuevo, F. Brosseron, A. Cardiology

Study Findings from Maastricht University Broaden Understanding of Cardiology (Abnormal Ventricular and Aortic Wall Properties Can Cause Inconsistencies in Grading Aortic Regurgitation Severity: A Computer Simulation Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting from Maastricht, Netherlands, by NewsRx journalists, research stated, "Assessment of aortic regurgitation (AR) severity is often based on Doppler echocardiographic imaging. Hemodynamic responses to AR are influenced by the interplay among cardiovascular properties, including left ventricular (LV) and aortic tissue properties, that cannot be measured directly."

The news correspondents obtained a quote from the research from Maastricht University, "The aim of this study was to investigate how both echocardiographic measures of AR severity and the hemodynamic consequences of AR are influenced by LV and aortic stiffness. AR was simulated using the CircAdapt computational model of the human cardiovascular system. Simulations were performed with normal LV and aortic stiffness, high LV stiffness, high aortic stiffness, and high LV and aortic stiffness. For each configuration of levels of stiffness, four AR severity grades were simulated by setting the effective regurgitant orifice area (ROA) of the aortic valve at 0, 0.05, 0.25, and 0.6 cm(2), representing no, mild, moderate, and severe AR, respectively. The regurgitant volume, regurgitant fraction (RF), and pressure half-time (PHT) were computed for each simulation giving an AR severity score (mild, moderate, or severe). Mean left atrial pressure was also calculated. Increasing ROA resulted in faster decay of diastolic flow velocity and larger regurgitant blood flow across the aortic valve. This caused shorter PHT and larger regurgitant volume and RF, all indicating higher AR severity. Increasing aortic stiffness resulted in a larger decline in diastolic aortic pressure, whereas increasing LV stiffness resulted in a larger rise in diastolic LV pressure. Hence, increasing LV and/or aortic stiffness led to faster decay of the transvalvular pressure gradient and, therefore, to faster decay of diastolic flow velocity across the aortic valve compared with normal stiffness with the same ROA. This faster decay led, on one hand, to a shorter PHT, indicating higher severity scores, and, on the other hand, to a lower RF, as less regurgitant blood volume traveled into the left ventricle, indicating lower severity scores. AR severity scores reflected mean left atrial pressure poorly when variations in tissue properties were present. Simulating altered AR hemodynamics caused by variations in cardiovascular tissue properties led to inconsistent severity scores when evaluating the severity using RF, regurgitant volume, and PHT. In this situation, pulmonary congestion is poorly reflected by AR severity as quantified by ROA, RF, and PHT."

According to the news reporters, the research concluded: "Cardiac and aortic tissue properties should therefore be taken into account to improve clinical assessment of AR severity."

Our news journalists report that additional information may be obtained by contacting G. Palau-Caballero, Maastricht University, Dept. of Biomed Engn, Cardiovasc Res Inst Maastricht, Maastricht, Netherlands. Additional authors for this research include J. Walmsley, J. Gorcsan, J. Lumens and T. Delhaas.

Bone Research

Study Findings from Mayo Clinic Broaden Understanding of Bone Research (Deletion of Estrogen Receptor Beta in Osteoprogenitor Cells Increases Trabecular but Not Cortical Bone Mass in Female Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Bone Research have been published. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "Although the role of ERa in regulating bone metabolism has been extensively studied, ERb has been largely dismissed as a relevant modulator of bone mass. Previous studies examining ERb utilized a germline knockout mouse expressing transcript variants of ERb and displaying systemic hormonal changes that confounded interpretation of the skeletal phenotype."

Financial support for this research came from NIH.

The news correspondents obtained a quote from the research from Mayo Clinic, "Thus, we used a conditional ERb mouse model to achieve deletion of ERb specifically in early osteoprogenitor cells using the Prx1-Cre driver. We observed marked increases in the trabecular bone volume fraction (of 58% [p <0.003] and 93% [p <0.0003] in 6-and 12-week-old female ERb(Prx1-CKO) mice, respectively) but no changes in cortical bone. Serum estradiol and IGF-I levels were unaltered in ERb(Prx1-CKO) mice. Bone formation and resorption indices by histomorphometry and serum assays were unchanged in these mice, suggesting that alterations in bone turnover may have occurred early in development. However, the ratio of colony-forming unit-osteoblasts (CFU-OBs) to CFU-fibroblasts (CFU-Fs) was increased in bone marrow cultures from ERb(Prx1-CKO) compared with control mice, indicating increased differentiation of osteoblast precursor cells into osteoblasts in ERb(Prx1-CKO) mice. Detailed quantitative polymerase chain reaction analyses of 128 genes in 16 prespecified pathways revealed significant downregulation of 11 pathways in ERb(Prx1-CKO) mice. Thus, deletion of ERb specifically in osteoblast lineage cells, in the absence of all splice variants, increases trabecular bone mass and modulates multiple pathways related to bone metabolism."

According to the news reporters, the research concluded: "These findings suggest that pharmacological inhibition of ERb in bone may provide a novel approach to treat osteoporosis."

For more information on this research see: Deletion of Estrogen Receptor Beta in

Our news journalists report that additional information may be obtained by contacting K.M. Nicks, Mayo Clinic College of Medicine, Rochester, MN, United States. Additional authors for this research include K. Fujita, D. Fraser, U. McGregor, M.T. Drake, M.E. McGee-Lawrence, J.J. Westendorf, D.G. Monroe and S. Khosla.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/jbmr.2723. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Diseases and Conditions - Hereditary**

**Study Findings from Mayo Clinic Broaden Understanding of Hereditary Hemorrhagic Telangiectasia (Effect of Center Volume on Outcomes in Hospitalized Patients With Hereditary Hemorrhagic Telangiectasia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Hereditary Hemorrhagic Telangiectasia is the subject of a report. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "To determine whether hospitalized patients with hereditary hemorrhagic telangiectasia (HHT) had better outcomes at high-volume treatment centers (HVCs). The Nationwide Inpatient Sample (2000-2011) was used to identify HHT-related hospitalizations."

Our news journalists obtained a quote from the research from Mayo Clinic, "Hospitals were classified based on quartiles of annual HHT discharge volume. The 75th percentile cutoff value (third quartile) was used to classify hospitals as low-volume centers (1-7 HHT discharges per year) or as HVCs (>= 8 discharges per year). Demographic features, complication rates, and outcomes were compared between the 2 groups. We identified 9440 hospital discharges in patients with HHT. Of these patients, 6856 (72.6%) were admitted to low-volume centers and 2584 (27.4%) to HVCs. The former were more likely to be white race, older, and with higher income levels (P <.001 for each). The HVCs had higher rates of anemia, epistaxis, congestive heart failure, pulmonary hypertension, and cerebral and pulmonary arteriovenous malformations and lower rates of ischemic stroke and myocardial infarction. After adjusting for baseline differences in a multivariate model, patients treated at HVCs were more likely to be discharged home (odds ratio [OR] = 1.35; 95% CI, 1.21-1.52; P<.001) and less likely to be discharged to short-term rehabilitation facilities (OR = 0.45; 95% CI, 0.31-0.64; P <.001). Patients treated at HVCs also had a significantly lower risk of in-hospital mortality (OR = 0.51; 95% CI, 0.34-0.74; P<.001). Patients with HHT hospitalized at HVCs had better outcomes, with lower in-hospital mortality and higher home discharge rates."

According to the news editors, the research concluded: "These findings strongly
support ongoing efforts to expand access to HHT centers of excellence in the United States and worldwide."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mayocp.2016.07.005. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Multiple Myeloma**

**Study Findings from Mayo Clinic Provide New Insights into Multiple Myeloma (IAP antagonists induce anti-tumor immunity in multiple myeloma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Multiple Myeloma have been published. According to news reporting originating from Scottsdale, Arizona, by NewsRx correspondents, research stated, "The cellular inhibitors of apoptosis (cIAP) 1 and 2 are amplified in about 3% of cancers and have been identified in multiple malignancies as being potential therapeutic targets as a result of their role in the evasion of apoptosis. Consequently, small-molecule IAP antagonists, such as LCL161, have entered clinical trials for their ability to induce tumor necrosis factor (TNF)mediated apoptosis of cancer cells."

Our news editors obtained a quote from the research from Mayo Clinic, "However, cIAP1 and cIAP2 are recurrently homozygously deleted in multiple myeloma (MM), resulting in constitutive activation of the noncanonical nuclear factor (NF)-kappa B pathway. To our surprise, we observed robust in vivo anti-myeloma activity of LCL161 in a transgenic myeloma mouse model and in patients with relapsed-refractory MM, where the addition of cyclophosphamide resulted in a median progression-free-survival of 10 months. This effect was not a result of direct induction of tumor cell death, but rather of upregulation of tumor-cell-autonomous type I interferon (IFN) signaling and a strong inflammatory response that resulted in the activation of macrophages and dendritic cells, leading to phagocytosis of tumor cells. Treatment of a MM mouse model with LCL161 established long-term anti-tumor protection and induced regression in a fraction of the mice."

According to the news editors, the research concluded: "Notably, combination of LCL161 with the immune-checkpoint inhibitor anti-PD1 was curative in all of the treated mice."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nm.4229. This DOI is a link to an online electronic document that is either free or for purchase.

**Heart Disorders and Diseases - Heart Attack**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting out of Montreal, Canada, by NewsRx editors, research stated, "High lipoprotein(a) (Lp[a]) is the most common genetic dyslipidemia and is a causal factor for myocardial infarction (MI) and aortic stenosis (AS). We sought to estimate the population impact of Lp(a) lowering that could be achieved in primary prevention using the therapies in development."

Our news journalists obtained a quote from the research from McGill University, "Approach and Results-We used published data from 2 prospective cohorts. High Lp(a) was defined as >= 50 mg/dL (approximate to 20th percentile). Relative risk, attributable risk, the attributable risk percentage, population attributable risk, and the population attributable risk percentage were calculated as measures of the population impact. For MI, the event rate was 4.0% versus 2.8% for high versus low Lp(a) (relative risk, 1.46; 95% confidence interval [CI], 1.45-1.46). The attributable risk was 1.26% (95% CI, 1.24-1.27), corresponding to 31.3% (95% CI, 31.0-31.7) of the excess MI risk in those with high Lp(a). The population attributable risk was 0.21%, representing a population attributable risk percentage of 7.13%. For AS, the event rate was 1.51% versus 0.78% for high versus low Lp(a) (relative risk, 1.95; 95% CI, 1.94-1.97). The attributable risk was 0.74% (95% CI, 0.73-0.75), corresponding to 48.8% (95% CI, 48.3-49.3) of the excess AS risk in those with high Lp(a). The population attributable risk was 0.13%, representing a population attributable risk percentage of 13.9%. In sensitivity analyses targeting the top 10% of Lp(a), the population attributable risk percentage was 5.2% for MI and
7.8% for AS. Lp(a) lowering among the top 20% of the population distribution for Lp(a) could prevent 1 in 14 cases of MI and 1 in 7 cases of AS, suggesting a major impact on reducing the burden of cardiovascular disease."

According to the news editors, the research concluded: "Targeting the top 10% could prevent 1 in 20 MI cases and 1 in 12 AS cases."

Our news journalists report that additional information may be obtained by contacting G. Thanassoulis, McGill University, Center Hlth, Dept. of Clin Epidemiol, Montreal, PQ, Canada. Additional authors for this research include P.R. Kamstrup, K. Williams, A.D. Sniderman, B.G. Nordestgaard and G. Thanassoulis.

*Mosquito-Borne Diseases - Malaria*

**Study Findings from Medical Research Institute Provide New Insights into Malaria (The Impact of Established Immunoregulatory Networks on Vaccine Efficacy and the Development of Immunity to Malaria)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mosquito-Borne Diseases - Malaria have been published. According to news originating from Brisbane, Australia, by NewsRx correspondents, research stated, "The development of vaccines to protect against parasites is difficult, in large part due to complex host-parasite interactions that have evolved over millennia. Parasitic factors such as antigenic variation and host factors such as age, transmission intensity, and genetic influences are all thought to contribute to the limited efficacy of parasite vaccines."

Our news journalists obtained a quote from the research from Medical Research Institute, "A developing theme in field studies investigating antiparasitic immunity is the emergence, establishment, and maintenance of immunoregulatory networks that shape the immune responses to new infections, as well as vaccines, thereby influencing disease outcome. In this review, we will examine why parasite vaccine candidates perform poorly in target populations and, in particular, the role of immunoregulatory networks in influencing antimalarial immunity and vaccine efficacy."

According to the news editors, the research concluded: "We will focus our discussion on malaria, the most important parasitic disease of humans, but also highlight the broader impact of immunoregulatory networks on vaccine efficacy."

For more information on this research see: The Impact of Established Immunoregulatory Networks on Vaccine Efficacy and the Development of Immunity to Malaria. *Journal of Immunology*, 2016;197(12):4518-4526. *Journal of Immunology* can be contacted at:
Study Findings from Medical University Broaden Understanding of Molecular Biology [Synthesis and In Vitro Antiproliferative Activity of Novel Phenyl Ring-Substituted 5-Alkyl-12(H)-quino[3,4-b][1,4]benzothiazineDerivatives]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Life Science Research - Molecular Biology. According to news reporting from Sosnowiec, Poland, by NewsRx journalists, research stated, "A novel series of tetracyclic quinobenzothiazine derivatives was synthetized. Compounds containing a substituent (hydroxyl, methyl, phenyl, piperidyl, or piperazinyl) in positions 9 and 11 were obtained by cyclization of suitable 4-aminoquinolinium-3-thiolates."

The news correspondents obtained a quote from the research from Medical University, "Quinobenzothiazine 10-O-substituted derivatives were obtained by alkylating the hydroxyl group in position 10 of the parent (quinobenzothiazine) system. Antiproliferative activity of the synthesized compounds was studied using cultured neoplastic cells (MDA-MB-231, SNB-19, and C-32 cell lines). Four selected compounds were investigated in more detail for cytotoxicity and antiproliferative effect. Transcriptional activity of genes regulating cell cycle (TP53), apoptosis (BAX, BCL-2), as well as proliferation (H3) were assessed."

According to the news reporters, the research concluded: "Finally, the ability of the selected compounds to bind DNA was checked in the presence of ethidium bromide."

For more information on this research see: Synthesis and In Vitro Antiproliferative Activity of Novel Phenyl Ring-Substituted 5-Alkyl-12(H)-quino[3,4-b][1,4]benzothiazineDerivatives. Molecules, 2016;21(11):581-594. Molecules can be contacted at: Mdpf Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. Study Findings from Memorial Sloan-Kettering Cancer Center Broaden Understanding of Cardiology (Roadmap for biomarkers of cancer therapy cardiotoxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Contemporary cancer treatment uses multiple modalities such as chemotherapy, targeted therapy and radiotherapy. These therapies, often used in combination, are associated with an increased risk of cardiotoxicity, specifically cardiomyopathy and heart failure."

Our news journalists obtained a quote from the research from Memorial Sloan-Kettering Cancer Center, "Cardiologists and oncologists are faced with the challenge of maximising the clinical benefit from cancer therapy while minimising the risk of early and late-onset cardiotoxicity. The current paradigm for cardiotoxicity detection and management relies primarily upon the assessment of left ventricular ejection fraction (LVEF). However, LVEF alone is limited in both diagnostic and prognostic ability. There is growing enthusiasm over the identification of newer biomarkers of cardiotoxicity that can detect cardiac injury at earlier stages of disease and could be used as an adjunctive prognostic measure to routine LVEF assessment. Thus, imaging and circulating biomarkers are currently under active investigation for use throughout the continuum of cancer care-for risk stratification of cardiotoxicity prior to treatment, detection of early cardiotoxicity during treatment and diagnosis of late cardiotoxicity in survivorship."

According to the news editors, the research concluded: "Myocardial strain, cardiac troponin and brain natriuretic peptide are the most prominent biomarkers currently being studied, although data on novel circulating biomarkers are emerging."

For more information on this research see: Roadmap for biomarkers of cancer therapy cardiotoxicity. Heart, 2015;102(6):425-30. (BMJ Publishing Group - group.bmj.com/; Heart - heart.bmj.com/)

The news correspondents report that additional information may be obtained from A.F. Yu, Dept. of Medicine, Cardiology Service, Memorial Sloan Kettering Cancer Center, New York, New York, United States.

Nutritional and Metabolic Diseases and Conditions —

Study Findings from Mossakowski Medical Research Center Provide New Insights into Type 2 Diabetes (SIRT1-AMPK crosstalk is involved in high glucose-dependent impairment of insulin responsiveness in primary rat podocytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news originating from Gdansk, Poland, by NewsRx correspondents, research stated, "Growing evidence indicates that in diabetes, high glucose concentrations affect podocyte metabolism and function. The crucial pathological feature of type 2 diabetes mellitus and metabolic syndrome is insulin resistance, often developed as a result of dysregulation of nutrient-responsible systems and disturbance of cellular homeostasis under diabetic conditions."

Financial support for this research came from National Science Center, Poland. Our news journalists obtained a quote from the research from Mossakowski Medical Research Center, "Here, we report the involvement of the reciprocal interplay between deacetylase SIRT1 and protein kinase AMPK in podocyte high glucose induced abolition of insulin dependent glucose uptake, manifesting insulin resistance. Experiments were performed on primary rat podocytes cultured in standard or high glucose conditions. Immunodetection methods were used to determine SIRT1 protein level and AMPK phosphorylation degree. Insulin-stimulated changes in glucose uptake were used to determine podocyte responsiveness to insulin. SIRT1 activity was modulated by resveratrol, EX-527, or small interfering RNA targeting SIRT1. We have demonstrated that the absence of the stimulating effect of insulin on glucose uptake into primary rat podocytes after long-time exposition to high glucose concentrations, is a result of decreased SIRT1 protein levels and activity, associated with decreased AMPK phosphorylation degree, presumably underlying the induction of insulin resistance."

According to the news editors, the research concluded: "Our findings suggest that the interplay between SIRT1 and AMPK is involved in the regulation of insulin action in podocytes."

For more information on this research see: SIRT1-AMPK crosstalk is involved in high glucose-dependent impairment of insulin responsiveness in primary rat podocytes. Experimental Cell Research, 2016;349(2):328-338. Experimental Cell Research can be contacted at: Elsevier Inc, 525 B Street, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Experimental Cell Research - www.journals.elsevier.com/experimental-cell-research/)

The news correspondents report that additional information may be obtained from D. Rogacka, Polish Academy Sci, Mossakowski Med Res Center, Lab Mol & Cellular Nephrol, Gdansk, Poland. Additional authors for this research include A. Piwkowska, I. Audzeyenka, S. Angielski and M. Jankowski.

Drugs and Therapies - Gamma-aminobutyric Acid...

Study Findings from Okayama University Provide New Insights into Gamma-aminobutyric Acid Analogs (Activation of Antioxidative Functions by Radon Inhalation Enhances the Mitigation Effects of Pregabalin on Chronic Constriction Injury-Induced ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Gamma-aminobutyric Acid Analogs have been published. According to news reporting originating in Okayama, Japan, by NewsRx journalists, research stated, "Radon inhalation brings pain relief for chronic constriction injury-(CCI-) induced neuropathic pain in mice due to the activation of antioxidative functions, which is different from the mechanism of the pregabalin effect. In this study, we assessed whether a combination of radon inhalation and pregabalin administration is more effective against neuropathic pain than radon or pregabalin only."

Financial support for this research came from Ryobi Teien Memory Foundation.

The news reporters obtained a quote from the research from Okayama University, "Mice were treated with inhaled radon at a concentration of 1,000 Bq/m(3) for 24 hours and pregabalin administration after CCI surgery. In mice treated with pregabalin at a dose of 3 mg/kg weight, the 50% paw withdrawal threshold of mice treated with pregabalin or radon and pregabalin was significantly increased, suggesting pain relief. The therapeutic effects of radon inhalation or the combined effects of radon and pregabalin (3 mg/kg weight) were almost equivalent to treatment with pregabalin at a dose of 1.4 mg/kg weight or 4.1 mg/kg weight, respectively. Radon inhalation and the combination of radon and pregabalin increased antioxidant associated substances in the paw. The antioxidant substances increased much more in radon inhalation than in pregabalin administration."

According to the news reporters, the research concluded: "These findings suggested that the activation of antioxidative functions by radon inhalation enhances the pain relief of pregabalin and that this combined effect is probably an additive effect."

For more information on this research see: Activation of Antioxidative Functions by Radon Inhalation Enhances the Mitigation Effects of Pregabalin on Chronic Constriction Injury-Induced Neuropathic Pain in Mice. *Oxidative Medicine and Cellular Longevity, 2015;2016*:9853692. Oncology - Carcinomas

Study Findings from Oscar Lambret Center Broaden Understanding of Carcinomas [Fluorescence-assisted sentinel (SND) and pelvic node dissections by single-port transvaginal laparoscopic surgery, for the management of an endometrial carcinoma (EC) ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Carcinomas. According to news reporting out of Lille, France, by NewsRx editors, research stated, "To explore the feasibility of an oncologically acceptable management for an intermediate-risk endometrial cancer (EC) in an elderly, using the combination of transvaginal single-port laparoscopy and sentinel node policy. For this 85-years old patient, BMI 321 g/m(2), with IB grade 2 endometrioid EC, a single vaginal approach was attempted [1] to perform a total hysterectomy, bilateral salpingo-oophorectomy and pelvic node assessment guided by SND [2]."

Our news journalists obtained a quote from the research from Oscar Lambret Center, "Injections of indocyanine green (ICG) were performed at 3 and 9 o'clock and 2 depths [3] into the uterine cervix A simple vaginal hysterectomy was first performed using a 5 mm vessel sealer (LigaSure ®-Medtronics) to limit ICG leakage. As poorly accessible, adnexas were divided close to cornuas; uterine corpus was delivered vaginally. Then, a single port device (Gelpoint ®-Applied), equipped with 3 trocars for optique and instruments, was installed through vagina. After transvaginal pneumoperitoneum insufflation, bowel loops were cleared from the pelvis. Latero-pelvic peritoneum was incised between external iliac pedicles and ureters. Following the algorithm, node dissection was limited to sentinel node clearly identified on the right side under color-segmented fluorescence (Pinpoint ®-Novadaq), but a full pelvic dissection completed an unsatisfactory SND on the left side. Procedure was terminated with salpingo-oophorectomies. After protected vaginal specimen delivery, the single-port device was removed and vagina was closed as usual. Patient was discharged on the 1st post-operative day. Final pathology confirmed the FIGO stageB grade2 EC. A transvaginal laparoscopic pelvic SND after vaginal hysterectomy is feasible."

According to the news editors, the research concluded: "This single-port 'NOTES' strategy bridges the previous gaps of a pure vaginal approach and seems interesting in fragile EC patients."

For more information on this research see: Fluorescence-assisted sentinel (SND) and pelvic node dissections by single-port transvaginal laparoscopic surgery, for the management of an endometrial carcinoma (EC) in an elderly obese patient. Gynecologic Oncology, 2016;143 (3):686-687. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Mycobacterium Infections - Tuberculosis

Study Findings from Otsuka Pharmaceutical Development & Commercialization, Inc. Provide New Insights into Tuberculosis (Delamanid Coadministered with Antiretroviral Drugs or Antituberculosis Drugs Shows No Clinically Relevant Drug-Drug ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news reporting originating from Princeton, New Jersey, by NewsRx correspondents, research stated, "Delamanid is a medicinal product approved for treatment of multidrug-resistant tuberculosis. Three studies were conducted to evaluate the potential drug-drug interactions between delamanid and antiretroviral drugs, including ritonavir, a strong inhibitor of CYP3A4, and selected anti-TB drugs, including rifampin, a strong inducer of cytochrome P450 (CYP) isozymes."

Our news editors obtained a quote from the research from Otsuka Pharmaceutical Development & Commercialization, Inc., "Multiple-dose studies were conducted in parallel groups of healthy subjects. Plasma samples were analyzed for delamanid, delamanid metabolite, and coadministered drug concentrations, and pharmacokinetic (PK) parameters were determined. The magnitude of the interaction was assessed by the ratio of the geometric means and 90% confidence intervals. Coadministration of delamanid with tenofovir or efavirenz did not affect the PK characteristics of delamanid. Coadministration of Kaletra (lopinavir/ritonavir) with delamanid resulted in an approximately 25% higher delamanid area under the concentration-time curve from time 0 to the end of the dosing interval (AUC tau). Tenofovir, efavirenz, lopinavir, and ritonavir exposure were not affected by delamanid. Coadministration of delamanid with the TB drugs (ethambutol plus Rifater [rifampin, pyrazinamide, and isoniazid]) resulted in lower delamanid exposures (47 and 42% for the AUC tau and C-max [maximum concentration of a drug in plasma] values, respectively), as well as decreased exposure of three primary metabolites (approximately 30 to 50% lower AUC tau values). Delamanid did not affect rifampin, pyrazinamide, and isoniazid exposure; the ethambutol AUC tau and C-max values were about 25% higher with delamanid coadministration. The lack of clinically significant drug-drug interactions between delamanid and selected antiretroviral agents (including the strong CYP inhibitor ritonavir) and a combination of anti-TB drugs was demonstrated."

According to the news editors, the research concluded: "Although there was a decrease in the delamanid concentrations when coadministered with ethambutol plus Rifater,
this is likely related to decreased delamanid absorption and not to CYP induction."

For more information on this research see: Delamanid Coadministered with Antiretroviral Drugs or Antituberculosis Drugs Shows No Clinically Relevant Drug-Drug Interactions in Healthy Subjects. *Antimicrobial Agents and Chemotherapy*, 2016;60(10):5976-5985. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Neurodegenerative Diseases and Conditions -...

**Study Findings from P.H. Nguyen et al Broaden Understanding of Alzheimer Disease [Dimerization Mechanism of Alzheimer A beta(40) Peptides: The High Content of Intrapeptide-Stabilized Conformations in A2V and A2T Heterozygous Dimers Retards ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Neurodegenerative Diseases and Conditions - Alzheimer Disease have been presented. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "Amyloid beta (A beta) oligomerization is associated with the origin and progression of Alzheimer's disease (AD). While the A2V mutation enhances aggregation kinetics and toxicity, mixtures of wild-type (WT) and A2V, and also WT and A2T, peptides retard fibril formation and protect against AD."

The news reporters obtained a quote from the research, "In this study, we simulate the equilibrium ensemble of WT:A2T A beta(40) dimer by means of extensive atomistic replica exchange molecular dynamics and compare our results with previous equivalent simulations of A2V:A2V, WT:WT, and WT:A2V A beta(40) dimers for a total time scale of nearly 0.1 ms. Qualitative comparison of the resulting thermodynamic properties, such as the relative binding free energies, with the reported experimental kinetic and thermodynamic data affords us important insight into the conversion from slow-pathway to fast-pathway dimer conformations. The crucial reaction coordinate or driving force of such transformation turns out to be related to hydrophobic interpeptide interactions. Analysis of the equilibrium ensembles shows that the fast-pathway conformations contain interpeptide out-of-register antiparallel beta-sheet structures.
at short interpeptide distances. In contrast, the slow-pathway conformations are formed by the association of peptides at large interpeptide distances and high intrapeptide compactness, such as conformations containing intramolecular three-stranded beta-sheets which sharply distinguish fast (A2V:A2V and WT:WT) and slow (WT:A2T and WT:A2V) amyloid-forming sequences."

According to the news reporters, the research concluded: "Also, this analysis leads us to predict that a molecule stabilizing the intramolecular three-stranded beta-sheet or inhibiting the formation of an interpeptide beta-sheet spanning residues 17-20 and 31-37 would further reduce fibril formation and probably the cytotoxicity of A beta species."

Our news correspondents report that additional information may be obtained by contacting P. Derreumaux, IUF, F-75005 Paris, France. Additional authors for this research include F. Sterpone, R. Pouplana, P. Derreumaux and J.M. Campanera.

macrophages (M1, pro-inflammatory). Further analysis showed that M1 stimulated UC-MSCs to increase expression of interleukin (IL)-6, a molecule which upregulated IL4R expression, promoted phosphorylation of STAT6 in macrophages, and eventually polarized macrophages into M2 phenotype. Moreover, the UC-MSCs effect on macrophages was largely abrogated by small interfering RNA (siRNA) knockdown of IL-6. Together, our results indicate that UC-MSCs can alleviate insulin resistance in part via production of IL-6 that elicits M2 polarization. Additionally, human obesity and insulin resistance were associated with increased pro-inflammatory ATMs infiltration.

According to the news reporters, the research concluded: "Thus, MSCs may be a new treatment for obesity-related insulin resistance and T2D concerning macrophage polarized effects."

Our news journalists report that additional information may be obtained by contacting Z. Xie, Dept. of Endocrinology, Chinese PLA General Hospital, Beijing, People's Republic of China. Additional authors for this research include H. Hao, C. Tong, Y. Cheng, J. Liu, Y. Pang, Y. Si, Y. Guo, L. Zang, Y. Mu and W. Han.

Cardiovascular Diseases and Conditions -

Study Findings from Pennsylvania State University Provide New Insights into Atherosclerosis (High fructose-mediated attenuation of insulin receptor signaling does not affect PDGF-induced proliferative signaling in vascular smooth muscle cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting from Hershey, Pennsylvania, by NewsRx journalists, research stated, "Insulin resistance is associated with accelerated atherosclerosis. Although high fructose is known to induce insulin resistance, it remains unclear as to how fructose regulates insulin receptor signaling and proliferative phenotype in vascular smooth muscle cells (VSMCs), which play a major role in atherosclerosis."

The news correspondents obtained a quote from the research from Pennsylvania State University, "Using human aortic VSMCs, we investigated the effects of high fructose treatment on insulin receptor substrate-1 (IRS-1) serine phosphorylation, insulin versus platelet-derived growth factor (PDGF)-induced phosphorylation of Akt, S6 ribosomal protein,
extracellular signal-regulated kinase (ERK), and cell cycle proteins. In comparison with PDGF (a potent mitogen), neither fructose nor insulin enhanced VSMC proliferation and cyclin D1 expression. D-[C-14(U)] fructose uptake studies revealed a progressive increase in fructose uptake in a time-dependent manner. Concentration-dependent studies with high fructose (5-25 mM) showed marked increases in IRS-1 serine phosphorylation, a key adapter protein in insulin receptor signaling. Accordingly, high fructose treatment led to significant diminutions in insulin-induced phosphorylation of downstream signaling components including Akt and S6. In addition, high fructose significantly diminished insulin-induced ERK phosphorylation. Nevertheless, high fructose did not affect PDGF-induced key proliferative signaling events including phosphorylation of Akt, S6, and ERK and expression of cyclin D1 protein. Together, high fructose dysregulates IRS-1 phosphorylation state and proximal insulin receptor signaling in VSMCs, but does not affect PDGF-induced proliferative signaling.

According to the news reporters, the research concluded: "These findings suggest that systemic insulin resistance rather than VSMC-specific dysregulation of insulin receptor signaling by high fructose may play a major role in enhancing atherosclerosis and neointimal hyperplasia."

For more information on this research see: High fructose-mediated attenuation of insulin receptor signaling does not affect PDGF-induced proliferative signaling in vascular smooth muscle cells. European Journal of Pharmacology, 2016;791():703-710. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. According to news reporting out of Melbourne, Australia, by NewsRx editors, research stated, "Restoration of tumor suppression is an attractive onco-therapeutic approach. It is particularly relevant when a tumor suppressor is excessively degraded by an overactive oncogenic E3 ligase."

Our news journalists obtained a quote from the research from Peter MacCallum Cancer Center, "We previously discovered that the E6-associated protein (E6AP; as classified in the human papilloma virus context) is an E3 ligase that has an important role in the cellular stress response, and it directly targets the tumor-suppressor promyelocytic leukemia protein (PML) for proteasomal degradation. In this study, we have examined the role of the E6AP-PML axis in prostate cancer (PC). We show that knockdown (KD) of E6AP expression attenuates growth of PC cell lines in vitro. We validated this finding in vivo using cell line xenografts, patient-derived xenografts and mouse genetics. We found that KD of E6AP attenuates cancer cell growth by promoting cellular senescence in vivo, which correlates with restoration of tumor suppression by PML. In addition, we show that KD of E6AP sensitizes cells to radiation-induced death."

According to the news editors, the research concluded: "Overall, our findings demonstrate a role for E6AP in the promotion of PC and support E6AP targeting as a novel approach for PC treatment, either alone or in combination with radiation."

For more information on this research see: Restoration of tumor suppression in prostate cancer by targeting the E3 ligase E6AP. *Oncogene*, 2016;35(48):6235-6245. *Oncogene* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **Drugs and Therapies - Drug Delivery Systems**

**Study Findings from Petru Poni Institute of Macromolecular Chemistry Broaden Understanding of Drug Delivery Systems [Poly(N-isopropylacrylamide-co-N-isopropylmethacrylamide) Thermo-Responsive Microgels as Self-Regulated Drug Delivery System]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Drug Delivery
Systems. According to news originating from Iasi, Romania, by NewsRx correspondents, research stated, "Poly(N-isopropylacrylamide-co-N-isopropylmethacrylamide) (poly(NIPAAm-co-NIPMAAm)) is synthesized as an attractive thermo-responsive copolymer by an original procedure. Due to the similar structure of the two co-monomers, the poly(NIPAAm-co-NIPMAAm) copolymer displays a very sharp phase transition, under physiological conditions (phosphate buffer solution at pH = 7.4)."

Our news journalists obtained a quote from the research from the Petru Poni Institute of Macromolecular Chemistry, "The copolymer, showing the 51/49 co-monomer NIPAAm/NIPMAAm molar ratio, displays a lower critical solution temperature (LCST) close to that of the human body temperature (36.8 degrees C). The poly(NIPAAm-co-NIPMAAm) microgels obtained at the 51:49 co-monomer ratio displays a volume phase transition temperature (VPTT) slightly smaller than LCST. The deswelling rate of the microgels is very high (k = 0.019 s(-1)), the shrinkage occurring almost instantaneously, whereas the swelling rate is slightly lower (k = 0.0077 s(-1)). The microgels are loaded with the model drug dexamethasone and the drug release is investigated at different temperatures, below and above the VPTT."

According to the news editors, the research concluded: "Under thermal cycling operation between 32 and 38 degrees C, the pulsatile release of dexamethasone is observed."

The news correspondents report that additional information may be obtained from G. Fundueanu, Petru Poni Inst Macromol Chem, Dept. of Nat Polymers Bioact & Biocompatible Mat, Iasi 700487, Romania. Additional authors for this research include M. Constantin, S. Bucatariu and P. Ascenzi.

Oncology - Chronic Myeloid Leukemia

Study Findings from Pondicherry University Provide New Insights into Chronic Myeloid Leukemia (Hsp90 Inhibitors for the Treatment of Chronic Myeloid Leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Chronic Myeloid Leukemia. According to news reporting originating in Pondicherry, India, by NewsRx journalists, research stated, "Chronic myeloid leukemia (CML) is a hematological malignancy that arises due to reciprocal translocation of 3' sequences from c-Abelson (ABL) protooncogene of chromosome 9 with 5' sequence of truncated break point cluster region (BCR) on chromosome 22. BCR-ABL is a functional oncoprotein p210 that exhibits constitutively activated tyrosine kinase causing genomic alteration of hematopoietic stem cells."
The news reporters obtained a quote from the research from Pondicherry University, "BCR-ABL specific tyrosine kinase inhibitors (TKIs) successfully block CML progression. However, drug resistance owing to BCR-ABL mutations and overexpression is still an issue. Heat-shock proteins (Hsps) function as molecular chaperones facilitating proper folding of nascent polypeptides. Their increased expression under stressful conditions protects cells by stabilizing unfolded or misfolded peptides. Hsp90 is the major mammalian protein and is required by BCR-ABL for stabilization and maturation. Hsp90 inhibitors destabilize the binding of BCR-ABL protein thus leading to the formation of heteroprotein complex that is eventually degraded by the ubiquitin-proteasome pathway. Results of many novel Hsp90 inhibitors that have entered into various clinical trials are encouraging."

According to the news reporters, the research concluded: "The present review targets the current development in the CML treatment by availing Hsp90 specific inhibitors."

For more information on this research see: Hsp90 Inhibitors for the Treatment of Chronic Myeloid Leukemia. Leukemia Research and Treatment, 2015;2015():757694. (Hindawi Publishing - www.hindawi.com; Leukemia Research and Treatment - www.hindawi.com/journals/lrt/)

Oncology - Rhabdomyosarcomas

Study Findings from Postgraduate Institute of Medical Education and Research Provide New Insights into Rhabdomyosarcomas (Adult rhabdomyosarcoma: Clinical presentation, treatment, and outcome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Rhabdomyosarcomas are presented in a new report. According to news reporting out of Chandigarh, India, by NewsRx editors, research stated, "Rhabdomyosarcoma (RMS) in adults is a rare malignancy. The objective of our study was to determine presentation, treatment, patterns of failure, and outcome in this disease."

Our news journalists obtained a quote from the research from the Postgraduate Institute of Medical Education and Research, "A retrospective analysis of 25 patients of adult (> 16 years) RMS who were treated at our institute from 2000 to 2009 was carried out. Tumors were classified according to the Intergroup Rhabdomyosarcoma Study (IRS) staging. All patients were treated with multimodality treatment except for three patients who received chemotherapy as the only modality. The median age was 19 years (range, 16-68 years). The most common site was head and neck (52%) followed by extremities (24%), genitourinary (20%), and retroperitoneal RMS (4%). Three out of 25 patients presented with distant..."
metastasis. With a median follow-up of 45 months, the 5-year overall survival (OS) rate was 45%. The 5-year local control (LC) rate was 53%. IRS grouping and complete response after primary therapy were predictors of a better survival. RMS in adults have poor prognosis as compared to childhood RMS."

According to the news editors, the research concluded: "Adult RMS should therefore be treated aggressively with multidisciplinary approach comprising of surgery, radiation, and chemotherapy to achieve cure and prolonged survival."

Our news journalists report that additional information may be obtained by contacting D. Khosla, Dept. of Radiotherapy and Oncology, Regional Cancer Centre, Postgraduate Institute of Medical Education and Research, Chandigarh, India. Additional authors for this research include S. Sapkota, R. Kapoor, R. Kumar and S.C Sharma.

**Gram-Negative Bacteria - Helicobacter pylori**

**Study Findings from Qingdao University Broaden Understanding of Helicobacter pylori (Association of Endoscopic Features of Gastric Mucosa with Helicobacter pylori Infection in Chinese Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Helicobacter pylori have been published. According to news reporting out of Qingdao, People's Republic of China, by NewsRx editors, research stated, "The aim of this study is to identify and consolidate reliable endoscopic features associated with H. pylori infection in gastric mucosa, which is one of the major causes of gastric cancer. A total of 256 Chinese patients with symptomatic stomach disturbances were enrolled."

Our news journalists obtained a quote from the research from Qingdao University, "Pathological examination was conducted using a light microscope and biopsy specimens stained with hematoxylin-eosin. Endoscopic examination was performed using a high resolution video endoscope. The association between endoscopic features and pathological H. pylori diagnosis was compared, and endoscopic features significantly associated with H. pylori infection were identified. A total of 14 endoscopic features were observed. Six of the 14 endoscopic features, including mucus on the gastric mucosa, diffuse redness, spotty redness of fundic mucosa, enlarged fold, mucosal edema, and RAC(type D and type I), were highly associated with H. pylori infection and were significantly sensitive and specific predictors for H. pylori diagnosis. The type R RAC was not significantly associated with H. pylori diagnosis."

According to the news editors, the research concluded: "Our results indicate that conventional endoscopy features can be used to diagnose H. pylori in Chinese patients and can
help determine the risk factor for gastric cancer."

For more information on this research see: Association of Endoscopic Features of Gastric Mucosa with Helicobacter pylori Infection in Chinese Patients. *Gastroenterology Research and Practice*, 2016;():1-7. *Gastroenterology Research and Practice* can be contacted at: Hindawi Publishing Corp, 315 Madison Ave 3RD Flr, Ste 3070, New York, NY 10017, USA. **Skin Diseases and Conditions - Psoriasis**

**Study Findings from R. Nguyen et al Broaden Understanding of Psoriasis (Five-year experience with infliximab: Follow up of the product familiarisation program)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Skin Diseases and Conditions - Psoriasis is the subject of a report. According to news reporting originating from Melbourne, Australia, by NewsRx correspondents, research stated, "This 5-year retrospective analysis is of 22 patients who participated in the product familiarisation program (PFP) at St Vincent's Hospital Melbourne, prior to the listing of infliximab on the Pharmaceutical Benefit Scheme. Criteria for inclusion were being an adult with chronic plaque psoriasis, having a psoriasis area and severity index (PASI) score of at least 15 with an inadequate response or intolerance to three of the following: phototherapy, acitretin, cyclosporin and methotrexate."

Our news editors obtained a quote from the research, "Participants were infused with infliximab 5 mg/kg on the standard induction (weeks 0, 2 and 6) and maintenance (8-weekly) protocols. At each visit PASI and dermatology life quality index (DLQI) scores were recorded. Success was determined as the proportion of patients achieving at least a 75% improvement in the PASI score from baseline (PASI 75). At 60 months after commencement of therapy, 31% of patients remained on infliximab. Those who did retained PASI 75 with a DLQI of 0 or 1. Of those who ceased infliximab, nine did so due to loss of efficacy, three for personal reasons, two for serious adverse events and one was lost to follow up. Adverse events included non-melanoma skin cancers, infections and abnormal liver enzymes. Infliximab in the Australian context has proven to be a highly effective treatment of chronic plaque psoriasis, and patients who remained on the drug derived a high level of satisfaction, assessed both subjectively (DLQI) and objectively (PASI 75)."
According to the news editors, the research concluded: "The variable response indicates that psoriasis is a heterogeneous disease and investigation into potential patient selection for treatment in the future is warranted."

The news editors report that additional information may be obtained by contacting R. Nguyen, Skin & Canc Fdn, Melbourne, Vic, Australia. Additional authors for this research include A. Braue, C. Baker and P. Foley.

**Speech, Language and Learning Diseases and...**

**Study Findings from Radboud University Broaden Understanding of Speech, Language and Learning Diseases and Conditions (Functional characterization of rare FOXP2 variants in neurodevelopmental disorder)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Speech, Language and Learning Diseases and Conditions. According to news reporting originating from Nijmegen, Netherlands, by NewsRx correspondents, research stated, "Heterozygous disruption of FOXP2 causes a rare form of speech and language impairment. Screens of the FOXP2 sequence in individuals with speech/language-related disorders have identified several rare protein-altering variants, but their phenotypic relevance is often unclear."

Our news editors obtained a quote from the research from Radboud University, "FOXP2 encodes a transcription factor with a forkhead box DNA-binding domain, but little is known about the functions of protein regions outside this domain. We performed detailed functional analyses of seven rare FOXP2 variants found in affected cases, including three which have not been previously characterized, testing intracellular localization, transcriptional regulation, dimerization, and interaction with other proteins. To shed further light on molecular functions of FOXP2, we characterized the interaction between this transcription factor and co-repressor proteins of the C-terminal binding protein (CTBP) family. Finally, we analysed the functional significance of the polyglutamine tracts in FOXP2, since tract length variations have been reported in cases of neurodevelopmental disorder. We confirmed etiological roles of multiple FOXP2 variants. Of three variants that have been suggested to cause speech/language disorder, but never before been characterized, only one showed functional effects. For the other two, we found no effects on protein function in any assays, suggesting that they are incidental to the phenotype. We identified a CTBP-binding region within the N-terminal portion of FOXP2."
This region includes two amino acid substitutions that occurred on the human lineage following the split from chimpanzees. However, we did not observe any effects of these amino acid changes on CTBP binding or other core aspects of FOXP2 function. Finally, we found that FOXP2 variants with reduced polyglutamine tracts did not exhibit altered behaviour in cellular assays, indicating that such tracts are non-essential for core aspects of FOXP2 function, and that tract variation is unlikely to be a highly penetrant cause of speech/language disorder.

According to the news editors, the research concluded: "Our findings highlight the importance of functional characterization of novel rare variants in FOXP2 in assessing the contribution of such variants to speech/language disorder and provide further insights into the molecular function of the FOXP2 protein."

For more information on this research see: Functional characterization of rare FOXP2 variants in neurodevelopmental disorder. *Journal of Neurodevelopmental Disorders*, 2016;8():1-19. *Journal of Neurodevelopmental Disorders* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. **Hematology - Laboratory Hematology**

**Study Findings from S. Buoro et al Provide New Insights into Laboratory Hematology (Mindray BC-6800 body fluid mode, performance of nucleated cells, and differential count in ascitic and pleural fluids)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematology - Laboratory Hematology. According to news reporting originating from Bergamo, Italy, by NewsRx correspondents, research stated, "An accurate and rapid analysis of cells in body fluids (BFs) is important for diagnosis and follow-up in many pathological conditions. We evaluated the analytical performance of the module BF Mindray BC-6800 (BC-6800-BF) for cytometric analysis of ascitic and pleural fluids."

Our news editors obtained a quote from the research, "A total of 99 ascitic and 45 pleural samples were collected and assessed with BC-6800-BF and optical microscopy. This study also includes the evaluation of limit blank (LoB), limit detection (LoD), limit quantitation, (LoQ), carryover, linearity, and diagnostic concordance between the two methods. For TC-BF, LoB was 1 ? 10(6) cells/L, LoD was 3 ? 10(6) cells/L, and LoQ was 4 ? 10(6) cells/L. Linearity..."
was excellent \( r(2)=0.99 \) and carryover was negligible. TC-BF performed with the two methods showed Pearson's correlation of 0.99 \( p <0.0001 \), Passing-Bablok regression \( y=1.04x -1.17 \), and bias 33.7 cells. In ascitic fluids, polymorphonuclear cells (PMN) showed an area under curve (AUC) of 0.98 \( p <0.0001 \). In pleural fluids, mononuclear cells (MN) and PMN % displayed an AUC of 0.79 \( p <0.0001 \) and 0.93 \( p <0.0001 \), respectively. BC-6800-BF in ascitic and pleural fluids offers rapid and accurate cell and differential counts in clinically relevant concentration ranges.

According to the news editors, the research concluded: "The use of BC-6800-BF may allow to replace routine optical counting, except for samples displaying abnormal cell counts or abnormal DIFF scattergram."

The news editors report that additional information may be obtained by contacting S. Buoro, Chemical Chemistry Laboratory, Hospital Papa Giovanni XXIII, Bergamo, Italy. Additional authors for this research include T. Mecca, G. Azzara, M. Seghezzi, E. Candiago, A. Gianatti, A. Crippa and A. La Gioia.

**Nervous System Diseases and Conditions - Normal…**

**Study Findings from S. Yamada et al Provide New Insights into Normal Pressure Hydrocephalus (Choroidal fissure acts as an overflow device in cerebrospinal fluid drainage: morphological comparison between idiopathic and secondary normal-pressure …)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nervous System Diseases and Conditions - Normal Pressure Hydrocephalus are discussed in a new report. According to news reporting out of Kyoto, Japan, by NewsRx editors, research stated, "To clarify the pathogenesis of two different types of adult-onset normal-pressure hydrocephalus (NPH), we investigated cerebrospinal fluid distribution on the high-field three-dimensional MRI. The subarachnoid spaces in secondary NPH were smaller than those in the controls, whereas those in idiopathic NPH were of similar size to the controls."

Our news journalists obtained a quote from the research, "In idiopathic NPH, however, the basal cistern and Sylvian fissure were enlarged in concurrence with ventricular
enlargement towards the z-direction, but the convexity subarachnoid space was severely diminished. In this article, we provide evidence that the key cause of the disproportionate cerebrospinal fluid distribution in idiopathic NPH is the compensatory direct CSF communication between the inferior horn of the lateral ventricles and the ambient cistern at the choroidal fissure. In contrast, all parts of the subarachnoid spaces were equally and severely decreased in secondary NPH."

According to the news editors, the research concluded: "Blockage of CSF drainage from the subarachnoid spaces could cause the omnidirectional ventricular enlargement in secondary NPH."

Our news journalists report that additional information may be obtained by contacting S. Yamada, Rakuwakai Otowa Hosp, Dept. of Neurosurgery & Stroke Center, Kyoto, Japan. Additional authors for this research include M. Ishikawa, Y. Iwamuro and K. Yamamoto.

Keywords for this news article include: Kyoto, Japan, Asia, Central Nervous System Diseases and Conditions, Normal Pressure Hydrocephalus, Cardiology.

**Oncology - Burkitt Lymphoma**

**Study Findings from Safdarjang Hospital Provide New Insights into Burkitt Lymphoma (Disseminated Renal Burkitt Lymphoma With Malignant Inferior Vena Caval Thrombosis in a Child)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Burkitt Lymphoma is now available. According to news reporting out of New Delhi, India, by NewsRx editors, research stated, "The most common causes of renal mass with malignant venous thrombosis are Wilms' tumor and renal cell carcinoma. Although renal involvement may occur in disseminated lymphomas, primary renal Burkitt lymphoma (BL) is rare."

Our news journalists obtained a quote from the research from Safdarjang Hospital, "Vascular tropism is not a usual feature of lymphoma; thus, primary renal BL with venous extension is distinctly unusual. However, it is important to diagnose this entity because such patients respond well to medical management and may not require surgery."

According to the news editors, the research concluded: "We report a pediatric case of primary renal BL with malignant vascular thrombus and systemic dissemination where biopsy was diagnostic and enabled appropriate treatment."

Our news journalists report that additional information may be obtained by
Study Findings from Saga University Broaden Understanding of Gastric Cancer (Impaired mitophagy activates mtROS/HIF-1a interplay and increases cancer aggressiveness in gastric cancer cells under hypoxia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Gastric Cancer is now available. According to news reporting originating from Saga, Japan, by NewsRx correspondents, research stated, "Mitochondrial autophagy (mitophagy) is a selective form of autophagy and a critical step in excluding mitochondria damaged by stress, including hypoxia. This study aimed to determine whether the integrity of mitophagy affected production of the mitochondrial reactive oxygen species (mtROS), hypoxia inducible factor (HIF)-1α expression and aggressive characteristics in GC cells under hypoxia."

Our news editors obtained a quote from the research from Saga University, "Three GC cell lines, 44As3, 58As9 and MKN45, were investigated in this study. HIF-1α expression was induced in the three GC cell lines under hypoxia, with higher expression observed in 44As3 and 58As9 cells compared with MKN45 cells. Cell survival and invasion abilities under hypoxia were significantly stronger in 44As3 and 58As9 cells than MKN45 cells. Moreover, mtROS accumulated in a time-dependent manner in 44As3 and 58As9 cells, but not in MKN45 cells. ROS scavenger N-acetyl-L-cysteine (NAC) treatment resulted in strong attenuation of HIF-1α expression, whereas HIF-1α knockdown increased ROS production in the three GC cell lines under hypoxia. These results suggested that the mtROS/HIF-1α interplay affected the hypoxia-induced cancer aggressiveness. Assessment of mitophagy by LC3-I/II conversion, SQSTM1/p62 degradation and specific fluorescence markers demonstrated that hypoxia-induced mitophagy was observed only in MKN45 cells, while the process was impaired in the other two cell lines. Treatment with the autophagy inhibitor chloroquine conversely increased HIF-1α expression, mtROS generation, cell survival and invasion in hypoxic MKN45 cells."

According to the news editors, the research concluded: "The present study revealed a novel mechanism in which the integrity of mitophagy might determine cancer aggressiveness via mtROS/HIF-1α interplay in GC cells under hypoxic conditions."

For more information on this research see: Impaired mitophagy activates mtROS/HIF-1α interplay and increases cancer aggressiveness in gastric cancer cells under...

Angiology

Study Findings from Shengjing Hospital Broaden Understanding of Angiology (Progranulin and short-term outcome in patients with acute ischaemic stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Angiology. According to news reporting out of Shenyang, People's Republic of China, by NewsRx editors, research stated, "Stroke is a leading cause of death and severe disability worldwide. Serum biomarkers play a critical role in the assessment of the severity and prognosis in stroke patients."

Our news journalists obtained a quote from the research from Shengjing Hospital, "In this prospective cohort study, the measurement of serum progranulin (PGRN) was conducted in 316 participants, including 216 patients with an identified diagnosis of acute ischaemic stroke and 100 normal control subjects. The primary end-point was defined as all-cause mortality for a short-term follow-up of 6 months. Adverse functional outcome (modified Rankin Scale score (>=)3) was considered as the secondary end-point. The median value of serum PGRN for patients with acute ischaemic stroke was 64.2 ng/ml (interquartile range 54.6-73.7), which was significantly higher than the control group [59.7 (54.4-64.4) ng/ml; p<0.001]. Multivariable linear regression suggested that PGRN levels were significantly correlated with body mass index, alcohol consumption, fasting blood glucose, total cholesterol, National Institutes of Health Stroke Scale (NIHSS) score and high-density lipoprotein cholesterol. Serum PGRN concentrations were independently associated with increased risks of all-cause mortality and adverse functional outcome after adjustment for clinical variables. In Cox proportional hazards models, PGRN levels were associated with the risk of mortality (hazard ratio 1.090, 95% confidence interval 1.033-1.150, p=0.002). The net reclassification improvement of the model with added PGRN was 0.1902 (p=0.0234) after adjustment for the variables in the Cox regression model for predicting all-cause mortality, and the integrated discrimination improvement was 0.1052 (p <0.001). Serum PGRN levels independently predicted all-cause mortality and adverse functional outcome in the short term in stroke patients."
According to the news editors, the research concluded: "The discriminative power was improved by PGRN on the basis of NIHSS score."

Our news journalists report that additional information may be obtained by contacting S. Xie, Dept. of Clinical Laboratory, Shengjing Hospital of China Medical University, Shenyang, People's Republic of China. Additional authors for this research include L. Lu, L. Liu, G. Bi and L. Zheng.

**Mosquito-Borne Diseases - Malaria**

**Study Findings from Singapore National University Broaden Understanding of Malaria (Ex Vivo Maturation Assay for Testing Antimalarial Sensitivity of Rodent Malaria Parasites)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Mosquito-Borne Diseases - Malaria have been presented. According to news reporting out of Singapore, Singapore, by NewsRx editors, research stated, "Ex vivo assay systems provide a powerful approach to studying human malaria parasite biology and to testing antimalarials. For rodent malaria parasites, short-term in vitro culture and ex vivo antimalarial susceptibility assays are relatively cumbersome, relying on in vivo passage for synchronization, since ring-stage parasites are an essential starting material."

Our news journalists obtained a quote from the research from Singapore National University, "Here, we describe a new approach based on the enrichment of ring-stage Plasmodium berghei, P. yoelii, and P. vinckei vinckei using a single-step Percoll gradient. Importantly, we demonstrate that the enriched ring-stage parasites develop synchronously regardless of the parasite strain or species used. Using a flow cytometry assay with Hoechst and ethidium or MitoTracker dye, we show that parasite development is easily and rapidly monitored."

According to the news editors, the research concluded: "Finally, we demonstrate that this approach can be used to screen antimalarial drugs."

Our news journalists report that additional information may be obtained by contacting L. Renia, Singapore National University, Natl Univ Hlth Syst, Yong Loo Lin Sch
Med, Dept. of Microbiol & Immunol, Singapore, Singapore. Additional authors for this research include B. Malleret, B. Russell, L. Renia and C. Clasera.

Study Findings from St. George's Vascular Institute Broaden Understanding of Endarterectomy (Editor's Choice - Delays to Surgery and Procedural Risks Following Carotid Endarterectomy in the UK National Vascular Registry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Surgery - Endarterectomy. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Guidelines recommend that patients suffering an ischaemic transient ischaemic attack (TIA) or stroke caused by carotid artery stenosis should undergo carotid endarterectomy (CEA) within 14 days. The degree to which UK vascular units met this standard was examined and whether rapid interventions were associated with procedural risks."

The news correspondents obtained a quote from the research from St. George's Vascular Institute, "The study analysed patients undergoing CEA between January 2009 and December 2014 from 100 UK NHS hospitals. Data were collected on patient characteristics, intervals of time from symptoms to surgery, and 30-day postoperative outcomes. The relationship between outcomes and time from symptom to surgery was evaluated using multilevel multivariable logistic regression. In 23,235 patients, the median time from TIA/stroke to CEA decreased over time, from 22 days (IQR 10-56) in 2009 to 12 days (IQR 7-26) in 2014. The proportion of patients treated within 14 days increased from 37% to 58%. This improvement was produced by shorter times across the care pathway: symptoms to referral, from medical review to being seen by a vascular surgeon, and then to surgery. The spread of the median time from symptom to surgery among NHS hospitals shrank between 2009 and 2013 but then grew slightly. Low-, medium-, and high-volume NHS hospitals all improved their performance similarly. Performing CEA within 48 h of symptom onset was associated with a small increase in the 30-day stroke and death rate: 3.1% (0-2 days) compared with 2.0% (3-7 days); adjusted odds ratio 1.64 (95% CI 1.04-2.59) but not with longer delays. The delay from symptom to CEA in symptomatic patients with ipsilateral 50-99% carotid stenoses has reduced substantially, although 42% of patients underwent CEA after the recommended 14 days."

According to the news reporters, the research concluded: "The risk of stroke after CEA was low, but there may be a small increase in risk during the first 48 h after symptoms."

For more information on this research see: Editor's Choice - Delays to Surgery and Procedural Risks Following Carotid Endarterectomy in the UK National Vascular Registry. European Journal of Vascular and Endovascular Surgery, 2016;52(4):438-443. European

Information Technology - Electronic Medical Records

Study Findings from St. Jude Children's Research Hospital Provide New Insights into Electronic Medical Records (Integrating pharmacogenomics into electronic health records with clinical decision support)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Information Technology - Electronic Medical Records are discussed in a new report. According to news originating from Memphis, Tennessee, by NewsRx correspondents, research stated, "Existing pharmacogenomic informatics models, key implementation steps, and emerging resources to facilitate the development of pharmacogenomic clinical decision support (CDS) are described. Pharmacogenomics is an important component of precision medicine."

Our news journalists obtained a quote from the research from St. Jude Children's Research Hospital, "Informatics, especially CDS in the electronic health record (EHR), is a critical tool for the integration of pharmacogenomics into routine patient care. Effective integration of pharmacogenomic CDS into the EHR can address implementation challenges, including the increasing volume of pharmacogenomic clinical knowledge, the enduring nature of pharmacogenomic test results, and the complexity of interpreting results. Both passive and active CDS provide point-of-care information to clinicians that can guide the systematic use of pharmacogenomics to proactively optimize pharmacotherapy. Key considerations for a successful implementation have been identified; these include clinical workflows, identification of alert triggers, and tools to guide interpretation of results. These considerations, along with emerging resources from the Clinical Pharmacogenetics Implementation Consortium and the National Academy of Medicine, are described. The EHR with CDS is essential to curate pharmacogenomic data and disseminate patient-specific information at the point of care. As part of the successful implementation of pharmacogenomics into clinical settings, all relevant clinical recommendations pertaining to gene drug pairs must be summarized and presented to clinicians in a manner that is seamlessly integrated into the clinical workflow of the EHR."

According to the news editors, the research concluded: "In some situations, ancillary systems and applications outside the EHR may be integrated to augment the capabilities of the EHR."
For more information on this research see: Integrating pharmacogenomics into electronic health records with clinical decision support. *American Journal of Health-System Pharmacy*, 2016;73(23):1967-1976. *American Journal of Health-System Pharmacy* can be contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD 20814, USA.

The news correspondents report that additional information may be obtained from J.M. Hoffman, St Jude Childrens Res Hosp, Dept. of Pharmaceut Sci, Memphis, TN 38105, United States. Additional authors for this research include H.M. Dunnenberger, K.F. Gumpper, C.E. Haidar and J.M. Hoffman.

*Study Findings from Sungkyunkwan University Broaden Understanding of Type 2 Diabetes [Inhibitory Effect of Methyl 2-(4'-Methoxy-4'-oxobutanamide) Benzoate from Jerusalem Artichoke (Helianthus tuberosus) on the Inflammatory Paracrine Loop ...]*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news originating from Suwon, South Korea, by NewsRx correspondents, research stated, "The interaction between macrophages and adipocytes is known to aggravate inflammation of the adipose tissue, leading to decreased insulin sensitivity. Hence, attenuation of the inflammatory paracrine loop between macrophages and adipocytes is deemed essential to ameliorate insulin resistance and diabetes mellitus type 2. Methyl 2-(4'-methoxy-4'-oxobutanamide) benzoate (compound 1), a newly isolated compound from Jerusalem artichoke (JA), has not been biologically characterized yet."

Our news journalists obtained a quote from the research from Sungkyunkwan University, "Here, we investigated whether JA-derived compound 1 attenuates the inflammatory cycle between RAW 264.7 macrophages and 3T3-L1 adipocytes. Compound 1 suppressed the inflammatory response of RAW 264.7 cells to lipopolysaccharide through decreased secretion of IL-1 beta, IL-6, and TNF-alpha. Moreover, the mRNA expression of TNF-alpha, IL-6, IL-1 beta, MCP-1, and Rantes and MAPK pathway activation in 3T3-L1 adipocytes, incubated in macrophage-conditioned media, were inhibited."

According to the news editors, the research concluded: "These findings suggest an anti-inflammatory effect of a newly extracted compound against adipose tissue inflammation and insulin resistance."

For more information on this research see: Inhibitory Effect of Methyl 2-(4'-Methoxy-4'-oxobutanamide) Benzoate from Jerusalem Artichoke (Helianthus tuberosus) on the Inflammatory Paracrine Loop between Macrophages and Adipocytes. *Journal of Agricultural*

Drugs and Therapies - Dopaminergic...

Study Findings from Suven Life Sciences Ltd Broaden Understanding of Dopaminergic Antiparkinsonism Agents (Development and Validation of a RP-HPLC Method for Determination of Related Substances and Degradants in Entacapone)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Dopaminergic Antiparkinsonism Agents have been presented. According to news reporting out of Andhra Pradesh, India, by NewsRx editors, research stated, "A new reverse phase-liquid chromatography (RP-HPLC) method has been developed for simultaneous determination of entacapone and its pharmacopoeia impurities, in-house impurities and degradation impurities (total 17 analytes). Chromatographic separation was achieved on a C18 column (size: 250 x 4.6 mm; 5 μm particle size) at a flow rate of 1.0 mL/min with 210 nm detection."

Our news journalists obtained a quote from the research from Suven Life Sciences Ltd, "The mobile phase (MP) consists of 1.361 g of potassium di-hydrogen phosphate and 1.742 g of di-potassium phosphate in 1.0 L water, pH adjusted to 2.5 with ortho phosphoric acid (MP-A) and acetonitrile (MP-B) through gradient elution. The product was subjected to stress conditions such as acid, base, peroxide, thermal and photolytic degradation. Two new impurities above 2% level were observed and isolated through preparative HPLC and well characterized. However, no interference observed due to degradation impurities and entacapone and its EP impurities, in-house impurities. As part of the method validation, specificity, limit of detection, limit of quantitation (LOQ), linearity, accuracy, precision, robustness and ruggedness were determined. LOQ values were achieved between 0.01 and 0.04%. Good linearity (r(2) > 0.99) was obtained ranging from LOQ to 150%. Recovery was verified for all impurities at concentrations ranging from LOQ to 150%.

According to the news editors, the research concluded: "Hence, a newly developed RP-HPLC method was capable for well separation of all analytes with acceptable resolution and tailing factor."

Our news journalists report that additional information may be obtained by contacting D. Purnachand, Suven Life Sci Ltd, Res & Dev Center, Hyderabad 500055, Andhra Pradesh, India. Additional authors for this research include A. Veerareddy, B. Ramadevi, C. Kameswarrao and B. Madhusudhanreddy.

Nutritional and Metabolic Diseases and Conditions ...

Study Findings from Swiss Federal Institute of Technology Broaden Understanding of Type 1 Diabetes Mellitus (beta-cell-mimetic designer cells provide closed-loop glycemic control)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus have been presented. According to news reporting from Basel, Switzerland, by NewsRx journalists, research stated, "Chronically deregulated blood-glucose concentrations in diabetes mellitus result from a loss of pancreatic insulin-producing beta cells (type 1 diabetes, T1D) or from impaired insulin sensitivity of body cells and glucose-stimulated insulin release (type 2 diabetes, T2D). Here, we show that therapeutically applicable beta-cell-mimetic designer cells can be established by minimal engineering of human cells."

The news correspondents obtained a quote from the research from the Swiss Federal Institute of Technology, "We achieved glucose responsiveness by a synthetic circuit that couples glycolysis-mediated calcium entry to an excitation-transcription system controlling therapeutic transgene expression. Implanted circuit-carrying cells corrected insulin deficiency and self-sufficiently abolished persistent hyperglycemia in T1D mice. Similarly, glucose-inducible glucagon-like peptide 1 transcription improved endogenous glucose-stimulated insulin release and glucose tolerance in T2D mice."

According to the news reporters, the research concluded: "These systems may enable a combination of diagnosis and treatment for diabetes mellitus therapy."

For more information on this research see: beta-cell-mimetic designer cells provide closed-loop glycemic control. Science, 2016;354(6317):1296-1301. Science can be contacted at: Amer Assoc Advancement Science, 1200 New York Ave, NW, Washington, DC 20005, USA. (Springer - www.springer.com; Science - www.springerlink.com/content/0926-7220/)

DNA Research

Study Findings from Tabriz University of Medical Sciences Provide New Insights into DNA Research (DNA damage response regulation by microRNAs as a therapeutic target in cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on DNA Research. According to news reporting from Tabriz, Iran, by NewsRx journalists, research stated, "The inability of cancer cells in taking care of DNA damages can lead to cancer development and/or progression. Due to the essential role of DNA repair in maintaining genomic stability, tightly controlled regulatory mechanism are required for these processes."

The news correspondents obtained a quote from the research from the Tabriz University of Medical Sciences, "Recent studies have shown a myriad of interactions among DNA damage response (DDR) components and miRNAs. While DDR modulates miRNA expression in transcriptional and post-transcriptional levels and affects miRNA degradation, miRNAs in turn, directly modulate the expression of multiple proteins in the DDR pathways, or indirectly fine-tune the expression of such proteins. A better understanding of DDR-miRNA interactions can facilitate the development of new anticancer agents targeting miRNAs involved in the DNA repair process. In this review, we provide a brief introduction about miRNA biogenesis and functions, DDR pathways, and recent findings about DDR-microRNA interactions."

According to the news reporters, the research concluded: "Finally, the therapeutic importance of miRNAs in modulation of DDR/DNA repair mechanisms will be discussed."

For more information on this research see: DNA damage response regulation by microRNAs as a therapeutic target in cancer. DNA Repair, 2016;47():1-11. DNA Repair can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; DNA Repair - www.journals.elsevier.com/dna-repair/)

Our news journalists report that additional information may be obtained by contacting B. Yousefi, Tabriz Univ Med Sci, Stem Cell Res Center, Tabriz, Iran.

Heart Disorders and Diseases - Heart Attack

Study Findings from Tabriz University of Medical Sciences Provide New Insights into Heart Attack (The Value of Lead aVR ST Segment Changes in Localizing Culprit Lesion in Acute Inferior Myocardial Infarction and Its Prognostic Impact)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Attack. According to news reporting originating from Tabriz, Iran, by NewsRx correspondents, research stated, "Identifying infarct-related artery (IRA) in patients with inferior ST elevation myocardial infarction (STEMI) has prognostic and therapeutic benefits. To differentiate IRA and the location of culprit lesion in inferior STEMI, using ST segment changes in lead aVR."

Our news editors obtained a quote from the research from the Tabriz University of Medical Sciences, "ST segment changes in lead aVR were recorded in 150 patients, admitted with first inferior STEMI. The association of IRA and the location of culprit lesion with ST segment changes in aVR were investigated. ST elevation >= 0.5 mm in lead aVR was present in 17 patients (11.3%), ST depression >= 0.5 mm in 74 patients (49.3%) and 59 patients (39.3%) did not have significant ST segment changes. Right coronary artery (RCA) was the IRA in 117 patients (78%) and left circumflex artery (LCX) in 33 patients (22%). Prevalence of RCA involvement as the IRA was different in three study groups (94.1% in ST elevation group, 83.1% in isoelectric group and 70.3% in ST depression group, P = 0.049). Presence of ST elevation had a sensitivity and specificity of 13.68 % and 96.97%, for detecting RCA lesions, respectively. ST depression had 66.67% sensitivity and 55.56% specificity for identifying LCX lesions. Clinical complications were low in our study with no significant difference among patients of three groups. Presence of ST elevation is highly suggestive of RCA lesions versus LCX lesions, whereas absence of ST elevation cannot rule out RCA lesions."

According to the news editors, the research concluded: "Presence of ST depression has a moderate sensitivity and specificity for LCX lesions."

The news editors report that additional information may be obtained by contacting S. Ghaffari, Tabriz Univ Med Sci, Cardiovasc Res Center, Tabriz, Iran. Additional authors for this research include A. Tajlil, S.S. Mahmoudi and S. Ghaffari.

Central Nervous System Diseases and Conditions –…

Study Findings from Temple University Provide New Insights into Progressive Multifocal Leukoencephalopathy (Diagnostic assays for polyomavirus JC and progressive multifocal leukoencephalopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Progressive Multifocal Leukoencephalopathy. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "Progressive multifocal leukoencephalopathy (PML) is a devastating and often fatal demyelinating disease of the central nervous system for which effective therapies are lacking. It is caused by the replication of polyomavirus JC (JCV) in the oligodendrocytes and astrocytes leading to their cytolytic death and loss of myelin from the subcortical white matter."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from Temple University, "While the virus is very common in human populations worldwide, the incidence of the disease is very low and confined almost exclusively to individuals with some form of immunological dysfunction. However, the number of people who constitute the at-risk population is growing larger and includes individuals with HIV-1/AIDS and patients receiving immunomodulatory therapies such as multiple sclerosis patients treated with natalizumab. Further adding to the public health significance of this disease are the difficulties encountered in the diagnosis of PML and the lack of useful biomarkers for PML progression."

According to the news editors, the research concluded: "In this review, we examine the diagnostic assays that are available for different aspects of the JCV life cycle, their usefulness and drawbacks, and the prospects for improvements."

Our news journalists report that additional information may be obtained by contacting M.K. White, Dept. of Neuroscience, Center for Neurovirology and Comprehensive NeuroAIDS Center, Lewis Katz School of Medicine at Temple University, Philadelphia, Pennsylvania, United States. Additional authors for this research include I.K. Sariyer, J. Gordon, S. Delbue, V. Pietropaolo, J.R. Berger and K. Khalili.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/rmv.1866. This DOI is a link to an online electronic document that is either free or for purchase.

Study Findings from Tongji University Broaden Understanding of Neurofibromatosis Type 1 (Novel mutations in one allele in a Chinese family with neurofibromatosis type 1: Including a complex insertion-deletion mutation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nervous System Diseases and Conditions - Neurofibromatosis Type 1. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Neurofibromatosis type 1 (NF1) is a hereditary disease with variable clinical manifestations. This study was performed in a Chinese three-generation family containing two members with NF1."

Financial support for this research came from National Natural Science Foundation of China.

Our news editors obtained a quote from the research from Tongji University, "Two novel mutations, c.853_854insTC and c.1975_1976delinsTA, were identified in the same allele in both patients by direct sequencing. By reverse transcription polymerase chain reaction, we found that the NF1 transcript contained the first mutation instead of the second mutation, suggesting a pathological role of c.853_854insTC mutation. Case reports of patients with two NF1 mutations in the same allele have not been reported."

According to the news editors, the research concluded: "Our findings expand the known spectrum of NF1 mutations and the ongoing recognition of different mutations may give insight into the mysterious NF1 pathogenesis."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1346-8138.13498. This DOI is a link to an online electronic document that is either free or for purchase.

**Antioxidants**

**Study Findings from Trakia University Broaden Understanding of Antioxidants (Protective effect of two essential oils isolated from Rosa damascena Mill. and Lavandula angustifolia Mill, and two classic antioxidants against L-dopa oxidative ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Antioxidants. According to news reporting originating in Stara Zagora, Bulgaria, by NewsRx journalists, research stated, "Levodopa (L-dopa) is a 'gold standard' and most effective symptomatic agent in the Parkinson's disease (PD) treatment. The several treatments have been developed in an attempt to improve PD treatment, but most patients were still levodopa dependent."

Financial support for this research came from Trakia University.

The news reporters obtained a quote from the research from Trakia University, "The issue of toxicity was raised in vitro studies, and suggests that L-dopa can be toxic to dopaminergic neurons, but it is not yet entirely proven. L-dopa prolonged treatment is associated with motor complications and some limitations. Combining the L-dopa therapy with antioxidants can reduce related sideeffects and provide symptomatic relief. The natural antioxidants can be isolated from any plant parts such as seeds, leaves, roots, bark, etc., and their extracts riched in phenols can retard the oxidative degradation of the lipids, proteins and DNA."

According to the news reporters, the research concluded: "Thus, study suggests that combination of essential oils (Rose oil and Lavender oil), Vitamin C and Trolox with Ldopa can reduce oxidative toxicity, and may play a key role in ROS/RNS disarm."

Our news correspondents report that additional information may be obtained by contacting A. Zheleva, Trakia Univ, Fac Med, Dept. of Chem & Biochem, Stara Zagora 6000, Bulgaria. Additional authors for this research include Y. Karamalakova, N. Kovacheva, S. Stanev, A. Zheleva and V. Gadjeva.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.yrtph.2016.06.024. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Stara Zagora, Bulgaria, Europe, Protective Agents, Antioxidants, Genetics, Trakia University.

Heart Disorders and Diseases - Heart Attack

Study Findings from Tulane University Provide New Insights into Heart Attack (Multivessel Revascularization Does Not Increase Contrast-Induced Acute Kidney Injury Incidence in Acute Myocardial Infarction: A Meta-Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting originating from New Orleans, Louisiana, by NewsRx correspondents, research stated, "Recent studies and meta-analysis have shown that complete revascularization (CR) compared with infarct-related artery revascularization (IRA) during percutaneous coronary intervention for ST-segment elevation myocardial infarction (STEMI) is associated with decreased mortality. However, it is unclear if CR versus IRA in STEMI during indexed hospitalization is associated with risk of contrast-induced acute kidney injury (CI-AKI)."

Our news editors obtained a quote from the research from Tulane University, "A database search was conducted for all randomized controlled trials that enrolled STEMI patients and compared CR versus IRA and reported CI-AKI. Comprehensive Meta-Analysis Version 2.0 (Wiley, Chichester) was used to determine summary effect size with a fixed-effect model and expressed as a risk ratio with 95 % confidence intervals. A total of four trials were identified and had a mean follow-up of 24.5 +/- 9.9 months, a total sample size of 1537, a mean age of 63.8 +/- 1.2 years, 64.2 +/- 1.2 years, 31.2 +/- 5.3 vs. 30.1 +/- 4.7 three-vessel disease, and 33.7 +/- 4.1 vs. 37.2 +/- 4.5 % anterior STEMI in the CR versus IRA groups, respectively. A total of 276.7 +/- 25.2 vs. 186.7 +/- 15.3 mL contrast was used in the CR versus IRA respectively (p = 0.006). There were no statistical significant differences between the two groups in the reported incidence of CI-AKI (1.3 % CR vs. 1.9 % IRA; p = 0.4), major bleeding (1.7 % CR vs. 2.5 % IRA; p = 0.4) and stroke (1.1 % CR vs. 0.4 % IRA; p = 0.24). However, there was a significantly increased incidence of cardiovascular death (2.0 % CR vs. 4.7 % IRA; p = 0.01) and ischemia-driven revascularization (6.2 % CR vs. 18.3 % IRA; p< 0.01)."

According to the news editors, the research concluded: "In the index hospitalization, CR in STEMI patients is associated with significant risk reduction in cardiac death and revascularization and a non-significant reduced trend of CI-AKI, despite increased use of contrast when compared with IRA."

The news editors report that additional information may be obtained by contacting T.H. Le Jemtel, Tulane University, Sch Med, Inst Heart & Vasc, Div CardiolDept Med, New Orleans, LA 70112, United States. Additional authors for this research include R.A. Riehl, A. Alonso, R. Samson, A. Jaiswal and T.H. Le Jemtel.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s40256-016-0184-1. This DOI is a link to an online electronic document that is either free or for purchase.
Biomedical Engineering - Regenerative Medicine

Study Findings from Tulane University School of Medicine Provide New Insights into Regenerative Medicine (Human Adipose Stromal/Stem Cells from Obese Donors Show Reduced Efficacy in Halting Disease Progression in the Experimental Autoimmune ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biomedical Engineering - Regenerative Medicine have been presented. According to news originating from New Orleans, Louisiana, by NewsRx correspondents, research stated, "Multiple sclerosis is an autoimmune disease that affects the white matter of the central nervous system and involves inflammation and demyelination. The recent advances in our understanding of adipose-derived stromal/stem cells (ASCs) and the utilization of these cells in clinical settings to treat diseases have made it essential to identify the most effective ASCs for therapy."

Our news journalists obtained a quote from the research from the Tulane University School of Medicine, "Studies have not yet investigated the impact of obesity on the therapeutic efficacy of ASCs. Obesity is characterized by adipocyte hyperplasia and hypertrophy and can extend to metabolic and endocrine dysfunction. Investigating the impact obesity has on ASC biology will determine whether these cells are suitable for use in regenerative medicine. The therapeutic efficacy of ASCs isolated from lean subjects (body mass index [BMI] <25; lnASCs) and obese subjects (BMI >30; obASCs) were determined in murine experimental autoimmune encephalomyelitis (EAE), a model of multiple sclerosis. Compared with the EAE disease-modifying effects of lnASCs, obASCs consistently failed to alleviate clinical symptoms or inhibit inflammation in the central nervous system. When activated, obASCs expressed higher mRNA levels of several pro-inflammatory cytokines compared with lnASCs. Additionally, conditioned media (CM) collected from the obASCs markedly enhanced the proliferation and differentiation of T cells; whereas, CM from lnASC did not. These results indicate that obesity reduces, or eliminates, the anti-inflammatory effects of human ASCs such that they may not be a suitable cell source for the treatment of autoimmune diseases."

According to the news editors, the research concluded: "The data suggest that donor demographics may be particularly important when identifying suitable stem cells for treatment."

The news correspondents report that additional information may be obtained from A.L. Strong, Center for Stem Cell Research and Regenerative Medicine, Tulane University School of Medicine, New Orleans, Louisiana, United States. Additional authors for this research...

Granulocytes

Study Findings from University Hospital Provide New Insights into Granulocytes (Ascites' neutrophil function is significantly impaired in patients with decompensated cirrhosis but can be restored by autologous plasma incubation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Granulocytes is the subject of a report. According to news reporting from Leipzig, Germany, by NewsRx journalists, research stated, "Systemic immune cell dysfunction is a typical feature of liver diseases and increases the risk of bacterial infection, especially spontaneous bacterial peritonitis. We evaluated functional properties of neutrophil granulocytes in blood and ascites of patients both with and without decompensated cirrhosis."

The news correspondents obtained a quote from the research from University Hospital, "We collected blood and ascites samples from 63 patients with cirrhosis and eight without cirrhosis. Phagocytosis activity (PA) and oxidative burst activity (OBA) were evaluated after ex vivo stimulation with E. coli, while fluorescence signals were measured by flow cytometry. Ascites' neutrophil function tests were repeated after incubation with autologous plasma. Ascites' neutrophils showed an impaired PA and OBA (median blood PA 98.1% (86.8-99.8) vs. ascites' PA 50.5% (0.4-97.3), p< 0.0001; median blood OBA 98.7% (27.5-100) vs. ascites' OBA 27.5% (0.3-96.7), p< 0.0001). Patients with non-cirrhotic ascites showed higher PA but equally suppressed OBA. Ascites' neutrophil function could be partially restored after incubation with autologous plasma (median increase PA: 22.5% (-49.7 - +93.2), p = 0.002; OBA: 22.8% (-10.4 - +48.8), p = 0.002). Ascites' neutrophils of patients with cirrhosis are functionally impaired, but could be partially restored after incubation with plasma."

According to the news reporters, the research concluded: "Further investigations are needed to identify the factors in ascites that are associated with neutrophils' function."

For more information on this research see: Ascites' neutrophil function is significantly impaired in patients with decompensated cirrhosis but can be restored by autologous plasma incubation. Scientific Reports, 2016;6():1-9. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Study Findings from University Medical Center Broaden Understanding of Inflammation (miR-146a-mediated suppression of the inflammatory response in human adipocytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Inflammation. According to news reporting out of Ulm, Germany, by NewsRx editors, research stated, "The obesity-associated inflammation of white adipose tissue (WAT) is one of the factors leading to the development of related diseases such as insulin resistance and liver steatosis. Recently, microRNAs (miRNAs) were identified as important regulators of WAT functions."

Our news journalists obtained a quote from the research from University Medical Center, "Herein, we cultured human Simpson-Golabi-Behmel syndrome (SGBS) adipocytes with macrophage-conditioned medium (MacCM) and performed an Affimetrix miRNA array to identify miRNAs differentially expressed under inflammatory conditions. We identified 24 miRNAs differentially expressed upon inflammation in human adipocytes and miR-146a was the most up-regulated miRNA species. In subcutaneous WAT, miR-146a was elevated in both human and murine obesity. Transfection of miR-146a mimics prevented the MacCM-induced inflammatory response in SGBS adipocytes as seen by reduced levels of IL-8 and MCP-1 mRNA and protein. We identified IRAK1 and TRAF6 as targets of miR-146a in human adipocytes and detected a reduced inflammation-induced activation of JNK and p38 upon miR-146a transfection. Taken together, we could show that miR-146a reduces the inflammatory response in human adipocytes."

According to the news editors, the research concluded: "In a negative feedback loop miR-146a might contribute to the regulation of inflammatory processes in WAT and possibly prevent an overwhelming inflammatory response."

For more information on this research see: miR-146a-mediated suppression of the inflammatory response in human adipocytes. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Study Findings from University of Abertay Provide New Insights into Mental Health (Predictive validity of the HCR-20 for violent and non-violent sexual behaviour in a secure mental health service)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Mental Health have been presented. According to news reporting out of Dundee, United Kingdom, by NewsRx editors, research stated, "Violent and non-violent sexual behaviour is a fairly common problem among secure mental health service patients, but specialist sexual violence risk assessment is time-consuming and so performed infrequently. We aimed to establish whether a commonly used violence risk assessment tool, the Health Clinical Risk management 20(HCR-20), has predictive validity specifically for inappropriate sexual behaviour."

Our news journalists obtained a quote from the research from the University of Abertay, "A pseudo-prospective cohort design was used for a study in the adult wards of a large provider of specialist secure mental health services. Routine clinical team HCR-20 assessments were extracted from records, and incidents involving inappropriate sexual behaviour were recorded for the 3 months following assessment. Of 613 patients, 104 (17%) had engaged in at least one inappropriate sexual behaviour; in 65 (10.6%), the sexual act was violent. HCR-20 total score, clinical and risk management subscales, predicted violent and non-violent sexual behaviour. The negative predictive value of the HCR-20 for inappropriate sexual behaviour was over 90%. Prediction of violent sexual behaviour may be regarded as well within the scope of the HCR-20 as a structured professional judgement tool to aid violence risk prediction, but we found that it also predicts behaviours that may be of concern but fall below the violence threshold."

According to the news editors, the research concluded: "High negative predictive values suggest that HCR-20 scores may have some utility for screening out patients who do not require more specialist assessment for inappropriate sexual behaviour."

Our news journalists report that additional information may be obtained by contacting G.L. Dickens, Abertay Univ, Sch Social & Hlth Sci, Dundee DD1 1HG, United Kingdom. Additional authors for this research include D.K. Thaker, M.M. Picchioni, F.L. Mason, C. Knight and G.L. Dickens.

Health and Medicine - Medical Hypotheses

Study Findings from University of Amsterdam Provide New Insights into Medical Hypotheses (Wound scabs protect regenerating tissue against harmful ultraviolet radiation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Health and Medicine - Medical Hypotheses is the subject of a report. According to news reporting originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Benefits attributed to wound scabs include prevention of blood loss and protection against infection. However, when formation of a wound scab is prevented, the risk of infection is reduced."

Our news editors obtained a quote from the research from the University of Amsterdam, "Moreover, in the absence of a wound scab, wounds heal faster and scar formation is reduced. The question arises why we develop a wound scab. Here we show that wound scabs inhibit transmission of ultraviolet radiation (UVR). We compared the UVR transmittance of human wound scabs to sunscreen by measuring the sun protection factor (SPF) with diffuse transmittance spectroscopy. Three wound scabs showed SPFs of 70, 84, and 300, which is more effective than the most protective commercially available sun block."

According to the news editors, the research concluded: "Because our results demonstrate that a wound scab offers natural protection against UVR, and because no beneficial trait is attributed to wound scabs, we hypothesize that the main function of wound scabs is to limit DNA damage in underlying cells during regeneration of wound tissue exposed to sunlight, thereby reducing the risk of developing skin cancer."

The news editors report that additional information may be obtained by contacting E. van der Pol, University of Amsterdam, Academy Med Center, Vesicle Observat Center, NL-1100 DD Amsterdam, Netherlands. Additional authors for this research include Y.D. Mudde, F.A.W. Coumans, T.G. van Leeuwen, A. Sturk and R. Nieuwland.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mehy.2016.09.011. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Pancreatic Cancer

Study Findings from University of California Broaden Understanding of Pancreatic Cancer (Molecular network, pathway, and functional analysis of-time dependent gene changes associated with pancreatic cancer susceptibility to oncolytic vaccinia ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Pancreatic Cancer is now available. According to news reporting originating from San Diego, California, by NewsRx correspondents, research stated, "Pancreatic cancer is a fatal disease associated with resistance to conventional therapies. This study aimed to determine changes in gene expression patterns associated with infection and susceptibility of pancreatic cancer cells to an oncolytic vaccinia virus, GLV-1h153, carrying the human sodium iodide symporter for deep tissue imaging of virotherapy."

Our news editors obtained a quote from the research from the University of California, "Replication and susceptibility of pancreatic adenocarcinoma PANC-1 cells to GLV-1h153 was confirmed with replication and cytotoxicity assays. PANC-1 cells were then infected with GLV-1h153 and near-synchronous infection confirmed via flow cytometry of viral-induced green fluorescent protein (GFP) expression. Six and 24 hours after infection, three samples of each time point were harvested, and gene expression patterns assessed using HG-U133A cDNA microarray chips as compared to uninfected control. Differentially expressed genes were identified using Bioconductor LIMMA statistical analysis package. A fold change of 2.0 or above was used as a cutoff, with a P value of 0.01. The gene list was then analyzed using Ingenuity Pathways Analysis software. Differential gene analysis revealed a total of 12,412 up- and 11,065 downregulated genes at 6 and 24 hours postinfection with GLV-1h153 as compared to control. At 6 hours postinfection, a total of 139 genes were either up or downregulated > twofold (false discovery rate < 0.05), of which 124 were mapped by Ingenuity Pathway Analysis (IPA). By 24 hours postinfection, a total of 5,698 genes were identified and 5,563 mapped by IPA. Microarray revealed gene expression changes, with gene networks demonstrating downregulation of processes such as cell death, cell cycle, and DNA repair, and upregulation of infection mechanisms (P < 0.01). Six hours after infection, gene changes involved pathways such as HMGB-1, interleukin (IL)-2, IL-6, IL-8, janus kinase/signal transducer and activator of transcription (JAK/STAT), interferon, and ERK 5 signaling (P < 0.01). By 24 hours, prominent pathways included P53-and Myc-induced apoptotic processes, pancreatic adenocarcinoma signaling, and phosphoinositide 3-kinase/v-akt murine thymoma vial oncogene homolog 1 (PI3/AKT) pathways. Our study reveals the ability to assess time-dependent changes in gene expression patterns in pancreatic cancer cells associated with infection and susceptibility to vaccinia viruses."

According to the news editors, the research concluded: "This suggests that molecular assays may be useful to develop safer and more efficacious oncolytic virotherapies and support the idea that these treatments may target pathways implicated in pancreatic cancer resistance to conventional therapies."

For more information on this research see: Molecular network, pathway, and functional analysis of-time dependent gene changes associated with pancreatic cancer susceptibility to oncolytic vaccinia virotherapy. Molecular Therapy-Oncolytics, 2016;3():10-18. Molecular Therapy-Oncolytics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.
Oncology - Prostate Cancer

Study Findings from University of Colorado Broaden Understanding of Prostate Cancer (Survival outcomes of combined external beam radiotherapy and brachytherapy vs. brachytherapy alone for intermediate-risk prostate cancer patients using the ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news reporting out of Aurora, Colorado, by NewsRx editors, research stated, "The purpose was to evaluate survival outcomes between external beam radiotherapy (EBRT) plus brachytherapy and brachytherapy alone for intermediate-risk prostate cancer, using the National Cancer Data Base. The National Cancer Data Base was queried for cNOMO intermediate-risk patients treated from 2004 to 2006, with available data for Gleason score (GS), prostate-specific antigen (PSA), tumor stage, and receipt of radiation therapy (RT) and androgen deprivation therapy."

Our news journalists obtained a quote from the research from the University of Colorado, "RT comparison groups were the following: EBRT (40-50.4 Gy) plus brachytherapy and brachytherapy alone. A total of 10,571 patients were included: 3,148 received EBRT plus brachytherapy and 7,423 received brachytherapy alone. Median followup was 84 months (2-122 months); median age was 68 years (40-90 years). Unadjusted 5- and 7-year overall survival (OS) rates between EBRT plus brachytherapy vs. brachytherapy alone were 91.4% vs. 90.2% and 85.7% vs. 82.9%, respectively (p < 0.001). EBRT plus brachytherapy was associated with longer OS compared with brachytherapy alone under multivariate (hazard ratio [HR], 0.84; 95% confidence interval [CI], 0.75-0.93; p = 0.001) and propensity score-matched analyses (HR, 0.85; 95% CI, 0.75-0.97; p = 0.006). Further subset analysis performed based on the Radiation Therapy Oncology Group 0232 inclusion criteria (GS 7 if PSA < 10 or GS < 7 if PSA 10-20) also demonstrated longer OS with EBRT plus brachytherapy (HR, 0.87; 95% CI, 0.77-0.98; p = 0.026). EBRT plus brachytherapy is associated with a modest OS improvement compared with brachytherapy alone in this population-based analysis. Although this benefit appears statistically significant, the relatively small difference in OS raises the question of overall clinical benefit with combined modality RT for intermediate-risk prostate cancer, given the potential increased risk for toxicities."

According to the news editors, the research concluded: "Future results from Radiation Therapy Oncology Group 0232 should provide further insight on this topic."

For more information on this research see: Survival outcomes of combined external beam radiotherapy and brachytherapy vs. brachytherapy alone for intermediate-risk prostate cancer.

Our news journalists report that additional information may be obtained by contacting A. Amini, University of Colorado, Sch Med, Dept. of Radiat Oncol, Aurora, CO 80045, United States. Transfusion Medicine - Blood Transfusion

Study Findings from University of Heidelberg Broaden Understanding of Blood Transfusion (Neuronal HIF-1 alpha and HIF-2 alpha deficiency improves neuronal survival and sensorimotor function in the early acute phase after ischemic stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Transfusion Medicine - Blood Transfusion is the subject of a report. According to news reporting from Heidelberg, Germany, by NewsRx journalists, research stated, "Hypoxia-inducible factors mediate adaptive responses to ischemia, among others, by induction of anti- and pro-survival genes. Thus, the impact of HIF on neuronal survival upon stroke is controversial."

The news correspondents obtained a quote from the research from the University of Heidelberg, "Therefore, neuron-specific knockout mice deficient for Hif1 alpha and Hif2 alpha were exposed to inspiratory hypoxia or ischemia-reperfusion injury. Both Hif1 alpha- and Hif2 alpha-deficient mice showed no altered infarct and edema size, suggesting that both HIF-alpha subunits might compensate for each other. Accordingly, hypoxic HIF-target gene regulation was marginally affected with exception of anti-survival Bnip3 and pro-survival erythropoietin. In the early acute stage upon stroke, Hif1 alpha/Hif2 alpha double knockout mice exhibited significantly reduced expression of the anti-survival Bnip3, Bnip3L, and Pmaip1. Accordingly, global cell death and edema were significantly reduced upon 24 h but not 72 h reperfusion. Behavioral assessment indicated that Hif1 alpha/Hif2 alpha-deficient mice initially performed better, but became significantly more impaired after 72 h accompanied by increased apoptosis and reduced angiogenesis. Our findings suggest that in neurons HIF-1 and HIF-2 have redundant functions for cellular survival under ischemic conditions."

According to the news reporters, the research concluded: "By contrast, lack of anti-survival factors in Hif1 alpha/Hif2 alpha-deficient mice might protect from early acute neuronal cell death and neurological impairment, indicating a benefit of HIF-pathway inhibition in
neurons in the very acute phase after ischemic stroke."

Our news journalists report that additional information may be obtained by contacting R. Kunze, Heidelberg Univ, Inst Physiol & Pathophysiol, D-69120 Heidelberg, Germany. Additional authors for this research include L.X. Li, A.S. Ernst, L.I. Bohler, H.H. Marti and R. Kunze.

**Oncology - Cancer Care**

**Study Findings from University of Jaen Provide New Insights into Cancer Care (Coping strategies and anxiety in caregivers of palliative cancer patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Care have been published. According to news reporting originating in Jaen, Spain, by NewsRx journalists, research stated, "The study purpose was to determine the relationship between coping strategies and anxiety in primary family caregivers of palliative cancer patients. A cross-sectional study was carried out in a Pain and Palliative Care Unit in Spain."

The news reporters obtained a quote from the research from the University of Jaen, "Data were collected through interviews from fifty primary family caregivers of palliative cancer patients. Main research variables were: (1) dependent variable: anxiety (subscale of anxiety from Goldberg's scale); (2) independent variable: coping (Brief COPE); (3) control variables: functional capacity and perceived burden. Analyses comprised descriptive statistics, correlation coefficients and multiple linear regression. Anxiety was present in the majority of caregivers surveyed (76%). Anxiety was related to the perception of perceived burden (beta = 0.42, P< 0.001), the emotion-focused coping (beta = -0.28, P = 0.01) and dysfunctional coping (beta = 0.41, P< 0.001), after adjusting for control variables. Thus, emotion-focused coping is negatively associated with anxiety, while dysfunctional coping is positively associated with anxiety. Problem-focused coping is not related to anxiety."

According to the news reporters, the research concluded: "Assessment of coping should be done in a systematic way in caregivers of palliative cancer patients."

Our news correspondents report that additional information may be obtained by contacting R. Del-Pino-Casado, University of Jaen, Fac Hlth Sci, Dept. of Nursing, Jaen, Spain. Additional authors for this research include A. Frias-Osuna, Y. Romero-Rodriguez and R. Del-Pino-Casado.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ccc.12507. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Jaen, Spain, Europe, Cancer Care, Oncology, Cancer, University of Jaen.

Hearing Diseases and Conditions - Tinnitus

Study Findings from University of Klagenfurt Broaden Understanding of Tinnitus (Differential tinnitus-related neuroplastic alterations of cortical thickness and surface area)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hearing Diseases and Conditions - Tinnitus have been presented. According to news reporting from Klagenfurt, Austria, by NewsRx journalists, research stated, "Structural neuroimaging techniques have been used to identify cortical and subcortical regions constituting the neuroarchitecture of tinnitus. One recent investigation used voxel-based morphometry (VBM) to analyze a sample of tinnitus patients (T1, n = 257) (Schecklmann et al., 2013)."

The news correspondents obtained a quote from the research from the University of Klagenfurt, "A negative relationship between individual distress and cortical volume (CV) in bilateral auditory regions was observed. However, CV has meanwhile been identified as a neuroanatomical measurement that confounds genetically distinct neuroanatomical traits, namely cortical thickness (CT) and cortical surface area (CSA). We performed a re-analysis of the identical sample using the automated FreeSurfer surface-based morphometry (SBM) approach (Fischl, 2012). First, we replicated the negative correlation between tinnitus distress and bilateral supratemporal gray matter volume. Second, we observed a negative correlation for CSA in the left periauditory cortex and anterior insula. Furthermore, we noted a positive correlation between tinnitus duration and CT in the left periauditory cortex as well as a negative correlation in the subcallosal anterior cingulate, a region collated to the serotonergic circuit and germane to inhibitory functions. In short, the results elucidate differential neuroanatomical alterations of CSA and CT for the two independent tinnitus-related psychological traits distress and duration."

According to the news reporters, the research concluded: "Beyond this, the study provides further evidence for the distinction and specific susceptibility of CSA and CT within the context of neuroplasticity of the human brain."

For more information on this research see: Differential tinnitus-related neuroplastic alterations of cortical thickness and surface area. Hearing Research, 2016;342():1-12. Hearing Research can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Hearing Research - www.journals.elsevier.com/hearing-research/)

Oncology - Prostate Cancer

Study Findings from University of Louisville Provide New Insights into Prostate Cancer (Inhibition of AKT promotes FOXO3a-dependent apoptosis in prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting originating in Louisville, Kentucky, by NewsRx journalists, research stated, "Growth factor-induced activation of protein kinase-B (PKB), also known as AKT, induces pro-survival signaling and inhibits activation of pro-apoptotic signaling molecules including the Forkhead box O-3a (FOXO3a) transcription factor and caspase in transformed prostate cells in vitro. Earlier we reported that Withaferin-A (WA), a small herbal molecule, induces pro-apoptotic response-4 (Par-4) mediated apoptosis in castration-resistant prostate cancer (CRPC) cells."

The news reporters obtained a quote from the research from the University of Louisville, "In the present study, we demonstrate that inhibition of AKT facilitates nuclear shuttling of FOXO3a where it regulates Par-4 transcription in CRPC cells. FOXO3a is upstream of Par-4 signaling, which is required for induction of apoptosis in CRPC cells. Promoter bashing studies and Ch-IP analysis confirm a direct interaction of FOXO3a and Par-4; a sequential deletion of FOXO3a-binding sites in the Par-4 promoter fails to induce Par-4 activation. To confirm these observations, we either overexpressed AKT or silenced FOXO3a activation in CRPC cells. Both methods inhibit Par-4 function and apoptosis is significantly compromised. In xenograft tumors derived from AKT-overexpressed CRPC cells, FOXO3a and Par-4 expression is downregulated, leading to aggressive tumor growth. Oral administration of WA to mice with xenograft tumors restores FOXO3a-mediated Par-4 functions and results in inhibited tumor growth. Finally, an inverse correlation of nuclear localization of AKT expression corresponds to cytoplasmic Par-4 localization in human prostate tissue array. Our studies suggest that Par-4 is one of the key transcriptional targets of FOXO3a, and Par-4 activation is required for induction of apoptosis in CRPC cells."

According to the news reporters, the research concluded: "Activation of FOXO3a appears to be an attractive target for the treatment of CRPC and molecules such as WA can be explored further for the treatment of CRPC."
For more information on this research see: Inhibition of AKT promotes FOXO3a-dependent apoptosis in prostate cancer. *Cell Death & Disease*, 2016;7():e2111. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

**Nephrology**

**Study Findings from University of Manchester Broaden Understanding of Nephrology (Novel minimal physiologically-based model for the prediction of passive tubular reabsorption and renal excretion clearance)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nephrology are discussed in a new report. According to news reporting originating from Manchester, United Kingdom, by NewsRx correspondents, research stated, "Develop a minimal mechanistic model based on in vitro-in vivo extrapolation (IVIVE) principles to predict extent of passive tubular reabsorption. Assess the ability of the model developed to predict extent of passive tubular reabsorption (F-reab) and renal excretion clearance (CLR) from in vitro permeability data and tubular physiological parameters."

Our news editors obtained a quote from the research from the University of Manchester, "Model system parameters were informed by physiological data collated following extensive literature analysis. A database of clinical CLR was collated for 157 drugs. A subset of 45 drugs was selected for model validation; for those, Caco-2 permeability (P-app) data were measured under pH 6.5-7.4 gradient conditions and used to predict F-reab and subsequently CLR. An empirical calibration approach was proposed to account for the effect of inter-assay/laboratory variation in P-app on the IVIVE of F-reab. The 5-compartmental model accounted for regional differences in tubular surface area and flow rates and successfully predicted the extent of tubular reabsorption of 45 drugs for which filtration and reabsorption were contributing to renal excretion. Subsequently, predicted CLR was within 3-fold of the observed values for 87% of drugs in this dataset, with an overall gmfe of 1.96. Consideration of the empirical calibration method improved overall prediction of CLR (gmfe = 1.73 for 34 drugs in the internal validation dataset), in particular for basic drugs and drugs with low extent of tubular reabsorption. The novel 5-compartment model represents an important addition to the IVIVE toolbox for physiologically-based prediction of renal tubular reabsorption and CLR."

According to the news editors, the research concluded: "Physiological basis of the model proposed allows its application in future mechanistic kidney models in preclinical species
and human."

The news editors report that additional information may be obtained by contacting A. Galetin, University of Manchester, Center Appl Pharmacokinet Res, Manchester Pharm Sch, Manchester M13 9PT, Lancs, United Kingdom. Additional authors for this research include C. Jones, A. Rostami-Hodjegan and A. Galetin.

Respiratory Tract Diseases and Conditions - Thoracic...

Study Findings from University of Miami Jackson Memorial Hospital Broaden Understanding of Thoracic Aortic Aneurysm (TEVAR for Flash Pulmonary Edema Secondary to Thoracic Aortic Aneurysm to Pulmonary Artery Fistula)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Respiratory Tract Diseases and Conditions - Thoracic Aortic Aneurysm. According to news reporting from Miami, Florida, by NewsRx journalists, research stated, "Enlarging aneurysms in the thoracic aorta frequently remain asymptomatic. Fistulization of thoracic aortic aneurysms (TAA) to adjacent structures or the presence of a patent ductus arteriosus and TAA may lead to irreversible cardiopulmonary sequelae."

The news correspondents obtained a quote from the research from the University of Miami Jackson Memorial Hospital, "This article reports on a large aneurysm of the thoracic aorta with communication to the pulmonary artery causing pulmonary edema and cardiorespiratory failure. The communication was ultimately closed after thoracic endovascular aortic aneurysm repair allowing rapid symptom resolution."

According to the news reporters, the research concluded: "Early diagnosis and closure of such communication in the presence of TAA are critical for prevention of permanent cardiopulmonary damage."

Oncology - Colon Cancer

Study Findings from University of Michigan Broaden Understanding of Colon Cancer (Transcription Factor ZBP-89 Drives a Feedforward Loop of beta-Catenin Expression in Colorectal Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "In colorectal cancer, APC-mediated induction of unregulated cell growth involves posttranslational mechanisms that prevent proteasomal degradation of proto-oncogene beta-catenin (CTNNB1) and its eventual translocation to the nucleus. However, about 10% of colorectal tumors also exhibit increased CTNNB1 mRNA."

Our news editors obtained a quote from the research from the University of Michigan, "Here, we show in colorectal cancer that increased expression of ZNF148, the gene coding for transcription factor ZBP-89, correlated with reduced patient survival. Tissue arrays showed that ZBP-89 protein was overexpressed in the early stages of colorectal cancer. Conditional deletion of Zfp148 in a mouse model of Apc-mediated intestinal polyps demonstrated that ZBP-89 was required for polyp formation due to induction of Ctnnb1 gene expression. Chromatin immunoprecipitation (ChIP) and EMSA identified a ZBP-89-binding site in the proximal promoter of CTNNB1. Reciprocally, siRNA-mediated reduction of CTNNB1 expression also decreased ZBP-89 protein. ChIP identified TCF DNA binding sites in the ZNF148 promoter through which Wnt signaling regulates ZNF148 gene expression. Suppression of either ZNF148 or CTNNB1 reduced colony formation in WNT-dependent, but not WNT-independent cell lines."

According to the news editors, the research concluded: "Therefore, the increase in intracellular beta-catenin protein initiated by APC mutations is sustained by ZBP-89-mediated feedforward induction of CTNNB1 mRNA."

For more information on this research see: Transcription Factor ZBP-89 Drives a Feedforward Loop of beta-Catenin Expression in Colorectal Cancer. Cancer Research, 2016;76 (23):6877-6887. Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Study Findings from University of Milan Broaden Understanding of Candida [CAND-LO 2014-15 study: changing epidemiology of candidemia in Lombardy (Italy)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Fungal Diseases and Conditions - Candida is now available. According to news reporting originating in Milan, Italy, by NewsRx journalists, research stated, "The aim of this study was to monitor recent changes in the epidemiology of candidemia and in the antifungal susceptibility profiles of Candida isolates in one Italian region (Lombardy) in 2014-2015 in comparison with two other studies performed in the same area in 1997-1999 and in 2009. A laboratory-based surveillance was conducted in 11 microbiology laboratories."

The news reporters obtained a quote from the research from the University of Milan, "Identification of Candida isolates from 868 episodes and antifungal susceptibility testing (YeastOne) was performed locally. A progressive increase in the rate of candidemia up to 1.27/1000 admissions and 1.59/10,000 patient days was documented. In all the three surveys, Candida albicans remains the most frequently isolated species, ranging from 52 to 59 % of the etiology of BSIs. The epidemiological shift to the more resistant C. glabrata, observed between 1997-1999 and 2009 surveys, was not confirmed by our more recent data. The pattern of etiology of BSIs occurred in 2014-2015 overlaps that of the 90s. Acquired antifungal resistance is a rare event. No isolate had an amphotericin B minimal inhibitory concentration (MIC, mg/L) value higher than the epidemiological cutoff. All the echinocandin MIC distributions are typical for wild-type organisms except for those of two C. glabrata isolates. Fluconazole resistance declined from 24.9 % in the 2009 survey to 5.4 % in the recent one."

According to the news reporters, the research concluded: "Data from regional surveys may highlight the influence of therapeutic practices on the epidemiology of Candida BSIs and may optimize empirical therapies."

For more information on this research see: CAND-LO 2014-15 study: changing epidemiology of candidemia in Lombardy (Italy). *Infection*, 2016;44(6):765-780. *Infection* can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. (Springer - [www.springer.com](http://www.springer.com); Infection - [www.springerlink.com/content/0300-8126/])

Our news correspondents report that additional information may be obtained by contacting A.M. Tortorano, University of Milan, Dept. of Biomed Sci Hlth, Milan, Italy. Additional authors for this research include C. Cavanna, M. Passera, C. Ossi, E. Sala, G.
Study Findings from University of New Mexico Provide New Insights into Arteriovenous Fistula (Transverse Sinus Dural Arteriovenous Fistula Presenting with Acute Hydrocephalus from Cerebellar Venous Engorgement Resolving with Endovascular ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Arteriovenous Fistula are discussed in a new report. According to news reporting originating in Albuquerque, New Mexico, by NewsRx journalists, research stated, "A 77-year-old woman presented with a several week history of progressively worsening nausea and vomiting and a sudden change in mental status. She was found to have hydrocephalus with transependymal flow."

The news reporters obtained a quote from the research from the University of New Mexico, "Angiography revealed a Cognard class IIb/Borden class II transverse sinus dural arteriovenous fistula. Cerebellar venous engorgement causing posterior fossa mass effect was thought to be the cause of her hydrocephalus. Treatment involved transarterial embolization resulting in angiographic cure. Following treatment she had resolution of nausea and vomiting, and her ventriculostomy was discontinued without need for shunting."

According to the news reporters, the research concluded: "Six-month follow-up magnetic resonance imaging indicated no sign of hydrocephalus and significantly improved posterior fossa congestion."

Our news correspondents report that additional information may be obtained by contacting A.P. Carlson, University of New Mexico, Univ New Mexico Hosp, Dept. of Neurosurg, Albuquerque, NM 87131, United States.

Oncology - Brain Cancer

Study Findings from University of Paris Broaden Understanding of Brain Cancer (The multidimensional burden of informal caregivers in primary malignant brain tumor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Brain Cancer are presented in a new report. According to news reporting from Paris, France, by NewsRx journalists, research stated, "Informal caregivers (ICs) provide care and improve the quality of life of patients with malignant brain tumor. We analyze the impact of their involvement on themselves from a triple perspective."

Financial supporters for this research include Society of Physical and Rehabilitation Medicine (SOFMER), Fondation des "Gueules Cassees", Caisse Nationale de Solidarite pour l’Autonomie (CNSA), Fondation de France.

The news correspondents obtained a quote from the research from the University of Paris, "Home-dwelling patients with primary malignant brain tumor underwent a medical examination. ICs burden was evaluated by a self-administered postal questionnaire. Objective burden (Informal Care Time, ICT), subjective burden (Zarit Burden Inventory, ZBI), and financial burden (valuation of lost earnings using the Replacement and Opportunity Cost Methods, RCM, OCM) were evaluated. ICs (N = 84) were principally women (87 %) and spouses (64 %), of mean age 55 years, who assisted patients of mean age 53 years and with a mean KPS score of 61 (range = 30-90, med = 60). Subjective burden was moderate (mean ZBI = 30). Objective burden was high (mean ICT = 11.7 h/day), mostly consisting of supervision time. Higher subjective and objective burden were associated with poorer functional status (KPS) but not with a higher level of cognitive disorders in multivariate analyses. Other independent associated factors were bladder dysfunction and co-residency for objective burden and working and a poor social network for subjective burden. The 56 working ICs made work arrangements (75 %) that impacted their wages (36 %) and careers (30 %). Financial burden due to uncompensated caregiving hours for Activities of Daily Living had a mean monetary value from D’677 (RCM) to D’1683 (OCM) per month (i.e., ranging from D’8124 to D’20196 per year). IC burden is multidimensional."

According to the news reporters, the research concluded: "Greater provision of formal care, more IC support programs, and economic interventions targeting IC employment and finances are needed."

For more information on this research see: The multidimensional burden of informal caregivers in primary malignant brain tumor. Supportive Care in Cancer, 2017;25(1):245-253. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Supportive Care in Cancer - www.springerlink.com/content/0941-4355/)

**Peptide Proteins - Peptide Hormones**

**Study Findings from University of Paris Provide New Insights into Peptide Hormones (Hypothalamic regulation of body growth and appetite by ghrelin-derived peptides during balanced nutrition or undernutrition)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Peptide Proteins - Peptide Hormones have been presented. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "Among the gastrointestinal hormones that regulate food intake and energy homeostasis, ghrelin plays a unique role as the first one identified to increases appetite and stimulate GH secretion. This review highlights the latest mechanism by which ghrelin modulates body growth, appetite and energy metabolism by exploring pharmacological actions of the hormone and consequences of genetic or pharmacological blockade of the ghrelin/GHS-R (Growth Hormone Secretagogue Receptor) system on physiological responses in specific nutritional situations."

Funders for this research include Agence Nationale de la Recherche Jeunes Chercheuses Jeunes Chercheurs, Institut National de la Sante et de la Recherche Medicale (INSERM).

The news reporters obtained a quote from the research from the University of Paris, "Within the hypothalamus, novel mechanisms of action of this hormone involve its interaction with other ghrelin-derived peptides, such as desacyl ghrelin and obestatin, which are thought to act as functional ghrelin antagonists, and possible modulation of the GHS-R with other G-protein coupled receptors. During chronic undernutrition such as anorexia nervosa, variations of ghrelin-derived peptides may be an adaptative metabolic response to maintain normal glycemic control."

According to the news reporters, the research concluded: "Interestingly, some of ghrelin's metabolic actions are thought to be relayed through modulation of GH, an anabolic and hyperglycemic agent."

Our news correspondents report that additional information may be obtained by contacting V. Tolle, University of Paris, Center Psychiat & Neurosci, INSERM, UMR S 894Sorbonne Paris Cite, F-75014 Paris, France. Additional authors for this research include A. Labarthe and V. Tolle.

Study Findings from University of Paris-Sud Broaden Understanding of Oncology (Fertility-sparing surgery in epithelial ovarian cancer: a systematic review of oncological issues)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology. According to news reporting originating in Le Kremlin Bicetre, France, by NewsRx journalists, research stated, "Since the last two decades, the feasibility of fertility-sparing surgery (FSS) in early-stage epithelial ovarian cancer (EOC) has been explored by several teams and is reconsidered in this systematic review undertaken using the PRISMA guidelines. Borderline ovarian tumours and non-EOCs were excluded."

The news reporters obtained a quote from the research from the University of Paris-Sud, "This review comprises 1150 patients and 139 relapsing patients reported by 21 teams. This conservative treatment can be safely carried out for stage IA and IC grade 1 and 2 disease and stage IC1 according to the new FIGO staging system. Nevertheless, the number of patients reported with grade 2 disease is too small to definitively confirm whether FSS is safe in this subgroup. For patients with 'less favourable' prognostic factors (grade 3 or stage IC3 disease), the safety of FSS could not be confirmed, but patients should be informed that radical treatment probably may not necessarily improve their oncological outcome, because the poorest survival observed could be related to the natural history of the disease itself and not specifically to the use of conservative therapy. FSS could probably be considered in stage I clear-cell tumours but should remain contraindicated for stage II/III disease (whatever the histologic subtype)."

According to the news reporters, the research concluded: "As the disease stage and the histologic data (tumour type and grade) are crucial to patient selection for this treatment, this implies careful and mandatory complete surgical staging surgery in this context and a pathological analysis (or review) of the tumour by an expert pathologist."

Our news correspondents report that additional information may be obtained by contacting P. Morice, Univ Paris Sud, Le Kremlin Bicetre, France. Additional authors for this research include S. Gouy, A. Maulard, P. Pautier, A. Leary, N. Colombo and P. Morice.

Study Findings from University of Pennsylvania Hospital Broaden Understanding of Psychosis (Disrupted anatomic networks in the 22q11.2 deletion syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Mental Health Diseases and Conditions - Psychosis are discussed in a new report. According to news originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "The 22q11.2 deletion syndrome (22q11DS) is an uncommon genetic disorder with an increased risk of psychosis. Although the neural substrates of psychosis and schizophrenia are not well understood, aberrations in cortical networks represent intriguing potential mechanisms."

Financial support for this research came from NIH.

Our news journalists obtained a quote from the research from the University of Pennsylvania Hospital, "Investigations of anatomic networks within 22q11DS are sparse. We investigated group differences in anatomic network structure in 48 individuals with 22q11DS and 370 typically developing controls by analyzing covariance patterns in cortical thickness among 68 regions of interest using graph theoretical models. Subjects with 22q11DS had less robust geographic organization relative to the control group, particularly in the occipital and parietal lobes. Multiple global graph theoretical statistics were decreased in 22q11DS."

According to the news editors, the research concluded: "These results are consistent with prior studies demonstrating decreased connectivity in 22q11DS using other neuroimaging methodologies."

The news correspondents report that additional information may be obtained from J.E. Schmitt, University of Pennsylvania Hospital, Dept. of Radiol, Div Neuroradiol, Philadelphia, PA 19104, United States. Additional authors for this research include J. Yi, M.E. Calkins, K. Ruparel, D.R. Roalfl, A. Cassidy, M.C. Souders, T.D. Satterthwaite, D.M. McDonald-McGinn, E.H. Zackai, R.C. Gur, B.S. Emanuel and R.E. Gur.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.nicl.2016.08.020. This DOI is a link to an online electronic document that is either free or for purchase.

Study Findings from University of Pittsburgh Broaden Understanding of Tumors (Targeting regulatory T cells in tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Tumors is now available. According to news reporting from Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "Regulatory T (T-reg) cells play a crucial role in maintaining peripheral tolerance and preventing autoimmunity. However, they also represent a major barrier to effective antitumor immunity and immunotherapy."

Funders for this research include National Institutes of Health, National Cancer Institute.

The news correspondents obtained a quote from the research from the University of Pittsburgh, "Consequently, there has been considerable interest in developing approaches that can selectively or preferentially target Treg cells in tumors, while not impacting their capacity to maintain peripheral immune homeostasis. In this review, we describe our current understanding of the mechanisms underlying the recruitment, expansion, and suppressive activity of tumor-associated Treg cells, and discuss the approaches used and the challenges encountered in the immunotherapeutic targeting of Treg cells. In addition, we summarize the primary clinical targets and some emerging data on exciting new potential Treg cell-restricted targets."

According to the news reporters, the research concluded: "We propose that discovering and understanding mechanisms that are preferentially used by Treg cells within the tumor microenvironment will lead to strategies that selectively target Treg cell-mediated suppression of antitumor immunity while maintaining peripheral immune tolerance."

Our news journalists report that additional information may be obtained by contacting D.A.A. Vignali, University of Pittsburgh, Inst Canc, Tumor Microenviromn Center, Pittsburgh, PA 15232, United States. Additional authors for this research include C.J. Workman and D.A.A. Vignali.

Surgery - Esophagectomy

Study Findings from University of Pittsburgh Provide New Insights into Esophagectomy (Cancer Recurrence After Esophagectomy: Impact of Postoperative Infection in Propensity-Matched Cohorts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Surgery - Esophagectomy are discussed in a new report. According to news reporting from Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "Postoperative infection increases cancer recurrence and worsens survival in colorectal cancer, but the relationship for esophagogastric adenocarcinoma after esophagectomy is not well defined. We aimed to determine whether recurrence and survival after minimally invasive esophagectomy for esophagogastric adenocarcinoma were influenced by postoperative infection using propensity-matched analysis."

Financial supporters for this research include National Cancer Institute, National Institutes of Health.

The news correspondents obtained a quote from the research from the University of Pittsburgh, "We abstracted data for 810 patients (19972010) and defined exposure as at least 1 in-hospital or 30-day infectious complication (n = 206 [25%]). Using 29 pretreatment/intraoperative variables, patients were propensity-score matched (caliper = 0.05). Time to cancer recurrence and survival (Kaplan-Meier curves and the Breslow test), and associated factors (Cox regression with shared frailty) were assessed. After propensity matching (n = 167 pairs), median bias across propensity-score variables was reduced from 12.9% (p < 0.001) to 4.4% (p = 1.000). Postoperative infection was not associated with rate (n = 60 versus 63; McNemar p = 0.736) or time to recurrence in those in whom disease recurred (median, 10.7 versus 11.1 months; Wilcoxon signed-rank p = 0.455) but was associated with shorter overall survival (n = 124 versus 102 deaths; median, 26 versus 41 months; Breslow p = 0.002). After adjusting for age, body mass index, neoadjuvant therapy, sex, comorbidity score, positive resection margins, pathologic stage, R0 resection, and recurrence, postoperative infection was associated with a 44% greater hazard for death (hazard ratio, 1.44; 95% confidence interval, 1.10-1.89). In patients with esophagogastric adenocarcinoma, infections after esophagectomy were not associated with an increased rate or earlier time to recurrence when baseline characteristics associated with infection risk were balanced using propensity-score matching. Despite this, overall survival was shorter in patients with infectious complications."

According to the news reporters, the research concluded: "After adjusting for other important survival predictors, infections after esophagectomy continued to be independently associated with worse survival. 2016 by The Society of Thoracic Surgeons."

Our news journalists report that additional information may be obtained by contacting V. Tam, University of Pittsburgh, Clin & Translat Sci Inst, Pittsburgh, PA, United States. Additional authors for this research include J.D. Luketich, D.G. Winger, I.S. Sarkaria, R.M. Levy, N.A. Christie, O. Awais, M.R. Shende and K.S. Nason.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mtheracsur.2016.04.097. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antineoplastics

Study Findings from University of Rochester Broaden Understanding of Antineoplastics (Fetal Myelomeningocele After Maternal Methotrexate Administration A Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antineoplastics. According to news reporting originating in Rochester, New York, by NewsRx journalists, research stated, "Folate supplementation in women of reproductive age has a well-established role in the prevention of neural tube defects. Methotrexate is a commonly used drug which functions by inhibiting normal folate metabolism in active cells."

The news reporters obtained a quote from the research from the University of Rochester, "An association between fetal methotrexate exposure and myelomeningocele might be expected, considering this relationship. However, to our knowledge, no cases of myelomeningocele secondary to in utero methotrexate exposure have been reported. We present the case of a gravid patient who, having received methotrexate for management of an ectopic pregnancy, was lost to follow-up and returned several weeks later carrying an intrauterine pregnancy. The fetus was found prenatally to be suffering from multiple congenital anomalies. At birth the infant demonstrated many of the abnormalities commonly associated with fetal methotrexate syndrome, including craniosynostosis and talipes equinovarus. Most interestingly, the newborn was also diagnosed with a lumbar myelomeningocele and concomitant type II Chiari malformation, as is often associated with such a neural tube defect. Methotrexate exposure may impact the fetal risk of myelomeningocele."

According to the news reporters, the research concluded: "Patients should be counseled thoroughly on the importance of follow-up care."

For more information on this research see: Fetal Myelomeningocele After Maternal Methotrexate Administration A Case Report. Journal of Reproductive Medicine, 2016;61(11-12):609-611. Journal of Reproductive Medicine can be contacted at: Sci Printers & Publ Inc, Po Drawer 12425 8342 Olive Blvd, St Louis, MO 63132, USA.

Study Findings from University of Rostock Broaden Understanding of Carbamazepine Therapy (A Case Report of a Carbamazepine Overdose With Focus on Pharmacokinetic Aspects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Carbamazepine Therapy have been published. According to news reporting out of Rostock, Germany, by NewsRx editors, research stated, "In this article a case of carbamazepine overdose is reported. It is common to use immuno-based methods in the field of therapeutic drug monitoring but it might be difficult to adapt such values to toxicological cases."

Our news journalists obtained a quote from the research from the University of Rostock, "For carbamazepine overdoses it is recommended also to determine the metabolite carbamazepine-10,11-epoxide. Especially for critical conditions a definite substance identification should be performed."

According to the news editors, the research concluded: "In addition, quantifying main metabolites is recommended for an acute clinical toxicological assessment."

Our news journalists report that additional information may be obtained by contacting N. Mittag, Institute of Toxicology and Pharmacology, University of Rostock, Rostock, Germany. Additional authors for this research include S. Meister, A.M. Berg and U.I Walther.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1055/s-0035-1569268. This DOI is a link to an online electronic document that is either free or for purchase.

subject of a report. According to news originating from Ribeirao Preto, Brazil, by NewsRx correspondents, research stated, "The clinical benefits of short-term therapy with glucocorticoids (GC) in patients with inflammatory bowel disease (IBD) are widely known. However, the effects of this treatment towards the re-establishment of the regulatory network in IBD are not fully explored."

Financial supporters for this research include Nucleo de Apoio a Pesquisa em Doencas Inflamatorias [NAPDIN], Fundacao de Amparo a Pesquisa do Estado de Sao Paulo, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico.

Our news journalists obtained a quote from the research from the University of Sao Paulo, "We have evaluated the immunological effects of the abbreviated GC therapy in experimental colitis induced by 3% dextran sulphate sodium in C57BL/6 mice. Treatment with GC improved disease outcome, constrained circulating leucocytes and ameliorated intestinal inflammation. The control of the local inflammatory responses involved a reduction in the expression of interferon-gamma and interleukin-1 beta, associated with augmented mRNA levels of peroxisome proliferator-activated receptors (alpha and gamma) in intestine. Furthermore, there was a reduction of CD4(+) T cells producing interferon-gamma, together with an increased frequency of the putative regulatory population of T cells producing interleukin-10, in spleen. These systemic alterations were accompanied by a decrease in the proliferative potential of splenocytes of mice treated in vivo with GC. Notably, treatment with GC also led to an increase in the frequency of the regulatory markers GITR, CTLA-4, PD-1, CD73 and FoxP3, more prominently in spleen. Taken together, our results pointed to a role of GC in the control of leucocyte responsiveness and re-establishment of a regulatory system, which probably contributed to disease control and the restoration of immune balance."

According to the news editors, the research concluded: "Finally, this is the first time that GC treatment was associated with the modulation of a broad number of regulatory markers in an experimental model of colitis."

The news correspondents report that additional information may be obtained from C.R.B. Cardoso, University of Sao Paulo, Fac Ciencias Farmaceut Ribeirao Preto, Dept. of Anal Clin Toxicol & Bromatol, Ribeirao Preto, Brazil. **Disease Attributes - Chronic Disease**

**Study Findings from University of Sao Paulo Provide New Insights into Chronic Disease (Patterns of regional gray matter loss at different stages of schizophrenia: A multisite, cross-sectional VBM study in first-episode and chronic illness)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Disease Attributes - Chronic Disease is the subject of a report. According to news reporting from Sao Paulo, Brazil, by NewsRx journalists, research stated, "Structural brain abnormalities in schizophrenia have been repeatedly demonstrated in magnetic resonance imaging (MRI) studies, but it remains unclear whether these are static or progressive in nature. While longitudinal MRI studies have been traditionally used to assess the issue of progression of brain abnormalities in schizophrenia, information from cross-sectional neuroimaging studies directly comparing first-episode and chronic schizophrenia patients to healthy controls may also be useful to further clarify this issue."

The news correspondents obtained a quote from the research from the University of Sao Paulo, "With the recent interest in multisite mega-analyses combining structural MRI data from multiple centers aiming at increased statistical power, the present multisite voxel-based morphometry (VBM) study was carried out to examine patterns of brain structural changes according to the different stages of illness and to ascertain which (if any) of such structural abnormalities would be specifically correlated to potential clinical moderators, including cumulative exposure to antipsychotics, age of onset, illness duration and overall illness severity. We gathered a large sample of schizophrenia patients (161, being 99 chronic and 62 first-episode) and controls (151) from four previous morphometric MRI studies (1.5 T) carried out in the same geographical region of Brazil. Image processing and analyses were conducted using Statistical Parametric Mapping (SPM8) software with the diffeomorphic anatomical registration through exponentiated Lie algebra (DARTEL) algorithm. Group effects on regional gray matter (GM) volumes were investigated through whole-brain voxel-wise comparisons using General Linear Model Analysis of Co-variance (ANCOVA), always including total GM volume, scan protocol, age and gender as nuisance variables. Finally, correlation analyses were performed between the aforementioned clinical moderators and regional and global brain volumes. First-episode schizophrenia subjects displayed subtle volumetric deficits relative to controls in a circumscribed brain regional network identified only in small volume-corrected (SVC) analyses (p < 0.05, FWE-corrected), including the insula, temporolimbic structures and striatum. Chronic schizophrenia patients, on the other hand, demonstrated an extensive pattern of regional GM volume decreases relative to controls, involving bilateral superior, inferior and orbital frontal cortices, right middle frontal cortex, bilateral anterior cingulate cortices, bilateral insulae and right superior and middle temporal cortices (p < 0.05, FWE-corrected over the whole brain). GM volumes in several of those brain regions were directly correlated with age of disease onset on SVC analyses for conjoined (first-episode and chronic) schizophrenia groups. There were also widespread foci of significant negative correlation between duration of illness and relative GM volumes, but such findings remained significant only for the right dorsolateral prefrontal cortex after accounting for the influence of age of disease onset. Finally, significant negative correlations were detected between life-time cumulative exposure to antipsychotics and total GM and white matter volumes in schizophrenia patients, but no significant relationship was found between indices of antipsychotic usage and relative GM volume in any specific brain region. The above data indicate that brain changes associated with the diagnosis of
schizophrenia are more widespread in chronic schizophrenia compared to first-episode patients. Our findings also suggest that relative GM volume deficits may be greater in (presumably more severe) cases with earlier age of onset, as well as varying as a function of illness duration in specific frontal brain regions."

According to the news reporters, the research concluded: "Finally, our results highlight the potentially complex effects of the continued use of antipsychotic drugs on structural brain abnormalities in schizophrenia, as we found that cumulative doses of antipsychotics affected brain volumes globally rather than selectively on frontal-temporal regions."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.nicl.2016.06.002. This DOI is a link to an online electronic document that is either free or for purchase.

Study Findings from University of Saskatchewan Provide New Insights into Pharmacy Practice (Evaluation of a refill synchronization program in two community pharmacies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Pharmacy Practice are presented in a new report. According to news reporting from Saskatoon, Canada, by NewsRx journalists, research stated, "To describe medication adherence by the proportion of days covered before and after enrollment in a refill synchronization program. We conducted a retrospective analysis of medication adherence in 2 pharmacies offering a refill synchronization program."

The news correspondents obtained a quote from the research from the University of Saskatchewan, "The study population consisted of individuals who received 2 or more medications from any of 15 predefined medication classes within 6 months of enrollment in the synchronization program. Medication adherence and refill consolidation were measured over 6 months before and after enrollment. Optimal adherence was defined as proportion of days covered >= 80%. Among 109 patients who enrolled in the program between 2009 and 2014, 68
were included in a pre-post analysis of medication adherence. In the preenrollment period, optimal adherence was observed in 85% (217/254) of the medications taken by the 68 patients, increasing to 93% (237/254) in the postenrollment period (P < 0.01). In addition, the percentage maintaining optimal adherence to all of their medications increased significantly from 60% (n = 41) to 83% (n = 57; P < 0.01). Among a small group of patients who voluntarily participated in refill synchronization programs, high levels of medication adherence were observed in the preenrollment period."

According to the news reporters, the research concluded: "These results combined with previous studies suggest that voluntary participants of these programs are at a low risk for nonadherence; therefore, current estimates of benefit from refill synchronization programs may be overestimated."

Our news journalists report that additional information may be obtained by contacting D.F. Blackburn, University of Saskatchewan, Coll Pharm & Nutr, Patient Adherence, Saskatoon, SK, Canada. Additional authors for this research include D. Tran and C. Quiring.

Propiophenones

**Study Findings from University of Texas Medical Branch Broaden Understanding of Propiophenones (Bupropion therapy during pregnancy: the drug and its major metabolites in umbilical cord plasma and amniotic fluid)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Propiophenones is now available. According to news reporting originating in Galveston, Texas, by NewsRx journalists, research stated, "Bupropion is used for treatment of depression during pregnancy. However, its use as a smoking cessation aid for pregnant women is currently under evaluation."

The news reporters obtained a quote from the research from the University of Texas Medical Branch, "The aim of this opportunistic study was to investigate the transfer of bupropion and its major pharmacologically active metabolites, hydroxybupropion and threohydrobupropion, across the placenta in vivo. In addition, the concentrations of the drug and its metabolites were determined in the amniotic fluid. The following samples were collected at deliveries from 22 women taking bupropion: maternal blood (n = 22), umbilical cord venous blood (n = 22), and amniotic fluid (n = 9). The concentrations of the drug and its metabolites in blood plasma and amniotic fluid were determined by means of liquid chromatography-mass spectrometry. Placental passage was calculated as a ratio of umbilical cord venous plasma to maternal plasma concentrations. The levels of hydroxybupropion and threohydrobupropion in umbilical cord venous plasma were invariably lower than their corresponding concentrations in maternal plasma. The concentrations of bupropion in umbilical cord plasma were lower than in maternal plasma in the majority of the maternal-cord blood pairs. The median values of the umbilical cord venous plasma to maternal plasma ratios were: bupropion, 0.53 (interquartile range 0.35, n = 18), hydroxybupropion, 0.21 (interquartile range 0.12, n = 18), and
threohydrobupropion, 0.61 (interquartile range 0.11, n = 21). In umbilical cord venous plasma, the median concentration of bupropion was 5.3 ng/mL; hydroxybupropion, 103.6 ng/mL; and threohydrobupropion, 59.6 ng/mL. Bupropion and its metabolites were detectable in the amniotic fluid but the concentrations of threohydrobupropion were higher than those in the corresponding umbilical cord venous plasma. Bupropion and its active metabolites cross the placenta to the fetal circulation. The concentrations of hydroxybupropion and threohydrobupropion in umbilical cord venous plasma were higher than bupropion concentrations suggesting a higher fetal exposure to the metabolites than the parent drug. The higher levels of threohydrobupropion in the amniotic fluid than those in umbilical cord venous plasma suggest that enzymes involved in the metabolism of bupropion to threohydrobupropion are most likely active in the fetus.

According to the news reporters, the research concluded: "The biological consequences of fetal exposure to maternally administered bupropion and/or its active metabolites via placental transfer and recirculation of the amniotic fluid are yet to be determined."

Our news correspondents report that additional information may be obtained by contacting T.N. Nanovskaya, Univ Texas Med Branch, Dept. of Obstet & Gynecol, Galveston, TX 77555, United States. Additional authors for this research include H. West, C. Oncken, S.M. Clark, M.S. Ahmed, G.D.V. Hankins and T.N. Nanovskaya.

**Genetics**

**Study Findings from University of Texas Provide New Insights into Genetics (LncPRESS1 Is a p53-Regulated LncRNA that Safeguards Pluripotency by Disrupting SIRT6-Mediated De-acetylation of Histone H3K56)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics is now available. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Recent evidence suggests that lncRNAs play an integral regulatory role in numerous functions, including determination of cellular identity. We determined global expression (RNA-seq) and genome-wide profiles (ChIP-seq) of histone post-translational modifications and p53 binding in human embryonic stem cells (hESCs) undergoing differentiation to define a high-confidence set of 40
lncRNAs, which are p53 transcriptional targets."

Funders for this research include NIH, CPRIT Core Facility, UT MD Anderson Cancer Center NCI.

Our news editors obtained a quote from the research from the University of Texas, "We focused on lncRNAs highly expressed in pluripotent hESCs and repressed by p53 during differentiation to identify lncPRESS1 as a p53-regulated transcript that maintains hESC pluripotency in concert with core pluripotency factors. RNA-seq of hESCs depleted of lncPRESS1 revealed that lncPRESS1 controls a gene network that promotes pluripotency. Further, we found that lncPRESS1 physically interacts with SIRT6 and prevents SIRT6 chromatin localization, which maintains high levels of histone H3K56 and H3K9 acetylation at promoters of pluripotency genes."

According to the news editors, the research concluded: "In summary, we describe a p53-regulated, pluripotency-specific lncRNA that safeguards the hESC state by disrupting SIRT6 activity."

For more information on this research see: LncPRESS1 Is a p53-Regulated LncRNA that Safeguards Pluripotency by Disrupting SIRT6-Mediated De-acetylation of Histone H3K56. *Molecular Cell*, 2016;64(5):967-981. *Molecular Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. **Oncology - Liver Cancer**

**Study Findings from University of Thessaly Broaden Understanding of Liver Cancer (HIF-2 alpha phosphorylation by CK1 delta promotes erythropoietin secretion in liver cancer cells under hypoxia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting from Larisa, Greece, by NewsRx journalists, research stated, "Hypoxia inducible factor 2 (HIF-2) is a transcriptional activator implicated in the cellular response to hypoxia. Regulation of its inducible subunit, HIF-2 alpha (also known as EPAS1), involves post-translational modifications."

The news correspondents obtained a quote from the research from the University of Thessaly, "Here, we demonstrate that casein kinase 1d (CK1d; also known as CSNK1D) phosphorlates HIF-2 alpha at Ser383 and Thr528 in vitro. We found that disruption of these
phosphorylation sites, and silencing or chemical inhibition of CK1 delta, reduced the expression of HIF-2 target genes and the secretion of erythropoietin (EPO) in two hepatic cancer cell lines, Huh7 and HepG2, without affecting the levels of HIF-2 alpha protein expression. Furthermore, when CK1 delta-dependent phosphorylation of HIF-2 alpha was inhibited, we observed substantial cytoplasmic mislocalization of HIF-2 alpha, which was reversed upon the addition of the nuclear protein export inhibitor leptomycin B. Taken together, these data suggest that CK1 delta enhances EPO secretion from liver cancer cells under hypoxia by modifying HIF-2 alpha and promoting its nuclear accumulation.

According to the news reporters, the research concluded: "This modification represents a new mechanism of HIF-2 regulation that might allow HIF isoforms to undertake differing functions."

Our news journalists report that additional information may be obtained by contacting P. Liakos, University of Thessaly, Fac Med, Lab Biochem, Larisa 41500, Greece. Additional authors for this research include C. Befani, I. Mylonis, M. Samiotaki, G. Panayotou, G. Simos and P. Liakos.

Keywords for this news article include: Larisa, Greece, Europe, Intercellular Signaling Peptides and Proteins, Colony Stimulating Factors, Biological Factors, Erythropoietin, Liver Cancer, Cytokines, Oncology, Genetics, University of Thessaly.

**Blood Pressure**

**Study Findings from University of Tokyo Provide New Insights into Blood Pressure (Potassium depletion stimulates Na-Cl cotransporter via phosphorylation and inactivation of the ubiquitin ligase Kelch-like 3)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Blood Pressure. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "Kelch-like 3 (KLHL3) is a component of an E3 ubiquitin ligase complex that regulates blood pressure by targeting With-No-Lysine (WNK) kinases for degradation. Mutations in KLHL3 cause constitutively increased renal salt reabsorption and impaired K+ secretion, resulting in hypertension and hyperkalemia."

Funders for this research include JSPS KAKENHI, Japan Agency for Medical Research and Development, AMED, Banyu Life Science Foundation International, Basic Science Research Projects from The Sumitomo Foundation, Kanae Foundation for the Promotion of Medical Science, Swiss National Centre of Competence in Research Kidney.CH, NIH.

The news reporters obtained a quote from the research from the University of Tokyo, "Although clinical studies have shown that dietary K+ intake affects blood pressure, the mechanisms have been obscure. In this study, we demonstrate that the KLHL3 ubiquitin ligase..."
complex is involved in the low-K+-mediated activation of Na-Cl cotransporter (NCC) in the kidney. In the distal convoluted tubules of mice eating a low-K+ diet, we found increased KLHL3 phosphorylation at S433 (KLHL3(S433-P)), a modification that impairs WNK binding, and also reduced total KLHL3 levels. These changes are accompanied by the accumulation of the target substrate WNK4, and activation of the downstream kinases SPAK (STE20/SPS1-related proline-alanine-rich protein kinase) and OSR1 (oxidative stress responsive 1), resulting in NCC phosphorylation and its accumulation at the plasma membrane. Increased phosphorylation of S433 was explained by increased levels of active, phosphorylated protein kinase C (but not protein kinase A), which directly phosphorylates S433. Moreover, in HEK cells expressing KLHL3 and WNK4, we showed that the activation of protein kinase C by phorbol 12-myristate 13-acetate induces KLHL3(S433-P) and increases WNK4 levels by abrogating its ubiquitination.

According to the news reporters, the research concluded: "These data demonstrate the role of KLHL3 in low-K+-mediated induction of NCC; this physiologic adaptation reduces distal electrogenic Na+ reabsorption, preventing further renal K+ loss but promoting increased blood pressure."

For more information on this research see: Potassium depletion stimulates Na-Cl cotransporter via phosphorylation and inactivation of the ubiquitin ligase Kelch-like 3. *Biochemical and Biophysical Research Communications*, 2016;480(4):745-751. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Enzymes and Coenzymes - One-Carbon Group...**

**Study Findings from University of Toronto Broaden Understanding of One-Carbon Group Transferases (Structural Chemistry of Human RNA Methyltransferases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Enzymes and Coenzymes - One-Carbon Group Transferases. According to news originating from Toronto, Canada, by NewsRx editors, the research stated, "RNA methyltransferases (RNMTs) play important roles in RNA stability, splicing, and epigenetic mechanisms. They constitute a promising target class that is
underexplored by the medicinal chemistry community."

Funders for this research include Wellcome Trust, Structural Genomics Consortium.

Our news journalists obtained a quote from the research from the University of Toronto, "Information of relevance to drug design can be extracted from the rich structural coverage of human RNMTs. In this work, the structural chemistry of this protein family is analyzed in depth. Unlike most methyltransferases, RNMTs generally feature a substrate-binding site that is largely open on the cofactor-binding pocket, favoring the design of bisubstrate inhibitors. Substrate purine or pyrimidines are often sandwiched between hydrophobic walls that can accommodate planar ring systems. When the substrate base is laying on a shallow surface, a 5' flanking base is sometimes anchored in a druggable cavity. The cofactor-binding site is structurally more diverse than in protein methyltransferases and more druggable in SPOUT than in Rossman-fold enzymes. Finally, conformational plasticity observed both at the substrate and cofactor binding sites may be a challenge for structure-based drug design."

According to the news editors, the research concluded: "The landscape drawn here may inform ongoing efforts toward the discovery of the first human RNMT inhibitors."

The news correspondents report that additional information may be obtained from M. Schapira, Structural Genomics Consortium, University of Toronto, Toronto, Ontario M5G 1L7, Canada.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acscambio.5b00781. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Canada, Toronto, Ontario, Chemicals, Methyltransferases, Structural Chemistry, Enzymes and Coenzymes, North and Central America, One Carbon Group Transferases, One-Carbon Group Transferases.

**Study Findings from University of Toronto Provide New Insights into Substance Withdrawal Syndrome (Electronic Cigarettes for Smoking Cessation: A Systematic Review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Diseases and Conditions - Substance Withdrawal Syndrome. According to news reporting originating in Toronto, Canada, by NewsRx journalists, research stated, "Electronic cigarettes (e-cigarettes) have been steadily increasing in popularity among smokers, most of whom report using them to quit smoking. This study systematically reviews the current literature on the effectiveness of e-cigarettes as cessation aids."

Financial support for this research came from Ministry of Health and Long-Term Care.

The news reporters obtained a quote from the research from the University of
Toronto, "We searched PubMed, MEDLINE, PsycINFO, CINAHL, ERIC, ROVER, Scopus, ISI Web of Science, Cochrane Library, the Ontario Tobacco Research Unit (OTRU) library catalogue, and various gray literature sources. We included all English-language, empirical quantitative and qualitative papers that investigated primary cessation outcomes (smoking abstinence or reduction) or secondary outcomes (abstinence-related withdrawal symptoms and craving reductions) and were published on or before February 1, 2016. Literature searches identified 2855 references. After removing duplicates and screening for eligibility, 62 relevant references were reviewed and appraised. In accordance with the GRADE system, the quality of the evidence in support of e-cigarettes' effectiveness in helping smokers quit was assessed as very low to low, and the evidence on smoking reduction was assessed as very low to moderate. The majority of included studies found that e-cigarettes, especially second-generation types, could alleviate smoking withdrawal symptoms and cravings in laboratory settings. While the majority of studies demonstrate a positive relationship between e-cigarette use and smoking cessation, the evidence remains inconclusive due to the low quality of the research published to date. Well-designed randomized controlled trials and longitudinal, population studies are needed to further elucidate the role of e-cigarettes in smoking cessation. This is the most comprehensive systematic evidence review to examine the relationship between e-cigarette use and smoking cessation among smokers. This review offers balanced and rigorous qualitative and quantitative analyses of published evidence on the effectiveness of e-cigarette use for smoking abstinence and reduction as well as important outcomes such as withdrawal symptoms and craving to smoke. While inconclusive due to low quality, overall the existing literature suggests e-cigarettes may be helpful for some smokers for quitting or reducing smoking."

According to the news reporters, the research concluded: "However, more carefully designed and scientifically sound studies are urgently needed to establish unequivocally the long-term cessation effects of e-cigarettes and to better understand how and when e-cigarettes may be helpful."

Our news correspondents report that additional information may be obtained by contacting M. Malas, University of Toronto, Dalla Lana Sch Public Hlth, Toronto, ON M5T 3M7, Canada. Additional authors for this research include J. van der Tempel, R. Schwartz, A. Minichiello, C. Lightfoot, A. Noormohamed, J. Andrews, L. Zawertailo and R. Ferrence.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/ntr/ntw119. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Cardiomyopathies

Study Findings from University of Tsukuba Provide New Insights into Cardiomyopathies (J Waves Are Associated With the Increased Occurrence of Life-Threatening Ventricular Tachyarrhythmia in Patients With Nonischemic Cardiomyopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Cardiomyopathies are presented in a new report. According to news reporting from Ibaraki, Japan, by NewsRx journalists, research stated, "J Wave and VT/VF of Nonischemic Cardiomyopathy. Recent studies showed that J waves were associated with higher incidence of ventricular tachyarrhythmia (VT/VF) in patients with idiopathic ventricular fibrillation (VF) and myocardial infarction."

The news correspondents obtained a quote from the research from the University of Tsukuba, "We sought to assess the association between J waves and VT/VF in patients with nonischemic cardiomyopathy (NICM). We retrospectively enrolled 109 patients (79 men; mean age, 60 +/- 15 years) with NICM who underwent implantable cardioverter defibrillator (ICD) implantation. The primary endpoint of this study was the occurrence of appropriate device therapy due to sustained VT/VF. The J wave was electrocardiographically defined as an elevation of the terminal portion of the QRS complex of > 0.1 mV in at least 2 contiguous inferior or lateral leads. Among the 109 patients, 37 (34%) experienced an episode of appropriate device therapy during a median follow-up period of 25.9 (IQR 11.5-54.3) months. Kaplan-Meier curves showed that the presence of J waves on the 12-lead ECG obtained before device implantation was associated with an increased occurrence of appropriate device therapy (P < 0.001). Multivariate Cox proportional regression analysis revealed that the presence of J waves (HR 2.95; 95% CI 1.31-6.64; P = 0.009) was an independent predictor for the occurrence of appropriate device therapy. In the subgroup analysis of the patients with dilated or hypertrophic cardiomyopathy, J wave tended to increase the occurrence of appropriate device therapy (P = 0.056 and P = 0.092, respectively)."

According to the news reporters, the research concluded: "The presence of J waves was an independent predictor for the occurrence of appropriate device therapy in patients with NICM who underwent ICD implantation."

Study Findings from University of Wollongong Provide New Insights into Obesity (Sleep Quality Subtypes and Obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating from Wollongong, Australia, by NewsRx correspondents, research stated, "Poor sleep quality could be a risk factor for obesity. This article utilized a person-centered approach to investigate whether distinct sleep quality subtypes were associated with obesity directly, and indirectly via physical activity."

Our news editors obtained a quote from the research from the University of Wollongong, "The sample included 8,932 Australian employees who participated in the Household, Income and Labor Dynamics in Australia Survey. Structured interviews and self-report questionnaires collected information on sleep quality, obesity, and relevant demographic, health, and work-related variables. Latent class analysis identified distinct subtypes of sleep quality. General linear modeling examined the associations of sleep quality subtypes with body mass index (BMI) and waist circumference. Multicategorical mediation models examined indirect paths linking sleep quality classes with obesity via physical activity. Five distinct sleep quality subtypes were identified: Poor Sleepers (20.0%), Frequent Sleep Disturbances (19.2%), Minor Sleep Disturbances (24.5%), Long Sleepers (9.6%), and Good Sleepers (26.7%). BMI, waist circumference, and physical activity differed among the sleep quality subtypes, with similar results observed for males and females. For example, Poor Sleepers had the highest BMIs, followed by Frequent Sleep Disturbances and Minor Sleep Disturbances; Long Sleepers and Good Sleepers had the lowest BMIs. Mediation analyses indicated that low levels of physical activity linked the Poor Sleep, Frequent Sleep Disturbance, and Long Sleep classes with higher BMI. These results provide new insights into the nature of sleep quality in employees."

According to the news editors, the research concluded: "In particular, distinct sleep quality patterns had differing associations with measures of obesity, suggesting the need for tailored workplace interventions."

For more information on this research see: Sleep Quality Subtypes and Obesity. *Health Psychology*, 2016;35(12):1289-1297. *Health Psychology* can be contacted at: Amer Psychological Assoc, 750 First St NE, Washington, DC 20002-4242, USA.

The news editors report that additional information may be obtained by contacting C.A. Magee, University of Wollongong, Center Hlth Initiat, Wollongong, NSW 2522, Australia. Additional authors for this research include P. Reddy, L. Robinson and A. McGregor.

Blood Pressure

Study Findings from University of Yuzuncu Yil Broaden Understanding of Blood Pressure (The effect of low-sodium dialysate on ambulatory blood pressure measurement parameters in patients undergoing hemodialysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Blood Pressure is the subject of a report. According to news originating from Van, Turkey, by NewsRx correspondents, research stated, "End stage renal disease is related to increased cardiovascular mortality and morbidity. Hypertension is an important risk factor for cardiovascular disorder among hemodialysis (HD) patients."

Our news journalists obtained a quote from the research from the University of Yuzuncu Yil, "The aim of this study was to investigate the effect of low-sodium dialysate on the systolic blood pressure (SBP) and diastolic blood pressure (DBP) levels detected by ambulatory BP monitoring (ABPM) and interdialytic weight gain (IDWG) in patients undergoing sustained HD treatment. The study included 46 patients who had creatinine clearance levels less than 10 mL/min/1.73 m(2) and had been on chronic HD treatment for at least 1 year. After the enrollment stage, the patients were allocated low-sodium dialysate or standard sodium dialysate for 6 months via computer-generated randomization. Twenty-four hour SBP, daytime SBP, nighttime SBP, and nighttime DBP were significantly decreased in the low-sodium dialysate group (p<0.05). No significant reduction was observed in both groups in terms of 24-hour DBP and daytime DBP (p=NS). No difference was found in the standard sodium dialysate group in terms of ABPM. Furthermore, IDWG was found to be significantly decreased in the low-sodium dialysate group after 6 months (p <0.001)."

According to the news editors, the research concluded: "The study revealed that low-sodium dialysate leads to a decrease in ABPM parameters including 24-hour SBP, daytime SBP, nighttime SBP, and nighttime DBP and it also reduces the number of antihypertensive drugs used and IDWG."

For more information on this research see: The effect of low-sodium dialysate on ambulatory blood pressure measurement parameters in patients undergoing hemodialysis. Therapeutics and Clinical Risk Management, 2015;11():1829-35.

The news correspondents report that additional information may be obtained from S. Akdag, Dept. of Cardiology, Yuzuncu Yil University Medical Faculty, Van, Turkey. Additional authors for this research include A. Akyol, H.A. Cakmak, A.R. Tosu, M. Asker, M. Yaman, N. Babat, Y. Soyoral, M.B. Cegin, A.K. Gur and H.A Gumrukcuoglu.

Study Findings from Uppsala University Broaden Understanding of Science (Iron chelators target both proliferating and quiescent cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Science is the subject of a report. According to news reporting from Uppsala, Sweden, by NewsRx journalists, research stated, "Poorly vascularized areas of solid tumors contain quiescent cell populations that are resistant to cell cycle-active cancer drugs. The compound VLX600 was recently identified to target quiescent tumor cells and to inhibit mitochondrial respiration."

The news correspondents obtained a quote from the research from Uppsala University, "We here performed gene expression analysis in order to characterize the cellular response to VLX600. The compound-specific signature of VLX600 revealed a striking similarity to signatures generated by compounds known to chelate iron. Validation experiments including addition of ferrous and ferric iron in excess, EXAFS measurements, and structure activity relationship analyses showed that VLX600 chelates iron and supported the hypothesis that the biological effects of this compound is due to iron chelation. Compounds that chelate iron possess anti-cancer activity, an effect largely attributed to inhibition of ribonucleotide reductase in proliferating cells. Here we show that iron chelators decrease mitochondrial energy production, an effect poorly tolerated by metabolically stressed tumor cells."

According to the news reporters, the research concluded: "These pleiotropic features make iron chelators an attractive option for the treatment of solid tumors containing heterogeneous populations of proliferating and quiescent cells."

For more information on this research see: Iron chelators target both proliferating and quiescent cancer cells. Scientific Reports, 2016:6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Diabetic Neuropathy are discussed in a new report. According to news originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "The molecular mechanisms behind diabetic neuropathy remains to be investigated. This is a secondary study on microarray dataset (GSE24290) downloaded from Gene Expression Omnibus (GEO) at the National Center for Biotechnology Information (NCBI), which included 18 nerve tissue samples of progressing diabetic neuropathy (fibers loss >= 500 fibers/mm(2)) and 17 nerve tissue samples of nonprogressing diabetic neuropathy (fibers loss <= 100 fibers/mm(2))."

Our news journalists obtained a quote from the research from Xi'an Jiao Tong University, "Differentially expressed genes (DEGs) were screened between progressing and nonprogressing diabetic neuropathy. With the DEGs obtained, a weighted gene coexpression network analysis was conducted to identify gene clusters associated with diabetic neuropathy. Diabetes-related microRNAs (miRNAs) and their target genes were predicted and mapped to the genes in the gene clusters identified. Consequently, a miRNA-gene network was constructed, for which gene ontology (GO) and Kyoto Encyclopedia of Genes and Genomes (KEGG) enrichment analysis was performed. Potential drugs for treatment of diabetic neuropathy were also predicted. Total 370 upregulated and 379 downregulated DEGs were screened between nonprogressing and progressing diabetic neuropathy. Has-miR-377, has-miR-216a, and has-miR-217 were associated with diabetes. Inflammation was the most significant GO term. The peroxisome proliferator-activated receptor (PPAR) pathway and the adenosine monophosphate (AMP)-activated protein kinase (AMPK) signaling pathway were significantly KEGG pathways enriched with PPAR gamma (PPARG), stearoyl-CoA desaturase (SCD), cluster of differentiation 36 (CD36), and phosphoenolpyruvate carboxykinase 1 (PCK1)."

According to the news editors, the research concluded: "The study suggests that PPARG, SCD, CD36, PCK1, AMPK pathway, and PPAR pathway may be involved in progression of diabetic neuropathy.

For more information on this research see: Identification of genes and signaling pathways associated with diabetic neuropathy using a weighted correlation network analysis A consort study. Oncology - Leukemia

Study Findings from Y.N. Wang et al Provide New Insights into Leukemia (Changes in cellular glycosylation of leukemia cells upon treatment with acridone derivatives yield insight into drug action)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Leukemia have been published. According to news reporting originating from Shenzhen, People's Republic of China, by NewsRx correspondents, research stated, "A new acridone derivative 2-aminoacetamido-10-(3, 5-dimethoxy)-benzyl-9(10H)-acridone hydrochloride (8a) has been shown to have potent antitumor activity. In order to understand the underlying action mechanism of 8a, three compounds of the same class with structures optimized step-by-step, 9(10H)-acridone (A), 10-(3,5-dimethoxy) benzyl-9(10H)-acridone (I) and 8a, were exposed to CCRF-CEM leukemia cell to determine the N-glycosylation changes using the microfluidic HPLC-chip-TOF MS platform."

Funders for this research include National Natural Science Foundation of China, Shenzhen Municipal government SZSITIC, National Institutes of Health.

Our news editors obtained a quote from the research, "N-Glycans from whole cell lysates (WCL) and cell membranes (CM) were analyzed using isomer-sensitive chip-based porous graphitized carbon nano-LC/MS. A total of 223 N-glycan compositions and 398 N-glycan compounds were identified. Comparison of the two analyses showed that more apparent changes were observed in the CM compared with WCL, suggesting that CM may be a more sensitive indicator of changes in glycosylation. Upon 8a exposure to CCRF-CEM cells, a significant decrease in high-mannose-type glycans was observed. Different expressions of oligosaccharyltransferase subunits appear to play a key functional role in regulating the hypoglycosylation and contribute to the action mechanism of 8a."

According to the news editors, the research concluded: "Taken together our findings suggest that glycosylation is strongly affected by therapeutic potency and can be used as possible biomarkers for monitoring toxicity and antitumor activity of 8a."

The news editors report that additional information may be obtained by contacting H.X. Liu, Key Lab Tumor Metabol Shenzhen, Shenzhen, People's Republic of China. Additional authors for this research include D. Park, A.G. Galermo, D. Gao, H.X. Liu and C.B. Lebrilla.

**Algorithms**

**Study Findings from Zhejiang University Provide New Insights into Algorithms (Recent Advances in Protein-Protein Docking)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Algorithms are presented in a new report. According to news reporting from Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "Protein-protein interactions (PPIs) play important roles in a variety of biological processes, and many PPIs have been regarded as biologically compelling targets for drug discovery. Extensive efforts have been made to develop feasible protein-protein docking approaches to study PPIs in silico."

The news correspondents obtained a quote from the research from Zhejiang University, "Most of these approaches are composed of two stages: sampling and scoring. Sampling is used to generate a number of plausible protein-protein binding conformations and scoring can rank all those conformations. Due to large and flexible binding interface of PPI, determination of the near native structures is computationally expensive, and therefore computational efficiency is the most challenging issue in protein-protein docking. Here, we have reviewed the basic concepts and implementations of the sampling, scoring and acceleration algorithms in some established docking programs, and the limitations of these algorithms have been discussed. Then, some suggestions to the future directions for sampling, scoring and acceleration algorithms have been proposed."

According to the news reporters, the research concluded: "This review is expected to provide a better understanding of protein-protein docking and give some clues for the optimization and improvement of available approaches."

For more information on this research see: Recent Advances in Protein-Protein Docking. Current Drug Targets, 2016;17(14):1586-1594. (Bentham Science Publishers - www.benthamscience.com; Current Drug Targets - www.benthamscience.com/cdt/index.htm)

**Nanotechnology - Nanoparticles**

**Study Findings from Zhejiang University Provide New Insights into Nanoparticles (Chitosan nanoparticles and their Tween 80 modified counterparts disrupt the developmental profile of zebrafish embryos)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nanotechnology - Nanoparticles.

According to news reporting from Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "Chitosan nanoparticles (CS-NPs) and their Tween 80 modified counterparts (TmCS-NPs) are among the most commonly used brain-targeted vehicles. However, their potential developmental toxicity is poorly understood."

Financial support for this research came from National Natural Sciences Foundation of China.

The news correspondents obtained a quote from the research from Zhejiang University, "In this study, zebrafish embryos are introduced as an in vivo platform. Both NPs showed a dose-dependent increase in developmental toxicity (decreased hatching rate, increased mortality and incidences of malformation). Neurobehavioral changes included decreased spontaneous movement in TmCS-NP treated embryos and hyperactive effect in CS-NP treated larvae. Both NPs remarkably inhibited axonal development of primary and secondary motor neurons, and affected the muscle structure."

According to the news reporters, the research concluded: "Overall, this study demonstrated that CS-NPs and TmCS-NPs could affect embryonic development, disrupt neurobehavior of zebrafish larvae and affect muscle and neuron development, suggesting more attention on biodegradable chitosan nanoparticles."

Enzymes and Coenzymes - Acyltransferases

Study Findings on Acyltransferases Are Outlined in Reports from Emory University (Tetrameric Acetyl-CoA Acetyltransferase 1 Is Important for Tumor Growth)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Acyltransferases have been published. According to news originating from Atlanta, Georgia, by NewsRx
correspondents, research stated, "Mitochondrial acetyl-CoA acetyltransferase 1 (ACAT1) regulates pyruvate dehydrogenase complex (PDC) by acetylated pyruvate dehydrogenase (PDH) and PDH phosphatase. How ACAT1 is 'hijacked' to contribute to the Warburg effect in human cancer remains unclear."

Financial supporters for this research include NIH, T.J. Martell Foundation, Winship Cancer Institute, American Cancer Society, Winship Inverts, Emory University, Hematology Tissue Bank of Emory University School of Medicine.

Our news journalists obtained a quote from the research from Emory University, "We found that active, tetrameric ACAT1 is commonly upregulated in cells stimulated by EGF and in diverse human cancer cells, where ACAT1 tetramers, but not monomers, are phosphorylated and stabilized by enhanced Y407 phosphorylation. Moreover, we identified arecoline hydrobromide (AH) as a covalent ACAT1 inhibitor that binds to and disrupts only ACAT1 tetramers. The resultant AH-bound ACAT1 monomers cannot reform tetramers. Inhibition of tetrameric ACAT1 by abolishing Y407 phosphorylation or AH treatment results in decreased ACAT1 activity, leading to increased PDC flux and oxidative phosphorylation with attenuated cancer cell proliferation and tumor growth."

According to the news editors, the research concluded: "These findings provide a mechanistic understanding of how oncogenic events signal through distinct acetyltransferases to regulate cancer metabolism and suggest ACAT1 as an anti-cancer target."

For more information on this research see: Tetrameric Acetyl-CoA Acetyltransferase 1 Is Important for Tumor Growth. *Molecular Cell*, 2016;64(5):859-874. *Molecular Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Molecular Cell - www.journals.elsevier.com/molecular-cell/)

**Algorithms**

**Study Findings on Algorithms Are Outlined in Reports from University of Patras (Breast tomosynthesis using the multiple projection algorithm adapted for stationary detectors)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Algorithms is the subject of a report. According to news reporting from Patras, Greece, by NewsRx journalists, research stated, "The aim of this study is to investigate the validity of using the Multiple Projection Algorithm (MPA) for Breast
Tomosynthesis (BT) using real projection images acquired with phantoms at a clinical setting. The CIRS-BR3D phantom with ranging thicknesses between 3 cm and 6 cm was used for all image quality evaluations.

The news correspondents obtained a quote from the research from the University of Patras, "Five sets of measurements were acquired, each comprised of a 2D mammographic image followed by a set of 25 projections within an arc length of 50°. A reconstruction algorithm based on the MPA was adapted for partial isocentric rotation using a stationary detector. For reference purposes, a Back Projection (BP) algorithm was also developed for this geometry. The performance of the algorithms was evaluated, in combination with pre-filtering of the projections, in comparative studies that involved also a comparison between tomosynthesis slices and 2D mammograms. Evaluation of tomosynthesis slices reconstructed with BP and MPA showed close performance for the two algorithms with no considerable differences in feature detection, size and appearance of the background tissue with the MPA running faster the overall process. Pre-filtering of the projections, led to better BT images compared to non-filtering. Increased thickness resulted in limited detection of the features of interest, especially the smaller sized ones. In these cases, the filtered BT slices allowed improved visualization due to removed superimposed tissue compared to the 2D images. The different breast-like slab arrangements in phantoms of the same thickness demonstrated a slight influence on the quality of reconstructed features. The MPA which had been applied previously to reconstruct tomograms from projections acquired at synchrotron facilities, is a time efficient algorithm, and is fully compliant with and can be successfully used in BT clinical systems."

According to the news reporters, the research concluded: "Compared to 2D mammography, BT shows advantage in visualizing features of small size and for increased phantom thickness or features within a dense background with superimposed structures."

Our news journalists report that additional information may be obtained by contacting A. Malliori, Dept. of Medical Physics, School of Medicine, University of Patras, Patras, Greece. Additional authors for this research include K. Bliznakova, Z. Bliznakov, L. Cockmartin, H. Bosmans and N. Pallikarakis.

**Drugs and Therapies - Antibiotics**

**Study Findings on Antibiotics Are Outlined in Reports from Medical University (Understanding the Activity of Antibiotics in Cerebrospinal Fluid in vitro)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antibiotics is now available. According to news reporting originating in Vienna, Austria, by NewsRx journalists, research stated, "In vitro studies suggest that antimicrobial activity of antibiotics meant to treat central nervous system infections such as meningitis or ventriculitis may be altered by cerebrospinal fluid (CSF). This could explain the reason behind the often observed discrepancies between the activity of antibiotics determined in artificial growth media in vitro, and their sometimes reduced clinical efficacy in CSF in vivo."

The news reporters obtained a quote from the research from Medical University, "If conducted in CSF, in vitro microbiological investigations might predict the ability of antibiotic drugs to treat CSF infections better than experiments in artificial growth media. In addition, they are less expensive, critical and time consuming than animal studies, and might potentially be appreciated in drug development as a rapid and cost-effective means to gain valuable information on drugs meant to treat infections residing in CSF. Data from microbiological in vitro experiments performed in CSF were compiled for fosfomycin, rifampicin, cefepime, cefotaxime, ceftiraxone, ciprofloxacin, gentamicin and vancomycin. Where possible, correlations between in vitro data and evidence from in vivo studies were established. As discussed in the text, no clear correlations between in vitro studies in CSF and clinical outcomes could be identified."

According to the news reporters, the research concluded: "Methodological recommendations derived from the collected studies are summarized in order to optimize future research on the topic."

Our news correspondents report that additional information may be obtained by contacting P. Matzneller, Dept. of Clinical Pharmacology, Medical University of Vienna, Vienna, Austria. Additional authors for this research include A. Burian, M. Zeitlinger and R. Sauermann.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000444263. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antibiotics

Study Findings on Antibiotics Are Outlined in Reports from Shaanxi Normal University (Combination of enzymatic degradation by chloroperoxidase with activated sludge treatment to remove sulfamethoxazole: performance, and eco-toxicity assessment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antibiotics have been presented.
According to news reporting originating in Xi'an, People's Republic of China, by NewsRx journalists, research stated, "Sulfamethoxazole is found in surface and ground waters because it is usually not metabolized and simply passes through the human body after ingestion. This drug is difficult to degrade by conventional treatments and may cause environmental concerns."

The news reporters obtained a quote from the research from Shaanxi Normal University, "A rapid and efficient enzymatic degradation of sulfamethoxazole by a heme peroxidase, chloroperoxidase (CPO), was investigated in this work. The degradation efficiency of sulfamethoxazole reached 98.64% within 20 min at room temperature, atmospheric pressure and environment-friendly reaction conditions with an enzyme concentration of approximately 10(-9) mol L-1. High performance liquid chromatography-mass spectrometry analysis was employed to identify the intermediates and final products. Moreover, chemical oxygen demand (COD) measurements showed that pre-treatment by CPO-H2O2 oxidative degradation followed by existing bioremediation technologies can effectively improve the efficiency and thoroughness of decontaminating this drug from wastewater. The degradation efficiency was enhanced from 76.5% to 84.47%, and the COD removal increased from 29.72% to 51.32%. The eco-toxicity test using a green algae, Cinorella pyrenoidos, showed that the degraded products had lower toxicity than the parent drug. CPO catalyzed oxidative degradation is a promising alternative for treatment of wastewater containing sulfonamide drugs."

According to the news reporters, the research concluded: "This enzymatic method is also suitable for treatment of other sulfonamide antibiotics."

Our news correspondents report that additional information may be obtained by contacting Y.C. Jiang, Shaanxi Normal Univ, Key Lab Macromol Sci Shaanxi Prov, Xian 710062, People's Republic of China. Additional authors for this research include X.H. Li, Y.C. Jiang, M.C. Hu, S.N. Li and Q.G. Zhai.

Drugs and Therapies - Antibiotics

Study Findings on Antibiotics Are Outlined in Reports from State University of New York (Synergistic combinations of polymyxins)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antibiotics have been published. According to news reporting from Buffalo, New York, by NewsRx journalists, research stated, "The proliferation of extensively drug-resistant Gram-negative pathogens has necessitated the therapeutic use of colistin and polymyxin B. However, treatment failures with polymyxin monotherapies and the emergence of polymyxin resistance have catalysed the search
for polymyxin combinations that synergistically kill polymyxin-susceptible and-resistant organisms."

The news correspondents obtained a quote from the research from the State University of New York, "This mini-review examines recent (2011-2016) in vitro and in vivo studies that have attempted to identify synergistic polymyxin combinations against Pseudomonas aeruginosa, Klebsiella pneumoniae and Acinetobacter baumannii."

According to the news reporters, the research concluded: "Clinical evidence for the use of combination regimens is also discussed."

Our news journalists report that additional information may be obtained by contacting B.T. Tsuji, University of Buffalo, Sch Pharm & Pharmaceut Sci, Buffalo, NY 14228, United States. Additional authors for this research include R.L. Nation and B.T. Tsuji.

Drugs and Therapies - Antifungals

Study Findings on Antifungals Are Outlined in Reports from IMIM (Comparative Population Plasma and Tissue Pharmacokinetics of Micafungin in Critically Ill Patients with Severe Burn Injuries and Patients with Complicated Intra-Abdominal Infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antifungals is now available. According to news reporting originating in Barcelona, Spain, by NewsRx journalists, research stated, "Severely burned patients have altered drug pharmacokinetics (PKs), but it is unclear how different they are from those in other critically ill patient groups. The aim of the present study was to compare the population pharmacokinetics of micafungin in the plasma and burn eschar of severely burned patients with those of micafungin in the plasma and peritoneal fluid of postsurgical critically ill patients with intra-abdominal infection."

Financial support for this research came from Astellas Pharma Europe.

The news reporters obtained a quote from the research from IMIM, "Fifteen burn patients were compared with 10 patients with intra-abdominal infection; all patients were treated with 100 to 150 mg/day of micafungin. Micafungin concentrations in serial blood, peritoneal fluid, and burn tissue samples were determined and were subjected to a population pharmacokinetic analysis. The probability of target attainment was calculated using area under
the concentration-time curve from 0 to 24 h/MIC cutoffs of 285 for Candida parapsilosis and 3,000 for non-parapsilosis Candida spp. by Monte Carlo simulations. Twenty-five patients (18 males; median age, 50 years; age range, 38 to 67 years; median total body surface area burned, 50%; range of total body surface area burned, 35 to 65%) were included. A three-compartment model described the data, and only the rate constant for the drug distribution from the tissue fluid to the central compartment was statistically significantly different between the burn and intra-abdominal infection patients (0.47 +/- 0.47 versus 0.15 +/- 0.06 h(-1), respectively; P< 0.05). Most patients would achieve plasma PK/pharmacodynamic (PD) targets of 90% for non-parapsilosis Candida spp. and C. parapsilosis with MICs of 0.008 and 0.064 mg/liter, respectively, for doses of 100 mg daily and 150 mg daily. The PKs of micafungin were not significantly different between burn patients and intra-abdominal infection patients."

According to the news reporters, the research concluded: 
"After the first dose, micafungin at 100 mg/day achieved the PK/PD targets in plasma for MIC values of < 0.008 mg/liter and < 0.064 mg/liter for non-parapsilosis Candida spp. and Candida parapsilosis species, respectively."

For more information on this research see: Comparative Population Plasma and Tissue Pharmacokinetics of Micafungin in Critically Ill Patients with Severe Burn Injuries and Patients with Complicated Intra-Abdominal Infection. *Antimicrobial Agents and Chemotherapy*, 2016;60(10):5914-5921. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Drugs and Therapies - Antihyperlipidemic Agents**

**Study Findings on Antihyperlipidemic Agents Are Outlined in Reports from Temple University (Intracellular Unbound Atorvastatin Concentrations in the Presence of Metabolism and Transport)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antihyperlipidemic Agents are discussed in a new report. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Accurate prediction of drug target activity and rational dosing regimen design require knowledge of drug concentrations at the
target. It is important to understand the impact of processes such as membrane permeability, partitioning, and active transport on intracellular drug concentrations."

Our news editors obtained a quote from the research from Temple University, "The present study aimed to predict intracellular unbound atorvastatin concentrations and characterize the effect of enzyme-transporter interplay on these concentrations. Single-pass liver perfusion studies were conducted in rats using atorvastatin (ATV, 1 μM) alone at 4 degrees C and at 37 degrees C in presence of rifampin (rif, 20 μM) and 1-aminobenzotriazole (ATB, 1 mM), separately and in combination. The unbound intracellular ATV concentration was predicted with a five-compartment explicit membrane model using the parameterized diffusional influx clearance, active basolateral uptake clearance, and metabolic clearance. Chemical inhibition of uptake and metabolism at 37 degrees C proved to be better controls relative to studies at 4 degrees C. The predicted unbound intracellular concentration at the end of the 50-minute perfusion in the +ABT, +ABT+RIF, and the ATV-only groups was 6.5 μM, 0.58 μM, and 5.14 μM, respectively. The predicted total liver concentrations and amount recovered in bile were within 0.94-1.3 fold of the observed value in all groups. The fold difference in total liver concentration did not always extrapolate to the fold difference in predicted unbound concentration across groups. Together, these results support the use of compartmental modeling to predict intracellular concentrations in dynamic organ-based systems."

According to the news editors, the research concluded: "These predictions can provide insight into the role of uptake transporters and metabolizing enzymes in determining drug tissue concentrations."

The news editors report that additional information may be obtained by contacting S. Nagar, Temple University, Sch Pharm, Dept. of Pharmaceut Sci, Philadelphia, PA, United States. Additional authors for this research include K. Korzekwa and S. Nagar.

Lactation studies are necessary evaluations of medications for reproductive-age women."

Financial support for this research came from HHS | National Institutes of Health (NIH).

The news correspondents obtained a quote from the research from the Johns Hopkins University Bloomberg School of Public Health. "We evaluated pharmacokinetics (PK), pharmacodynamics, safety, and adherence profiles associated with 7 days of 1% tenofovir (TFV) vaginal gel use during lactation. Tenofovir levels (maternal/infant serum, milk) and anti-HIV activity (milk), adverse events (AEs), and adherence were measured for 17 HIV-1-seronegative breast-feeding mother-infant pairs."

According to the news reporters, the research concluded: "Tenofovir use was well-tolerated and detected at low levels in maternal serum, milk, and infant serum but demonstrated no anti-HIV activity in milk."

For more information on this research see: Detectable Tenofovir Levels in Breast-Feeding Infants of Mothers Exposed to Topical Tenofovir. Antimicrobial Agents and Chemotherapy, 2016;60(9):5616-5619. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Drugs and Therapies - Antiretrovirals

Study Findings on Antiretrovirals Are Outlined in Reports from State University (The Initial Months of Antiretroviral Therapy and Its Influence on AGEs, HMGB1, and sRAGE Levels in Asymptomatic HIV-Infected Individuals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies -
Antiretrovirals. According to news reporting originating in Botucatu, Brazil, by NewsRx journalists, research stated, "The development of the typical comorbidities of aging which currently affects people living with HIV/AIDS (PLWHA) can be partially ascribed to the persistent immune activation and chronic inflammation characterizing these individuals. The aim of this study was to analyze the effect exerted by combined antiretroviral therapy (cART) administration on plasma levels of HMGB1 (high mobility group box protein-1), AGEs (advanced glycation end products), their soluble receptor sRAGE, cytokines, Creative protein (CRP), and some metabolic markers in asymptomatic PLWHA."

Funders for this research include Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior, Reitoria/UNESP, Fundacao de Amparo a Pesquisa do Estado de Sao Paulo.

The news reporters obtained a quote from the research from State University, "Analyses were performed longitudinally in 30 PLWHA, before and about 6-12 months after cART initiation. We observed that lower levels of AGEs in post-cART group were accompanied by an increase of CRP and triglyceride levels already in the early months of therapy."

According to the news reporters, the research concluded: "Because of the current ever-earlier recommendations to start cART and its prolonged use, these and other markers should be investigated in order to monitor and postpone the appearance of non-AIDS comorbidities in PLWHA."

For more information on this research see: The Initial Months of Antiretroviral Therapy and Its Influence on AGEs, HMGB1, and sRAGE Levels in Asymptomatic HIV-Infected Individuals. *Mediators of Inflammation, 2016;():1-9. **Study Findings on Arachnoid Cysts Are Outlined in Reports from University of Washington (Prenatal Diagnosis of Chudley-McCullough Syndrome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions -
Arachnoid Cysts have been presented. According to news reporting originating in Seattle, Washington, by NewsRx journalists, research stated, "Chudley-McCullough syndrome (CMS) is an autosomal-recessive disorder characterized by a complex brain malformation and profound congenital sensorineural hearing loss."

The news reporters obtained a quote from the research from the University of Washington, "Postnatal brain imaging findings include ventriculomegaly, partial agenesis of corpus callosum, inferior cerebellar dysplasia, arachnoid cysts, and malformations of cortical development including frontal subcortical heterotopia and polymicrogyria. Prenatal diagnosis of CMS is important due to the markedly less severe neurodevelopmental prognosis compared to disorders with similar brain imaging findings."

According to the news reporters, the research concluded: "We report prenatal imaging features that help distinguish CMS from other disorders, including slit-like frontal horns, agenesis of the corpus callosum, frontal subcortical heterotopia, arachnoid cysts, and cerebellar dysplasia."

Our news correspondents report that additional information may be obtained by contacting T. Chapman, University of Washington, Dept. of Radiol, Seattle Childrens Hosp, Seattle, WA 98195, United States. Additional authors for this research include F.A. Perez, G.E. Ishak and D. Doherty.

**Arterial Occlusive Disease**

**Study Findings on Arterial Occlusive Disease Are Outlined in Reports from National Taiwan University (Association between peripheral arterial occlusive disease and cardiothoracic ratio in patients on chronic hemodialysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Arterial Occlusive Disease are discussed in a new report. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "The cardiothoracic ratio (CTR) and peripheral arterial occlusive disease (PAOD) are related to mortality in hemodialysis patients. However, data on
the association between PAOD and CTR are limited."

Our news editors obtained a quote from the research from National Taiwan University, "In this study, we aim to elucidate this relationship in patients on chronic hemodialysis. Using a retrospective cross-sectional study of 622 Taiwanese patients, we investigated the association of PAOD and CTR. PAOD was significantly associated with CTR in the crude analysis. The odds ratio (OR) for CTR > 0.5 was 1.77 [95% confidence interval (CI), 1.32-2.37], and the odds ratio for CTR > 0.6 was 2.18 [95% CI, 1.44-3.30]. After adjusting for confounding variables, this difference continued to exhibit significant predictive power for CTR > 0.6 (OR, 1.88; 95% CI, 1.14-3.11), but the predictive power for CTR > 0.5 was attenuated (OR, 1.41; 95% CI, 0.98-2.03). In the subgroup analysis, PAOD was an independent factor for CTR > 0.6, particularly in elderly and female patients or patients with hemoglobin > 10 mg/dl and with no history of cardiovascular disease."

According to the news editors, the research concluded: "In this research, we showed that the detection of PAOD was independently associated with CTR > 0.6 in patients on chronic hemodialysis."

For more information on this research see: Association between peripheral arterial occlusive disease and cardiothoracic ratio in patients on chronic hemodialysis. Scientific Reports, 2016;6():1-8. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Cardiovascular Diseases and Conditions -...

Study Findings on Atherosclerosis Are Outlined in Reports from University of Texas [Hemodynamic Correlates of Blood Pressure in Older Adults: The Atherosclerosis Risk in Communities (ARIC) Study]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news reporting from Austin, Texas, by NewsRx journalists, research stated, "The primary aim of the present study was to identify the hemodynamic correlates of both steady and pulsatile blood pressure (BP) in community-dwelling older adults. In 3762 adults aged 70 to 89 years, significant hemodynamic determinants of both brachial and carotid systolic BP included arterial stiffness as measured by aortic pulse wave velocity, stroke volume (via echocardiography), arterial wave reflection, left ventricular ejection time, and upstroke time."

Financial supporters for this research include National Heart, Lung, and Blood Institute, National Institute of General Medical Sciences, Ellison Foundation, American Heart
Association.

The news correspondents obtained a quote from the research from the University of Texas, "The strongest influence was exerted by arterial stiffness. The steady-state component of blood pressure, mean arterial pressure, was associated with both cardiac index and total peripheral resistance (TPR), but was more strongly associated with TPR. Results were similar when participants taking antihypertensive medications were excluded from analyses."

According to the news reporters, the research concluded: "The overall findings suggest that mean arterial pressure is associated strongly with TPR and that significant hemodynamic correlates of systolic BP included arterial stiffness, stroke volume, and arterial wave reflection."

Our news journalists report that additional information may be obtained by contacting H. Tanaka, Univ Texas Austin, Austin, TX 78712, United States. Additional authors for this research include G. Heiss, E.L. McCabe, M.L. Meyer, A.M. Shah, J.R. Mangion, J. Wu, S.D. Solomon and S. Cheng.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jch.12898. This DOI is a link to an online electronic document that is either free or for purchase.

**Heart Disorders and Diseases - Atrial Flutter**

**Study Findings on Atrial Flutter Are Outlined in Reports from Medical College (Improved Ventricular Function after TEE-guided Cardioversion of Atrial Arrhythmias in Patients after the Fontan Operation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Flutter. According to news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research stated, "Atrial tachyarrhythmias frequently develop after the Fontan operation. Patients with Fontan physiology rely on atrial contribution to cardiac output, and thus control of atrial arrhythmias is important."

Our news editors obtained a quote from the research from Medical College, "Outcomes after cardioversion in patients after Fontan have not been reported. We sought to determine if cardioversion results in improved echocardiographic parameters or clinical symptomatology; and, discern risk factors for arrhythmia recurrence. We retrospectively analyzed the Mayo Clinic echocardiographic database to capture patients after the Fontan operation who underwent transesophageal echocardiography-guided electrical cardioversion..."
from 2000-2015. Clinical and echocardiographic data were collected and compared at baseline and follow-up. Eight hundred ninety patients with prior Fontan operation underwent echocardiographic evaluation; 341 (38%) developed atrial arrhythmias. Thirty-six patients [20 males, median age 29 (12-51)] underwent transesophageal echocardiography-guided cardioversion of atrial arrhythmias [atrial flutter/intraatrial reentrant tachycardia (75%); atrial fibrillation (25%)]. At follow-up, improvements were noted in ejection fraction by 10% (P < .0001); atrioventricular valve regurgitation grade (39%) (P = .002); New York Heart Association (NYHA) class (61%) (P < .001); and resolution of spontaneous echo contrast in the Fontan circuit (65%) (P < .01). No embolic events occurred following cardioversion. Eighteen patients (50%) developed recurrent atrial arrhythmias at 15 (3-36) months after cardioversion. Five-year freedom from arrhythmia recurrence was 61%. Significant univariate predictors of arrhythmia recurrence were atrial flutter/intraatrial reentrant tachycardia (HR=4.3, P = .02); NYHA >= II (HR = 4.1, P = .03); systemic right ventricle (HR = 5.2; P = .02); and ejection fraction <= 40% (HR = 2.8; P = .04). On multivariate analysis, only systemic right ventricle (HR = 3.7; P = .02) remained an independent predictor of arrhythmia recurrence. After the Fontan operation, cardioversion of atrial arrhythmias improves ventricular function, atrioventricular valve regurgitation grade, and NYHA class. Arrhythmia recurrence was common and patients with atrial flutter/intraatrial reentrant tachycardia, systemic right ventricle, or reduced ventricular function may be at risk of arrhythmia recurrence.7

According to the news editors, the research concluded: "Further studies are required to identify additional risk factors and protective factors for arrhythmia recurrence."

For more information on this research see: Improved Ventricular Function after TEE-guided Cardioversion of Atrial Arrhythmias in Patients after the Fontan Operation. Congenital Heart Disease, 2016;11(6):578-583. Congenital Heart Disease can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. **Bioluminescence**

**Study Findings on Bioluminescence Are Outlined in Reports from George Washington University (A synthetic luciferin improves in vivo bioluminescence imaging of gene expression in cardiovascular brain regions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Bioluminescence are discussed in a new report. According to news reporting originating from Washington, District of Columbia, by NewsRx correspondents, research stated, "Bioluminescence imaging is an effective tool for in vivo investigation of molecular processes. We have demonstrated the applicability of bioluminescence imaging to spatiotemporally monitor gene expression in cardioregulatory brain nuclei during the development of cardiovascular disease, via incorporation of firefly luciferase into living animals, combined with exogenous D-luciferin substrate administration."

Financial support for this research came from HHS | National Institutes of Health (NIH).

Our news editors obtained a quote from the research from George Washington University, "Nevertheless, D-luciferin uptake into the brain tissue is low, which decreases the sensitivity of bioluminescence detection, particularly when considering small changes in gene expression in tiny central areas. Here, we tested the hypothesis that a synthetic luciferin, cyclic alkyaminoluciferin (CycLuc1), would be superior to D-luciferin for in vivo bioluminescence imaging in cardiovascular brain regions. Male C57B1/6 mice underwent targeted delivery of an adenovirus encoding the luciferase gene downstream of the CMV promoter to the subformical organ (SFO) or paraventricular nucleus of hypothalamus (PVN), two crucial cardioregulatory neural regions. While bioluminescent signals could be obtained following D-luciferin injection (150 mg/kg), CycLuc1 administration resulted in a three-to fourfold greater bioluminescent emission from the SFO and PVN, at 10- to 20-fold lower substrate concentrations (7.5-15 mg/kg). This CycLuc1-mediated enhancement in bioluminescent emission was evident early following substrate administration (i.e., 6-10 min) and persisted for up to 1 h. When the exposure time was reduced from 60 s to 1,500 ms, minimal signal in the PVN was detectable with D-luciferin, whereas bioluminescent images could be reliably captured with CycLuc1."

According to the news editors, the research concluded: "These findings demonstrate that bioluminescent imaging with the synthetic luciferin CycLuc1 provides an improved physiological genomics tool to investigate molecular events in discrete cardioregulatory brain nuclei."

The news editors report that additional information may be obtained by contacting C.N. Young, George Washington University, Sch Med & Hlth Sci, Dept. of Physiol & Pharmacol, Washington, DC 20052, United States. Additional authors for this research include C. Hurr and C.N. Young.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1152/physiolgenomics.00055.2016. This DOI is a link to an online electronic document that is either free or for purchase.

Hematology - Blood Coagulation Factors

Study Findings on Blood Coagulation Factors Are Outlined in Reports from University of Utah (Synergy Between Tissue Factor and Exogenous Factor XIa in Initiating Coagulation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hematology - Blood Coagulation Factors. According to news reporting originating from Salt Lake City, Utah, by NewsRx correspondents, research stated, "Recent evidence suggests involvement of coagulation factor XIa (FXIa) in thrombotic event development. This study was conducted to explore possible synergies between tissue factor (TF) and exogenous FXIa (E-FXIa) in thrombin generation."

Our news editors obtained a quote from the research from the University of Utah, "Approach and Results-In thrombin generation assays, for increasing concentrations of E-FXIa with low, but not with high TF concentrations, peak thrombin significantly increased whereas lag time and time to peak significantly decreased. Similar dependencies of lag times and rates of thrombin generation were found in mathematical model simulations. In both in vitro and in silico experiments that included E-FXIa, thrombin bursts were seen for TF levels much lower than those required without E-FXIa. For in silico thrombin bursts initiated by the synergistic action of TF and E-FXIa, the mechanisms leading to the burst differed substantially from those for bursts initiated by high TF alone. For the synergistic case, sustained activation of platelet-bound FIX by E-FXIa, along with the feedback-enhanced activation of platelet-bound FVIIa and FXa, was needed to elicit a thrombin burst. Furthermore, the initiation of thrombin bursts by high TF levels relied on different platelet FIX/FIXa binding sites than those involved in bursts initiated by low TF levels with E-FXIa. Low concentrations of TF and exogenous FXIa, each too low to elicit a burst in thrombin production alone, act synergistically when in combination to cause substantial thrombin production."

According to the news editors, the research concluded: "The observation about FIX/FIXa binding sites may have therapeutic implications."

For more information on this research see: Synergy Between Tissue Factor and Exogenous Factor XIa in Initiating Coagulation. Arteriosclerosis Thrombosis and Vascular Biology, 2016;36(12):2334-2345. Oncology - Breast Cancer

Study Findings on Breast Cancer Are Outlined in Reports from A. Simbrich and Colleagues (Trends in advanced breast cancer incidence rates after implementation of a mammography screening program in a German population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting originating from Munster, Germany, by NewsRx correspondents, research stated, "Mammography screening programs (MSPs) aim to detect early-stage breast cancers in order to decrease the incidence of advanced-stage breast cancers and to reduce breast cancer mortality. We analyzed the time trends of advanced-stage breast cancer incidence rates in the target population before and after implementation of the MSP in a region of northwestern Germany."

Our news editors obtained a quote from the research, "The MSP in the Munster district started in October 2005. A total of 13,874 women with an incident invasive breast cancer (BC) was identified by the population-based epidemiological cancer registry between 2000 and 2013 in the target group 50-69 years. Multiple imputation methods were used to replace missing data on tumor stages (10.4%). The incidence rates for early-stage (UICC I) and advanced-stage (UICC II+) BC were determined, and Poisson regression analyses were performed to assess trends over time. The incidence rates for UICC I breast cancers increased during the step-up introduction of the MSP and remained elevated thereafter. By contrast, after increasing from 2006 to 2008, the incidence rates of UICC II+ breast cancers decreased to levels below the pre-screening period. Significantly decreasing UICC II+ incidence rates were limited to the age group 55-69 years and reached levels that were significantly lower than incidence rates in the pre-screening period. The incidence rates of advanced-stage breast cancers decreased in the age groups from 55 years to the upper age limit for screening eligibility, but not in the adjacent age groups."

According to the news editors, the research concluded: "The findings are consistent with MSP lead time effects and seem to indicate that the MSP lowers advanced-stage breast cancer rates in the target population."

For more information on this research see: Trends in advanced breast cancer incidence rates after implementation of a mammography screening program in a German population. Cancer Epidemiology, 2016;44():44-51. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Oncology - Breast Cancer

Study Findings on Breast Cancer Are Outlined in Reports from Cancer Hospital (A nomogram to predict the probability of axillary lymph node metastasis in early breast cancer patients with positive axillary ultrasound)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Among patients with a preoperative positive axillary ultrasound, around 40% of them are pathologically proved to be free from axillary lymph node (ALN) metastasis. We aimed to develop and validate a model to predict the probability of ALN metastasis as a preoperative tool to support clinical decision-making."

Our news journalists obtained a quote from the research from Cancer Hospital, "Clinicopathological features of 322 early breast cancer patients with positive axillary ultrasound findings were analyzed. Multivariate logistic regression analysis was performed to identify independent predictors of ALN metastasis. A model was created from the logistic regression analysis, comprising lymph node transverse diameter, cortex thickness, hilum status, clinical tumor size, histological grade and estrogen receptor, and it was subsequently validated in another 234 patients. Coefficient of determination (R(2)) and the area under the ROC curve (AUC) were calculated to be 0.9375 and 0.864, showing good calibration and discrimination of the model, respectively. The false-negative rates of the model were 0% and 5.3% for the predicted probability cut-off points of 7.1% and 13.8%, respectively. This means that omission of axillary surgery may be safe for patients with a predictive probability of less than 13.8%.

According to the news editors, the research concluded: "After further validation in clinical practice, this model may support increasingly limited surgical approaches to the axilla in breast cancer."

For more information on this research see: A nomogram to predict the probability of axillary lymph node metastasis in early breast cancer patients with positive axillary ultrasound. Scientific Reports, 2016;6():21196. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Study Findings on Breast Cancer Are Outlined in Reports from University of Birmingham (Comparison of quadrant-specific breast cancer incidence trends in the United States and England between 1975 and 2013)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating in Birmingham, United Kingdom, by NewsRx journalists, research stated, "UK breast cancer incidence rates suggest that upper outer quadrant (UOQ) cancers have risen disproportionately compared with other areas over time. We aimed to provide a comparison of the trend in quadrant-specific breast cancer incidence between the United States (US) and England, and determine whether a disproportionate UOQ increase is present."

Financial support for this research came from Office for National Statistics for providing the English data and the National Cancer Institute SEER registries for providing the US data.

The news reporters obtained a quote from the research from the University of Birmingham, "Surveillance Epidemiology and End Results (SEER) cancer registry data were obtained on 630,007 female breast cancers from 1975 to 2013. English cancer registry data were obtained on 1,121,134 female breast cancers from 1979 to 2013. Temporal incidence changes were analysed using negative binomial regression. Interaction terms determined whether incidence changes were similar between sites. English breast cancer incidence in the UOQ rose significantly from 13% to 28% from 1979 to 2013 whereas no significant increase was observed among SEER data. The significant interaction between quadrant and year of diagnosis (p < 0.001) in both SEER and English data indicates that breast cancer incidence in each quadrant changed at a different rate. Incidence in the UOQ rose disproportionately compared to the nipple (SEER IRR = 0.81, p< 0.001; England IRR = 0.78, p< 0.001) and axillary tail (SEER IRR = 0.87, p = 0.018; England IRR = 0.69, p< 0.001) in both SEER and England. In addition, incidence rose disproportionately in the UOQ compared to non-site-specific tumours in England (Overlapping lesions IRR = 0.81, p = 0.002; NOS IRR = 0.78, p< 0.001). The proportion of non-site-specific tumours was substantially higher in England than SEER throughout the study period (62% in England; 39% in SEER). Breast cancer incidence in the UOQ increased disproportionately compared to non-site-specific tumours in England but not in SEER, likely due to the decrease in non-site-specific tumours observed in England over time."

According to the news reporters, the research concluded: "There may be real differences in incidence between the two countries, possibly due to differences in aetiology, but is much more likely to be an artefact of changing data collection methods and improvements in site coding in either country."

Our news correspondents report that additional information may be obtained by contacting C.J. Bright, University of Birmingham, Center Childhood Canc Survivor Studies, Inst Appl Hlth Res, Birmingham B15 2TT, W Midlands, United Kingdom. Additional authors for this research include D.W. Rea, A. Francis and R.G. Feltbower.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.canep.2016.08.019. This DOI is a link to an online electronic document that is either free or for purchase.

Diagnostics and Screening - Breast Cancer Screening

Study Findings on Breast Cancer Screening Are Outlined in Reports from University of California (Inter-reader Variability in the Use of BI-RADS Descriptors for Suspicious Findings on Diagnostic Mammography: A Multi-institution Study of 10 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Diagnostics and Screening - Breast Cancer Screening is now available. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated, "The study aimed to determine the inter-observer agreement among academic breast radiologists when using the Breast Imaging Reporting and Data System (BI-RADS) lesion descriptors for suspicious findings on diagnostic mammography. Ten experienced academic breast radiologists across five medical centers independently reviewed 250 de identified diagnostic mammographic cases that were previously assessed as BI-BADS 4 or 5 with subsequent pathologic diagnosis by percutaneous or surgical biopsy."

The news reporters obtained a quote from the research from the University of California, "Each radiologist assessed the presence of the following suspicious mammographic findings: mass, asymmetry (one view), focal asymmetry (two views), architectural distortion, and calcifications. For any identified calcifications, the radiologist also described the morphology and distribution. Inter-observer agreement was determined with Fleiss kappa statistic. Agreement was also calculated by years of experience. Of the 250 lesions, 156 (62%) were benign and 94 (38%) were malignant. Agreement among the 10 readers was strongest for recognizing the presence of calcifications (k = 0.82). There was substantial agreement among the readers for the identification of a mass (k = 0.67), whereas agreement was fair for the presence of a focal asymmetry (k = 0.21) or architectural distortion (k = 0.28). Agreement for asymmetries (one view) was slight (k = 0.09). Among the categories of calcification morphology and distribution, reader agreement was moderate (k = 0.51 and k = 0.60, respectively). Readers with more experience (10 or more years in clinical practice) did not demonstrate higher levels of agreement compared to those with less experience. Strength of agreement varies widely for different types of mammographic findings, even among dedicated academic breast radiologists. More subtle findings such as asymmetries and architectural distortion demonstrated the weakest agreement."
According to the news reporters, the research concluded: "Studies that seek to evaluate the predictive value of certain mammographic features for malignancy should take into consideration the inherent interpretive variability for these findings."

Our news correspondents report that additional information may be obtained by contacting A.Y. Lee, University of California, Dept. of Radiol & Biomed Imaging, San Francisco, CA 94115, United States. Additional authors for this research include D.J. Wisner, S. Aminololama-Shakeri, V.A. Arasu, S.A. Feig, J. Hargreaves, H. Ojeda-Fournier, L.W. Bassett, C.J. Wells, J. De Guzman, C.I. Flowers, J.E. Campbell, S.L. Elson, H. Retallack and B.N. Joe.

**Oncology - Cancer Prevention**

**Study Findings on Cancer Prevention Are Outlined in Reports from Harvard School of Medicine (Molecular Liver Cancer Prevention in Cirrhosis by Organ Transcriptome Analysis and Lysophosphatidic Acid Pathway Inhibition)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Prevention. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Cirrhosis is a milieu that develops hepatocellular carcinoma (HCC), the second most lethal cancer worldwide. HCC prediction and prevention in cirrhosis are key unmet medical needs."

Funders for this research include Uehara Memorial Foundation, FLAGS foundation, Nuovo-Soldati Cancer Research Foundation, Geneva University Hospital, Kaohsiung Medical University, Kaohsiung Medical University Hospital, ARC, Institut Hospitalo-Universitaire, Laboratory of Excellence, European Union, NIH, American Institute for Cancer Research, Irma T. Hirschl Trust, U.S. Department of Defense.

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Here we have established an HCC risk gene signature applicable to all major HCC etiologies: hepatitis B/C, alcohol, and non-alcoholic steatohepatitis. A transcriptome meta-analysis of >500 human cirrhotics revealed global regulatory gene modules driving HCC risk and the lysophosphatidic acid pathway as a central chemoprevention target. Pharmacological inhibition of the pathway in vivo reduced tumors and reversed the gene signature, which was verified in organotypic ex vivo culture of patient-derived fibrotic liver tissues."

According to the news editors, the research concluded: "These results demonstrate the utility of clinical organ transcriptome to enable a strategy, namely, reverse-engineering
precision cancer prevention."

For more information on this research see: Molecular Liver Cancer Prevention in Cirrhosis by Organ Transcriptome Analysis and Lysophosphatidic Acid Pathway Inhibition. *Cancer Cell*, 2016;30(6):879-890. *Cancer Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cancer Cell - www.journals.elsevier.com/cancer-cell/)

**Oncology - Cancer Risk**

**Study Findings on Cancer Risk Are Outlined in Reports from McMaster University (Biennial lung cancer screening in Canada with smoking cessation outcomes and cost-effectiveness)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Risk have been published. According to news reporting out of Hamilton, Canada, by NewsRx editors, research stated, "Guidelines recommend low-dose CT (LDCT) screening to detect lung cancer among eligible at-risk individuals. We used the OncoSim model (formerly Cancer Risk Management Model) to compare outcomes and costs between annual and biennial LDCT screening."

Our news journalists obtained a quote from the research from McMaster University, "OncoSim incorporates vital statistics, cancer registry data, health survey and utility data, cost, and other data, and simulates individual lives, aggregating outcomes over millions of individuals. Using OncoSim and National Lung Screening Trial eligibility criteria (age 55-74, minimum 30 pack-year smoking history, smoking cessation less than 15 years from time of first screen) and data, we have modeled screening parameters, cancer stage distribution, and mortality shifts for screen diagnosed cancer. Costs (in 2008 Canadian dollars) and quality of life years gained are discounted at 3% annually. Compared with annual LDCT screening, biennial screening used fewer resources, gained fewer life-years (61,000 vs. 77,000), but resulted in very similar quality-adjusted life-years (QALYs) (24,000 vs. 23,000) over 20 years. The incremental cost-effectiveness ratio (ICER) of annual compared with biennial screening was $54,000-$4.8 million/QALY gained. Average incremental CT scan use in biennial screening was 52% of that in annual screening. A smoking cessation intervention decreased the average cost-effectiveness ratio in most scenarios by half. Over 20 years, biennial LDCT screening for lung cancer appears
to provide similar benefit in terms of QALYs gained to annual screening and is more cost-effective. Further study of biennial screening should be undertaken in population screening programs."

According to the news editors, the research concluded: "A smoking cessation program should be integrated into either screening strategy."

Our news journalists report that additional information may be obtained by contacting J.R. Goffin, McMaster University, Dept. of Oncol, Hamilton, ON L8V 5C2, Canada. Additional authors for this research include W.M. Flanagan, A.B. Miller, N.R. Fitzgerald, S. Memon, M.C. Wolfson and W.K. Evans.

**Drugs and Therapies - Cancer Therapy**

**Study Findings on Cancer Therapy Are Outlined in Reports from University of New South Wales (PEGylated Albumin-Based Polion Complex Micelles for Protein Delivery)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Cancer Therapy. According to news originating from Kensington, Australia, by NewsRx correspondents, research stated, "An increasing amount of therapeutic agents are based on proteins. However, proteins as drug have intrinsic problems such as their low hydrolytic stability."

Financial support for this research came from Australian Research Council.

Our news journalists obtained a quote from the research from the University of New South Wales, "Delivery of proteins using nanoparticles has increasingly been the focus of interest with polion complex micelles, prepared from charged block copolymer and the oppositely charged protein, as an example of an attractive carrier for proteins. Inspired by this approach, a more biocompatible pathway has been developed here, which replaces the charged synthetic polymer with an abundant protein, such as albumin. Although bovine serum albumin (BSA) was observed to form complexes with positively charged proteins directly, the resulting protein nanoparticle were not stable and aggregated to large precipitates over the course of a day. Therefore, maleimide functionalized poly(oligo (ethylene glycol) methyl ether methacrylate) (MI-POEGMEMA) (Mn=26000 g/mol) was synthesized to generate a polymer-albumin conjugate, which was able to condense positively charged proteins, here lysozyme (Lyz) as a model. The PEGylated albumin polion complex micelle with lysozyme led to nanoparticles between 15 and 25 nm in size depending on the BSA to Lyz ratio. The activity of the encapsulated protein was tested using Sprouty 1 (C-12; Spry1) proteins, which can act as an
endogenous angiogenesis inhibitor. Condensation of Spry1 with the PEGylated albumin could improve the anticancer efficacy of Spry1 against the breast cancer cells lowering the IC$_{50}$ value of the protein. Furthermore, the high anticancer efficacy of the POEGMEMA-BSA/Spry1 complex micelle was verified by effectively inhibiting the growth of three-dimensional MCF-7 multicellular tumor spheroids.

According to the news editors, the research concluded: "The PEGylated albumin complex micelle has great potential as a drug delivery vehicle for a new generation of cancer pharmaceuticals."

For more information on this research see: PEGylated Albumin-Based Polyion Complex Micelles for Protein Delivery. Biomacromolecules, 2016;17(3):808-17. (American Chemical Society - www.acs.org; Biomacromolecules - www.pubs.acs.org/journal/bomaf6)

Carcinomas

Study Findings on Carcinomas Are Outlined in Reports from Ghent University Hospital [Pretreatment with VEGF(R)-inhibitors reduces interstitial fluid pressure, increases intraperitoneal chemotherapy drug penetration, and impedes tumor growth in a ...]
VEGFR; daily) followed by intraperitoneal oxaliplatin chemotherapy. Bevacizumab and Pazopanib significantly lowered interstitial fluid pressure, increased Oxaliplatin penetration (assessed by laser ablation inductively coupled plasma mass spectrometry) and delayed tumor growth of peritoneal implants (assessed by MRI).

According to the news editors, the research concluded: "Our findings suggest that VEGF®-inhibition may improve the efficacy of IPC, particularly for patients for whom a complete cytoreduction might not be feasible."

For more information on this research see: Pretreatment with VEGF®-inhibitors reduces interstitial fluid pressure, increases intraperitoneal chemotherapy drug penetration, and impedes tumor growth in a mouse colorectal carcinomatosis model. Oncotarget, 2015;6 (30):29889-900.

The news correspondents report that additional information may be obtained from F. Gremonprez, Dept. of Surgery, Ghent University Hospital, Ghent, Belgium. Additional authors for this research include B. Descamps, A. Izmer, C. Vanhove, F. Vanhaecke, O. De Wever and W. Ceelen.

Oncology - Carcinomas

Study Findings on Carcinomas Are Outlined in Reports from Sapienza University (Clinical experience with everolimus in the second-line treatment of advanced renal cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Carcinomas is now available. According to news reporting originating in Rome, Italy, by NewsRx journalists, research stated, "Everolimus is an oral inhibitor of mammalian target of rapamycin (mTOR-I) and is currently approved for the treatment of metastatic renal cell carcinoma (mRCC) after failure of first-line vascular endothelial growth factor receptor tyrosine kinase inhibitor (TKI). In this narrative review, we aim to report the available evidence about the use of everolimus as second-line therapy for mRCC."

The news reporters obtained a quote from the research from Sapienza University, "A literature search was performed using PubMed/MEDLINE and abstracts from major conferences on clinical oncology as sources. We report data from prospective as well as retrospective and real world data studies and we analyze the safety and efficacy profile of everolimus as second-line therapy for mRCC."

According to the news reporters, the research concluded: "Although different drugs are currently available for the second-line treatment of mRCC, everolimus represents a feasible
and safe option in this setting, especially for patients who have experienced high-grade toxicity or are still carrying TKI-related toxicities from first-line treatment."

For more information on this research see: Clinical experience with everolimus in the second-line treatment of advanced renal cell carcinoma. Therapeutic Advances In Urology, 2015;7(5):286-94. (Sage Publications - www.sagepub.com; Therapeutic Advances In Urology - tau.sagepub.com)

Our news correspondents report that additional information may be obtained by contacting D. Alesini, Dept. of Radiology, Oncology and Human Pathology, Sapienza University of Rome, Rome, Italy. Additional authors for this research include C. Mosillo, G. Naso, E. Cortesi and R. Iacovelli.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/1756287215591764. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiology**

**Study Findings on Cardiology Are Outlined in Reports from Institute for Cardiovascular Diseases (Successful surgical repair of a triple cardiac rupture using modified cohesive double patch technique)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiology are presented in a new report. According to news originating from Bucharest, Romania, by NewsRx correspondents, research stated, "The association between both left and right ventricular free wall ruptures (FWR) and post-infarction anterior ventricular septal defect (VSD) is an exceptional situation. Case report We present the case of a patient who developed a VSD and two FWRs (of the left and right ventricle, respectively) shortly after the onset of an anterior AMI."

Our news journalists obtained a quote from the research from Institute for Cardiovascular Diseases, "We surgically closed this complex rupture using the cohesive double patch technique with two Teflon patches combined with an infarct exclusion technique. The left and right ventricular patches were attached cohesively to the septal wall and the infarcted area was excluded without reducing the left ventricular cavity. Association between post-infarction ventricular septal rupture and both left and right free wall ruptures are a very rare and dangerous situation."

According to the news editors, the research concluded: "The modified cohesive double patch technique associated the modified Cooley technique seems to be the correct surgical solution."

The news correspondents report that additional information may be obtained from L.F. Dorobantu, Prof Dr CC Iliescu Emergency Inst Cardiovasc Dis, Dept. of Cardiovasc Surg, Bucharest, Romania. Additional authors for this research include O. Stiru and V.A. Iliescu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1080/00015458.2016.1139826. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Diseases**

**Study Findings on Cardiovascular Diseases Are Outlined in Reports from University of Queensland School of Medicine (The Association between HbA1c and Cardiovascular Disease Markers in a Remote Indigenous Australian Community with and without ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases have been published. According to news reporting originating from Herston, Australia, by NewsRx correspondents, research stated, "This study investigates the burden of cardiovascular risk markers in people with and without diabetes in a remote Indigenous Australian community, based on their HbA1c concentration. This study included health screening exams of 1187 remote Indigenous residents over 15 years old who represented 70% of the age-eligible community."

Financial support for this research came from National Health and Medical Research Council.

Our news editors obtained a quote from the research from the University of Queensland School of Medicine, "The participants were stratified by HbA1c into 5 groups using cut-off points recommended by international organisations. The associations of traditional cardiovascular risk markers with HbA1c groups were assessed using logistic and linear regressions and ANOVA models. Of the 1187 participants, 158 (13%) had a previous diabetes diagnosis, up to 568 (48%) were at high risk (5.7-6.4% (39-46 mmol/mol) HbA1c), and 67 (6%) potential new cases of diabetes ( (>=)6.5% (48 mmol/mol)) were identified. Individuals with higher HbA1c levels were more likely to have albuminuria (OR 3.14, 95% CI 1.26-7.82) and dyslipidaemia (OR 2.37, 95% CI 1.29-4.34) and visited the clinic more often (OR 2.52, 95% CI 1.26-4.99). Almost all traditional CVD risk factors showed a positive association with HbA1c."

According to the news editors, the research concluded: "Screening in this remote Indigenous Australian community highlights the high proportion of individuals who are at high risk of diabetes as indicated by HbA1c and who also had an accentuated cardiovascular risk profile."

The news editors report that additional information may be obtained by contacting L.W. Arnold, Centre for Chronic Disease, The University of Queensland School of Medicine, Royal Brisbane & Women's Hospital, Health Sciences Building Level 8, Herston, QLD 4029,
Australia. Additional authors for this research include W.E. Hoy, S.K. Sharma and Z. Wang.

Nervous System Diseases and Conditions - Charcot-Marie-Tooth Disease Are Outlined in Reports from University of Sydney (Relationship between physical performance and quality of life in Charcot-Marie-Tooth disease: a pilot study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- New research on Nervous System Diseases and Conditions - Charcot-Marie-Tooth Disease is the subject of a report. According to news reporting from Lidcombe, Australia, by NewsRx journalists, research stated, "Charcot-Marie-Tooth (CMT) is a rare inherited peripheral neuropathy in which quality of life (QoL) is reduced compared with the general population. This paper investigates the relationship between QoL and physical performance in people with CMT with the aim of identifying avenues for future research into rehabilitation strategies."

The news correspondents obtained a quote from the research from the University of Sydney, "Cross-sectional data was obtained from 10 participants (5 men, 5 women, age 46 +/- 13 years, height 1.7 +/- 0.1 m, body mass 77 +/- 17 kg) with CMT (CMT1A n=5; CMT-X n=3; unknown genetic origin n=2). Participants were evaluated for QoL, falls efficacy (FES), balance, mobility, muscle strength, and power. Physical component score (PCS) of the Short Form-36 (SF-36) was significantly and directly related to higher leg press power (r=0.75, p=0.02). Better FES scores were significantly related to faster habitual gait speed (r=-0.70, p=0.02), left hip abduction, and seated row strength (r=-0.68, p=0.03; r=-0.73, p=0.03, respectively)."

According to the news reporters, the research concluded: "Future research should aim to substantiate these preliminary findings in a larger cohort and investigate whether interventions targeting muscle strength and power can improve QoL and mobility outcomes in people with CMT."

Our news journalists report that additional information may be obtained by contacting D. Hackett, University of Sydney, Fac Hlth Sci, Exercise Hlth & Performance Fac, Res Grp, Lidcombe, NSW 2141, Australia. Additional authors for this research include C. Fornusek, N. Saigal, M. Halaki, J. Burns, G. Nicholson, M.F. Singh and D. Hackett.

Keywords for this news article include: Lidcombe, Australia, Australia and New Zealand, Peripheral Nervous System Diseases and Conditions, Neurodegenerative Diseases and
Study Findings on Chemical Research Are Outlined in Reports from AstraZeneca (Reactive Metabolites: Current and Emerging Risk and Hazard Assessments)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Chemical Research have been presented. According to news originating from Molndal, Sweden, by NewsRx correspondents, research stated, "Although idiosyncratic adverse drug reactions are rare, they are still a major concern to patient safety. Reactive metabolites are widely accepted as playing a pivotal role in the pathogenesis of idiosyncratic adverse drug reactions."

Financial support for this research came from AstraZeneca.

Our news journalists obtained a quote from the research from AstraZeneca, "While there are today well established strategies for the risk assessment of stable metabolites within the pharmaceutical industry, there is still no consensus on reactive metabolite risk assessment strategies. This is due to the complexity of the mechanisms of these toxicities as well as the difficulty in identifying and quantifying short-lived reactive intermediates such as reactive metabolites. In this review, reactive metabolite risk and hazard assessment approaches are discussed, and their pros and cons highlighted. We also discuss the nature of idiosyncratic adverse drug reactions, using acetaminophen and nefazodone to exemplify the complexity of the underlying mechanisms of reactive metabolite mediated hepatotoxicity. One of the key gaps moving forward is our understanding of and ability to predict the contribution of immune activation in idiosyncratic adverse drug reactions. Sections are included on the clinical phenotypes of immune mediated idiosyncratic adverse drug reactions and on the present understanding of immune activation by reactive metabolites. The advances being made in microphysiological systems have a great potential to transform our ability to risk assess reactive metabolites, and an overview of the key components of these systems is presented."

According to the news editors, the research concluded: "Finally, the potential impact of systems pharmacology approaches in reactive metabolite risk assessments is highlighted."

For more information on this research see: Reactive Metabolites: Current and Emerging Risk and Hazard Assessments. Chemical Research In Toxicology, 2016;29(4):505-33. (American Chemical Society - www.acs.org; Chemical Research In Toxicology - www.pubs.acs.org/journal/crtoec)

The news correspondents report that additional information may be obtained from R.A. Thompson, DMPK, Respiratory, Inflammation & Autoimmunity iMed, AstraZeneca R&D, 431 83 Molndal, Sweden. Additional authors for this research include E.M. Isin, M.O. Ogese, J.T. Mettetal and D.P Williams.

**Oncology - Cholangiocarcinoma**

**Study Findings on Cholangiocarcinoma Are Outlined in Reports from People's Hospital (Profiling of downregulated blood-circulating miR-150-5p as a novel tumor marker for cholangiocarcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cholangiocarcinoma. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Altered microRNA (miRNA) expression plays a role in cholangiocarcinoma (CCA) development; thus, detection of blood-circulating miRNAs could be useful as CCA markers. This study profiled serum miRNA levels in patients with primary sclerosing cholangitis (PSC) and CCA and then assessed the role of miR-150-5p in CCA progression in vitro."

Financial supporters for this research include National Natural Science Foundation of China, Natural Science Foundation of Jiangsu Province, Wuxi Municipal Science and Technology Development Planning funds.

The news correspondents obtained a quote from the research from People's Hospital, "Three samples were randomly selected from each of 50 sera of healthy controls, 30 PSC sera, and 28 CCA sera with matched bile samples for miRNA microarray profiling. The dysregulated miRNAs were confirmed using qRT-PCR, and miR-150-5p was selected for further in vitro and ex vivo studies. The miRNA microarray identified three dysregulated miRNAs in both CCA and PSC samples, while miR-150-5p level was consistently lower in CCA sera, bile, and tissues than in normal control and PSC sera (P < 0.05). Furthermore, levels of miR-150-5p were associated with serum carbohydrate antigen 19-9 (CA19-9) levels and CCA pathological grade. Bioinformatic Kyoto Encyclopedia of Genes and Genomes (KEGG) and Gene Ontology (GO) analyses showed that miR-150-5p could regulate hand-full gene pathways, including cancer pathway (P < 0.01). However, overexpression of miR-150-5p inhibited proliferation, migration, and invasion capability of CCA cells (P < 0.05). Luciferase reporter assay showed that miR-150-5p bound to an oncogene Ets including gene-1 (ELK1), and Western blot data confirmed that miR-1505p suppressed ELK1 expression in CCA cell lines. These results suggest that reduced miR-150-5p expression could contribute to CCA development and progression due to uncontrolled ELK1 expression."

According to the news reporters, the research concluded: "Thus, further study could evaluate miR-150-5p as a novel target and predictor for CCA prevention and treatment."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13277-016-5313-6. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Chronic Hepatitis B...

Study Findings on Chronic Hepatitis B Virus Are Outlined in Reports from Mahidol University (Treatment outcomes and validation of the stopping rule for response to peginterferon in chronic hepatitis B: A Thai nationwide cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Chronic Hepatitis B Virus have been published. According to news reporting from Bangkok, Thailand, by NewsRx journalists, research stated, "Peginterferon has demonstrated effectiveness in clinical trials in patients with chronic hepatitis B (CHB). However, its efficacy in real-life settings remains unclear."

The news correspondents obtained a quote from the research from Mahidol University, "We investigated the efficacy of peginterferon for CHB and validated the performance of previously identified response predictors in clinical practice. We analyzed prospectively collected data from a Thai nationwide cohort of CHB patients treated with peginterferon alfa-2a (180 mu g/week, 48 weeks). Among a total of 233 patients, mostly with genotype B or C, sustained response was observed in 23% of 135 hepatitis B e antigen (HBeAg)-positive patients (HBeAg seroconversion with hepatitis B virus [HBV] DNA < 2000 IU/mL) and 42% of 98 HBeAg-negative patients (HBV DNA < 2000 IU/mL with aminotransferase normalization) at 24 weeks after treatment. Age, sex, presence of cirrhosis, genotype, and pretreatment levels of aminotransferase, HBV DNA, and hepatitis B surface antigen (HBsAg) were not identified as significant predictors of sustained response. In HBeAg-positive patients, HBsAg > 20 000 IU/mL at week 12 provided a good stopping rule, with a negative predictive value of 96%. In HBeAg-negative patients, the performance of 12-week stopping rules of no decline in HBsAg with a< 2log(10) decline in HBV DNA and a< 10% log (10) decline in HBsAg showed modest negative predictive values of 80% and 66%, respectively, for achieving sustained response. Outcomes in CHB patients treated with peginterferon in a clinical setting are similar to those demonstrated in clinical trials."

According to the news reporters, the research concluded: "Application of the early stopping rule based on HBsAg quantification may allow individualization of therapy, particularly in HBeAg-positive patients."

For more information on this research see: Treatment outcomes and validation of the stopping rule for response to peginterferon in chronic hepatitis B: A Thai nationwide cohort study.
Study Findings on Chronic Kidney Disease Are Outlined in Reports from Federal University (Protein-Bound Uremic Toxins from Gut Microbiota and Inflammatory Markers in Chronic Kidney Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Kidney Diseases and Conditions - Chronic Kidney Disease. According to news reporting originating in Niteroi, Brazil, by NewsRx journalists, research stated, "Protein-bound uremic toxins from gut microbiota tend to accumulate in chronic kidney disease (CKD) patients and are poorly removed by current dialysis techniques. These toxins induce inflammation and are associated with cardiovascular disease (CVD)."

The news reporters obtained a quote from the research from Federal University, "The aim of this study was to report the relationship between uremic toxins and inflammatory and cardiovascular markers in CKD patients. This was a cross sectional study. Twenty-one nondialysis patients were included (43% men, 63.0 +/- 7.8 years, glomerular filtration rate: 34.4 +/- 12.5 mL/min) as well as 29 hemodialysis (HD) patients [58% men, 52.7 +/- 10.3 years, time on dialysis 54 (31-94.5 months)]. Total levels of uremic toxins (IS, p-CS, and IAA) were assessed by high-performance liquid chromatography with fluorescence detection. C-reactive protein, Interleukin-6 (IL-6), monocyte chemoattractant protein-1 (MCP-1), and calprotectin plasma levels were determined by immunometric assays. HD patients presented higher inflammatory markers and uremic toxins levels than nondialysis patients. IL-6 levels were positively correlated with IS (r = 0.49; P = .03), p-CS (r = 0.35; P = .04) and IAA (r = 0.36; P = .03). A positive correlation was also observed between MCP-1 levels with IS (r=0.72; P=.001), p-CS (r=0.48; P=.001) and IAA (r=0.75; P=.0001). Linear regression showed that IS was an independent predictor for IL-6 and MCP-1 levels after adjustment."

According to the news reporters, the research concluded: "Plasma uremic toxins were associated with higher IL-6 and MCP-1 levels in CKD patients, potentially playing a role in the development of CVD."

Our news correspondents report that additional information may be obtained by contacting N.A. Borges, Federal University of Fluminense, Medical Sci Grad Program, Niteroi, RJ, Brazil. Additional authors for this research include A.F. Barros, L.S. Nakao, C.J. Dolenga, D. Fouque and D. Mafra.

**Digestive System Diseases and Conditions - Colitis**

**Study Findings on Colitis Are Outlined in Reports from Guangzhou University (Huangqin-tang ameliorates dextran sodium sulphate-induced colitis by regulating intestinal epithelial cell homeostasis, inflammation and immune response)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Colitis. According to news originating from Guangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Huangqin-tang (HQT) is a traditional Chinese medicine (TCM) formula widely used for the treatment of inflammatory bowel disease in China. However, the molecular mechanisms by which HQT protects the colon are unclear."

Our news journalists obtained a quote from the research from Guangzhou University, "We studied the protective effects of HQT and the underlying mechanisms in an experimental mouse model and in vitro. In vivo, dextran sodium sulphate (DSS)-induced acute and chronic colitis were significantly ameliorated by HQT as gauged by phenotypic, histopathologic and inflammatory manifestations of the disease. Mechanistically, DSS-induced nuclear factor-kappa B (NF-kappa B) signalling was inhibited by HQT. Moreover, HQT-treated mice demonstrated significant changes in cell apoptosis, expression of apoptosis-associated genes such as caspase-3, bax, bcl-2, and intestinal permeability. HQT also increased occluding and zonula occludens-1 (ZO-1), inhibited cell proliferation (Ki67), and increased regulatory T cells numbers, protein expression of Foxp3 and IL-10 in the colonic tissue. In vitro, HQT down-regulated production of pro-inflammatory cytokines and suppressed the NF-kappa B signalling pathway in lipopolysaccharides-induced RAW 264.7 macrophages."

According to the news editors, the research concluded: "Our study suggests that HQT plays a critical role in regulating intestinal epithelial cell homeostasis, inflammation and
immune response in colitis and offers novel therapeutic options in the management of inflammatory bowel disease."

Keywords for this news article include: Guangzhou, People's Republic of China, Asia, Digestive System Diseases and Conditions, Gastrointestinal Diseases and Conditions, Colonic Diseases and Conditions, Bowel Diseases and Conditions, Inflammatory Bowel Disease, Epithelial Cells, Gastroenterology, Gastroenteritis, Inflammation, Genetics, Colitis, Guangzhou University.

**Oncology - Colon Cancer**

**Study Findings on Colon Cancer Are Outlined in Reports from Mayo Clinic (Stool DNA Analysis is Cost-Effective for Colorectal Cancer Surveillance in Patients With Ulcerative Colitis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Colon Cancer are presented in a new report. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "Patients with chronic ulcerative colitis are at increased risk for colorectal neoplasia (CRN). Surveillance by white-light endoscopy (WLE) or chromoendoscopy may reduce risk of CRN, but these strategies are underused."

The news correspondents obtained a quote from the research from Mayo Clinic, "Analysis of DNA from stool samples (sDNA) can detect CRN with high levels of sensitivity, but it is not clear if this approach is cost-effective. We simulated these strategies for CRN detection to determine which approach is most cost-effective. We adapted a previously published Markov model to simulate the clinical course of chronic ulcerative colitis, the incidence of cancer or dysplasia, and costs and benefits of care with 4 surveillance strategies: (1) analysis of sDNA and diagnostic chromoendoscopy for patients with positive results, (2) analysis of sDNA with diagnostic WLE for patients with positive results, (3) chromoendoscopy with targeted collection of biopsies, or (4) WLE with random collection of biopsies. Costs were based on 2014 Medicare reimbursement. The primary outcome was the incremental cost-effectiveness ratio (incremental cost/incremental difference in quality adjusted life-years) compared with no surveillance and a willingness-to-pay threshold of $50,000. All strategies fell below the willingness-to-pay threshold at 2-year intervals. Incremental cost-effectiveness ratios were $16,362 per quality-adjusted life-year for sDNA analysis with diagnostic chromoendoscopy; $18,643 per quality-adjusted life-year for sDNA analysis with diagnostic
WLE; $23,830 per quality-adjusted life-year for chromoendoscopy alone; and $27,907 per quality-adjusted life-year for WLE alone. In sensitivity analyses, sDNA analysis with diagnostic chromoendoscopy was more cost-effective than chromoendoscopy alone, up to a cost of $1135 per sDNA test. sDNA analysis remained cost-effective at all rates of compliance; when combined with diagnostic chromoendoscopy, this approach was preferred over chromoendoscopy alone, when the specificity of the sDNA test for CRN was >65%. Based on a Markov model, surveillance for CRN is cost-effective for patients with chronic ulcerative colitis."

According to the news reporters, the research concluded: "Analysis of sDNA with chromoendoscopies for patients with positive results was more cost-effective than chromoendoscopy or WLE alone."

For more information on this research see: Stool DNA Analysis is Cost-Effective for Colorectal Cancer Surveillance in Patients With Ulcerative Colitis. *Clinical Gastroenterology and Hepatology*, 2016;14(12):1778-1787. *Clinical Gastroenterology and Hepatology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Oncology - Colon Cancer**

**Study Findings on Colon Cancer Are Outlined in Reports from University Medical Center (Significant increase of synchronous disease in first-line metastatic colorectal cancer trials: Results of a systematic review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting originating in Utrecht, Netherlands, by NewsRx journalists, research stated, "Although synchronous and metachronous metastases are considered as separate entities of metastatic colorectal cancer (mCRC) with different outcomes, its proportion is reported infrequently. We compared inclusion rates and survival of synchronous versus metachronous mCRC in different types of studies investigating initial systemic therapy or surgical treatment of mCRC."
The news reporters obtained a quote from the research from University Medical Center, "We searched PubMed and EMBASE (January 2004 - February 2016) for mCRC studies investigating first-line systemic therapy or surgical treatment of mCRC including information on synchronous versus metachronous metastases. Outcomes were the proportion of synchronous mCRC, and estimated median overall survival (OS) of the total study population. Spearman analysis (rs) was used to study correlations between outcomes and median year of study enrolment. We included 46 articles, reporting data from 23 phase 3 randomised controlled trials (RCTs), twenty cohort and three population-based studies (total: 25,941 patients). Seventeen different definitions for synchronous mCRC were identified. In systemic therapy RCTs, we observed an increased proportion of synchronous mCRC during recent years (rs.77, p < .001). In these trials, estimated median OS slightly improved over time (rs.48, p = .03). No significant inclusion or survival trends were observed in included cohort and population-based studies. In recent years, the proportion of patients with synchronous compared with metachronous mCRC enrolled in first-line systemic therapy RCTs increased. Estimated median OS of the total study population in these RCTs slightly increased over time. Many different definitions of synchronous disease were used."

According to the news reporters, the research concluded: "Uniform definitions and consistent reporting of the proportion of synchronous versus metachronous metastases could improve cross-study comparisons and interpretation of reported data in all mCRC studies."

For more information on this research see: Significant increase of synchronous disease in first-line metastatic colorectal cancer trials: Results of a systematic review. European Journal of Cancer, 2016;69():166-177.

research stated, "To better understand the impact of microarray preprocessing normalization techniques on the analysis of biological pathways in the prediction of chronic fatigue (CF) following radiation therapy, this study has compared the list of predictive genes found using the Robust Multiarray Averaging (RMA) and the Affymetrix MAS5 method, with the list that is obtained working with raw data (without any preprocessing). First, we modeled the spiked-in data set where differentially expressed genes were known and spiked-in at different known concentrations, showing that the precisions established by different gene ranking methods were higher than working with raw data."

Our news editors obtained a quote from the research from the University of Oviedo, "The results obtained from the spiked-in experiment were extrapolated to the CF data set to run learning and blind validation. RMA and MAS5 provided different sets of discriminatory genes that have a higher predictive accuracy in the learning phase, but lower predictive accuracy during the blind validation phase, suggesting that the genetic signatures generated using both preprocessing techniques cannot be generalizable. The pathways found using the raw data set better described what is a priori known for the CF disease. Besides, RMA produced more reliable pathways than MAS5. Understanding the strengths of these two preprocessing techniques in phenotype prediction is critical for precision medicine. Particularly, this article concludes that biological pathways might be better unraveled working with raw expression data. Moreover, the interpretation of the predictive gene profiles generated by RMA and MAS5 should be done with caution."

According to the news editors, the research concluded: "This is an important conclusion with a high translational impact that should be confirmed in other disease data sets."

The news editors report that additional information may be obtained by contacting J.L. Fernandez-Martinez, University of Oviedo, Dept. of Math, E-33006 Oviedo, Asturias, Spain. Additional authors for this research include J.L. Fernandez-Martinez, L.N. Saligan and S.T. Sonis.

**Diseases and Conditions - Coxsackievirus**

**Study Findings on Coxsackievirus Are Outlined in Reports from Harbin Medical University (Coxsackievirus B3 induces the formation of autophagosomes in cardiac fibroblasts both in vitro and in vivo)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Data detailed on Diseases and Conditions - Coxsackievirus have been presented. According to news reporting from Harbin, People's Republic of China, by NewsRx journalists, research stated, "Coxsackievirus group B (CVB) is one of the common pathogens that cause myocarditis and cardiomyopathy. Evidence has shown that CVB replication in cardiomyocytes is responsible for the damage and loss of cardiac muscle and the dysfunction of the heart."

Financial support for this research came from National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from Harbin Medical University, "However, it remains largely undefined how CVB would directly impact cardiac fibroblasts, the most abundant cells in human heart. In this study, cardiac fibroblasts were isolated from Balb/c mice and infected with CVB type 3 (CVB3). Increased double-membraned, autophagosome-like vesicles in the CVB3-infected cardiac fibroblasts were observed with electron microscope. Punctate distribution of LC3 and increased level of LC3-II were also detected in the infected cardiac fibroblasts. Furthermore, we observed that the expression of pro-inflammatory cytokines, IL-6 and TNF-alpha, was increased in the CVB3-infected cardiac fibroblasts, while suppressed autophagy by 3-MA and Atg7-siRNA inhibited cytokine expression. Consistent with the in vitro findings, increased formation of autophagosomes was observed in the cardiac fibroblasts of Balb/c mice infected with CVB3."

According to the news reporters, the research concluded: "Our data demonstrated that cardiac fibroblasts respond to CVB3 infection with the formation of autophagosomes and the release of the pro-inflammatory cytokines. These results suggest that the autophagic response of cardiac fibroblasts may play a role in the pathogenesis of myocarditis caused by CVB3 infection."

For more information on this research see: Coxsackievirus B3 induces the formation of autophagosomes in cardiac fibroblasts both in vitro and in vivo. *Experimental Cell Research*, 2016;349(2):255-263. *Experimental Cell Research* can be contacted at: Elsevier Inc, 525 B Street, Ste 1900, San Diego, CA 92101-4495, USA. Study Findings on DNA Research Are Outlined in Reports from University of Copenhagen (SCAI promotes DNA double-strand break repair in distinct chromosomal contexts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in DNA Research. According to news reporting originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "DNA double-strand breaks (DSBs) are highly cytotoxic DNA lesions, whose accurate repair by non-homologous end-joining (NHEJ) or homologous recombination (HR) is crucial for genome integrity and is strongly influenced by the local chromatin environment(1,2). Here, we identify SCAI (suppressor of cancer cell invasion) as a 53BP1-interacting chromatin-associated protein that promotes the functionality of several DSB repair pathways in mammalian cells."

Our news editors obtained a quote from the research from the University of Copenhagen, "SCAI undergoes prominent enrichment at DSB sites through dual mechanisms involving 53BP1-dependent recruitment to DSB-surrounding chromatin and 53BP1-independent accumulation at resected DSBs. Cells lacking SCAI display reduced DSB repair capacity, hypersensitivity to DSB-inflicting agents and genome instability. We demonstrate that SCAI is a mediator of 53BP1-dependent repair of heterochromatin-associated DSBs, facilitating ATM kinase signalling at DSBs in repressive chromatin environments. Moreover, we establish an important role of SCAI in meiotic recombination, as SCAI deficiency in mice leads to germ cell loss and subfertility associated with impaired retention of the DMC1 recombinase on meiotic chromosomes."

According to the news editors, the research concluded: "Collectively, our findings uncover SCAI as a physiologically important component of both NHEJ-and HR-mediated pathways that potentiates DSB repair efficiency in specific chromatin contexts."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/ncb3436. This DOI is a link to an online electronic document that is either free or for purchase.

Study Findings on Diabetes and Obesity Are Outlined in Reports from Children's Hospital (Genomic insights into growth and its disorders: an update)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Diabetes and Obesity. According to news originating from Cincinnati, Ohio, by NewsRx correspondents, research stated, "This article provides an update of the most striking new developments in the field of growth genetics over the past 12 months. A number of large genome-wide association studies have identified new genetic loci and pathways associated to human growth and adult height as well as related traits and comorbidities."

Our news journalists obtained a quote from the research from Children's Hospital, "New genetic causes of primordial dwarfism and several short stature syndromes have been elucidated. Moreover, a breakthrough finding of Xq26 microduplications as a cause of pituitary gigantism was made. Several new developments in imprinted growth-related genes (including the first human mutation in insulin-like growth factor II) and novel insights into the epigenetic regulation of growth have been reported."

According to the news editors, the research concluded: "Genomic investigations continue to provide new insights into the genetic basis of human growth as well as its disorders."

The news correspondents report that additional information may be obtained from C. de Bruin, Cincinnati Center for Growth Disorders, Division of Endocrinology, Cincinnati Children's Hospital Medical Center, Cincinnati, Ohio, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1097/MED.0000000000000209. This DOI is a link to an online electronic document that is either free or for purchase.

been published. According to news reporting from Nuthetal, Germany, by NewsRx journalists, research stated, "Evidence of an association between dietary patterns and individual foods and the risk of overall mortality among cancer survivors has not been reviewed systematically. The aim of this meta-analysis of cohort studies was to investigate the association between food intake and dietary patterns and overall mortality among cancer survivors."

The news correspondents obtained a quote from the research from the German Institute of Human Nutrition, "The PubMed and Embase databases were searched. A total of 117 studies enrolling 209,597 cancer survivors were included. The following data were extracted: study location, types of outcome, population characteristics, dietary assessment method, risk estimates, and adjustment factors. Higher intakes of vegetables and fish were inversely associated with overall mortality, and higher alcohol consumption was positively associated with overall mortality (RR, 1.08; 95% CI, 1.02-1.16). Adherence to the highest category of diet quality was inversely associated with overall mortality (RR, 0.78; 95% CI, 0.72-0.85; postdiagnosis RR, 0.79; 95% CI, 0.71-0.89), as was adherence to the highest category of a prudent/healthy dietary pattern (RR, 0.81; 95% CI, 0.67-0.98; postdiagnosis RR, 0.77; 95% CI, 0.60-0.99). The Western dietary pattern was associated with increased risk of overall mortality (RR, 1.46; 95% CI, 1.27-1.68; postdiagnosis RR, 1.51; 95% CI, 1.24-1.85)."

According to the news reporters, the research concluded: "Adherence to a high-quality diet and a prudent/healthy dietary pattern is inversely associated with overall mortality among cancer survivors, whereas a Western dietary pattern is positively associated with overall mortality in this population."

Our news journalists report that additional information may be obtained by contacting L. Schwingshackl, German Inst Human Nutr, Dept. of Epidemiol, Nuthetal, Germany. Additional authors for this research include H. Boeing, G. Hoffmann, K. Aleksandrova and L. Schwingshackl.

**Drug Development**

**Study Findings on Drug Development Are Outlined in Reports from Hebrew University (Importance of ABC Transporters in Drug Development)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drug Development is the subject of a report. According
to news reporting from Jerusalem, Israel, by NewsRx journalists, research stated, "ATP-binding cassette (ABC) transporters are a huge family of ATP-dependent transmembrane proteins whose main function is exporting or importing substances or molecules through the cell membranes, plasma cell membrane, or inner membranes in organelles. They fulfill these functions by maintaining cell integrity, metabolism, and homeostasis."

The news correspondents obtained a quote from the research from Hebrew University, "They are expressed in a variety of tissues as they transport numerous essential compounds including lipids and other signaling molecules. ABC transporters became widely studied since the discovery of their ability to carry a multitude of xenobiotics, including therapeutic drugs, and in light of the fact that they represent a hurdle for the treatment of resistant cancers. In contrast, the role of ABC transporters in neurological diseases like Alzheimer's and Parkinson's, depression, schizophrenia, and epilepsy remains controversial and their mechanism of action in these pathologies remains elusive, thus hindering the implementation of therapies aimed at modulating the functions of these transporters. To date, a number of natural and synthetic compounds are known to act as inhibitors, substrates, and even inducers of these transporters, being able to modulate their expression and/or function; however, their implication as therapeutic agents is far from reaching wide clinical utilization."

According to the news reporters, the research concluded: "This review highlights the importance of overcoming the challenges posed by ABC transporters in drug development."

Our news journalists report that additional information may be obtained by contacting M. Benadiba, Hebrew University of Jerusalem, Phytor Lab Drug Dev, Hadassah Med Center, Jerusalem, Israel.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2174/138161282266610810120359. This DOI is a link to an online electronic document that is either free or for purchase.

Edema

**Study Findings on Edema Are Outlined in Reports from Peking University (Heterogeneous Characteristics Of Mri Changes Of Thigh Muscles In Patients With Dysferlinopathy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Edema is the subject of a report. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to evaluate the pattern of thigh muscle MRI changes in a large cohort of patients with dysferlinopathy. MRI of the thigh was performed in 60 patients."
The news reporters obtained a quote from the research from Peking University, "We correlated the scale of muscle involvement on MRI with the modified Gardner-Medwin and Walton (GM-W) scale and disease duration. We also analyzed the relationship between muscle changes and genetic mutations. Fatty infiltration and edema were observed in 95.50% and 86.67% of patients, respectively. The hamstring muscles had the highest frequency and mean score of fatty infiltration, although a posterior-dominant pattern was found in only 56%. Edema most commonly and severely affected the quadriceps and adductor magnus muscles. Fatty infiltration score correlated positively with disease duration and GM-W scale. The pattern of fatty infiltration was heterogeneous in dysferlinopathy patients. Muscle edema was common."

According to the news reporters, the research concluded: "Fatty infiltration can be used to assess disease progression."

Our news correspondents report that additional information may be obtained by contacting Y. Yuan, Peking University, Hosp 1, Dept. of Neurol, Beijing 100034, People's Republic of China. Additional authors for this research include J. Du, Z.X. Wang, W. Zhang, H. Lv, L.C. Meng, J.X. Xiao and Y. Yuan.

**Study Findings on Environmental Research and Public Health Are Outlined in Reports from Chosun University (Association between Family and Friend Smoking Status and Adolescent Smoking Behavior and E-Cigarette Use in Korea)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Environmental Health - Environmental Research and Public Health are discussed in a new report. According to news originating from Gwangju, South Korea, by NewsRx correspondents, research stated, "Smoking is harmful to the health of adolescents because their bodies are still growing. The aim of this study was to analyze the association between the smoking status of Korean adolescents' parents and friends and their own smoking behavior."

Our news journalists obtained a quote from the research from Chosun University, "The study assessed a nationwide sample of 72,060 middle and high students from the 10th Korea Youth Risk Behavior Web-based Survey (2014). Descriptive analysis, chi-square tests, and multiple logistic regression analysis were used to probe the association between family and friend smoking status and adolescent smoking behavior. The current cigarette smoking rates were 13.3% of boys and 4.1% of girls. The corresponding rates for electronic cigarette smoking were 4.1% and 1.5%, respectively. Higher exposure to secondhand smoke, smoking by any family member, more friends smoking, and witnessed smoking at school were associated with
current smoking and electronic smoking. The smoking status of family and friends was significantly related to adolescent smoking behavior."

According to the news editors, the research concluded: "These results should be considered in designing programs to control adolescent smoking."

**Hormones - Estradiol Congeners**

**Study Findings on Estradiol Congeners Are Outlined in Reports from Shanghai Jiao-Tong University (Different effect of testosterone and oestrogen on urinary excretion of metformin via regulating OCTs and MATEs expression in the kidney of mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hormones - Estradiol Congeners is the subject of a report. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to investigate the effect of testosterone and oestrogen on regulating organic cation transporters (Octs) and multidrug and toxin extrusions (Mates) expression in the kidney of mice and urinary excretion of metformin. 8 week-old male db/db mice were treated with estradiol (5 mg/kg), testosterone (50 mg/kg) or olive oil with same volume. Metformin (150 mg/kg) was injected in daily for successive 7 days."

Financial supporters for this research include National Natural Science Foundation of China, Shanghai Science & Technology Pillar Program in the Field of Medicine and Agriculture.

The news reporters obtained a quote from the research from Shanghai Jiao-Tong University. "Plasma, urine and tissue concentrations of metformin were determined by liquid chromatography-tandem mass spectrometry (LCMS) assay. Western blotting and Real-time PCR analysis were successively used to evaluate the renal protein and mRNA expression of Octs and MATEs. After treatment, the protein expression of Mate1 and Oct2 in testosterone group was significantly increased than those in control group (both P< 0.05). The protein expression of Mate1 and Oct2 in estradiol group was significantly reduced by 29.4% and 43.3%, respectively, compared to those in control group (all P< 0.05). These data showed a good agreement with the change in mRNA level (all P< 0.05). The plasma metformin concentration (ng/ml) in mice treated with estradiol was significantly higher than control and testosterone group (677.56 +/- 72.49 versus 293.92 +/- 83.27 and 261.46 +/- 79.45; P< 0.01). Moreover,
testosterone increased the metformin urine excretion of mice while estradiol decreasing (both P < 0.01). Spearman correlation analysis showed that gonadal hormone was closely associated with Mate1 and Oct2 expression and metformin urine excretion in db/db mice (all P< 0.05)."

According to the news reporters, the research concluded: "Testosterone and oestrogen exerted reverse effect on metformin urinary excretion via regulating Octs and Mates expression in the kidney of mice."

Our news correspondents report that additional information may be obtained by contacting F. Liu, Shanghai Jiao Tong University, Shanghai Clin Med Center DiabetShanghai Inst Diabe, Dept. of Endocrinol & MetabKey Clin Center Metab Dis, Shanghai Key Lab DiabetAffiliated Peoples Hosp 6, Shanghai, People's Republic of China. Additional authors for this research include L.G. Ai, D.D. Zhang, L.L. Wan, T.S. Zheng, J. Yin, H.J. Lu, J.X. Lu, F.D. Lu, F. Liu and W.P. Jia.

**Genetics - Genetic Epidemiology**

**Study Findings on Genetic Epidemiology Are Outlined in Reports from School of Public Health (Validity of using ad hoc methods to analyze secondary traits in case-control association studies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Genetics - Genetic Epidemiology. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Control association studies often collect from their subjects information on secondary phenotypes. Reusing the data and studying the association between genes and secondary phenotypes provide an attractive and cost-effective approach that can lead to discovery of new genetic associations."

Our news journalists obtained a quote from the research from the School of Public Health, "A number of approaches have been proposed, including simple and computationally efficient ad hoc methods that ignore ascertainment or stratify on case-control status. Justification for these approaches relies on the assumption of no covariates and the correct specification of the primary disease model as a logistic model. Both might not be true in practice, for example, in the presence of population stratification or the primary disease model following a probit model. In this paper, we investigate the validity of ad hoc methods in the presence of covariates..."
and possible disease model misspecification. We show that in taking an ad hoc approach, it may be desirable to include covariates that affect the primary disease in the secondary phenotype model, even though these covariates are not necessarily associated with the secondary phenotype. We also show that when the disease is rare, ad hoc methods can lead to severely biased estimation and inference if the true disease model follows a probit model instead of a logistic model. Our results are justified theoretically and via simulations.

According to the news editors, the research concluded: "Applied to real data analysis of genetic associations with cigarette smoking, ad hoc methods collectively identified as highly significant (P < 10^-5) single nucleotide polymorphisms from over 10 genes, genes that were identified in previous studies of smoking cessation."

The news correspondents report that additional information may be obtained from X.H. Lin, Harvard TH Chan Sch Public Hlth, Dept. of Biostat, Boston, MA 02115, United States.

Keywords for this news article include: Boston, Massachusetts, United States, North and Central America, Genetic Epidemiology, Genetics, Epidemiology, Genetics, School of Public Health.

Oncology - Gliomas

Study Findings on Gliomas Are Outlined in Reports from Y.F. Gao and Colleagues (A critical overview of long non-coding RNA in glioma etiology 2016: an update)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Gliomas have been presented. According to news reporting out of Changsha, People's Republic of China, by NewsRx editors, research stated, "With the development of whole genome and transcriptome sequencing technologies, a growing body of long non-coding RNAs (lncRNAs) has been identified and is receiving increasing attention. LncRNAs are non-protein encoding transcripts whose functions are crucial for advancing our comprehensive understanding of biological processes in human health and diseases, specifically glioma."

Financial supporters for this research include National Natural Science Foundation of China, Hunan Provincial Science and Technology Plan of China, Open Foundation of Innovative Platform in University of Hunan Province of China.

Our news journalists obtained a quote from the research, "It has been established that lncRNAs are differently expressed in the central nervous system and may play a vital role in glioma. As of June 2016, 20 lncRNAs have been identified that may play a role in glioma pathogenesis. Investigation into the role of lncRNAs in glioma may help to identify potential biomarkers which can improve the diagnosis and treatment of glioma."

According to the news editors, the research concluded: "In this paper, we review
current understanding of the function of lncRNAs in glioma initiation and progression."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13277-016-5307-4. This DOI is a link to an online electronic document that is either free or for purchase.

**Immunology - Granulocytes**

**Study Findings on Granulocytes Are Outlined in Reports from University of Wisconsin (Rac2 Functions in Both Neutrophils and Macrophages To Mediate Motility and Host Defense in Larval Zebrafish)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunology - Granulocytes. According to news reporting from Madison, Wisconsin, by NewsRx journalists, research stated, "Leukocyte motility is required for host defense responses. Rac-family Rho GTPases are implicated in leukocyte function; however, the distinct roles of different Rac isoforms in host defense in vivo have remained unclear."

The news correspondents obtained a quote from the research from the University of Wisconsin, "In this study, we generated Rac2-deficient zebrafish using transcription activator-like effector nucleases to directly compare the role of Rac2 in vivo in neutrophils and macrophages in motility and the response to infection. This zebrafish larval model is highly amenable to live imaging of leukocyte behavior, and we report that in rac2(-/-) larvae both neutrophils and macrophages are defective in basic motility, leading to impaired responses to localized wounds or infections. rac2(-/-) larvae are highly susceptible to infection with Pseudomonas aeruginosa, which can be almost fully rescued by ectopic expression of either Rac2 or Rac1 specifically in neutrophils, indicating that these isoforms have partially overlapping functions in vivo. Rescue of Rac2 expression specifically in macrophages also confers resistance to Pseudomonas infection, highlighting an important role for Rac2 in this leukocyte population as well."

According to the news reporters, the research concluded: "Surprisingly, in contrast to neutrophils expressing a Rac2 dominant inhibitory human disease mutation, rac2(-/-) neutrophils do not have altered polarity or mobilization from hematopoietic tissue, suggesting that a different Rac isoform, such as Rac1, also contributes to these phenotypes in vivo."

For more information on this research see: Rac2 Functions in Both Neutrophils and
Heart Disorders and Diseases - Heart Attack

Study Findings on Heart Attack Are Outlined in Reports from Cardiovascular Outcomes Research (Predicting Likelihood for Coronary Artery Bypass Grafting After Non-ST-Elevation Myocardial Infarction: Finding the Best Prediction Model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting originating from Kansas City, Missouri, by NewsRx correspondents, research stated, "Up to half of patients with non-ST-elevation myocardial infarction (NSTEMI) do not receive dual antiplatelet therapy before angiography 'pretreatment' because of the risk of increased bleeding if coronary artery bypass grafting (CABG) operation is needed. Several models have been published that predict the likelihood of CABG after NSTEMI, but they have not been independently validated."

Our news editors obtained a quote from the research from Cardiovascular Outcomes Research, "The purpose of this study was to validate these models and improve the best one. We studied patients with NSTEMI who were enrolled in the 24-center Translational Research Investigating Underlying Disparities in Acute Myocardial Infarction Patients' Health Status (TRIUMPH) registry between 2005 and 2008. Previous CABG prediction models were assessed using c-statistics and calibration assessments to determine the best model. Variables from TRIUMPH likely to be associated with CABG were tested to see whether they could improve the best model's performance. Among 2,473 patients with NSTEMI, 11.8% underwent inhospital CABG. C-statistics for the Modified Thrombolysis in Myocardial Infarction, Treat Angina With Aggrastat and Determine the Cost of Therapy With an Invasive or Conservative Strategy-Thrombolysis in Myocardial Infarction 18, Poppe, and Global Risk of Acute Coronary Events (GRACE) models were 0.54, 0.61, 0.61, and 0.62, respectively. The GRACE model showed the best discrimination and calibration. From the TRIUMPH registry, preselected variables were added to the GRACE model but did not significantly improve model..."
discrimination. A GRACE model risk score of less than 9 had high sensitivity (96%), thus making it useful for predicting patients with NSTEMI who were at low risk for requiring CABG, which included approximately 21% of patients with NSTEMI.

According to the news editors, the research concluded: "This study could not improve on the GRACE model, which had the best predictive value for identifying a need for CABG after NSTEMI with a broader range of predicted risk levels and high sensitivity, especially in patients with scores lower than 9."

The news editors report that additional information may be obtained by contacting A. Shafiq, St Lukes Mid Amer Heart Inst, Cardiovasc Outcomes Res, Kansas City, MO 64111, United States. Heart Disorders and Diseases - Heart Failure

Study Findings on Heart Failure Are Outlined in Reports from University of Groningen (Optimizing clinical use of biomarkers in high-risk acute heart failure patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Failure is now available. According to news reporting originating in Groningen, Netherlands, by NewsRx journalists, research stated, "The clinical value of single biomarkers at single time-points to predict outcomes in patients with acute heart failure (AHF) is limited. We performed a multimarker, multi-time-point analysis of biomarkers for the prediction of post-discharge clinical outcomes in high-risk AHF patients."

The news reporters obtained a quote from the research from the University of Groningen, "A set of 48 circulating biomarkers were measured in the PROTECT trial which enrolled 2033 patients with AHF. Associations between baseline levels of biomarkers and outcomes (30-day all-cause mortality, 30-day death or rehospitalization for renal/cardiovascular causes and 180-day all-cause mortality) were evaluated. Prognostic accuracies of baseline, days 2 or 3, 7, and 14 biomarker measurements were estimated and compared utilizing a time-dependent area under the curve (AUC) analysis. Forty-four biomarkers were significantly associated with outcomes, but 42 had limited prognostic value (C-index <0.70). However, multimarker models combining best-performing biomarkers from different clusters had a much
stronger prognostic value. Combining blood urea nitrogen (BUN), chloride, interleukin (IL)-6, cTnI, sST-2 and VEGFR-1 into a clinical model yielded a 11% increase in C-index to 0.84 and 0.78 for 30-day and 180-day all-cause mortality, respectively, and cNRI of 0.86 95% CI [0.55-1.11] and 0.76 95% CI [0.57-0.87]. Prognostic gain was modest for the 30-day death/rehospitalization for cardiovascular or renal causes endpoint. Comparative time-dependent AUC analysis indicated that late measurements provided superior accuracy for the prediction of all-cause mortality over 180 days, with few exceptions including BUN and galectin-3. However, the predictive value of most biomarkers showed a diminishing pattern over time irrespective of moment of measurement. Multimarker models significantly improve risk prediction."

According to the news reporters, the research concluded: "Subsequent measurements, beyond admission, are needed for majority of biomarkers to maximize prognostic value over time, particularly in the long term."

For more information on this research see: Optimizing clinical use of biomarkers in high-risk acute heart failure patients. European Journal of Heart Failure, 2015;18(3):269-80. (Oxford University Press - www.oup.com; European Journal of Heart Failure - eurjhf.oxfordjournals.org)

Our news correspondents report that additional information may be obtained by contacting B.G. Demissei, Dept. of Cardiology, University of Groningen, University Medical Centre Groningen, Hanzeplein 1, 9713 GZ, Groningen, Netherlands. Additional authors for this research include M.A. Valente, J.G. Cleland, C.M. O'Connor, M. Metra, P. Ponikowski, J.R. Teerlink, G. Cotter, B. Davison, M.M. Givertz, D.M. Bloomfield, H. rat isolated jejunum strips and were conducted under isometric conditions. Hesperetin and diosmetin, but not hesperidin and diosmin, dose-dependently (10-100 μM) and reversibly inhibited acetylcholine (1 μM) and KCl (80 mM) induced contractile activity. The antispasmodic effect of hesperetin was partially blocked by 4-aminopyridine (100 μM), glibenclamide (100 μM) and NG-nitro-L-arginine methyl ester (L-NAME, 100 μM). By contrast, apamin (0.1 μM), tetraethylammonium (500 μM) and methylene blue (10 μM) did not affect the magnitude of hesperetin-induced myorelaxant effect. Indomethacin (10 μM) increased the force of hesperetin-evoked reaction." 

According to the news reporters, the research concluded: "Hesperetin and diosmetin are potent myorelaxant agents. The antispasmodic effect of hesperetin is partially mediated by fast current low-voltage activated K+ channels, voltage-independent K+ channels and involves the nitric oxide pathway. Finally, hesperetin shows a synergistic effect with indomethacin towards jejunal KCl-precontracted smooth muscle."

For more information on this research see: Antispasmodic effect of selected Citrus flavonoids on rat isolated jejunum specimens. European Journal of Pharmacology, 2016;791 ():640-646. WES/WGS DTC regarding the following elements of IC: pre-test counseling, benefits and risks, and incidental findings (IFs). The analysis revealed concerns, including the potential lack of pre-test counseling in three of the companies studied, missing relevant information in the risks and benefits sections, and potentially misleading information for consumers. Regarding IFs, only one company, which provides opportunistic screening, provides basic information about their management.

According to the news editors, the research concluded: "Some of the information (and related practices) present on the companies' Web pages salient to the consent process are not adequate in reference to recommendations for IC for WGS or WES in the clinical context. Requisite resources should be allocated to ensure that commercial companies are offering high-throughput sequencing under responsible conditions, including an adequate consent process."

The news correspondents report that additional information may be obtained from E. Niemiec, Leibniz Univ Hannover, Center Eth & Law Life Sci, Hannover, Germany. Additional authors for this research include P. Borry, W. Pinxten and H.C. Howard.

Human Papillomavirus

Study Findings on Human Papillomavirus Are Outlined in Reports from Research Institute (Intravaginal Administration of Fc-Fused IL7 Suppresses the Cervicovaginal Tumor by Recruiting HPV DNA Vaccine-Induced CD8 T Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Human Papillomavirus have been published. According to news reporting out of Gyeonggi Do, South Korea, by NewsRx editors, research stated, "The induction of tissue-localized virus-specific CD8 T-cell response is essential for the development of an effective therapeutic vaccine against genital diseases, such as cervical cancer and genital herpes. Here, we aimed to elucidate the immunologic role of IL7 in the induction of mucosal cellular immunity."

Our news journalists obtained a quote from the research from Research Institute, "IL7 was engineered through Fc fusion to enhance mucosal delivery across the genital epithelial barrier. The immunomodulatory role of IL7 was evaluated by monitoring the kinetics of various immune cells and measuring the expression of chemokines and cytokines after intravaginal administration of Fc-fused IL7 (IL7-Fc). The antitumor effects of intramuscular human papillomavirus (HPV) DNA vaccine or topical IL7-Fc alone or in a combinational regimen on mice survival were compared using a orthotopic cervical cancer model. Intravaginal treatment of IL7-Fc, but not native IL7, induces upregulation of chemokines (CXCL10, CCL3, CCL4, and
CCL5), cytokines (IFN-gamma, TNF alpha, IL6, and IL1 beta), and an adhesion molecule (VCAM-1) in the genital tract, leading to the recruitment of several leukocytes, including CD4, CD8, gamma delta T cells, and dendritic cells. Importantly, in this murine cervical cancer model, topical administration of IL7-Fc after intramuscular HPV DNA vaccination increases the number of HPV-specific CD8 T cells in the genital mucosa, but not in the spleen, leading to stronger antitumor activity than the HPV DNA vaccine alone."

According to the news editors, the research concluded: "Our findings provide an important insight into the immunomodulatory role of IL7-Fc via topical application and the design of therapeutic vaccine regimen that induces effective genital-mucosal CD8 T-cell responses."

For more information on this research see: Intravaginal Administration of Fc-Fused IL7 Suppresses the Cervicovaginal Tumor by Recruiting HPV DNA Vaccine-Induced CD8 T Cells. *Clinical Cancer Research*, 2016;22(23):5898-5908. *Clinical Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. **Cardiovascular Diseases and Conditions - Hyperemia**

**Study Findings on Hyperemia Are Outlined in Reports from Sahlgrenska University (Effects of nitroglycerine on coronary flow velocity before and during adenosine provocation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hyperemia have been published. According to news reporting out of Gothenburg, Sweden, by NewsRx editors, research stated, "Transthoracic echocardiography-assessed coronary flow velocity reserve (CFVR) evaluates coronary microvascular arterial function. Coronary flow velocity measurements at baseline and during hyperemia are used to calculate CFVR."

Our news journalists obtained a quote from the research from Sahlgrenska University, "Adenosine infusion induces hyperemia but it is not known if it causes a maximal response. We hypothesized that pre-treatment with nitroglycerine before adenosine provocation enhances hyperemia. Twenty-three healthy study subjects (mean age 27.5 +/- 5.5, 35% women) underwent CFVR measurements before and after pretreatment with sublingual nitroglycerine

Hyperemia was induced by adenosine infusion (140 μg/kg/min). In addition, the effect of nitroglycerin on left main coronary artery diameter was assessed. Pretreatment with nitroglycerine increased median CFVR from 3.6 (range 2.8-4.3) to 5.0 (4.1-6.0), p = 0.002. The increase was caused by a marked reduction in baseline coronary flow velocity 17 (15-24) vs 27 (19-31) cm/s, p < 0.0001) while hyperemic velocity remained unchanged (90 (68-116) vs 93 (75-105) cm/s, p = 0.48). Nitroglycerin significantly dilated the left main coronary artery (from median 3.1 (2.7-3.6) mm to 3.8 (3.1-4.3) mm, p = 0.018).

According to the news editors, the research concluded: "Pretreatment with nitroglycerine dilates coronary arteries and increases coronary flow velocity reserve indicating that adenosine alone causes a submaximal hyperemia."

For more information on this research see: Effects of nitroglycerine on coronary flow velocity before and during adenosine provocation. *Cardiovascular Ultrasound*, 2016;14 ():1-6. **Cardiovascular Diseases and Conditions** -...

**Study Findings on Hypertension Are Outlined in Reports from Imperial College (Associations of night-time road traffic noise with carotid intima-media thickness and blood pressure: The Whitehall II and SABRE study cohorts)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Hypertension is now available. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Road traffic noise has been linked to increased risk of stroke, for which hypertension and carotid intima-media thickness (cIMT) are risk factors. A link between traffic noise and hypertension has been established, but there are few studies on blood pressure and no studies on cIMT."

Our news journalists obtained a quote from the research from Imperial College, "To examine cross-sectional associations for long-term exposure to night-time noise with cIMT, systolic blood pressure (SBP), diastolic blood pressure (DBP) and hypertension. The study population consisted of 2592 adults from the Whitehall II and SABRE cohort studies living within Greater London who had cIMT, SBP and DBP measured. Exposure to night-time road traffic noise (A-weighted dB, referred to as dBA) was estimated at each participant's residential postcode centroid. Mean night-time road noise levels were 52 dBA (SD=4). In the pooled analysis adjusted for cohort, sex, age, ethnicity, marital status, smoking, area-level deprivation and NOx there was a 9.1 μm (95% CI: -7.1, 25.2) increase in cIMT in association with 10
dBA increase in night-time noise. Analyses by noise categories of 5560 dBA (16.2 mu m, 95% Cl:-8.7, 41.2), and N60 dBA (21.2 mu m, 95% Cl:-2.5, 44.9) vs. <55 dBA were also positive but non-significant, except among those not using antihypertensive medication and exposed to >

60 dBA vs. <55 dBA (32.6 mu m, 95% Cl: 6.2, 59.0). Associations for SBP, DPB and hypertension were close to null.

According to the news editors, the research concluded: "After adjustments, including for air pollution, the association between night-time road traffic noise and cIMT was only observed among non-medication users but associations with blood pressure and hypertension were largely null."

Our news journalists report that additional information may be obtained by contacting J.I. Halonen, Imperial Coll London, Sch Public Hlth, Dept. of Epidemiol & Biostat, Small Area Hlth Stat UnitMRC PHE Center Environm &, London, United Kingdom. Additional authors for this research include H.M. Dehbi, A.L. Hansell, J. Gulliver, D. Fecht, M. Blangiardo, F.J. Kelly, N. Chaturvedi, M. Kivimaki and C. Tonne.

**Biotechnology - Liposomes**

**Study Findings on Liposomes Are Outlined in Reports from Korea University (Nitric Oxide Releasing Coronary Stent: A New Approach Using Layer-by-Layer Coating and Liposomal Encapsulation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology - Liposomes. According to news originating from Daejeon, South Korea, by NewsRx correspondents, research stated, "The sustained or controlled release of nitric oxide (NO) can be the most promising approach for the suppression or prevention of restenosis and thrombosis caused by stent implantation. The aim of this study is to investigate the feasibility in the potential use of layer-by-layer (LBL) coating with a NO donor-containing liposomes to control the release rate of NO from a metallic stent."

Financial supporters for this research include Ministry of Science, ICT and Future Planning, Strategic Core Materials Program.

Our news journalists obtained a quote from the research from Korea University, "Microscopic observation and surface characterizations of LBL-modified stents demonstrate
successful LBL coating with liposomes on a stent. Release profiles of NO show that the release rate is sustained up to 5 d. In vitro cell study demonstrates that NO release significantly enhances endothelial cell proliferation, whereas it markedly inhibits smooth muscle cell proliferation. Finally, in vivo study conducted with a porcine coronary injury model proves the therapeutic efficacy of the NO-releasing stents coated by liposomal LBL technique, supported by improved results in luminal healing, inflammation, and neointimal thickening except thrombo-resistant effect.

According to the news editors, the research concluded: "As a result, all these results demonstrate that highly optimized release rate and therapeutic dose of NO can be achieved by LBL coating and liposomal encapsulation, followed by significantly efficacious outcome in vivo."

The news correspondents report that additional information may be obtained from D.K. Han, Korea Univ Sci & Technol, Dept. of Biomed Engn, Daejeon 305333, South Korea. Additional authors for this research include S.H. Seo, S. Gobaa, K.S. Lim, I.H. Bae, M.H. Jeong, D.K. Han and Y.K. Joung.

Interviews with patients who have lung cancer were used to ascertain a range of experiences and to make recommendations regarding the improvement of treatment based on these patients' preferences. Because chemotherapy is the common treatment option for lung cancer, we focused on this treatment. The interviews were audio-taped, verbally transcribed and evaluated via content analysis. A total of 18 participants (11 men and 7 women) with small or non-small-cell lung cancer who were receiving chemotherapy in one clinic were interviewed between June and July 2013. Two main aspects with different subthemes were identified during the interviews. One main aspect focused on organizational context, such as the treatment day process, or experiences with different stakeholders, such as with the health insurance company or physicians. The other category referred to experiences that influenced psychosocial factors, including physical and mental experiences. Patients reported different experiences concerning physical, psychological and organizational areas during chemotherapy. Nevertheless, some potential areas for improving care, and therefore the quality of life of patients with lung cancer, could be identified.

According to the news editors, the research concluded: "These improvement measures highlighted that with small, non-time-consuming and inexpensive changes, the treatment for patients with lung cancer can be improved."

The news editors report that additional information may be obtained by contacting I. Aumann, Center for Health Economics Research Hannover (CHERH), Leibniz University of Hannover, Hannover, Germany. Additional authors for this research include K. Kreis, K. Damm, H. Golpon, T. Welte and J.M Graf von der Schulenburg.

Lung Diseases and Conditions - Lung Injury

**Study Findings on Lung Injury Are Outlined in Reports from University of California (Cigarette smokers have exaggerated alveolar barrier disruption in response to lipopolysaccharide inhalation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Lung Injury is the subject of a report. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated, "Cigarette smoke exposure is associated with an increased risk of the acute respiratory distress syndrome (ARDS); however, the mechanisms underlying this relationship remain largely unknown. To assess pathways of lung injury and inflammation in smokers and non-smokers with and without lipopolysaccharide (LPS) inhalation using established biomarkers."
The news reporters obtained a quote from the research from the University of California, "We measured plasma and bronchoalveolar lavage (BAL) biomarkers of inflammation and lung injury in smokers and non-smokers in two distinct cohorts of healthy volunteers, one unstimulated (n=20) and one undergoing 50 μg LPS inhalation (n=30). Measurements and main results After LPS inhalation, cigarette smokers had increased alveolar-capillary membrane permeability as measured by BAL total protein, compared with non-smokers (median 274 vs 208 μg/mL, p=0.04). Smokers had exaggerated inflammation compared with non-smokers, with increased BAL interleukin-1 beta (p=0.002), neutrophils (p=0.02), plasma interleukin-8 (p=0.003), and plasma matrix metalloproteinase-8 (p=0.006). Alveolar epithelial injury after LPS was more severe in smokers than nonsmokers, with increased plasma (p=0.04) and decreased BAL (p=0.02) surfactant protein D. Finally, smokers had decreased BAL vascular endothelial growth factor (VEGF) (p <0.0001) with increased soluble VEGF receptor-1 (p=0.0001). Cigarette smoke exposure may predispose to ARDS through an abnormal response to a 'second hit,' with increased alveolar-capillary membrane permeability, exaggerated inflammation, increased epithelial injury and endothelial dysfunction."

According to the news reporters, the research concluded: "LPS inhalation may serve as a useful experimental model for evaluation of the acute pulmonary effects of existing and new tobacco products."

For more information on this research see: Cigarette smokers have exaggerated alveolar barrier disruption in response to lipopolysaccharide inhalation. *Thorax*, 2016;71 (12):1130-1136. *Thorax* can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. ---

**Study Findings on Malnutrition Are Outlined in Reports from University of Toronto (Malnutrition-associated liver steatosis and ATP depletion is caused by peroxisomal and mitochondrial dysfunction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
Malnutrition is the subject of a report. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "Severe malnutrition in young children is associated with signs of hepatic dysfunction such as steatosis and hypoalbuminemia, but its etiology is unknown. Peroxisomes and mitochondria play key roles in various hepatic metabolic functions including lipid metabolism and energy production."

Our news editors obtained a quote from the research from the University of Toronto, "To investigate the involvement of these organelles in the mechanisms underlying malnutrition-induced hepatic dysfunction we developed a rat model of malnutrition. Weanling rats were placed on a low protein or control diet (5% or 20% of calories from protein, respectively) for four weeks. Peroxisomal and mitochondrial structural features were characterized using immunofluorescence and electron microscopy. Mitochondrial function was assessed using high resolution respirometry. A novel targeted quantitative proteomics method was applied to analyze 47 mitochondrial proteins involved in oxidative phosphorylation, tricarboxylic acid cycle and fatty acid beta-oxidation pathways. Low protein diet-fed rats developed hypoalbuminemia and hepatic steatosis, consistent with the human phenotype. Hepatic peroxisomal content was decreased and metabolomic analysis indicated peroxisomal dysfunction. This was followed by changes in mitochondrial ultrastructure and increased mitochondrial content. Mitochondrial function was impaired due to multiple defects affecting respiratory chain complex I and IV, pyruvate uptake and several 13-oxidation enzymes, leading to strongly reduced hepatic ATP levels. Fenofibrate supplementation restored hepatic peroxisomal abundance and increased mitochondrial beta-oxidation capacity, resulting in reduced steatosis and normalization of ATP and plasma albumin levels. Malnutrition leads to severe impairments in hepatic peroxisomal and mitochondrial function, and hepatic metabolic dysfunction. We discuss the potential future implications of our findings for the clinical management of malnourished children. Lay summary: Severe malnutrition in children is associated with metabolic disturbances that are poorly understood."

According to the news editors, the research concluded: "In order to study this further, we developed a malnutrition animal model and found that severe malnutrition leads to an impaired function of liver mitochondria which are essential for energy production and a loss of peroxisomes, which are important for normal liver metabolic function."

For more information on this research see: Malnutrition-associated liver steatosis and ATP depletion is caused by peroxisomal and mitochondrial dysfunction. *Journal of Hepatology*, 2016;65(6):1198-1208. *Journal of Hepatology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Oncology - Non-Small Cell Lung Cancer

Study Findings on Non-Small Cell Lung Cancer Are Outlined in Reports from Department of Medicine (Cabozantinib in patients with advanced RET-rearranged non-small-cell lung cancer: an open-label, single-centre, phase 2, single-arm trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Non-Small Cell Lung Cancer have been presented. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "RET rearrangements are found in 1-2% of non-small-cell lung cancers. Cabozantinib is a multikinase inhibitor with activity against RET that produced a 10% overall response in unselected patients with lung cancers."

The news reporters obtained a quote from the research from the Department of Medicine, "To assess the activity of cabozantinib in patients with RET-rearranged lung cancers, we did a prospective phase 2 trial in this molecular subgroup. We enrolled patients in this open-label, Simon two-stage, single-centre, phase 2, single-arm trial in the USA if they met the following criteria: metastatic or unresectable lung cancer harbouring a RET rearrangement, Karnofsky performance status higher than 70, and measurable disease. Patients were given 60 mg of cabozantinib orally per day. The primary objective was to determine the overall response (Response Criteria Evaluation in Solid Tumors version 1.1) in assessable patients; those who received at least one dose of cabozantinib, and had been given CT imaging at baseline and at least one protocol-specified follow-up timepoint. We did safety analyses in the modified intention-to-treat population who received at least one dose of cabozantinib. The accrual of patients with RET-rearranged lung cancer to this protocol has been completed but the trial is still ongoing because several patients remain on active treatment. This study was registered with ClinicalTrials.gov, number NCT01639508. Between July 13, 2012, and April 30, 2016, 26 patients with RET-rearranged lung adenocarcinomas were enrolled and given cabozantinib; 25 patients were assessable for a response. KIF5B-RET was the predominant fusion type identified in 16 (62%) patients. The study met its primary endpoint, with confirmed partial responses seen in seven of 25 response-assessable patients (overall response 28%, 95% CI 12-49). Of the 26 patients given cabozantinib, the most common grade 3 treatment-related adverse events were lipase elevation in four (15%) patients, increased alanine aminotransferase in two (8%) patients, increased aspartate aminotransferase in two (8%) patients, decreased platelet count in two (8%) patients, and hypophosphataemia in two (8%) patients. No drug-related deaths were recorded but 16 (62%) patients died during the course of follow-up. 19 (73%) patients required dose reductions due to drug-related adverse events. The reported activity of cabozantinib in patients with RET-rearranged lung cancers defines RET rearrangements as actionable drivers in patients with lung cancers."

According to the news reporters, the research concluded: "An improved understanding of tumour biology and novel therapeutic approaches will be needed to improve outcomes with RET-directed targeted treatment."

For more information on this research see: Cabozantinib in patients with advanced RET-rearranged non-small-cell lung cancer: an open-label, single-centre, phase 2, single-arm trial. *Lancet Oncology*, 2016;17(12):1653-1660. *Lancet Oncology* can be contacted at:
Study Findings on Operations Science Are Outlined in Reports from National Chengchi University (On the risk prediction and analysis of soft information in finance reports)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Science - Operations Science is the subject of a report. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "We attempt in this paper to utilize soft information in financial reports to analyze financial risk among companies. Specifically, on the basis of the text information in financial reports, which is the so-called soft information, we apply analytical techniques to study relations between texts and financial risk."

The news reporters obtained a quote from the research from National Chengchi University, "Furthermore, we conduct a study on financial sentiment analysis by using a finance-specific sentiment lexicon to examine the relations between financial sentiment words and financial risk. A large collection of financial reports published annually by publicly-traded companies is employed to conduct our experiments; moreover, two analytical techniques - regression and ranking methods - are applied to conduct these analyses. The experimental results show that, based on a bag-of-words model, using only financial sentiment words results in performance comparable to using the whole texts; this confirms the importance of financial sentiment words with respect to risk prediction. In addition to this performance comparison, via the learned models, we draw attention to some strong and interesting correlations between texts and financial risk."

According to the news reporters, the research concluded: "These valuable findings yield greater insight and understanding into the usefulness of soft information in financial reports and can be applied to a broad range of financial and accounting applications."

For more information on this research see: On the risk prediction and analysis of soft information in finance reports. European Journal of Operational Research, 2017;257
Study Findings on Pharmacoepidemiology Are Outlined in Reports from McGill University (Conditions for confounding of interactions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Pharmacoepidemiology are presented in a new report. According to news reporting originating in Montreal, Canada, by NewsRx journalists, research stated, "Pharmaco-epidemiology increasingly investigates drug-drug or drug-covariate interactions. Yet, conditions for confounding of interactions have not been elucidated."

Financial supporters for this research include Canadian Institutes for Health Research, Guzzo-Cancer Research Society Chair in Environment and Cancer.

The news reporters obtained a quote from the research from McGill University, "We explored the conditions under which the estimates of interactions in logistic regression are affected by confounding bias. We rely on analytical derivations to investigate the conditions and then use simulations to confirm our analytical results and to quantify the impact of selected parameters on the bias of the interaction estimates. Failure to adjust for a risk factor U results in a biased estimate of the interaction between exposures E1 and E2 on a binary outcome Y if the association between U and E1 varies depending on the value of E2. The resulting confounding bias increases with increase in the following: (i) prevalence of confounder U; (ii) strength of U-Y association; and (iii) heterogeneity in the association of E1 with U across the strata of E2. A variable that is not a confounder for the main effects of E1 and E2 may still act as an important confounder for their interaction."

According to the news reporters, the research concluded: "Studies of interactions should attempt to identify-as potential confounders-those risk factors whose associations with one of the exposures in the interaction term may be modified by the other exposure."

Our news correspondents report that additional information may be obtained by
The news editors report that additional information may be obtained by contacting G. Cabot, Spanish Network Res Infect Dis REIPI, Seville, Spain. Additional authors for this research include G. Cabot, A.A. Ocampo-Sosa, M.C. Conejo, L. Zamorano, F. Navarro, A. Pascual, L. Martinez-Martinez and A. Oliver.

Lung Diseases and Conditions - Pulmonary...

Study Findings on Pulmonary Hypertension Are Outlined in Reports from Peking Union Medical College (Glycoprotein 130 Inhibitor Ameliorates Monocrotaline-Induced Pulmonary Hypertension in Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Pulmonary Hypertension is the subject of a report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Pulmonary arterial hypertension (PAH) is characterized by vasoconstriction, vascular remodelling, and microthrombotic events. Inflammatory cytokine interleukin (IL-6) may be a key factor in the development of PAH, and glycoprotein 130 (Gp130) is an important signal-transducing subunit of IL-6."

The news correspondents obtained a quote from the research from Peking Union Medical College, "The aim of our study was to evaluate the effectiveness of Gp130 inhibitor in reducing inflammation and ameliorating PAH-related vascular remodelling in monocrotaline (MCT)-exposed rats. Sprague-Dawley rats (n = 96; weight, 240-250 g) were randomly divided into 3 groups: control, MCT-exposed (MCT), and MCT-exposed plus Gp130 inhibitor (MCT-Gp) administered daily (5 mg/kg) from days 14-28. Eight rats were killed in each group at weeks 1 through 4, with the following measured variables compared across groups on day 28: hemodynamics, right ventricular hypertrophy, morphometric measurements, immunohistochemical results, levels of IL-6, phosphorylated signal transducer and activator of transcription 3, proliferating cell nuclear antigen (PCNA), bone morphogenetic protein receptor-2 (BMPR2), proangiogenic factor, vascular endothelial growth factor (VEGF), proliferative kinase extracellular signal-regulated kinase (ERK), survivin, Bcl-2, and Bax. Compared with the MCT group, Gp130 inhibitor, after MCT exposure, improved hemodynamics and significantly reduced the severity of inflammation, as estimated by levels of IL-6 (P < 0.0001), and reversed pulmonary arterial remodelling, as assessed by medial wall thickness (P < 0.0001). Gp130 inhibitor upregulated BMPR2 expression in MCT-exposed lungs (P = 0.040) and decreased the expression of PCNA, VEGF, ERK, and survivin (all P< 0.05)."

According to the news reporters, the research concluded: "Gp130 inhibitor upregulated BMPR2 expression in MCT-exposed lungs, restored the BMPR2/IL-6 balance, reduced IL-6-associated inflammation, inhibited pulmonary artery smooth muscle cell proliferation, and ameliorated pulmonary vascular remodelling in MCT-induced PH in rats."

Our news journalists report that additional information may be obtained by contacting Z.H. Liu, Peking Union Med College, Beijing 100037, People's Republic of China. Additional authors for this research include Z.H. Liu, Q. Luo, Z.H. Zhao, Q. Zhao, Y.G. Zheng,

Autoimmune Diseases and Conditions - Rheumatoid…

Study Findings on Rheumatoid Arthritis Are Outlined in Reports from Department of Rheumatology (The development of a questionnaire to evaluate rheumatoid arthritis patient’s knowledge about methotrexate)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Rheumatoid Arthritis. According to news originating from Clermont Ferrand, France, by NewsRx correspondents, research stated, "Assess knowledge concerning methotrexate in rheumatoid arthritis patients by means of a questionnaire. Methotrexate is the standard drug for rheumatoid arthritis treatment."

Our news journalists obtained a quote from the research from the Department of Rheumatology, "It has potentially serious side effects that can be largely prevented by making sure that patients are well informed and comply with prescription guidelines. Cross-sectional survey. A questionnaire on methotrexate (mode of action, administration, drug interactions), side effects, monitoring and lifestyle implications was offered to all the rheumatoid arthritis patients treated with the drug seen between March and September 2013 in a large hospital in France. One hundred and eighty-three patients (143 women), mean age 60 (13?5) years, with a median disease duration of 12 years [7-20] and treated with methotrexate for eight years [5-13] took part. Methotrexate was identified as a disease-modifying antirheumatic drug by 78% of the patients. The weekly administration method was well assimilated (97%); 67% indicated that the rationale for folic acid was to reduce treatment toxicity. Only 21% knew that trimethoprim was contraindicated. Half were aware of the haematologic risk and 36% were aware of the risk of hypersensitivity pneumonitis. There was knowledge concerning laboratory testing (80%), but 54% thought they were only being monitored for rheumatoid arthritis activity. Only 13% of the men, but 90% of the women, of childbearing age knew that contraception was essential, and 75% indicated that alcohol consumption should be limited. A low knowledge score correlated significantly with age and low educational level. It was independent of sex, duration of treatment for rheumatoid arthritis. Rheumatoid arthritis patient's knowledge concerning methotrexate is poor, particularly for the most serious side effects (haematologic and hypersensitivity pneumonitis), interactions with trimethoprim, and in men, the need for contraception."

According to the news editors, the research concluded: "Patient knowledge concerning methotrexate should be regularly checked and supported using the different therapeutic education tools available, especially when patients are older people and have had limited schooling."

The news correspondents report that additional information may be obtained from F. Fayet, Dept. of Rheumatology, CHU Gabriel Montpied, Clermont-Ferrand, France. Additional authors for this research include C. Savel, M. Rodere, B. Pereira, D. Abdi, S. Mathieu, A. Tournadre, M. Soubrier and J.J Dubost.

**Mental Health Diseases and Conditions - Schizophrenia**

**Study Findings on Schizophrenia Are Outlined in Reports from Tsinghua University (Variants in TERT influencing telomere length are associated with paranoid schizophrenia risk)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Mental Health Diseases and Conditions - Schizophrenia are presented in a new report. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Schizophrenia is one of the most severe psychiatric disorders, with a high heritability of up to 80%. Several studies have reported telomere dysfunction in schizophrenia, and common variants in the telomerase reverse transcriptase (TERT) gene."

Funders for this research include 973 Project, PCSIRT, National Natural Science Foundation of China, Fundamental Research Funds, PUMC Youth Fund.

Our news editors obtained a quote from the research from Tsinghua University, "TERT is a key component of the telomerase complex that maintains telomere length by addition of telomere repeats to telomere ends, and has repeatedly shown association with mean lymphocyte telomere length (LTL). Thus, we hypothesized that TERT may be a novel susceptibility gene for schizophrenia. Using a Taqman protocol, we genotyped eight tag SNPs from the TERT locus in 1,072 patients with paranoid schizophrenia and 1,284 control subjects from a Chinese Han population. We also measured mean LTL in 98 cases and 109 controls using a quantitative PCR-based technique. Chi-square tests showed that two SNPs, rs2075786 (p=0.0009, OR=0.76, 95%CI=0.65-0.90) and rs4975605 (p=0.0026, OR=0.73, 95%CI=0.60-0.90), were associated with a protective effect, while rs10069690 was associated with risk of paranoid schizophrenia (p=0.0044, OR=1.23, 95%CI=1.07-1.42). Additionally, the rs2736118-rs2075786 haplotype showed significant association with paranoid schizophrenia (p=0.0013). Moreover, mean LTL correlated with rs2075786 genotypes was significantly shorter in the patient group than the control group."

According to the news editors, the research concluded: "The present results suggest that the TERT gene may be a novel candidate involved in the development of paranoid
schizophrenia."

The news editors report that additional information may be obtained by contacting S. Rao, State Key Laboratory of Medical Molecular Biology, Institute of Basic Medical Sciences, Chinese Academy of Medical Sciences & Peking Union Medical College, Tsinghua University, Beijing, People's Republic of China. Heart Disorders and Diseases - Sick Sinus Syndrome

Study Findings on Sick Sinus Syndrome Are Outlined in Reports from Tokyo Women's Medical University (Long-Term Outcome of Arterial Switch Operation Conversion After Failed Senning/Mustard Procedure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Sick Sinus Syndrome. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "We evaluated long-term outcomes of the arterial switch operation (ASO) conversion after a failed Senning/Mustard operation among patients with dextro-transposition of the great arteries. Between 1986 and 2006, 9 patients with dextro-transposition of the great arteries underwent ASO conversion at our institute."

Our news editors obtained a quote from the research from Tokyo Women's Medical University, "All patients had systemic right ventricle failure, 6 had supraventricular tachycardia, and 8 had moderate or severe tricuspid valve regurgitation. All patients had New York Heart Association classification II or III. The median age of patients at the ASO conversion operation was 7.4 years (range, 0.6 to 32.4 years). Pulmonary artery banding for left ventricle training was performed in 8 of the 9 patients before conversion. There was 1 early death from low-output syndrome at 5 days postoperatively and 1 late sudden death at 5 months. Median follow-up time was 23.1 years (range, 0.08 to 28.0 years). The actuarial survival rate was 76.1% at 20 years. Long-term survivors revealed good New York Heart Association classification (class I, 6 patients; class II, 1 patient), with less than mild tricuspid regurgitation and brain natriuretic peptide levels of 40.6 +/- 16.2 pg/mL. Cardiac catheterization revealed significant improvements of right ventricle end-diastolic volume (decreased from 243.2% to 117.7% of normal), and right ventricle ejection fraction (increased from 0.42 to 0.572; p< 0.05). Three patients underwent new pacemaker implantation for sick sinus syndrome, and moderate neoaortic valve regurgitation developed in 1 patient."
According to the news editors, the research concluded: "Excellent long-term outcomes can be achieved after ASO conversion; however, careful observation for new-onset sick sinus syndrome and aortic regurgitation is mandatory."

The news editors report that additional information may be obtained by contacting T. Maeda, Tokyo Women's Medical University, Heart Inst Japan, Dept. of Cardiovascular Surg, Tokyo, Japan. Additional authors for this research include T. Sakamoto, M. Nagashima, T. Hiramatsu and K. Yamazaki.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.03.114. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Small Cell Lung Cancer**

**Study Findings on Small Cell Lung Cancer Are Outlined in Reports from Salamanca University Hospital (Stereotactic ablative radiotherapy for early stage non-small cell lung cancer: a word of caution)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Small Cell Lung Cancer are discussed in a new report. According to news reporting originating in Salamanca, Spain, by NewsRx journalists, research stated, "Recently published data from pooled randomised trials conclude that stereotactic ablative radiotherapy (SABR) can be considered the treatment of choice in operable lung cancer patients fit for lobectomy. This conclusion comes for comparable 3-year survival and much lower risk of early severe morbidity and mortality."

The news reporters obtained a quote from the research from Salamanca University Hospital, "In this editorial comment we discuss the validity of the conclusions due to the prematurity of the survival analysis and to the poor accuracy of patients' staging leading to higher rates of regional relapse in the SABR arm. Besides, therapy-related mortality and morbidity in the pooled cohort is much higher that the internationally accepted standards maybe because surgery was not performed according to the best approaches and procedures currently available. The effectiveness of SABR as the sole therapy for resectable lung cancer is still awaiting for sound evidences. It could be adopted for individual cases only in two situations: (I) the patient does not accept surgical treatment; and (II) in cases were the risk of surgical related mortality is considered to exceed the probability of long-term survival after lung resection."

According to the news reporters, the research concluded: "For this, a multidisciplinary team (MDT) assessment, including surgeons and oncologists, is mandatory."

For more information on this research see: Stereotactic ablative radiotherapy for...

Our news correspondents report that additional information may be obtained by contacting G. Varela, Thoracic Surgery Service, Salamanca University Hospital and Salamanca's Bio-sanitary Institute (IBSAL), Salamanca, Spain.

### Oncology - Squamous Cell Carcinoma

#### Study Findings on Squamous Cell Carcinoma Are Outlined in Reports from University of Rochester [Systemic Therapy in Advanced Cutaneous Squamous Cell Carcinoma (CSCC) The Roswell Park Experience and a Review of the Literature]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Squamous Cell Carcinoma are discussed in a new report. According to news originating from Rochester, New York, by NewsRx correspondents, research stated, "Treatment of locally advanced unresectable or metastatic cutaneous squamous cell carcinoma (mCSCC) is suboptimal with a paucity of robust data on systemic therapy. This retrospective study aimed to evaluate the efficacy and outcomes of patients with locally advanced unresectable or mCSCC treated with systemic therapy."

Our news journalists obtained a quote from the research from the University of Rochester, "Records of patients with CSCC treated with systemic therapy from January 2001 to January 2011 were reviewed. Response was assessed using WHO criteria. Descriptive results were assessed using Wilcoxon rank-sum test for ordinal responses and Pearson chi(2) test for categorical responses. Survival was calculated by the Kaplan-Meier method. Of 28 patients identified, 25 patients (M:F = 18:7), median age 66 years (range, 39 to 85 y), had the required data for final analysis. Partial response was 44% and stable disease (SD) was 24%. The median progression-free survival (PFS) and overall survival (OS) were 5.5 months (2.3, 13.2) and 10.9 months (5.3, 21.3) respectively; 3-year OS was 22%. Patients with WHO response had improved PFS (20.8 mo; 4.4, NR) and OS (37.5 mo; 10.3, NR) compared with patients with SD/PD (PFS 2.7 mo; OS 5.9 mo). Use of platinum-based therapy significantly improved PFS and OS, whereas taxanes and cetuximab had no impact in this Small cohort. There was no difference in PFS or OS with multiagent versus single-agent therapy. Platinum-based therapy remains as one of the standard options in advanced CSCC management."

According to the news editors, the research concluded: "Agents to improve response rates are needed and future trials should address the use of novel targeted and new chemotherapy combinations in CSCC."

For more information on this research see: Systemic Therapy in Advanced Cutaneous Squamous Cell Carcinoma (CSCC) The Roswell Park Experience and a Review of the Literature. *American Journal of Clinical Oncology-Cancer Clinical Trials*, 2016;39(6):545-548. *American Journal of Clinical Oncology-Cancer Clinical Trials* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.
Therapeutics

Study Findings on Therapeutics Are Outlined in Reports from University of Girona (Psychostimulant drugs for cocaine dependence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Therapeutics. According to news reporting out of Catalonia, Spain, by NewsRx editors, research stated, "Cocaine dependence is a severe disorder for which no medication has been approved. Like opioids for heroin dependence, replacement therapy with psychostimulants could be an effective therapy for treatment."

Our news journalists obtained a quote from the research from the University of Girona, "To assess the effects of psychostimulants for cocaine abuse and dependence. Specific outcomes include sustained cocaine abstinence and retention in treatment. We also studied the influence of type of drug and comorbid disorders on psychostimulant efficacy. Search methods This is an update of the review previously published in 2010. For this updated review, we searched the Cochrane Drugs and Alcohol Group Trials Register, CENTRAL, MEDLINE, Embase and PsycINFO up to 15 February 2016. We handsearched references of obtained articles and consulted experts in the field. Selection criteria We included randomised parallel group controlled clinical trials comparing the efficacy of a psychostimulant drug versus placebo. Data collection and analysis We used standard methodological procedures expected by Cochrane. We included 26 studies involving 2366 participants. The included studies assessed nine drugs: bupropion, dexamphetamine, lisdexamfetamine, methylphenidate, modafinil, mazindol, methamphetamine, mixed amphetamine salts and selegiline. We did not consider any study to be at low risk of bias for all domains included in the Cochrane 'Risk of bias' tool. Attrition bias was the most frequently suspected potential source of bias of the included studies. We found very low quality evidence that psychostimulants improved sustained cocaine abstinence (risk ratio (RR) 1.36, 95% confidence interval (CI) 1.05 to 1.77, P = 0.02), but they did not reduce cocaine use (standardised mean difference (SMD) 0.16, 95% CI -0.02 to 0.33) among participants who continued to use it. Furthermore, we found moderate quality evidence that psychostimulants did not improve retention in treatment (RR 1.00, 95% CI 0.93 to 1.06). The proportion of adverse event-induced dropouts and cardiovascular adverse event-induced dropouts was similar for psychostimulants and placebo (RD 0.00, 95% CI -0.01 to 0.01; RD 0.00, 95% CI -0.02 to 0.01, respectively). When we included the type of drug as a moderating variable, the proportion of patients achieving sustained cocaine abstinence was higher with bupropion and dexamphetamine than with placebo. Psychostimulants also appeared to increase the proportion of patients achieving sustained cocaine and heroin abstinence amongst
methadone-maintained, dual heroin-cocaine addicts. Retention to treatment was low, though, so our results may be compromised by attrition bias. We found no evidence of publication bias. Authors’ conclusions This review found mixed results. Psychostimulants improved cocaine abstinence compared to placebo in some analyses but did not improve treatment retention. Since treatment dropout was high, we cannot rule out the possibility that these results were influenced by attrition bias."

According to the news editors, the research concluded: "Existing evidence does not clearly demonstrate the efficacy of any pharmacological treatment for cocaine dependence, but substitution treatment with psychostimulants appears promising and deserves further investigation."

For more information on this research see: Psychostimulant drugs for cocaine dependence. Cochrane Database of Systematic Reviews, 2016;(9):1674-1854. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by contacting X. Castells, University of Girona, Dept. of Med Sci, TransLab Res Grp, Unit Clin Pharmacol, Girona 17071, Catalonia, Spain. Additional authors for this research include R. Cunill, C. Perez-Mana, X. Vidal and D. Capella.

**Drugs and Therapies - Toxicology and Pharmacology**

**Study Findings on Toxicology and Pharmacology Are Outlined in Reports from D. Poddalgoda and Colleagues (Derivation of biomonitoring equivalent for inorganic tin for interpreting population-level urinary biomonitoring data)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Toxicology and Pharmacology. According to news reporting out of Ottawa, Canada, by NewsRx editors, research stated, "Level biomonitoring of tin in urine has been conducted by the U.S. National Health and Nutrition Examination Survey (NHANES) and the National Nutrition and Health Study (ENNS - Etude nationale nutrition sante) in France."

Our news journalists obtained a quote from the research, "The general population is predominantly exposed to inorganic tin from the consumption of canned food and beverages. The National Institute for Public Health and the Environment of the Netherlands (RIVM) has established a tolerable daily intake (TDI) for chronic exposure to inorganic tin based on a NOAEL of 20 mg/kg bw per day from a 2-year feeding study in rats. Using a urinary excretion fraction (0.25%) from a controlled human study along with a TDI value of 0.2 mg/kg bw per day, a Biomonitoring Equivalent (BE) was derived for urinary tin (26 μg/g creatinine or 20 μg/L urine). The geometric mean and the 95th percentile tin urine concentrations of the general population in U.S. (0.705 and 4.5 μg/g creatinine) and France (0.51 and 2.28 μg/g creatinine) are below the BE associated with the TDI, indicating that the population exposure to
inorganic tin is below the exposure guidance value of 0.2 mg/kg bw per day. Overall, the robustness of pharmacokinetic data forming the basis of the urinary BE development is medium."

According to the news editors, the research concluded: "The availability of internal dose and kinetic data in the animal species forming the basis of the assessment could improve the overall confidence in the present assessment."

For more information on this research see: Derivation of biomonitoring equivalent for inorganic tin for interpreting population-level urinary biomonitoring data. Regulatory Toxicology and Pharmacology, 2016;81():430-436. Nutritional and Metabolic Diseases and Conditions …

Study Findings on Type 2 Diabetes Are Outlined in Reports from F. Haenen and Colleagues (Roux-en-Y gastric bypass for obesity after Belsey-Mark IV for large hiatus hernia and intrathoracic stomach, in combination with gastroesophageal reflux ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting originating from Geel, Belgium, by NewsRx correspondents, research stated, "Obesity is an increasing problem worldwide; patients who remain obese after non-surgical interventions are potential candidates for surgical intervention. Laparoscopic Roux-en-Y gastric bypass (RYGB) has proven its effects on excess weight loss and its positive effect on comorbidities and also, on reflux correction."

Our news editors obtained a quote from the research, "Case report: Our patient, a 53-year-old male, with a BMI of 45 kg/m(2) and type 2 diabetes, underwent a Belsey-Mark IV procedure in another center because of a large hiatus hernia and intrathoracic stomach, in combination with gastroesophageal reflux disease (GERD). He consulted at our center concerning his morbid obesity. After a positive preoperative evaluation a RYGB was performed with an uneventful postoperative course. RYGB is a safe and feasible procedure to perform after a Belsey-Mark IV procedure. To our knowledge, this is the first and only report of a RYGB after a Belsey-Mark IV procedure. There were no intra-operative complications and 18 months follow-up was unremarkable, with a 78.10% excess weight loss (EWL), at 86 kg, and no remaining symptoms of GERD."
According to the news editors, the research concluded: "We also mention resolution of the patient's diabetes mellitus type 2 measured by the cessation of the glucophage, which is an added health benefit."

The news editors report that additional information may be obtained by contacting F. Haenen, AZ St Dimpna, Dept. of Gen & Abdominal Surg, Geel, Belgium. Additional authors for this research include B. Gys, T. Gys and T. Lafullarde.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1080/00015458.2015.1128209. This DOI is a link to an online electronic document that is either free or for purchase.

Health and Medicine - Urology

Study Findings on Urology Are Outlined in Reports from Children's Hospital (Pathologic Risk Factors for Metastatic Disease in Postpubertal Patients With Clinical Stage I Testicular Stromal Tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Health and Medicine - Urology are presented in a new report. According to news reporting from Minneapolis, Minnesota, by NewsRx journalists, research stated, "To systematically review the existing literature to analyze the impact of previously identified pathologic risk factors on harboring occult metastatic disease (OMD) in patients with Clinical Stage I testicular stromal tumors (TSTs). A literature search using PubMed was conducted using the following terms: 'testicular stromal tumors,' 'testicular Leydig cell tumors,' 'testicular Sertoli tumors,' 'testicular interstitial tumors,' 'testicular granulosa tumor,' and 'testicular sex cord tumors.' For analysis, we included only studies with data on available recurrence, survival, and time-to-event."

The news correspondents obtained a quote from the research from Children's Hospital, "We hypothesized that patients with >= 2 risk factors would experience lower 5-year OMD-free survival (OMDFS) than those with <2 risk factors. Two hundred ninety-two patients from 47 publications were included with a median age at diagnosis of 35 years (range 12-76). Five-year OMDFS and overall survival in patients with Stage I TSTs were 91.2% and 93.2%, respectively. When comparing those who harbored OMD to those who did not, we observed an increased risk of OMD for each additional risk factor (P < .001). Five-year OMDFS was 98.1%
for those with <2 risk factors vs 44.9% for those with >= 2 risk factors (P < .001). The existing literature on pathologic risk factors for OMD in this population is insufficient to make broad clinical recommendations. However, these factors appear to risk-stratify patients and may be useful for future research investigating adjuvant therapy in higher-risk patients."

According to the news reporters, the research concluded: "This review indicates that such a stratification system has a rational basis."

For more information on this research see: Pathologic Risk Factors for Metastatic Disease in Postpubertal Patients With Clinical Stage I Testicular Stromal Tumors. *Urology*, 2016;97():138-144. *Urology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. independent predictors of NOC-UCB and formed the basis of the nomogram. By adding the GPS, the accuracy of the nomogram improved by 4.7% to 81.7%. The decision curve analysis showed a net benefit of this model compared with the Green model and the strategies of treating all patients or no patient with NAC. Limitations include the retrospective design and the lack of a validation cohort. NOC-UCB at radical cystectomy can be accurately predicted. The accuracy of preoperative models can be improved by adding biomarkers of systemic inflammatory response, such as the GPS."

According to the news reporters, the research concluded: "The use of this nomogram may help physicians to accurately identify patients with NOC-UCB who may benefit from NAC."

For more information on this research see: Development of a Preoperative Nomogram Incorporating Biomarkers of Systemic Inflammatory Response to Predict Nonorgan-confined Urothelial Carcinoma of the Bladder at Radical Cystectomy. Urology, 2016;95():132-138. Urology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Vaccination

Study Findings on Vaccination Are Outlined in Reports from Institute of Child Health (Epidemiology and risk factors for pneumonia severity and mortality in Bangladeshi children < 5 years of age before 10-valent pneumococcal conjugate vaccine ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Vaccination are discussed in a new report. According to news originating from Dhaka, Bangladesh, by NewsRx correspondents, research stated, "Pneumonia is the leading infectious cause of morbidity and mortality in young children in Bangladesh. We present the epidemiology of pneumonia in Bangladeshi children < 5 years before 10-valent pneumococcal conjugate vaccine introduction and investigate factors associated with disease severity and mortality."

Our news journalists obtained a quote from the research from the Institute of Child Health, "Children aged 2-59 months admitted to three Bangladeshi hospitals with pneumonia (i.e., cough or difficulty breathing and age-specific tachypnea without danger signs) or severe pneumonia (i.e., cough or difficulty breathing and = 1 danger signs) were included."
Demographic, clinical, laboratory, and vaccine history data were collected. We assessed associations between characteristics and pneumonia severity and mortality using multivariable logistic regression. Among 3639 Bangladeshi children with pneumonia, 61% had severe disease, and 2% died. Factors independently associated with severe pneumonia included ages 2-5 months (adjusted odds ratio [aOR] 1.60 [95% CI: 1.26-2.01]) and 6-11 months (aOR 1.31 [1.10-1.56]) relative to 12-59 months, low weight for age (aOR 1.22 [1.04-1.42]), unsafe drinking water source (aOR 2.00 [1.50-2.69]), higher paternal education (aOR 1.34 [1.15-1.57]), higher maternal education (aOR 0.74 [0.64-0.87]), and being fully vaccinated for age with pentavalent vaccination (aOR 0.64 [0.51-0.82]). Increased risk of pneumonia mortality was associated with age < 12 months, low weight for age, unsafe drinking water source, lower paternal education, disease severity, and having = 1 co-morbid condition. Modifiable factors for severe pneumonia and mortality included low weight for age and access to safe drinking water.

According to the news editors, the research concluded: "Improving vaccination status could decrease disease severity."

For more information on this research see: Epidemiology and risk factors for pneumonia severity and mortality in Bangladeshi children < 5 years of age before 10-valent pneumococcal conjugate vaccine introduction. *BMC Public Health*, 2016;16():57-68. *BMC Public Health* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. **Immunization - Vaccines**

**Study Findings on Vaccines Are Outlined in Reports from Institute of Molecular Genetics (Dendritic cells pulsed with tumor cells killed by high hydrostatic pressure induce strong immune responses and display therapeutic effects both in murine ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunization - Vaccines have been published. According to news reporting originating from Prague, Czech Republic, by NewsRx correspondents, research stated, "High hydrostatic pressure (HHP) has been shown to induce immunogenic cell death of cancer cells, facilitating their uptake by dendritic cells (DC) and subsequent presentation of tumor antigens. In the present study, we demonstrated immunogenicity of the HHP-treated tumor cells in mice."
Our news editors obtained a quote from the research from the Institute of Molecular Genetics, "HHP was able to induce immunogenic cell death of both TC-1 and TRAMP-C2 tumor cells, representing murine models for human papilloma virus-associated tumors and prostate cancer, respectively. HHP-treated cells induced stronger immune responses in mice immunized with these tumor cells, documented by higher spleen cell cytotoxicity and increased IFNg production as compared to irradiated tumor cells, accompanied by suppression of tumor growth in vivo in the case of TC-1 tumors, but not TRAMP-C2 tumors. Furthermore, HHP-treated cells were used for DC-based vaccine antigen pulsing. DC co-cultured with HHP-treated tumor cells and matured by a TLR 9 agonist exhibited higher cell surface expression of maturation markers and production of IL-12 and other cytokines, as compared to the DC pulsed with irradiated tumor cells. Immunization with DC cell-based vaccines pulsed with HHP-treated tumor cells induced high immune responses, detected by increased spleen cell cytotoxicity and elevated IFNg production. The DC-based vaccine pulsed with HHP-treated tumor cells combined with docetaxel chemotherapy significantly inhibited growth of both TC-1 and TRAMP-C2 tumors."

According to the news editors, the research concluded: "Our results indicate that DC-based vaccines pulsed with HHP-inactivated tumor cells can be a suitable tool for chemoimmunotherapy, particularly with regard to the findings that poorly immunogenic TRAMP-C2 tumors were susceptible to this treatment modality."

For more information on this research see: Dendritic cells pulsed with tumor cells killed by high hydrostatic pressure induce strong immune responses and display therapeutic effects both in murine TC-1 and TRAMP-C2 tumors when combined with docetaxel chemotherapy. International Journal of Oncology, 2015;48(3):953-64.

adverse effects of feminizing cross-sex hormone therapy (CSHT) is venous thromboembolism (VTE); however, no study has assessed the incidence of VTE from the hormone therapies used in the United States because previous publications on this topic have originated in Europe. CSHT in the United States typically includes estradiol with the antiandrogen spironolactone, whereas in Europe estradiol is prescribed with the progestin cyproterone acetate.

Our news journalists obtained a quote from the research from George Washington University. "To estimate the incidence of VTE from the standard feminizing CSHTs used in the United States. A retrospective chart review of transgender women who had been prescribed oral estradiol at a District of Columbia community health center was performed. The primary outcomes of interest were deep vein thrombosis or pulmonary emboli. From January 1, 2008 through March 31, 2016, 676 transgender women received oral estradiol-based CSHT for a total of 1,286 years of hormone treatment and a mean of 1.9 years of CSHT per patient. Only one individual, or 0.15% of the population, sustained a VTE, for an incidence of 7.8 events per 10,000 person-years."

According to the news editors, the research concluded: "There was a low incidence of VTE in this population of transgender women receiving oral estradiol."

The news correspondents report that additional information may be obtained from J.D. Arnold, George Washington University, Sch Med & Hlth Sci, Washington, DC 20052, United States. Additional authors for this research include E.P. Sarkodie, M.E. Coleman and D.A. Goldstein.

Heart Disorders and Diseases - Atrial Fibrillation

Study Results from A.L. Ross et al Provide New Insights into Atrial Fibrillation (Comparison Of Weight-based Dose Vs. Standard Dose Diltiazem In Patients With Atrial Fibrillation Presenting To The Emergency Department)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Fibrillation have been presented. According to news reporting originating from Hartford, Connecticut, by
NewsRx correspondents, research stated, "Despite evidence-based recommended weight-based (WB) dosing of diltiazem for the initial treatment of atrial fibrillation (AF) with rapid ventricular response (RVR), many providers utilize lower initial doses of diltiazem. We sought to determine whether a low, standard dose of diltiazem is noninferior to WB diltiazem as an initial bolus dose in the treatment of AF with RVR."

Our news editors obtained a quote from the research, "This retrospective review included patients who presented to the emergency department (ED) of an urban, academic tertiary medical center experiencing AF with RVR from November 2010 to August 2014. Adult patients were categorized by the dose of diltiazem received; 10 mg standard dose or 0.2-0.3 mg/kg WB dose. The primary outcome of successful treatment was defined as a composite of the following parameters 15 min after the initial bolus dose: heart rate (HR) < 100 beats/min, reduction of HR >= 20%, or a conversion to normal sinus rhythm. Four hundred and fifty-six patients who received diltiazem were included for study evaluation (standard dose: n = 255 patients, WB: n = 201 patients). Baseline characteristics, medical history, and medication use before ED presentation were similar between the groups. Significant differences at baseline between the groups included weight and HR at presentation. The primary outcome of successful treatment was attained in 60.8% of the standard dose patients and 68.7% of the WB patients (p = 0.082)."

According to the news editors, the research concluded: "In patients presenting to the ED, we found that standard dose diltiazem was noninferior to WB dosing in the initial treatment of AF with RVR."

The news editors report that additional information may be obtained by contacting M.A. Krawczynski, Dept. of Pharm Serv, Hartford, CT, United States. Additional authors for this research include D.M. O'Sullivan, M.J. Drescher and M.A. Krawczynski.

report. According to news reporting originating from Cairo, Egypt, by NewsRx correspondents, research stated, "Buccal delivery seems to be a very promising administration route for macromolecular drugs. Here, we explored the potential of cationic polymethacrylate nanoparticles (NPs) as a carrier system for the buccal delivery of low molecular weight heparin (LMWH)."

Financial support for this research came from French National Research Agency.

Our news editors obtained a quote from the research from Ain Shams University, "LMWH-loaded NPs were prepared by emulsification solvent diffusion method and the NPs were analyzed for their physiochemical properties, rheological evaluations and ex vivo transport studies across buccal mucosa. The prepared LMWH-loaded NPs showed a mean diameter between 400 and 500 nm with unimodal size distribution with negative surface charge. Viscosity measurements revealed a positive rheological synergism between the prepared NPs and mucin when mixed under physiological conditions. After 4 h, about 6.3 +/- 0.9% of LMWH was released in case of using Eudragit ® RS (ERS); while Eudragit ® RL (ERL) NPs released only 3.0 +/- 0.3 % of its LMWH content and this incomplete release was slightly ameliorated in the presence of mucin reaching to 7.2 +/- 0.3 % and 4.8 +/- 0.3 % for ERS and ERL, respectively. The ex-vivo permeability of heparin through the buccal mucosa was significantly increased after using polymetharylate NPs while no heparin permeation was detected from free heparin solution. Confocal laser scanning microscopy (CLSM) imaging indicated the mucoadhesive properties of the polymetharylate NPs where the drug-free NPs were detected in the superficial layers of buccal mucosa. LMWH-loaded NPs had less mucoadhesive properties showing significant deeper penetration of the mucosa."

According to the news editors, the research concluded: "The results indicated that mucoadhesive cationic polymethacrylate NPs offer a possible approach for the buccal delivery of heparin."

The news editors report that additional information may be obtained by contacting M.M.A. Abdel-Mottaleb, Ain Shams University, Dept. of Pharmaceut & Ind Pharm, Fac Pharm, Cairo, Egypt. Additional authors for this research include M.M.A. Abdel-Mottaleb and A. Lamprecht.

**Oncology - Pancreatic Cancer**

**Study Results from Albert Einstein Medical Center Broaden Understanding of Pancreatic Cancer (Metastatic pancreatic cancer presenting as linitis plastica of the stomach)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Pancreatic Cancer. According to news reporting originating in Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Metastatic disease from pancreatic carcinoma involving the stomach is an unusual event, and the pattern of spread in the form of linitis plastica, to our knowledge, has not been reported previously. Local recurrence after curative resection for pancreatic cancer is the most common pattern of disease."

The news reporters obtained a quote from the research from Albert Einstein Medical Center, "We report a case of metastatic pancreatic adenocarcinoma presenting as linitis plastica of the stomach 4 years after curative resection. A 52-year-old man presented with epigastric pain and melaena 4 years after undergoing a Whipple's procedure for a poorly-differentiated pancreatic adenocarcinoma, stage IB; T2N0M0. CT imaging of the abdomen revealed thickening of the gastric wall, and subsequent oesophagogastroduodenoscopy (OGD) revealed diffuse friable erythaematous tissue."

According to the news reporters, the research concluded: "The biopsy specimen obtained during the OGD revealed a poorly differentiated adenocarcinoma, with similar appearance to the prior specimen obtained from the pancreas."

For more information on this research see: Metastatic pancreatic cancer presenting as linitis plastica of the stomach. *Bmj Case Reports*, 2016;2016():. (BMJ Publishing Group - group.bmj.com/; Bmj Case Reports - casereports.bmj.com/)

Our news correspondents report that additional information may be obtained by contacting S. Garg, Albert Einstein Medical Center, Philadelphia, Pennsylvania, United States. Additional authors for this research include R. Mulki and D. Sher.

**Heart Disorders and Diseases - Tachycardia**

**Study Results from All India Institute of Medical Sciences Update Understanding of Tachycardia (Systemic Inflammatory Response Syndrome Following Percutaneous Nephrolithotomy: Assessment of Risk Factors and Their Impact on Patient Outcomes)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Tachycardia are discussed in a new report. According to news reporting originating in New Delhi, India, by NewsRx journalists, research stated, "To identify perioperative risk factors for postoperative systemic inflammatory response syndrome (SIRS) and suggest possible modifications to reduce morbidity. We prospectively analysed perioperative data such as history of pervious stone surgery, number and configuration of stones, presence of stent or nephrostomy, any previous positive urine culture, intraoperative renal pelvic urine and stone culture, aspiration of turbid urine on initial puncture, number of tracts required and clearance of stones, operative time and intraoperative hypotension and tachycardia of all patients who underwent percutaneous nephrolithotomy over a period of 15 months."

The news reporters obtained a quote from the research from the All India Institute of Medical Sciences, "A total of 182 patients were included, average stone size was 2.8 cm, 36.2% had staghorn stones and 15.9% had an indwelling stent or nephrostomy. Despite sterile preoperative urine culture, renal pelvic urine culture (RPUC) was positive in 14.8% (27 patients) and stone culture was positive in 21.9% (40 patients). SIRS developed in 17.5% (32 patients) and septic shock in 1.09% (2 patients). On analysis younger age, positive RPUC and stone culture, longer operative time and intraoperative tachycardia correlated significantly with the development of SIRS."

According to the news reporters, the research concluded: "Intra-operative cultures are only therapy-guiding cultures during SIRS, as preoperative urine cultures seldom accurately depict bacteriological status of upper tracts and thus should be obtained in all patients."

Our news correspondents report that additional information may be obtained by contacting P. Singh, Dept. of Urology, All India Institute of Medical Sciences, New Delhi, India. Additional authors for this research include S. Yadav, A. Singh, A.K. Saini, R. Kumar, A. Seth and P.N Dogra.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pregnancy Complications - Spontaneous Abortion have been presented. According to news originating from Amiens, France, by NewsRx correspondents, research stated, "Acquired and inherited thrombophilia have both been reported to be associated with an increased risk of obstetric complications in early or later stages of pregnancy. Annexin A2 (ANXA2) is strongly expressed in vascular and placental tissues and plays a crucial role in fibrinolysis."

Our news journalists obtained a quote from the research from Amiens University Hospital, "The aim of the present study was to evaluate the prevalence of antibodies directed against ANXA2 in patients with recurrent miscarriage or obstetric complications. Anti-ANXA2 antibodies (aANXA2) were detected by ELISA in the sera from 46 women with obstetric morbidity, mainly recurrent miscarriage. The cut-off value for positivity was defined as 3 standard deviations above the mean optical density (OD) obtained in the sera from 42 female blood donors. The prevalence of aANXA2 in patients and healthy individuals was 15.2% and 2.3%, respectively. A statistically significant difference was observed between the 2 groups in terms of aANXA2 IgG titers (p = 0.01). The highest aANXA2 levels were observed in sera from 2 patients with recurrent miscarriage and one patient with preeclampsia. aANXA2 could play a role in thrombotic mechanisms leading to recurrent pregnancy loss and placental vascular disease."

According to the news editors, the research concluded: "Further studies are needed to determine whether ANXA2 is critical for maintenance of placental integrity."

For more information on this research see: Antibodies directed against annexin A2 and obstetric morbidity. *Journal of Reproductive Immunology*, 2016;118():50-53. *Journal of Reproductive Immunology* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Connective Tissue Cells**

**Study Results from Anhui Medical University Provide New Insights into Connective Tissue Cells (Inhibitory effect of recombinant human endostatin on the proliferation of hypertrophic scar fibroblasts in a rabbit ear model)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Connective Tissue Cells is the subject of a report. According to news originating from Hefei, People's Republic of China, by NewsRx correspondents, research stated, "Hypertrophic scar (HS) is a pathological scar that particularly occurs after traumatic injuries, surgical procedures and burning. Abnormal activation of hypertrophic scar fibroblasts (HSFs) intensifies fibrosis during wound healing."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Anhui Medical University, "Our previous studies demonstrated that recombinant human endostatin (rhEndostatin) prevented synovial thickening in adjuvant arthritis (AA) rats via inhibition of proliferation and enhancement of apoptosis in synovial fibroblasts. However, the effect of this protein on HSF proliferation is not known. This study investigated the inhibitory effect of rhEndostatin on the proliferation of cultured HSFs in a rabbit ear model. MTT assay and flow cytometric detection were performed to investigate HSF proliferation and cell cycle progression, respectively. The expression levels of p53, p21, cyclinD1, cyclin-dependent kinase 4 (CDK4) and proliferating cell nuclear antigen (PCNA) in HSFs were detected using real-time PCR and Western blotting. Our data revealed that HSFs treated with rhEndostatin were significantly inhibited in a concentration-dependent manner with an IC50 value of 100 mg/L. Also, rhEndostatin (100 mg/L) primarily induced G(0)/G(1) and partially G(2)/M cell cycle arrest of HSFs. There were significant decreases in the expression levels of p53, p27, CDK4, cyclinD(1) and PCNA in HSFs treated with rhEndostatin."

According to the news editors, the research concluded: "RhEndostatin inhibited HSF proliferation via G(0)/G(1) and/or G(2)/M phase arrest of the cell cycle, which was partially due to the down-regulation of cyclinD(1), CDK4 and PCNA. These findings suggest that rhEndostatin may reduce scar hypertrophy in vivo via inhibition of HSF proliferation and may be a novel agent for HS treatment."

The news correspondents report that additional information may be obtained from Y.F. Gong, Anhui Medical University, Dept. of Anat, Hefei 230032, People's Republic of China. Additional authors for this research include X.M. Zhang, F. Liu, Z.Z. Wang, X.F. Deng, Y. Jiao, X.J. Li and X.Y. Huang.

Oncology - Breast Cancer

Study Results from Army General Hospital Broaden Understanding of Breast Cancer (The Expression and Clinical Outcome of pCHK2-Thr68 and pCDC25C-Ser216 in Breast Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Checkpoint kinase 2 (CHK2) and cell division cycle 25C (CDC25C) are two proteins involved in the DNA damage response pathway, playing essential roles in maintaining genome integrity. As one of the major hallmarks of abnormal cellular division, genomic instability occurs in most cancers."

Our news journalists obtained a quote from the research from Army General Hospital, "In this study, we identified the functional expression of pCHK2-Thr68 and pCDC25C-Ser216 in breast cancer, as well as its association with breast cancer survival. Tissue microarray analysis using immunohistochemistry was constructed to identify the expression of pCHK2-Thr68 and pCDC25C-Ser216 in 292 female breast cancer patients. The relationship among protein expression, clinicopathological factors (e.g., human epidermal growth factor receptor 2 (HER 2), tumor size, tumor-node-metastasis (TNM) classification), and overall survival of the breast cancer tissues were analyzed using Pearson's chi-square (chi(2)) test, Fisher's exact test, multivariate logistic regression and Kaplan-Meier survival analysis. Significantly higher expressions of pCHK2-Thr68 and pCDC25C-Ser216 were observed in the nucleus of the breast cancer cells compared to the paracancerous tissue (pCHK2-Thr68, 20.38% vs. 0%; pCDC25C-Ser216, 82.26% vs. 24.24%). The expression of pCHK2-Thr68 and pCDC25C-Ser216 in breast cancer showed a positive linear correlation (p = 0.026). High expression of pCHK2-Thr68 was associated with decreased patient survival (p = 0.001), but was not an independent prognostic factor."

According to the news editors, the research concluded: "Our results suggest that pCHK2-Thr68 and pCDC25C-Ser216 play important roles in breast cancer and may be potential treatment targets."

For more information on this research see: The Expression and Clinical Outcome of pCHK2-Thr68 and pCDC25C-Ser216 in Breast Cancer. International Journal of Molecular Sciences, 2016;17(11):674-683. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Our news journalists report that additional information may be obtained by contacting H.Y. Jiang, PLA Army Gen Hosp, Dept. of Radiat Oncol, Beijing 100700, People's Republic of China. Additional authors for this research include B. Wang, F.L. Zhang, Y.Y. Qian, Chia, M.Z. Ying, Y.J. Wang and L. Zuo.

Keywords for this news article include: Beijing, People's Republic of China, Asia, Women's Health, Breast Cancer, Oncology, Genetics, Army General Hospital.

Study Results from AstraZeneca Provide New Insights into Gastric Cancer (Intra-Tumoral Heterogeneity of HER2, FGFR2, cMET and ATM in Gastric Cancer: Optimizing Personalized Healthcare through Innovative Pathological and Statistical Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gastric Cancer. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Current drug development efforts on gastric cancer are directed against several molecular targets driving the growth of this neoplasm. Intra-tumoral biomarker heterogeneity however, commonly observed in gastric cancer, could lead to biased selection of patients."

Our news journalists obtained a quote from the research from AstraZeneca, "MET, ATM, FGFR2, and HER2 were profiled on gastric cancer biopsy samples. An innovative pathological assessment was performed through scoring of individual biopsies against whole biopsies from a single patient to enable heterogeneity evaluation. Following this, false negative risks for each biomarker were estimated in silico. 166 gastric cancer cases with multiple biopsies from single patients were collected from Shanghai Renji Hospital. Following pre-set criteria, 56 ~ 78% cases showed low, 15 ~ 35% showed medium and 0 ~ 11% showed high heterogeneity within the biomarkers profiled. If 3 biopsies were collected from a single patient, the false negative risk for detection of the biomarkers was close to 5% (exception for FGFR2: 12.2%). When 6 biopsies were collected, the false negative risk approached 0%.

According to the news editors, the research concluded: "Our study demonstrates the benefit of multiple biopsy sampling when considering personalized healthcare biomarker strategy, and provides an example to address the challenge of intra-tumoral biomarker heterogeneity using alternative pathological assessment and statistical methods."

For more information on this research see: Intra-Tumoral Heterogeneity of HER2, FGFR2, cMET and ATM in Gastric Cancer: Optimizing Personalized Healthcare through Innovative Pathological and Statistical Analysis. Plos One, 2015;10(11):e0143207. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news journalists report that additional information may be obtained by contacting P. Ye, Asia & Emerging Markets iMed, AstraZeneca R&D, Shanghai, People's Republic of China. Additional authors for this research include M. Zhang, S. Fan, T. Zhang, H. Fu, X. Su, P.R. Gavine, Q. Liu and X. Yin.

Study Results from Banaras Hindu University Provide New Insights into Lymphoma [Chelerythrine delayed tumor growth and increased survival duration of Dalton’s lymphoma bearing BALB/c H(2d) mice by activation of NK cells in vivo]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lymphoma. According to news reporting out of Uttar Pradesh, India, by NewsRx editors, research stated, "The aims of the present investigation were to evaluate the antitumor effect of chelerythrine (CHE) on in vivo growth and survival duration of BALB/c (H2d) mice bearing Dalton's lymphoma (DL) and enhanced function of tumor associated NK cells (TANK cells). BALB/c (H2d) mice at 8-10 weeks of age of either sex were used."

Our news journalists obtained a quote from the research from Banaras Hindu University, "Increasing concentration of CHE (1.25, 2.5, and 5.0 mg/kg), staurosporine (0.625, 1.0, 1.5, and 2.0 mg/kg) and cyclophosphamide (25, 50, 100, and 200 mg/kg) were administered intraperitoneally and tumor regression and survival duration of tumor bearing host were determined, and thereafter expression of NKG2D and NKG2A on TANK cells were detected. Our results show that treatment with 2.5 mg/kg of CHE results in a significant reduction in mean tumor volume and increased survival duration of DL bearing BALB/c (H2d) mice when compared to control. Activating receptor NKG2D on TANK cells were observed upregulated in contrast to inhibitory receptor NKG2A. CHE reduced mean tumor volume and increased survival duration of DL bearing BALB/c (H2d) mice. Increased expression of activating receptor NKG2D on TANK cells results in recovery of immunosuppression during tumor progression."

According to the news editors, the research concluded: "Therefore, CHE could be a potential anticancer therapeutic agent that may be used to replace chemo-radio-therapy in future."

For more information on this research see: Chelerythrine delayed tumor growth and increased survival duration of Dalton's lymphoma bearing BALB/c H(2d) mice by activation of NK cells in vivo. Journal of Cancer Research and Therapeutics, 2015;11(4):904-10.

Our news journalists report that additional information may be obtained by contacting A. Acharya, Dept. of Zoology, Faculty of Science, Banaras Hindu University, Varanasi, Uttar Pradesh, India. Additional authors for this research include M.S. Tomar and A. Acharya.

Study Results from Beth Israel Deaconess Medical Center Provide New Insights into Atherosclerosis [Circulating Des-gamma-carboxy prothrombin is not associated with cardiovascular calcification or stiffness: The Multi-Ethnic Study of ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Atherosclerosis is the subject of a report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Vitamin K-dependent protein (VKDP) activity may have a role in preventing cardiovascular calcification, but has not previously been studied in large, generally healthy populations. Using an elevated ankle-brachial index (ABI) as a measure of medial vascular calcification, we performed a case-cohort analysis within the Multi-Ethnic Study of Atherosclerosis, measuring Des-gamma-carboxy prothrombin (DCP) to estimate VKDP activity."

Our news journalists obtained a quote from the research from Beth Israel Deaconess Medical Center, "In secondary analyses of the weighted subcohort, we examined the cross-sectional associations between DCP and prevalent vascular calcification of the coronary vessels, aortic and mitral valves, and aortic wall, and with vascular stiffness. In adjusted analysis, cases (n = 104) had 0.21 ng/ml (-0.94-0.52) lower DCP concentrations than the subcohort (n = 613). Furthermore, amongst the 717 participants in the weighted cohort, VKDP activity was not associated with coronary artery, mitral valve, aortic valve or aortic wall calcification, nor was it associated with vascular stiffness."

According to the news editors, the research concluded: "Our negative results do not support a role of circulating VKDP activity in cardiovascular calcification in community-dwelling adults."

The news correspondents report that additional information may be obtained from J. Danziger, Beth Israel Deaconess Med Center, Dept. of Med, Boston, MA 02215, United States. Additional authors for this research include R.L. Young, K.M. Shea, D.A. Duprez, D.R. Jacobs, R.P. Tracy, J.H. Ix, N.S. Jenny and K.J. Mukamal.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.atherosclerosis.2016.07.924. This DOI is a link to an online electronic document that is either free or for purchase.

Immunology - Immunoglobulins

Study Results from Boehringer Ingelheim Pharmaceuticals Provide New Insights into Immunoglobulins [Unexpected Potency Differences between B-Cell-Activating Factor (BAFF) Antagonist Antibodies against Various Forms of BAFF: Trimer, 60-Mer, and ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immunoglobulins have been published. According to news reporting out of Ridgefield, Connecticut, by NewsRx editors, research stated, "Therapeutic agents antagonizing B-cell-activating factor/B-lymphocyte stimulator (BAFF/BLyS) are currently in clinical development for autoimmune diseases; belimumab is the first Food and Drug Administration-approved drug in more than 50 years for the treatment of lupus. As a member of the tumor necrosis factor superfamily, BAFF promotes B-cell survival and homeostasis and is overexpressed in patients with systemic lupus erythematosus and other autoimmune diseases."

Our news journalists obtained a quote from the research from Boehringer Ingelheim Pharmaceuticals, "BAFF exists in three recognized forms: membrane-bound and two secreted, soluble forms of either trimeric or 60-mer oligomeric states. To date, most in vitro pharmacology studies of BAFF neglect one or more of these forms. Here, we report a comprehensive in vitro cell-based analysis of BAFF in assay systems that measure all forms of BAFF-mediated activation. We demonstrate the effects of these BAFF forms in both a primary human B-cell proliferation assay and in nuclear factor kappa B reporter assay systems in Chinese hamster ovary cells expressing BAFF receptors and transmembrane activator and calcium-modulator and cyclophilin ligand interactor (TACI). In contrast to the mouse system, we find that BAFF trimer activates the human TACI receptor. Further, we profiled the activities of two clinically advanced BAFF antagonist antibodies, belimumab and tabalumab. Unexpectedly, we revealed differences in inhibitory potencies against the various BAFF forms, in particular that belimumab does not potently inhibit BAFF 60-mer."

According to the news editors, the research concluded: "Through this increased understanding of the activity of BAFF antagonists against different forms of BAFF, we hope to influence the discovery of BAFF antagonist antibodies with distinct therapeutic mechanisms for improvement in the treatment of lupus or other related autoimmune pathologies."

Our news journalists report that additional information may be obtained by contacting S.M. DeWire, Boehringer Ingelheim Pharmaceut Inc, Immune Modulat & Biotherapeut Discovery, Ridgefield, CT, United States. Additional authors for this research include C.H. Kenny, A.M. Khalil, Q. Pan, K.L.M. Ralph, J. Ritchie, S. Venkataramani, D.H. Presky, S.M. DeWire and S.R. Brodeur.

Oncology - Chronic Myeloid Leukemia

Study Results from CONICET Update Understanding of Chronic Myeloid Leukemia (GSTM1 and GSTP1, but not GSTT1 genetic polymorphisms are associated with chronic myeloid leukemia risk and treatment response)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Chronic Myeloid Leukemia have been presented. According to news reporting originating from Buenos Aires, Argentina, by NewsRx correspondents, research stated, "Chronic myeloid leukemia (CML) is associated to the BCR-ABL1 oncogene and can successfully be treated with tyrosine kinase inhibitors (TKIs). However, it remains still under investigation which molecular factors may influence CML risk or varying responses to TKIs."

Funders for this research include National Research Council, National Agency of Scientific and Technical Promotion, National Institute of Cancer.

Our news editors obtained a quote from the research from CONICET, "The aim of this study was to assess the role of Glutathione-S-transferases (GSTs) genetic polymorphisms in CML susceptibility and TKI clinical outcome. Deletion polymorphisms in GSTM1 and GSTT1 genes and the single nucleotide polymorphism in GSTP1 c.319A > G (rs1695; p.105Ile > Val) were genotyped by PCR methods in 141 CML treated patients and 141 sex-and age-matched healthy individuals. Individual analysis of each GST gene showed no association with CML risk. A trend toward significance (p = 0.07) for a recessive model was found for GSTP1 (OR: 2.04; CI: 0.94-4.4). However, the combined analysis showed that GSTM1-null/GSTP1-GG as well as GSTT1-null/GSTP1-GG were associated with CML development (p = 0.03; OR: 3.54 CI: 1.2-14.57; p = 0.05; OR: 12.65; CI: 1.17-21.5). The relationship with treatment outcome showed that the presence of GSTM1 gene was significantly linked with an inferior rate of major molecular response (p = 0.048) and poor event free-survival (EFS) (p = 0.02). Furthermore, a group of patients with GSTP1-GG genotype were significantly associated with reduced EFS comparing to those carrying other GSTP1 genotypes (p = 0.049). GSTP1-GG genotypes had short time to treatment failure in a group of patients unresponsive to TKIs comparing to other GSTP1 genotypes (p = 0.03)."

According to the news editors, the research concluded: "This study highlights the significance of GSTM1 and GSTP1 polymorphisms on CML susceptibility and response to TKIs in the Argentinean population."

For more information on this research see: GSTM1 and GSTP1, but not GSTT1 genetic polymorphisms are associated with chronic myeloid leukemia risk and treatment response. Cancer Epidemiology, 2016;44():16-21. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England.
Study Results from CSIRO Update Understanding of Molecular Pharmaceutics (Modeling the Influence of Fatty Acid Incorporation on Mesophase Formation in Amphiphilic Therapeutic Delivery Systems)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Biotechnology - Molecular Pharmaceutics are presented in a new report. According to news reporting from Clayton, Australia, by NewsRx journalists, research stated, "Dispersed amphiphile-fatty acid systems are of great interest in drug delivery and gene therapies because of their potential for triggered release of their payload. The mesophase behavior of these systems is extremely complex and is affected by environmental factors such as drug loading, percentage and nature of incorporated fatty acids, temperature, pH, and so forth."

Financial support for this research came from Commonwealth Scientific and Industrial Research Organisation.

The news correspondents obtained a quote from the research from CSIRO, "It is important to study phase behavior of amphiphilic materials as the mesophases directly influence the release rate of the incorporated drugs. We describe a robust machine learning method for predicting the phase behavior of these systems."

According to the news reporters, the research concluded: "We have developed models for each mesophase that simultaneously and reliably model the effects of amphiphile and fatty acid structure, concentration, and temperature and that make accurate predictions of these mesophases for conditions not used to train the models."

Our news journalists report that additional information may be obtained by contacting B.T. Le, CSIRO Manufacturing, Clayton 3169, Australia. Additional authors for this research include N. Tran, X. Mulet and D.A Winkler.

The direct object identifier (DOI) for that additional information is:
Study Results from Cancer Institute Provide New Insights into Non-Small Cell Lung Cancer [Erlotinib, cabozantinib, or erlotinib plus cabozantinib as second-line or third-line treatment of patients with EGFR wild-type advanced non-small-cell lung ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news reporting from Stanford, California, by NewsRx journalists, research stated, "Erlotinib is approved for the treatment of all patients with advanced non-small-cell lung cancer (NSCLC), but is most active in the treatment of EGFR mutant NSCLC. Cabozantinib, a small molecule tyrosine kinase inhibitor, targets MET, VEGFR, RET, ROS1, and AXL, which are implicated in lung cancer tumorigenesis."

Financial support for this research came from National Cancer Institute of the National Institutes of Health under the following award numbers:

The news correspondents obtained a quote from the research from Cancer Institute, "We compared the efficacy of cabozantinib alone or in combination with erlotinib versus erlotinib alone in patients with EGFR wild-type NSCLC. This three group, randomised, controlled, open-label, multicentre, phase 2 trial was done in 37 academic and community oncology practices in the USA. Patients were eligible if they had received one or two previous treatments for advanced non-squamous, EGFR wild-type, NSCLC. Patients were stratified by performance status and line of therapy, and randomly assigned using permuted blocks within strata to receive open-label oral daily dosing of erlotinib (150 mg), cabozantinib (60 mg), or erlotinib (150 mg) and cabozantinib (40 mg). Imaging was done every 8 weeks. At the time of radiographic progression, there was optional crossover for patients in either single-drug group to receive combination treatment. The primary endpoint was to compare progression-free survival in patients given erlotinib alone versus cabozantinib alone, and in patients given erlotinib alone versus the combination of erlotinib plus cabozantinib. We assessed the primary endpoint in the per-protocol population, which was defined as all patients who were eligible, randomly assigned, and received at least one dose of treatment. The safety analysis population included all patients who received study treatment irrespective of eligibility. This trial is registered with ClinicalTrials.gov, number NCT01708954: Between Feb 7, 2013, and July 1, 2014, we enrolled and randomly assigned 42 patients to erlotinib treatment, 40 patients to cabozantinib treatment, and 43 patients to erlotinib plus cabozantinib treatment, of whom 111 (89%) in total were included in the primary analysis (erlotinib [n= 38], cabozantinib [n= 38], erlotinib plus cabozantinib [n= 35]). Compared with erlotinib alone (median 1.8 months [95% CI 1.7-2.2]), progression-free survival was significantly improved in the cabozantinib group (4.3 months [3.6-7.4]; hazard ratio [HR] 0.39, 80% CI 0.27-0.55; one-sided p= 0.0003) and in the erlotinib plus cabozantinib group (4.7 months [2.4-7.4]; HR 0.37, 0.25-0.53; one-sided p= 0.0003).
Among participants included in the safety analysis of the erlotinib (n= 40), cabozantinib (n= 40), and erlotinib plus cabozantinib (n= 39) groups, the most common grade 3 or 4 adverse events were diarrhoea (three [8%] cases in the erlotinib group vs three [8%] in the cabozantinib group vs 11 [28%] in the erlotinib plus cabozantinib group), hypertension (none vs ten [25%] vs one [3%]), fatigue (five [13%] vs six [15%] vs six [15%]), oral mucositis (none vs four [10%] vs one [3%]), and thromboembolic event (none vs three [8%] vs two [5%]). One death due to respiratory failure occurred in the cabozantinib group, deemed possibly related to either drug, and one death due to pneumonitis occurred in the erlotinib plus cabozantinib group, deemed related to either drug or the combination. Despite its small sample size, this trial showed that, in patients with EGFR wild-type NSCLC, cabozantinib alone or combined with erlotinib has clinically meaningful, superior efficacy to that of erlotinib alone, with additional toxicity that was generally manageable.

According to the news reporters, the research concluded: "Cabozantinib-based regimens are promising for further investigation in this patient population."

For more information on this research see: Erlotinib, cabozantinib, or erlotinib plus cabozantinib as second-line or third-line treatment of patients with EGFR wild-type advanced non-small-cell lung cancer (ECOG-ACRIN 1512): a randomised, controlled, open-label, multicentre, phase 2 trial. Lancet Oncology, 2016;17(12):1661-1671. Lancet Oncology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Oncology - Prostate Cancer

Study Results from Cancer Institute Update Understanding of Prostate Cancer (Simple diagrammatic method to delineate male urethra in prostate cancer radiotherapy: an MRI based approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news reporting originating from Gurgaon, India, by NewsRx correspondents, research stated, "Stereotactic body radiotherapy (SBRT) is being increasingly utilized in the treatment of prostate cancer. With the advent of high-precision radiosurgery systems, it is possible to obtain dose distributions akin to high-dose rate brachytherapy with SBRT."
Our news editors obtained a quote from the research from Cancer Institute, "However, urethral toxicity has a significant impact on the quality of life in patients with prostate cancer. Contouring the male urethra on a CT scan is difficult in the absence of an indwelling catheter."

According to the news editors, the research concluded: "In this pictorial essay, we have used the MRI obtained for radiotherapy planning to aid in the delineation of the male urethra and have attempted to define guidelines for the same."

The news editors report that additional information may be obtained by contacting D. Gupta, Medanta, Div Radiat Oncol, Medanta Canc Inst, Gurgaon, Haryana, India. Additional authors for this research include D. Gupta, S. Goyal, S.S. Bisht, R. Chaudhary, K. Narang, S. Banerjee, T. Basu, A. Abhishek, S. Sambasivam and N.T. Vishnu.

**Oncology - Gastric Cancer**

**Study Results from Capital Medical University Provide New Insights into Gastric Cancer (Prognostic significance of tumor-associated macrophages density in gastric cancer: a systemic review and meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gastric Cancer. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Tumor-associated macrophages (TAM) play a dual role in the development of gastric cancer (GC). This study aims to analyze the prognostic value of TAM density in GC patients."

Our news journalists obtained a quote from the research from Capital Medical University. "EVIDENCE ACQUISITION: We conducted a meta-analysis of 11 studies (N.=1043) to investigate the correlation between TAM density and the overall survival (OS) or disease free survival (DFS) of GC patients. Pooled hazard ratios (HRs) and 95% confidence intervals (CIs) were calculated by the STATA statistical software. EVIDENCE SYNTHESIS: The HR of OS of GC patients with high-density TAM is 1.56 (95% Cl: 0.90 similar to 2.22, P<0.001) as compared with those with low-density TAM, and that of DFS is 1.10 (95% Cl: 0.16 similar to 2.03, P=0.022), indicating that TAM density does not significantly predict the poor survival of GC. A subgroup analysis by ethnicity also revealed no significance effect between TAM density aCaucasians:nd a worse OS among both Asians and (Asians: HR=1.47, 95% Cl: 0.76 similar to 2.18, P<0.001; Caucasians: HR=2.23, 95% Cl: 0.62 similar to 3.84, P=0.007, respectively)."

According to the news editors, the research concluded: "Our findings provide empirical evidence that TAM density is not an independent predictor for the survival of GC patients."

Our news journalists report that additional information may be obtained by contacting Y. Li, Capital Med Univ, Beijing Shijitan Hosp, Dept. of Peritoneal Canc Surg, Beijing, People's Republic of China. Additional authors for this research include X.J. Yang, X.F. Geng, C.Q. Huang, Y. Yu and Y. Li.

Keywords for this news article include: Beijing, People's Republic of China, Asia, Mononuclear Phagocyte System, Cancer, Article Review, Gastroenterology, Gastric Cancer, Macrophages, Immunology, Phagocytes, Oncology, Capital Medical University.

**Oncology - Liver Cancer**

**Study Results from Capital Medical University Provide New Insights into Liver Cancer (Combination of transcatheter arterial chemoembolization and CT-guided percutaneous segment ablation for hepatocellular carcinoma therapy A retrospective study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Liver Cancer. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Treatment option for liver cancer patients with large tumor >5cm and/or portal vein tumor thrombosis is very limited. New treatment strategy is badly needed."

Our news journalists obtained a quote from the research from Capital Medical University, "Our study is to determine the safety and treatment efficacy of a new minimally invasive treatment strategy-liver segment thermal ablation. Late-stage hepatocellular carcinoma patients were included and treated with percutaneous ablation to destroy the entire tumor-containing liver segment to reduce reoccurrence and prolong survival. Transcatheter arterial chemoembolization was used before ablation to label tumor margin. The patients were followed up routinely. The patients were followed up for 8 to 95 months. Mean overall survival (OS) (n=6) was 21.5 months (range 8-95). For patients in BCLC stage B (n=2), average OS was 16 months; for those in stage C (n=4), mean OS was 25 months (range 15-95). Out of all 6 patients, 2 reoccurred within 1 year, and 1 reoccurred after 13 months postoperatively. The average alpha-fetoprotein was dropped from 1153.69 to 41.22 mg/L postoperatively. No severe intra or postoperative complications were observed. Our preliminary data indicated that transcatheter arterial chemoembolization + segment ablation is safe and benefits survival significantly for late-stage hepatocellular carcinoma patients."

According to the news editors, the research concluded: "A prospective multicenter, randomized trial comparing focal and segment ablation is now ongoing in China (Trial Registry Number, ChiCTR-TRC-12002786)."

For more information on this research see: Combination of transcatheter arterial chemoembolization and CT-guided percutaneous segment ablation for hepatocellular carcinoma therapy A retrospective study. *Medicine*, 2016;95(47):182-185. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103,
Oncology - Pancreatic Cancer

Study Results from Catholic University of Korea in the Area of Pancreatic Cancer Reported (Role of immune cells in pancreatic cancer from bench to clinical application An updated review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Pancreatic Cancer are presented in a new report. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Pancreatic cancer (PC) remains difficult to treat, despite the recent advances in various anticancer therapies. Immuno-inflammatory response is considered to be a major risk factor for the development of PC in addition to a combination of genetic background and environmental factors."

Our news journalists obtained a quote from the research from the Catholic University of Korea, "Although patients with PC exhibit evidence of systemic immune dysfunction, the PC microenvironment is replete with immune cells. We searched PubMed for all relevant English language articles published up to March 2016. They included clinical trials, experimental studies, observational studies, and reviews. Trials enrolled at Clinical trial. gov were also searched. PC induces an immunosuppressive microenvironment, and intratumoral activation of immunity in PC is attenuated by inhibitory signals that limit immune effector function. Multiple types of immune responses can promote an immunosuppressive microenvironment; key regulators of the host tumor immune response are dendritic cells, natural killer cells, macrophages, myeloid derived suppressor cells, and T cells. The function of these immune cells in PC is also influenced by chemotherapeutic agents and the components in tumormicroenvironment such as pancreatic stellate cells. Immunotherapy of PC employs monoclonal antibodies/effector cells generated in vitro or vaccination to stimulate antitumor response. Immune therapy in PC has failed to improve overall survival; however, combination therapies comprising immune checkpoint inhibitors and vaccines have been attempted to increase the response. A number of studies have begun to elucidate the roles of immune cell subtypes and their capacity to function or dysfunction in the tumor microenvironment of PC."

According to the news editors, the research concluded: "It will not be long before immune therapy for PC becomes a clinical reality."

For more information on this research see: Role of immune cells in pancreatic cancer from bench to clinical application An updated review. Medicine, 2016;95(49):329-341. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine -
Immune System Diseases and Conditions - HIV/AIDS

Study Results from Center for Disease Control and Prevention Provide New Insights into HIV/AIDS (Maternal and Breastmilk Viral Load: Impacts of Adherence on Peripartum HIV Infections Averted-The Breastfeeding, Antiretrovirals, and Nutrition ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news reporting originating in Atlanta, Georgia, by NewsRx journalists, research stated, "Antiretroviral (ARV) interventions are used to reduce HIV viral replication and prevent mother-to-child transmission. Viral suppression relies on adherence to ARVs."

The news reporters obtained a quote from the research from Center for Disease Control and Prevention, "A 2-phase study was conducted using data from the Breastfeeding, Antiretrovirals, and Nutrition study. We included mothers randomized to 28 weeks of postpartum ARVs with >= 1 plasma or breastmilk specimen. All mothers who transmitted HIV to their infants from 2-28 weeks (n = 31) and 15% of mothers who did not (n = 232) were included. Adherence was measured by pill count [categorized as poor (0%-80%), partial (81%-98%), and near perfect (>98%)]. Associations between adherence and breastmilk RNA were assessed using mixed-effects models. Cox models were used to estimate associations between breastmilk RNA and HIV transmission. Using Monte Carlo simulation, we estimated the number of transmissions that would occur had everyone randomized to maternal ARVs been 90% and 100% adherent. Partial or near perfect ARV adherence significantly reduced the odds of having detectable (>= 40 copies/mL) breastmilk RNA, compared with poor adherence (Odds Ratio (OR) 0.23, 95% CI: 0.08 to 0.67; OR 0.36, 95% CI: 0.16 to 0.81, respectively). Detectable breastmilk RNA was associated with increased breast milk transmission compared with undetectable breastmilk RNA (hazard ratio 3.8, 95% CI: 1.2 to 12.1). All transmitting mothers had >= 1 plasma viral load specimen >100 copies per milliliter. An estimated similar number of transmissions would occur with 90% adherence compared with 100%. Helping patients adhere to ARVs throughout breastfeeding is important for realizing the full potential of recommended ARV interventions to prevent mother-to-child HIV transmission."

According to the news reporters, the research concluded: "Maintaining plasma viral load <100 copies per milliliter may prevent breastmilk transmission."

For more information on this research see: Maternal and Breastmilk Viral Load: Impacts of Adherence on Peripartum HIV Infections Averted-The Breastfeeding,

Heart Disorders and Diseases - Atrial Fibrillation

**Study Results from Chaim Sheba Medical Center in the Area of Atrial Fibrillation Reported (Poor Heart Rate Recovery Is Associated With the Development of New-Onset Atrial Fibrillation in Middle-Aged Adults)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting out of Tel Hashomer, Israel, by NewsRx editors, research stated, "To investigate the association between heart rate recovery (HRR) and new-onset atrial fibrillation (AF) in middle-aged adults. Heart rate recovery was calculated using the exercise stress test in 15,729 apparently healthy self-referred men and women who attended periodic health screening examinations between January 2000, and December 2015."

Our news journalists obtained a quote from the research from Chaim Sheba Medical Center, "All participants completed the maximal exercise stress test according to the Bruce protocol and were followed clinically on a yearly basis for a median of 6.4 +/- 4 years. The primary end point was new-onset AF. Participants were grouped according to HRR at 5 minutes, dichotomized at the median value (< 73 beats/min). Participants with low HRR were older, were more commonly men, had a higher rate of comorbidities, and were less fit. Kaplan-Meier survival analysis revealed that the cumulative probability of AF at 6 years was higher in participants with low HRR (2.1%) than in those with high HRR (0.6%) (log-rank, P<.001). Older age, male sex, obesity resting heart rate, and ischemic heart disease were all associated with increased AF risk in a univariate Cox regression model (P <.05 for all). Multivariate Cox regression analysis revealed that low HRR was independently associated with increased AF risk (hazard ratio, 1.92; 95% CI, 1.3-2.8; P<.001) after adjustment for multiple confounders."

According to the news editors, the research concluded: "Lower HRR is independently associated with the development of new-onset AF during long-term follow-up in middle-aged adults."

For more information on this research see: Poor Heart Rate Recovery Is Associated
Oncology - Pancreatic Cancer

Study Results from Charles University in the Area of Pancreatic Cancer Reported (Mutation analysis of the PALB2 gene in unselected pancreatic cancer patients in the Czech Republic)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news reporting from Prague, Czech Republic, by NewsRx journalists, research stated, "Pancreatic ductal adenocarcinoma (PDAC) has the worst prognosis among common solid cancer diagnoses. It has been shown that up to 10% of PDAC cases have a familial component."

The news correspondents obtained a quote from the research from Charles University, "Characterization of PDAC-susceptibility genes could reveal high-risk individuals and patients that may benefit from tailored therapy. Hereditary mutations in PALB2 (Partner and Localizer of BRCA2) gene has been shown to predispose, namely to PDAC and breast cancers; however, frequencies of mutations vary among distinct geographical populations. Using the combination of sequencing, high-resolution melting and multiplex ligation dependent probe amplification analyses, we screened the entire PALB2 gene in 152 unselected Czech PDAC patients. Truncating mutations were identified in three (2.0%) patients. Genotyping of found PALB2 variants in 1226 control samples revealed one carrier of PALB2 truncating variant (0.08%; P = 0.005). The mean age at PDAC diagnosis was significantly lower among PALB2 mutation carriers (51 years) than in non-carriers (63 years; P = 0.016). Only one patient carrying germline PALB2 mutation had a positive family breast cancer history."

According to the news reporters, the research concluded: "Our results indicate that hereditary PALB2 mutation represents clinically considerable genetic factor increasing PDAC susceptibility in our population and that analysis of PALB2 should be considered not only in PDAC patients with familial history of breast or pancreatic cancers but also in younger PDAC patients without family cancer history."

Our news journalists report that additional information may be obtained by contacting M. Janatova, Charles Univ Prague, Fac Med 1, Inst Biochem & Expt Oncol, Prague, Czech Republic. **Congenital Diseases and Conditions - Congenital...**

**Study Results from Chelsea and Westminster Hospital NHS Trust in the Area of Congenital Heart Disease Reported (Anaesthetic management of parturients with univentricular congenital heart disease and the Fontan operation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Congenital Diseases and Conditions - Congenital Heart Disease have been presented. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "Women with a single ventricle circulation palliated with the Fontan operation require specialist multidisciplinary management. We report 14 such cases with successful pregnancies and detail the pathophysiology encountered."

The news reporters obtained a quote from the research from Chelsea and Westminster Hospital NHS Trust, "A combined obstetric and cardiac service between Chelsea and Westminster Hospital and Royal Brompton Hospital provides care for women with heart disease, and maintains a prospective database of referred women. We searched this database for women with a known Fontan circulation and reviewed the case notes and electronic patient records between January 1994 and December 2015. Eight women palliated with the Fontan operation delivered 14 live babies over the study period, with detailed peripartum management available for 11. Low-dose combined spinal - epidural or epidural labour analgesia was the intended mode of analgesia or anaesthesia for all deliveries (depending on clinical scenario and clinician preference), and was performed in 79%. Seven cases (50%) had a caesarean delivery. A neuraxial catheter technique was preferred (86%), whether or not vaginal delivery was attempted first. There were no deliveries under general anaesthesia. Fifty percent of cases were complicated by postpartum haemorrhage. Other peripartum complications included arrhythmias (29%), chest pain (14%) and intrauterine growth restriction (57%). Women with a Fontan circulation are increasingly encountered in obstetric practice. A good understanding of the underlying anatomy and its impact on physiology, coupled with meticulous care are essential to
allow safe delivery for mother and baby."

According to the news reporters, the research concluded: "Multidisciplinary input into peripartum care is required, with anticipation of increased risk of complications such as haemorrhage and arrhythmias."

Our news correspondents report that additional information may be obtained by contacting D.P. Dob, Chelsea & Westminster Hospital, Magill Dept. of Anaesthesia, London, United Kingdom. Additional authors for this research include D.P. Dob, M.R. Cauldwell and M.A. Gatzoulis.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijoa.2016.08.004. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Cancer Therapy**

**Study Results from Chengdu Medical College in the Area of Cancer Therapy Reported (Mono-PEGylation of Alpha-MMC and MAP30 from Momordica charantia L.: Production, Identification and Anti-Tumor Activity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cancer Therapy have been published. According to news originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "PEGylation is a well-established and effective strategy to decrease immunogenicity, which can increase the stability and in vivo half-life time. However, the generation of multi-site modified products is inevitable due to the lysine chemistry, which will bring difficulties in subsequent research, such as purification and quantification."

Our news journalists obtained a quote from the research from Chengdu Medical College, "Site-specific modification by mPEG-succinimidyl carbonate (mPEG-SC) is a widely used method for N-terminal conjugation. In this study, we used it for site-directed modification on two ribosome-inactivating proteins (RIPs), alpha-momorcharin (alpha-MMC) and momordica anti-HIV protein (MAP30), from Momordica charantia L. According to the optimization of previous modification conditions, we compared Macro-Cap SP with SP-Sepharose FF chromatography for separating the final mPEGylated RIPs. Two kinds of methods
both can obtain homogenous mPEGylated RIPs which were identified by sodium dodecylsulphate polyacrylamide gel electrophoresis (SDS-PAGE), isoelectric focusing electrophoresis (IEF), and matrix-assisted laser desorption ionization-time of flight/time of flight (MALDI-TOF/TOF) analysis. We also used iodine staining method to detect the amount of unmodified PEG. Furthermore, the inhibition activity of both mPEGylated and non-PEGylated RIPs against human lung adenocarcinoma epithelial A549 cells was detected."

According to the news editors, the research concluded: "All of the results suggested that the mPEGylated alpha-MMC/MAP30 might be potentially developed as new anti-tumor drugs."

For more information on this research see: Mono-PEGylation of Alpha-MMC and MAP30 from Momordica charantia L.: Production, Identification and Anti-Tumor Activity. *Molecules*. 2016;21(11):606-614. *Molecules* can be contacted at: MdpI Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. **Drugs and Therapies - Cancer Therapy**

**Study Results from China Pharmaceutical University Update Understanding of Cancer Therapy (Design, Synthesis, and Biological Evaluation of Novel Cholesteryl Peptides with Anticancer and Multidrug Resistance-Reversing Activities)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Cancer Therapy have been presented. According to news reporting originating in Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Antimicrobial peptides have been suggested as promising chemotherapeutics for cancer therapy due to their efficient antitumor activity and lower toxicity to benign cells. In previous study, we find the peptide B1 presents specific cytotoxicity to cancer cells."

Funders for this research include National Natural Science Foundation of China, Natural Science Foundation of Jiangsu Province.

The news reporters obtained a quote from the research from China Pharmaceutical University, "As hydrophobicity plays a pivotal role in the anticancer activity of peptide, we introduce cholesterol-like moiety (3β-amino-5-cholesten5-cholesterene) to the N-terminus of B1 expect to ameliorate the anticancer activity of B1. Biological evaluations revealed that target peptides show improved anticancer activity. The peptides can also penetrate into the cytoplasm and activating mitochondria-cytochrome c apoptosis pathway. Besides, the peptides acted on multidrug-resistant cells and had multidrug resistance-reversing activity."

According to the news reporters, the research concluded: "It is therefore suggested..."
these peptides might be promising candidates for oncotherapy."

Our news correspondents report that additional information may be obtained by contacting X. Deng, Center of Drug Discovery, State Key Laboratory of Natural Medicines, China Pharmaceutical University, 24 Tongjiaxiang, Nanjing, Jiangsu, 210009, People's Republic of China. Additional authors for this research include Q. Qiu, X. Wang, W. Huang and H. Qian.

**Nanotechnology - Nanoparticles**

**Study Results from Chongqing Key Lab of Agricultural Resources and Environment Broaden Understanding of Nanoparticles (The effect of different TiO2 nanoparticles on the release and transformation of mercury in sediment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nanotechnology - Nanoparticles. According to news reporting from Chongqing, People's Republic of China, by NewsRx journalists, research stated, "The environmental safety of both nano-TiO2 particles and mercury (Hg) pollution has been of widespread concern. Soils and sediments were the main receiving environments of nano-TiO2 and Hg."

Financial supporters for this research include The National Natural Science Foundation of China, The National Key Basic Research Program of China, The Scientific Research Project of Sichuan Provincial Department of Education.

The news correspondents obtained a quote from the research from the Chongqing Key Lab of Agricultural Resources and Environment, "There was a strong association between nano-TiO2 with Hg compounds. Very limited research has been carried out on the impact of nano-TiO2 on the environmental behavior of Hg in sediments. The objective of this study was to investigate the effects of nano-TiO2 on the release and transformation of Hg in sediments. Two types of TiO2 nanoparticles were employed. Sediment samples were collected in the water level fluctuating zone of the Three Gorges Reservoir, China. Sediment samples spiked with HgCl2 solution were taken as Hg-contaminated sediments. The flooding experiments were conducted using capped borosilicate glass bottles containing 300 ml TiO2 suspensions (0.2 g L-
1 and 0.4 g L-1) and 30 g original or Hg-contaminated sediment samples outdoors. All experiments were conducted in triplicate. Water samples were collected at determined interval times over a 60-day period. Sediments were collected on the 60th day. Total Hg (THg) and methylmercury (MHg) in both water and sediment samples and Hg speciation just in sediment samples were determined. A series of control samples without TiO2 addition were also prepared. The results showed that nano-TiO2 particles at high content (4 g kg(-1)) promoted the release of Hg in sediments, and the anatase particles showed a stronger effect. Methyl Hg concentrations in waters of nano-TiO2 treatments significantly decreased by the 10th day. The effect of nano-TiO2 greatly depended on anatase and rutile particles. After that, methyl Hg concentrations had no significant difference between nano-TiO2 treatments and the control, except 2 g kg(-1) rutile treatment by the 20th day. The changes of Hg speciation in sediments demonstrated that nano-TiO2 inhibited the transformation of Hg-bound organic matter into the oxidated state, especially upon 2 g kg(-1) rutile treatment. This was consistent with the lower MHg concentrations in the 2 g kg(-1) rutile treatment. Both anatase and rutile nano-TiO2 were found to affect the release of Hg in sediment. Nano-TiO2 promoted THg release in sediments and posed an increased risk of Hg contamination in waters, especially for anatase particles."

According to the news reporters, the research concluded: "Moreover, nano-TiO2 inhibited the methylation process of Hg in sediments at the initial stage of flooding and could affect the transformation of Hg speciation in sediments, especially for low-content rutile particles."

Our news journalists report that additional information may be obtained by contacting D.Y. Wang, Chongqing Key Lab Agr Resources & Environm, Chongqing 400715, People’s Republic of China. Additional authors for this research include C.X. Li, D.Y. Wang, C. Zhang, L. Liang and X. Zhou.

Alzheimer Disease are discussed in a new report. According to news reporting originating from Taichung, Taiwan, by NewsRx correspondents, research stated, "Deficiency of insulin signaling has been linked to diabetes and ageing-related neurodegenerative diseases such as Alzheimer's disease (AD). In this regard, brains exhibit defective insulin receptor substrate-1 (IRS-1) and hence result in alteration of insulin signaling in progression of AD, the most common cause of dementia."

Our news editors obtained a quote from the research from Chung Shan Medical University, "Consequently, dysregulation of insulin signaling plays an important role in amyloid-b (Ab)-induced neurotoxicity. As the derivation of induced pluripotent stem cells (iPSC) involves cell reprogramming, it may provide a means for regaining the control of ageing-associated dysfunction and neurodegeneration via affecting insulin-related signaling. To this, we found that an embryonic stem cell (ESC)-specific microRNA, miR-302, silences phosphatase and tensin homolog (PTEN) to activate Akt signaling, which subsequently stimulates nuclear factor erythroid 2-related factor 2 (Nrf2)/heme oxygenase-1 (HO-1) elevation and hence inhibits Ab-induced neurotoxicity. miR-302 is predominantly expressed in iPSCs and is known to regulate several important biological processes of anti-oxidative stress, anti-apoptosis, and anti-aging through activating Akt signaling. In addition, we also found that miR-302-mediated Akt signaling further stimulates Nanog expression to suppress Ab-induced p-Ser307 IRS-1 expression and thus enhances tyrosine phosphorylation and p-Ser 473-Akt/p-Ser 9-GSK3β formation. Furthermore, our in vivo studies revealed that the mRNA expression levels of both Nanog and miR-302-encoding LARP7 genes were significantly reduced in AD patients' blood cells, providing a novel diagnosis marker for AD."

According to the news editors, the research concluded: "Taken together, our findings demonstrated that miR-302 is able to inhibit Ab-induced cytotoxicity via activating Akt signaling to upregulate Nrf2 and Nanog expressions, leading to a marked restoration of insulin signaling in AD neurons."

The news editors report that additional information may be obtained by contacting H.H. Li, Institute of Medicine, Chung Shan Medical University, Taichung, Taiwan. Additional authors for this research include S.L. Lin, C.N. Huang, F.J. Lu, P.Y. Chiu, W.N. Huang, T.J. Lai and C.L Lin.

Biotechnology

Study Results from Cleveland Clinic Broaden Understanding of Biotechnology [Recommendations for neoadjuvant pathologic staging (ypTNM) of cancer of the esophagus and esophagogastric junction for the 8th edition AJCC/UICC staging manuals]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology. According to news reporting from Cleveland, Ohio, by NewsRx journalists, research stated, "We report analytic and consensus processes that produced recommendations for neoadjuvant pathologic stage groups (ypTNM) of esophageal and esophagogastric junction cancer for the AJCC/UICC cancer staging manuals, 8th edition. The Worldwide Esophageal Cancer Collaboration provided data for 22,654 patients with epithelial esophageal cancers; 7,773 had pathologic assessment after neoadjuvant therapy."

The news correspondents obtained a quote from the research from Cleveland Clinic, "Risk-adjusted survival for each patient was developed. Random forest analysis identified data-driven neoadjuvant pathologic stage groups wherein survival decreased monotonically with increasing group, was distinctive between groups, and homogeneous within groups. An additional analysis produced data-driven anatomic neoadjuvant pathologic stage groups based only on ypT, ypN, and ypM categories. The AJCC Upper GI Task Force, by smoothing, simplifying, expanding, and assessing clinical applicability, produced consensus neoadjuvant pathologic stage groups. Grade and location were much less discriminating for stage grouping ypTNM than pTNM. Data-driven stage grouping without grade and location produced nearly identical groups for squamous cell carcinoma and adenocarcinoma. However, ypTNM groups and their associated survival differed from pTNM. The need for consensus process was minimal. The consensus groups, identical for both cell types were as follows: ypStage I comprised ypT0-N0M0; ypStage II ypT3N0M0; ypStage IIA ypT0-2N1M0; ypStage IIIB ypT3N1M0, ypT0-3N2, and ypT4aN0M0; ypStage IVA ypT4aN1-2, ypT4bN0-2, and ypTanyN3M0; and ypStage IVB ypTanyNanyM1."

According to the news reporters, the research concluded: "Absence of equivalent pathologic (pTNM) categories for the peculiar neoadjuvant pathologic categories ypTisN0-3M0 and ypT0N0-3M0, dissimilar stage group compositions, and markedly different early- and intermediate-stage survival necessitated a unified, unique set of stage grouping for patients of either cell type who receive neoadjuvant therapy."

Our news journalists report that additional information may be obtained by contacting T.W. Rice, Cleveland Clinic, Cleveland, OH 44195, United States. Additional authors for this research include H. Ishwaran, D.P. Kelsen, W.L. Hofstetter, C. Apperson-Hansen and E.H. Blackstone.

Life Science Research - Cryobiology

Study Results from Council of Scientific and Industrial Research (CSIR)
Update Understanding of Cryobiology (Replacement of serum with
ocular fluid for cryopreservation of immature testes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Data detailed on Life Science Research - Cryobiology have been presented.
According to news reporting originating from Andhra Pradesh, India, by NewsRx
correspondents, research stated, "Cryopreservation of immature testis is a feasible approach for
germplasm preservation of male animals. Combinations of dimethyl sulfoxide (DMSO) and
foetal bovine serum (FBS) are used for testis cryopreservation."

Our news editors obtained a quote from the research from the Council of Scientific
and Industrial Research (CSIR), "However, an alternative to FBS is needed, because FBS is
expensive. Buffalo ocular fluid (BuOF), a slaughter house by-product, could be an economical
option. The objective of the present study was to assess whether BuOF can replace FBS for
cryopreservation of immature mouse (Mus musculus), rat (Rattus norvegicus), and buffalo
(Bubalus bubalis) testes. Results showed that rodent and buffalo testes frozen in DMSO (10% for
rodents and 20% for buffalo) with 20% FBS or BuOF had similar numbers of viable and
DNA-damaged cells (P > 0.05). The expression of cell proliferation-(PCNA) and apoptosis-specific
proteins (Annexin V and BAX/BCL2 ratio) were also comparable in mouse and buffalo
testes frozen in DMSO with FBS or BuOF (P > 0.05). Interestingly, rat testis frozen in DMSO
with BuOF had lower expression of Annexin V protein than testis frozen in DMSO with FBS (P
< 0.05). The percentage of meiotic germ cells (pachytene-stage spermatocytes) in xenografts
from testis frozen either in DMSO with BuOF or FBS did not significantly differ in rats or
buffalo (P > 0.05). These findings provide evidence that BuOF has potential to replace FBS for
cryopreservation of immature rodent and buffalo testis."

According to the news editors, the research concluded: "Further investigation is
needed to explore whether BuOF can replace FBS for testis cryopreservation of other species."

For more information on this research see: Replacement of serum with ocular fluid
for cryopreservation of immature testes. Cryobiology, 2016;73(3):356-366. Cryobiology can be

Study Results from Creighton University Broaden Understanding of Phytotherapy (Hepatoprotective Effects of a Proprietary Glycyrrhizin Product during Alcohol Consumption: A Randomized, Double-Blind, Placebo-Controlled, Crossover Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Phytotherapy. According to news originating from Frisco, Texas, by NewsRx correspondents, research stated, "Traditionally, licorice has been used to treat liver problems. Glycyrrhizin, the primary active compound, has been shown to suppress elevations in liver enzymes that occur when the liver becomes diseased or damaged."

Our news journalists obtained a quote from the research from Creighton University, "This randomized, double-blind, placebo-controlled, crossover study evaluated the hepatoprotective effects of a proprietary glycyrrhizin product during alcohol consumption. Twelve healthy individuals (six male and six female subjects) in a clinic setting consumed vodka nightly for 12 days with the glycyrrhizin product or placebo (blank control), achieving a blood alcohol level of 0.12%. Liver function enzymes including alanine aminotransferase (ALT), aspartate aminotransferase (AST), gamma-glutamyl transferase (GGT), and alkaline phosphatase and serum reduced glutathione were measured at overnight visits 1, 6, and 12. In the alcohol only group, AST, ALT, and GGT significantly increased from baseline (overnight visit 1) to overnight visit 12. In the active group, no statistically significant increases were observed for AST, ALT, and GGT, while alkaline phosphatase significantly decreased and plasma glutathione decreased relative to the alcohol control group."

According to the news editors, the research concluded: "These results suggest that consumption of the proprietary glycyrrhizin study product during alcohol consumption may support improved liver health compared with drinking alcohol alone."

The news correspondents report that additional information may be obtained from S.J. Stohs, Creighton University, Frisco, TX 75034, United States. Additional authors for this research include B. Auddy, M. Biyani and S.J. Stohs.

Keywords for this news article include: Frisco, Texas, United States, North and Central America, Phytotherapy, Drugs and Therapies, Enzymes and Coenzymes, Aminotransferase, Creighton University.

Neurodegenerative Diseases and Conditions... Study Results from D. Scarabino and Colleagues Broaden Understanding of Alzheimer Disease (Influence of family history of dementia in the development and progression of late-onset Alzheimer's disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Neurodegenerative Diseases and Conditions - Alzheimer Disease is now available. According to news reporting originating in Rome, Italy, by NewsRx journalists, research stated, "Family history of dementia (FH) is a recognized risk factor for developing late-onset Alzheimer's disease (AD). We asked whether having FH increases AD risk and influences disease severity (age at onset and cognitive impairment) in 420 AD patients and 109 controls with (FH+) or without (FH-)."

Financial supporters for this research include Sapienza University of Rome, Fondazione Cariverona.

The news reporters obtained a quote from the research, "The relationships of APOE and other AD risk genes with FH were analyzed as well. The proportion of APOE e4 allele carriers was higher among the FH+ than the FH-AD patients (49.6% vs. 38.9%; p=0.04). The distribution of the risk genotypes of nine AD susceptibility genes previously examined (CHAT, CYP17, CYP19, ESR1, FSHR, P53, P73, P21, PPARG) did not differ between the FH+ and the FH-AD patients, indicating that none contributed significantly to familial clustering of disease. FH was associated with an increased AD risk (odds ratio [OR] 2.71, 95% confidence interval [CI] 1.44-5.09; p=0.002) independent of carrying the APOE e4 allele (OR 2.61, 95%CI 1.53-4.44; p=0.0004). Having a first-degree relative or a parent with dementia was significantly associated with AD risk (OR 2.9, 95%CI 1.3-6.4; p=0.009 and OR 2.7, 95%CI 1.1-6.2; p=0.02) but having a sibling with dementia was not (OR 1.7, 95%CI 0.2 to 14.7; p=0.6)."

According to the news reporters, the research concluded: "Among the FH+ AD patients, having one or both parents affected seemed to raise the risk of earlier onset age (p=0.02) and greater cognitive impairment (p=0.02) than having only an affected sibling, whereas having two or more affected relatives did not."

Our news correspondents report that additional information may be obtained by contacting D. Scarabino, CNR Institute of Cellular Biology and Neurobiology, Monterotondo Scalo, Rome, Italy. Additional authors for this research include G. Gambina, E. Broggio, F. Pelliccia and R.M Corbo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/ajmg.b.32399. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from DZIF German Center for Infection Research in the Area of Streptomyces coelicolor Reported

[The VanRS Homologous Two-Component System VnlRS(Ab) of the Glycopeptide Producer Amycolatopsis balhimycina Activates Transcription of ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Positive Bacteria - Streptomyces coelicolor have been published. According to news reporting originating from Tubingen, Germany, by NewsRx correspondents, research stated, "In enterococci and in Streptomyces coelicolor, a glycopeptide nonproducer, the glycopeptide resistance genes vanHAX are colocized with vanRS. The two-component system (TCS) VanRS activates vanHAX transcription upon sensing the presence of glycopeptides."

Our news editors obtained a quote from the research from DZIF German Center for Infection Research, "Amycolatopsis balhimycina, the producer of the vancomycin-like glycopeptide balhimycin, also possesses vanHAX(Ab) genes. The genes for the VanRS-like TCS VnlRS(Ab), together with the carboxypeptidase gene vanY(Ab), are part of the balhimycin biosynthetic gene cluster, which is located 2 Mb separate from the vanHAX(Ab). The deletion of vnlRS(Ab) did not affect glycopeptide resistance or balhimycin production. In the A. balhimycina vnlR(Ab) deletion mutant, the vanHAX(Ab) genes were expressed at the same level as in the wild type, and peptidoglycan (PG) analyses proved the synthesis of resistant PG precursors. Whereas vanHAX(Ab) expression in A. balhimycina does not depend on VnlR(Ab), a VnlR(Ab)-depending regulation of vanY(Ab) was demonstrated by reverse transcriptase polymerase chain reaction (RT-PCR) and RNA-seq analyses. Although VnlR(Ab) does not regulate the vanHAX(Ab) genes in A. balhimycina, its heterologous expression in the glycopeptide-sensitive S. coelicolor Delta vanRS(Sc) deletion mutant restored glycopeptide resistance. VnlR(Ab) activates the vanHAX(Sc) genes even in the absence of VanS."

According to the news editors, the research concluded: "In addition, expression of vnlR(Ab) increases actinorhodin production and influences morphological differentiation in S. coelicolor."

For more information on this research see: The VanRS Homologous Two-Component System VnlRS(Ab) of the Glycopeptide Producer Amycolatopsis balhimycina Activates Transcription of the vanHAX(Sc) Genes in Streptomyces coelicolor, but not in A. balhimycina. Microbial Drug Resistance, 2016;22(6):499-509. Microbial Drug Resistance can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Cardiovascular Research

Study Results from Daiichi Sankyo Pharma Development Provide New Insights into Cardiovascular Research (Assessment of the Cardiovascular Risk of Olmesartan Medoxomil-Based Treatment: Meta-Analysis of Individual Patient Data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Research have been published. According to news reporting originating in Edison, New Jersey, by NewsRx journalists, research stated, "Results from two long-term studies (ROADMAP and ORIENT) indicated a numerical imbalance in the number of cardiovascular deaths between the olmesartan medoxomil (OM) and placebo groups. Our objective was to conduct an individual patient data meta-analysis to provide more complete information regarding OM-associated cardiovascular risks and/or benefits."

The news reporters obtained a quote from the research from Daiichi Sankyo Pharma Development, "We created an integrated database based on 191 clinical trials from the OM development program. Events were identified and adjudicated by an independent, blinded clinical events committee. The incidence of major cardiovascular events and total mortality for OM versus placebo/active control were evaluated, and the effect of OM on cardiovascular mortality (main endpoint of interest) and morbidity was calculated using a two-stage approach (Tian method). A total of 46 studies (similar to 27,000 patients) met the US FDA-specified inclusion criteria (phase II-IV randomized, double-blind, placebo- or active-controlled studies [OM-based monotherapy or combination, double-blind period ae <yen >28 days] and adult patients). The incidence of known adjudicated endpoints in the analysis of all studies combined was low among OM (0.11-0.53 %) and placebo/active control (0.08-0.76 %) groups. For cardiovascular mortality, the estimated risk difference (OM vs. control) was 0.00070 (95 % confidence interval [CI] -0.0011 to 0.0024; p = 0.60); the risk difference for each endpoint was < 1/1000, with no statistically significant difference between groups. Results were similar with and without ROADMAP and ORIENT."

According to the news reporters, the research concluded: "The results from this meta-analysis did not show a clinically meaningful or statistically significant difference in cardiovascular risk between OM and the placebo/active control groups, and thus did not corroborate the numerical imbalance observed in ROADMAP and ORIENT."

Our news correspondents report that additional information may be obtained by contacting A.C. Wang, Daiichi Sankyo Pharma Dev, Biostat, Edison, NJ 08837, United States. Additional authors for this research include U. Stellmacher, J. Schumi, N. Tu and P.E. Reimitz.

Oncology - Prostate Cancer

Study Results from Dalian Institute of Chemical Physics in the Area of Prostate Cancer Reported (Integration of lipidomics and transcriptomics unravels aberrant lipid metabolism and defines cholesteryl oleate as potential biomarker of prostate ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Prostate Cancer is the subject of a report. According to news originating from Dalian, People's Republic of China, by NewsRx correspondents, research stated, "In-depth delineation of lipid metabolism in prostate cancer (PCa) is significant to open new insights into prostate tumorigenesis and progression, and provide potential biomarkers with greater accuracy for improved diagnosis. Here, we performed lipidomics and transcriptomics in paired prostate cancer tumor (PCT) and adjacent nontumor (ANT) tissues, followed by external validation of biomarker candidates."

Our news journalists obtained a quote from the research from the Dalian Institute of Chemical Physics, "We identified major dysregulated pathways involving lipogenesis, lipid uptake and phospholipids remodeling, correlated with widespread lipid accumulation and lipid compositional reprogramming in PCa. Specifically, cholesteryl esters (CEs) were most prominently accumulated in PCa, and significantly associated with cancer progression and metastasis. We showed that overexpressed scavenger receptor class B type I (SR-BI) may contribute to CEs accumulation. In discovery set, CEs robustly differentiated PCa from nontumor (area under curve (AUC) of receiver operating characteristics (ROC), 0.90-0.94). In validation set, CEs potently distinguished PCa and non-malignance (AUC, 0.84-0.91), and discriminated PCa and benign prostatic hyperplasia (BPH) (AUC, 0.90-0.96), superior to serum prostate-specific antigen (PSA) (AUC=0.83). Cholesteryl oleate showed highest AUCs in distinguishing PCa from non-malignance or BPH (AUC=0.91 and 0.96)."

According to the news editors, the research concluded: "Collectively, our results unravel the major lipid metabolic aberrations in PCa and imply the potential role of CEs, particularly, cholesteryl oleate, as molecular biomarker for PCa detection."

For more information on this research see: Integration of lipidomics and transcriptomics unravels aberrant lipid metabolism and defines cholesteryl oleate as potential biomarker of prostate cancer. Cardiovascular Diseases and Conditions - Aneurysm

Study Results from Democritus University Update Understanding of Aneurysm (Estimating the influence of aortic-stent grafts after endovascular aneurysm repair: Are we missing something?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Aneurysm have been published. According to news originating from Alexandroupolis, Greece, by NewsRx editors, the research stated, "The implantation of a stiff aortic endograft for endovascular abdominal aneurysm repair (EVAR) has been reported to increase aortic stiffness and pulse wave velocity (PWV), raising potential concern over deterioration of myocardial performance."

Our news journalists obtained a quote from the research from Democritus University, "Yet, additional stiffness indices such as the augmentation index (Alx), reflection magnitude (RM) and changes in augmentation pressure (AP) have not been studied adequately to facilitate and improve our knowledge regarding the ways that EVAR affects central hemodynamics. In this article it is suggested that the implantation of an aortic stent-graft exerts its immediate effects not only by interposing extra stiffness on the infrarenal segment but by also modifying the pulse wave reflection site and changing the aortic flow field without necessarily causing significant alterations in PWV."

According to the news editors, the research concluded: "Hence, further studies on myocardial performance in large patient populations are expected to delineate the precise influence of different designs of EVAR endografts on the cardiovascular hemodynamic which, in turn, can affect the morbidity and survival of these patients."

The news correspondents report that additional information may be obtained from E. Georgakarakos, Democritus University of Thrace, Univ Hosp Alexandroupolis, Dept. of Vasc Surg, Alexandroupolis, Greece.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mehy.2016.10.003. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Lung Cancer

Study Results from Department of Anesthesiology Update Understanding of Lung Cancer (Sevoflurane attenuates platelets activation of patients undergoing lung cancer surgery and suppresses platelets-induced invasion of lung cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting from Foshan, People's Republic of China, by NewsRx journalists, research stated, "Platelets play a pivotal role in metastasis of tumor cells. The aim of this study is to explore the effects of sevoflurane and isoflurane on platelets activation of patients undergoing lung cancer surgery, and the effects of sevoflurane and isoflurane on platelets-induced invasion of lung cancer cells."

Funders for this research include Guangdong Province Medicine Scientific Research Fund of China, Guangdong Province Science and Technology Project of China.

The news correspondents obtained a quote from the research from the Department of Anesthesiology, "Prospective and randomized study, and in vitro experiment. University-affiliated teaching hospital and laboratory. Forty-six patients scheduled for lung cancer radical surgery. Patients were randomized to two groups of 23 patients each and were received sevoflurane (group SEV) or isoflurane (group ISO) during surgery, respectively. In vitro, lung cancer cells were treated with platelets in the presence or absence anesthetics. Platelets activation were determined by detecting glycoproteinIIb/IIIa (GPIIb/IIIa), CD62P, and platelets aggregation rate (PAR) pre-, intra-, and postoperatively. Invasion ability of lung cancer cells were evaluated by Transwell assay. The levels of GPIIb/IIIa, CD62P, and PAR were reduced markedly in group SEV during perioperative period compared with group ISO. In vitro, activated platelets contributed profoundly to the invasive ability of lung cancer cells. Sevoflurane, but not isoflurane, inhibited platelets-induced invasion of lung cancer cells. Furthermore, sevoflurane suppressed the platelets activity in vitro. Sevoflurane attenuates platelets activation of patients undergoing lung cancer surgery."

According to the news reporters, the research concluded: "In vitro, sevoflurane suppresses platelets-induced invasion of lung cancer cells via decreasing platelets activity."

Our news journalists report that additional information may be obtained by contacting B. Zhang, Sun Yat Sen UniversityAffiliated FoShan Hosp, Dept. of Anesthesiol, Foshan 528000, People's Republic of China. Additional authors for this research include C.X. Yang, B. Zhang, Z.L. Zhao, J.Y. Zhong and X.J. Wen.

Study Results from Department of Cardiology Update Understanding of Vessel Disease (Comparison of first- and second-generation drug-eluting stent efficacies for treating left main and/or three-vessel disease: a propensity matched study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Vessel Disease. According to news originating from Kanagawa, Japan, by NewsRx correspondents, research stated, "The efficacy of second-generation drug-eluting stent (DES) for the treatment of left main disease (LM) and/or three vessel disease (3VD) remains unclear. We compared 2-year outcomes of second- versus first-generation DES implantation among patients with LM and/or 3VD and to assess the differential of risk by complexity of coronary artery disease using synergy between percutaneous coronary intervention with taxus and cardiac surgery (SYNTAX) scores."

Our news journalists obtained a quote from the research from the Department of Cardiology, "Between April 2007 and December 2012, 341 patients with LM and/or 3VD were treated by percutaneous coronary intervention; 154 with first-generation DES and 137 with second-generation DES. After propensity matching, 101 patients remained in each group. The rate of target lesion revascularization (TLR) and major adverse cardiac event (MACE) were compared. TLR and MACE at 2 years were more common in the first- compared with second-generation DES group (TLR 19.8 vs. 8.9 %; p = 0.016, MACE 24.8 vs. 10.9 %; p = 0.008). In patients with low (0-22) and intermediate (23-32) SYNTAX scores, TLR and MACE tended to occur more often with first-generation DES group. In patients with high SYNTAX scores (ae 33), TLR and MACE were significantly more common with first-generation DES group (TLR 29.0 vs. 11.1 %; p = 0.035, MACE 35.5 vs. 13.9 %; p = 0.034)."

According to the news editors, the research concluded: "Compared with first-generation DES, second-generation DES proved beneficial in reducing risk of TLR and MACE in patients with LM and/or 3VD, particularly among those with high SYNTAX scores (ae 33)."

For more information on this research see: Comparison of first- and second-generation drug-eluting stent efficacies for treating left main and/or three-vessel disease: a propensity matched study. Angiology
Study Results from Department of Neurology in the Area of Angiology
Reported (Factors associated with timing of early neurological
improvement after thrombolysis for ischaemic stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Angiology. According to news
reporting out of Caen, France, by NewsRx editors, research stated, "Early neurological
improvement (ENI) after fibrinolysis for ischaemic stroke is strongly associated with
recanalization and favourable outcome. However, it remains unknown why some patients
recover within the first hour after treatment (very ENI, VENI) whereas others recover later
within 24 h."

Our news journalists obtained a quote from the research from the Department of
Neurology, "The factors associated with the timing of ENI were assessed. Consecutive stroke
patients treated with intravenous recombinant tissue plasminogen activator (rt-PA) within 4.5 h
after onset in four stroke centres of our geographical area were retrospectively studied. VENI
assessed at 1 h and ENI assessed at 24 h post-treatment were defined by National Institutes of
Health Stroke Scale (NIHSS) improvement by 40% from baseline. Of 421 patients, 65 (15%)
had VENI and 110 (26%) had ENI. Patients with VENI had significantly lower serum creatinine
level than patients with ENI (79 ? 19 vs. 91 ? 35 mmol/l; p=0.01). After adjustment for age, sex,
baseline NIHSS, hypertension and blood glucose level, patients with low serum creatinine level
were more likely to have VENI (lowest tertile, odds ratio 3.8, 95% confidence interval 1.5-9.7;
intermediate tertile, odds ratio 1.8, 95% confidence interval 0.8-4.3; P for trend <0.01). VENI
patients were as likely as ENI patients to have a modified Rankin scale score (<=)2 at 3
months."

According to the news editors, the research concluded: "Low serum creatinine levels
are associated with VENI, suggesting that swiftness of the efficacy of rt-PA or of neurological
recovery may depend on renal function."

For more information on this research see: Factors associated with timing of early
neurological improvement after thrombolysis for ischaemic stroke. European Journal of
Neurology - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1468-1331)

Study Results from Department of Obstetrics & Gynecology Broaden Understanding of Obstetrics and Gynecology (Rupture risk factors of fallopian tubal pregnancy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Women's Health - Obstetrics and Gynecology are presented in a new report. According to news originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "The present authors analyzed patients' backgrounds and pre-surgical findings to clarify the risk factors of rupture of fallopian tubal pregnancy. The surgical findings 113 cases were clearly diagnosed as fallopian tubal pregnancy with or without rupture."

Our news journalists obtained a quote from the research from the Department of Obstetrics & Gynecology, "Twenty-six cases of fallopian tubal pregnancy were ruptured and 87 cases were not ruptured at the time of operation. The risk factors of fallopian tubal rupture were assessed by Chi-square for independence test and multiple regression analysis. Obesity (BMI over 26), prior birth history, social welfare entitlement, ultrasonography findings of fetal heart movement, and pre-surgical serum beta-hCG level more than 3,000 mIU/ml patient were significantly higher risk in fallopian tubal rupture. Fertility treatment patient were at significantly lower risk for fallopian tubal rupture."

According to the news editors, the research concluded: "Higher beta-hCG levels, especially >3,000 mIU/ml is associated with increased risk of fallopian tubal rupture in ectopic pregnancy."

The news correspondents report that additional information may be obtained from T. Fukami, ASO Iizuka Hosp, Dept. of Obstet & Gynecol, Iizuka, Fukuoka 8208505, Japan. Additional authors for this research include H. Tsujioka, S. Matsuoka, S. Sorano, A. Tohyama, H. Yamamoto, S. Nakamura, M. Goto, R. Matsuoka and F. Eguchi.

Study Results from Department of Pathology Update Understanding of Genetics and Cancer (Secondary EWSR1 Gene Abnormalities in SMARCB1-Deficient Tumors with 22q11-12 Regional Deletions: Potential Pitfalls in Interpreting EWSR1 FISH Results)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genetics - Genetics and Cancer have been published. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "SMARCB1 inactivation occurs in a variety of tumors, being caused by various genetic mechanisms. Since SMARCB1 and EWSR1 genes are located close to each other on chromosome 22, larger SMARCB1 deletions may encompass the EWSR1 locus."

The news correspondents obtained a quote from the research from the Department of Pathology, "Herein, we report four cases with SMARCB1-deletions showing concurrent EWSR1 gene abnormalities by FISH, which lead initially to misinterpretations as EWSR1-rearranged tumors. Our study group included various morphologies: a poorly differentiated chordoma, an extrarenal rhabdoid tumor, a myoepithelial carcinoma, and a proximal-type epithelioid sarcoma. All cases showed loss of SMARCB1 (INI1) by immunohistochemistry (IHC) and displayed characteristic histologic features for the diagnoses. The SMARCB1 FISH revealed homozygous or heterozygous deletions in three and one case, respectively. The co-hybridized EWSR1 probes demonstrated either unbalanced split signals or heterozygous deletion in two cases each. The former suggested bona fide rearrangement, while the latter resembled an unbalanced translocation. However, all the FISH patterns were quite complex and distinct from the simple and uniform split signals seen in typical EWSR1 rearrangements. We conclude that in the context of 22q11-12 regional alterations present in SMARCB1-deleted tumors, simultaneous EWSR1 involvement may be misinterpreted as equivalent to EWSR1 rearrangement."

According to the news reporters, the research concluded: "A detailed clinicopathologic correlation and supplementing the EWSR1 FISH assay with complementary methodology is mandatory for correct diagnosis."

Our news journalists report that additional information may be obtained by contacting C.R. Antonescu, Mem Sloan Kettering Canc Center, Dept. of Pathol, New York, NY 10065, United States. Additional authors for this research include L. Zhang, Y.S. Sung, C.L. Chen, Y.C. Kao, N.P. Agaram and C.R. Antonescu.

Drugs and Therapies - Immunotherapy

Study Results from Department of Veterans Affairs in the Area of Immunotherapy Reported (Interleukin 2 Activates Brain Microvascular Endothelial Cells Resulting in Destabilization of Adherens Junctions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Immunotherapy. According to news reporting originating from Nashville, Tennessee, by NewsRx correspondents, research stated, "The pleiotropic cytokine interleukin 2 (IL2) disrupts the blood-brain barrier and alters brain microcirculation, underlying vascular leak syndrome that complicates cancer immunotherapy with IL2. The microvascular effects of IL2 also play a role in the development of multiple sclerosis and other chronic neurological disorders."

Financial support for this research came from National Institutes of Health.

Our news editors obtained a quote from the research from the Department of Veterans Affairs, "The mechanism of IL2-induced disruption of brain microcirculation has not been determined previously. We found that both human and murine brain microvascular endothelial cells express constituents of the IL2 receptor complex. Then we established that signaling through this receptor complex leads to activation of the transcription factor, nuclear factor kappa B, resulting in expression of proinflammatory interleukin 6 and monocyte chemoattractant protein 1. We also discovered that IL2 induces disruption of adherens junctions, concomitant with cytoskeletal reorganization, ultimately leading to increased endothelial cell permeability. IL2-induced phosphorylation of vascular endothelial cadherin (VE-cadherin), a constituent of adherens junctions, leads to dissociation of its stabilizing adaptor partners, p120-catenin and beta-catenin. Increased phosphorylation of VE-cadherin was also accompanied by a reduction of Src homology 2 domain-containing protein-tyrosine phosphatase 2, known to maintain vascular barrier function."

According to the news editors, the research concluded: "These results unravel the mechanism of deleterious effects induced by IL2 on brain microvascular endothelial cells and may inform the development of new measures to improve IL2 cancer immunotherapy, as well as treatments for autoimmune diseases affecting the central nervous system."

The news editors report that additional information may be obtained by contacting J. Hawiger, Tennessee Valley Healthcare Syst, Dept. of Vet Affairs, Nashville, TN 37232, United States.

Amyotrophic Lateral Sclerosis

Study Results from Division of Neurosciences Provide New Insights into Amyotrophic Lateral Sclerosis (Unraveling gene expression profiles in peripheral motor nerve from amyotrophic lateral sclerosis patients: insights into pathogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Amyotrophic Lateral Sclerosis is the subject of a report. According to news reporting out of Milan, Italy, by NewsRx editors, research stated, "The aim of the present study is to investigate the molecular pathways underlying amyotrophic lateral sclerosis (ALS) pathogenesis within the peripheral nervous system. We analyzed gene expression changes in human motor nerve diagnostic biopsies obtained from eight ALS patients and seven patients affected by motor neuropathy as controls."

Our news journalists obtained a quote from the research from the Division of Neurosciences, "An integrated transcriptomics and system biology approach was employed. We identified alterations in the expression of 815 genes, with 529 up-regulated and 286 down-regulated in ALS patients. Up-regulated genes clustered around biological process involving RNA processing and protein metabolisms. We observed a significant enrichment of up-regulated small nucleolar RNA transcripts (p = 2.68*10^-11) and genes related to endoplasmic reticulum unfolded protein response and chaperone activity. We found a significant down-regulation in ALS of genes related to the glutamate metabolism. Interestingly, a network analysis highlighted HDAC2, belonging to the histone deacetylase family, as the most interacting node."

According to the news editors, the research concluded: "While so far gene expression studies in human ALS have been performed in postmortem tissues, here specimens were obtained from biopsy at an early phase of the disease, making these results new in the field of ALS research and therefore appealing for gene discovery studies."

Study Results from Drexel University Broaden Understanding of Antiinfectives (Local delivery of minocycline from metal ion-assisted self-assembled complexes promotes neuroprotection and functional recovery after spinal cord injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiinfectives have been published. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Many mechanisms contribute to the secondary injury cascades following traumatic spinal cord injury (SCI). However, most current treatment strategies only target one or a few elements in the injury cascades, and have been largely unsuccessful in clinical trials."

Financial support for this research came from National Institutes of Health.

The news correspondents obtained a quote from the research from Drexel University, "Minocycline hydrochloride (MH) is a clinically available antibiotic and anti-inflammatory drug that has been shown to target a broad range of secondary injury mechanisms via its anti-inflammatory, anti-oxidant, and anti-apoptotic properties. However, MH is only neuroprotective at high concentrations. The inability to translate the high doses of MH used in experimental animals to tolerable doses in human patients limits its clinical efficacy. In addition, the duration of MH treatment is limited because long-term systemic administration of high doses of MH has been shown to cause liver toxicity and even death. We have developed a drug delivery system in the form of hydrogel loaded with polysaccharide-MH complexes self-assembled by metal ions for controlled release of MH. This drug delivery system can be injected into the intrathecal space for local delivery of MH with sufficient dose and duration, without causing any additional tissue damage."

According to the news reporters, the research concluded: "We show that local delivery of MH at a dose that is lower than the standard human dose (3 mg/kg) was more effective in reducing secondary injury and promoting locomotor functional recovery than systemic injection of MH with the highest dose and duration reported in experimental animal SCI (90-135 mg/kg)."

Study Results from Duke University Broaden Understanding of Arrestins (beta-Arrestin mediates the Frank-Starling mechanism of cardiac contractility)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Membrane Proteins - Arrestins is now available. According to news reporting originating from Durham, North Carolina, by NewsRx correspondents, research stated, "The Frank-Starling law of the heart is a physiological phenomenon that describes an intrinsic property of heart muscle in which increased cardiac filling leads to enhanced cardiac contractility. Identified more than a century ago, the Frank-Starling relationship is currently known to involve length-dependent enhancement of cardiac myofilament Ca2+ sensitivity."

Our news editors obtained a quote from the research from Duke University, "However, the upstream molecular events that link cellular stretch to the length-dependent myofilament Ca2+ sensitivity are poorly understood. Because the angiotensin II type 1 receptor (AT1R) and the multifunctional transducer protein beta-arrestin have been shown to mediate mechanosensitive cellular signaling, we tested the hypothesis that these two proteins are involved in the Frank-Starling mechanism of the heart. Using invasive hemodynamics, we found that mice lacking beta-arrestin 1, beta-arrestin 2, or AT1R were unable to generate a Frank-Starling force in response to changes in cardiac volume. Although wildtype mice pretreated with the conventional AT1R blocker losartan were unable to enhance cardiac contractility with volume loading, treatment with a beta-arrestin-biased AT1R ligand to selectively activate beta-arrestin signaling preserved the Frank-Starling relationship. Importantly, in skinned muscle fiber preparations, we found markedly impaired length-dependent myofilament Ca2+ sensitivity in beta-arrestin 1, beta-arrestin 2, and AT1R knockout mice."

According to the news editors, the research concluded: "Our data reveal beta-arrestin 1, beta-arrestin 2, and AT1R as key regulatory molecules in the Frank-Starling mechanism, which potentially can be targeted therapeutically with beta-arrestin-biased AT1R ligands."

The news editors report that additional information may be obtained by contacting H.A. Rockman, Duke University, Medical Center, Dept. of Mol Genet, Durham, NC 27710, United States. Additional authors for this research include R.T. Davis, C.M. Warren, L. Mao,
Study Results from E.V. Filonenko et al Provide New Insights into Bladder Cancer [5-Aminolevulinic acid in intraoperative photodynamic therapy of bladder cancer (results of multicenter trial)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Bladder Cancer is now available. According to news originating from Moscow, Russia, by NewsRx correspondents, research stated, "The results of multicenter prospective trial for efficacy of combined modality treatment: transurethral resection (TUR) + photodynamic therapy (PDT) with alasens for bladder cancer are represented in the article. Trials were organized by Research Institute of Organic Intermediates and Dyes and conducted according to clinical protocol approved by Ministry of Health of Russia, at the sites of leading Russian cancer clinical centers."

Our news journalists obtained a quote from the research, "The trial included 45 subjects with verified diagnosis of non-muscle-invasive bladder cancer. Patients underwent TUR of bladder with simultaneous PDT as anti-relapse treatment. Alasens was administered to patients as intravesicular instillation of 3% solution in volume of 50 ml with 1.5-2 h exposure (prior to TUR). TUR was performed after instillation. PDT session was conducted immediately after the completion of TUR on a single occasion by means of combined local irradiation on tumor bed with diffuse irradiation on whole urinary bladder mucosa (light dose of local irradiation- 100 j/cm(2), diffuse irradiation- 20 j/cm2). Good tolerance of the treatment was noticed, there were no complications. Among 45 patients included in the trial, 35 (78%) completed 12 month protocol follow-up without relapse. In our study PDT with alasens after TUR reported a recurrence rate of non-muscle-invasive bladder cancer for 1st year after treatment of 22%.”

According to the news editors, the research concluded: "TUR with intraoperative PDT with 5-aminolevulinic acid may offer an alternative in the treatment of non-muscle-invasive intermediate and high-risk bladder cancer.”

For more information on this research see: 5-Aminolevulinic acid in intraoperative photodynamic therapy of bladder cancer (results of multicenter trial). *Photodiagnosis and Photodynamic Therapy*, 2016;16():106-109. *Photodiagnosis and Photodynamic Therapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Oncology - Breast Cancer

Study Results from F. Garner et al Provide New Insights into Breast Cancer (RAD1901: a novel, orally bioavailable selective estrogen receptor degrader that demonstrates antitumor activity in breast cancer xenograft models)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting from Andover, Massachusetts, by NewsRx journalists, research stated, "Agents that inhibit estrogen production, such as aromatase inhibitors or those that directly block estrogen receptor (ER) activity, such as selective estrogen receptor modulators and selective estrogen receptor degraders, are routinely used in the treatment of ER-positive breast cancers. However, although initial treatment with these agents is often successful, many women eventually relapse with drug-resistant breast cancers."

The news correspondents obtained a quote from the research, "To overcome some of the challenges associated with current endocrine therapies and to combat the development of resistance, there is a need for more durable and more effective ER-targeted therapies. Here we describe and characterize a novel, orally bioavailable small-molecule selective estrogen receptor degrader, RAD1901, and evaluate its therapeutic potential for the treatment of breast cancer. RAD1901 selectively binds to and degrades the ER and is a potent antagonist of ER-positive breast cancer cell proliferation. Importantly, RAD1901 produced a robust and profound inhibition of tumor growth in MCF-7 xenograft models. In an intracranial MCF-7 model, RAD1901-treated animals survived longer than those treated with either control or fulvestrant, suggesting the potential benefit of RAD1901 in the treatment of ER-positive breast cancer that has metastasized to the brain. Finally, RAD1901 preserved ovariectomy-induced bone loss and prevented the uterotropic effects of E2, suggesting that it may act selectively as an agonist in bone but as an antagonist in breast and uterine tissues."

According to the news reporters, the research concluded: "RAD1901 is currently under clinical study in postmenopausal women with ER-positive advanced breast cancer."

For more information on this research see: RAD1901: a novel, orally bioavailable selective estrogen receptor degrader that demonstrates antitumor activity in breast cancer xenograft models. Oncology - Lung Cancer

Study Results from Fox Chase Cancer Center in the Area of Lung Cancer Reported (End-of-Life Care in Patients with Metastatic Lung Cancer Harboring Epidermal Growth Factor Receptor Mutations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Patients with metastatic nonsmall cell lung cancer (NSCLC) harboring epidermal growth factor receptor (EGFR) mutations benefit from improved survival and quality of life with EGFR-directed therapy. We sought to explore if these improvements in cancer care impacted the delivery of end-of-life (EOL) care in this population."

The news correspondents obtained a quote from the research from Fox Chase Cancer Center, "We retrospectively reviewed medical records of patients cared for at our institution with the diagnosis of metastatic EGFR-mutant NSCLC who died by January 2015. Sixty-one patients were included. The majority of patients were female (68%), white or Asian (97%), and never or minimal smokers (76%). Forty-two out of fifty-eight patients (72%) received chemotherapy within 30 days of death. Forty-one out of sixty-one patients (67%) had a hospital admission within 30 days of death. EOL outcomes were known for 53 patients. Of these, 34 (64%) patients enrolled on hospice. The median length of stay on hospice was 6 days (range 0-206). Thirty-three (62%) patients died at home with hospice services or at an inpatient hospice facility. Eighteen patients (34%) died in the hospital. Patients with metastatic NSCLC harboring EGFR mutations had high rates of chemotherapy use and hospital admissions in the last month of life, and many died in the hospital. Hospital admissions near the EOL and short admissions to hospice are indicators of poor quality EOL care and are likely a result of prolonged chemotherapy administration in this population."

According to the news reporters, the research concluded: "Thus, current healthcare delivery models may be insufficient to provide comprehensive EOL care for patients with EGFR mutations."

Our news journalists report that additional information may be obtained by contacting J.R. Bauman, Fox Chase Canc Center, Philadelphia, PA 19111, United States. Additional authors for this research include Z. Piotrowska, A. Muzikansky, E. Gallagher, E. Scribner, B. Temel, L.V. Sequist, R.S. Heist and J.S. Temel.

Study Results from Fox Chase Cancer Center in the Area of Prostate Cancer Reported (The impact of trainee involvement on outcomes in low-dose-rate brachytherapy for prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "To determine the impact of fellow, resident, or medical student (MS) involvement on outcomes in patients undergoing permanent I-125 prostate seed implant. The study population consisted of men with clinically localized low/intermediate-risk prostate cancer treated with low-dose-rate permanent interstitial brachytherapy."

Our news journalists obtained a quote from the research from Fox Chase Cancer Center, "Cases were stratified according to resident, fellow, MS, or attending involvement. Outcomes were compared using analysis of variance, logistic regression, and log rank tests. A total of 291 patients were evaluated. Fellows, residents, and MS were involved in 47 (16.2%), 231 (79.4%), and 34 (11.7%) cases, respectively. Thirteen (4.4%) cases were completed by an attending physician alone. There was no difference in freedom from biochemical failure when comparing the resident, fellow, or attending alone groups (p = 0.10). There was no difference in V-100 (volume of the prostate receiving 100% of the prescription dose) outcomes when comparing resident cases to fellow cases (p = 0.72) or attending alone cases (p = 0.78). There was no difference in D-90 (minimum dose covering 90% of the postimplant volume) outcomes when comparing resident cases to fellow cases (p = 0.74) or attending alone cases (p = 0.58). When examining treatment toxicity, fellow cases had higher rates of acute Grade 2 + GU toxicity (p = 0.028). With the exception of higher urethra D90 among PGY 2-3 cases (p = 0.02), dosimetric outcomes were similar to cases with PGY 4-5 resident participation. There was no difference in outcomes for cases with and without MS participation. Interstitial prostate seed implants can be safely performed by trainees with appropriate supervision."

According to the news editors, the research concluded: "Hands-on brachytherapy training is effective and feasible for trainees."

The news correspondents report that additional information may be obtained from E.M. Horwitz, Fox Chase Canc Center. Dept. of Radiat Oncol, Philadelphia, PA 19111, United States. Additional authors for this research include L. Wang, K. Ruth, M. Hallman, D.Y. Chen, R.E. Greenberg, J.S. Li, K. Crawford and E.M. Horwitz.

Study Results from Free University in the Area of Drug Delivery Systems Reported (Development of biodegradable hyperbranched core-multishell nanocarriers for efficient topical drug delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news reporting out of Berlin, Germany, by NewsRx editors, research stated, "The topical application of drugs allows for a local application in skin disease and can reduce side effects. Here we present biodegradable core-multishell (CMS) nanocarriers which are composed of a hyperbranched polyglycerol core functionalized with diblock copolymers consisting of polycaprolactone (PCL) and poly(ethylene glycol) (mPEG) as the outer shell."

Financial supporters for this research include SFB 1112, China Scholarship Council, Focus Area Nanoscale of Freie Universitat Berlin.

Our news journalists obtained a quote from the research from Free University, "The anti-inflammatory drug Dexamethasone (Dexa) was loaded into these CMS nanocarriers. DLS results suggested that Dexa loaded nanoparticles mostly act as a unimolecular carrier system. With longer PCL segments, a better transport capacity is observed. In vitro skin permeation studies showed that CMS nanocarriers could improve the Nile red penetration through the skin by up to 7 times, compared to a conventional cream formulation. Interestingly, covalently FITC-labeled CMS nanocarriers remain in the stratum corneum layer. This suggests the enhancement is due to the release of cargo after being transported into the stratum corneum by the CMS nanocarriers."

According to the news editors, the research concluded: "In addition, the hPG-PCL-mPEG CMS nanocarriers exhibited good stability, low cytotoxicity, and their production can easily be scaled up, which makes them promising nanocarriers for topical drug delivery."

For more information on this research see: Development of biodegradable hyperbranched core-multishell nanocarriers for efficient topical drug delivery. *Journal of Controlled Release*, 2016;242():42-49. *Journal of Controlled Release* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Controlled Release - www.journals.elsevier.com/journal-of-controlled-release/)

Study Results from French National Institute of Health and Medical Research (INSERM) in the Area of Genetics Reported (Constitutive p53 heightens mitochondrial apoptotic priming and favors cell death induction by BH3 mimetic inhibitors of BCL-xL)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics. According to news reporting from Nantes, France, by NewsRx journalists, research stated, "Proapoptotic molecules directly targeting the BCL-2 family network are promising anticancer therapeutics, but an understanding of the cellular stress signals that render them effective is still elusive. We show here that the tumor suppressor p53, at least in part by transcription independent mechanisms, contributes to cell death induction and full activation of BAX by BH3 mimetic inhibitors of BCL-xL."

The news correspondents obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "In addition to mildly facilitating the ability of compounds to derepress BAX from BCL-xL, p53 also provides a death signal downstream of anti-apoptotic proteins inhibition. This death signal cooperates with BH3-induced activation of BAX and it is independent from PUMA, as enhanced p53 can substitute for PUMA to promote BAX activation in response to BH3 mimetics."

According to the news reporters, the research concluded: "The acute sensitivity of mitochondrial priming to p53 revealed here is likely to be critical for the clinical use of BH3 mimetics."

For more information on this research see: Constitutive p53 heightens mitochondrial apoptotic priming and favors cell death induction by BH3 mimetic inhibitors of BCL-xL. Cell Death & Disease, 2016;7():e2083. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

Our news journalists report that additional information may be obtained by contacting J. Le Pen, UMR 892 INSERM, 6299 CNRS, Universite de Nantes, Team 8 'Cell Survival And Tumor Escape In Breast Cancer', Institut de Recherche en Sante de l'Universite de Nantes, Nantes, France. Study Results from Fudan University Provide New Insights into Atherosclerosis (Exosomes derived from mature dendritic cells increase endothelial inflammation and atherosclerosis via membrane TNF-alpha mediated NF-kappa B pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Atherosclerosis are presented in a new report. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Whether dendritic cell (DC) derived exosomes play a role in the progression of endothelial inflammation and atherosclerosis remains unclear. Using a transwell system and exosome release inhibitor GW4869, we demonstrated that mature DCs contributed to endothelial inflammation and exosomes were involved in the process."

The news correspondents obtained a quote from the research from Fudan University, "To further confirm this finding, we isolated exosomes from bone marrow dendritic cell (BMDC) culture medium (named DC-exos) and stimulated human umbilical vein endothelial cell (HUVEC) with these DC-exos. We observed that mature DC-exos increased HUVEC inflammation through NF-kappa B pathway in a manner similar to that of lipopolysaccharide. After a protein array analysis of exosomes, we identified and confirmed tumour necrosis factor (TNF)-alpha on exosome membrane being the trigger of NF-kappa B pathway in HUVECs. We then performed an in vivo study and found that the aorta endothelial of mice could uptake intravenously injected exosomes and was activated by these exosomes. After a period of 12 weeks of mature DC-exos injection into ApoE-/- mice, the atherosclerotic lesions significantly increased. Our study demonstrates that mature DCs derived exosomes increase endothelial inflammation and atherosclerosis via membrane TNF-alpha mediated NF-kappa B pathway."

According to the news reporters, the research concluded: "This finding extends our knowledge on how DCs affect inflammation and provides a potential method to prevent endothelial inflammation and atherosclerosis."

Our news journalists report that additional information may be obtained by contacting Y.Z. Zou, Fudan University, Inst Biomed Sci, Shanghai, People's Republic of China. Additional authors for this research include H.B. Liu, J. Yuan, C.N. Wu, D. Huang, Y.J. Ma, J.B. Zhu, L.L. Ma, J.J. Guo, H.T. Shi, Y.Z. Zou and J.B. Ge.

Human Herpesvirus Diseases and Conditions -…

Study Results from Fudan University Update Understanding of Epstein-Barr Virus (Acute viral hepatitis presenting as cytomegalovirus, hepatitis E and Epstein-Barr virus IgM antibody positive)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Human Herpesvirus Diseases and Conditions - Epstein-Barr Virus. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "We report a case of acute cytomegalovirus (CMV) infection with positive HEV and Epstein-Barr virus (EBV) serology. No patients have been reported positive for immunoglobulin (Ig)M antibodies to all three viruses."

The news correspondents obtained a quote from the research from Fudan University, "This patient had progressively increasing titres of IgM antibody for CMV, HEV and EBV. Only CMV DNA was detectable before antiviral treatment. After antiviral treatment, the patient recovered completely. At day 180 the CMV IgG test had converted to positive with CMV IgM (+), EBV IgM (-) and HEV IgM (-). Our report indicates that dependence upon serology alone is unreliable in the diagnosis of acute CMV, EBV and HEV infections."

According to the news reporters, the research concluded: "The diagnosis of CMV, HEV and EBV should be based on a combination of clinical features, serology and confirmatory PCR testing."

Our news journalists report that additional information may be obtained by contacting Y. Ling, Fudan University, Shanghai Public Hlth Clin Center, Dept. of Infect Dis, Shanghai, People's Republic of China. Additional authors for this research include X.H. Li, C.Y. Zhu, J.J. Yan, Z.G. Song, S. Zhang, Y.W. Hu, L. Chen and Y. Ling.

Proteins - DNA-Binding Proteins

Study Results from Fudan University in the Area of DNA-Binding Proteins Reported (Dihydroartemisinin inhibits catabolism in rat chondrocytes by activating autophagy via inhibition of the NF-kappa B pathway)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - DNA-Binding Proteins have been published. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Osteoarthritis is a disease with inflammatory and catabolic imbalance in cartilage. Dihydroartemisinin (DHA), a natural and safe anti-malarial agent, has been reported to inhibit inflammation, but its effects on chondrocytes have yet to be elucidated."

Our news journalists obtained a quote from the research from Fudan University, "We investigated the effects of DHA on catabolism in chondrocytes. Viability of SD rats chondrocytes was analyzed. Autophagy levels were determined via expression of autophagic markers LC3 and ATG5, GFP-LC3 analysis, acridine orange staining, and electron microscopy. ATG5 siRNA induced autophagic inhibition. Catabolic gene and chemokine expression was evaluated using qPCR. The NF-kappa B inhibitor SM7368 and p65 over-expression were used to analyze the role of NF-kappa B pathway in autophagic activation. A concentration of 1 mu M DHA without cytotoxicity increased LC3-II and ATG5 levels as well as autophagosomal numbers in chondrocytes. DHA inhibited TNF-alpha-induced expression of MMP-3 and -9, ADAMTS5, CCL-2 and -5, and CXCL1, which was reversed by autophagic inhibition. TNF-alpha-stimulated nuclear translocation and degradation of the p65 and I kappa B alpha proteins, respectively, were attenuated in DHA-treated chondrocytes. NF-kappa B inhibition activated autophagy in TNF-alpha-treated chondrocytes, but p65 over-expression reduced the autophagic response to DHA."

According to the news editors, the research concluded: "These results indicate that DHA might suppress the levels of catabolic and inflammatory factors in chondrocytes by promoting autophagy via NF-kappa B pathway inhibition."

Myeloid Cells

Study Results from Fukuoka University Provide New Insights into Myeloid Cells (IL-1 beta promotes tubulointerstitial injury in MPO-ANCA-associated glomerulonephritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Myeloid Cells are presented in a new report. According to news reporting originating from Fukuoka, Japan, by NewsRx correspondents, research stated, "It
is widely accepted that tubulointerstitial injury (TII) is caused by glomerular injury (GI) in glomerular diseases. Glomerular endocapillary inflammation may result in crescent formation and exuded protein leakage, which may induce TII in antineutrophil cytoplasmic antibody-associated glomerulonephritis (ANCAGN).

Our news editors obtained a quote from the research from Fukuoka University, "However, some reports have indicated a glomerulonephritis-independent mechanism of TII in ANCAGN. The aim of this study was to determine the principle cytokines correlated with TII severity and to elucidate a characteristic mechanism for TII in ANCAGN. 28 myeloperoxidase-ANCA-positive ANCAGN patients were enrolled, and their kidney biopsy specimens were histologically evaluated with regard to GI and TII. The mRNA expression of various cytokines was examined in 28 specimens. Interleukin (IL)-1 beta was significantly correlated with the severity of TII. The mRNA expression of Toll-like receptor 4 (TLR4) and Nod-like receptor family pyrin domain-containing-3 (NLRP3) also correlated with TII severity. Immunohistochemical analysis demonstrated that TLR4 protein was positively stained in the tubulointerstitial infiltrating cells. NLRP3 protein was detected in macrophages in the severe infiltrating area but was absent or only very faintly expressed in the glomeruli. These results indicated that NLRP3 inflammasome-dependent processing in macrophages releases the mature active form of IL-1 beta, which may lead to the development and deterioration of TII. Sterile inflammation leads to the formation of ANCA-mediated neutrophil extracellular traps (NETs), which may stimulate macrophages and dendritic cells via TLR4 and induce NF-kappa B-dependent mRNA expression and translation of pro-IL-1 beta. Simultaneously, damage-associated molecular pattern signals resulting from NETs promote NLRP3 inflammasome-dependent process-inflammation utilizing the NLRP3 inflamma-some might be a characteristic reaction limited to the tubulointerstitium."

According to the news editors, the research concluded: "Thus, neutralizing IL-1 beta may be a promising strategy to suspend the progress of TII and improve the prognosis of chronic kidney disease resulting from ANCAGN."

For more information on this research see: IL-1 beta promotes tubulointerstitial injury in MPO-ANCA-associated glomerulonephritis. *Clinical Nephrology*, 2016;86(4):190-199. *Clinical Nephrology* can be contacted at: Dustri-Verlag Dr Karl Feistle, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

The news editors report that additional information may be obtained by contacting H. Nakashima, Fukuoka Univ, Fac Med, Div Nephrol & Rheumatol, Dept. of Internal Med, Fukuoka, Japan. Additional authors for this research include Y. Sasatomi, R. Watanabe, M. Watanabe, K. Miyake, Y. Abe, T. Yasuno, K. Ito, N. Ueki, A. Hamauchi, R. Noda, S. Hisano and H. Nakashima.

**Study Results from Genentech, Inc. Broaden Understanding of Drug Delivery Systems (Targeted drug delivery through the traceless release of tertiary and heteroaryl amines from antibody-drug conjugates)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news reporting from San Francisco, California, by NewsRx journalists, research stated, "The reversible attachment of a small-molecule drug to a carrier for targeted delivery can improve pharmacokinetics and the therapeutic index. Previous studies have reported the delivery of molecules that contain primary and secondary amines via an amide or carbamate bond; however, the ability to employ tertiary-amine-containing bioactive molecules has been elusive."

The news correspondents obtained a quote from the research from Genentech, Inc., "Here we describe a bioreversible linkage based on a quaternary ammonium that can be used to connect a broad array of tertiary and heteroaryl amines to a carrier protein. Using a concise, protecting-group-free synthesis we demonstrate the chemoselective modification of 12 complex molecules that contain a range of reactive functional groups. We also show the utility of this connection with both protease-cleavable and reductively cleavable antibody-drug conjugates that were effective and stable in vitro and in vivo."

According to the news reporters, the research concluded: "Studies with a tertiary-amine-containing antibiotic show that the resulting antibody-antibiotic conjugate provided appropriate stability and release characteristics and led to an unexpected improvement in activity over the conjugates previously connected via a carbamate."

Keywords for this news article include: San Francisco, California, United States, North and Central America, Drug Delivery Systems, Drugs and Therapies, Organic Chemicals, Drug Development, Immunoglobulins, Blood Proteins, Immunology, Antibodies, Amines, Genentech Inc.

Study Results from Genome Institute in the Area of Gastric Cancer Reported (ADAR-Mediated RNA Editing Predicts Progression and Prognosis of Gastric Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gastric Cancer. According to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "BACKGROUND & AIM: Gastric cancer (GC) is the third leading cause of global cancer mortality. Adenosine-to-inosine RNA editing is a recently described novel epigenetic mechanism involving sequence alterations at the RNA but not DNA level, primarily mediated by ADAR (adenosine deaminase that act on RNA) enzymes."

Our news editors obtained a quote from the research from Genome Institute, "Emerging evidence suggests a role for RNA editing and ADARs in cancer, however, the relationship between RNA editing and GC development and progression remains unknown. In this study, we leveraged on the next-generation sequencing transcriptomics to demarcate the GC RNA editing landscape and the role of ADARs in this deadly malignancy. Relative to normal gastric tissues, almost all GCs displayed a clear RNA misediting phenotype with ADAR1/2 dysregulation arising from the genomic gain and loss of the ADAR1 and ADAR2 gene in primary GCs, respectively. Clinically, patients with GCs exhibiting ADAR1/2 imbalance demonstrated extremely poor prognoses in multiple independent cohorts. Functionally, we demonstrate in vitro and in vivo that ADAR-mediated RNA misediting is closely associated with GC pathogenesis, with ADAR1 and ADAR2 playing reciprocal oncogenic and tumor suppressive roles through their catalytic deaminase domains, respectively. Using an exemplary target gene PODXL (podocalyxin-like), we demonstrate that the ADAR2-regulated recoding editing at codon 241 (His to Arg) confers a loss-of-function phenotype that neutralizes the tumorigenic ability of the unedited PODXL. Our study highlights a major role for RNA editing in GC disease and progression, an observation potentially missed by previous next-generation sequencing analyses of GC focused on DNA alterations alone."

According to the news editors, the research concluded: "Our findings also suggest new GC therapeutic opportunities through ADAR1 enzymatic inhibition or the potential restoration of ADAR2 activity."

Study Results from German Cancer Research Center Broaden Understanding of Chronic Disease (The effects of intermittent calorie restriction on metabolic health: Rationale and study design of the HELENA Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Disease Attributes - Chronic Disease have been presented. According to news reporting from Heidelberg, Germany, by NewsRx journalists, research stated, "Mechanistic studies suggest benefits of intermittent calorie restriction (ICR) in chronic disease prevention that may exceed those of continuous calorie restriction (CCR), even at equal net calorie intake. Despite promising results from first trials, it remains largely unknown whether ICR-induced metabolic alterations reported from experimental studies can also be observed in humans, and whether ICR diets are practicable and effective in real life situations."

Financial support for this research came from Helmholtz Association of German Research Centers.

The news correspondents obtained a quote from the research from German Cancer Research Center, "Thus, we initiated the HELENA Trial to test the effects of ICR (eu-caloric diet on five days and very low energy intake-on two days per week) on metabolic parameters and body composition over one year. We will assess the effectiveness of ICR compared to CCR and a control diet over a 12-week intervention, 12-week maintenance phase and 24-week follow-up in 150 overweight or obese non-smoking adults (50 per group, 50% women). Our primary endpoint is the difference between ICR and CCR with respect to fold-changes in expression levels of 82 candidate genes in abdominal subcutaneous adipose tissue biopsies (SATb) during the intervention phase. The candidate genes represent pathways, which may link obesity-related metabolic alterations with the risk for major chronic diseases. In secondary and exploratory analyses, changes in metabolic, hormonal, inflammatory and metagenomic parameters measured in different biospecimens (SATb, blood, urine, stool) are investigated and effects of ICR/CCR/control on imaging-based measures of subcutaneous, visceral and hepatic fat are evaluated."

According to the news reporters, the research concluded: "Our study is the first randomized trial over one year testing the effects of ICR on metabolism, body composition and psychosocial factors in humans."

For more information on this research see: The effects of intermittent calorie restriction on metabolic health: Rationale and study design of the HELENA Trial. Contemporary Clinical Trials, 2016;51():28-33. Contemporary Clinical Trials can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Contemporary Clinical Trials - www.journals.elsevier.com/contemporary-clinical-trials/)

Gram-Negative Bacteria - Acinetobacter baumannii

Study Results from Grand Valley State University Broaden Understanding of Acinetobacter baumannii (Clinical Variants of the Native Class D beta-Lactamase of Acinetobacter baumannii Pose an Emerging Threat through Increased Hydrolytic Activity ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Acinetobacter baumannii are presented in a new report. According to news reporting out of Allendale, Michigan, by NewsRx editors, research stated, "The threat posed by the chromosomally encoded class D beta-lactamase of Acinetobacter baumannii (OXA-51/66) has been unclear, in part because of its relatively low affinity and turnover rate for carbapenems. Several hundred clinical variants of OXA51/66 have been reported, many with substitutions of active-site residues."

Our news journalists obtained a quote from the research from Grand Valley State University, "We determined the kinetic properties of OXA-66 and five clinical variants with respect to a wide variety of beta-lactam substrates. The five variants displayed enhanced activity against carbapenems and in some cases against penicillins, late-generation cephalosporins, and the monobactam aztreonam. Molecular dynamics simulations show that in OXA-66, P130 inhibits the side-chain rotation of I129 and thereby prevents doripenem binding because of steric clash. A single amino acid substitution at this position (P130Q) in the variant OXA-109 greatly enhances the mobility of both I129 and a key active-site tryptophan (W222), thereby facilitating carbapenem binding."

According to the news editors, the research concluded: "This expansion of substrate specificity represents a very worrisome development for the efficacy of beta-lactams against this troublesome pathogen."

For more information on this research see: Clinical Variants of the Native Class D beta-Lactamase of Acinetobacter baumannii Pose an Emerging Threat through Increased Hydrolytic Activity against Carbapenems. Antimicrobial Agents and Chemotherapy, 2016;60 (10):6155-6164. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news journalists report that additional information may be obtained by contacting D.A. Leonard, Grand Valley State Univ, Dept. of Chem, Allendale, MI 49401, United States. Study Results from Grigore T. Popa University of Medicine and Pharmacy in the Area of Myelodysplastic Syndromes Reported (Using Iron Chelators - deferasirox in the Treatment of Hypersiderosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematologic Diseases and Conditions - Myelodysplastic Syndromes are discussed in a new report. According to news reporting originating from Iasi, Romania, by NewsRx correspondents, research stated, "Hemosiderosis is a condition characterized by a pathological increase of iron levels in the body. One of the main etiologies of hemosiderosis is represented by massive transfusions of packed red blood cells, as it happens in major beta-thalassemia or in myelodysplastic syndromes, haematological disorders evolving with low values of haemoglobin which require transfusion frequently."

Our news editors obtained a quote from the research from the Grigore T. Popa University of Medicine and Pharmacy, "Hypersideremia therapy consists of the administration of iron chelators. Deferasirox is a next generation iron chelator, which is administered to multiple transfused patients. It is used to prevent iron storage in deposits by increasing its excretion rate. The purpose of this paper is to highlight the role of the treatment with iron chelators, respectively Deferasirox in preventing the onset of hemosiderosis and its complications. We also intend to analyze aspects of the chemical and pharmacological profile of Deferasirox. We present the case of a 27 year-old man diagnosed with myelodysplastic syndrome of the refractory anemia type, in which increased transfusion treatment imposed by the severely low hemoglobin values, led to the risk of secondary hemosiderosis installation."

According to the news editors, the research concluded: "We intend to emphasize the beneficial effect of iron chelators therapy, which prevents the installation of hypersideremia complications, reduces the transfusion requirements and improves patient's quality of life."

The news editors report that additional information may be obtained by contacting O.V. Badulescu, Grigore T Popa Univ Med & Pharm, Fac Med, Dept. of Pathophysiol, Iasi 700115, Romania. Additional authors for this research include M.M. Leon and M. Mocanu.

Study Results from Guangdong General Hospital Provide New Insights into Lung Cancer (Leptomeningeal Metastases in Patients with NSCLC with EGFR Mutations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Lung Cancer have been presented. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Leptomeningeal metastases (LM) have increased in patients with NSCLC, and prognostic factors and outcomes for LM with EGFR gene mutations have not been well studied. We retrospectively analyzed patients with lung cancer from January 2011 to June 2015 at our institute."

Financial supporters for this research include National Health and Family Planning Commission, Lung Cancer Translational Medicine, Guangzhou Science and Technology Bureau, Natural Science Foundation of Guangdong Province.

The news correspondents obtained a quote from the research from Guangdong General Hospital, "Treatments and clinical outcomes of LM were reviewed. LM were diagnosed in 184 (3.4%) of 5387 patients with lung cancer. Patients with LM harboring EGFR mutations (9.4%) were significantly more frequent than those with wild-type EGFR (1.7% [p < 0.001]). The median overall survival (OS) after LM was 8.7 months (95% confidence interval [CI]: 7.3-10.1). Among the 109 patients with common EGFR mutations, the 88 patients who received tyrosine kinase inhibitor (TKI) therapy demonstrated longer OS than those who did not (10.0 months versus 3.3 months [p < 0.001]), but 42 patients who underwent whole brain radiotherapy (WBRT) did not show longer OS than those without WBRT, and a combination of WBRT and TKIs did not add any survival benefit beyond that in patients receiving only TKIs. A multivariate analysis indicated that TKI therapy (p < 0.001, hazard ratio = 0.218) was an independent predictor of favorable survival, whereas poor Eastern Cooperative Oncology Group performance status (p < 0.001, hazard ratio = 3.657) was a predictor of poor survival. LM were much more frequent in patients with NSCLC harboring EGFR mutations."

According to the news reporters, the research concluded: "EGFR TKIs were the optimal treatment for LM, and active treatment with WBRT did not prolong OS for EGFR-mutated patients."

Study Results from Guangzhou Medical University Broaden Understanding of Oral Cancer (Overexpression of HOXB7 protein reduces sensitivity of oral cancer cells to chemo-radiotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Oral Cancer are discussed in a new report. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "The upregulation of homeobox-B7 (HOXB7) in cancers has been reported. However, its role in oral cancer progression remains to be investigated."

Our news journalists obtained a quote from the research from Guangzhou Medical University, "In current study, our data revealed that reconstitution of HOXB7 expression by transient transfection resulted in increased cell growth, migration and invasion in vitro. In addition, apoptosis and clonogenic assay data showed that overexpression of HOXB7 decreased the sensitivity of oral cancer cells to vincristine-induced apoptosis of HSC-4 and KBNCR cells. Furthermore, overexpression of HOXB7 promoted oral cancer cells' migration and invasion through activation of TGF beta 2/SMAD3 signaling pathway. Moreover, forced expression of HOXB7 increased Bcl-2 to Bax ratio, which would promote cell survival and induce drug and radiotherapy resistance. Altogether, our findings support the role of HOXB7 in the progression of oral cancer."

According to the news editors, the research concluded: "Therefore, HOXB7 potentially can be a therapeutic target for oral cancer."

Our news journalists report that additional information may be obtained by contacting Y. Wei, Guangzhou Med Univ, Guangzhou Peoples Hosp 1, Dept. of Blood Transfus, Guangzhou 510180, Guangdong, People's Republic of China. Additional authors for this research include D. Chen, X. Chen, H. Yang and Y. Wei.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/cgt.2016.55. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from Guangzhou Medical University Provide New Insights into Osteosarcomas (Long non-coding RNA TUG1 contributes to tumorigenesis of human osteosarcoma by sponging miR-9-5p and regulating POU2F1 expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Osteosarcomas are discussed in a new report. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Recent studies have shown that long non-coding RNAs (lncRNAs) have critical roles in tumorigenesis, including osteosarcoma. The lncRNA taurine-upregulated gene 1 (TUG1) was reported to be involved in the progression of osteosarcoma."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Guangzhou Medical University, "Here, we investigated the role of TUG1 in osteosarcoma cells and the underlying mechanism. TUG1 expression was measured in osteosarcoma cell lines and human normal osteoblast cells by quantitative real-time PCR (qRT-PCR). The effects of TUG1 on osteosarcoma cells were studied by RNA interference in vitro and in vivo. The mechanism of competing endogenous RNA (ceRNA) was determined using bioinformatic analysis and luciferase assays. Our data showed that TUG1 knockdown inhibited cell proliferation and colony formation, and induced G0/G1 cell cycle arrest and apoptosis in vitro, and suppressed tumor growth in vivo. Besides, we found that TUG1 acted as an endogenous sponge to directly bind to miR-9-5p and downregulated miR-9-5p expression. Moreover, TUG1 overturned the effect of miR-9-5p on the proliferation, colony formation, cell cycle arrest, and apoptosis in osteosarcoma cells, which involved the derepression of POU class 2 homeobox 1 (POU2F1) expression."

According to the news editors, the research concluded: "Our study elucidated a novel TUG1/miR-9-5p/POU2F1 pathway, in which TUG1 acted as a ceRNA by sponging miR-9-5p, leading to downregulation of POU2F1 and facilitating the tumorigenesis of osteosarcoma. These findings may contribute to the lncRNA-targeted therapy for human osteosarcoma."

For more information on this research see: Long non-coding RNA TUG1 contributes to tumorigenesis of human osteosarcoma by sponging miR-9-5p and regulating POU2F1 expression. Tumor Biology, 2016;37(11):15031-15041. Tumor Biology can be contacted at: Springer, Van Godewijkstraat 30, 3311 Gz Dordrecht, Netherlands. Hemodialysis

Study Results from Harvard School of Medicine Provide New Insights into Hemodialysis (Factors associated with the receipt of antimicrobials among chronic hemodialysis patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hemodialysis are discussed in a new report. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Antimicrobial use is common among patients receiving chronic hemodialysis (CHD) and may represent an important antimicrobial stewardship opportunity. The objective of this study is to characterize CHD patients at increased risk of receiving antimicrobials, including not indicated antimicrobials."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "We conducted a prospective cohort study over a 12-month period among patients receiving CHD in 2 outpatient dialysis units. Each parenteral antimicrobial dose administered was characterized as indicated or not indicated based on national guidelines. Patient factors associated with receipt of antimicrobials and receipt of >= 1 inappropriate antimicrobial dose were analyzed. A total of 89 of 278 CHD patients (32%) received >= 1 antimicrobial doses and 52 (58%) received >= 1 inappropriately indicated dose. Patients with tunneled catheter access, a history of colonization or infection with a multidrug-resistant organism, and receiving CHD sessions during daytime shifts were more likely to receive antimicrobials (odds ratio [OR], 5.16; 95% confidence interval [CI], 2.72-9.80; OR, 5.43; 95% CI, 1.84-16.06; OR, 4.59; 95% CI, 1.20-17.52, respectively). Patients with tunneled catheter access, receiving CHD at dialysis unit B, and with a longer duration of CHD prior to enrollment were at higher risk of receiving an inappropriately indicated antimicrobial dose (incidence rate ratio, 2.23; 95% CI, 1.16-4.29; incidence rate ratio, 2.67; 95% CI, 1.34-5.35; incidence rate ratio, 1.11; 95% CI, 1.01-1.23, respectively)."

According to the news editors, the research concluded: "This study of all types of antimicrobials administered in 2 outpatient dialysis units identified several important factors to consider when developing antimicrobial stewardship programs in this health care setting."

For more information on this research see: Factors associated with the receipt of antimicrobials among chronic hemodialysis patients. American Journal of Infection Control, 2016;44(11):1269-1274. American Journal of Infection Control can be contacted at: Mosby-Elsevier, 360 Park Avenue South, New York, NY 10010-1710, USA.

Our news journalists report that additional information may be obtained by contacting G.M. Snyder, Harvard Med Sch, Beth Israel Deaconess Med Center, Boston, MA, United States. Additional authors for this research include P.R. Patel, A.J. Kallen, J.A. Strom, J.K. Tucker and E.M.C. D'Agata.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajic.2016.03.034. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from Harvard School of Medicine Update Understanding of Gliomas (Phase I study of low-dose metronomic temozolomide for recurrent malignant gliomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gliomas have been published. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "The treatment goal for recurrent malignant gliomas centers on disease stabilization while minimizing therapy-related side effects. Metronomic dosing of cytotoxic chemotherapy has emerged as a promising option to achieve this objective."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "This phase I study was performed using metronomic temozolomide (mTMZ) at 25 or 50 mg/m(2)/day continuously in 42-day cycles. Correlative studies were incorporated using arterial spin labeling MRI to assess tumor blood flow, analysis of matrix metalloproteinase-2 (MMP-2) and MMP-9 activities in the cerebrospinal fluid (CSF) as surrogates for tumor angiogenesis and invasion, as well as determination of CSF soluble interleukin-2 receptor alpha (sIL-2Ra) levels as a marker of immune modulation. Nine subjects were enrolled and toxicity consisted of primarily grade 1 or 2 hematological and gastrointestinal side effects; only one patient had a grade 3 elevated liver enzyme level that was reversible. Tumor blood flow was variable across subjects and time, with two experiencing a transient increase before a decrease to below baseline level while one exhibited a gradual drop in blood flow over time. MMP-2 activity correlated with overall survival but not with progression free survival, while MMP-9 activity did not correlate with either outcome parameters. Baseline CSF sIL-2Ra level was inversely correlated with time from initial diagnosis to first progression, suggesting that subjects with higher sIL-2Ra may have more aggressive disease. But they lived longer when treated with mTMZ, probably due to drug-related changes in T-cell constituency."

According to the news editors, the research concluded: "MTMZ possesses efficacy against recurrent malignant gliomas by altering blood flow, slowing invasion and modulating antitumor immune function."

For more information on this research see: Phase I study of low-dose metronomic temozolomide for recurrent malignant gliomas. BMC Cancer, 2016;16():43-52. BMC Cancer can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. (BioMed Central - www.biomedcentral.com/; BMC Cancer - www.biomedcentral.com/bmccancer/)

Our news journalists report that additional information may be obtained by contacting E.T. Wong, Harvard Med Sch, Beth Israel Deaconess Med Center, Dept. of Neurol, Neurooncol Unit, Boston, MA 02215, United States. Additional authors for this research include J. Timmons, A. Callahan, L. O’Loughlin, B. Giarusso and D.C. Alsop.

Study Results from Harvard School of Medicine in the Area of Medical Genetics Reported (Family health history reporting is sensitive to small changes in wording)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Genetics - Medical Genetics have been presented. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Family health history is often collected through single item queries that ask, patients whether their family members are affected by certain conditions. The specific wording of these queries may influence what individuals report."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Parents of Boston Children's Hospital patients were invited to participate in a Web-based survey about the return of individual genomic research results regarding their children. Participants reported whether 11 types of medical conditions affected them or their family. Randomization determined whether participants were specifically instructed to consider their extended family. Family health history was reported by 2,901 participants. Those asked to consider their extended family were more likely to report a positive family history for 8 of 11 medical conditions. The largest differences were observed for cancer (65.1 vs. 45.7%; P< 0.001), cardiovascular conditions (72.5 vs. 56.0%; P< 0.001), and endocrine/hormonal conditions (50.9 vs. 36.7%; P< 0.001). Small alterations to the way family health history queries are worded can substantially change patient responses."

According to the news editors, the research concluded: "Clinicians and researchers need to be sensitive about patients' tendencies to omit extended family from health history reporting unless specifically asked to consider them."

For more information on this research see: Family health history reporting is sensitive to small changes in wording. Genetics in Medicine, 2016;18(12):1308-1311. **Influenza A Virus Subtype H1N1**

**Study Results from Haukeland Hospital Provide New Insights into Influenza A Virus Subtype H1N1 [Pulmonary changes in Norwegian fatal cases of pandemic influenza H1N1 (2009) infection: a morphologic and molecular genetic study]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Influenza A Virus Subtype H1N1 have been published. According to news reporting out of Bergen, Norway, by NewsRx editors, research stated, "During the pandemic outbreak of the 2009 swine influenza (A(H1N1) pdm09), 32 fatal cases occurred in Norway and 19 of these were included in this study. We characterised pulmonary changes in these fatal Norwegian cases.”

Funders for this research include Universitetet i Bergen, Helse- og Omsorgsdepartementet, Norges Forskningsrad, European Union Agency for Network and Information Security.

Our news journalists obtained a quote from the research from Haukeland Hospital, "Patients and Methods: Upon hospitalisation, detailed clinical information and specimens from the upper and lower respiratory pathways were collected. At post-mortem, lung tissue was collected, formalin-fixed and paraffin-embedded. Immunohistochemical and light microscopic examination was performed to visualise the local expression of the A(H1N1) pdm09 virus. Reverse transcription-polymerase chain reaction (RT-PCR) and pyrosequencing of the non-fixed specimens allowed the identification of mutations in the influenza virus surface glycoprotein (haemagglutinin gene) particularly at position 222. The overall course of illness lasted from 2 to 40 days (median 9 days). Diffused alveolar damage (DAD) was evident in 11 cases, 4 of which had no apparent underlying illness. Obesity was prominent in 12 cases, where three individuals were classified as otherwise healthy. The HA D222G mutation was detected in six cases, 3 of which had no underlying illness. Immunohistochemistry showed the A(H1N1) pdm09 virus to be prominent at the site of inflammation both in close proximity to and inside alveolar structures in the lung tissue. In addition to a possible role for the HA D222G mutation, our findings indicate that host factors and underlying conditions in the infected individuals are fundamental for disease outcome in many cases."

According to the news editors, the research concluded: "This study increases our understanding of determinants for the clinical outcome of pandemic influenza, which could guide future treatment."

Our news journalists report that additional information may be obtained by contacting R.J. Cox, Haukeland Hosp, Dept. of Res & Dev, Bergen, Norway. Additional authors for this research include L.A. Aqrawi, S. Dudman, O. Hungnes, L. Bostad, K.A. Brokstad and R.J. Cox.

Heart Disorders and Diseases - Heart Attack

Study Results from Heart of England NHS Foundation Trust Provide New Insights into Heart Attack [Pre-hospital Assessment of the Role of Adrenaline: Measuring the Effectiveness of Drug administration In Cardiac arrest (PARAMEDIC-2): Trial ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting originating from Birmingham, United Kingdom, by NewsRx correspondents, research stated, "Despite its use since the 1960s, the safety or effectiveness of adrenaline as a treatment for cardiac arrest has never been comprehensively evaluated in a clinical trial. Although most studies have found that adrenaline increases the chance of return of spontaneous circulation for short periods, many studies found harmful effects on the brain and raise concern that adrenaline may reduce overall survival and/or good neurological outcome."

Our news editors obtained a quote from the research from the Heart of England NHS Foundation Trust, "The PARAMEDIC-2 trial seeks to determine if adrenaline is safe and effective in out-of-hospital cardiac arrest. This is a pragmatic, individually randomised, double blind, controlled trial with a parallel economic evaluation. Participants will be eligible if they are in cardiac arrest in the out-of-hospital environment and advanced life support is initiated. Exclusions are cardiac arrest as a result of anaphylaxis or life threatening asthma, and patient known or appearing to be under 16 or pregnant. 8000 participants treated by 5 UK ambulance services will be randomised between December 2014 and August 2017 to adrenaline (intervention) or placebo (control) through opening pre-randomised drug packs."

According to the news editors, the research concluded: "Clinical outcomes are survival to 30 days (primary outcome), hospital discharge, 3, 6 and 12 months, health related quality of life, and neurological and cognitive outcomes (secondary outcomes)."

The news editors report that additional information may be obtained by contacting G.D. Perkins, Heart England NHS Fdn Trust, Birmingham B9 5SS, W Midlands, United Kingdom. Additional authors for this research include T. Quinn, C.D. Deakin, J.P. Nolan, R. Lall, A.M. Slowther, M. Cooke, S.E. Lamb, S. Petrou, F. Achana, J. Finn, I.G. Jacobs, A. Carson, M. Smyth, K. Han, S. Byers, N. Rees, R. Whitfield, F. Moore, R. Fothergill and Stallard.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.resuscitation.2016.08.029. This DOI is a link to an online electronic document that is either free or for purchase.

**Peptide Proteins - Proinsulin**

**Study Results from Helwan University Update Understanding of Proinsulin (Selenium Nanoparticles Attenuate Oxidative Stress and Testicular Damage in Streptozotocin-Induced Diabetic Rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Peptide Proteins - Proinsulin are discussed in a new report. According to news reporting originating from Cairo, Egypt, by NewsRx correspondents, research stated, "We investigated the protective and antioxidative effects of selenium nanoparticles (SeNPs) in streptozotocin STZ-induced diabetic rats. STZ-diabetic rats were exposed daily to treatments with SeNPs and/or insulin and then the effect of these treatments on the parameters correlated to oxidative damage of the rat testes were assessed."

Our news editors obtained a quote from the research from Helwan University, "Biochemical analysis revealed that SeNPs are able to ameliorate the reduction in the serum testosterone caused by STZ-induced diabetes. Furthermore, SeNPs could significantly decrease testicular tissue oxidative stress markers, namely lipid peroxidation and nitric oxide. In contrast, treatment of the STZ-diabetic rats with SeNPs increased the glutathione content and antioxidant enzyme activities in testicular tissues. Moreover, microscopic analysis proved that SeNPs are able to prevent histological damage in the testes of STZ-diabetic rats. Molecular analysis revealed that the mRNA level of Bcl-2 (B-cell lymphoma 2) is significantly upregulated. On the contrary, the mRNA level of Bax (Bcl-2 Associated X Protein) was significantly downregulated. Furthermore, treatment of STZ-diabetic rats with SeNPs led to an elevation in the expression of PCNA (Proliferating Cell Nuclear Antigen Gene). Interestingly, the insulin treatment also exhibited a significant improvement in the testicular function in STZ-diabetic rats."

According to the news editors, the research concluded: "Collectively, our results demonstrated the possible effects of SeNPs in attenuating diabetes-induced oxidative damage, in particular in testicular tissue."

For more information on this research see: Selenium Nanoparticles Attenuate Oxidative Stress and Testicular Damage in Streptozotocin-Induced Diabetic Rats. *Molecules*, 2016;21(11):1482-1494. *Molecules* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. Drugs and Therapies - Vancomycin Resistance

Study Results from Henry Ford Hospital Update Understanding of Vancomycin Resistance (Vancomycin-Resistant Enterococci Epidemiology, Infection Prevention, and Control)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Vancomycin Resistance. According to news reporting out of Detroit, Michigan, by NewsRx editors, research stated, "Vancomycin-resistant enterococci (VRE) infections have acquired prominence as a leading cause of health care associated infections. Understanding VRE epidemiology, transmission modes in health care settings, risk factors for colonization, and infection is essential to prevention and control of VRE infections."

Our news journalists obtained a quote from the research from Henry Ford Hospital, "Infection control strategies are pivotal in management of VRE infections and should be based on patient characteristics, hospital needs, and available resources. Hand hygiene is basic to decrease acquisition of VRE. The effectiveness of surveillance and contact precautions is variable and controversial in endemic settings, but important during VRE outbreak investigations and control."

According to the news editors, the research concluded: "Environmental cleaning, chlorhexidine bathing, and antimicrobial stewardship are vital in VRE prevention and control."

Our news journalists report that additional information may be obtained by contacting K. Reyes, Henry Ford Hospital, Div Infect Dis, Henry Ford Hlth Syst, Infect Prevent & Control, Detroit, MI 48202, United States. Additional authors for this research include A.C. Bardossy and M. Zervos.

Enzymes and Coenzymes

Study Results from Hokkaido University Broaden Understanding of Enzymes and Coenzymes [Alternative Selection of beta-Site APP-Cleaving Enzyme 1 (BACE1) Cleavage Sites in Amyloid beta-Protein Precursor (APP) Harboring Protective and Pathogenic ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Enzymes and Coenzymes are presented in a new report. According to news reporting originating in Hokkaido, Japan, by NewsRx journalists, research stated, "Beta-Site APP-cleaving enzyme 1 (BACE1) cleaves amyloid -protein precursor (APP) at the bond between Met(671) and Asp(672) (-site) to generate the carboxyl-terminal fragment (CTF/C99). BACE1 also cleaves APP at another bond between Thr(681) and Gln(682) (-site), yielding CTF/C89."

The news reporters obtained a quote from the research from Hokkaido University, "Cleavage of CTF/C99 by -secretase generates A(1-XX), whereas cleavage of CTF/C89 generates A(11-XX). Thus, -site cleavage by BACE1 is amyloidolytic rather than amyloidogenic. cleavage of mouse APP is more common than the corresponding cleavage of human APP. We found that the H684R substitution within human A, which replaces the histidine in the human protein with the arginine found at the corresponding position in mouse, facilitated cleavage irrespective of the species origin of BACE1, thereby significantly increasing the level of A(11-XX) and decreasing the level of A(1-XX). Thus, amino acid substitutions within the A sequence influenced the selectivity of alternative - or -site cleavage of APP by BACE1. In familial Alzheimer's disease (FAD), the APP gene harbors pathogenic variations such as the Swedish (K670N/M671L), Leuven (E682K), and A673V mutations, all of which decrease A(11-40) generation, whereas the protective Icelandic mutation (A673T) increases generation of A(11-40). Thus, A673T promotes cleavage of APP and protects subjects against AD. In addition, CTF/C99 was cleaved by excess BACE1 activity to generate CTF/C89, followed by A(11-40), even if APP harbored pathogenic mutations. The resultant A(11-40) was more metabolically labile in vivo than A(1-40)."

According to the news reporters, the research concluded: "Our analysis suggests that some FAD mutations in APP are amyloidogenic and/or amyloidolytic via selection of alternative BACE1 cleavage sites."

Our news correspondents report that additional information may be obtained by contacting T. Suzuki, Hokkaido University, Grad Sch Pharmaceut Sci, Lab Neurosci, Kita Ku, Sapporo, Hokkaido 0600812, Japan. Additional authors for this research include S. Hata and T. Suzuki.

Keywords for this news article include: Hokkaido, Japan, Asia, Amyloid beta-Protein Precursor, Enzymes and Coenzymes, Protein Precursors, Proteomics, Proteins, Genetics, Hokkaido University.
Study Results from Hospital Clinic Update Understanding of Cryopyrin-Associated Periodic Syndromes (Late-Onset Cryopyrin-Associated Periodic Syndrome Due to Myeloid-Restricted Somatic NLRP3 Mosaicism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Autoinflammatory Diseases and Conditions - Cryopyrin-Associated Periodic Syndromes is now available. According to news reporting originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Gain-of-function NLRP3 mutations cause cryopyrin-associated periodic syndrome (CAPS), with gene mosaicism playing a relevant role in the pathogenesis. This study was undertaken to characterize the genetic cause underlying late-onset but otherwise typical CAPS."

Our news editors obtained a quote from the research from Hospital Clinic, "We studied a 64-year-old patient who presented with recurrent episodes of urticaria-like rash, fever, conjunctivitis, and oligoarthritis at age 56 years. DNA was extracted from both unfractionated blood and isolated leukocyte and CD341 subpopulations. Genetic studies were performed using both the Sanger method of DNA sequencing and next-generation sequencing (NGS) methods. In vitro and ex vivo analyses were performed to determine the consequences that the presence of the variant have in the normal structure or function of the protein of the detected variant. NGS analyses revealed the novel p.Gln636Glu NLRP3 variant in unfractionated blood, with an allele frequency (18.4%) compatible with gene mosaicism. Sanger sequence chromatograms revealed a small peak corresponding to the variant allele. Amplicon-based deep sequencing revealed somatic NLRP3 mosaicism restricted to myeloid cells (31.8% in monocytes, 24.6% in neutrophils, and 11.2% in circulating CD34+ common myeloid progenitor cells) and its complete absence in lymphoid cells. Functional analyses confirmed the gain-offunction behavior of the gene variant and hyperactivity of the NLRP3 inflammasome in the patient. Treatment with anakinra resulted in good control of the disease. We identified the novel gain-of-function p.Gln636Glu NLRP3 mutation, which was detected as a somatic mutation restricted to myeloid cells, as the cause of late-onset but otherwise typical CAPS."

According to the news editors, the research concluded: "Our results expand the diversity of CAPS toward milder phenotypes than previously reported, including those starting during adulthood."

For more information on this research see: Late-Onset Cryopyrin-Associated Periodic Syndrome Due to Myeloid-Restricted Somatic NLRP3 Mosaicism. Arthritis & Rheumatology, 2016;68(12):3035-3041. Arthritis & Rheumatology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news editors report that additional information may be obtained by contacting J.I. Arostegui, Barcelona Hospital Clinic, Barcelona, Spain. Additional authors for this research include M.T. Bosque, G. Magri, Y. Honda, H. Martinez-Banaclocha, M. Casorran-Berges, J. Sintes, E. Gonzalez-Roca, E. Ruiz-Ortiz, T. Heike, J.J. Martinez-Garcia, A. Baroja-Mazo, A. Cerutti, R. Nishikomori, J. Oncology - Rhabdoid Tumors

Study Results from Hospital for Sick Children Provide New Insights into Rhabdoid Tumors [Integrated (epi)-Genomic Analyses Identify Subgroup-Specific Therapeutic Targets in CNS Rhabdoid Tumors]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Rhabdoid Tumors have been published. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "We recently reported that atypical teratoid rhabdoid tumors (ATRTs) comprise at least two transcriptional subtypes with different clinical outcomes; however, the mechanisms underlying therapeutic heterogeneity remained unclear."

Financial supporters for this research include Genome Canada, CCSRI, Mitchell Duckman, Tal Doron, Suri Boon, C17, McGill University, Genome Quebec Innovation Center, Princess Margaret Genomics Center, Center for Applied Genomics.

Our news journalists obtained a quote from the research from Hospital for Sick Children, "In this study, we analyzed 191 primary ATRTs and 10 ATRT cell lines to define the genomic and epigenomic landscape of ATRTs and identify subgroup-specific therapeutic targets. We found ATRTs segregated into three epigenetic subgroups with distinct genomic profiles, SMARCB1 genotypes, and chromatin landscape that correlated with differential cellular responses to a panel of signaling and epigenetic inhibitors."

According to the news editors, the research concluded: "Significantly, we discovered that differential methylation of a PDGFRB-associated enhancer confers specific sensitivity of group 2 ATRT cells to dasatinib and nilotinib, and suggest that these are promising therapies for this highly lethal ATRT subtype."

For more information on this research see: Integrated (epi)-Genomic Analyses Identify Subgroup-Specific Therapeutic Targets in CNS Rhabdoid Tumors. Cancer Cell, 2016;30(6):891-908. Cancer Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cancer Cell - www.journals.elsevier.com/cancer-cell/)

Nutritional and Metabolic Diseases and Conditions — …

Study Results from Hospital for Sick Children Provide New Insights into Vitamin A Deficiency (Vitamin A supplementation for the prevention of morbidity and mortality in infants one to six months of age)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Vitamin A Deficiency is the subject of a report. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "Vitamin A deficiency is a significant public health problem in low-and middle-income countries. Vitamin A supplementation provided to infants less than six months of age is one of the strategies to improve the nutrition of infants at high risk of vitamin A deficiency and thus potentially reduce their mortality and morbidity."

Our news journalists obtained a quote from the research from Hospital for Sick Children, "To evaluate the effect of synthetic vitamin A supplementation in infants one to six months of age in low-and middle-income countries, irrespective of maternal antenatal or postnatal vitamin A supplementation status, on mortality, morbidity and adverse effects. Search methods We used the standard search strategy of Cochrane Neonatal to search the Cochrane Central Register of Controlled Trials (CENTRAL 2016, Issue 2), MEDLINE via PubMed (1966 to 5 March 2016), Embase (1980 to 5 March 2016) and CINAHL (1982 to 5 March 2016). We also searched clinical trials databases, conference proceedings and the reference lists of retrieved articles for randomised controlled trials and quasi-randomised trials. Selection criteria Randomised or quasi-randomised, individually or cluster randomised trials involving synthetic vitamin A supplementation compared to placebo or no intervention provided to infants one to six months of age were eligible. Data collection and analysis Two review authors assessed the studies for eligibility and assessed their risk of bias and collected data on outcomes. The review included 12 studies (reported in 22 publications). The included studies assigned 24,846 participants aged one to six months to vitamin A supplementation or control group. There was no effect of vitamin A supplementation for the primary outcome of all-cause mortality based on seven studies that included 21,339 (85%) participants (risk ratio (RR) 1.05, 95% confidence interval (CI) 0.89 to 1.25; I-2 = 0%; test for heterogeneity: P = 0.79; quality of evidence: moderate). Also, there was no effect of vitamin A supplementation on mortality or morbidity due to diarrhoea and respiratory tract infection. There was an increased risk of bulging fontanelle within 24 to 72 hours of supplementation in the vitamin A group compared to control (RR 3.10, 95% CI 1.89 to 5.09; I-2 = 9%; test for heterogeneity: P = 0.36; quality of evidence: high). There was no reported subsequent increased risk of death, convulsions or irritability in infants who developed bulging fontanelle after vitamin A supplementation, and it resolved in most cases within 72 hours. There was no increased risk of other adverse effects such as vomiting, irritability, diarrhoea, fever and convulsions in the vitamin A supplementation group compared to control. Vitamin A supplementation did not have any statistically significant effect on vitamin A deficiency (RR 0.86, 95% CI 0.70 to 1.06; I-2 = 27%; test for heterogeneity: P = 0.25; quality of evidence: moderate). Authors' conclusions There is no convincing evidence that vitamin A supplementation for infants one to six months of age results in a reduction in infant mortality or morbidity in low-and middle-income countries."
According to the news editors, the research concluded: "There is an increased risk of bulging fontanelle with vitamin A supplementation in this age group; however, there were no reported subsequent complications because of this adverse effect."

For more information on this research see: Vitamin A supplementation for the prevention of morbidity and mortality in infants one to six months of age. *Cochrane Database of Systematic Reviews*, 2016;(9):1855-1917. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

**Lung Diseases and Conditions - Cystic Fibrosis**

**Study Results from Howard Hughes Medical Institute Broaden Understanding of Cystic Fibrosis (Atomic Structure of the Cystic Fibrosis Transmembrane Conductance Regulator)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Cystic Fibrosis. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "The cystic fibrosis transmembrane conductance regulator (CFTR) is an anion channel evolved from the ATP-binding cassette (ABC) transporter family. In this study, we determined the structure of zebrafish CFTR in the absence of ATP by electron cryo-microscopy to 3.7 angstrom resolution."

Funders for this research include Rockefeller University, Howard Hughes Medical Institute.

Our news journalists obtained a quote from the research from Howard Hughes Medical Institute, "Human and zebrafish CFTR share 55% sequence identity, and 42 of the 46 cystic-fibrosis-causing missense mutational sites are identical. In CFTR, we observe a large anion conduction pathway lined by numerous positively charged residues. A single gate near the extracellular surface closes the channel. The regulatory domain, dephosphorylated, is located in the intracellular opening between the two nucleotide-binding domains (NBDs), preventing NBD dimerization and channel opening."

According to the news editors, the research concluded: "The structure also reveals why many cystic-fibrosis-causing mutations would lead to defects either in folding, ion conduction, or gating and suggests new avenues for therapeutic intervention."

For more information on this research see: Atomic Structure of the Cystic Fibrosis Transmembrane Conductance Regulator. *Cell*, 2016;167(6):1586-1597,300-308. *Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell - www.journals.elsevier.com/cell/)
Our news journalists report that additional information may be obtained by contacting J. Chen, Howard Hughes Med Inst, New York, NY 10065, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cell.2016.11.014. This DOI is a link to an online electronic document that is either free or for purchase.

Myeloid Cells

Study Results from Huazhong Agricultural University Update Understanding of Myeloid Cells (Surfactin inducing mitochondria-dependent ROS to activate MAPKs, NF-kappa B and inflammasomes in macrophages for adjuvant activity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Myeloid Cells. According to news reporting originating in Wuhan, People's Republic of China, by NewsRx journalists, research stated, "Surfactin, a natural lipopeptide, can be used both as parenteral and non-parenteral adjuvant for eliciting immune response. However, the mechanisms that confer its adjuvant properties have not been fully explored."

The news reporters obtained a quote from the research from Huazhong Agricultural University, "By staining with NHS-Rhodamine B labeled surfactin and Mito-Tracker Green, we found surfactin could penetrate into macrophages to bind with mitochondria, following induce ROS that could be inhibited by mitochondria-dependent ROS inhibitor. ROS enhanced p38 MAPK and JNK expression, as well their phosphorylation, following activated NF-kappa B nuclear translocation in macrophages that was obviously inhibited by mitochondria-dependent ROS inhibitor. However, inhibition of ROS production only weakened p38 MAPK and JNK expression, but not their phosphorylation in macrophages. As a result, surfaction could activate NF-kappa B to release TNF-alpha by the mitochondria-dependent ROS signalling pathway. ROS also induced macrophages apoptosis to release endogenous danger signals, following activated inflammasomes of NLRP1, NLRP3, IPAF and AIM2 in vitro and only NLRP1 in vivo, as well caspase-1 and IL-1 in macrophages, which were significantly inhibited by pretreatment with ROS inhibitors."

According to the news reporters, the research concluded: "Collectively, surfactin as a kind of non-pathogen-associated molecular patterns, modulates host innate immunity by multiple signalling pathways, including induction of mitochondria-dependent ROS, activating MAPKs and NF-kappa B, and inducing cell apoptosis to realease endogenous danger signals for activation of inflammasomes."

For more information on this research see: Surfactin inducing mitochondria-dependent ROS to activate MAPKs, NF-kappa B and inflammasomes in macrophages for

Our news correspondents report that additional information may be obtained by contacting G.F. Qi, Huazhong Agricultural University, Biomed Center, Wuhan 430070, People's Republic of China. Additional authors for this research include Z.Q. Gao, X.Y. Zhao and G.F. Qi.

**Digestive System Diseases and Conditions -**

**Study Results from Huazhong University of Science and Technology in the Area of Gastrointestinal Neoplasms Reported (KIT over-expression by p55PIK-PI3K leads to Imatinib-resistance in patients with gastrointestinal stromal tumors)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Digestive System Diseases and Conditions - Gastrointestinal Neoplasms is now available. According to news reporting originating in Wuhan, People's Republic of China, by NewsRx journalists, research stated, "Imatinib is the first-line drug for gastrointestinal stromal tumors (GISTs), as mutated KIT is closely associated with the occurrence of GIST. However, Imatinib resistance (IMA-resistance) occurs inevitably in most GIST patients."

The news reporters obtained a quote from the research from the Huazhong University of Science and Technology, "Although the over-expression of KIT in GIST is one of the major factors contributing to IMA-resistance, the underlying mechanism is still unclear. In this study, we demonstrate that p55PIK, an isoform of phosphoinositide 3-kinase (PI3K), increases KIT expression, leading to IMA-resistance in GISTs by activating NF-kB signaling pathway. Furthermore, down-regulation of p55PIK significantly decreases KIT expression and re-sensitizes IMA-resistance-GIST cells to Imatinib in vitro and in vivo. Interestingly, the expression of both p55PIK and KIT proteins is significantly increased in tumor samples from IMA-resistance-GIST patients, suggesting that p55PIK up-regulation may be important for IMA-resistance in the clinical setting. Altogether, our data provide evidence that p55PIK-PI3K signaling can contribute to IMA-resistance in GIST by increasing KIT expression."

According to the news reporters, the research concluded: "Moreover, p55PIK may be a novel potential drug target for treating tumors that develop IMA-resistance."

Our news correspondents report that additional information may be obtained by contacting S. Lai, Dept. of Gastrointestinal Surgery Center, Tongji Hospital, Huazhong
Study Results from IDIBAPS Update Understanding of Acute Myeloid Leukemia (The expression level of BAALC-associated microRNA miR-3151 is an independent prognostic factor in younger patients with cytogenetic intermediate-risk acute myeloid ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Acute Myeloid Leukemia have been published. According to news reporting originating in Barcelona, Spain, by NewsRx journalists, research stated, "Acute myeloid leukemia (AML) is a heterogeneous disease whose prognosis is mainly related to the biological risk conferred by cytogenetics and molecular profiling. In elderly patients (&#10878;60 years) with normal karyotype AML miR-3151 have been identified as a prognostic factor."

The news reporters obtained a quote from the research from IDIBAPS, "However, miR-3151 prognostic value has not been examined in younger AML patients. In the present work, we have studied miR-3151 alone and in combination with BAALC, its host gene, in a cohort of 181 younger intermediate-risk AML (IR-AML) patients. Patients with higher expression of miR-3151 had shorter overall survival (p=0.0025), shorter leukemia-free survival (p=0.026) and higher cumulative incidence of relapse (p=0.082). Moreover, in the multivariate analysis miR-3151 emerged as independent prognostic marker in both the overall series and within the unfavorable molecular prognostic category. Interestingly, the combined determination of both miR-3151 and BAALC improved this prognostic stratification, with patients with low levels of both parameters showing a better outcome compared with those patients harboring increased levels of one or both markers (p=0.003). In addition, we studied the microRNA expression profile associated with miR-3151 identifying a six-microRNA signature."

According to the news reporters, the research concluded: "The analysis of miR-3151 and BAALC expression may well contribute to an improved prognostic stratification of younger patients with IR-AML."

For more information on this research see: The expression level of BAALC-associated microRNA miR-3151 is an independent prognostic factor in younger patients with cytogenetic intermediate-risk acute myeloid leukemia. Blood Cancer Journal, 2015:5();e352. (Nature Publishing Group - www.nature.com/; Blood Cancer Journal - www.nature.com/bcj/)
Oncology - Multiple Myeloma

Study Results from Indiana University School of Medicine in the Area of Multiple Myeloma Reported (Cell Adhesion Molecule CD166 Drives Malignant Progression and Osteolytic Disease in Multiple Myeloma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Multiple Myeloma have been presented. According to news originating from Indianapolis, Indiana, by NewsRx correspondents, research stated, "Multiple myeloma is incurable once osteolytic lesions have seeded at skeletal sites, but factors mediating this deadly pathogenic advance remain poorly understood. Here, we report evidence of a major role for the cell adhesion molecule CD166, which we discovered to be highly expressed in multiple myeloma cell lines and primary bone marrow cells from patients."

Our news journalists obtained a quote from the research from the Indiana University School of Medicine, "CD166(+) multiple myeloma cells homed more efficiently than CD166(-) cells to the bone marrow of engrafted immunodeficient NSG mice. CD166 silencing in multiple myeloma cells enabled longer survival, a smaller tumor burden, and less osteolytic lesions, as compared with mice bearing control cells. CD166 deficiency in multiple myeloma cell lines or CD138(+) bone marrow cells from multiple myeloma patients compromised their ability to induce bone resorption in an ex vivo organ culture system. Furthermore, CD166 deficiency in multiple myeloma cells also reduced the formation of osteolytic disease in vivo after intratibial engraftment. Mechanistic investigation revealed that CD166 expression in multiple myeloma cells inhibited osteoblastogenesis of bone marrow-derived osteoblast progenitors by suppressing Runx2 gene expression. Conversely, CD166 expression in multiple myeloma cells promoted osteoclastogenesis by activating TRAF6-dependent signaling pathways in osteoclast progenitors."

According to the news editors, the research concluded: "Overall, our results define CD166 as a pivotal director in multiple myeloma cell homing to the bone marrow and multiple myeloma progression, rationalizing its further study as a candidate therapeutic target for multiple myeloma treatment."

For more information on this research see: Cell Adhesion Molecule CD166 Drives Malignant Progression and Osteolytic Disease in Multiple Myeloma. Cancer Research, 2016;76(23):6901-6910. Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. (American Association for
Study Results from Institute for Cancer Research and Treatment (IRCCS) Broaden Understanding of Chronic Lymphocytic Leukemia (TCL1 transgenic mouse model as a tool for the study of therapeutic targets and microenvironment in human B-cell ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Chronic Lymphocytic Leukemia is now available. According to news reporting originating in Rome, Italy, by NewsRx journalists, research stated, "Chronic lymphocytic leukemia (CLL) is a B-cell malignancy with a mature phenotype. In spite of its relatively indolent nature, no radical cure is as yet available."

The news reporters obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "CLL is not associated with either a unique cytogenetic or a molecular defect, which might have been a potential therapeutic target. Instead, several factors are involved in disease development, such as environmental signals which interact with genetic abnormalities to promote survival, proliferation and an immune surveillance escape. Among these, PI3-Kinase signal pathway alterations are nowadays considered to be clearly important. The TCL1 gene, an AKT co-activator, is the cause of a mature T-cell leukemia, as well as being highly expressed in all B-CLL. A TCL1 transgenic mouse which reproduces leukemia with a distinct immunophenotype and similar to the course of the human B-CLL was developed several years ago and is widely used by many groups."

According to the news reporters, the research concluded: "This is a review of the CLL biology arising from work of many independent investigators who have used TCL1 transgenic mouse model focusing on pathogenetic, microenvironment and therapeutic targets."

For more information on this research see: TCL1 transgenic mouse model as a tool for the study of therapeutic targets and microenvironment in human B-cell chronic lymphocytic leukemia. *Cell Death & Disease*, 2016;7():e2071. (Nature Publishing Group -
Our news correspondents report that additional information may be obtained by contacting A. Bresin, Laboratorio di Oncologia Molecolare, Istituto Dermopatico dell’Immacolata, IDI-IRCCS, Rome, Italy. Environmental Research

Study Results from Institute of Clinical Physiology Broaden Understanding of Environmental Research (Risk perception and access to environmental information in four areas in Italy affected by natural or anthropogenic pollution)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Environmental Research are presented in a new report. According to news originating from Pisa, Italy, by NewsRx correspondents, research stated, "A human biomonitoring (HBM) survey in four areas affected by natural or anthropogenic arsenic pollution was conducted in Italy within the framework of the SEpiAs project. A questionnaire, including the exploration of risk perception (RP) regarding environmental hazards and access to and trust in information, was administered to 282 subjects stratified by area, gender and age."

Financial support for this research came from Ministry of Health, Italy.

Our news journalists obtained a quote from the research from the Institute of Clinical Physiology, "The survey was designed to investigate how populations living in polluted areas could adopt prevention-oriented habits, fostered by the awareness of existing risks and, in addition, how increased knowledge of RP and information flows could support researchers in identifying recommendations, and presenting and disseminating HBM results. This study characterizes the four areas in terms of RP and access to and trust in environmental information, and provides insights into the influence of RP and environmental information on food consumption. For the data analysis, a combined random forest (RF) and logistic regression approach was carried out. RF was applied to the variables derived from the questionnaire in order to identify the most important in terms of the aims defined. Associations were then tested using Fisher's exact test and assessed with logistic regression in order to adjust for confounders. Results showed that the perception of and personal exposure to atmospheric and water pollution, hazardous industries and waste, hazardous material transportation and waste was higher in geographical areas characterized by anthropogenic pollution. Citizens living in industrial areas appeared to be aware of environmental risks and had more confidence in environmental non-governmental organizations (NGOs) than in public authorities. In addition, they reported an insufficient circulation of information. Concerning the influence of RP and environmental information on food consumption, a high perception of personal exposure to atmospheric pollution and hazardous industries was associated with a lower consumption of local fish."
According to the news editors, the research concluded: "Different RPs and information flow patterns were observed in areas with arsenic of natural origin or in industrial contexts. These findings may be useful for targeted risk communication plans in support of risk management strategies."

For more information on this research see: Risk perception and access to environmental information in four areas in Italy affected by natural or anthropogenic pollution. Environment International, 2016;95():8-15. Environment International can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. Central Nervous System

Study Results from Institute of Gerontology Provide New Insights into Central Nervous System (Importance of P-gp PET Imaging in Pharmacology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System are presented in a new report. According to news originating from Tokyo, Japan, by NewsRx editors, the research stated, "Capillary endothelial cells in the brain express P-glycoprotein (P-gp), which works as a functional blood-brain barrier (BBB). P-gp pumps out multiple types of molecules from the brain parenchyma into the blood."

Our news journalists obtained a quote from the research from the Institute of Gerontology, "Therefore, altered P-gp function at the BBB will change the concentrations of therapeutic drugs in the central nervous system (CNS) and hence impact the toxicity and efficacy of CNS drugs. Positron emission tomography (PET) is the only way to non-invasively measure P-gp function in the living human brain. PET imaging of P-gp function was first demonstrated in 1998 with the substrate tracer racemic [C-11] verapamil. Since then, several drug interaction studies and proof-of-concept studies regarding drug resistance have been performed with P-gp PET imaging. Although preclinical findings have been very positive regarding the possibilities and importance of P-gp PET imaging, very few studies have shown the clinical relevance of P-gp PET imaging in different disorders of the brain."

According to the news editors, the research concluded: "This review summarizes the pharmacological studies with PET using substrate tracers and emphasizes the importance of PET imaging to understand the mechanism of action of CNS drugs."

For more information on this research see: Importance of P-gp PET Imaging in

**Health and Medicine - Integrated Care**

**Study Results from Institute of Technology in the Area of Integrated Care Reported (Discharge Planning: Screening Older Patients for Multidisciplinary Team Referral)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Integrated Care have been published. According to news originating from Napier, New Zealand, by NewsRx correspondents, research stated, "The objective was to determine whether the Elders Risk Assessment Index can predict multi-disciplinary team referral of older patients (>= 65 years) in Emergency Department same-day discharges. The study identified 1,376 qualifying individuals from a regional New Zealand hospital database."

Our news journalists obtained a quote from the research from the Institute of Technology, "Of these, 12.7 % were referred to the multi-disciplinary team. Univariate and multivariate analyses were used to explore associations between the Index, its components, and other demographic factors with referral. With every unit increase in the Index there was a 9% increase in the odds of being referred. When the components of the Index were analysed separately, an increased likelihood of being referred was associated with not being married, having had a previous hospital admission of more than five days, having chronic obstructive pulmonary disease, and being older. Conversely, a decreased likelihood was associated with having diabetes. When non-Index items were analysed it was found that females were more likely to be referred than males and that Maori were less likely to be referred than New Zealand Europeans."

According to the news editors, the research concluded: "With adaptation, the Elders Risk Assessment Index may provide a simple, cost-effective, and timely tool to assist in determining the need for multi-disciplinary team referral for older people who present to the Emergency Department."

For more information on this research see: Discharge Planning: Screening Older Patients for Multidisciplinary Team Referral. *International Journal of Integrated Care*, 2016;16():11-18. *International Journal of Integrated Care* can be contacted at: Ubiquity Press
Oncology - Non-Hodgkin Lymphoma

Study Results from International Agency for Research on Cancer Broaden Understanding of Non-Hodgkin Lymphoma (The burden of non-Hodgkin lymphoma in Central and South America)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Hodgkin Lymphoma have been published. According to news reporting originating in Lyon, France, by NewsRx journalists, research stated, "Rationale and objective: The burden of non-Hodgkin lymphoma (NHL) has increased in some Central and South American countries. We describe the current patterns and trends in NHL incidence and mortality in Central and South America."

The news reporters obtained a quote from the research from International Agency for Research on Cancer, "We obtained regional and national-level incidence data from 48 population-based cancer registries in 13 countries, and national-level cancer mortality data from the WHO mortality database for 18 countries. We estimated world population age-standardized incidence rates (ASRs) and mortality rates (ASMRs) per 100,000 person-years for 2003-2007, and presented distributions by histological subtype. NHL incidence and mortality rates varied between countries by 2-8- and 6-fold, respectively. ASRs per 100,000 ranged from 1.4 to 10.9 among males and 1.3-9.2 among females. Corresponding ASMRs were between 0.5 and 4.8 among males and between 0.5 and 3.0 among females. The highest incidence was observed in Uruguay (males), Ecuador, Peru and Colombia (males). The highest mortality was seen in Uruguay and Costa Rica. Trends in NHL incidence and mortality in Argentina, Brazil, Chile and Costa Rica did not show marked changes. B-cell neoplasms and NHL not otherwise specified (NOS) accounted for 44% and 34% of all NHL cases. Diffuse large B-cell lymphoma, NOS, was the most frequent histological subtype. The geographic variations in NHL rates may partially reflect differences in registration practices, disease classification, diagnostic practice, and death certification quality. There is a need for high-quality data and improvements in the accuracy of NHL histological diagnosis."

According to the news reporters, the research concluded: "Given the expected increase in NHL, careful monitoring of rates remains a priority to guide cancer control programs."

Our news correspondents report that additional information may be obtained by
Cardiovascular Diseases and Conditions - Thrombosis

Study Results from Istanbul University Broaden Understanding of Thrombosis (Behcet's disease: How to diagnose and treat vascular involvement)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Thrombosis is now available. According to news reporting originating from Istanbul, Turkey, by NewsRx editors, the research stated, "Behcet's disease is a multisystem disorder with unknown etiology and a unique geographic distribution. The disease is characterized by recurrent skin-mucosa lesions and sight-threatening panuveitis."

Our news editors obtained a quote from the research from Istanbul University, "Vascular involvement, which is more common and more severe among males, has also equally characteristic features such as affecting mostly veins, having a significant tendency for thrombosis, and running a relapsing course. Lower extremity vein thrombosis (LEVT) is the most frequent manifestation, followed by vena cava inferior thrombosis. Pulmonary artery involvement (PAI), the most common form of arterial involvement, manifests as aneurysms and 'in situ' thrombosis. PAI and Budd Chiari syndrome are the leading causes of increased mortality. In vascular cluster, typically, several types of venous or arterial vascular involvement may accumulate in the same individual. LEVI or cerebral venous sinus thrombosis is often present in these subgroups as the first event."

According to the news editors, the research concluded: "Immunosuppressive treatment is essential in preventing the attacks and increasing survival."

The news editors report that additional information may be obtained by contacting E. Seyahi, Istanbul University, Cerrahpasa Med Fac, Dept. of Med, Div Rheumatol, TR-81310 Istanbul, Turkey.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.berh.2016.08.002. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from JSS University in the Area of Cancer Therapy Reported (Nanosponge Carriers- An Archetype Swing in Cancer Therapy: A Comprehensive Review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Cancer Therapy are presented in a new report. According to news originating from Karnataka, India, by NewsRx correspondents, research stated, "Nanotechnology and nanomedicines are emerging research meadows; which chiefly focuses on creating and manipulating materials at a nanometer level for the betterment in imaging, diagnosis and treatment of a range of diseases together with cancer. Cyclodextrin-based nanosponges, anticipated as a new-fangled nanosized delivery system, are ground-breaking hyper-crosslinked cyclodextrin polymers nanostructured within a three-dimensional network."

Our news journalists obtained a quote from the research from JSS University, "Nanosponges based systems hold the potential of elevating the solubility, absorption, penetration, bioavailability, in vivo stability, targeted as well as sustained delivery, and therapeutic efficiency of numerous anticancer agents. The extension of nanosponges based drug delivery systems is an exhilarating and demanding research pasture, predominantly to overcome aforementioned problems allied to existing anticancer formulations and for the further progressions in cancer therapies. Nanosponges in cancer therapy, particularly cyclodextrin based nanosponges are brought up in this review."

According to the news editors, the research concluded: "By quoting diverse attempts made in pertinent direction, efforts have been made to exemplify the characteristics, suitability and versatility of cyclodextrin based nanosponges for their promising applications in cancer treatment."

The news correspondents report that additional information may be obtained from R.A. Osmani, Dept. of Pharmaceutics, JSS College of Pharmacy, JSS University, Sri Shivarakshethwara Nagar, Mysuru-570 015, Karnataka, India. Additional authors for this research include U. Hani, R.R. Bhosale, P.K. Kulkarni and S. Shanmuganathan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2174/138945011666151001105449. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from Jikei University in the Area of Kidney Transplants
Reported (Subclinical antibody-mediated rejection due to anti-human-leukocyte-antigen-DR53 antibody accompanied by plasma cell-rich acute rejection in a patient with cadaveric ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Transplant Medicine - Kidney Transplants are presented in a new report. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "A 56-year-old man who had undergone cadaveric kidney transplantation 21 months earlier was admitted to our hospital for a protocol biopsy; he had a serum creatinine level of 1.2mg/dL and no proteinuria. Histological features showed two distinct entities: (i) inflammatory cell infiltration, in the glomerular and peritubular capillaries and (ii) focal, aggressive tubulointerstitial inflammatory cell infiltration, predominantly plasma cells, with mild tubulitis (Banff 13 classification: i2, t1, g2, ptc2, v0, ci1, ct1, cg0, cv0)."

"Immunohistological studies showed mildly positive C4d immunoreactivity in the peritubular capillaries. The patient had donor specific antibody to human-leucocyte-antigen-DR53. We diagnosed him with subclinical antibody-mediated rejection accompanied by plasma cell-rich acute rejection. Both antibody-mediated rejection due to anti-human-leucocyte-antigen -DR53 antibodies and plasma cell-rich acute rejection are known to be refractory and have a poor prognosis. Thus, we started plasma exchange with intravenous immunoglobulin and rituximab for the former and 3 days of consecutive steroid pulse therapy for the latter. Three months after treatment, a follow-up allograft biopsy showed excellent responses to treatment for both histological features."

According to the news reporters, the research concluded: "This case report considers the importance of an early diagnosis and appropriate intervention for subclinical antibody-mediated rejection due to donor specific antibody to human leucocyte-antigen-DR53 and plasma cell-rich acute rejection."

Keywords for this news article include: Tokyo, Japan, Asia, Hemic and Immune Systems, Transplant Medicine, Kidney Transplants, Organ Transplants, Immunoglobulins, Transplantation, Blood Proteins, B-Lymphocytes, Plasma Cells, Blood Cells, Biomedicine, Immunology, Leukocytes, Antibodies, Jikei University.

Oncology - Lung Cancer

Study Results from Jilin University Broaden Understanding of Lung Cancer (The proceedings of brain metastases from lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Lung Cancer is now available. According to news originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "Brain tumors include primary tumors of various intracranial tissue and secondary intracranial tumors that transferred from other parts of the body. Secondary intracranial tumors are especially prevalent in patients with lung cancer."

Our news journalists obtained a quote from the research from Jilin University, "The mechanisms of lung cancer with brain metastases are complicated, they are affected by a variety of factors. Thus, identifying the mechanisms of lung cancer with brain metastases will have far-reaching meanings both for clinic pharmacy research and for a better quality of life for patients; Brain metastases from lung cancer represent a prevalent and challenging clinical dilemma, and some research suggests that the outcomes and characteristics of brain metastases that result from lung cancer primary sites are perhaps different than those from other primary sites, therefore increasing the difficulty of clinical treatment. Despite steady research developments during recent years, the survival rates remain poor."

According to the news editors, the research concluded: "The mechanisms and therapeutic options for treating brain metastases arising from lung cancer are review in this article."

For more information on this research see: The proceedings of brain metastases from lung cancer. Open Life Sciences, 2016;11(1):116-121. Open Life Sciences can be contacted at: De Gruyter Open Ltd, Bogumila Zuga 32A St, 01-811 Warsaw, Poland.

The news correspondents report that additional information may be obtained from Z. An, Jilin University, Dept. of Cardiol, China Japan Union Hosp, Changchun 130033, People's Republic of China. Additional authors for this research include G.J. Li, C.L. Yu and Z. An.

Cell Research - Blood Cells

Study Results from Juntendo University Broaden Understanding of Blood Cells [Leukocyte concentration and composition in platelet-rich plasma (PRP) influences the growth factor and protease concentrations]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cell Research - Blood Cells. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "Platelet-rich plasma (PRP) therapy has become an increasingly popular treatment for orthopaedics and sports-related injuries, and various clinically available PRP preparation
methods exist. However, the differences in PRP quality among numerous preparation methods remain unclear."

The news reporters obtained a quote from the research from Juntendo University, "Specifically, the benefit of including leukocytes in the PRP product remains controversial, and few studies have been conducted to evaluate the effects of the interaction between platelets and leukocytes on the growth factor concentrations. The aim of the present study was to compare the biological characteristics of PRPs focusing on the leukocyte concentration and composition. Leucocyte rich (LR)-PRP, leucocyte poor (LP)-PRP, and pure-PRP were prepared from the peripheral blood of 6 healthy male volunteers (mean age: 31.3 years). The concentrations of platelets, leukocytes, erythrocytes, growth factors (transforming growth factor-beta 1: TGF-beta 1; fibroblast growth factor-basic: FGF-beta; platelet-derived growth factor-BB: PDGF-BB; vascular endothelial growth factor: VEGF) and matrix metalloproteinase-9 (MMP-9) from each of the PRP samples were measured. Considering the interaction between platelets and leukocytes, correlations between platelets/leukocytes and growth factors/MMP-9 were analyzed using partial correlation coefficients. The platelet concentration did not differ among the three PRP preparation methods. Conversely, the leukocyte concentration was dramatically different: 14.9 +/- 4.5 (10^3/mu l) in LR-PRP, 2.4 +/- 1.3 (10^3/mu l) in LP-PRP, 0.2 +/- 0.2 (10^3/mu l) in pure-PRP. The platelet concentration positively correlated with all growth factors. On the other hand, the leukocyte concentration positively correlated with PDGF-BB and the VEGF concentration, while it negatively correlated with FGF-beta. Regarding catabolic factors, the MMP-9 concentration strongly correlated with the leukocyte concentration, while there was no correlation between the platelet and MMP-9 concentrations. These findings demonstrate that leukocytes strongly influence the quality of PRPs."

According to the news reporters, the research concluded: "Therefore, modifying the PRP preparation method according to the pathology is essential to achieve better clinical results with PRP therapy."

Our news correspondents report that additional information may be obtained by contacting Y. Saita, Juntendo University, Fac Med, Dept. of Orthopaed, Tokyo, Japan. Additional authors for this research include Y. Saita, H. Nishio, H. Ikeda, Y. Takazawa, M. Nagao, T. Takaku, N. Komatsu and K. Kaneko.

Drugs and Therapies - Antiretrovirals

Study Results from K.G. Bhavani et al Provide New Insights into Antiretrovirals (Determination of genotoxic impurity in atazanavir sulphate drug substance by LC-MS)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antiretrovirals are presented in a new report. According to news reporting from Andhra Pradesh, India, by NewsRx journalists, research stated, "A sensitive LC-MS method was developed for the determination of tert-butyl 2-[4-(pyridine-2-yl)benzyl] hydrazine carboxylate (GTI-A), a genotoxic impurity in Atazanavir sulphate drug substance. The method was validated as per International Council for Harmonization guidelines, for QL, DL, linearity and accuracy."

The news correspondents obtained a quote from the research, "The QL and DL values obtained were 1.1 ppm and 0.3 ppm respectively. The Correlation coefficient found for the linearity study was 0.999."

According to the news reporters, the research concluded: "The % recovery of the added impurity in the range of 96.4-100.4 ensured the accuracy of the method."

For more information on this research see: Determination of genotoxic impurity in atazanavir sulphate drug substance by LC-MS. *Journal of Pharmaceutical and Biomedical Analysis*, 2017;132():156-158.* Journal of Pharmaceutical and Biomedical Analysis* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Cardiovascular Diseases

Study Results from Kaohsiung Medical University Update Understanding of Cardiovascular Diseases (Angiopoietin-2, Angiopoietin-1 and subclinical cardiovascular disease in Chronic Kidney Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases is the subject of a report. According to news reporting originating in Kaohsiung, Taiwan, by NewsRx journalists, research stated, "Angiopoietins (Angpt) and vascular endothelial growth factor (VEGF) have been associated with cardiovascular disease. The study enrolled 270 pre-dialysis stage 3-5 CKD patients to assess the link between circulating Angpt2, Angpt1 and VEGF-A and subclinical
measures of cardiovascular structure and function."

The news reporters obtained a quote from the research from Kaohsiung Medical University, "Serum markers of angiogenesis were measured using commercial enzyme-linked immunosorbent assays. Cardiac structure and function were examined by echocardiography. Brachial-ankle pulse wave velocity (baPWV) was measured by the ankle-brachial index. The adjusted mean of left ventricular mass index (LVMI) was 2.05 in patients of Angpt2 quartile 4 and 1.99 in those of Angpt2 quartile 1 (P = 0.04). Angpt2 was significantly associated with LV hypertrophy (LVH) (Angpt2 quartile 4 compared with Angpt2 quartile 1: adjusted OR: 2.68, 95% CI: 1.15-6.20). Angpt1 was negatively correlated with left atrial diameter (adjusted mean of LAD: 3.59 in Angpt1 quartile 4, 3.92 in Angpt1 quartile 1, P = 0.03). A positive and significant correlation was found between Angpt2 level and baPWV in spearman's correlation, but not in adjusted model."

According to the news reporters, the research concluded: "High Angpt2 and low Angpt1 levels were positively associated with abnormal cardiac structure in stages 3-5 CKD patients, which is compatible with the viewpoint that angiopoietins participates in cardiovascular burdens."

Our news correspondents report that additional information may be obtained by contacting M.C. Kuo, Kaohsiung Medical University, Fac Renal Care, Kaohsiung, Taiwan. Additional authors for this research include C.S. Lee, Y.W. Chiu, H.T. Kuo, S.C. Lee, S.J. Hwang, M.C. Kuo and H.C. Chen.

Keywords for this news article include: Kaohsiung, Taiwan, Asia, Intercellular Signaling Peptides and Proteins, Cardiovascular Diseases and Conditions, Angiogenic Proteins, Angiopoietin-1, Angiopoietin-2, Angiopoietins, Cardiology, Kaohsiung Medical University.

Oncology - Esophageal Cancer

Study Results from Karolinska Institute in the Area of Esophageal Cancer Reported (Prevalence and predictors of anxiety and depression among esophageal cancer patients prior to surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Esophageal Cancer have been published. According to news reporting out of Stockholm, Sweden, by NewsRx editors, research stated, "This study aims to establish the prevalence and predictors of anxiety and depression among esophageal cancer patients, post-diagnosis but prior to curatively intended surgery. This was a cross-sectional study using data from a hospital-based prospective cohort study, carried out at St Thomas' Hospital, London."

Our news journalists obtained a quote from the research from Karolinska Institute, "Potential predictor variables were retrieved from medical charts and self-report questionnaires.
Anxiety and depression were measured prior to esophageal cancer surgery, using the Hospital Anxiety and Depression Scale. Prevalence of anxiety and depression was calculated using the established cutoff (scores 8 on each subscale) indicating cases of possible-probable anxiety or depression, and multivariable logistic regression analyses were performed to examine predictors of emotional distress. Among the 106 included patients, 36 (34%) scored above the cutoff (8) for anxiety and 24 (23%) for depression. Women were more likely to report anxiety than men (odds ratio 4.04, 95% confidence interval 1.45-11.16), and patients reporting limitations in their activity status had more than five times greater odds of reporting depression (odds ratio 6.07, 95% confidence interval 1.53-24.10)."

According to the news editors, the research concluded: "A substantial proportion of esophageal cancer patients report anxiety and/or depression prior to surgery, particularly women and those with limited activity status, which highlights a need for qualified emotional support."

Our news journalists report that additional information may be obtained by contacting Y. Hellstadius, Karolinska Inst, Surg Care Sci, Stockholm, Sweden. Additional authors for this research include J. Lagergren, J. Zylstra, J. Gossage, A. Davies, C.M. Hultman, P. Lagergren and A. Wikman.

Immunology - Immunoglobulins

Study Results from Karolinska University Hospital Provide New Insights into Immunoglobulins (Targeting Receptor Tyrosine Kinases Using Monoclonal Antibodies: The Most Specific Tools for Targeted-Based Cancer Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Immunoglobulins. According to news reporting from Stockholm, Sweden, by NewsRx journalists, research stated, "Receptor tyrosine kinases (RTKs) family is comprised of different cell surface glycoproteins. These enzymes participate in and regulate vital processes such as cell proliferation, polarity, differentiation, cell to cell interactions, signaling, and cell survival."

The news correspondents obtained a quote from the research from Karolinska University Hospital, "Dysregulation of RTKs contributes to the development of different types of tumors. RTKs deregulation in different types of cancer has been reported for more than 30 RTKs. Due to their critical roles, the specific targeting of RTKs in malignancies is a promising approach. Targeted cellular and molecular therapies (personalized medicine) have been known as new types of therapeutics, which prevent tumor cell proliferation and invasion by interfering with molecules essential for tumor growth and survival. Specific targeting of RTKs using monoclonal antibodies (mAbs) in malignancies as well as in autoimmune disorders is of great
interest. The growing number of mAbs approved by the authorities implies on the increasing attentions and applications of these therapeutic tools. Due to the high specificity, mAbs are the most promising substances that target RTKs expressed on the tumor cell surface."

According to the news reporters, the research concluded: "In this communication, we review the recent progresses in the development of mAbs targeting oncogenic RTKs for cancer treatment."

Our news journalists report that additional information may be obtained by contacting M. Hojjat-Farsangi, Dept. of Oncology-Pathology, Cancer Center Karolinska (CCK), Karolinska University Hospital, Solna, SE-171 76 Stockholm, Sweden.

**Health and Medicine - Dermatology**

**Study Results from Kawasaki Medical University in the Area of Dermatology Reported (Numerous intertriginous xanthomas in infant: A diagnostic clue for sitosterolemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Dermatology have been published. According to news reporting from Kurashiki, Japan, by NewsRx journalists, research stated, "Sitosterolemia is a very rare autosomal recessive lipoprotein metabolic disorder caused by homozygous or compound heterozygous mutations in one of the two adenosine triphosphate-binding cassette transporter genes, ABCG5 and ABCG8. Sitosterolemia is clinically characterized by xanthomas and atherosclerosis, arthritis, fever, hemolysis and macrothrombocytopenia even in early childhood."

Financial support for this research came from Kawasaki Medical School.

The news correspondents obtained a quote from the research from Kawasaki Medical University. "We described a 16-month-old girl, who had numerous yellowish-brown intertriginous xanthomas along the skin creases on the extremities with severe hypercholesterolemia and elevated plant sterol levels. Histopathologically, xanthoma showed aggregation of foam cells in the dermis with a zone of mucin deposits in the dermal papilla. Electron microscopy showed numerous membrane-bound lipid droplets and multivesicular lipid bodies in the foam cells, a round cell containing lipid droplets in the basal cell layer and abundant mucin deposits just beneath the basal lamina. Diagnosis of sitosterolemia was confirmed by DNA sequencing showing compound heterozygosity for previously reported missense mutations in exon 9 of ABCG5."
According to the news reporters, the research concluded: "Infants presenting with multiple xanthomas should be investigated for sitosterolemia, if there is no family history of dyslipidemia."

Our news journalists report that additional information may be obtained by contacting T. Yamamoto, Kawasaki Med Univ, Dept. of Dermatol, Kurashiki, Okayama 7010192, Japan. Additional authors for this research include J. Matsuda, S. Dateki, K. Ouchi and W. Fujimoto.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1346-8138.13511. This DOI is a link to an online electronic document that is either free or for purchase.

**RNA Viruses - Influenza A Virus**

**Study Results from Korea Advanced Institute of Science and Technology (KAIST) Provide New Insights into Influenza A Virus (Structural features of influenza A virus panhandle RNA enabling the activation of RIG-I independently of 5'-triphosphate)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on RNA Viruses - Influenza A Virus. According to news reporting originating from Daejeon, South Korea, by NewsRx correspondents, research stated, "Retinoic acid-inducible gene I (RIG-I) recognizes specific molecular patterns of viral RNAs for inducing type I interferon. The C-terminal domain (CTD) of RIG-I binds to double-stranded RNA (dsRNA) with the 5'-triphosphate (5'-PPP), which induces a conformational change in RIG-I to an active form."

Our news editors obtained a quote from the research from the Korea Advanced Institute of Science and Technology (KAIST), "It has been suggested that RIG-I detects infection of influenza A virus by recognizing the 5'-triphosphorylated panhandle structure of the viral RNA genome. Influenza panhandle RNA has a unique structure with a sharp helical bending. In spite of extensive studies of how viral RNAs activate RIG-I, whether the structural elements of the influenza panhandle RNA confer the ability to activate RIG-I signaling has been poorly explored."

According to the news editors, the research concluded: "Here, we investigated the dynamics of the influenza panhandle RNA in complex with RIG-I CTD using NMR spectroscopy and showed that the bending structure of the panhandle RNA negates the requirement of a 5'-PPP moiety for RIG-I activation."

For more information on this research see: Structural features of influenza A virus panhandle RNA enabling the activation of RIG-I independently of 5'-triphosphate. *Nucleic
Peptide Proteins - Posterior Pituitary Hormones

Study Results from L. Gebauer and Colleagues Broaden Understanding of Posterior Pituitary Hormones (Oxytocin improves synchronisation in leader-follower interaction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Peptide Proteins - Posterior Pituitary Hormones have been published. According to news originating from Aarhus, Denmark, by NewsRx correspondents, research stated, "The neuropeptide oxytocin has been shown to affect social interaction. Meanwhile, the underlying mechanism remains highly debated."

Our news journalists obtained a quote from the research, "Using an interpersonal finger-tapping paradigm, we investigated whether oxytocin affects the ability to synchronise with and adapt to the behaviour of others. Dyads received either oxytocin or a non-active placebo, intranasally. We show that in conditions where one dyad-member was tapping to another unresponsive dyad-member -i.e. one was following another who was leading/self-pacing - dyads given oxytocin were more synchronised than dyads given placebo. However, there was no effect when following a regular metronome or when both tappers were mutually adapting to each other. Furthermore, relative to their self-paced tapping partners, oxytocin followers were less variable than placebo followers. Our data suggests that oxytocin improves synchronisation to an unresponsive partner's behaviour through a reduction in tapping-variability. Hence, oxytocin may facilitate social interaction by enhancing sensorimotor predictions supporting interpersonal synchronisation."

According to the news editors, the research concluded: "The study thus provides novel perspectives on how neurobiological processes relate to socio-psychological behaviour and contributes to the growing evidence that synchronisation and prediction are central to social cognition."

The news correspondents report that additional information may be obtained from M.A.G. Witek, Royal Academy Mus Aarhus Aalborg, Aarhus, Denmark. Additional authors for
this research include M.A.G. Witek, N.C. Hansen, J. Thomas, I. Konvalinka and P. Vuust.

Keywords for this news article include: Aarhus, Denmark, Europe, Posterior Pituitary Hormones, Peptide Proteins, Peptide Hormones, Oxytocin.

Butyric Acids

**Study Results from L. Giampietro and Colleagues in the Area of Butyric Acids Reported (Synthesis of Naphthyl-, Quinolin- and Anthracenyl Analogues of Clofibric Acid as PPARa Agonists)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Butyric Acids are presented in a new report. According to news reporting out of Chieti, Italy, by NewsRx editors, research stated, "PPARα is a ligand activated transcription factor belonging to the nuclear receptor subfamily, involved in fatty acid metabolism in tissues with high oxidative rates such as muscle, heart and liver. PPARα activation is important in steatosis, inflammation and fibrosis in preclinical models of non-alcoholic fatty liver disease identifying a new potential therapeutic area."

Financial support for this research came from Università degli Studi G. d'Annunzio Chieti - Pescara.

Our news journalists obtained a quote from the research, "In this work, three series of clofibric acid analogues conjugated with naphthyl, quinolin, chloroquinolin and anthracenyl scaffolds were synthesized. In an effort to obtain new compounds active as PPARα agonists, these molecules were evaluated for PPARα transactivation activity."

According to the news editors, the research concluded: "Naphthyl and quinolin derivatives showed a good activation of PPARα; noteworthy, optically active naphthyl derivatives activated PPARα better than corresponding parent compound."

Our news journalists report that additional information may be obtained by contacting L. Giampietro, Dipartimento di Farmacia, Universita G d'Annunzio di Chieti, via dei Vestini, 66100, Chieti, Italy. Additional authors for this research include A. Ammazzalorso, I. Bruno, S. Carradori, B. De Filippis, M. Fantacuzzi, A. Giancristofaro, C. Maccallini and R. Amoroso.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/cbdd.12677. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from L. Wymore and Colleagues Update Understanding of Sports Medicine (Performance and Injury Characteristics of Pitchers Entering the Major League Baseball Draft After Ulnar Collateral Ligament Reconstruction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Sports Medicine have been published. According to news reporting originating from Leonardtown, Maryland, by NewsRx correspondents, research stated, "Ulnar collateral ligament (UCL) reconstruction (UCLR) has been studied and shown to be a successful procedure for returning overhead athletes to sport. Many studies of Major League Baseball (MLB) players have shown high levels of return to play with successful statistical performance."

Our news editors obtained a quote from the research, "No study has followed professional advancement of drafted pitchers who underwent UCLR as amateurs when compared with drafted pitchers who did not undergo the procedure before selection in the MLB draft. There would be no difference in professional advancement, statistical performance, or injury rate between the UCLR and control groups. Cohort study; Level of evidence, 3. Thirty-eight pitchers with a UCLR as an amateur and 114 controls were identified in the MLB draft between 2006 and 2010. Highest level of professional baseball achieved was collected from all players, as well as statistical performance metrics including velocity, wins, earned run average (ERA), and walks and hits per inning pitched (WHIP). Additional data on future injuries were analyzed for days on the disabled list (DL), risk of being placed on the DL, and DL assignment for elbow injury. Thirteen of 38 UCLR pitchers reached the major league level (34.2%) compared with 29 of 114 (25.4%) control pitchers, which was not statistically significant (P = .295). The UCLR and control groups were similar for average velocity, peak velocity, innings pitched, games, games started, innings per game, ERA, WHIP, wins, losses, saves, batters faced, and innings pitched per year, as well as hits, runs, home runs allowed, strikeouts, batters walked, and batters struck per inning. The UCLR group had a significantly increased rate of DL assignment when compared with controls (86.8% vs 64.0%; P = .008); however, days on DL (152.8 vs 135.6; P = .723) and DL assignment for elbow injury (45.5% vs 43.8%; P = .877) were similar. There was no difference in the rate of professional advancement among pitchers drafted by the MLB who had undergone UCLR as amateurs compared with controls. Both groups had similar statistical performance."

According to the news editors, the research concluded: "Pitchers in the UCLR group had an increased risk of DL assignment but no increase in the number of days on DL or risk of DL placement for elbow injury."

Study Results from La Timone Hospital Update Understanding of Psychosocial (Disclosure of research results: a randomized study on GENEPSO-PS cohort participants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Psychosocial. According to news reporting originating from Marseille, France, by NewsRx correspondents, research stated, "There exist no recommendations as to how aggregate research results should best be disclosed to long-term cohort participants. To study the impact of cohort results disclosure documents of various kinds on participants' satisfaction."

Financial support for this research came from Institut National Du Cancer.

Our news editors obtained a quote from the research from La Timone Hospital, "Randomized study with a 2x2 factorial design. The GENEPSO-PS cohort is used to study the psychosocial characteristics and preventive behaviour of both BRCA1/2 carriers and non-carriers; 235 participants wishing to receive 'information about the survey results' answered a self-administered questionnaire. The impact of providing the following items in addition to a leaflet about aggregate psychosocial research results was investigated (i) an up-to-date medical information sheet about BRCA1/2 genetic topics, (ii) a photograph with the names of the researchers. Satisfaction profiles drawn up using cluster analysis methods. Providing additional medical and/or research team information had no significant effect on satisfaction. The patients attributed to the 'poorly satisfied' group (n = 60, 25.5%) differed significantly from those in the 'highly satisfied' group (n = 51, 21.7%): they were younger [odds ratio (OR) = 0.96, 95% confidence interval (0.92-0.99), P = 0.028], less often had a daughter [OR = 4.87 (1.80-13.20), P = 0.002], had reached a higher educational level [OR = 2.94 (1.24-6.95), P = 0.014] and more frequently carried a BRCA1/2 mutation [OR = 2.73 (1.20-6.23), P = 0.017]. This original approach to disclosing research results to cohort participants was welcomed by most of the participants, but less by the more educated and by BRCA1/2 carriers."

According to the news editors, the research concluded: "Although an easily understandable document is necessary, it might also be worth providing some participants with more in-depth information."

The news editors report that additional information may be obtained by contacting J. Mancini, Hopital La Timone, APHM, BiosTIC, Marseille, France. Additional authors for this research include E. Le Cozannet, A.D. Bouhnik, N. Ressegui, C. Lasset, E. Mouret-Fourme, C. Nogues and C. Julian-Reynier.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/hex.12390. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Marseille, France, Europe, Psychosocial, Genetics, BRCA1, La Timone Hospital.

Heart Disorders and Diseases - Heart Disease

Study Results from Lanzhou University in the Area of Heart Disease Reported (Efficacy and safety of long-term treatment with statins for coronary heart disease: A Bayesian network meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Disease is now available. According to news originating from Lanzhou, People's Republic of China, by NewsRx correspondents, research stated, "Our study aims to evaluate the efficacy and safety of long-term treatment of statins for coronary heart disease (CHD). Efficacy outcomes included changes in blood lipids, risk of CHD mortality and all-cause mortality."

Our news journalists obtained a quote from the research from Lanzhou University, "Safety outcomes were evaluated by the risk of adverse events (AE). Bayesian network meta-analysis was used to compare the direct and indirect effects between different statins. The systematic review showed that levels of blood lipids decreased during statin treatment. High dose of atorvastatin was the most obvious treatment for the reduction of blood lipids. Network meta-analysis showed that statins were significantly more effective than the control in reducing the risk of CHD mortality (Odds Ratio (OR) 0.69, 95% CI 0.61-0.77) and all-cause mortality (OR 0.84, 95% CI 0.80-0.87). In terms of reducing the risk of CHD morality, fluvastatin (77.3%), atorvastatin (72.3%) and lovastatin (68.4%) had higher cumulative probability than other statins, which were more effective treatments for the reduction of CHD mortality. In terms of reducing all-cause mortality, atorvastatin (78.6%), fluvastatin (77.1%) and pitavastatin (74.1%) had higher cumulative probability than other statins, which were more effective treatment for reducing the all-cause mortality. Compared with placebo, statins increased the incidence risk of muscle disease (OR 1.05, 95% CI 1.00-1.10) and kidney disease (OR 1.11, 95% CI 1.05-1.72). Statins significantly reduced levels of blood lipids, with a high dose of atorvastatin being the most effective in blood-lipid level modification. Statins reduced the risk of CHD mortality and all-cause mortality, with atorvastatin and fluvastatin being the most effective in reducing the risk of CHD mortality and all-cause mortality."

According to the news editors, the research concluded: "Statins increased the risk of muscle disease and kidney damage."

For more information on this research see: Efficacy and safety of long-term treatment with statins for coronary heart disease: A Bayesian network meta-analysis. *Atherosclerosis*, 2016;254():215-227. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd,
Oncology - Breast Cancer

Study Results from Laval University Broaden Understanding of Breast Cancer [Evaluation of human epidermal growth factor receptor 2 (HER2) single nucleotide polymorphisms (SNPs) in normal and breast tumor tissues and their link with breast cancer ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting originating in Quebec City, Canada, by NewsRx journalists, research stated, "Amplification of the human epidermal growth factor receptor 2 (HER2) gene is associated with worse prognosis and decreased overall survival in breast cancer patients. The HERZ gene contains several polymorphisms; two of the best-characterized HER2 polymorphisms are Ile655Val and Ala1170Pro."

Financial supporters for this research include Fonds de recherche du Quebec - Sante, Laval University Cancer Research Center.

The news reporters obtained a quote from the research from Laval University, "The aim of this study was to evaluate the association between these two HER2 polymorphisms in normal breast and breast cancer tissues and known breast cancer prognostic factors in a retrospective cohort study of 73 women with non-metastatic HER2-positive breast cancer. HER2 polymorphisms were assessed in breast cancer tissue and normal breast tissue using TaqMan assay. Ala1170Pro polymorphism in normal breast tissue was associated with age at diagnosis (p = 0.007), tumor size (p = 0.004) and lymphovascular invasion (p = 0.06). Similar significant associations in cancer tissues were observed. No association between the Ile655Val polymorphism and prognostic factors were observed. However, we found significant differences in the distribution of Ile655Val (p = 0.03) and Ala1170Pro (p = 0.01) genotypes between normal breast and breast tumor tissues. This study demonstrates that only the Ala1170Pro polymorphism is associated with prognostic factors in HER2-positive breast cancer patients."

According to the news reporters, the research concluded: "Moreover, our results suggest that both HER2 polymorphisms could play a significant role in carcinogenesis in non-metastatic HER2-positive breast cancer women."

Our news correspondents report that additional information may be obtained by contacting C. Diorio, Laval University, Fac Med, Quebec City, PQ G1V 0A6, Canada. Additional authors for this research include J. Lemieux, Cote MA, L. Provencher, C. Laflamme, F. Barabe, S. Jacob, A. Michaud and C. Diorio.

Cytokines

**Study Results from Lomonosov Moscow State University Update Understanding of Cytokines (Myeloid-derived suppressor cells and proinflammatory cytokines as targets for cancer therapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cytokines. According to news reporting from Moscow, Russia, by NewsRx journalists, research stated, "Myeloid-derived suppressor cells represent a heterogeneous population of immature myeloid cells. Under normal conditions, these cells differentiate into macrophages, dendritic cells, and granulocytes."

The news correspondents obtained a quote from the research from Lomonosov Moscow State University, "However, in pathological states such as inflammation, infection, or tumor growth, there is an arrest of their differentiation that results in the accumulation of immature myeloid cells in the organism. In addition, these cells acquire a suppressor phenotype, expressing anti-inflammatory cytokines and reactive oxygen and nitrogen species, and suppress T-cell immune response. Myeloid-derived suppressor cells (MDSC) contribute to cancerogenesis by forming a favorable microenvironment for tumor growth. Proinflammatory cytokines, secreted by tumor cells and the tumor microenvironment, induce angiogenesis and metastasis and promote tumor growth. They also provide signals necessary for survival, accumulation, and function of MDSC."

According to the news reporters, the research concluded: "Understanding the mechanisms of myeloid suppressor cell development and the use of proinflammatory cytokine inhibitors may prove beneficial for tumor therapy."

For more information on this research see: Myeloid-derived suppressor cells and proinflammatory cytokines as targets for cancer therapy. *Biochemistry-Moscow*, 2016;81(11):1274-1283. *Biochemistry-Moscow* can be contacted at: Maik Nauka, Interperiodica, Springer, 233 Spring St, New York, NY 10013-1578, USA.
Our news journalists report that additional information may be obtained by contacting M.S. Drutskaya, Lomonosov Moscow State Univ, Fac Biol, Moscow 119991, Russia. **Oncology - Breast Cancer**

**Study Results from London School of Hygiene and Tropical Medicine Broaden Understanding of Breast Cancer (No 'cure' within 12 years of diagnosis among breast cancer patients who are diagnosed via mammographic screening: women diagnosed in the ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "We have previously reported that there is little evidence of population 'cure' among two populations of women diagnosed with invasive breast cancer. 'Cure' has not yet been examined in the context of screen-detection. We examined cancer registry data on 19 800 women aged 50-70, diagnosed with a primary, invasive, non-metastatic breast cancer between 1 April 1989 and 31 March 2011 in the West Midlands region of England, linked to Hospital Episode Statistics (HES) and the National Breast Screening Service (NBSS)."

The news reporters obtained a quote from the research from the London School of Hygiene and Tropical Medicine, "Follow-up was complete on all women up to 31 July 2012. Analyses were stratified by screening status, age, tumour stage, deprivation and ethnicity. We estimated net survival for the whole cohort and each subgroup. Population 'cure' was evaluated by fitting flexible parametric log-cumulative excess hazard regression models in which the excess hazard of breast cancer death was assumed to be equal to zero after a given follow-up time. There was an overall lack of evidence for 'cure'. Across all subgroups examined, the general pattern was that of a continuous decrease in net survival over time, with no obvious asymptotic tendency within 12 years of follow-up. Model-based analyses confirmed this observation. Despite dramatic improvements in survival over past decades, diagnosis with breast cancer remains associated with a small but persistent increased risk of death for all groups of women, including those whose cancer is detected asymptomatically. These findings are unlikely to be due to methodological inadequacies."

According to the news reporters, the research concluded: "Communication of these long-term consequences of breast cancer among women recently diagnosed and to those considering undergoing screening should take due consideration of these patterns."

Lung Diseases and Conditions - Chronic Obstructive... Study Results from Lund University Broaden Understanding of Chronic Obstructive Pulmonary Disease (Oxygen for breathlessness in patients with chronic obstructive pulmonary disease who do not qualify for home oxygen therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease. According to news reporting originating in Lund, Sweden, by NewsRx journalists, research stated, "Breathlessness is a cardinal symptom of chronic obstructive pulmonary disease (COPD). Long-term oxygen therapy (LTOT) is given to improve survival time in people with COPD and severe chronic hypoxaemia at rest."

The news reporters obtained a quote from the research from Lund University, "The efficacy of oxygen therapy for breathlessness and health-related quality of life (HRQOL) in people with COPD and mild or no hypoxaemia who do not meet the criteria for LTOT has not been established. To determine the efficacy of oxygen versus air in mildly hypoxaemic or non-hypoxaemic patients with COPD in terms of (1) breathlessness; (2) HRQOL; (3) patient preference whether to continue therapy; and (4) oxygen-related adverse events. Search methods We searched the Cochrane Airways Group Register, the Cochrane Central Register of Controlled Trials (CENTRAL), MEDLINE and Embase, to 12 July 2016, for randomised controlled trials (RCTs). We handsearched the reference lists of included articles. Selection criteria We included RCTs of the effects of non-invasive oxygen versus air on breathlessness, HRQOL or patient preference to continue therapy among people with COPD and mild or no hypoxaemia (partial pressure of oxygen (PaO2) >7.3 kPa) who were not already receiving LTOT. Two review authors independently assessed articles for inclusion in the review. Data collection and analysis Two review authors independently collected and analysed data. We assessed risk of bias by using the Cochrane 'Risk of bias tool'. We pooled effects recorded on different scales as standardised mean differences (SMDs) with 95% confidence intervals (CIs) using random-effects models. Lower SMDs indicated decreased breathlessness and reduced HRQOL. We performed subanalyses and sensitivity analyses and assessed the quality of evidence according to the Grading of Recommendations, Assessment, Development and Evaluations (GRADE) approach. Compared with the previous review, which was published in 2011, we included 14 additional studies (493 participants), excluded one study and included data for meta-analysis of HRQOL. In total, we included in this review 44 studies including 1195 participants, and we included 33 of these (901 participants) in the meta-analysis. We found that..."
breathlessness during exercise or daily activities was reduced by oxygen compared with air (32 studies; 865 participants; SMD -0.34, 95% CI -0.48 to -0.21; I² = 37%; low-quality evidence). This translates to a decrease in breathlessness of about 0.7 points on a 0 to 10 numerical rating scale. In contrast, we found no effect of short-burst oxygen given before exercise (four studies; 90 participants; SMD 0.01, 95% CI -0.26 to 0.28; I² = 0%; low-quality evidence). Oxygen reduced breathlessness measured during exercise tests (25 studies; 442 participants; SMD -0.34, 95% CI -0.46 to -0.22; I² = 29%; moderate-quality evidence), whereas evidence of an effect on breathlessness measured in daily life was limited (two studies; 274 participants; SMD -0.13, 95% CI, -0.37 to 0.11; I² = 0%; low-quality evidence). Oxygen did not clearly affect HRQOL (five studies; 267 participants; SMD 0.10, 95% CI -0.06 to 0.26; I² = 0%; low-quality evidence). Patient preference and adverse events could not be analysed owing to insufficient data. Authors’ conclusions We are moderately confident that oxygen can relieve breathlessness when given during exercise to mildly hypoxaemic and non-hypoxaemic people with chronic obstructive pulmonary disease who would not otherwise qualify for home oxygen therapy. Most evidence pertains to acute effects during exercise tests, and no evidence indicates that oxygen decreases breathlessness in the daily life setting."

According to the news reporters, the research concluded: "Findings show that oxygen does not affect health-related quality of life."

For more information on this research see: Oxygen for breathlessness in patients with chronic obstructive pulmonary disease who do not qualify for home oxygen therapy. *Cochrane Database of Systematic Reviews*, 2016;(11):1912-2038.  *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Drugs and Therapies - Female Contraceptive Agents

**Study Results from M. Rotermann et al Provide New Insights into Female Contraceptive Agents (Oral contraceptive use among women aged 15 to 49: Results from the Canadian Health Measures Survey)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Female Contraceptive Agents is the subject of a report. According to news reporting originating in Ottawa, Canada, by NewsRx journalists, research stated, "Oral contraceptives (OCs) have been available in Canada for over 50 years and are the most commonly used method of reversible contraception. OCs have evolved over time, with decreasing estrogen doses, new progestins, and different dosing regimens."

The news reporters obtained a quote from the research, "Detailed data about OC use
among Canadian women are lacking. Data from Statistics Canada's 2007/2009 and 2009/2011 Canadian Health Measures Survey (CHMS) were used to estimate OC use, by selected sociodemographic characteristics, cardiovascular risk factors, and estrogen dose and progestin type. Logistic regression was used to model relationships between OC use and sociodemographic factors. An estimated 1.3 million (16%) women aged 15 to 49 reported taking OCs in the previous month. OC use decreased with age (30% among 15-to 19-year-olds; 3% among 40-to 49-year-olds). OC users were significantly more likely than non-users to be nulliparous, sexually active and Canadian-born. At ages 35 to 49, users were less likely than non-users to have one or more cardiovascular risk factors. Almost all (99%) OC users took combined formulations containing ethinyl estradiol (EE) and progestin. Two-thirds of OCs users took formulations containing 30 or more mcg of EE. Women aged 15 to 24 were more likely than those aged 35 to 49 to use lower-dose formulations (less than 30 mcg of EE). A substantial percentage of reproductive-aged Canadian women, particularly younger women, used OCs. OC use varied by sociodemographic and some cardiovascular risk factors."

According to the news reporters, the research concluded: "The majority took formulations containing 30 or more mcg of EE."

For more information on this research see: Oral contraceptive use among women aged 15 to 49: Results from the Canadian Health Measures Survey. Health Reports, 2015;26 (10):21-28. Health Reports can be contacted at: Statistics Canada, 100 Tunneys Pasture Driveway, Ottawa, Ontario K1A 0T6, Canada.

Transmission Electron Microscopy

Study Results from M.C. Rusu and Colleagues Update Understanding of Transmission Electron Microscopy (Subsets of telocytes: Myocardial telocytes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transmission Electron Microscopy is now available. According to news reporting originating from Bucharest, Romania, by NewsRx correspondents, research stated, "Telocytes (TCs) are morphologically defined as small-sized cells with long, thin, moniliform processes called telopodes (Tps). Numerous papers imply that TCs are a distinctive cell type, and that transmission electron microscopy (TEM) is the gold standard tool for their identification."

Our news editors obtained a quote from the research, "We aimed to reproduce previous studies on myocardial TCs to check their validity. For this purpose we performed an immunohistochemical study on human cardiac samples from six autopsied donor cadavers, using antibodies against CD10, CD31, CD34, CD146, Ki67, alpha-smooth muscle actin (a-
SMA), Platelet-Derived Growth Factor Receptor-alpha (PDGFRα) and laminin. Additionally we performed a TEM study on cardiac samples from three human autopsied donor cadavers and five adult Sprague-Dawley rats. We found endothelial cells (ECs), cords, and filopodia-projecting endothelial tip cells (ETCs) that expressed CD10, CD31, CD34, CD146, and PDGFR-a. Often, endothelial cells closely neighbored the sarcolemmal basal laminae. Endothelial progenitor cells, as well as nascent capillaries, were CD31+/CD34+. Proliferative endothelial cells expressed Ki67. In larger vessels we found pericytes that expressed CD146 and alpha-SMA; scarce alpha-SMA-expressing spindle-shaped cells lining cardiomyocytes were suggestive of a pericytic role in angiogenic sprout guidance. The TEM study showed that endothelial tubes are almost exclusively found in the narrow myocardial interstitia. ECs that built them up appeared identical to the cells that previous TEM studies have suggested to be myocardial telocytes. A subset of stromal cells with TC-like phenotype and telopodes-like processes actually seem to configure blood vessels, and therefore belong to the endothelial lineage. This study shows that data presented in previous studies on myocardial telocytes is not enough to allow the reproducibility of the results."

According to the news editors, the research concluded: "At least a subset of cells considered to be TCs might belong to the endothelial lineage."

The news editors report that additional information may be obtained by contacting M.C. Rusu, MEDCENTER, Center Excellence Lab Med & Pathol, Bucharest, Romania. Additional authors for this research include S. Hostiuc, A.D. Vrapciu, L. Mogoanta, V.S. Manoiu and F. Grigoriu.

**Immune System Diseases and Conditions - HIV/AIDS**

**Study Results from Maastricht University Update Understanding of HIV/AIDS (Comparison of urine samples and penile swabs for detection of human papillomavirus in HIV-negative Dutch men)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - HIV/AIDS are presented in a new report. According to news reporting originating in Maastricht, Netherlands, by NewsRx journalists, research stated, "Penile swab sampling is the method of choice when testing for human papillomavirus (HPV) in men. Urine sampling is already used in routine sexually transmitted infections (STI) diagnostics and could provide a less invasive sampling method in men to detect HPV."

The news reporters obtained a quote from the research from Maastricht University,
"Therefore we compared detection of HPV types in urine samples and penile swabs by the highly sensitive SPF10-LiPA25 system. First void urine and self-obtained penile swab samples were collected from 120 men, with a mean age of 29.4 years, visiting a STI clinic in South Limburg, the Netherlands. In total 111 of 120 men were included in the analysis. Broad-spectrum HPV DNA amplification and mucosal HPV genotyping were performed using the SPF10 DEIA-LiPA25 system (SPF10 HPV LiPA, V.1). In total 75 (68%) men were positive for HPV in the combined analysis. Sixty-six (59%) paired samples were concordant in being positive or negative. In 39% of the men HPV DNA was detected only in the penile swab. In 2% of the men HPV DNA was detected only in the urine sample. Considering penile swabs as the gold standard, a sensitivity of 41% (95% CI 30% to 53%) and a specificity of 95% (95% CI 81% to 99%) was found. In 6 (5%) urines high risk types were repeatedly found that were not detected in the matching swab. Urine samples are not comparable to penile swabs in the detection of HPV in men."

According to the news reporters, the research concluded: "However, the addition of urine samples to penile swabs could be of use in epidemiological or clearance studies."

For more information on this research see: Comparison of urine samples and penile swabs for detection of human papillomavirus in HIV-negative Dutch men. *Sexually Transmitted Infections*, 2016;92(6):467-469. **Oncology - Breast Cancer**

**Study Results from Mahidol University Update Understanding of Breast Cancer (5-Acetyl goniothalamin suppresses proliferation of breast cancer cells via Wnt/beta-catenin signaling)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting out of Bangkok, Thailand, by NewsRx editors, research stated, "Styryl lactones are plant-derived compounds from genus Goniothalamus with promising anti-
proliferation and anticancer properties. However, the exact mechanism and the target for their activities remained unclear."

Our news journalists obtained a quote from the research from Mahidol University, "In the present study, we investigated the effect of 5-acetyl goniothalamin (5GTN) from Goniothalamus marcanii on Wnt/beta-catenin signaling pathway which is a key regulator in controlling cell proliferation in breast cancer cells (MCF-7 and MDA-MB-231). 5GTN, a naturally occurring derivative of goniothalamin (GTN) mediated the toxicity to MCF-7 and MDA-MB-231 cells in a dose- and time-related manner, and was more potent than that of GTN. 5GTN strongly inhibited cell proliferation and markedly suppressed transcriptional activity induced by beta-catenin in luciferase reporter gene assay. In consistent with this view, the expression of Wnt/beta-catenin signaling target genes including c-Myc, cyclin D1 and Axin in MCF-7 and MDA-MB-231 cells were suppressed after treatment with 5GTN. It was concomitant with cell cycle arrest at G(1) phase and cell apoptosis in MCF-7 cells. In addition, 5GTN enhanced glycogen synthase kinase (GSK-3 beta) activity and therefore reduced the expression of active form of beta-catenin protein in MCF-7 and MDA-MB-231 cells. Taken together, 5GTN exhibited a promising anticancer effect against breast cancer cells through an inhibition of Wnt/beta-catenin signaling."

According to the news editors, the research concluded: "This pathway may be served as a potential chemotherapeutic target for breast cancer by 5GTN."

For more information on this research see: 5-Acetyl goniothalamin suppresses proliferation of breast cancer cells via Wnt/beta-catenin signaling. European Journal of Pharmacology, 2016;791():455-464. Oncology - Gastric Cancer

Study Results from Mashhad University of Medical Sciences Broaden Understanding of Gastric Cancer (Circulating microRNAs as Potential Diagnostic Biomarkers and Therapeutic Targets in Gastric Cancer: Current Status and Future Perspectives)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gastric Cancer is the subject of a report. According to news reporting from Mashhad, Iran, by NewsRx journalists, research stated, "Gastric cancer is among the leading causes of cancer related death worldwide. Patients with
gastric cancer are typically asymptomatic, and diagnosed at late stages, supporting the need for the identification of novel prognostic and diagnostic biomarkers."

The news correspondents obtained a quote from the research from the Mashhad University of Medical Sciences, "Recently, microRNAs have emerged as molecular regulators that can play key roles in pathogenesis and progression of different malignancies, including gastric cancer. There is a growing body of evidence showing the aberrant activation of some known circulating miRNAs, e.g. let-7a, miR-21, miR-16, miR-93, miR103, miR-192 as well as tissue specific-miRNAs, e.g. miR-18a, miR-10b, miR-544, miR-195, miR-378, miR-34a, miR-145 in patients affected by gastric cancer, which involved with modulation of gastric-cancer-associated genes. In addition, there are mounting evidences on the value of miRNAs which are detected to be associated with drug-resistance mechanisms; suggesting their modulation as a potential approach to overcome chemo-resistance."

According to the news reporters, the research concluded: "Attuned with these facts, in this review we highlight several recent preclinical and clinical studies performed on circulating and tissue-specific miRNAs as promising biomarkers for detection of patients at early stages, prediction of prognosis, and monitoring of the patients in response to therapy."

Our news journalists report that additional information may be obtained by contacting A. Avan, Mashhad Univ Med Sci, Sch Med, Canc Res Center, Mashhad, Iran. Additional authors for this research include S. Khataminfar, S. Mohammadparast, S. ShahidSales, M. Maftouh, M. Mohammadi, M. Simonian, S.M.R. Parizadeh, S.M. Hassanian and A. Avan.

Oncology - Multiple Myeloma

Study Results from Massachusetts General Hospital Update Understanding of Multiple Myeloma (Phase 1 Study of Tabalumab, a Human Anti-B-Cell Activating Factor Antibody, and Bortezomib in Patients with Relapsed/Refractory Multiple Myeloma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Multiple Myeloma is now available. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated,
"Tabalumab, a human mAb that neutralizes B-cell-activating factor (BAFF), demonstrated antitumor activity in xenograft models of multiple myeloma. Here we report on a phase I study of relapsed/refractory multiple myeloma patients in which the primary objective was to identify a tolerable and potentially efficacious dose of tabalumab when combined with bortezomib."

The news correspondents obtained a quote from the research from Massachusetts General Hospital, "Forty-eight patients were enrolled; 20 to the dose-escalation cohort, and 28 to cohort expansion in which a dose of 100 mg of tabalumab was evaluated. All patients had received either prior bortezomib or an immunomodulatory drug; the median number of prior therapies was 3. Bortezomib was administered intravenously on days 1, 4, 8, and 11 of a 21-day schedule. Tabalumab was given every 21 days for 3 cycles, then every 42 days thereafter. The most common grade 3/4 toxicities included thrombocytopения, neutropenia, pneumonia, and peripheral sensory neuropathy. There were no dose-limiting toxicities, and the maximum tolerated dose was not reached. Pharmacokinetic data suggested serum exposure increased in a greater than dose-proportional manner up to a dose of 100 mg. Out of 46 evaluable patients, 20 had confirmed responses. The median time to progression (9 patients censored) was 4.8 months, and the median response duration (4 patients censored) was 7.2 months."

According to the news reporters, the research concluded: "A dose of 100 mg tabalumab in combination with bortezomib was well tolerated and active and is currently under further investigation."

For more information on this research see: Phase 1 Study of Tabalumab, a Human Anti-B-Cell Activating Factor Antibody, and Bortezomib in Patients with Relapsed/Refractory Multiple Myeloma. Lymphoproliferative Diseases and Conditions...

Study Results from Matsumoto Dental University Broaden Understanding of Granuloma (Pathological Analysis of Cell Differentiation in Cholesterol Granulomas Experimentally Induced in Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lymphoproliferative Diseases and Conditions - Granuloma is the subject of a report. According to news reporting out of Shiojiri, Japan, by NewsRx editors, research stated, "In this study, cholesterol was implanted in the subcutaneous tissue in mice to induce the formation of cholesterol granuloma. Histological examination was carried out to determine the type and source of cells."

Our news journalists obtained a quote from the research from Matsumoto Dental University, "The tissue surrounding the embedded cholesterol was examined histologically within the period of 6 months. Cell differentiation in cholesterol granulomas was investigated using ddY mice and GFP bone marrow transplanted mice. Cholesterol was embedded in mice subcutaneously and histopathological examination was carried out in a period of 6 months. Results showed that at 2 weeks, cholesterol was replaced partly by granulation tissues. The majority of cells in the granulation tissues were macrophages and foreign body giant cells and the center consists of small amount of fibroblasts, collagen fibers and capillaries. At 3 months, more granulation tissue was observed compared to 2 weeks. Similar cells were observed, however, there were more fibroblasts, collagen bundles and capillaries present compared to 2 weeks. At 6 months, the cholesterol was mostly substituted by fibrous tissues consisting mainly of fibroblasts and collagen fibers with some macrophages and foreign body giant cells. Specifically, the outer part of the tissue consists of fibroblasts, collagen bundles and capillaries and the inner portion is filled with collagen bundles. Immunohistochemistry revealed that macrophages and foreign body giant cells were positive to GFP and CD68 although the fibroblasts and capillaries in the outer portion of cholesterol granulomas were GFP negative. Some spindle shape fibroblasts were also GFP positive. Immunofluorescent double staining revealed that cells lining the blood vessels were both positive to GFP and CD31 indicating that those were endothelial cells and were actually derived from the transplanted bone marrow cells."

According to the news editors, the research concluded: "The results suggest that macrophages, foreign body giant cells as well as fibroblasts and capillary endothelial cells are bone marrow derived mesenchymal cells."

For more information on this research see: Pathological Analysis of Cell Differentiation in Cholesterol Granulomas Experimentally Induced in Mice. *International Journal of Medical Sciences*, 2016;13(3):220-4.

Heart Disorders and Diseases - Heart Failure

Study Results from Mayo Clinic Provide New Insights into Heart Failure (Multimorbidity in Heart Failure: Effect on Outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Failure have been presented. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "To investigate the effect of the number and type of comorbid conditions on death and hospitalizations in individuals with incident heart failure (HF). Population-based cohort study."

Financial supporters for this research include National Institute on Aging, National Heart, Lung, and Blood Institute.

The news correspondents obtained a quote from the research from Mayo Clinic, "Olmsted County, Minnesota. Olmsted County, Minnesota, residents with incident HF from 2000 to 2010 (mean age 76 +/- 14, 56% female) (N = 1,714). The prevalence of 16 chronic conditions obtained at HF diagnosis classified into three groups: cardiovascular (CV) related, other physical, and mental. The mean number of conditions per participant was 2.6 +/- 1.5 for CV-related conditions, 1.3 +/- 1.1 for other physical conditions, and 0.30 +/- 0.61 for mental conditions. After a mean follow-up of 4.2 years, 1,073 deaths and 6,306 hospitalizations had occurred. After adjustment for age, sex, ejection fraction, in-or outpatient status, and number of other conditions, an increase of one other physical condition was associated with a 14% (HR = 1.14, 95% CI = 1.08-1.20) greater risk of death and a 26% (HR = 1.26, 95% CI = 1.20-1.32) greater risk of hospitalization, and an increase of one mental condition was associated with a 31% (HR = 1.31, 95% CI = 1.19-1.44) greater risk of death and an 18% (HR = 1.18, 95% CI = 1.071.29) greater risk of hospitalization. In contrast, an increase of one CV-related condition was not associated with greater risk of death and was associated with a 10% (HR = 1.10, 95% CI = 1.06-1.15) greater risk of hospitalization. CV-related conditions are the most common type of comorbid conditions in individuals with HF, but other physical and mental conditions are more strongly associated with death and hospitalizations."

According to the news reporters, the research concluded: "This underscores the effect of non-CV conditions on outcomes in HF."

Our news journalists report that additional information may be obtained by contacting V.L. Roger, Mayo Clinic, Div Cardiovasc Dis, Rochester, MN, United States. Additional authors for this research include A.M. Chamberlain, C.M. Boyd, Y. Gerber, S.M. Dunlay, S.A. Weston, R.X. Jiang and V.L. Roger.

The direct object identifier (DOI) for that additional information is:
Study Results from McMaster University in the Area of Neurodevelopmental Disorders Reported (Wnt signaling networks in autism spectrum disorder and intellectual disability)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Neurologic Diseases and Conditions - Neurodevelopmental Disorders are presented in a new report. According to news originating from Hamilton, Canada, by NewsRx correspondents, research stated, "Genetic factors play a major role in the risk for neurodevelopmental disorders such as autism spectrum disorders (ASDs) and intellectual disability (ID). The underlying genetic factors have become better understood in recent years due to advancements in next generation sequencing."

Our news journalists obtained a quote from the research from McMaster University, "These studies have uncovered a vast number of genes that are impacted by different types of mutations (e.g., de novo, missense, truncation, copy number variations). Abstract: Given the large volume of genetic data, analyzing each gene on its own is not a feasible approach and will take years to complete, let alone attempt to use the information to develop novel therapeutics. To make sense of independent genomic data, one approach is to determine whether multiple risk genes function in common signaling pathways that identify signaling 'hubs' where risk genes converge. This approach has led to multiple pathways being implicated, such as synaptic signaling, chromatin remodeling, alternative splicing, and protein translation, among many others. In this review, we analyze recent and historical evidence indicating that multiple risk genes, including genes denoted as high-confidence and likely causal, are part of the Wingless (Wnt signaling) pathway. In the brain, Wnt signaling is an evolutionarily conserved pathway that plays an instrumental role in developing neural circuits and adult brain function."

According to the news editors, the research concluded: "We will also review evidence that pharmacological therapies and genetic mouse models further identify abnormal Wnt signaling, particularly at the synapse, as being disrupted in ASDs and contributing to disease pathology."

For more information on this research see: Wnt signaling networks in autism spectrum disorder and intellectual disability. Journal of Neurodevelopmental Disorders, 2016;8 ():1-10. Journal of Neurodevelopmental Disorders can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. Study Results from Medical University Provide New Insights into Breast Cancer (Dihydroartemisinin prevents breast cancer-induced osteolysis via inhibiting both breast cancer cells and osteoclasts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting out of Linhai, People's Republic of China, by NewsRx editors, research stated, "Bone is the most common site of distant relapse in breast cancer, leading to severe complications which dramatically affect the patients' quality of life. It is believed that the crosstalk between metastatic breast cancer cells and osteoclasts is critical for breast cancer-induced osteolysis."

Our news journalists obtained a quote from the research from Medical University, "In this study, the effects of dihydroartemisinin (DHA) on osteoclast formation, bone resorption, osteoblast differentiation and mineralization were initially assessed in vitro, followed by further investigation in a titanium-particle-induced osteolysis model in vivo. Based on the proved inhibitory effect of DHA on osteolysis, DHA was further applied to MDA-MB-231 breast cancer-induced mouse osteolysis model, with the underlying molecular mechanisms further investigated. Here, we verified for the first time that DHA suppressed osteoclast differentiation, F-actin ring formation and bone resorption through suppressing AKT/SRC pathways, leading to the preventive effect of DHA on titanium-particle-induced osteolysis without affecting osteoblast function. More importantly, we demonstrated that DHA inhibited breast tumor-induced osteolysis through inhibiting the proliferation, migration and invasion of MDA-MB-231 cells via modulating AKT signaling pathway."

According to the news editors, the research concluded: "DHA effectively inhibited osteoclastogenesis and prevented breast cancer-induced osteolysis."

For more information on this research see: Dihydroartemisinin prevents breast cancer-induced osteolysis via inhibiting both breast cancer cells and osteoclasts. Scientific Reports, 2016;6():19074. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting M.X. Feng, Orthopaedic Department, Taizhou Hospital, Wenzhou Medical University, Linhai, 317000, People's Republic of China. Additional authors for this research include J.X. Hong, Q. Wang, Y.Y. Fan, C.T. Yuan, X.H. Lei, M. Zhu, A. Qin, H.X. Chen and D. Hong.

Study Results from Medical University Provide New Insights into Central Nervous System Depressants (Continuous intra-articular local anesthetic drug instillation versus discontinuous sciatic nerve block after total knee arthroplasty)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Central Nervous System Depressants have been published. According to news originating from Feldkirch, Austria, by NewsRx correspondents, research stated, "Sciatic nerve block (SNB) is commonly used as adjunct to femoralis nerve block (FNB) to achieve high-quality pain relief after total knee arthroplasty (TKA). However, this combination is associated with considerable muscle weakness, foot drop and surgically related nerve injuries may be masked."

Our news journalists obtained a quote from the research from Medical University, "The purpose of this study was to assess whether low risk continuous intra-articular anesthetic drug instillation is an adequate alternative to SNB when adding to FNB after TKA. Retrospective investigational follow-up study. University teaching hospital. Interdisciplinary postoperative anesthetic and orthopedic survey. For this investigational analysis, 34 of 50 consecutive patients were available. All patients underwent primary unilateral TKA. Group A (18 patients) received a continuous intra-articular 0.33% ropivacaine (5 mL/h) instillation for the first 48 h postoperatively. In Group B (16 patients) a discontinuous SNB was used. Both groups were treated with a continuous FNB. Main endpoints were mean and maximum postoperative pain intensity levels for both anterior and posterior knee side, amount of postoperative administered opioid drugs, differences in functional outcome or hospital stay and rate of postoperative complications. Group A showed higher pain intensity levels for the posterior knee side (P <=.042). Merely on the second postoperative day there were no differences within either study group. No differences were found regarding anterior knee pain. Group A showed a significant higher postoperative piritramid consumption (P <=.007). Length of hospital stay or postoperative functional outcome was not significant different. Postoperative complications were not related to anesthesia techniques."

According to the news editors, the research concluded: "SNB technique resulted in superior pain relief in comparison to continuous intra-articular local anesthetic drug instillation as adjunct to continuous FNB after TKA."

The news correspondents report that additional information may be obtained from J. Cip, Medical University of Innsbruck, Dept. of Orthoped Surg, Academy Teaching Hosp Feldkirch, A-6800 Feldkirch, Austria. Additional authors for this research include H. Erb-Linzmeier, P. Stadlbauer, C. Bach, A. Martin and R. Germann.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jclinane.2016.08.027. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions - Carotid...

Study Results from Medical University in the Area of Carotid Stenosis Reported (Combined Effects of Inflammatory Status and Carotid Atherosclerosis A 12-Year Follow-Up Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Carotid Stenosis have been published. According to news reporting out of Vienna, Austria, by NewsRx editors, research stated, "Inflammatory responses play a key role in atherogenesis. The aim of this study was to assess the prognostic value of hsCRP (high-sensitivity C-reactive protein) and to evaluate whether degree of carotid stenosis and serum levels of hsCRP jointly predict long-term mortality in asymptomatic patients with carotid atherosclerosis."

Our news journalists obtained a quote from the research from Medical University, "One thousand sixty-five patients with neurological asymptomatic carotid atherosclerosis as evaluated by duplex sonography were prospectively followed for cause-specific mortality. During a median of 11.81 years, a total of 549 deaths, including 362 cardiovascular deaths, were recorded. The risk of all-cause and cardiovascular mortality significantly increased in patients with elevated serum levels of hsCRP (the adjusted hazard ratio for cardiovascular mortality per increase of 1 mg/dL of hsCRP levels was 1.47; P<0.001). Patients with a high degree of carotid stenosis and increased hsCRP levels were particularly at risk of adverse outcome. Patients with carotid narrowing over 50% and hsCRP levels >0.29 mg/dL (=median) had nearly twice as high a risk of cardiovascular mortality compared with patients with carotid stenosis of <50% and hsCRP levels <0.29 mg/dL (adjusted hazard ratio 1.89; P<0.001). Improvement in risk stratification with combined assessment of carotid stenosis and hsCRP was confirmed by an improvement of the continuous net reclassification improvement with 18% for all-cause mortality and 15% for cardiovascular mortality compared with the degree of carotid stenosis alone (P <0.01)."

According to the news editors, the research concluded: "Measurement of hsCRP in combination with ultrasound investigations of the carotid arteries at a single time point provides additional prognostic information for patients with asymptomatic carotid atherosclerosis."

For more information on this research see: Combined Effects of Inflammatory Status and Carotid Atherosclerosis A 12-Year Follow-Up Study. Stroke, 2016;47(12):2952-
Study Results from Mercy Hospital for Women in the Area of Prenatal Research Reported (Measuring circulating placental RNAs to non-invasively assess the placental transcriptome and to predict pregnancy complications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Prenatal Research have been published. According to news reporting out of Heidelberg, Australia, by NewsRx editors, research stated, "Circulating nucleic acids have revolutionized prenatal diagnosis in the last decade, allowing non-invasive screening for single gene or chromosomal defects using a single sample of maternal blood. In addition to DNAs, RNAs from the placenta are released into the maternal blood from early in pregnancy and may reflect changes in gene expression occurring within the placenta."

Our news journalists obtained a quote from the research from Mercy Hospital for Women, "Measuring circulating RNA may therefore provide insights into the placental transcriptome without the need for invasive testing. Combined with advances in next-generation sequencing and molecular analyses, it may be possible to measure circulating RNA to improve our understanding of placental pathology and develop novel non-invasive biomarkers for pregnancy complications and monitoring high-risk pregnancies. This review summarizes the current technologies available and the studies that have measured circulating placental RNA to predict and/or monitor pregnancies complicated by preeclampsia, fetal growth restriction, preterm birth, early pregnancy complications, invasive placentation and twin-twin transfusion syndrome."

According to the news editors, the research concluded: "Prospective cohort studies are now required to validate these findings to determine the clinical applicability of measuring circulating placental RNA to develop novel biomarkers for a wide spectrum of pregnancy complications."

For more information on this research see: Measuring circulating placental RNAs to non-invasively assess the placental transcriptome and to predict pregnancy complications.
Study Results from Mie University Broaden Understanding of Osteoporosis (Ginger hexane extract suppresses RANKL-induced osteoclast differentiation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Musculoskeletal Diseases and Conditions - Osteoporosis are presented in a new report. According to news reporting originating in Tsu, Japan, by NewsRx journalists, research stated, "Osteoporosis is a debilitating disease caused by decreased bone density. Compounds with anti-osteoclastic activity, such as bisphosphonates, may help in the prevention and treatment of osteoporosis."

The news reporters obtained a quote from the research from Mie University, "Herein, we determined the inhibitory effects of ginger hexane extract (GHE) on receptor activator of nuclear factor kappa-B ligand (RANKL)-induced osteoclastogenesis in RAW264.7 cells. The results showed that GHE (1) suppressed osteoclast differentiation and the formation of actin rings; (2) inhibited the expression of Nfatc1, a master transcriptional factor for osteoclast differentiation, in a dose-dependent manner (10-20 mg/mL); and (3) inhibited other osteoclastogenesis-related genes, such as Oscar, Dc-stamp, Trap, and Mmp9."

According to the news reporters, the research concluded: "These findings suggest that GHE may be used to prevent and treat osteoporosis by inhibiting osteoclast differentiation."

For more information on this research see: Ginger hexane extract suppresses RANKL-induced osteoclast differentiation. *Bioscience, Biotechnology, and Biochemistry*, 2016;80(4):779-85.

Our news correspondents report that additional information may be obtained by contacting S. Ito, a Tsuji Health & Beauty Science Laboratory, Mie University, Tsu, Japan. Additional authors for this research include A. Ohmi, A. Sakamiya, T. Yano, K. Okumura, N. Nishimura and K. Kagontani.

Mosquito-Borne Diseases - Malaria

Study Results from Monash University Broaden Understanding of Malaria (Metabolomics-Based Screening of the Malaria Box Reveals both Novel and Established Mechanisms of Action)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mosquito-Borne Diseases - Malaria is now available. According to news originating from Parkville, Australia, by NewsRx correspondents, research stated, "High-throughput phenotypic screening of chemical libraries has resulted in the identification of thousands of compounds with potent antimalarial activity, although in most cases, the mechanism(s) of action of these compounds remains unknown. Here we have investigated the mode of action of 90 antimalarial compounds derived from the Malaria Box collection using high-coverage, untargeted metabolomics analysis."

Our news journalists obtained a quote from the research from Monash University, "Approximately half of the tested compounds induced significant metabolic perturbations in in vitro cultures of Plasmodium falciparum. In most cases, the metabolic profiles were highly correlated with known antimalarials, in particular artemisinin, the 4-aminoquinolines, or atovaquone. Select Malaria Box compounds also induced changes in intermediates in essential metabolic pathways, such as isoprenoidbiosynthesis (i.e., 2-C-methyl-D-erythritol 2,4-cyclodiphosphate) and linolenic acid metabolism (i.e., traumatic acid)."

According to the news editors, the research concluded: "This study provides a comprehensive database of the metabolic perturbations induced by chemically diverse inhibitors and highlights the utility of metabolomics for triaging new lead compounds and defining specific modes of action, which will assist with the development and optimization of new antimalarial drugs."

For more information on this research see: Metabolomics-Based Screening of the Malaria Box Reveals both Novel and Established Mechanisms of Action. Antimicrobial Agents and Chemotherapy, 2016;60(11):6650-6663. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news correspondents report that additional information may be obtained from D.J. Creek, Monash University, Bio21 Mol Sci & Biotechnol Inst, Dept. of Biochem & Mol Biol, Parkville, Vic, Australia. Study Results from N. Gujjar et al Provide New Insights into Human Influenza [Co-expression of sialic acid receptors compatible with avian and human influenza virus binding in emus (Dromaius novaehollandiae)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Respiratory Tract Diseases and Conditions - Human Influenza have been published. According to news reporting originating from Andhra Pradesh, India, by NewsRx correspondents, research stated, "Influenza A viruses (IAVs) continue to threaten animal and human health with constant emergence of novel variants. While aquatic birds are a major reservoir of most IAVs, the role of other terrestrial birds in the evolution of IAVs is becoming increasingly evident."

Funders for this research include National Institute of Animal Biotechnology, UKIERI, Pennsylvania State University.

Our news editors obtained a quote from the research, "Since 2006, several reports of IAV isolations from emus have surfaced and avian influenza infection of emus can lead to the selection of mammalian like PB2-E627K and PB2-D701N mutants. However, the potential of emus to be co-infected with avian and mammalian IAVs is not yet understood. As a first step, we investigated sialic acid (SA) receptor distribution across major organs and body systems of emu and found a widespread co-expression of both SA alpha 2,3Gal and SA alpha 2,6Gal receptors in various tissues that are compatible with avian and human IAV binding."

According to the news editors, the research concluded: "Our results suggest that emus could allow genetic recombination and hence play an important role in the evolution of IAVs."

For more information on this research see: Co-expression of sialic acid receptors compatible with avian and human influenza virus binding in emus (Dromaius novaehollandiae). Virology, 2017;500():114-121. Virology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Virology - www.journals.elsevier.com/virology/)

The news editors report that additional information may be obtained by contacting M. Subbiah, Natl Inst Anim Biotechnol, Hyderabad, Andhra Pradesh, India. Fatigue

Study Results from N. Strenzke and Colleagues Broaden Understanding of Fatigue (Hair cell synaptic dysfunction, auditory fatigue and thermal sensitivity in otoferlin Ile515Thr mutants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Fatigue is now available. According to news reporting originating in Gottingen, Germany, by NewsRx journalists, research stated, "The multi-C2 domain protein otoferlin is required for hearing and mutated in human deafness. Some OTOF mutations cause a mild elevation of auditory thresholds but strong impairment of speech perception."

Financial supporters for this research include Max Planck Society, Deutsche Forschungsgemeinschaft (DFG), University Medical Center Gottingen.

The news reporters obtained a quote from the research, "At elevated body temperature, hearing is lost. Mice homozygous for one of these mutations, Otof(I515T/I515T), exhibit a moderate hearing impairment involving enhanced adaptation to continuous or repetitive sound stimulation. In Otof(I515T/I515T) inner hair cells (IHCs), otoferlin levels are diminished by 65%, and synaptic vesicles are enlarged. Exocytosis during prolonged stimulation is strongly reduced. This indicates that otoferlin is critical for the reformation of properly sized and fusion-competent synaptic vesicles. Moreover, we found sustained exocytosis and sound encoding to scale with the amount of otoferlin at the plasma membrane. We identified a 20 amino acid motif including an RXR motif, presumably present in human but not in mouse otoferlin, which reduces the plasma membrane abundance of Ile515Thr-otoferlin."

According to the news reporters, the research concluded: "Together, this likely explains the auditory synaptopathy at normal temperature and the temperature-sensitive deafness in humans carrying the Ile515Thr mutation."

Our news correspondents report that additional information may be obtained by contacting N. Strenzke, Collaborat Res Center 889 Cellular Mech Sensory Proc, Gottingen, Germany. Additional authors for this research include R. Chakrabarti, H. Al-Moyed, A. Muller, G. Hoch, T. Pangrsic, G. Yamanbaeva, C. Lenz, K.T. Pan, E. Auge, R. Geiss-Friedlander, H. Urlaub, N. Brose, C. Wichmann and E. Reisinger.

**Pheochromocytomas**

**Study Results from N. Sundahl and Colleagues in the Area of Pheochromocytomas Reported (A rare case of clinically and biochemically silent giant right pheochromocytoma: case report and review of literature)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Pheochromocytomas are discussed in a new report. According to news reporting out of Aalst, Belgium, by NewsRx editors, research stated, "Non-secreting pheochromocytomas are rare adrenal tumours. We report the case of a clinically and biochemically silent giant pheochromocytoma that presented as bilateral pulmonary embolisms."

Our news journalists obtained a quote from the research, "Successful surgical resection was performed. Multiple endocrine neoplasia 2 syndrome and neurofibromatosis type 1 were clinically excluded."

According to the news editors, the research concluded: "Subsequent DNA analysis of the succinate dehydrogenase complex subunits B and D (SDHB and SDHD), and Von Hippel-Lindau (VHL) genes revealed no mutations."

Our news journalists report that additional information may be obtained by contacting S. Van Slycke, OLV Clin Aalst, Dept. of Gen & Endocrine Surg, B-9300 Aalst, Belgium. Additional authors for this research include S. Van Slycke and N. Brusselaers.

**Heart Disorders and Diseases - Heart Failure**

**Study Results from N.M. Orr and Colleagues Broaden Understanding of Heart Failure (Skilled Nursing Facility Care for Patients With Heart Failure: Can We Make It "Heart Failure Ready?")**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting from Wellesley, Massachusetts, by NewsRx journalists, research stated, "Skilled nursing facilities (SNFs) have emerged as an integral component of care for older adults with heart failure (HF). Despite their prominent role, poor
clinical outcomes for the medically complex patients with HF managed in SNFs are common."

The news correspondents obtained a quote from the research, "Barriers to providing quality care include poor transitional care during hospital-to-SNF and SNF-to-community discharges, lack of HF training among SNF staff, and a lack of a standardized care process among SNF facilities. Although no evidence-based practice standards have been established, various measures and tools designed to improve HF management in SNFs are being investigated. In this review, we discuss the challenges of HF care in SNFs as well as potential targets and recommendations that can help improve care with respect to transitions, HF management within SNFs, and modifiable factors within facilities."

According to the news reporters, the research concluded: "Policy considerations that might help catalyze improvements in SNF-based HF management are also discussed."

For more information on this research see: Skilled Nursing Facility Care for Patients With Heart Failure: Can We Make It "Heart Failure Ready?." Journal of Cardiac Failure, 2016;22(12):1004-1014. Journal of Cardiac Failure can be contacted at: Churchill Livingstone Inc Medical Publishers, Curtis Center, Independence Square West, Philadelphia, PA 19106-3399, USA. (Elsevier - www.elsevier.com; Journal of Cardiac Failure - www.journals.elsevier.com/journal-of-cardiac-failure/)

Oncology - Breast Cancer

Study Results from Nanjing Medical University Broaden Understanding of Breast Cancer [miR-222 induces Adriamycin resistance in breast cancer through PTEN/Akt/p27(kip1) pathway]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "The high resistant rate of Adriamycin (Adr) is associated with a poor prognosis of breast cancer in women worldwide. Since miR-222 might contribute to chemoresistance in many cancer types, in this study, we aimed to investigate its efficacy in breast cancer through PTEN/Akt/p27(kip1) pathway."

The news correspondents obtained a quote from the research from Nanjing Medical University. "Firstly, in vivo, we verified that miR-222 was upregulated in chemoresistant tissues after surgery compared with the paired preneoadjuvant samples of 21 breast cancer patients. Then, human breast cancer Adr-resistant cell line (MCF-7/Adr) was constructed to validate the pathway from the parental sensitive cell line (MCF-7/S). MCF-7/Adr and MCF-7/S were transfected with miR-222 mimics, miR-222 inhibitors, or their negative controls, respectively. The results showed that inhibition of miR-222 in MCF-7/Adr significantly increased the expressions of PTEN and p27(kip1) and decreased phospho-Akt (p-Akt) both in mRNA and
protein levels (p < 0.05) by using quantitative real-time PCR (qRT-PCR) and western blot. MTT and flow cytometry suggested that lower expressed miR-222 enhanced apoptosis and decreased the IC50 of MCF-7/Adr cells. Additionally, immunofluorescence demonstrated that the subcellular location of p27(kip1) was dislocated resulting from the alteration of miR-222. Conversely, in MCF-7/S transfected with miR-222 mimics, upregulation of miR-222 is associated with decreasing PTEN and p27(kip1) and increasing Akt accompanied by less apoptosis and higher IC50. Importantly, Adr resistance induced by miR-222 overexpression through PTEN/Akt/p27 was completely blocked by LY294002, an Akt inhibitor.

According to the news reporters, the research concluded: "Taken together, these data firstly elucidated that miR-222 could reduce the sensitivity of breast cancer cells to Adr through PTEN/Akt/p27(kip1) signaling pathway, which provided a potential target to increase the sensitivity to Adr in breast cancer treatment and further improved the prognosis of breast cancer patients."

**Drugs and Therapies - Cromolyn Therapy**

**Study Results from Nanjing Medical University Broaden Understanding of Cromolyn Therapy (Cerebral Mast Cells Participate In Postoperative Cognitive Dysfunction by Promoting Astrocyte Activation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Cromolyn Therapy. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Astrocytes, the major glial cell type that has been increasingly recognized as contributing to neuroinflammation, are critical in the occurrence and development of postoperative cognitive dysfunction (POCD). Although emerging evidence showed that brain mast cells (MCs) are the 'first responders' in neuroinflammation, little is known about the functional communication between MCs and astrocytes."

Our news editors obtained a quote from the research from Nanjing Medical University, "In this study, we investigated the potential regulation of astrocyte activation by MCs. Rats received an intracerebroventricular injection of Cromolyn (an MC stabilizer) or sterile saline 30 min before undergoing open tibial fracture surgery, and the levels of neuroinflammation and the degree of memory dysfunction were evaluated at 1 day and 3 days
after surgery. In the in vitro study, the effect of activated MCs on astrocytes were further clarified. Surgery increased the number of MCs, the astrocyte activation and the production of inflammatory factors, and resulted in cognitive deficits. Site-directed pre-injection of Cromolyn can inhibit this effect. In the in vitro study, the conditioned medium from C48/80-stimulated mast cells (P815) could induce primary astrocyte activation and subsequent production of inflammatory cytokines, which could be inhibited by Cromolyn. These findings indicate that activated MCs could trigger astrocyte activation, be involved in neuroinflammation and possibly contribute to POCD."

According to the news editors, the research concluded: "Interactions between MCs and astrocytes could provide potential therapeutic targets for POCD."

The news editors report that additional information may be obtained by contacting Y.N. Qian, Nanjing Medical University, Affiliated Hosp 1, Dept. of Anesthesiol, Nanjing, Jiangsu, People's Republic of China. Additional authors for this research include H. Yao, Q.Q. Qian, N. Li, W.J. Jin and Y.N. Qian.

**Oncology - Osteosarcomas**

**Study Results from Nanjing Medical University Provide New Insights into Osteosarcomas (Down-regulation of RBP-J mediated by microRNA-133a suppresses dendritic cells and functions as a potential tumor suppressor in osteosarcoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Osteosarcomas. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "In recent years, immunotherapy for the treatment of tumors have been established. Dendritic cells (DCs) are extremely efficient and professional antigen presenting cells (APCs), which are an important target for immune therapeutic interventions in cancer."

Our news editors obtained a quote from the research from Nanjing Medical University, "In present study, we investigated whether RBP-J signaling regulated by miR-133a was involved in the DCs mediated tumor suppressor in osteosarcoma. DCs were isolated from
30 osteosarcoma patients and 30 healthy subjects. Mouse macrophage-like cell line RAW264.7 were cultured and osteosarcoma mouse model with injection of murine osteosarcoma cell line S180 were established. In osteosarcoma patients, miR-133a expression level of DCs was increased, and RBP-J expression in mRNA and protein levels were decreased. MiR-133a inhibitor promoted maturation and activation of DCs in osteosarcoma patients. In osteosarcoma mouse model, miR-133a mimic suppressed the maturation and activation of spleen DCs, while miR-133a inhibitor promoted them. Overexpression of miR-133a decreased therapeutic effect of DCs on osteosarcoma mice. In RAW264.7 cells, miR-133a was observed to target RBP-J and regulate its expression. MiR-133a mimic inhibited the maturation of DCs in cells exposed to LPS, the effect of which was reversed by overexpression of RBP-J."

According to the news editors, the research concluded: "RBP-J mediated by miR-133a probably contributed to the regulation of DCs maturation and activation in osteosarcoma, which functioned as a therapeutic target for the immunotherapy in cancers."

The news editors report that additional information may be obtained by contacting W.M. Fan, Nanjing Medical University, Affiliated Hosp 1, Dept. of Orthoped, Nanjing 210000, Jiangsu, People's Republic of China. Additional authors for this research include D. Han and W.M. Fan.

Immune System Diseases and Conditions - Graft-…

Study Results from Nanjing Medical University Update Understanding of Graft-Versus-Host Disease (The impact of P2X7 receptor antagonist, brilliant blue G on graft-versus-host disease in mice after allogeneic hematopoietic stem cell ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immune System Diseases and Conditions - Graft-Versus-Host Disease. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "The purpose of this study was to investigate the role of P2X7 on liver inflammation in mice after HSCT. Hematopoietic stem cells obtained from C57BL/6 mice were administrated into BALB/c mice to establish GVHD model."
Financial support for this research came from National Science Foundation of China.

Our new journalists obtained a quote from the research from Nanjing Medical University, "On day 7, 14, 21 and 28 after HSCT, mice received P2X7R antagonist brilliant blue G (BBG) or not were sacrificed for analysis of weight loss, liver inflammation, cytokine secretion, P2X7, NLRP3 expression as well as caspase-1 activation. Liver inflammation with neutrophils and macrophages infiltration as well as weight loss increase was present after HSCT, but improved after administration with high dose of BBG compared with lower dose. High dose of P2X7R inhibitor administration after HSCT previously reduced levels of IL-1 beta, IL-18, caspase-1, NLRP3 as well as P2X7, and the level of alanine transaminase (ALT) and the ratio of aspartate amino transferase (AST)/ALT compared with that receiving low dose of BBG. Meanwhile, P2X7R blockage also reduced infiltration of macrophages and neutrophils and levels of CXCL8 and CCL2 in peripheral blood as well as improved liver function."

According to the news editors, the research concluded: "Blockage of P2X7R by BBG exerts a protective effect on GVHD post HSCT and improves liver function suggesting that this receptor could be considered as an attractive target for treatment of GVHD."

For more information on this research see: The impact of P2X7 receptor antagonist, brilliant blue G on graft-versus-host disease in mice after allogeneic hematopoietic stem cell transplantation. *Cellular Immunology*, 2016;310():71-77. *Cellular Immunology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Musculoskeletal Diseases and Conditions - …

Study Results from Nanjing University Broaden Understanding of Arachnodactyly (y The clinical application of preimplantation genetic diagnosis for the patient affected by congenital contractual arachnodactyly and spinal and bulbar muscular ...)
Arachnodactyly have been presented. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "To investigate the usefulness of preimplantation genetic diagnosis (PGD) for the patient affected by congenital contractural arachnodactyly (CCA) and spinal and bulbar muscular atrophy (SBMA). Multiple displacement amplification (MDA) was performed for whole genome amplification (WGA) of biopsied trophectoderm (TE) cells."

The news correspondents obtained a quote from the research from Nanjing University, "Direct mutation detection by sequencing and next-generation sequencing (NGS)-based single nucleotide polymorphism (SNP) haplotyping were used for CCA diagnosis. Direct sequencing of the PCR products and sex determination by amplification of sex-determining region Y (SRY) gene were used for SBMA diagnosis. After PGD, the unaffected blastocyst (B4) was transferred in the following frozen embryo transfer (FET). In this PGD cycle, sixteen MII oocytes were inseminated by ICSI with testicular spermatozoa. Four blastocysts (B4, B5, B10, B13) were utilized for TE cell biopsy on day 5 after ICSI. After PGD, B4 was unaffected by CCA and SBMA. B5 was affected by CCA and carried SBMA. B10 was unaffected by CCA and carried SBMA. B13 was affected by CCA and unaffected by SBMA. B4 was the only unaffected blastocyst and transferred into the uterus for the subsequent FET cycle. The accuracy of PGD was confirmed by amniocentesis at 21 weeks of gestation. A healthy boy weighing 2850 g was born by cesarean section at the 38th week of gestation."

According to the news reporters, the research concluded: "PGD is a valid screening tool for patient affected of CCA and SBMA to prevent transmission of these genetic diseases from parents to children."

Immune System Diseases and Conditions - HIV/AIDS

Study Results from National Cancer Institute Provide New Insights into HIV/AIDS (Role of APOBEC3F Gene Variation in HIV-1 Disease Progression and Pneumocystis Pneumonia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- A new study on Immune System Diseases and Conditions - HIV/AIDS is now available. According to news originating from Frederick, Maryland, by NewsRx correspondents, research stated, "Human APOBEC3 cytidine deaminases are intrinsic resistance factors to HIV-1. However, HIV-1 encodes a viral infectivity factor (Vif) that degrades APOBEC3 proteins."

Our news journalists obtained a quote from the research from National Cancer Institute, "In vitro APOBEC3F (A3F) anti-HIV-1 activity is weaker than A3G but is partially resistant to Vif degradation unlike A3G. It is unknown whether A3F protein affects HIV-1 disease in vivo. To assess the effect of A3F gene on host susceptibility to HIV-acquisition and disease progression, we performed a genetic association study in six well-characterized HIV-1 natural cohorts. A common six-Single Nucleotide Polymorphism (SNP) haplotype of A3F tagged by a codon-changing variant (p. I231V, with allele (V) frequency of 48% in European Americans) was associated with significantly lower set-point viral load and slower rate of progression to AIDS (Relative Hazards (RH)=0.71, 95% CI: 0.56, 0.91) and delayed development of pneumocystis pneumonia (PCP) (RH=0.53, 95% CI: 0.37-0.76). A validation study in the International Collaboration for the Genomics of HIV (ICGH) showed a consistent association with lower set-point viral load. An in vitro assay revealed that the A3F I231V variant may influence Vif mediated A3F degradation."

According to the news editors, the research concluded: "Our results provide genetic epidemiological evidence that A3F modulates HIV-1/AIDS disease progression."

For more information on this research see: Role of APOBEC3F Gene Variation in HIV-1 Disease Progression and Pneumocystis Pneumonia. Plos Genetics, 2016;12(3):e1005921. (Public Library of Science - www.plos.org; Plos Genetics - www.plosgenetics.org)

The news correspondents report that additional information may be obtained from P. An, Basic Research Laboratory, Center for Cancer Research, National Cancer Institute, Leidos Biomedical Research, Inc, Frederick National Laboratory for Cancer Research, Frederick, Maryland, United States. Additional authors for this research include S. Penugonda, C.W. Thorball, I. Bartha, J.J. Goedert, S. Donfield, S. Buchbinder, E. Binns-Roemer, G.D. Kirk, W. Zhang, J. Fellay, X.F. Genetics

Study Results from National Heart Lung and Blood Institute in the Area of Genetics Reported [Forkhead Box O3A (FOXO3) and the Mitochondrial Disulfide Relay Carrier (CHCHD4) Regulate p53 Protein Nuclear Activity in Response to Exercise]
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Genetics is the subject of a report. According to news reporting out of Bethesda, Maryland, by NewsRx editors, research stated, "Although exercise is linked with improved health, the specific molecular mechanisms underlying its various benefits require further clarification. Here we report that exercise increases the nuclear localization and activity of p53 by acutely down-regulating coiled-coil-helix-coiled-coil-helix domain 4 (CHCHD4), a carrier protein that mediates p53 import into the mitochondria."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research from National Heart Lung and Blood Institute, "This response to exercise is lost in transgenic mice with constitutive expression of CHCHD4. Mechanistically, exercise-induced nuclear transcription factor FOXO3 binds to the CHCHD4 promter and represses its expression, preventing the translocation of p53 to the mitochondria and thereby increasing p53 nuclear localization. The synergistic increase in nuclear p53 and FOXO3 by exercise can facilitate their known interaction in transactivating Sirtuin 1 (SIRT1), a NAD(+)‐dependent histone deacetylase that mediates adaptation to various stresses."

According to the news editors, the research concluded: "Thus, our results reveal one mechanism by which exercise could be involved in preventing cancer and potentially other diseases associated with aging."

Our news journalists report that additional information may be obtained by contacting P.M. Hwang, National Heart Lung & Blood Institute, Center Mol Med, National Institutes of Health, Bethesda, MD 20892, United States. Additional authors for this research include W.M. Kamp, J. Li, C.Y. Liu, J.G. Kang, P.Y. Wang and P.M. Hwang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.745737. This DOI is a link to an online electronic document that is either free or for purchase.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hormones - Gastrointestinal Hormones are discussed in a new report. According to news reporting out of Taipei, Taiwan, by NewsRx editors, research stated, "The first- and second-generation epidermal growth factor receptor tyrosine kinase inhibitors (1/2G EGFR-TKIs) gefitinib, erlotinib, and afatinib have all been approved as standard first-line treatments for advanced EGFR mutation-positive non-small cell lung cancer. The third-generation (3G) EGFR-TKIs have been developed to overcome the EGFR T790M mutation, which is the most common mechanism of acquired resistance to 1/2G EGFR-TKI treatment."

Our news journalists obtained a quote from the research from National Taiwan University, "This resistance mutation develops in half of the patients who respond to 1/2G EGFR-TKI therapy. The structures of the novel 3G EGFR-TKIs are different from those of 1/2G EGFR-TKIs. Particularly, 3G EGFR-TKIs have lower affinity to wild-type EGFR, and are therefore associated with lower rates of skin and gastrointestinal toxicities. However, many of the adverse events (AEs) that are observed in patients receiving 3G EGFR-TKIs have not been observed in patients receiving 1/2G EGFR-TKIs. Although preclinical studies have revealed many possible mechanisms for these AEs, the causes of some AEs remain unknown. Many mechanisms of resistance to 3G EGFR-TKI therapy have also been reported."

According to the news editors, the research concluded: "Here, we have reviewed the recent clinical and preclinical developments related to novel 3G EGFR-TKIs, including osimertinib, rociletinib, olmutinib, EGF816, and ASP8273."

For more information on this research see: Update on recent preclinical and clinical studies of T790M mutant-specific irreversible epidermal growth factor receptor tyrosine kinase inhibitors. *Journal of Biomedical Science*, 2016;23():1-10. *Journal of Biomedical Science* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. **Periodontal Diseases and Conditions - Gingival...**

**Study Results from Nihon University Provide New Insights into Gingival Overgrowth (Possible pharmacotherapy for nifedipine-induced gingival overgrowth: 18a-glycyrrhetinic acid inhibits human gingival fibroblast growth)**
Data detailed on Periodontal Diseases and Conditions - Gingival Overgrowth have been presented. According to news reporting originating from Chiba, Japan, by NewsRx correspondents, research stated, "This investigation aimed to establish the basis of a pharmacotherapy for nifedipine-induced gingival overgrowth. Gingival overgrowth has been attributed to the enhanced growth of gingival fibroblasts."

Our news editors obtained a quote from the research from Nihon University, "In this study, we investigated the effects of 18α-glycyrrhetinic acid (18α-GA) on growth, the cell cycle, and apoptosis and on the regulators of these processes in gingival fibroblasts isolated from patients who presented with nifedipine-induced gingival overgrowth. Gingival fibroblasts were cultured in medium containing 1% FBS with/without 10 mM 18α-GA for 24 or 48 h, and the cell number, cell cycle phase distribution, relative DNA content, apoptotic cell number and morphological characteristics of the cells undergoing apoptosis were measured together with the levels of proteins that regulate these processes and the level of caspase activity. 18α-GA significantly decreased cell numbers and significantly increased the percentage of cells in the sub-G1 and G0/G1 phases of the cell cycle and the number of apoptotic cells. Nuclear condensation and fragmentation of cells into small apoptotic bodies appeared in the fibroblasts treated with 18α-GA. In addition, 18α-GA significantly decreased the protein levels of cyclins A and D1, CDKs 2 and 6, phosphorylated Rb (ser(780) and ser(807/811)), Bcl-xL and Bcl-2 and increased the protein levels of p27, cytosolic cytochrome c, pro-caspase-3, and cleaved caspase-3 and the activities of caspases 3 and 9. 18α-GA inhibited gingival fibroblast growth by suppressing the G1/S phase transition and inducing apoptosis."

According to the news editors, the research concluded: "18α-GA may be used as a pharmacotherapy for nifedipine-induced gingival overgrowth."

The news editors report that additional information may be obtained by contacting R. Takeuchi, Dept. of Biochemistry and Molecular Biology, Nihon University School of Dentistry at Matsudo, Matsudo, Chiba, Japan. Additional authors for this research include K. Hiratsuka, K. Arikawa, M. Ono, M. Komiya, Y. Akimoto, A. Fujii and H. Matsumoto.

Study Results from Northwest A&F University Broaden Understanding of Prostate Cancer (Triptolide induces protective autophagy through activation of the CaMKKb-AMPK signaling pathway in prostate cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting originating in Yangling, People's Republic of China, by NewsRx journalists, research stated, "Triptolide, an active compound extracted from the Chinese herb thunder god vine (Tripterygium wilfordii Hook F.), has potent anti-tumor activity. Recently, triptolide was found to induce autophagy in cancer cells."

The news reporters obtained a quote from the research from Northwest A&F University, "However, the effects of triptolide on autophagy in human prostate cancer (PCa) cells have not yet been clearly elucidated. In this study, we demonstrated that triptolide induces autophagy in three PCa cell lines, PC-3, LNCaP and C4-2. Furthermore, we found that triptolide mediates intracellular accumulation of free calcium by stimulating the endoplasmic reticulum (ER) stress response. This activates the CaMKKb-AMPK signaling pathway, which in turn inhibits mTOR and activates both ULK1 and Beclin 1, finally resulting in autophagy. Moreover, we found that treatment with autophagy inhibitors 3-methyladenine (3-MA) and chloroquine (CQ) enhances triptolide-induced PCa cell death and growth inhibition. Using a PC-3-xenografted mouse model, we showed that blocking autophagy with CQ significantly promoted triptolide-induced tumor growth inhibition in vivo."

According to the news reporters, the research concluded: "Overall, our results show that triptolide induces protective autophagy through the CaMKKb-AMPK pathway in PCa cells, implying that a combination of triptolide with autophagy inhibitors may potentially be an effective therapeutic strategy for PCa."

For more information on this research see: Triptolide induces protective autophagy through activation of the CaMKKb-AMPK signaling pathway in prostate cancer cells. *Oncotarget*, 2016;7(5):5366-82.

Our news correspondents report that additional information may be obtained by contacting F. Zhao, College of Life Sciences, Northwest A & F University, Yangling, Shaanxi Province, People's Republic of China. Additional authors for this research include W. Huang, Z. Zhang, L. Mao, Y. Han, J. Yan and M. Lei.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18632/oncotarget.6783. This DOI is a link to an online electronic document that is either free or for purchase.

Hormones

Study Results from Northwestern University in the Area of Hormones Reported (Alcohol, cigarette smoking, and ovarian reserve in reproductive-age African-American women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hormones is the subject of a report. According to news originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Although alcohol consumption and cigarette smoking are common behaviors in reproductive-age women, little is known about the impact of consumption patterns on ovarian reserve. Even less is known about the effects of smoking and alcohol use in reproductive-age African-American women."

Our news journalists obtained a quote from the research from Northwestern University, "The objective of the study was to examine the impact of the patterns of alcohol intake and cigarette smoking on anti-Mullerian hormone levels as a marker of ovarian reserve in African-American women. This was a cross-sectional analysis from the baseline clinical visit and data collection of the Study of Environment, Lifestyle, and Fibroids performed by the National Institute of Environmental Health Sciences. A total of 1654 volunteers, aged 23-34 years, recruited from the Detroit, Michigan community completed questionnaires on alcohol intake and cigarette smoking and provided serum for anti-Mullerian hormone measurement. Multivariable linear and logistic regressions were used as appropriate to estimate the effect of a range of exposure patterns on anti-Mullerian hormone levels while adjusting for potential confounders including age, body mass index, and hormonal contraception. Most participants were alcohol drinkers (74%). Of those, the majority (74%) engaged in binge drinking at least once in the last year. Women who reported binge drinking twice weekly or more had 26% lower anti-Mullerian hormone levels compared with current drinkers who never binged (95% confidence interval, -44, -2, P< .04). Other alcohol consumption patterns (both past and current) were unrelated to anti-Mullerian hormone. The minority of participants currently (19%) or formerly (7%) smoked, and only 4% of current smokers used a pack a day or more. Neither smoking status nor second-hand smoke exposure in utero, childhood, or adulthood was associated with anti-Mullerian hormone levels. Results suggest that current, frequent binge drinking may have an adverse impact on ovarian reserve. Other drinking and smoking exposures were not associated with anti-Mullerian hormone in this cohort of healthy, young, African-American women."

According to the news editors, the research concluded: "A longitudinal study of how these common lifestyle behaviors have an impact on the variability in age-adjusted anti-Mullerian hormone levels is merited."

The news correspondents report that additional information may be obtained from E.E. Marsh, Northwestern University, Dept. of Obstet & Gynecol, Div Reprod Endocrinol & Infertil, Chicago, IL 60611, United States. Additional authors for this research include L.A. Bernardi, P.J.D. De Chavez, D.D. Baird, M.R. Carnethon and E.E. Marsh.

Study Results from Norwegian University of Science and Technology (NTNU) in the Area of Health and Society Reported (The impact of neighborhood social capital on life satisfaction and self-rated health: A possible pathway for health promotion?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Health and Society have been published. According to news reporting out of Trondheim, Norway, by NewsRx editors, research stated, "Neighborhood social capital has repeatedly been linked to favorable health-outcomes and life satisfaction. However, it has been questioned whether it's impact on health has been over-rated."

Our news journalists obtained a quote from the research from the Norwegian University of Science and Technology (NTNU), "We aim to investigate relationships between neighborhood social capital and self-rated health (SRH) and life satisfaction (LS) respectively, both directly and indirectly mediated via Sense of Coherence and self-esteem. Based on a crosssectional population-survey (N=865) in a medium size Norwegian municipality, we specified a structural equation model (SEM) including the above-listed variables, while controlling for gender, age, education, income, and employment status. The applied model explains more variance in LS (46%) than in SRH (23%). Social capital has a stronger impact on life satisfaction than on health. The indirect pathway via SOC had the highest impact on life satisfaction, but no significant relationship to SRH. Self-rated health was more tightly linked to personal background variables."

According to the news editors, the research concluded: "Enhancing social capital in the neighborhood might be a beneficial strategy to promote life satisfaction, as well as strengthening sense of coherence even in healthy communities."

Our news journalists report that additional information may be obtained by contacting R. Maass, Norwegian Univ Sci & Technol NTNU, Center Hlth Promot Res, N-7491 Trondheim, Norway. Additional authors for this research include C.A. Kloeckner, B. Lindstrom and M. Lillefjell.

Study Results from Ogaki Municipal Hospital Update Understanding of Liver Cancer (Utility of combined gray-scale and perflubutane contrast-enhanced ultrasound for diagnosing early hepatocellular carcinomas: Comparison of well differentiated and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news originating from Gifu, Japan, by NewsRx correspondents, research stated, "To clarify the value of gray-scale ultrasound (US) combined with contrast-enhanced US (CEUS) with perflubutane in diagnosing early hepatocellular carcinoma (HCC). A total of 57 surgically resected, well differentiated HCCs were analyzed."

Our news journalists obtained a quote from the research from Ogaki Municipal Hospital, "Hepatocellular carcinomas were macroscopically diagnosed as vaguely nodular or distinctly nodular types, which correspond to early HCC or progressed HCC, respectively. Gray-scale US findings were evaluated in terms of shape (round or roundish, or irregular), border and contour (well-defined and smooth, or poorly defined), and intratumor echo levels (hyper, hypo, iso, heterogeneous, or mosaic). Contrast-enhanced US findings were evaluated during the arterial phase (vascularity [finely homogeneous, dendritic, or chaotic] and perfusion enhancement [homogeneous or heterogeneous]), portal phase (presence or absence of washout), and post-vascular phase (echo intensity level [defect, incomplete defect, or iso-enhancing]). Eighteen HCCs were categorized as early HCCs and the remaining 39 were categorized as progressed HCCs. Receiver operating characteristic curve analysis for the diagnosis of early HCC yielded area under the receiver operating characteristic curve (A(z)) values for border and contour on gray-scale US and echo intensity level in the CEUS post-vascular phase of 0.782 and 0.828, respectively. Multiple logistic regression analysis also indicated that both of these gray-scale US and CEUS findings were independently associated with early HCC. The A(z) value for the combination of border and contour and echo intensity for the diagnosis of early HCC was 0.907, corresponding to a high diagnostic value."

According to the news editors, the research concluded: "The combination of gray-scale US and CEUS can provide high-quality imaging assessment for diagnosing early HCC."

The news correspondents report that additional information may be obtained from T. Tada, Ogaki Municipal Hosp, Dept. of Gastroenterol & Hepatol, Ogaki, Gifu 5038502, Japan. Additional authors for this research include T. Kumada, H. Toyoda, Y. Sone, Y. Kaneoka, A. Maeda, S. Okuda, K. Otobe and N. Tsuji.

Study Results from Okayama University Hospital Update Understanding of Tissue Engineering (Challenges to success in heart failure: Cardiac cell therapies in patients with heart diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biomedical Engineering - Tissue Engineering have been presented. According to news reporting from Okayama, Japan, by NewsRx journalists, research stated, "Heart failure remains the leading cause of death worldwide, and is a burgeoning problem in public health due to the limited capacity of postnatal hearts to self-renew. The pathophysiological changes in injured hearts can sometimes be manifested as scar formation or myocardial degradation, rather than supplemental muscle regeneration to replenish lost tissue during the healing processes."

The news correspondents obtained a quote from the research from Okayama University Hospital, "Stem cell therapies have been investigated as a possible treatment approach for children and adults with potentially fatal cardiovascular disease that does not respond to current medical therapies. Although the heart is one of the least regenerative organs in mammals, discoveries made during the past few decades have improved our understanding of cardiac development and resident stem/progenitor pools, which may be lineage-restricted subpopulations during the post-neonatal stage of cardiac morphogenesis. Recently, investigation has specifically focused on factors that activate either endogenous progenitor cells or preexisting cardiomyocytes, to regenerate cardiovascular cells and replace the damaged heart tissues. The discovery of induced pluripotent stem cells has advanced our technological capability to direct cardiac reprogramming by essential factors that are crucial for heart field completion in each stage. Cardiac tissue engineering technology has recently shown progress in generating myocardial tissue on human native cardiac extracellular matrix scaffolds. This review summarizes recent advances in the field of cardiac cell therapies with an emphasis on cellular mechanisms, such as bone marrow stem cells and cardiac progenitor cells, which show the high potential for success in preclinical and clinical meta-analysis studies."

According to the news reporters, the research concluded: "Expanding our current understanding of mechanisms of self-renewal in the neonatal mammalian heart may lead to the development of novel cardiovascular regenerative medicines for pediatric heart diseases."

For more information on this research see: Challenges to success in heart failure: Cardiac cell therapies in patients with heart diseases. Journal of Cardiology, 2016;68(5-6):361-367. Study Results from Ordu University Provide New Insights into Central Nervous System Agents (Haemodynamic Responses to Tracheal Intubation Using Propofol, Etomidate and Etomidate-Propofol Combination in Anaesthesia Induction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Central Nervous System Agents. According to news reporting from Ordu, Turkey, by NewsRx journalists, research stated, "The aim of this study was to measure the haemodynamic responses to a etomidate-propofol combination used for anaesthesia induction and to compare the haemodynamic responses with the separate use of each drug. The patients were randomly divided into three groups as group P (n=30, propofol 2.5 mg kg(-1)), group E (n=30, etomidate 0.3 mg kg(-1)) and group PE (n=30, propofol 1.25 mg kg(-1) + etomidate 0.15 mg kg(-1))."

The news correspondents obtained a quote from the research from Ordu University, "For each patient, the times of measurement of the heart rate (HR) and mean arterial pressure values were defined as baseline, after the induction, before the intubation, immediately after the intubation and 1, 2, 3, 4, 5 and 10 minutes after the intubation. In all 3 groups, a significant decrease in MAP values were seen at T2 and T3 compared to the baseline values, and this decrease was greater in group P compared to that in group E and PE (p <0.001, p<0.01). A significant increase was seen in all 3 groups in the mean arterial pressure (MAP) value at T4 after the intubation. When the groups were compared with each other, this increase was greater in group E than in the other two groups (with group P, p<0.001; with group PE, p<0.01)."

According to the news reporters, the research concluded: "Etomidate-propofol combination may be a valuable alternative when extremes of hypotensive and hypertensive responses due to propofol and etomidate are best to be avoided."

For more information on this research see: Haemodynamic Responses to Tracheal Intubation Using Propofol, Etomidate and Etomidate-Propofol Combination in Anaesthesia Induction. Journal of Cardiovascular and Thoracic Research, 2015;7(4):134-40.

Our news journalists report that additional information may be obtained by contacting O. Yagan, Ordu University, School of Medicine, Dept. of Anesthesiology, Ordu, Turkey. Additional authors for this research include N. Tas, A. Kucuk, V. Hanci and B.S Yurtlu.

Study Results from P. Westhead and Colleagues in the Area of Small Business Reported (Entrepreneurship education and entrepreneurial intention: Do female students benefit?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Business - Small Business have been published. According to news reporting originating from Haugesund, Norway, by NewsRx correspondents, research stated, "This article explores links between entrepreneurship education (EE) participation, alertness and risk-taking skills and the intensity of entrepreneurial intention relating to becoming an entrepreneur. Guided by insights from human capital and socially learned stereotypes theories, we conceptualize and test novel hypotheses that consider the potential moderating effect of gender and participation in EE."

Our news editors obtained a quote from the research, "Business students participating in EE modules were compared with engineering students excluded from such programmes. Hierarchical regression analysis revealed that EE students reported high intensity of intention; however, EE did not generate equal benefits for all students. Women were significantly less likely to report high intensity of intention; however, those citing the alertness skill were more likely to report high intensity of intention than non-EE women students."

According to the news editors, the research concluded: "Both male EE and non-EE students citing the risk perception skill reported higher intention, whereas women EE students citing the risk perception skill reported lower intention."

The news editors report that additional information may be obtained by contacting M.Z. Solesvik, Stord Haugesund Univ College, Innovat & Management, Haugesund, Norway.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/0266242615612534. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Neuroblastomas

Study Results from P.Y. Liu and Colleagues Broaden Understanding of Neuroblastomas (NCYM is upregulated by IncUSMycN and modulates N-Myc expression)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Neuroblastomas. According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "Neuroblastoma is the most common solid tumor in early childhood. Patients with neuroblastoma due to the amplification of a 130-kb genomic DNA region containing the MYCN, MYCN antisense NCYM and IncUSMyCN genes show poor prognosis."

The news reporters obtained a quote from the research, "BET bromodomain inhibitors show anticancer efficacy against neuroblastoma partly by reducing MYCN gene transcription and N-Myc mRNA and protein expression. We have previously shown that the long noncoding RNA IncUSMyCN upregulates N-Myc mRNA expression by binding to the RNA-binding protein NonO. In this study, we found that IncUSMyCN upregulated NCYM expression, and knocking down IncUSMyCN reduced histone H3 lysine 4 trimethylation, a marker for active gene transcription, at the NCYM gene promoter. NCYM upregulated N-Myc mRNA expression, NCYM RNA formed a complex with NonO protein, and knocking down NCYM expression reduced neuroblastoma cell proliferation. Importantly, treatment with BET bromodomain inhibitors reduced NCYM expression. In human neuroblastoma patients, high levels of NCYM expression in tumor tissues correlated with high levels of N-Myc, NonO and IncUSMyCN expression as well as poor patient prognosis. Taken together, our findings suggest that IncUSMyCN upregulates NCYM expression by activating its gene transcription, and that NCYM RNA upregulates N-Myc mRNA expression by binding to NonO."

According to the news reporters, the research concluded: "Our findings also provide further evidence for the application of BET bromodomain inhibitors for the therapy of neuroblastoma characterized by MYCN/NCYM gene locus amplification."

For more information on this research see: NCYM is upregulated by IncUSMyCN and modulates N-Myc expression. *International Journal of Oncology*, 2016;49(6):2464-2470. *International Journal of Oncology* can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

Our news correspondents report that additional information may be obtained by contacting T. Liu, UNSW Australia, Center Childhood Canc Res, Sydney, NSW 2052, Australia. Additional authors for this research include B. Atmadibrata, S. Mondal, A.E. Tee and T. Liu.

**Epithelial Cells**

**Study Results from Pacific Dental College and Hospital Broaden Understanding of Epithelial Cells (Nuclear anomalies in exfoliated buccal epithelial cells of petrol station attendants in Udaipur, Rajasthan)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Epithelial Cells have been published. According to news reporting originating from Rajasthan, India, by NewsRx correspondents, research stated, "The petroleum derivatives consist of a complex mixture of chemical compounds one among
which is benzene. Petrol station workers who pump fuel to vehicles absorb the products of fuel fumes and the products of combustion."

Our news editors obtained a quote from the research from Pacific Dental College and Hospital, "To study the occupational exposure to petroleum derivatives such as benzene, exfoliated buccal cells from 40 petrol station attendants and 40 age-matched control subjects were examined for micronuclei, binucleation, karyorrhexis and karyolysis frequency by using Feulgen and Giemsa stains. Statistical evaluation was performed with ANOVA test. In the present study, inter-comparison of mean values for micronuclei, binucleation, karyorrhexis and karyolysis using Feulgen stain between smokers of study and control group, as well as between smokers and non-smokers of study and control group revealed statistically highly significant results with P value 0.00002 and 0.0001 respectively. Whereas inter comparison between non-smokers of study and control group using Feulgen stain and inter comparison between smokers of study and control group, using Giemsa stain revealed statistically significant results with P value 0.0034 and 0.0004, respectively."

According to the news editors, the research concluded: "This study revealed that the studied individuals belong to a risk group and should periodically undergo biological monitoring and proper care."

The news editors report that additional information may be obtained by contacting R. Metgud, Dept. of Oral Pathology and Microbiology, Pacific Dental College and Hospital, Udaipur, Rajasthan, India. Additional authors for this research include N. Khajuria, S. Patel and S. Lerra.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0973-1482.146058. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Basal Cell Cancer**

**Study Results from Peking University Update Understanding of Basal Cell Cancer (Heterozygous PTCH1 Mutations Impact the Bone Metabolism in Patients With Nevod Basal Cell Carcinoma Syndrome Likely by Regulating SPARC Expression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Basal Cell Cancer have been presented. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Nevod basal cell carcinoma syndrome (NBCCS) is an autosomal dominant disorder characterized by bone and skin abnormalities and a predisposition to various tumors. Keratocystic odontogenic tumors (KCOTs), which are common tumors of the jaw that cause extensive damage to the jawbone, are usually accompanied with NBCCS."

The news correspondents obtained a quote from the research from Peking University, "Germline PTCH1 mutations in NBCCS tumorigenesis have been frequently studied; however,
little is known regarding the pathogenesis of bone abnormalities in this disease. This study sought to investigate the mechanism underlying heterozygous PTCH1 mutation-mediated abnormal bone metabolism in patients with NBCCS. Stromal cells were isolated from the fibrous capsules of patients with NBCCS-associated or non-syndromic keratocystic odontogenic tumors and non-syndromic tumor stromal cells without PTCH1 mutations served as controls. Germline PTCH1 heterozygous mutations were confirmed in all NBCCS samples and differential protein expression was identified using tandem mass tag-labeled proteomics analysis. Our findings revealed that osteonectin/SPARC expression was significantly downregulated in syndromic stromal cells compared with non-syndromic stromal cells. SPARC expression was even lower in stromal cells carrying PTCH1 protein truncation mutations. PTCH1 siRNA transfection demonstrated that SPARC downregulation correlates with decreased PTCH1 expression. Furthermore, exogenous SPARC promoted osteogenic differentiation of syndromic stromal cells with enhanced development of calcium nodules. In addition, bone mineral density tests showed that patients with NBCCS exhibit weak bone mass compared with sex- and age-matched controls. This study indicates that germline PTCH1 heterozygous mutations play a major role in bone metabolism in patients with NBCCS, in particular in those with PTCH1 protein truncation mutations. SPARC may represent an important downstream modulator of PTCH1 mediation of bone metabolism. Thus, bone mineral density monitoring is critical for patients with NBCCS for prevention of osteoporosis."

According to the news reporters, the research concluded: "In addition, surgical procedures on syndromic-associated KCOTs should be performed with consideration of the weaker bone mass in such patients."

Our news journalists report that additional information may be obtained by contacting F. Chen, Peking University, Cent Lab, Sch & Hosp Stomatol, Beijing 100081, People's Republic of China. Additional authors for this research include J.Y. Zhang, H.Y. Zhang, X.F. Li, J.F. Qu, J.M. Zhai, L. Zhang, F. Chen and T.J. Li.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Human Immunodeficiency Virus is now available. According to news reporting out of Hershey, Pennsylvania, by NewsRx editors, research stated, "HIV Gag (Pr55(Gag)), a multidomain polyprotein that orchestrates the assembly and release of the human immunodeficiency virus (HIV), is an active target of antiretroviral inhibitor development. However, highly pure, stable, recombinant Pr55(Gag) has been difficult to produce in quantities sufficient for biophysical studies due to its susceptibility to proteolysis by cellular proteases during purification."

Our news journalists obtained a quote from the research from Pennsylvania State College, "Stability has been improved by using a construct that omits the p6 domain (Delta p6). In vivo, p6 is crucial to the budding process and interacts with protein complexes in the ESCRT (Endosomal Sorting Complexes Required for Transport) pathway, it has been difficult to study its role in the context of Gag using in vitro approaches. Here we report the generation of a full length Gag construct containing a tobacco etch virus (TEV)-cleavable C-terminal hexahistidine tag, allowing a detailed comparison of its nucleic acid binding properties with other constructs, including untagged, Delta p6, and C-terminally tagged (TEV-cleavable and non-cleavable) Gags, respectively. We have developed a standard expression and purification protocol that minimizes nucleic acid contamination and produces milligram quantities of full length Gag for in vitro studies and compound screening purposes. We found that the presence of a carboxyl-terminal hexahistidine tag changes the nucleic binding properties compared to the proteins that did not contain the tag (full length protein that was either untagged or resulted from removal of the tag during purification)."

According to the news editors, the research concluded: "The HIV Gag expression and purification protocol described herein provides a facile method of obtaining large quantities of high quality protein for investigators who wish to study the full length protein or the effect of the p6 domain on the biophysical properties of Gag."

For more information on this research see: A non-cleavable hexahistidine affinity tag at the carboxyl-terminus of the HIV-1 Pr55(Gag) polyprotein alters nucleic acid binding properties. Protein Expression and Purification, 2017;130():137-145. Protein Expression and Purification can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Platinum Compounds

Study Results from Q. Xie et al Provide New Insights into Platinum Compounds (ABT737 reverses cisplatin resistance by regulating ER-mitochondria Ca2+ signal transduction in human ovarian cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Platinum Compounds have been published. According to news reporting from Jilin, People's Republic of China, by NewsRx journalists, research stated, "Bcl-2, which belongs to the Bcl-2 family, is frequently overexpressed in various types of cancer cells and contributes to drug resistance. However, the function of Bcl-2 in cisplatin resistance in human ovarian cancer cells is not fully understood."

The news correspondents obtained a quote from the research, "In this study, we found that the pharmacological inhibitor ABT737 or genetic knockdown of Bcl-2 increased cisplatin cytotoxicity in cisplatin-resistant ovarian cancer cells. Additionally, treatment with ABT737 or Bcl-2 siRNA increased cisplatin-induced free Ca2+ levels in the cytosol and mitochondria, which increased endoplasmic reticulum (ER)-associated and mitochondria-mediated apoptosis. In addition, ABT737 or Bcl-2 siRNA increased the ER-mitochondria contact sites induced by cisplatin in cisplatin-resistant SKOV3/DDP ovarian cancer cells. Consistently with the in vitro results, ABT737 potently synergized with cisplatin in inhibiting the growth of human ovarian cancer xenografts in nude mice."

According to the news reporters, the research concluded: "Collectively, these results indicate that pharmacological inhibitors or genetic knockdown of Bcl-2 may be a potential strategy for improving cisplatin treatment of ovarian cancer."

Keywords for this news article include: Jilin, People's Republic of China, Asia, Small Interference RNAs, Subcellular Fractions, Cellular Structures, Intracellular Space, Drugs and Therapies, Chlorine Compounds, Nitrogen Compounds, Platinum Compounds, Cisplatin Therapy, Alkylating Agents, Pharmaceuticals, Antineoplastics, Biotechnology, Pharmacology, Mitochondria, Organelles, Cytoplasm, Genetics, Oncology, Cancer, siRNA.

Nanotechnology - Biochips

Study Results from Queen's University Broaden Understanding of Biochips (Genetic diagnosis of familial hypercholesterolaemia using a rapid biochip array assay for 40 common LDLR, APOB and PCSK9 mutations)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nanotechnology - Biochips. According to news reporting out of Belfast, United Kingdom, by NewsRx editors, research stated, "Familial hypercholesterolaemia (FH) leads to a lifelong increase in plasma LDL levels with subsequent increase in premature vascular disease. Early diagnosis and treatment is the key to effective management of this condition."

Our news journalists obtained a quote from the research from Queen's University, "This research aims to produce a simple and cost effective genetic test which could identify the majority (71%) of mutations causing FH in the UK and Ireland. The Randox Biochip Array Technology was used to detect 40 point mutations in LDLR, APOB and PCSK9 genes, over two 5 x 5 arrays. This technology uses multiplex allele specific PCR and biochip array hybridisation, followed by a chemiluminescence detection system and software for automated mutation calling. The FH biochip array assay was validated in the Belfast Genetics Laboratory using 199 cascade screening samples previously sequenced for known FH causing family mutations, the overall sensitivity was 98%. The assay was then used for routine testing of 663 patients with possible FH, from clinics across the UK and Ireland. A total of 49 (7.4%) mutation positive individuals were identified, however, for the clinics in England the detection rate was 12.9%. Further analysis of 120 biochip negative patients, using DNA sequencing, did not identify any false negatives. The FH biochip array provides a rapid and reliable genetic test for the majority of FH causing point mutations in the UK and Ireland."

According to the news editors, the research concluded: "A total of 32 samples can be run in 3 h. This allows clinics to evaluate additional patients for a possible diagnosis of FH such as patients with high LDL, patients with early onset coronary disease, and patients with relatives known to have FH."

For more information on this research see: Genetic diagnosis of familial hypercholesterolaemia using a rapid biochip array assay for 40 common LDLR, APOB and PCSK9 mutations. *Atherosclerosis*, 2016;254():8-13. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Our news journalists report that additional information may be obtained by contacting C.A. Graham, Queen's University, Center Public Hlth, Belfast, Antrim, United Kingdom. Additional authors for this research include M. Latten, P. Hart, H. Murray, D.A. Bailie, M. Crockard, J. Lamont, P. Fitzgerald and C.A. Graham.

Epithelial Cells

Study Results from Queensland University of Technology Provide New Insights into Epithelial Cells (Promotion of a cancer-like phenotype, through chronic exposure to inflammatory cytokines and hypoxia in a bronchial epithelial cell line model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Epithelial Cells. According to news reporting from Brisbane, Australia, by NewsRx journalists, research stated, "Globally, lung cancer accounts for approximately 20% of all cancer related deaths. Five-year survival is poor and rates have remained unchanged for the past four decades."

The news correspondents obtained a quote from the research from the Queensland University of Technology, "There is an urgent need to identify markers of lung carcinogenesis and new targets for therapy. Given the recent successes of immune modulators in cancer therapy and the improved understanding of immune evasion by tumours, we sought to determine the carcinogenic impact of chronic TNF-a and IL-1b exposure in a normal bronchial epithelial cell line model. Following three months of culture in a chronic inflammatory environment under conditions of normoxia and hypoxia (0.5% oxygen), normal cells developed a number of key genotypic and phenotypic alterations. Important cellular features such as the proliferative, adhesive and invasive capacity of the normal cells were significantly amplified. In addition, gene expression profiles were altered in pathways associated with apoptosis, angiogenesis and invasion. The data generated in this study provides support that TNF-a, IL-1b and hypoxia promotes a neoplastic phenotype in normal bronchial epithelial cells. In turn these mediators may be of benefit for biomarker and/or immune-therapy target studies."

According to the news reporters, the research concluded: "This project provides an important inflammatory in vitro model for further immuno-oncology studies in the lung cancer setting."

For more information on this research see: Promotion of a cancer-like phenotype, through chronic exposure to inflammatory cytokines and hypoxia in a bronchial epithelial cell line model. Scientific Reports, 2016;6():18907. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Drugs and Therapies - Coagulants

Study Results from R. Sinha and Colleagues Broaden Understanding of Coagulants [The use of hemostatic spray as an adjunct to conventional hemostatic measures in high-risk nonvariceal upper GI bleeding (with video)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Coagulants. According to news reporting from Edinburgh, United Kingdom, by NewsRx journalists, research stated, "Endoscopic management of nonvariceal upper GI bleed (NVUGIB) can be challenging. Hemospray is a novel endoscopic hemostatic agent for NVUGIB."

The news correspondents obtained a quote from the research, "Its efficacy in attaining hemostasis in NVUGIB is promising, particularly with respect to technically difficult lesions. However, most of the currently available data are focused on its application as monotherapy. The aim of this study was to evaluate its efficacy as a second agent to adrenaline, or as an addition to the combination of adrenaline with either clips or a thermal device in NVUGIB. Consecutive patients with Forrest 1a and 1b ulcer treated with hemostatic spray as an adjunct to conventional endoscopic hemostatic measures between July 2013 and June 2015 were included in this retrospective analysis. The endpoints were initial hemostasis, 7-day rebleeding, 30-day rebleeding, all-cause, and GI-related 30-day mortality. A total of 20 patients (median age, 75 years, 50% men, 60% Forrest 1a ulcer) were treated with hemostatic spray as a second agent to adrenaline, or as an adjunct to the combination of adrenaline with either clips or a thermal device. Hemostatic spray was used as a second agent to adrenaline in 40% and as a third agent to combined dual therapy in 60%. Initial hemostasis was attained in 95% with an overall rebleeding rate at 7 days of 16%. There was no difference between the 7-day and 30-day rebleeding rates. The combination of hemostatic spray and adrenaline resulted in 100% initial hemostasis and 25% 7-day rebleeding. Similarly, initial hemostasis was achieved in 92% with a 9% rebleeding rate when hemostatic spray was used as the third agent to 2 of the conventional measures. All-cause mortality was 15% with 1 GI-related death (3%)."

According to the news reporters, the research concluded: "In our single-center retrospective analysis, hemostatic spray appears promising as an adjunct to conventional methods for NVUGIB, although prospective controlled trials are needed to confirm this."

Our news journalists report that additional information may be obtained by contacting R. Sinha, Royal Infirmary, Center Liver & Digest Disorders, Edinburgh EH16 4SA, Midlothian, United Kingdom. Additional authors for this research include K.A. Lockman, N.I. Church, J.N. Plevris and P.C. Hayes.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.gie.2016.04.016. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from Radboud University in the Area of Myeloid Cells Reported (beta-Glucan Reverses the Epigenetic State of LPS-Induced Immunological Tolerance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Myeloid Cells are presented in a new report. According to news reporting out of Nijmegen, Netherlands, by NewsRx editors, research stated, "Innate immune memory is the phenomenon whereby innate immune cells such as monocytes or macrophages undergo functional reprogramming after exposure to microbial components such as lipopolysaccharide (LPS). We apply an integrated epigenomic approach to characterize the molecular events involved in LPS-induced tolerance in a time-dependent manner."

Our news journalists obtained a quote from the research from Radboud University, "Mechanistically, LPS-treated monocytes fail to accumulate active histone marks at promoter and enhancers of genes in the lipid metabolism and phagocytic pathways. Transcriptional inactivity in response to a second LPS exposure in tolerized macrophages is accompanied by failure to deposit active histone marks at promoters of tolerized genes. In contrast, beta-glucan partially reverses the LPS-induced tolerance in vitro. Importantly, ex vivo beta-glucan treatment of monocytes from volunteers with experimental endotoxemia re-instates their capacity for cytokine production."

According to the news editors, the research concluded: "Tolerance is reversed at the level of distal element histone modification and transcriptional reactivation of otherwise unresponsive genes."

For more information on this research see: beta-Glucan Reverses the Epigenetic State of LPS-Induced Immunological Tolerance. Cell, 2016;167(5):1354-1368,428-441. Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell - www.journals.elsevier.com/cell/)

Oncology - Penile Cancer

Study Results from Research Institute Update Understanding of Penile Cancer (Management of Penile Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Penile Cancer have been presented. According to news reporting out of Tampa, Florida, by NewsRx editors, research stated, "Although rare, penile cancer carries high morbidity and mortality particularly when pertaining to the management of locally advanced or metastatic disease. The current scientific literature lacks level I evidence and current guidelines are based largely on retrospective studies and small single center studies."

Our news journalists obtained a quote from the research from Research Institute, "Despite these limitations, there has been paradigm shifts in the management of both local and systemic disease. Current guidelines emphasize penile sparing strategies, minimizing morbidity from surgical management of loco-regional metastasis and multimodal management of bulky inguinal lymph node metastases."

According to the news editors, the research concluded: "The present review highlights the current state of knowledge and recommended treatment strategies of penile carcinoma."

Our news journalists report that additional information may be obtained by contacting P.E. Spiess, H Lee Moffitt Canc Center & Res Inst, Dept. of Genitourinary Oncol, Tampa, FL 33612, United States. Additional authors for this research include A.R. Leone and P.E. Spiess.

Mouth Diseases and Conditions - Stomatitis

Study Results from Research Institute in the Area of Stomatitis Reported (N-Myc expression enhances the oncolytic effects of vesicular stomatitis virus in human neuroblastoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mouth Diseases and Conditions - Stomatitis. According to news reporting originating in Calgary, Canada, by NewsRx journalists, research stated, "N-myc oncogene amplification is associated but not present in all cases of
high-risk neuroblastoma (NB). Since oncogene expression could often modulate sensitivity to oncolytic viruses, we wanted to examine if N-myc expression status would determine virotherapy efficacy to high-risk NB."

The news reporters obtained a quote from the research from Research Institute, "We showed that induction of exogenous N-myc in a non-N-myc-amplified cell line background (TET-21N) increased susceptibility to oncolytic vesicular stomatitis virus (mutant VSV Delta M51) and alleviated the type I IFN-induced antiviral state. Cells with basal N-myc, on the other hand, were less susceptible to virus-induced oncolysis and established a robust IFN-mediated antiviral state. The same effects were also observed in NB cell lines with and without N-myc amplification. Microarray analysis showed that N-myc overexpression in TET-21N cells downregulated IFN-stimulated genes (ISGs) with known antiviral functions. Furthermore, virus infection caused significant changes in global gene expression in TET-21N cells overexpressing N-myc. Such changes involved ISGs with various functions. Therefore, the present study showed that augmented susceptibility to VSV Delta M51 by N-myc at least involves downregulation of ISGs with antiviral functions and alleviation of the IFN-stimulated antiviral state."

According to the news reporters, the research concluded: "Our studies suggest the potential utility of N-myc amplification/overexpression as a predictive biomarker of virotherapy response for high-risk NB using IFN-sensitive oncolytic viruses."

For more information on this research see: N-Myc expression enhances the oncolytic effects of vesicular stomatitis virus in human neuroblastoma cells. Molecular Therapy-Oncolytics, 2016;3():15-26. Molecular Therapy-Oncolytics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

Clinical Research - Clinical Trials and Studies

Study Results from Royal Brisbane and Women's Hospital Broaden Understanding of Clinical Trials and Studies [A tiered multidisciplinary approach to the psychosocial care of adult cancer patients integrated into routine care: the PROMPT study (a ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news reporting out of Herston, Australia, by NewsRx editors, research stated, "A stepped-wedge cluster-randomised controlled trial was conducted to evaluate the feasibility and effectiveness of a brief psychosocial intervention for depressed cancer patients, delivered by trained front-line health professionals in routine clinical care. Nine
hundred two patients were assessed across four treatment centres which were allocated in random order from control epoch to intervention epoch."

Our news journalists obtained a quote from the research from Royal Brisbane and Women's Hospital, "Eligible patients had Hospital Anxiety and Depression Scale (HADS) scores of 8 or greater. Of eligible patients, 222 were recruited in control epoch and 247 in intervention epoch. Twenty-seven health professionals (HPs) were trained to deliver the psychosocial intervention consisting of up to four sessions, tailored to patient symptoms and distress. HPs participated in group supervision with a psychiatrist. The primary outcome, analysed by intention to treat, was depression measured with the HADS at 10 weeks after receiving the intervention. At 10-week follow-up, there were no significant differences in HADS score for the 181 patients in control epoch and 177 in intervention epoch (adjusted difference -1.23, 95% CI -3.81--1.35, p = 0.35). Patients with disease progression who received the intervention experienced significant benefits in unmet practical support needs including care and support, information, and physical and daily living. A brief psychosocial intervention delivered by front-line oncology health professionals is feasible to deliver but is insufficient as a stand-alone treatment for depression in cancer patients."

According to the news editors, the research concluded: "Psychosocial interventions should be targeted to populations most likely to experience benefit."

For more information on this research see: A tiered multidisciplinary approach to the psychosocial care of adult cancer patients integrated into routine care: the PROMPT study (a cluster-randomised controlled trial). *Supportive Care in Cancer*, 2017;25(1):17-26. *Supportive Care in Cancer* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

disease but one that can cause significant morbidity, the most severe being limb loss reported in 20% to 59% of cases. Two approaches to repair are described in the literature, the posterior and the medial; however, the 'gold standard' method of repair remains controversial."

Our news journalists obtained a quote from the research from Royal Oldham Hospital, "A systematic review of electronic information sources was undertaken to identify papers comparing outcomes of posterior repair vs medial repair. The methodologic quality of the papers was assessed using the Newcastle-Ottawa Scale. Fixed-effect or random-effects models were applied to synthesize data. The search yielded seven articles eligible for inclusion. The total population comprised 1427 patients; 338 had posterior repair and 1089 had medial repair. There was no difference in the two groups in terms of postoperative nerve damage (odds ratio [OR], 1.01; 95% confidence interval [CI], 0.24-4.2) and 30-day postoperative complications (OR, 0.87; 95% CI, 0.43-1.77). Limb loss at 30 days occurred more frequently in the medial approach group, but the difference was not statistically significant (risk difference [RD], 0.02; 95% CI, -0.04 to 0.00). Thirty-day primary patency was not statistically different between groups (RD, 0.01; 95% CI, -0.04 to 0.02), but the 30-day secondary patency suggested superiority of the posterior approach (RD, 0.05; 95% CI, 0.02-0.07). Long-term primary and secondary patency both favored the posterior approach (OR, 1.61 [95% CI, 1.06-2.43] and OR, 1.73 [95% CI, 0.91-3.30], respectively). Aneurysm exclusion was also superior with the posterior approach (OR, 4.20; 95% CI, 1.40-12.60). The rate of reoperation favored the posterior approach (OR, 0.26; 95% CI, 0.09-0.72). Long-term risk of limb loss favored posterior repair, but no statistically significant difference was found (OR, 0.32; 95% CI, 0.43-1.77). High-level comparative data comparing posterior and medial repair for popliteal artery aneurysms are not available. Within the parameters of this review, however, superiority of the posterior approach for primary and secondary patency, aneurysm exclusion, and need for reoperation was noted."

According to the news editors, the research concluded: "High-level evidence from randomized clinical trials is required to define the relative benefits of the posterior approach over the medial approach in selected patients."

The news correspondents report that additional information may be obtained from A. Phair, Pennine Acute Hosp NHS Trust, Dept. of Vasc & Endovasc Surg, Royal Oldham Hosp, Manchester, Lancs, United Kingdom. Additional authors for this research include S. Hajibande, S. Hajibande, D. Kelleher, R. Ibrahim and G.A. Antoniou.

Carrier Proteins - Membrane Transport Proteins

Study Results from Rutgers State University in the Area of Membrane Transport Proteins Reported (Mechanism of gating by calcium in connexin hemichannels)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Carrier Proteins - Membrane Transport Proteins is the subject of a report. According to news reporting originating in Newark, New Jersey, by NewsRx journalists, research stated, "Aberrant opening of nonjunctional connexin hemichannels at the plasma membrane is associated with many diseases, including ischemia and muscular dystrophy. Proper control of hemichannel opening is essential to maintain cell viability and is achieved by physiological levels of extracellular Ca2+, which drastically reduce hemichannel activity."

Financial support for this research came from HHS | NIH | National Institute of General Medical Sciences (NIGMS).

The news reporters obtained a quote from the research from Rutgers State University, "Here we examined the role of conserved charged residues that form electrostatic networks near the extracellular entrance of the connexin pore, a region thought to be involved in gating rearrangements of hemichannels. Molecular dynamics simulations indicate discrete sites for Ca2+ interaction and consequent disruption of salt bridges in the open hemichannels. Experimentally, we found that disruption of these salt bridges by mutations facilitates hemichannel closing. Two negatively charged residues in these networks are putative Ca2+ binding sites, forming a Ca2+-gating ring near the extracellular entrance of the pore. Accessibility studies showed that this Ca-2+(-)bound gating ring does not prevent access of ions or small molecules to positions deeper into the pore, indicating that the physical gate is below the Ca2+-gating ring. We conclude that intra- and intersubunit electrostatic networks at the extracellular entrance of the hemichannel pore play critical roles in hemichannel gating reactions and are tightly controlled by extracellular Ca2+.

According to the news reporters, the research concluded: "Our findings provide a general mechanism for Ca2+ gating among different connexin hemichannel isoforms."

Our news correspondents report that additional information may be obtained by contacting J.E. Contreras, Rutgers State University, New Jersey Med Sch, Dept. of Pharmacol Physiol & Neurosci, Newark, NJ 07103, United States. Additional authors for this research include J. Ramachandran, A. Alsamarah, Y. Luo, A.L. Harris and J.E. Contreras.

Study Results from S.P. Iupati and Colleagues Broaden Understanding of Chronic Obstructive Pulmonary Disease (Do community hospice programmes reduce hospitalisation rate in patients with advanced chronic obstructive pulmonary disease?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease have been presented. According to news reporting from Wellington, New Zealand, by NewsRx journalists, research stated, "Since Hinton first published his observations on the distress of patients dying on a medical ward in 1963, there has been increasing awareness of the palliative care needs in patients who have non malignant diseases. Patients with advanced chronic obstructive pulmonary disease (COPD) are known to have comparable symptom burden to lung cancer patients and are more likely receive invasive treatment at the end of life than patients with end stage lung cancer."

The news correspondents obtained a quote from the research, "They are also less likely to receive hospice services, and the benefit of such programmes in this key group of patients remain largely unknown, in particular what effect hospice programmes have on hospitalisation. (i) To examine any effect of community hospice programmes on hospitalisation in patients with advanced COPD. (ii) To identify any association between utilisation of specific hospice services with hospitalisation. (iii) To describe key peri-mortem outcomes. This was a retrospective study of consecutive patients with COPD admitted into community hospice programmes in the greater Wellington region, New Zealand between 1 October 2007 and 31 October 2013. A mean decrease of 2.375 (median decrease of 2; 95% confidence interval 1, 3) hospital admissions over a 12-month period was found after admission into hospice programme (p <0.0005)."

According to the news reporters, the research concluded: "Community hospice programmes may be associated with reduction in hospitalisation in patients with advanced COPD."

Our news journalists report that additional information may be obtained by contacting S.P. Iupati, Te Omanga Hospice, Wellington, New Zealand.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/imj.12947. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from S.de B. Cobra and Colleagues in the Area of Interstitial Lung Disease Reported (Usefulness of the second heart sound for predicting pulmonary hypertension in patients with interstitial lung disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Interstitial Lung Disease. According to news reporting originating from Brasilia, Brazil, by NewsRx correspondents, research stated, "P2 hyperphonosis is considered to be a valuable finding in semiological diagnoses of pulmonary hypertension (PH). The aim here was to evaluate the accuracy of the pulmonary component of second heart sounds for predicting PH in patients with interstitial lung disease."

Our news editors obtained a quote from the research, "Cross-sectional study at the University of Brasilia and Hospital de Base do Distrito Federal. Heart sounds were acquired using an electronic stethoscope and were analyzed using phonocardiography. Clinical signs suggestive of PH, such as second heart sound (S2) in pulmonary area louder than in aortic area; P2 >A2 in pulmonary area and P2 present in mitral area, were compared with Doppler echocardiographic parameters suggestive of PH. Sensitivity (S), specificity (Sp) and positive (LR+) and negative (LR-) likelihood ratios were evaluated. There was no significant correlation between S2 or P2 amplitude and PASP (pulmonary artery systolic pressure) (p=0.185 and 0.115; p=0.13 and 0.34, respectively). Higher S2 in pulmonary area than in aortic area, compared with all the criteria suggestive of PH, showed S=60%, Sp=22%; LR+=0.7; LR-=1.7; while P2 >A2 showed S=57%, Sp=39%; LR+=0.9; LR-=1.1; and P2 in mitral area showed: S=68%, Sp=41%; LR+=1.1; LR-=0.7. All these signals together showed: S=50%, Sp=56%.

According to the news editors, the research concluded: "The semiological signs indicative of PH presented low sensitivity and specificity levels for clinically diagnosing this comorbidity."

The news editors report that additional information may be obtained by contacting S.d.e. B Cobra, Hospital de Base do Distrito Federal, Brasilia, Federal District, Brazil. Additional authors for this research include R.M. Cardoso and M.P Rodrigues.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1590/1516-3180.2015.00701207. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from School of Public Health in the Area of Obstetrics and Gynecology Reported (Childhood abuse and suicidal ideation in a cohort of pregnant Peruvian women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Women's Health - Obstetrics and Gynecology. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Childhood abuse is a major global and public health problem associated with a myriad of adverse outcomes across the life course. Suicide is one of the leading causes of mortality during the perinatal period."

Our news editors obtained a quote from the research from the School of Public Health, "However, few studies have assessed the relationship between experiences of childhood abuse and suicidal ideation in pregnancy. We sought to examine the association between exposure to childhood abuse and suicidal ideation among pregnant women. A cross-sectional study was conducted among 2964 pregnant women attending prenatal clinics in Lima, Peru. Childhood abuse was assessed using the Childhood Physical and Sexual Abuse Questionnaire. Depression and suicidal ideation were assessed using the Patient Health Questionnaire-9 scale. Logistic regression procedures were performed to estimate adjusted odds ratios and 95% confidence intervals adjusted for potential confounders. Overall, the prevalence of childhood abuse in this cohort was 71.8% and antepartum suicidal ideation was 15.8%. The prevalence of antepartum suicidal ideation was higher among women who reported experiencing any childhood abuse compared to those reporting none (89.3% vs 10.7%, P<.0001). After adjusting for potential confounders, including antepartum depression and lifetime intimate partner violence, those with history of any childhood abuse had a 2.9-fold (2.90, adjusted odds ratio; 95% confidence interval, 2.12-3.97) increased odds of reporting suicidal ideation. Women who experienced both physical and sexual childhood abuse had much higher odds of suicidal ideation (adjusted odds ratio, 4.04; 95% confidence interval, 2.88-5.68). Women who experienced any childhood abuse and reported depression had 3.44fold (3.44, adjusted odds ratio; 95% confidence interval, 1.84-6.43) increased odds of suicidal ideation compared with depressed women with no history of childhood abuse. Finally, the odds of suicidal ideation increased with increased number of childhood abuse events experienced (P value for linear trend <.001). Maternal history of childhood abuse was associated with increased odds of antepartum suicidal ideation."

According to the news editors, the research concluded: "It is important for clinicians to be aware of the potential increased risk of suicidal behaviors among pregnant women with a history of childhood physical and sexual abuse."

The news editors report that additional information may be obtained by contacting Q.Y. Zhong, Harvard TH Chan Sch Public Hlth, Dept. of Epidemiol, Boston, MA, United States. Additional authors for this research include A. Wells, M.B. Rondon, M.A. Williams, Y.V. Barrios, S.E. Sanchez and B. Gelaye.
Study Results from Second Affiliated Hospital Provide New Insights into Colitis (Protective effect of melatonin on myenteric neuron damage in experimental colitis in rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Digestive System Diseases and Conditions - Colitis are discussed in a new report. According to news reporting originating from Xi'an, People's Republic of China, by NewsRx correspondents, research stated, "Inflammation of the colon in patients with ulcerative colitis (UC) causes pain and altered motility, at least in part through the damage of the myenteric neurons (MNs). Thus, it is important to evaluate new drugs for UC treatment that could also protect myenteric neurons efficiently."

Financial supporters for this research include National Natural Science Foundation of China, ‘Twelfth Five-Year’ National Science and Technology Support Program.

Our news editors obtained a quote from the research from Second Affiliated Hospital, "As a well-known neural protective and anti-inflammatory agent, melatonin could protect neurons from damage through the activation of the nuclear factor erythroid 2-related factor 2 and antioxidant responsive element (Nrf2-ARE) signaling pathway. Therefore, we investigated the potential protective effect of melatonin against MN damage during colitis induced by 2,4-dinitrobenzene sulfonic acid (DNBS) in rats. Colitis was induced by intracolonic (i.c.) instillation of DNBS and treated with melatonin at a dose of 2.5 mg/kg for 4 days. The damage of MN in the left colon was immunohistochemically evaluated in different groups. Ulcerations and inflammation in the colon were semiquantitatively observed. Myeloperoxidase (MPO), superoxide dismutase (SOD), and malondialdehyde (MDA) levels were detected to evaluate the inflammatory and oxidative stress status. The protein and mRNA expressions of Nrf2 and heme oxygenase-1 (HO-1) in the colon were detected by Western blot and quantitative polymerase chain reaction (qPCR), respectively. Melatonin partially prevented the loss of MN and alleviated the inflammation and oxidative stress induced by DNBS. In addition, melatonin markedly increased the Nrf2 and HO-1 level in the colitis."

According to the news editors, the research concluded: "These results indicate that melatonin protects MN from damage by reducing inflammation and oxidative stress, effects that are partly mediated by the Nrf2-ARE pathway."

The news editors report that additional information may be obtained by contacting B. Shang, Dept. of Gastroenterology, Second Affiliated Hospital of Xi'an Jiaotong University, Xi'an 710004, Shaanxi Province, People's Republic of China. Additional authors for this research include H. Shi, X. Wang, X. Guo, N. Wang, Y. Wang and L. Dong.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/fcp.12181. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions - Aneurysm

Study Results from Seoul National University Broaden Understanding of Aneurysm (The incidence of and risk factors for ischemic complications after microsurgical clipping of unruptured middle cerebral artery aneurysms and the efficacy of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Aneurysm. According to news reporting originating from Gyeonggi Do, South Korea, by NewsRx correspondents, research stated, "Ischemic complications (ICs) account for 6.7% after microsurgical clipping of unruptured intracranial aneurysms. This study aimed to evaluate the efficacy of somatosensory evoked potential (SSEP) monitoring during microsurgical clipping of unruptured middle cerebral artery (MCA) aneurysms and evaluate the incidence of and risk factors for ischemic complications after clipping of unruptured MCA aneurysms."

Our news editors obtained a quote from the research from Seoul National University, "Herein, 1208 patients with cerebral aneurysms and treated with microsurgical clipping between May 2003 and February 2015 were enrolled. Those with multiple aneurysms, history of head trauma, subarachnoid hemorrhage, bypass and/or endovascular treatment, and intraoperative rupture were excluded. Subsequently, 411 patients with single unruptured MCA aneurysms treated with simple microsurgical clipping were enrolled. Patients were divided into two groups based on the application of SSEP monitoring during surgery. The IC rate was 0.9% and 5.6% in the SSEP and non-SSEP groups, respectively. Univariate analysis revealed that age >= 62.5 years, aneurysm size >= 4.15 mm, temporary clipping, history of hyperlipidemia and stroke, and no-SSEP monitoring were risk factors for ICs. Multivariate logistic regression analysis showed that age >= 62.5 years (odds ratio [OR] = 7.7; 95% confidence interval [95% CI] = 1.5-37.7; P = 0.011), previous stroke (OR = 26.8, 95% CI = 2.4-289.2, P = 0.007), and inversely SSEP monitoring (OR = 0.14, 95% CI 0.02-0.72, P = 0.019) were independent risk factors for ICs. Clinicians should consider the possibility of IC during microsurgical clipping of unruptured MCA aneurysms in patient >= 62.5 years and/or a history of stroke."

According to the news editors, the research concluded: "Intraoperative SSEP monitoring is an effective and feasible tool for preventing IC."

Study Results from Shanghai Jiao-Tong University Update Understanding of Atrial Fibrillation (Concomitant Maze IV Ablation Procedure Performed Entirely by Bipolar Clamp Through Right Lateral Minithoracotomy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Atrial fibrillation ablation with bipolar clamp has proved to be effective for patients with valvular atrial fibrillation. However, left pulmonary vein ablation with bipolar clamp through right minithoracotomy was considered difficult or impossible."

The news reporters obtained a quote from the research from Shanghai Jiao-Tong University. "In this report, we described a novel technique of performing concomitant Maze IV ablation procedure entirely by bipolar clamp through right minithoracotomy. Left pulmonary vein ablation with bipolar clamp was performed through an established channel and a natural space."

According to the news reporters, the research concluded: "This technique has proved to be safe and feasible and to have good clinical outcomes that may deserve further use for patients with atrial fibrillation and mitral valve disease."

contacting J. Mei, Shanghai Jiao Tong University, Xinhua Hosp, Sch Med, Dept. of Cardiotorac Surg, Shanghai 200092, People's Republic of China. Additional authors for this research include N. Ma, Z.L. Jiang, D.F. Zhao, C.R. Bao and F.B. Ding.

Drugs and Therapies - Central Nervous System Agents

**Study Results from Shire Update Understanding of Central Nervous System Agents (Relative Bioavailabilities of Lisdexamfetamine Dimesylate and D-Amphetamine in Healthy Adults in an Open-Label, Randomized, Crossover Study After Mixing ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Central Nervous System Agents are presented in a new report. According to news reporting originating from Lexington, Massachusetts, by NewsRx correspondents, research stated, "This open-label, crossover study examined lisdexamfetamine dimesylate (LDX) and D-amphetamine pharmacokinetics in healthy adults after administration of an intact LDX capsule or after the capsule was emptied into orange juice or yogurt and the contents consumed. Healthy adult volunteers (N = 30) were administered a 70-mg LDX capsule or the contents of a 70-mg capsule mixed with yogurt or orange juice using a 3-way crossover design."

Our news editors obtained a quote from the research from Shire, "Blood samples were collected serially for up to 96 hours after dose. Pharmacokinetic endpoints included maximum plasma concentration (C-max) and area under the plasma concentration versus time curve from zero to infinity (AUC(0-infinity)) or to last assessment (AUC(last)). Relative LDX and D-amphetamine bioavailabilities from the contents of a 70-mg LDX capsule mixed with orange juice or yogurt were compared with those from the intact LDX capsule using bioequivalence-testing procedures. Geometric least squares mean ratios (90% confidence intervals [CIs]) for D-amphetamine (active moiety) were within the prespecified bioequivalence range (0.80-1.25) when the contents of a 70-mg LDX capsule were mixed with orange juice [C-max: 0.971 (0.945, 0.998); AUC(0-infinity): 0.986 (0.955, 1.019); AUC(last): 0.970 (0.937, 1.004)] or yogurt [C-max: 0.970 (0.944, 0.997); AUC(0-infinity): 0.945 (0.915, 0.976); AUC (last): 0.944 (0.912, 0.977)]. Geometric least squares mean ratios (90% CIs) for LDX (inactive prodrug) were below the accepted range when the contents of a 70-mg LDX capsule were mixed with orange juice [C-max: 0.641 (0.582, 0.707); AUC(0-infinity): 0.716 (0.647, 0.792); AUC (last): 0.708 (0.655, 0.766)]; the lower 90% CI for C-max [0.828 (0.752, 0.912)] was below the accepted range when the contents of a 70-mg LDX capsule were mixed with yogurt."

According to the news editors, the research concluded: "Relative bioavailability of D-amphetamine (the active moiety) did not differ across administrations, which suggests that emptying an LDX capsule into orange juice or yogurt and consuming it is an alternative to intact
capsules."

For more information on this research see: Relative Bioavailabilities of Lisdexamfetamine Dimesylate and D-Amphetamine in Healthy Adults in an Open-Label, Randomized, Crossover Study After Mixing Lisdexamfetamine Dimesylate With Food or Drink. *Therapeutic Drug Monitoring*, 2016;38(6):769-776. *Therapeutic Drug Monitoring* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Liver Diseases and Conditions - Chronic Hepatitis B**

**Study Results from Sichuan University Provide New Insights into Chronic Hepatitis B Virus (Quantitative intrahepatic HBV cccDNA correlates with histological liver inflammation in chronic hepatitis B virus infection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Chronic Hepatitis B Virus have been published. According to news reporting originating in Chengdu, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to determine the role of baseline hepatitis B virus (HBV) forming covalently closed circular DNA (HBV cccDNA) in liver inflammation in patients infected with HBV with serum alanine aminotransferase (ALT) levels under two times the upper limit of normal (2 x ULN). After liver biopsy and serum virological and biochemical marker screening, patients diagnosed with chronic HBV infection with serum ALT levels under 2 x ULN and histological liver inflammation of less than grade G2 were prospectively recruited into this study."

The news reporters obtained a quote from the research from Sichuan University, "Recruitment took place between March 2009 and November 2010 at the Center of Infectious Disease, Sichuan University. Patient virological and biochemical markers, as well as markers of liver inflammation, were monitored. A total of 102 patients were recruited and 68 met the inclusion criteria; the median follow-up was 4.1 years (range 3.9-5.2 years). During follow-up, 41 patients (60.3%) exhibited signs of inflammation. Baseline HBV cccDNA > 1 copy/cell (odds ratio 9.43, p = 0.049) and liver inflammation grade >= G1 (odds ratio 5.77, p = 0.046) were both independent predictors of liver inflammation. A higher baseline intrahepatic HBV cccDNA level may increase the risk of liver inflammation."

According to the news reporters, the research concluded: "Further investigations will be required to validate HBV cccDNA as an intrahepatic virological marker of patients who..."
require extended outpatient management."

Our news correspondents report that additional information may be obtained by contacting H. Tang, Sichuan University, West China Sch Med, West China Hosp, Center Infect DisState Key Lab Biotherapy, Chengdu 610041, People's Republic of China. Additional authors for this research include X. Zhu, L.B. Yan, L.Y. Du, C. Liu, J. Liao and H. Tang.

**Stem Cell Research - Mesenchymal Stem Cells**

**Study Results from Sichuan University Update Understanding of Mesenchymal Stem Cells (g-Secretase inhibitor reverts the Notch signaling attenuation of osteogenic differentiation in aged bone marrow mesenchymal stem cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Stem Cell Research - Mesenchymal Stem Cells is the subject of a report. According to news reporting out of Chengdu, People's Republic of China, by NewsRx editors, research stated, "The age-related changes in cell viability and osteogenic differentiation of bone marrow mesenchymal stem cells (BMSCs) play pivotal roles in the fracture healing process, especially in geriatric individuals. This study was designed to explore the age-related changes in murine BMSCs and the regulation of osteogenic differentiation in aged BMSCs in vitro."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Sichuan University, "Notch signaling pathway took part in the regulation of osteogenesis, while the relationship between Notch and the osteogenic differentiation in aged BMSCs has not been reported yet. BMSCs harvested from the bone marrow of young, adult, and aged C57BL/6 mice were cultured in osteogenic and adipogenic differentiation media. Histochemical staining results indicated that the osteogenic ability of BMSCs gradually decreased with aging, whereas the adipogenic ability increased. Cell activity assays showed that the proliferative and migrated capacity did not
decline with aging significantly. According to real-time PCR and Western blotting results, the aged cells exhibited higher Notch signaling expression level than the younger ones did. After the aged BMSCs being treated with g-secretase inhibitor, however, Notch activity was changed and the aging-impaired osteogenic ability reverted to a normal level.

According to the news editors, the research concluded: "This study demonstrated that the decreased bone formation capacity in aged BMSCs had relationship with the transdifferentiation between osteogenesis and adipogenesis, which would be regulated by Notch signaling pathway and the attenuated osteogenesis in aged BMSCs could be promoted when the inhibition of Notch pathway."

For more information on this research see: g-Secretase inhibitor reverts the Notch signaling attenuation of osteogenic differentiation in aged bone marrow mesenchymal stem cells. Cell Biology International, 2016;40(4):439-47. (Elsevier - www.elsevier.com; Cell Biology International - www.journals.elsevier.com/cell-biology-international/)

Heart Disorders and Diseases - Heart Attack

Study Results from Sorbonne University Broaden Understanding of Heart Attack (Venoarterial extracorporeal membrane oxygenation for refractory cardiogenic shock post-cardiac arrest)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news originating from Paris, France, by NewsRx correspondents, research stated, "To describe the characteristics, outcomes, and risk factors associated with poor outcome of venoarterial extracorporeal membrane oxygenation (VA-ECMO)-treated patients with refractory shock post-cardiac arrest. We retrospectively analyzed data collected prospectively (March 2007-January 2015) in a 26-bed tertiary hospital intensive care unit."

Our news journalists obtained a quote from the research from Sorbonne University, "All patients implanted with VA-ECMO for refractory cardiogenic shock after successful resuscitation from cardiac arrest were included. Refractory cardiac arrest patients, given VA-ECMO under cardiopulmonary resuscitation, were excluded. Ninety-four patients received VA-ECMO for refractory shock post-cardiac arrest. Their hospital and 12-month survival rates were 28 and 27 %, respectively. All 1-year survivors were cerebral performance category 1. Multivariable analysis retained INR > 2.4 (OR 4.9; 95 % CI 1.4-17.2), admission SOFA score >
14 (OR 5.3; 95 % CI 1.7-16.5), and shockable rhythm (OR 0.3; 95 % CI 0.1-0.9) as independent predictors of hospital mortality, but not SAPS II, out-of-hospital cardiac arrest score, or other cardiac arrest variables. Only 10 % of patients with an admission SOFA score > 14 survived, whereas 50 % of those with scores ≤14 were alive at 1 year. Restricting the analysis to the 67 patients with out-of-hospital cardiac arrest of coronary cause yielded similar results. Among 94 patients implanted with VA-ECMO for refractory cardiogenic shock post-cardiac arrest resuscitation, the 24 (27 %) 1-year survivors had good neurological outcomes, but survival was significantly better for patients with admission SOFA scores < 14, shockable rhythm, and INR ≤2.4.

According to the news editors, the research concluded: "VA-ECMO might be considered a rescue therapy for patients with refractory cardiogenic shock post-cardiac arrest resuscitation."

The news correspondents report that additional information may be obtained from C.E. Luyt, UPMC Univ Paris 06, Sorbonne Univ, INSERM, UMRS 1166ICAN, F-06 Paris, France. Additional authors for this research include N. Brechot, G. Lebreton, M. Schmidt, G. Hekimian, P. Demondion, J.L. Trouillet, P. Leprince, J. Chastre, A. Combes and C.E. Luyt.

Oncology - Lung Cancer

Study Results from Southern Medical University Update Understanding of Lung Cancer (Is it feasible to detect epidermal growth factor receptor mutations in circulating tumor cells in nonsmall cell lung cancer? A meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lung Cancer. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "The value of circulating tumor cells (CTCs) in detecting epidermal growth factor receptor (EGFR) mutations in patients with nonsmall cell lung cancer (NSCLC) is controversial. We performed a meta-analysis to investigate the diagnostic significance of CTCs with tumor tissues as the standard control."

Our news journalists obtained a quote from the research from Southern Medical University, "A systematic literature search, including papers published until November 26,
2015, was performed using PubMed, Medline, Embase, Web of Science, and the China National Knowledge Infrastructure, and the references of retrieved articles were screened. The pooled sensitivity, specificity, and diagnostic odds ratio (DOR) were calculated according to the data selection from the included studies. The evaluation indexes of the diagnostic performance were the summary receiver operating characteristic curve (SROC) and area under the SROC (AUSROC). Eight eligible articles with a total of 170 participants were identified in our meta-analysis. The pooled sensitivity and specificity were 0.91 [95% CI: 0.55-0.99] and 0.99 [95% CI: 0.59-1.00]. The positive likelihood ratio and negative likelihood ratio were 68 [95% CI: 1.4-3364] and 0.09 [95% CI: 0.01-0.64], respectively. The DOR was 788 [95% CI: 9-71884]. The high diagnostic performance of CTCs in detecting EGFR mutations was indicated by the AUSROC of 0.99 [95% CI: 0.98-1.00].

According to the news editors, the research concluded: "CTCs are a feasible and highly specific biomarker for detecting the EGFR mutation status in NSCLC patients."

For more information on this research see: Is it feasible to detect epidermal growth factor receptor mutations in circulating tumor cells in nonsmall cell lung cancer? A meta-analysis. Medicine, 2016;95(47):40-46. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Congenital Diseases and Conditions - Congenital...**

**Study Results from St. George’s University of London Provide New Insights into Congenital Heart Disease (Prevalence of prenatal brain abnormalities in fetuses with congenital heart disease: a systematic review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Congenital Diseases and Conditions - Congenital Heart Disease. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "Studies have shown an association between congenital heart defects (CHDs) and postnatal brain abnormalities and neurodevelopmental delay. Recent evidence suggests that some of these brain abnormalities are present before birth."

The news reporters obtained a quote from the research from the St. George's University of London, "The primary aim of this study was to perform a systematic review to quantify the prevalence of prenatal brain abnormalities in fetuses with CHDs. MEDLINE,
EMBASE and The Cochrane Library were searched electronically. Reference lists within each article were hand-searched for additional reports. The outcomes observed included structural brain abnormalities (on magnetic resonance imaging (MRI)) and changes in brain volume (on MRI, three-dimensional (3D) volumetric MRI, 3D ultrasound and phase-contrast MRI), brain metabolism or maturation (on magnetic resonance spectroscopy and phase-contrast MRI) and brain blood flow (on Doppler ultrasound, phase-contrast MRI and 3D power Doppler ultrasound) in fetuses with CHDs. Cohort and case-control studies were included and cases of chromosomal or genetic abnormalities, case reports and editorials were excluded. Proportion meta-analysis was used for analysis. Between-study heterogeneity was assessed using the I-2 test. The search yielded 1943 citations, and 20 studies (n=1175 cases) were included in the review. Three studies reported data on structural brain abnormalities, while data on altered brain volume, metabolism and blood flow were reported in seven, three and 14 studies, respectively. The three studies (221 cases) reporting on structural brain abnormalities were suitable for inclusion in a meta-analysis. The prevalence of prenatal structural brain abnormalities in fetuses with CHD was 28% (95% CI, 18-40%), with a similar prevalence (25% (95% CI, 14-39%)) when tetralogy of Fallot was considered alone. These abnormalities included ventriculomegaly (most common), agenesis of the corpus callosum, ventricular bleeding, increased extra-axial space, vermian hypoplasia, white-matter abnormalities and delayed brain development. Fetuses with CHD were more likely than those without CHD to have reduced brain volume, delay in brain maturation and altered brain circulation, most commonly in the form of reduced middle cerebral artery pulsatility index and cerebroplacental ratio. These changes were usually evident in the third trimester, but some studies reported them from as early as the second trimester.

According to the news reporters, the research concluded: "In the absence of known major aneuploidy or genetic syndromes, fetuses with CHD are at increased risk of brain abnormalities, which are discernible prenatally."

Our news correspondents report that additional information may be obtained by contacting A. Khalil, St. George's University London, Fetal Med Unit, London SW17 0RE, United Kingdom. Additional authors for this research include S. Bennet, B. Thilaganathan, D. Paladini, P. Griffiths and J.S. Carvalho.

Skin Diseases and Conditions - Psoriasis
Study Results from State University of New York in the Area of Psoriasis Reported (The psoriasis-associated deletion of late cornified envelope genes LCE3B and LCE3C has been maintained under
balancing selection since Human Denisovan divergence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Skin Diseases and Conditions - Psoriasis. According to news reporting originating in Buffalo, New York, by NewsRx journalists, research stated, "A common, 32kb deletion of LCE3B and LCE3C genes is strongly associated with psoriasis. We recently found that this deletion is ancient, predating Human-Denisovan divergence."

The news reporters obtained a quote from the research from the State University of New York, "However, it was not clear why negative selection has not removed this deletion from the population. Here, we show that the haplotype block that harbors the deletion (i) retains high allele frequency among extant and ancient human populations; (ii) harbors unusually high nucleotide variation (pi, P< 4.1 x 10(-3)); (iii) contains an excess of intermediate frequency variants (Tajima's D, P< 3.9 x 10(-3)); and (iv) has an unusually long time to coalescence to the most recent common ancestor (TSel, 0.1 quantile). Our results are most parsimonious with the scenario where the LCE3BC deletion has evolved under balancing selection in humans."

According to the news reporters, the research concluded: "More broadly, this is consistent with the hypothesis that a balance between autoimmunity and natural vaccination through increased exposure to pathogens maintains this deletion in humans."

For more information on this research see: The psoriasis-associated deletion of late cornified envelope genes LCE3B and LCE3C has been maintained under balancing selection since Human Denisovan divergence. BMC Evolutionary Biology, 2016;16():1-7. BMC Evolutionary Biology can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. Oncology

Study Results from T. Aasen and Colleagues Broaden Understanding of Oncology (Gap junctions and cancer: communicating for 50 years)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology. According to news reporting from Barcelona, Spain, by NewsRx journalists, research stated, "Fifty years ago, tumour cells were found to lack electrical coupling, leading to the hypothesis that loss of direct intercellular communication is commonly associated with cancer onset and progression."

The news correspondents obtained a quote from the research, "Subsequent studies linked this phenomenon to gap junctions composed of connexin proteins. Although many studies support the notion that connexins are tumour suppressors, recent evidence suggests that, in some tumour types, they may facilitate specific stages of tumour progression through both
junctional and non-junctional signalling pathways."

According to the news reporters, the research concluded: "This Timeline article highlights the milestones connecting gap junctions to cancer, and underscores important unanswered questions, controversies and therapeutic opportunities in the field."

Our news journalists report that additional information may be obtained by contacting T. Aasen, Vall d’Hebron Inst Res, Translat Mol Pathol, Barcelona 08035, Spain. Additional authors for this research include M. Mesnil, C.C. Naus, P.D. Lampe and D.W. Laird.

**Cardiology**

**Study Results from T. Cole-Hunter et al Provide New Insights into Cardiology (Impact of traffic-related air pollution on acute changes in cardiac autonomic modulation during rest and physical activity: a cross-over study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiology have been presented. According to news originating from Barcelona, Spain, by NewsRx correspondents, research stated, "People are often exposed to traffic-related air pollution (TRAP) during physical activity (PA), but it is not clear if PA modifies the impact of TRAP on cardiac autonomic modulation. We conducted a panel study among 28 healthy adults in Barcelona, Spain to examine how PA may modify the impact of TRAP on cardiac autonomic regulation."

Our news journalists obtained a quote from the research, "Participants completed four 2-h exposure scenarios that included either rest or intermittent exercise in high- and low-traffic environments. Time- and frequency-domain measures of heart rate variability (HRV) were monitored during each exposure period along with continuous measures of TRAP. Linear mixed-effects models were used to estimate the impact of TRAP on HRV as well as potential effect modification by PA. Exposure to TRAP was associated with consistent decreases in HRV; however, exposure-response relationships were not always linear over the broad range of exposures. For example, each 10 mg/m(3) increase in black carbon was associated with a 23% (95% CI: -31, -13) decrease in high frequency power at the low-traffic site, whereas no association was observed at the high-traffic site. PA modified the impact of TRAP on HRV at the high-traffic site and tended to weaken inverse associations with measures reflecting parasympathetic modulation (P (<=) 0.001). Evidence of effect modification at the low-traffic site was less consistent. The strength and direction of the relationship between TRAP and HRV..."
May vary across exposure gradients."

According to the news editors, the research concluded: "PA may modify the impact of TRAP on HRV, particularly at higher concentrations."

The news correspondents report that additional information may be obtained from T. Cole-Hunter, Centre for Research in Environmental Epidemiology (CREAL), Barcelona, Spain. Additional authors for this research include S. Weichenthal, N. Kubesch, M. Foraster, G. Carrasco-Turigas, L. Bouso, D. Martinez, D. Westerdahl, A. de Nazelle and M. Nieuwenhuijsen.

**Drugs and Therapies - Pharmacy and...**

**Study Results from Tabriz University of Medical Sciences Broaden Understanding of Pharmacy and Pharmaceutical Sciences (Crystal-liquid Fugacity Ratio as a Surrogate Parameter for Intestinal Permeability)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmacy and Pharmaceutical Sciences. According to news reporting originating from Tabriz, Iran, by NewsRx correspondents, research stated, "We assessed the feasibility of using crystal-liquid fugacity ratio (CLFR) as an alternative parameter for intestinal permeability in the biopharmaceutical classification (BCS) of passively absorbed drugs. Dose number, fraction of dose absorbed, intestinal permeability, and intrinsic dissolution rate were used as the input parameters."

Our news editors obtained a quote from the research from the Tabriz University of Medical Sciences, "CLFR was determined using thermodynamic parameters i.e., melting point, molar fusion enthalpy, and entropy of drug molecules obtained using differential scanning calorimetry. The CLFR values were in the range of 0.06-41.76 mole percent. There was a close relationship between CLFR and in vivo intestinal permeability (r > 0.8). CLFR values of greater than 2 mole percent corresponded to complete intestinal absorption. Applying CLFR versus
dose number or intrinsic dissolution rate, more than 92% of tested drugs were correctly classified with respect to the reported classification system on the basis of human intestinal permeability and solubility. This investigation revealed that the CLFR might be an appropriate parameter for quantitative biopharmaceutical classification. This could be attributed to the fact that CLFR could be a measure of solubility of compounds in lipid bilayer which was found in this study to be directly proportional to the intestinal permeability of compounds. This classification enables researchers to define characteristics for intestinal absorption of all four BCS drug classes using suitable cutoff points for both intrinsic dissolution rate and crystal-liquid fugacity ratio."

According to the news editors, the research concluded: "Therefore, it may be used as a surrogate for permeability studies."

The news editors report that additional information may be obtained by contacting H. Valizadeh, Tabriz Univ Med Sci, Drug Appl Res Center, Tabriz 51664, Iran. Additional authors for this research include Z. Fasihi, J. Akbari, E. Jannatabadi, M. Barzegar-Jalali, R. Loebenberg and H. Valizadeh.

Oncology - Soft Tissue Sarcomas

Study Results from Taussig Cancer Institute Provide New Insights into Soft Tissue Sarcomas (Radiation Therapy in the Management of Soft Tissue Sarcoma A Clinician's Guide to Timing, Techniques, and Targets)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Soft Tissue Sarcomas have been published. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "Radiation therapy represents a vital component in the multidisciplinary management of soft tissue sarcomas. Combined with limb-preserving surgery, radiation therapy represents a standard of care treatment option for patients with high-grade sarcomas."

The news reporters obtained a quote from the research from Taussig Cancer Institute, "Radiation therapy for soft tissue sarcoma continues to evolve with changes in timing, techniques, and targets. Over the past 2 decades, increasing data have supported the role of preoperative radiotherapy with the potential for lower total doses of radiation and improved long-term function coming at the cost of increased wound complications for certain locations. Retroperitoneal sarcomas represent a location where preoperative treatment is becoming the
standard of care based on anatomic constraints and challenges with delivering postoperative radiotherapy. Multiple radiation therapy techniques exist to deliver treatment; currently both 3-dimensional conformal radiotherapy and intensity-modulated radiation therapy (IMRT) are appropriate options, although increasing data support the role of IMRT in reducing dose to critical structures (bone, bowel, kidneys, vessels) while maintaining target coverage. Traditional target volumes have included larger fields; however, recent prospective data have demonstrated that image guidance in conjunction with smaller treatment volumes may reduce toxicity while not increasing marginal failures, although follow-up is short."

According to the news reporters, the research concluded: "Because of the toxicity associated with treatment, novel radiotherapy strategies are being used such as stereotactic radiotherapy as well as the use of tumor genetics to identify patients most likely to benefit most from radiotherapy."

Our news correspondents report that additional information may be obtained by contacting C. Shah, Cleveland Clinic, Taussig C canc Inst, Dept. of Radiat Oncol, Cleveland, OH 44195, United States. Additional authors for this research include V. Verma, R. Takiar, R. Vajapey, S. Amarnath, E. Murphy, N.W. Mesko, S. Lietman, M. Joyce, P. Anderson, D. Shepard and T. Budd.

Percutaneous Coronary Intervention

Study Results from Technical University Broaden Understanding of Percutaneous Coronary Intervention (High-Sensitivity Troponin T and Mortality After Elective Percutaneous Coronary Intervention)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Percutaneous Coronary Intervention have been published. According to news reporting originating in Munich, Germany, by NewsRx journalists, research stated, "The prognostic value of high-sensitivity troponin T (hs-TnT) elevation after elective percutaneous coronary intervention (PCI) in patients with or without raised baseline hs-TnT levels is unclear. The goal of this study was to assess whether the prognostic value of post-procedural hs-TnT level after elective PCI depends on the baseline hs-TnT level."

The news reporters obtained a quote from the research from Technical University, "This study included 5,626 patients undergoing elective PCI who had baseline and peak post-procedural hs-TnT measurements available. The primary outcome was 3-year mortality (with risk estimates calculated per SD increase of the log hs-TnT scale). Patients were divided into 4 groups: nonelevated baseline and post-procedural hs-TnT levels (hs-TnT <= 0.014 mu g/l; n =
742); nonelevated baseline but elevated post-procedural hs-TnT levels (peak post-procedural hs-TnT > 0.014 μg/l; n = 2,721); elevated baseline hs-TnT levels (hs-TnT > 0.014 μg/l) with no further rise post-procedure (n = 516); and elevated baseline hs-TnT levels with a further rise post-procedure (n = 1,647). A total of 265 deaths occurred: 6 (1.6%) in patients with nonelevated baseline and post-procedural hs-TnT levels; 54 (3.8%) in patients with nonelevated baseline but elevated post-procedural hs-TnT levels; 50 (16.0%) in patients with elevated baseline hs-TnT levels with no further rise post-procedure; and 155 (18.2%) in patients with elevated baseline hs-TnT levels with a further rise post-procedure (p < 0.001). After adjustment, baseline hs-TnT levels (hazard ratio [HR]: 1.22; 95% confidence interval [CI]: 1.09 to 1.38; p < 0.001) but not peak post-procedural hs-TnT levels (HR: 1.04; 95% CI: 0.85 to 1.28; p = 0.679) were associated with an increased risk of mortality. Peak post-procedural hs-TnT findings were not associated with mortality in patients with nonelevated (HR: 0.93; 95% CI: 0.69 to 1.25; p = 0.653) or elevated (HR: 1.24; 95% CI: 0.91 to 1.69; p = 0.165) baseline hs-TnT levels.

According to the news reporters, the research concluded: "In patients with coronary artery disease undergoing elective PCI, an increase in post-procedural hs-TnT level did not offer prognostic information beyond that provided by the baseline level of the biomarker."

Our news correspondents report that additional information may be obtained by contacting G. Ndrepepa, Technical Univ, Deutsch Herzzentrum Munchen, Dept. of Adult Cardiol, Munich, Germany. Additional authors for this research include R. Colleran, S. Braun, S. Cassese, J. Hieber, M. Fusaro, S. Kufner, I. Ott, R.A. Byrne, O. Husser, C. Hengstenberg, K.L. Laugwitz, H. Schunkert and A. Kastrati.

Japanese population. We retrospectively investigated the long-term prognosis in 80 consecutive patients with severe chronic AR who underwent AVR."

Our news journalists obtained a quote from the research from Tenri Hospital, "Additionally, 65 patients with follow-up echocardiography at 1 year after AVR were investigated to evaluate chronological changes in LV function. The mean follow-up period was 8.9 +/- 5.2 years. Freedom from all-cause death and cardiac death at 10 years after AVR was 76% and 91%, respectively. The preoperative ejection fraction (EF) and estimated glomerular filtration rate were independent predictors of all-cause death. Preoperative EF, LV end-systolic diameter, and diabetes might be useful predictors of cardiac death. Among the 65 patients with follow-up echocardiographic data, LV function had normalized at 1 year after AVR in all patients, except for 2 who died of cardiac causes in the long-term after AVR. LV end-diastolic diameter, LV end-systolic diameter, and EF at 1 year after AVR might be useful predictors of long-term cardiac death. In patients with severe chronic AR, preoperative LV dysfunction is remarkably improved at 1 year after AVR."

According to the news editors, the research concluded: "Pre- and postoperative echocardiographic data are important for predicting long-term outcome after AVR."

Our news journalists report that additional information may be obtained by contacting C. Izumi, Tenri Hosp, Dept. of Cardiol, Tenri, Nara 6328552, Japan. **Oncology - Pancreatic Cancer**

**Study Results from Third Military Medical University Update Understanding of Pancreatic Cancer (MiR-377 inhibits the proliferation of pancreatic cancer by targeting Pim-3)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Pancreatic Cancer are discussed in a new report. According to news reporting originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) play important roles in the regulation of various tumor biological processes including proliferation and apoptosis. MiR-377 has been implicated in many types of cancer, whereas its expression feature and potential biological function in pancreatic ductal adenocarcinoma (PDAC) remains unclear."

Our news editors obtained a quote from the research from Third Military Medical
University, "In this study, we scanned the global miRNA expression profiles in PDAC from The Cancer Genome Atlas (TCGA) and found miR-377 was down-regulated significantly in PDAC. Then, its expression was measured in both pancreatic cancer tissues and cells; the data showed that miR-377 was de-regulated and inversely correlated with pathologic parameters of tumor growth or metastasis. We generated PDAC cell lines with stable overexpression or inhibition of miR-377, and our results indicated that miR-377 up-regulation significantly promoted cell viability, proliferation, and migration in PDAC cells, and also induced cell apoptosis and cell cycle arrest simultaneously. Binding-site predictions by bioinformatics showed that Pim-3 might be a potential target of miR-377. Luciferase reporter assay ulteriorly identified that miR-377 suppressed Pim-3 expression by binding the 3'-UTR. In tumor tissues, we also showed that the Pim-3 expression was inversely correlated with that of miR-377. Furthermore, stable ectopic miR-377 expression in pancreatic cancer cell lines suppressed Pim-3 expression, leading to the attenuation of Bad phosphorylation level at its Ser(112) and promoting cell apoptosis. Overall, these results reveal that miR-377 may have tumor growth suppression function by down-regulating Pim-3 kinase expression to inhibit both pancreatic tumor growth and migration, and induce cell apoptosis."

According to the news editors, the research concluded: "Hence, miR-377 may be a potential diagnostic marker and therapeutic target."

For more information on this research see: MiR-377 inhibits the proliferation of pancreatic cancer by targeting Pim-3. Tumor Biology, 2016;37(11):14813-14824. Oncology - Liver Cancer

Study Results from Tianjin Medical University Provide New Insights into Liver Cancer (Phase-contrast CT: Qualitative and Quantitative Evaluation of Capillarized Sinusoids and Trabecular Structure in Human Hepatocellular Carcinoma Tissues)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Liver Cancer. According to news originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "Capillarization of sinusoids and change of trabecular thickness are the main histologic
features in hepatocellular carcinoma (HCC). Of particular interest are the three-dimensional (3D) visualization and quantitative evaluation of such alterations in the HCC progression."

Our news journalists obtained a quote from the research from Tianjin Medical University, "X-ray phase-contrast computed tomography (PCCT) is an emerging imaging method that provides excellent image contrast for soft tissues. This study aimed to explore the potential of in-line PCCT in microstructure imaging of capillarized sinusoids and trabecular structure in human HCC tissues and to quantitatively evaluate the alterations of those fine structures during the development of HCC. This project was designed as an ex vivo experimental study. The study was approved by the institutional review board, and informed consent was obtained from the patients. Eight human resected HCC tissue samples were imaged using in-line PCCT After histologic processing, PCCT images and histopathologic data were matched. Fine structures in HCC tissues were revealed. Quantitative analyses of capillarized sinusoids (ie, percentage of sinusoidal area [PSA], sinusoidal volume) and trabecular structure (ie, trabecular thickness, surface-area-to-volume ratio [SA/V]) in low-grade (well or moderately differentiated) and high-grade (poorly differentiated) HCC groups were performed. Using PCCT, the alterations of capillarized sinusoids and trabecular structure were clearly observed in 3D geometry, which was confirmed by the corresponding histologic sections. The 3D qualitative analyses of sinusoids in the high-grade HCC group were significantly different (P < 0.05) in PSA (7.8 +/- 2.5%) and sinusoidal volume (2.9 +/- 0.6 x 10⁷ μm³) from those in the low-grade HCC group (PSA, 12.9 +/- 2.2%; sinusoidal volume, 2.4 +/- 0.3 x 10⁷ μm³). Moreover, the 3D quantitative evaluation of the trabecular structure in the high-grade HCC group showed a significant change (P < 0.05) in the trabecular thickness (87.8 +/- 15.6 μm) and SAN (2.2 +/- 1.3 x 10³ μm⁻¹) compared to the low-grade HCC group (trabecular thickness, 75.9 +/- 7.1 μm; SA/V, 7.5 +/- 1.3 x 10³ μm⁻¹)."

According to the news editors, the research concluded: "This study provides insights into the 3D alterations of microstructures such as capillarized sinusoids and the trabecular structure at a micrometer level, which might allow for an improved understanding of the development of HCC."

The news correspondents report that additional information may be obtained from C.H. Hu, Tianjin Med Univ, Coll Biomed Engn, Tianjin 300070, People's Republic of China. Additional authors for this research include W.X. Zhang, H. Yang, X.Y. Zhao, R.J. Xuan, D.Y. Li and C.H. Hu.

Bone Research

Study Results from Tohoku University Broaden Understanding of Bone Research (Biomechanical and histological evaluation of the osseointegration capacity of two types of zirconia implant)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Bone Research have been presented. According to news reporting out of Miyagi, Japan, by NewsRx editors, research stated, "The purpose of this study was to evaluate the biomechanical and histological behavior of a ceria-stabilized zirconia-alumina nanocomposite (NanoZr) in comparison with that of 3 mol% yttria-stabilized tetragonal zirconia polycrystalline (3Y-TZP) in Sprague-Dawley rats. Cylindrical NanoZr and 3Y-TZP implants (diameter 1 mm, length 2 mm) were used."

Our news journalists obtained a quote from the research from Tohoku University, "Implant-surface morphology and surface roughness were determined by scanning white-light interferometry and scanning electron microscopy, respectively. The cylindrical zirconia implants were placed at the distal edge of the femur of Sprague Dawley rats. At weeks 2, 4, and 8, the interfacial shear strength between implant and bone was measured by push-in test. Histological analysis was performed using hard-tissue sections. Bone-implant contact (BIC), the thickness of new bone around the implant within the bone marrow area, and osteoclast numbers were evaluated. The average surface roughness of 3Y-TZP (Sa 0.788 mum) was significantly higher than that of NanoZr (Sa 0.559 mum). The shear strengths of 3Y-TZP and NanoZr were similar at 2 weeks, but at 4 and 8 weeks the shear strength of NanoZr was higher than that of 3Y-TZP. The average BIC values within the bone marrow area for 3Y-TZP and NanoZr were 25.26% and 31.51% at 2 weeks, 46.78% and 38% at 4 weeks, and 47.88% and 56.81% at 8 weeks, respectively. The average BIC values within the cortical area were 38.86% and 58.42% at 2 weeks, 66.82% and 57.74% at 4 weeks, and 79.91% and 78.97% at 8 weeks, respectively. The mean BIC value did not differ significantly between the two zirconia materials at any time point."

According to the news editors, the research concluded: "The NanoZr implants were biocompatible, capable of establishing close BIC, and may be preferred for metal-free dental implants."

For more information on this research see: Biomechanical and histological evaluation of the osseointegration capacity of two types of zirconia implant. International Journal of Nanomedicine, 2016;11():6507-6516. International Journal of Nanomedicine can be contacted at: Dove Medical Press Ltd, PO Box 300-008, Albany, Auckland 0752, New Zealand.

Oncology - Prostate Cancer

Study Results from Tongji University School of Medicine Update Understanding of Prostate Cancer (Quantitative proteomic study of human prostate cancer cells with different metastatic potentials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Metastatic dissemination is a feature of most cancers including prostate cancer (PCa), and is the main cause of treatment failure and mortality. The aim of the study is to explore the mechanisms of PCa metastasis and to search for potential prognostic markers using proteomics."

The news reporters obtained a quote from the research from the Tongji University School of Medicine, "Two-dimensional fluorescent differential gel electrophoresis (2D-DIGE) was used to quantify proteins in normal prostate epithelial cells, bone metastasis-derived PC-3 cells, and visceral metastasis-derived PC-3M cells. Metastatic potential was confirmed by flow cytometry, electron microscopy, proliferating cell nuclear antigen assay, and wound healing assay. Differential protein expression was compared between PCa cells with different metastatic potentials (LNcap, DU145, PC-3 and PC-3M) and normal prostate epithelial cells (RWPE-1). Selected candidate proteins in human prostate tissues were analyzed using GOA, UniProt and GeneCards analyses. Eighty-six proteins were differentially expressed between cell lines (>1.5-fold, p<0.05). Among them, twelve proteins were identified by MALDI-TOF-MS. One protein was upregulated in normal prostate epithelial cells, nine proteins were upregulated in PC-3, and two proteins were upregulated in PC-3M. Proteins were divided into five groups according to their functions. The SETDB1 protein was closely associated with the prognosis of PCa. Bioinformatics suggested that SETDB1 might promote PCa bone metastasis through the WNT pathway."

According to the news reporters, the research concluded: "SETDB1 might be associated with the development of bone metastases from PCa. Further study is necessary to assess its exact role in PCa."

Our news correspondents report that additional information may be obtained by contacting Q. Li, Dept. of Oncology, Shanghai East Hospital, Tongji University School of Medicine, Shanghai 200120, People's Republic of China. Additional authors for this research include Y. Li, Y. Wang, Z. Heart Disorders and Diseases - Atrial Fibrillation

Study Results from Tsuchiura Kyodo General Hospital Provide New Insights into Atrial Fibrillation (Pulmonary Vein Isolation Using a Second-Generation Cryoballoon in Patients With Paroxysmal Atrial Fibrillation: One-Year Outcome Using a Single ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Atrial Fibrillation is now available. According to news reporting from Ibaraki, Japan, by NewsRx journalists, research stated, "Cryoballoon Ablation of PAF. The second-generation cryoballoon (CB) has been recently introduced into clinical use for pulmonary vein isolation (PVI)."

The news correspondents obtained a quote from the research from Tsuchiura Kyodo General Hospital, "Data on the feasibility, long-term outcome, and optimal freeze cycle are still limited. We assessed the 1-year clinical outcome after second-generation CB ablation with single 3-minute freeze techniques, and clinical variables associated with AF recurrence. A total of 108 paroxysmal atrial fibrillation (PAF) patients undergoing cryothermal PVI were enrolled. PVI was performed with one 28-mm CB using single 3-minute freeze techniques without bonus applications. Fourteen-day consecutive monitoring was done after discharge to detect early AF recurrences (ERAFs). Out of 425 PVs, 409 (96.2%) were isolated using exclusively CBs, and 16 required touch-up ablation. Transient phrenic nerve injury, pericardial tamponade, and 50% PV stenosis occurred in 9, 1, and 1 patients, respectively. No PV stenosis >50% was observed in any patients. The total procedure and fluoroscopic times were 82.9 +/- 26.4 and 26.2 +/- 14.8 minutes, respectively. ERAFs were detected in 51 (47.2%) patients. At 1-year after single and repeat procedures, 71.6% and 84.3% of the patients were free from recurrent AF off antiarrhythmic drugs (AADs), respectively. Eighteen patients underwent repeat procedures (median 6.0 [4.0-9.3] months post procedure), and 68.6% of PVs were still isolated. Cox's proportional models determined that ERAFs were significantly associated with AF recurrence (HR = 7.236; 95% CI = 2.753-19.016; P< 0.0001). AF-freedom off AADs at 1-year after single procedures was 90.8% and 50.3% in patients without and with ERAFs. Second-generation CB ablation using single 3-minute freeze techniques appears feasible in PAF patients."

According to the news reporters, the research concluded: "ERAFs were significant factors for predicting clinical outcomes."

Our news journalists report that additional information may be obtained by contacting S. Miyazaki, Tsuchiura Kyodo Gen Hosp, Cardiovasc Center, Div Cardiol, Tsuchiura, Ibaraki 3000053, Japan. Additional authors for this research include H. Hachiya, H. Nakamura, H. Taniguchi, T. Takagi, K. Hirao and Y. Iesaka.

Study Results from Tufts University in the Area of Antibiotics Reported (Colistin loading dose: evaluation of the published pharmacokinetic and clinical data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Colistin (polymyxin E) has been widely used since the beginning of the century as a last-option antibiotic for the treatment of patients with multidrug-resistant and extensively-drug-resistant bacterial infections. However, colistin dosing is troublesome because each batch of the drug contains a mixture of components and because it is administered as the inactive pro-drug colistimethate sodium (CMS), which has different pharmacokinetic (PK) properties from the active drug."

Our news journalists obtained a quote from the research from Tufts University, "Significant inter-individual and intra-individual variability in colistin plasma concentrations have been observed in all available studies. Low plasma concentrations of the drug during the first hours from initiation of administration suggested that a loading dose would be appropriate. However, other PK studies challenge this approach. Clinical data from randomised controlled trials are not available, whilst data from observational studies do not support higher effectiveness of a loading dose."

According to the news editors, the research concluded: "In this review, we summarise the available data regarding the administration of a loading dose and discuss the issues surrounding the potential advantages and disadvantages as well as the context within which such an approach could be beneficial to patients."

The news correspondents report that additional information may be obtained from M.E. Falagas, Tufts University, Sch Med, Boston, MA 02111, United States. Additional authors for this research include K. Rellos, N.A. Triarides and M.E. Falagas.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijantimicag.2016.08.009. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from Tulane University Broaden Understanding of HIV/AIDS (In vitro effects of the small-molecule protein kinase C agonists on HIV latency reactivation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immune System Diseases and Conditions - HIV/AIDS have been presented. According to news originating from Covington, Louisiana, by NewsRx correspondents, research stated, "The persistence of latently HIV-infected cellular reservoirs represents the major obstacle to virus eradication in patients under antiretroviral therapy (ART). Cure strategies to eliminate these reservoirs are thus needed to reactivate proviral gene expression in latently infected cells."

Our news journalists obtained a quote from the research from Tulane University, "In this study, we tested optimal concentrations of PKC agonist candidates (PEP005/Ingenol-3-angelate, prostratin, bryostatin-1, and JQ1) to reactivate HIV latency in vitro, and examined their effects on cell survival, activation and epigenetic histone methylation after treatment alone or in combination in cell line and isolated CD4 T cells from SIV-infected macaques. The results showed that PKC agonists increased cell activation with different degrees of latency reactivation, concomitant with reduced levels of histone methylation. With increasing concentrations, prostratin and byrostain-1 treatment rapidly reduced cell survival and cell activation. The PKC agonist combinations, or in combination with JQ1, led to modest levels of synergistic reactivation of HIV. Remarkably, PEP005 treatment alone caused marked reactivation of HIV latency, similar to PMA stimulation."

According to the news editors, the research concluded: "These findings suggested that PEP005 alone, as indicated its lower cytotoxicity and lower effective dose inducing maximal reactivation, might be a candidate for effectively reactivating HIV latency as part of a therapeutic strategy for HIV infection."

For more information on this research see: In vitro effects of the small-molecule protein kinase C agonists on HIV latency reactivation. Scientific Reports, 2016;6():1-8. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from H.B. Xu, Tulane University, Sch Med, Tulane Natl Primate Res Center, Pathol & Lab Med, Covington, LA 70433, United States. Additional authors for this research include W. Ziani, X.L. Wang, R.S. Veazey and H.B. Xu.

Study Results from Tulane University in the Area of Plasma Reported
(Quantification of intact plasma AGT consisting of oxidized and reduced conformations using a modified ELISA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematology - Plasma. According to news originating from New Orleans, Louisiana, by NewsRx correspondents, research stated, "The pleiotropic actions of the renin-angiotensin system (RAS) depend on the availability of angiotensinogen (AGT) which generates angiotensin I (ANG I) when cleaved by renin. Thus, quantification of the intact AGT (iAGT) concentrations is important to evaluate the actual renin substrate available."

Our news journalists obtained a quote from the research from Tulane University, "The iAGT conformation exists as oxidized AGT (oxi-AGT) and reduced AGT (red-AGT) in a disulfide bond, and oxi-AGT has a higher affinity for renin, which may exacerbate RAS-associated diseases. Accordingly, we determined iAGT, oxi-AGT, and red-AGT levels in plasma from rats and mice. Blood samples were obtained by cardiac puncture and then immediately mixed with an inhibitor solution containing a renin inhibitor. Total AGT (tAGT) levels were measured by tAGT ELISA which detects both cleaved and iAGT. iAGT levels were determined by iAGT ELISA which was found to only detect red-AGT. Thus, it was necessary to treat samples with dithiothreitol, a reducing agent, to quantify total iAGT concentration. tAGT levels in rat and mouse plasma were 1,839 +/- 139 and 1,082 +/- 77 ng/ml, respectively. iAGT levels were 53% of tAGT in rat plasma but only 22% in mouse plasma, probably reflecting the greater plasma renin activity in mice. The ratios of oxi-AGT and red-AGT were similar to 4:1 (rat) and 16:1 (mouse). Plasma iAGT consists of oxi-AGT and red-AGT, suggesting that oxidative stress can influence ANG I generation by the AGT conformation switch."

According to the news editors, the research concluded: "Furthermore, the lower availability of plasma iAGT in mice suggests that it may serve as a limiting factor in ANG I formation in this species."

For more information on this research see: Quantification of intact plasma AGT consisting of oxidized and reduced conformations using a modified ELISA. American Journal of Physiology-Renal Physiology, 2016;311(6):F1211-F1216. Life Science Research - Bat Biology

Study Results from University College Update Understanding of Bat Biology [The effects of human-mediated habitat fragmentation on a sedentary woodland-associated species (Rhinolophus hipposideros) at its range margin]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Life Science Research - Bat Biology. According to news reporting out of Dublin, Ireland, by NewsRx editors, research stated, "Among the many anthropogenic modifications to earth's ecosystems, habitat loss and degradation pose the most immediate threat to many biota. The predicted consequences of fragmented habitats include lower species diversity, smaller population sizes, disrupted gene flow, increased drift and inbreeding and increased differentiation between neighbouring populations; all of which are thought to be further enhanced in species with low dispersal abilities."

Our news journalists obtained a quote from the research from University College, "These factors, especially when occurring in tandem, can lead to an increased risk of extinction. To examine the genetic consequences of habitat fragmentation we selected an isolated population of a sedentary woodland specialist species (Rhinolophus hipposideros) to act as an indicator of disruptions to landscape level connectivity. Based on 491 individuals from 37 colonies our results revealed the presence of a broad North-Range/South-Range differentiation within this species in Ireland; a finding supported across datasets (mtDNA and nuclear microsatellites) and analyses. Analyses of echolocation data and microsatellites suggested further differentiation of the northern-most colonies. A landscape genetics framework to assess the impact of habitat versus geographic distance on population differentiation showed that habitat features (at a five km resolution) were equally likely to be correlated with differentiation as geographic distance considered alone. Further differentiation of the geographically disjunct groups is likely to occur in the future. The viability of either group alone is uncertain given their restricted distribution, small population sizes (based on census data and N-e estimates) and isolation."

According to the news editors, the research concluded: "Roost provision and habitat restoration in the geographic region separating the differentiated groups will be fundamental to the recolonization of this area and the reestablishment of connectivity between the regional groups."

For more information on this research see: The effects of human-mediated habitat fragmentation on a sedentary woodland-associated species (Rhinolophus hipposideros) at its range margin. Acta Chiropterologica, 2016;18(2):377-393. Acta Chiropterologica can be contacted at: Museum & Inst Zoology Pas-Polish Acad Sciences, Wilcza Street 64, 00-679 Warsaw, Poland.

Liver Diseases and Conditions - Chronic Hepatitis B…

Study Results from University Health Network Provide New Insights into Chronic Hepatitis B Virus (Flares during long-term entecavir therapy in chronic hepatitis B)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Chronic Hepatitis B Virus is now available. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "The incidence and consequences of flares during first-line nucleos(t)ide analogue therapy are largely unknown. We aimed to investigate the incidence and outcome of alanine aminotransferase (ALT) flares during long-term entecavir (ETV) in chronic hepatitis B (CHB)."

Our news editors obtained a quote from the research from University Health Network, "CHB patients treated with ETV monotherapy from 11 European centers were studied. Flare was defined as > 3x increase in ALT compared with baseline or lowest on-treatment level and an absolute ALT > 3x ULN. Flares were designated as host-induced (preceded by hepatitis B virus (HBV)-DNA decline), virus-induced (HBV-DNA increase), or indeterminate (stable HBV-DNA). Seven hundred and twenty-nine patients were treated with ETV for median of 3.5 years. Thirty patients developed a flare with cumulative incidence of 6.3% at year 5. Baseline hepatitis B e antigen (HBeAg)-positivity (HR 2.84; P = 0.005) and high HBV-DNA (Hazard ratio (HR) 1.30; P = 0.003) predicted flares. There were 12 (40%) host-induced, 7 (23%) virus-induced, and 11 (37%) indeterminate flares. Host-induced flares occurred earlier than virus-induced (median: 15 vs 83 weeks; P = 0.027) or indeterminate flares (15 vs 109 weeks; P = 0.011). Host-induced flares were associated with biochemical remission, and HBeAg (n = 3) and hepatitis B surface antigen (n = 2) seroconversions were exclusively observed among patients with these flares. Virus-induced flares were associated with ETV resistance (n = 2) and non-compliance (n = 1). The incidence of ALT flares during ETV was low in this real-life cohort. ETV can be safely continued in patients with host-induced flares."

According to the news editors, the research concluded: "Treatment adherence and drug resistance must be assessed in patients with virus-induced flares."

Hematologic Diseases and Conditions -

Study Results from University Hospital Broaden Understanding of Thrombocytopenia (Procoagulant profile in patients with immune thrombocytopenia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematologic Diseases and Conditions - Thrombocytopenia is now available. According to news reporting out of Madrid, Spain, by NewsRx editors, research stated, "Despite their low platelet count some immune thrombocytopenia (ITP) patients seldom bleed, indicating the presence of factors to compensate thrombocytopenia. Moreover, ITP patients may have an increased risk for thrombosis."

Financial support for this research came from FIS-FEDER.

Our news journalists obtained a quote from the research from University Hospital, "These facts suggest the presence of procoagulant mechanisms that have not been clarified yet. The aim of this study was to identify these possible factors. Moreover, the utility of rotational thromboelastometry (ROTEM ®) to test haemostasis in these patients was also evaluated. Patients with ITP presented a procoagulant profile due to an increased amount of platelet- and red cell-microparticles, an increased resistance to protein C and the formation of a clot more resistant to fibrinolysis due to augmented levels of plasminogen activator inhibitor-1, which might reflect an endothelial damage/activation in ITP patients. Despite increased maximum clot firmness and reduced lysis, ROTEM ® profiles showed a prolonged clotting time that might rely on the presence of anti-platelet antibodies as suggested by the increased lagtime in thrombin generation test caused by plasma from ITP patients on platelets from healthy controls. These results indicate the need to individualize therapeutic treatment for ITP patients, considering their procoagulant profile and the presence of concomitant risk factors."

According to the news editors, the research concluded: "Moreover, ROTEM ® appeared to be useful for evaluating haemostasis in ITP patients."

Our news journalists report that additional information may be obtained by contacting N.V. Butta, Univ Hosp La Paz IdiPaz, Haematol & Haemotherapy Unit, Madrid 28046, Spain. Additional authors for this research include I. Fernandez-Bello, V. Jimenez-Yuste, M. Martin-Salces, E.G. Arias-Salgado, M.I.R. Pollmar, R.J. Sanz and N.V. Butta.

Study Results from University Hospital Provide New Insights into Atrial Fibrillation (Catheter ablation using the third-generation cryoballoon provides an enhanced ability to assess time to pulmonary vein isolation facilitating the ablation ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting originating from Staten Island, New York, by NewsRx correspondents, research stated, "Limited data exist on cryoablation of atrial fibrillation (Cryo-AF) using the newly available third-generation (Arctic Front Advance-Short Tip [AFA-ST]) cryoballoon. In this multicenter study, we evaluated the safety and efficacy of Cryo-AF using the AFA-ST vs the second-generation (Arctic Front Advance [AFA]) cryoballoon."

Our news editors obtained a quote from the research from University Hospital, "We examined the procedural safety and efficacy and the short- and long-term clinical outcomes associated with a first-time Cryo-AF performed in 355 consecutive patients (254/355 [72%] with paroxysmal AF), using either the AFA-ST (n = 102) or the AFA (n = 253) cryoballoon catheters. Acute isolation was achieved in 99.6% of all pulmonary veins (PVs) (AFA-ST: 100% vs AFA: 99.4%; P = .920). Time to pulmonary vein isolation was recorded in 89.2% of PVs using AFA-ST vs 60.2% using AFA (P < .001). PVs targeted using AFA-ST required fewer applications (1.6 +/- 0.8 vs 1.7 +/- 0.8; P = .023), whereas there were no differences in the balloon nadir temperature (AFA-ST: -47.0 degrees C +/- 7.3 degrees C vs AFA: -7.5 degrees C +/- 7.8 degrees C; P = .120) or thaw time (AFA-ST: 41 +/- 24 seconds vs AFA: 44 +/- 28 seconds; P = .056). However, AFA-ST was associated with shorter left atrial dwell time (43 +/- 5 minutes vs 53 +/- 16 minutes; P < .001) and procedure time (71 +/- 11 minutes vs 89 +/- 25 minutes; P < .001). Furthermore, Cryo-AF using AFA-ST was completed more frequently by 'single-shot' PV ablation (27.4% vs 20.2%; P = .031). Persistent phrenic nerve palsy (AFA-ST: 0% vs AFA: 0.8%; P = .507) and procedure-related adverse events (AFA-ST: 1.0% vs AFA: 1.6%; P = .554) were similar, as was the freedom from recurrent atrial arrhythmias at 10 months of follow-up (AFA-ST: 81.8% vs AFA: 79.9%; P = .658). Cryo-AF using the AFA-ST cryoballoon offers an enhanced ability to assess time to pulmonary vein isolation, allowing for fewer cryoapplications and shorter left atrial dwell time and procedure time."

According to the news editors, the research concluded: "Consequently, this allowed for procedural completion more frequently using a 'single-shot' PV ablation with equivalent safety and efficacy."

For more information on this research see: Catheter ablation using the third-generation cryoballoon provides an enhanced ability to assess time to pulmonary vein isolation

The news editors report that additional information may be obtained by contacting M. Kowalski, Staten Island University Hospital, Staten Island, New York, NY, United States. **Oncology - Cervical Cancer**

**Study Results from University Hospital in the Area of Cervical Cancer Reported [Barriers to Cervical Cancer Screening in Geneva (DEPIST Study)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Cervical Cancer is now available. According to news reporting from Geneva, Switzerland, by NewsRx journalists, research stated, "Cervical screening is only efficient if a large part of eligible women participate. Our aim was to identify sociodemographic barriers to cervical screening and consider self-reported reasons to postpone screening."

The news correspondents obtained a quote from the research from University Hospital. "Between September 2011 and June 2015, a questionnaire addressing reasons for nonparticipation in cervical screening was completed by 556 women who had not undergone a PAP test in the preceding 3 years. Pearson ch test was used to analyze differences between subgroups. Logistic regression was used to explore the association between sociodemographic characteristics and reasons for nonparticipation. The main reasons for nonparticipation in cervical cancer screening were practical barriers, such as lack of time and the cost of screening. These barriers were more likely to be reported by working women, women who were not sexually active, and those without health insurance. Younger women, non-European women living in Switzerland, and childless women were more likely to have never participated in a screening program before (adjusted odds ratio [aOR], 3.15; 95% CI, 1.41-6.98; aOR, 2.76; 95% CI, 1.48-5.16; aOR, 1.74; 95% CI, 1.03-2.99, respectively). Practical considerations seem to play a more important role in screening participation than emotional reasons and other beliefs."

According to the news reporters, the research concluded: "Particular attention should be paid to immigrant communities, where women seem more likely to skip cervical screening."

**Oncology - Glioblastomas**

**Study Results from University Medical Center Provide New Insights into Glioblastomas (Differential expression of CXCR4 and CXCR7 with various stem cell markers in paired human primary and recurrent glioblastomas)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Glioblastomas. According to news reporting from Kiel, Germany, by NewsRx journalists, research stated, "The chemokine CXCL12 (also termed SDF-1, stromal cell-derived factor-1) and its receptors CXCR4 and CXCR7 are known to play a pivotal role in tumor progression including glioblastomas (GBM). Previous investigations focused on the expression and functional roles of CXCR4 and CXCR7 in different GBM cell subpopulations, but comparative analysis in matched primary versus recurrent GBM samples are still lacking."

The news correspondents obtained a quote from the research from University Medical Center, "Thus, here we investigated the expression of CXCR4 and CXCR7 on mRNA and protein level using matched primary and recurrent GBM pairs. Additionally, as GBM CXCR4-positive stem-like cells are supposed to give rise to recurrence, we compared the expression of both receptors in primary and recurrent GBM cells expressing either neural (MUSASHI-1) or embryonic stem cell markers (KLF-4, OCT-4, SOX-2, NANOG). We were able to show that both CXCR4 and CXCR7 were expressed at considerable mRNA and protein levels. CXCR7 was downregulated in relapse cases, and different groups regarding CXCR4/CXCR7 expression differences between primary and recurrent samples could be distinguished. A co-expression of both receptors was rare. In line with this, CXCR4 was co-expressed with all investigated neural and embryonic stem cell markers in both primary and recurrent tissues, whereas CXCR7 was mostly found on stem cell marker-negative cells, but was co-expressed with KLF-4 on a distinct GBM cell subpopulation."
According to the news reporters, the research concluded: "These results point to an individual role of CXCR4 and CXCR7 in stem cell marker-positive GBM cells in glioma progression and underline the opportunity to develop new therapeutic tools for GBM intervention."

For more information on this research see: Differential expression of CXCR4 and CXCR7 with various stem cell markers in paired human primary and recurrent glioblastomas. *International Journal of Oncology*, 2016;48(4):1408-16.

Our news journalists report that additional information may be obtained by contacting C. Fluh, Dept. of Neurosurgery, University Medical Center Schleswig-Holstein UKSH, Campus Kiel, D-24105 Kiel, Germany. Additional authors for this research include K. Hattermann, H.M. Mehdorn, M. **Genetics - Human Genetics**

**Study Results from University Medical Center Provide New Insights into Human Genetics (Am I My Family's Keeper? Disclosure Dilemmas in Next-Generation Sequencing)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics - Human Genetics is now available. According to news reporting from Utrecht, Netherlands, by NewsRx journalists, research stated, "Ever since genetic testing is possible for specific mutations, ethical debate has sparked on the question of whether professionals have a duty to warn not only patients but also their relatives that might be at risk for hereditary diseases. As next-generation sequencing (NGS) swiftly finds its way into clinical practice, the question who is responsible for conveying unsolicited findings to family members becomes increasingly urgent."

Financial support for this research came from KWF Kankerbestrijding.

The news correspondents obtained a quote from the research from University Medical Center, "Traditionally, there is a strong emphasis on the duties of the professional in this debate. But what is the role of the patient and her family? In this article, we discuss the question of whose duty it is to convey relevant genetic risk information concerning hereditary diseases that can be cured or prevented to the relatives of patients undergoing NGS. We argue in favor of a shared responsibility for professionals and patients and present a strategy that reconciles these roles: a moral accountability nudge. Incorporated into informed consent and counseling services such as letters and online tools, this nudge aims to create awareness on specific patient responsibilities."

According to the news reporters, the research concluded: "Commitment of all parties is needed to ensure adequate dissemination of results in the NGS era."

Study Results from University of Alberta Broaden Understanding of Pneumococcal Pneumonia (Prognostic factors associated with mortality and major in-hospital complications in patients with bacteremic pneumococcal pneumonia Population-based study)

By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Pneumococcal Pneumonia. According to news reporting originating from Edmonton, Canada, by NewsRx correspondents, research stated, "Bacteremic pneumococcal pneumonia (BPP) causes considerable mortality and morbidity. We aimed to identify prognostic factors associated with mortality and major in-hospital complications in BPP."

Our news editors obtained a quote from the research from the University of Alberta, "A prospective, population-based clinical registry of 1636 hospitalized adult patients (≥18 years) with BPP was established between 2000 and 2010 in Northern Alberta, Canada. Prognostic factors for mortality and major in-hospital complications (e.g., cardiac events, mechanical ventilation, aspiration) were evaluated using multivariable logistic regression. Average age was 54 (standard deviation 18) years, 57% males, and 59% had high case-fatality rate (CFR) serotypes. Overall, 14% (226/1636) of patients died and 22% (315/1410) of survivors developed at least 1 complication. Independent prognostic factors for mortality were age (adjusted odds ratio [aOR], 1.5 per decade; 95% confidence interval [CI], 1.3-1.7), nursing home residence (aOR, 3.7; 95% CI 1.8-7.4), community-dwelling dementia (aOR 3.7; 95% CI, 1.6-8.6), alcohol abuse (aOR, 2.2; 95% CI, 1.4-3.4), acid-suppressing drugs (aOR, 1.5; 95% CI, 1.0-2.3), guideline-discordant antibiotics (aOR, 3.4; 95% CI, 2.4-4.8), multilobe pneumonia (aOR, 2.6; 95% CI, 1.8-3.6), and high CFR serotypes (aOR, 1.8; 95% CI, 1.2-2.8). Similar prognostic factors were observed for major in-hospital complications. Pneumococcal vaccination was associated with reduced in-hospital mortality (aOR, 0.2; 95% CI, 0.05-0.9) but not major complications (P=0.2). Older and frailer patients, and those who abuse alcohol or take acid-suppressing drugs, are at increased risk of BPP-related mortality and complications, as are those with high CFR serotypes."

According to the news editors, the research concluded: "Beyond identifying those at
highest risk, our findings demonstrate the importance of guideline-concordant antibiotics and pneumococcal vaccination in those with BPP."

The news editors report that additional information may be obtained by contacting D.T. Eurich, University of Alberta, Li Ka Shing Center 2 040, ACHORD, Edmonton, AB, Canada. Additional authors for this research include S.R. Majumdar, G.J. Tyrrell, T.J. Marrie and D.T. Eurich.

Keywords for this news article include: Edmonton, Alberta, Canada, North and Central America, Respiratory Tract Diseases and Conditions, Pneumococcal Disease, Epidemiology, Gram-Positive Bacterial Infections, Bacterial Infections and Mycoses, Lung Diseases and Conditions, Respiratory Tract Infections, Pneumococcal Infections, Pneumococcal Pneumonia, Bacterial Pneumonia, Infectious Disease, Public Health, Immunization, Vaccination, Pulmonology, Hospital, University of Alberta.

**Cell Research - Cell Adhesion Molecules**

**Study Results from University of Alcala Update Understanding of Cell Adhesion Molecules (TGF beta Induces Epithelial-Mesenchymal Transition of Thyroid Cancer Cells by Both the BRAF/MEK/ERK and Src/FAK Pathways)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cell Research - Cell Adhesion Molecules have been presented. According to news reporting from Madrid, Spain, by NewsRx journalists, research stated, "The epithelial-mesenchymal transition (EMT) is a crucial process in tumour progression, by which epithelial cells acquire a mesenchymal phenotype, increasing its motility and the ability to invade distant sites. Here, we describe the molecular mechanisms by which (V600E)BRAF, TGF beta and the Src/FAK complex cooperatively regulate EMT induction and cell motility of anaplastic thyroid cancer cells."

The news correspondents obtained a quote from the research from the University of Alcala, "Analysis of EMT marker levels reveals a positive correlation between TGF beta and Snail expression, with a concomitant downregulation of E-cadherin, accompanied by an increase of cell migration and invasion. Furthermore, we show that (V600E)BRAF depletion by siRNA or inhibition of its activity by treatment with its inhibitor PLX4720 reverses the TGF beta-mediated effects on Snail, E-cadherin, migration and invasion. Moreover, (V600E)BRAF induces TGF beta secretion through a MEK/ERK-dependent mechanism. In addition, TGF beta activates the Src/FAK complex, which in turn regulates the expression of Snail and E-cadherin as well as cell migration. The inhibition of Src with the inhibitor SU6656 or abrogation of FAK expression with a specific siRNA reverses the TGF beta-induced effects. Interestingly, we demonstrate that activation of the Src/FAK complex by TGF beta is independent of (V600E) BRAF signalling, since inhibition of this oncogene does not affect its phosphorylation. Our data
strongly suggest that TGF beta induces EMT and aggressiveness of thyroid cancer cells by parallel mechanisms involving both the (V600E)BRAF/MEK/ERK and Src/FAK pathways independently."

According to the news reporters, the research concluded: "Thus, we describe novel functions for Src/FAK in mediating the EMT program and aggressiveness regulated by TGF beta, establishing the inhibition of these proteins as a possible effective approach in preventing tumour progression of (V600E)BRAF-expressing thyroid tumours."

Our news journalists report that additional information may be obtained by contacting A. Chiloeches, Univ Alcala De Henares, Fac Med, Unidad Bioquim & Biol Mol, Dept. of Biol Sistemas, E-28871 Madrid, Spain. Additional authors for this research include E. Jimenez-Mora, A. Santos, M. Lasa and A. Chiloeches.

Study Results from University of Angers Provide New Insights into Peripheral Nervous System Research (Increased mitochondrial fusion in a autosomal recessive CMT2A family with mitochondrial GTPase mitofusin 2 mutations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Health and Medicine - Peripheral Nervous System Research are presented in a new report. According to news reporting originating from Angers, France, by NewsRx correspondents, research stated, "Charcot-Marie-Tooth type 2A disease (CMT2A) is an inherited peripheral neuropathy mainly caused by mutations in the MFN2 gene coding for the mitochondrial fusion protein mitofusin 2. Although the disease is mainly inherited in a dominant fashion, few cases of early-onset autosomal recessive CMT2A (AR-CMT2A) have been reported in recent years. In this study, we characterized the structure of the mitochondrial network in cultured primary fibroblasts obtained from AR-CMT2A family members."

Our news editors obtained a quote from the research from the University of Angers, "The patient-derived cells showed an increase of the mitochondrial fusion with large connected networks and an increase of the mitochondrial volume. Interestingly, fibroblasts derived from the two asymptomatic parents showed similar changes to a lesser extent. These results support the hypothesis that AR-CMT2A-related MFN2 mutations acts through a semi-dominant negative mechanism and suggest that other biological parameters might show mild alterations in asymptomatic heterozygote AR-CMT2A patients."

According to the news editors, the research concluded: "Such alterations could be
useful biomarkers helping to distinguish MFN2 mutations from variants, a growing challenge with the advent of next generation sequencing into routine clinical practice."

The news editors report that additional information may be obtained by contacting A. Chevrollier, Univ Angers, PREMMi Mitochondrial Med Res Center, CHU Angers, CNRSInst MITOVASCINSERMU1083UMR 6214, Angers, France. Additional authors for this research include A. Chevrollier, M.S. Kane, A. Echaniz-Laguna, P. Latour, P. Reynier, D. Bonneau, C. Verny, V. Procaccio, G. Lenaers and J. Cassereau.

**Nutritional and Metabolic Diseases and Conditions -…

**Study Results from University of Antioquia Broaden Understanding of Cerebrotendinous Xanthomatosis (Novel cerebrotendinous xanthomatosis mutation causes familial early dementia in Colombia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Cerebrotendinous Xanthomatosis. According to news reporting originating in Medellin, Colombia, by NewsRx journalists, research stated, "Cerebrotendinous xanthomatosis is an infrequent cause of dementia. It is an autosomal recessive disorder with clinical and molecular heterogeneity."

The news reporters obtained a quote from the research from the University of Antioquia, "To identify the presence of a possible mutation in a Colombian family with several affected siblings and clinical characteristics compatible with cerebrotendinous xanthomatosis associated to early dementia. We studied a series of cases with longitudinal follow-up and genetic analysis. These individuals had xanthomas, mental retardation, psychiatric disorders, behavioral changes, and multiple domains cognitive impairment with dysexecutive dominance that progressed to early dementia. CYP27A1 gene coding region sequencing revealed a novel mutation (c.1183_1184insT). The mutation found in this family is responsible for the described dementia features. Early identification of familial history with mental retardation, xanthomas and cognitive impairment might prevent the progression to this treatable type of dementia."

According to the news reporters, the research concluded: "Even though this mutation lies in the most frequently mutated codon of CYP27A1 gene, it has not been reported previously."

For more information on this research see: Novel cerebrotendinous xanthomatosis mutation causes familial early dementia in Colombia. *Biomedica*, 2015;35(4):563-71. (Elsevier - www.elsevier.com; Biomedica - www.journals.elsevier.com/biomedical-and-environmental-

Cytokines

Study Results from University of Basel Update Understanding of Cytokines (Permissive roles of cytokines interleukin-7 and Flt3 ligand in mouse B-cell lineage commitment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cytokines. According to news reporting originating in Basel, Switzerland, by NewsRx journalists, research stated, "Hematopoietic cells are continuously generated throughout life from hematopoietic stem cells, thus making hematopoiesis a favorable system to study developmental cell lineage commitment. The main factors incorporating environmental signals to developing hematopoietic cells are cytokines, which regulate commitment of hematopoietic progenitors to the different blood lineages by acting either in an instructive or a permissive manner."

Financial supporters for this research include Swiss National Science Foundation (Schweizerische Nationalfonds), European Commission (EC), Science Foundation Ireland (SFI).

The news reporters obtained a quote from the research from the University of Basel, "Fms-like tyrosine kinase-3 (Flt3) ligand (FL) and Interleukin-7 (IL-7) are cytokines pivotal for B-cell development, as manifested by the severely compromised B-cell development in their absence. However, their precise role in regulating B-cell commitment has been the subject of debate. In the present study we assessed the rescue of B-cell commitment in mice lacking IL-7 but simultaneously overexpressing FL. Results obtained demonstrate that FL overexpression in IL-7-deficient mice rescues B-cell commitment, resulting in significant Ebf1 and Pax5 expression in Ly6D(+) CD135(+)CD127(+)CD19(-) precursors and subsequent generation of normal numbers of CD19(+) B-cell progenitors, therefore indicating that IL-7 can be dispensable for commitment to the B-cell lineage."

According to the news reporters, the research concluded: "Further analysis of Ly6D(+)CD135(+)CD127(+)CD19(-) progenitors in IL-7-or FL-deficient mice overexpressing Bcl2, as well as in IL-7 transgenic mice suggests that both FL and IL-7 regulate B-cell commitment in a permissive manner: FL by inducing proliferation of Ly6D(+)CD135(+)CD127(+)CD19(-) progenitors and IL-7 by providing survival signals to these progenitors."

Our news correspondents report that additional information may be obtained by contacting P. Tsapogas, University of Basel, Dept. of Biomed, Dev & Mol Immunol, CH-4058 Basel, Switzerland. Additional authors for this research include L. Alberti-Servera, F. Klein, G. Capoferri, D. Finke, R. Ceredig, A. Rolink and P. Tsapogas.

**Hematology - Plasma**

**Study Results from University of Basel Update Understanding of Plasma (Single-Ascending-Dose Pharmacokinetic Study of Tribendimidine in Opisthorchis viverrini-Infected Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematology - Plasma. According to news reporting out of Basel, Switzerland, by NewsRx editors, research stated, "Praziquantel is the only drug available for the treatment of Opisthorchis viverrini infections. Tribendimidine has emerged as a potential treatment alternative; however, its pharmacokinetic (PK) properties have not been sufficiently studied to date."

Financial supporters for this research include The Forschungsfonds of the University of Basel, DFID/MRC/Wellcome Trust Joint Global Health Trials Scheme.

Our news journalists obtained a quote from the research from the University of Basel, "Via two phase IIa dose-finding studies, 68 O. viverrini patients were treated with 25- to 600-mg doses of tribendimidine using 50- and 200-mg tablet formulations. Plasma, blood, and dried blood spots (DBS) were sampled at selected time points. The two main metabolites of tribendimidine, active deacetylated amidantel (dADT) and acetylated dADT (adADT), were analyzed in plasma, blood, and DBS. PK parameters were estimated by noncompartmental analysis. An acceptable agreement among plasma and DBS concentrations was observed, with a mean bias of <= 10%, and 60% dADT and 74% adADT concentrations being within +/- 20% margins. We found that 200-mg tribendimidine tablets possess immediate floating characteristics, which led to variable time to maximal concentration of drug (T-max) values (2 to 24 h) between individuals. Dose proportionality was observed for dADT from 25 to 200 mg using 50-mg tablets, but at higher dosages (200 to 600 mg), saturation occurred. The median ratio of the area under the plasma concentration-time curve from 0 to 24 h (AUC(0-24)) of
dADT to the AUC(0-24) of adADT ranged from 0.8 to 26.4, suggesting substantial differences in acetylation rates. Cure rates ranged from 11% (25-mg dose) to 100% (400-mg dose). Cured patients showed significantly higher dADT maximal serum concentrations (C-max) and AUC(0-24) values than uncured patients. Tribendimidine is a promising drug for the treatment of opisthorchiasis. However, the tablet formulation should be optimized to achieve consistent absorption among patients.

According to the news editors, the research concluded: "Further studies are warranted to assess the large differences between individuals in the rate of metabolic turnover of dADT to adADT."

**Risk Management**

**Study Results from University of Bologna in the Area of Risk Management Reported (Knowledge, Risk Perceptions, and Xenophobic Attitudes: Evidence from Italy During the Ebola Outbreak)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Risk Management. According to news reporting out of Bologna, Italy, by NewsRx editors, research stated, "The purposes of the current study were twofold: (1) to investigate affective and cognitive responses and social-contextual factors related to Ebola and their intercorrelations in a developed country without widespread Ebola transmission; and (2) to examine the relationships among risk perception of Ebola, levels of knowledge about Ebola, and (blatant and subtle) prejudice toward African immigrants. Between January 2015 and March 2015, an anonymous cross-sectional survey was conducted among a convenience sample of 486 Italian adults."

Our news journalists obtained a quote from the research from the University of Bologna, "Results showed that most participants were not particularly concerned about Ebola and did not feel at risk of acquiring the virus. Cognitive dimensions of risk perception of Ebola (i.e., perceived severity of illness, perceived personal impact, perceived coping efficacy, and likelihood of infection), affective response (or worry) to Ebola, and social-contextual factors
(i.e., perceived preparedness of institutions, family members' and friends' levels of worry) were interrelated."

According to the news editors, the research concluded: "Prejudice toward African immigrants was positively related to risk perception of Ebola and negatively related to levels of knowledge about Ebola even when controlling for sociodemographic variables including political preference."

Our news journalists report that additional information may be obtained by contacting G. Prati, University of Bologna, Dept. of Psychol, Bologna, Italy.

**Cardiovascular Diseases and Conditions - Embolism**

**Study Results from University of Bordeaux Update Understanding of Embolism (Direct observation and modelling of embolism spread between xylem conduits: a case study in Scots pine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Embolism is the subject of a report. According to news reporting out of Pessac, France, by NewsRx editors, research stated, "Xylem embolism is one of the main processes involved in drought-related plant mortality. Although its consequences for plant physiology are already well described, embolism formation and spread are poorly evaluated and modelled, especially for tracheid-based species."

Our news journalists obtained a quote from the research from the University of Bordeaux, "The aim of this study was to assess the embolism formation and spread in Pinus sylvestris as a case study using X-ray microtomography and hydraulics methods. We also evaluated the potential effects of cavitation fatigue on vulnerability to embolism and the micro-morphology of the bordered pits using scanning electron microscopy (SEM) to test for possible links between xylem anatomy and embolism spread. Finally, a novel model was developed to simulate the spread of embolism in a 2D anisotropic cellular structure. Results showed a large variability in the formation and spread of embolism within a ring despite no differences being observed in intertracheid pit membrane anatomical traits. Simulations from the model showed a highly anisotropic tracheid-to-tracheid embolism spreading pattern, which confirms the major role of tracheid-to-tracheid air seeding to explain how embolism spreads in Scots pine."

According to the news editors, the research concluded: "The results also showed that prior embolism removal from the samples reduced the resistance to embolism of the xylem and could result in overestimates of vulnerability to embolism."

For more information on this research see: Direct observation and modelling of embolism spread between xylem conduits: a case study in Scots pine. *Plant Cell and Environment, 2016;39(12):2774-2785. Plant Cell and Environment* can be contacted at: Wiley-
Study Results from University of British Columbia in the Area of Arrhythmogenic Right Ventricular Dysplasia Reported (The Canadian Arrhythmogenic Right Ventricular Cardiomyopathy Registry: Rationale, Design, and Preliminary Recruitment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Arrhythmogenic Right Ventricular Dysplasia. According to news reporting out of Vancouver, Canada, by NewsRx editors, research stated, "Arrhythmogenic right ventricular cardiomyopathy (ARVC) is a complex and clinically heterogeneous arrhythmic condition. Incomplete penetrance and variable expressivity are particularly evident in ARVC, making clinical decision-making challenging."

Our news journalists obtained a quote from the research from the University of British Columbia, "Pediatric and adult cardiologists, geneticists, genetic counsellors, ethicists, nurses, and qualitative researchers are collaborating to create the Canadian ARVC registry using a web-based clinical database. Biological samples will be banked and systematic analysis will be performed to examine potentially causative mutations, variants, and biomarkers. Outcomes will include syncope, ventricular arrhythmias, defibrillator therapies, heart failure, and mortality. Preliminary recruitment has enrolled 365 participants (aged 42.7 +/- 17.1 years; 50% women), including 129 probands and 236 family members. Previous cardiac arrest occurred in 28 (8%) participants, syncope occurred in 43 (12%) participants, and 46% of probands had a family history of sudden death. Overall yield of genetic testing was 36% for a disease-causing mutation and 20% for a variant of unknown significance. Target enrollment is 1000 affected patients and 500 unaffected family member controls over 7 years. The cross-sectional and longitudinal data collected in this manner will allow a robust assessment of the natural history and clinical course of genetic subtypes."

According to the news editors, the research concluded: "The Canadian ARVC Registry will create a population-based cohort of patients and their families to inform clinical decisions regarding patients with ARVC."

Genetics - Human Genetics

Study Results from University of British Columbia in the Area of Human Genetics Reported (The Impact of Gender on Anthropometric Measures of Twins)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genetics - Human Genetics have been published. According to news reporting out of Vancouver, Canada, by NewsRx editors, research stated, "Literature suggests that male hormones influence fetal growth in singleton pregnancies. We hypothesized that the same phenomenon is seen in twin gestations."

Our news journalists obtained a quote from the research from the University of British Columbia, "(1) to identify the impact of gender associated with fetal birth weight, head circumference, and birth length for twins; (2) to examine the effect of gender on standardized fetal growth at birth, according to gestational age and birth order; (3) to examine the effect of gender on placenta weight and dimensions. This was a population-based retrospective cohort study of twins (4,368 twins, 2,184 pairs) born in British Columbia, Canada from 2000-2010. We excluded twins with stillbirth, congenital anomalies, and those delivered with cesarean section. We also controlled for confounding factors, including birth order, gestational age, maternal anthropometric measures, maternal smoking habits, and obstetric history. A subsample of this population was analyzed from Children and Women Hospital to obtain chorionicity information. Male-male twins were heavier than male-females and female-female twin pairs (p=.01). Within sex-discordant twin pairs, males were also heavier than females (p=.01). Regression analysis suggested that gender affects birth weight independent of birth order and gestational age. Other newborn anthropometric measures were not found to be dependent on gender. In analyzing a subsample with chorionicity data, birth weight was the only anthropometric measure that was both statistically and clinically affected by sex, even after adjustment for gestational age, chorionicity, birth order, and maternal age."
According to the news editors, the research concluded: "Birth weight was affected by gender while head circumference and birth length were not."

For more information on this research see: The Impact of Gender on Anthropometric Measures of Twins. Twin Research and Human Genetics, 2016;19(6):652-658. Oncology - Cancer Epidemiology

Study Results from University of California Provide New Insights into Cancer Epidemiology [Cancer burden in four countries of the Middle East Cancer Consortium (Cyprus; Jordan; Israel; Izmir (Turkey)) with comparison to the United States ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Cancer Epidemiology have been presented. According to news reporting originating from Irvine, California, by NewsRx correspondents, research stated, "It is important that population-based cancer registries provide accurate and reliable data for public health purposes. These data are essential data for planning of cancer control and prevention."

Our news editors obtained a quote from the research from the University of California, "In this study, we examined cancer incidence rates (year 2005-2010) in four MECC registries (Cyprus, Jordan, Israel, Izmir (Turkey)) and compared with the rates in the US. The overall age-standardized incidence rates for males were highest in the US followed by Israeli Jews, Izmir (Turkey), Cyprus, Israeli Arabs, and lowest in Jordan. In women the rates of cancer of all sites were also highest in US women followed by Israeli Jews, Cyprus, Israeli Arabs, Izmir (Turkey), and lowest in Jordan. It is of interest that although site-specific cancer rates differ between the countries studied, prostate, lung and colorectal cancers are within the five most common cancers males in all countries studied. In females, breast colorectal and endometrium cancers are three of the five most common cancers in females in all countries studied. The results presented in this paper can have implications for opportunities in cancer control and prevention in these countries."

According to the news editors, the research concluded: "Future studies on individual cancer sites with highest rates in these Countries are currently underway."

For more information on this research see: Cancer burden in four countries of the
Middle East Cancer Consortium (Cyprus; Jordan; Israel; Izmir (Turkey)) with comparison to the United States surveillance; epidemiology and end results program. *Cancer Epidemiology*, 2016;44():195-202. *Cancer Epidemiology* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Study Results from University of California Provide New Insights into Congenital Heart Disease (Evaluation of Impedance Cardiography for Measurement of Stroke Volume in Congenital Heart Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Congenital Diseases and Conditions - Congenital Heart Disease. According to news reporting out of San Diego, California, by NewsRx editors, research stated, "Noninvasive measurement of cardiac output (CO) and particularly stroke volume (SV) remain difficult but potentially valuable. These variables can be particularly challenging to measure in children with congenital heart disease (CHD)."

Our news journalists obtained a quote from the research from the University of California, "Impedance cardiography (IC) is a technique shown to be accurate in measuring SV in adults and in children with structurally normal hearts. The ease of use and rapidity of SV measurement using IC makes it potentially attractive for young patients with CHD. Advances in IC technology have led to more sophisticated signal-morphology IC (SMIC) devices that may further improve accuracy. We tested the accuracy of SMIC to measure SV in 21 subjects with CHD by comparing measurements with those from cardiac magnetic resonance (CMR) imaging. There was good agreement between SMIC and CMR in measurement of SV: mean difference = 1.7 ml (p = 0.47); r = 0.89. The agreement and correlation persisted when controlling for the differences in blood pressure and heart rate during the two testing methods."

According to the news editors, the research concluded: "SMIC is accurate at measuring SV and thus CO when compared to CMR in a variety of forms of CHD."

For more information on this research see: Evaluation of Impedance Cardiography for Measurement of Stroke Volume in Congenital Heart Disease. *Pediatric Cardiology*, 2016;37(8):1453-1457. *Pediatric Cardiology* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Drugs and Therapies - Antiretrovirals**

**Study Results from University of California Update Understanding of Antiretrovirals (Neurological Response to cART vs. cART plus Integrase Inhibitor and CCR5 Antagonist Initiated during Acute HIV)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antiretrovirals. According to news reporting from San Francisco, California, by NewsRx journalists, research stated, "To compare central nervous system (CNS) outcomes in participants treated during acute HIV infection with standard combination antiretroviral therapy (cART) vs. cART+ (cART plus integrase inhibitor and CCR5 antagonist (cART+). 24-week randomized open-label prospective evaluation."

The news correspondents obtained a quote from the research from the University of California, "Participants were evaluated then randomized to initiate cART (efavirenz, tenofovir, and either emtricitabine or lamivudine) vs. cART+ (cART plus raltegravir and maraviroc) during acute HIV and re-evaluated at 4, 12 and 24 weeks. We examined plasma and CSF cytokines, HIV RNA levels, neurological and neuropsychological findings, and brain MRS across groups and compared to healthy controls. At baseline, 62 participants were in Fiebig stages I-V. Randomized groups were similar for mean age (27 vs. 25, p=0.137), gender (each 94% male), plasma log10 HIV RNA (5.4 vs. 5.6, p=0.382), CSF log10 HIV RNA (2.35 vs. 3.31, p=0.561), and estimated duration of HIV (18 vs. 17 days, p=0.546). Randomized arms did not differ at 24 weeks by any CNS outcome. Combining arms, all measures concurrent with antiretroviral treatment improved, for example, neuropsychological testing (mean NPZ-4 of -0.408 vs. 0.245, p<0.001) and inflammatory markers by MRS (e.g. mean frontal white matter (FWM) choline of 2.92 vs. 2.84, p=0.045) at baseline and week 24, respectively. Plasma neopterin (p <0.001) and interferon gamma-induced protein 10 (IP-10) (p=0.007) remained elevated in participants compared to controls but no statistically significant differences were seen in CSF cytokines compared to controls, despite individual variability among the HIV-infected group."

According to the news reporters, the research concluded: "A 24-week course of cART+ improved CNS related outcomes, but was not associated with measurable differences
compared to standard cART."

For more information on this research see: Neurological Response to cART vs. cART plus Integrase Inhibitor and CCR5 Antagonist Initiated during Acute HIV. *Plos One*, 2015;10(11):e0142600. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

**Clinical Research - Clinical Trials and Studies**

**Study Results from University of California Update Understanding of Clinical Trials and Studies (Interventions for tobacco use cessation in people in treatment for or recovery from substance use disorders)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Research - Clinical Trials and Studies. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "Smoking rates in people with alcohol and other drug dependencies are two to four times those of the general population. Concurrent treatment of tobacco dependence has been limited due to concern that these interventions are not successful in this population or that recovery from other addictions could be compromised if tobacco cessation was combined with other drug dependency treatment."

Our news editors obtained a quote from the research from the University of California, "To evaluate whether interventions for tobacco cessation are associated with tobacco abstinence for people in concurrent treatment for or in recovery from alcohol and other drug dependence. Search methods We searched the Cochrane Tobacco Addiction Group Specialised Register, the Cochrane Central Register of Controlled Trials (CENTRAL), MEDLINE, and clinicaltrials.gov databases, with the most recent search completed in August 2016. A grey literature search of conference abstracts from the Society on Nicotine Research and Treatment and the ProQuest database of digital dissertations yielded one additional study, which was excluded. Selection criteria We included randomised controlled trials assessing tobacco cessation interventions among people in concurrent treatment for alcohol or other drug dependence or in outpatient recovery programmes. Data collection and analysis Two review authors independently assessed study risk of bias and extracted data. We resolved disagreements..."
by consensus. The primary outcome was abstinence from tobacco use at the longest period of follow-up, and the secondary outcome was abstinence from alcohol or other drugs, or both. We reported the strictest definition of abstinence. We summarised effects as risk ratios and 95% confidence intervals (CI). Two clustered studies did not provide intraclass correlation coefficients, and were excluded from the sensitivity analysis. We used the I-2 statistic to assess heterogeneity. Thirty-five randomised controlled trials, one ongoing, involving 5796 participants met the criteria for inclusion in this review. Included studies assessed the efficacy of tobacco cessation interventions, including counselling, and pharmacotherapy consisting of nicotine replacement therapy (NRT) or non-NRT, or the two combined, in both inpatient and outpatient settings for participants in treatment and in recovery. Most studies did not report information to assess the risk of allocation, selection, and attrition bias, and were classified as unclear. Analyses considered the nature of the intervention, whether participants were in treatment or recovery and the type of dependency. Of the 34 studies included in the meta-analysis, 11 assessed counselling, 11 assessed pharmacotherapy, and 12 assessed counselling in combination with pharmacotherapy, compared to usual care or no intervention. Tobacco cessation interventions were significantly associated with tobacco abstinence for two types of interventions. Pharmacotherapy appeared to increase tobacco abstinence (RR 1.60, 95% CI 1.22 to 2.12, 11 studies, 1808 participants, low quality evidence), as did combined counselling and pharmacotherapy (RR 1.74, 95% CI 1.39 to 2.18, 12 studies, 2229 participants, low quality evidence) at the period of longest follow-up, which ranged from six weeks to 18 months. There was moderate evidence of heterogeneity (I-2 = 56% with pharmacotherapy and 43% with counselling plus pharmacotherapy). Counselling interventions did not significantly increase tobacco abstinence (RR 1.33, 95% CI 0.90 to 1.95). Interventions were significantly associated with tobacco abstinence for both people in treatment (RR 1.99, 95% CI 1.59 to 2.50) and people in recovery (RR 1.33, 95% CI 1.06 to 1.67), and for people with alcohol dependence (RR 1.47, 95% CI 1.20 to 1.81) and people with other drug dependencies (RR 1.85, 95% CI 1.43 to 2.40). Offering tobacco cessation therapy to people in treatment or recovery for other drug dependence was not associated with a difference in abstinence rates from alcohol and other drugs (RR 0.97, 95% CI 0.91 to 1.03, 11 studies, 2231 participants, moderate evidence of heterogeneity (I-2 = 66%)). Data on adverse effect of the interventions were limited. Authors' conclusions  The studies included in this review suggest that providing tobacco cessation interventions targeted to smokers in treatment and recovery for alcohol and other drug dependencies increases tobacco abstinence. There was no evidence that providing interventions for tobacco cessation affected abstinence from alcohol and other drugs. The association between tobacco cessation interventions and tobacco abstinence was consistent for both pharmacotherapy and combined counselling and pharmacotherapy, for participants both in treatment and in recovery, and for people with alcohol dependency or other drug dependency. The evidence for the interventions was low quality due primarily to incomplete reporting of the risks of bias and clinical heterogeneity in the nature of treatment. Certain results were sensitive to the length of follow-up or the type of pharmacotherapy, suggesting that further research is warranted regarding whether tobacco cessation interventions are associated with tobacco abstinence for people in recovery, and the outcomes associated with NRT versus non-NRT or combined pharmacotherapy.

According to the news editors, the research concluded: "Overall, the results suggest that tobacco cessation interventions incorporating pharmacotherapy should be incorporated into clinical practice to reduce tobacco addiction among people in treatment for or recovery from alcohol and other drug dependence."

For more information on this research see: Interventions for tobacco use cessation in people in treatment for or recovery from substance use disorders. Cochrane Database of Systematic Reviews, 2016;(11):1041-1106. Cochrane Database of Systematic Reviews can be
Enzymes and Coenzymes

Study Results from University of California Update Understanding of Enzymes and Coenzymes (Liberating Chiral Lipid Mediators, Inflammatory Enzymes, and LIPID MAPS from Biological Grease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Enzymes and Coenzymes. According to news reporting originating from La Jolla, California, by NewsRx editors, the research stated, "In 1970, it was well accepted that the central role of lipids was in energy storage and metabolism, and it was assumed that amphipathic lipids simply served a passive structural role as the backbone of biological membranes. As a result, the scientific community was focused on nucleic acids, proteins, and carbohydrates as information-containing molecules."

Financial support for this research came from National Institute of General Medical Sciences.

Our news editors obtained a quote from the research from the University of California, "It took considerable effort until scientists accepted that lipids also 'encode' specific and unique biological information and play a central role in cell signaling. Along with this realization came the recognition that the enzymes that act on lipid substrates residing in or on membranes and micelles must also have important signaling roles, spurring curiosity into their potentially unique modes of action differing from those acting on water-soluble substrates. This led to the creation of the concept of 'surface dilution kinetics' for describing the mechanism of enzymes acting on lipid substrates, as well as the demonstration that lipid enzymes such as phospholipase A(2) (PLA(2)) contain allosteric activator sites for specific phospholipids as well as for membranes. As our understanding of phospholipases advanced, so did the understanding that many of the lipids released by these enzymes are chiral information containing signaling molecules; for example, PLA(2) regulates the generation of precursors for the biosynthesis of eicosanoids and other bioactive lipid mediators of inflammation and resolution underlying disease progression. The creation of the LIPID MAPS initiative in 2003 and the ensuing development of the lipidomics field have revealed that lipid metabolites are central to human metabolism. Today lipids are recognized as key mediators of health and disease as we enter a new era of biomarkers and personalized medicine."

According to the news editors, the research concluded: "This article is my personal 'reflection' on these scientific advances."

For more information on this research see: Liberating Chiral Lipid Mediators, Inflammatory Enzymes, and LIPID MAPS from Biological Grease. Journal of Biological Chemistry, 2016;291(47):24431-24448. Journal of Biological Chemistry can be contacted at:
Study Results from University of California Update Understanding of Gonorrhea (A prospective assessment of pelvic infection risk following same-day sexually transmitted infection testing and levonorgestrel intrauterine system placement)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Sexually Transmitted Diseases and Conditions (STDs) - Gonorrhea. According to news originating from Sacramento, California, by NewsRx correspondents, research stated, "Misperceptions persist that intrauterine device placement is related to pelvic infections and Chlamydia and gonorrhea testing results are needed prior to placement. We sought to evaluate the relationship of Chlamydia and gonorrhea screening to pelvic infection for up to 2 years following placement of the levonorgestrel 52-mg intrauterine system."

Our news journalists obtained a quote from the research from the University of California, "A total of 1751 nulliparous and multiparous females 16 to 45 years old enrolled in a multicenter trial designed to evaluate the efficacy and safety of a new levonorgestrel intrauterine system for up to 7 years. Participants had Chlamydia screening at study entry and yearly if they were age <= 25 years. Women also had baseline gonorrhea screening if testing had not been performed since starting their current sexual relationship. Those who changed sexual partners during the trial had repeated Chlamydia and gonorrhea testing. Intrauterine system insertion could occur on the same day as screening. Participants did not receive prophylactic antibiotics for intrauterine system placement. Investigators performed pelvic examinations after 12 and 24 months and when clinically indicated during visits at 3, 6, and 18 months after placement and unscheduled visits. Pelvic infection included any clinical diagnosis of pelvic inflammatory disease or endometritis. Most participants (n = 1364, 79.6%) did not have sexually transmitted infection test results available prior to intrauterine system placement. In all, 29 (1.7%) participants had positive baseline testing for a sexually transmitted infection (Chlamydia, n = 25; gonorrhea, n = 3; both, n = 1); 6 of these participants had known results (all with Chlamydia infection) prior to intrauterine system placement and received treatment before enrollment. The 23 participants whose results were not known at the time of intrauterine system placement
received treatment without intrauterine system removal and none developed pelvic infection. The incidence of positive Chlamydia testing was similar among those with and without known test results at the time of intrauterine system placement (1.9% vs 1.5%, respectively, P = .6). Nine (0.5%) participants had a diagnosis of pelvic infection over 2 years after placement, all of whom had negative Chlamydia screening on the day of or within 1 month after intrauterine system placement. Infections were diagnosed in 3 participants within 7 days, 1 at 39 days, and 5 at = 6 months. Seven participants received outpatient antibiotic treatment and 2 (diagnoses between 6-12 months after placement) received inpatient treatment. Two (0.1%) participants had intrauterine system removal related to infection (at 6 days and at 7 months after placement), both of whom only required outpatient treatment. Conducting Chlamydia and gonorrhea testing on the same day as intrauterine system placement is associated with a low risk of pelvic infection (0.2%). Over the first 2 years of intrauterine system use, infections are infrequent and not temporally related to intrauterine system placement. Pelvic infection can be successfully treated in most women with outpatient antibiotics and typically does not require intrauterine system removal."

According to the news editors, the research concluded: "Women without clinical evidence of active infection can have intrauterine system placement and sexually transmitted infection screening, if indicated, on the same day."

The news correspondents report that additional information may be obtained from M.D. Creinin, University of California, Dept. of Obstet & Gynecol, Sacramento, CA 95817, United States. Additional authors for this research include D.L. Eisenberg, S.B. Teal, L.M. Keder and M.D. Creinin.

Lung Diseases and Conditions - Cystic Fibrosis

Study Results from University of California in the Area of Cystic Fibrosis Reported (External Zn2+ binding to cysteine-substituted cystic fibrosis transmembrane conductance regulator constructs regulates channel gating and curcumin potentiation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
Investigators discuss new findings in Lung Diseases and Conditions - Cystic Fibrosis. According to news reporting out of Davis, California, by NewsRx editors, research stated, "The cystic fibrosis transmembrane conductance regulator (CFTR) chloride channel is activated by ATP binding-induced dimerization of nucleotide-binding domains, the interaction between the phosphorylated regulatory ® domain and the curcumin-sensitive interface between intracellular loop (ICL) 1 and ICL4, and the resultant inward-to-'outward' reorientation of transmembrane domains. Although transmembrane helices ™ 2 and TM11 link the ICL1-ICL4 interface with the interface between extracellular loop (ECL) 1 and ECL6, it is unknown whether both interfaces are gating-coupled during the reorientation."

Financial supporters for this research include National Institute of Diabetes and Digestive and Kidney Diseases, Cystic Fibrosis Foundation, American Heart Association.

Our news journalists obtained a quote from the research from the University of California, "Herein, R334C and T1122C mutations were used to engineer two Zn2+ bridges near and at the ECL1-ECL6 interface, respectively, and the gating effects of a Zn2+ disturbance at the ECL1-ECL6 interface on the stimulatory ICL1/ICL4-R interaction were determined. The results showed that both Zn2+ bridges inhibited channel activity in a dose-and Cl--dependent manner, and the inhibition was reversed by a washout or suppressed by thiol-specific modification. Interestingly, their Cl--dependent Zn2+ inhibition was weakened at higher Zn2+ concentrations, their Zn2+ affinity was stronger in the resting state than in the activated state, and their activation current noises were decreased by external Zn2+ binding. More importantly, the external Zn2+ inhibition was reversed by internal curcumin in the R334C construct but not in the T1122C mutant."

According to the news editors, the research concluded: "Therefore, although both Zn2+ bridges may promote channel closure, external Zn2+ may disturb the ECL1-ECL6 interface and thus prevent the stimulatory ICL1/ICL4-R interaction and curcumin potentiation via a gating coupling between these two interfaces."

Our news journalists report that additional information may be obtained by contacting G. Wang, University of California, Sch Med, Dept. of Physiol & Membrane Biol, Davis, CA, United States. Additional authors for this research include R. Linsley and Y. Norimatsu.

Mycobacterium Infections - Tuberculosis

Study Results from University of Cape Town Provide New Insights into Tuberculosis (Amikacin Optimal Exposure Targets in the Hollow-Fiber System Model of Tuberculosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Mycobacterium Infections - Tuberculosis. According to news reporting from Cape Town, South Africa, by NewsRx journalists, research stated, "Aminoglycosides such as amikacin are currently used for the treatment of multidrug-resistant tuberculosis (MDR-TB). However, formal pharmacokinetic/pharmacodynamic (PK/PD) studies to identify amikacin exposures and dosing schedules that optimize Mycobacterium tuberculosis killing have not been performed."

Financial support for this research came from HHS | National Institutes of Health (NIH).

The news correspondents obtained a quote from the research from the University of Cape Town, "It is believed that aminoglycosides do not work well under acidic conditions, which, if true, would mean poor sterilizing activity against semidormant bacilli at low pH. We performed time-kill studies to compare the bactericidal effect of amikacin in log-phase-growth bacilli with the sterilizing effect in semidormant bacilli at pH 5.8 in broth. In log-phase M. tuberculosis at normal pH versus semidormant M. tuberculosis at pH 5.8, the maximal kill (E-max) estimate and 95% confidence interval (CI) were 5.39 (95% CI, 4.91 to 5.63) versus 4.88 (CI, 4.46 to 5.22) log10 CFU/ml, while the concentration mediating 50% of E-max (EC50) was 1.0 (CI, 0.86 to 1.12) versus 0.60 (CI, 0.50 to 0.66) times the MIC, respectively. Thus, the optimal exposures and kill rates identified for log-phase M. tuberculosis will be optimal even for semidormant bacilli. Next, we performed exposure-response and dose-scheduling studies in the hollow-fiber system model of tuberculosis using log-phase M. tuberculosis. We recapitulated the amikacin concentration-time profiles observed in lungs of patients treated over 28 days. The PK/PD index linked to M. tuberculosis kill was the peak concentration (C-max)-to-MIC ratio (r(2) > 0.99), closely followed by the area under the concentration-time curve from 0 to 24 h (AUC(0-24))-to-MIC ratio (r(2) > 0.98). The EC90 was a C-max/MIC ratio of 10.13 (95% CI, 7.73 to 12.48)."

According to the news reporters, the research concluded: "The EC90 is the dosing target for intermittent therapy that optimizes cure in TB programs for MDR-TB patients."

For more information on this research see: Amikacin Optimal Exposure Targets in the Hollow-Fiber System Model of Tuberculosis. Antimicrobial Agents and Chemotherapy, 2016;60(10):5922-5927. Central Nervous System Diseases and Conditions - …

Study Results from University of Catania in the Area of Encephalitis Reported [The chitinases expression is related to Simian Immunodeficiency Virus Encephalitis (SIVE) and in HIV encephalitis (HIVE)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Encephalitis. According to news originating from Catania, Italy, by NewsRx correspondents, research stated, "Human Immunodeficiency Virus (HIV) infection can induce neurocognitive complications classified as HIV-associated neurocognitive disorder (HAND). The chitina family is associated with innate immunity cells and many infectious diseases."

Our news journalists obtained a quote from the research from the University of Catania, "We analyzed microarray datasets obtained from NCBI in order to verify the expression of chitinase family genes in hippocampus of uninfected rhesus macaques versus those with histopathologic evidence of Simian Immunodeficiency Virus Encephalitis (SIVE). Moreover, we have analysed two human microarray datasets to verify the results obtained in macaques hippocampus affected by SIVE. For these studies, we have also used the open source tools Genome-scale Integrated Analysis of gene Networks in Tissues (GIANT) to identify the chitinase genes network. CHIT1, CHI3L1 and CHI3L2 levels were significantly increased in SIVE hippocampus as compared to non-infected control specimens. Furthermore, we found a negative correlation between CHIA vs. Brain Viral Load (BVL). These data was confirmed partially in human brain section of HAD/HIVE subjects. Also, we showed that HIV-1 was able to modulate the expression of CHIT1, CHI3L1, CHI3L2 and CHID1 in human macrophages."

According to the news editors, the research concluded: "These results suggest that chitinase gene expression is altered in SIVE and in HAD/HIVE brain sections and call for more studies examining whether this is a protective immunological reaction or a destructive tissue response to encephalitis."

For more information on this research see: The chitinases expression is related to Simian Immunodeficiency Virus Encephalitis (SIVE) and in HIV encephalitis (HIVE). Virus Research, 2017;227():220-230. Virus Research can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Virus Research - www.journals.elsevier.com/virus-research/)

The news correspondents report that additional information may be obtained from M. Di Rosa, University of Catania, Dept. of Biomed & Biotechnol Sci, Catania, Italy. Additional authors for this research include G. Nunnari, A. Calcagno, L. Malaguarnera, K. Blennow, H. Zetterberg and M. Di Rosa.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.virusres.2016.10.012. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Prostate Cancer

Study Results from University of Colorado School of Medicine Provide New Insights into Prostate Cancer (Improved survival with the addition of radiotherapy to androgen deprivation: questions answered and a review of current controversies in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news reporting out of Aurora, Colorado, by NewsRx editors, research stated, "The contemporary standard of care for locally advanced high-risk prostate cancer includes a combination of dose-escalated radiotherapy (RT) plus androgen-deprivation therapy (ADT). However, 20 years ago, at the inception of the National Cancer Institute of Canada (NCIC) led study (NCIC Clinical Trials Group PR.3/Medical Research Council PR07/Intergroup T94-0110), the survival impact of prostate RT for high-risk disease was uncertain."

Our news journalists obtained a quote from the research from the University of Colorado School of Medicine, "Recently, Mason, Warde and colleagues presented the final results of this NCIC/MRC study (PMID: 25691677) randomizing 1,205 high-risk prostate cancer patients to ADT + RT vs. ADT alone. These updated results confirm substantial improvements with the addition of RT to ADT for the endpoints of overall survival (OS), disease-free survival (DFS), and biochemical recurrence."

According to the news editors, the research concluded: "Close examination of subtleties of this trial's design highlight some of the most salient controversies in the field of prostate RT, including the risk-stratified roles of ADT, optimal ADT duration, and RT field design in the dose-escalated and intensity-modulated radiotherapy (IMRT) era."

For more information on this research see: Improved survival with the addition of radiotherapy to androgen deprivation: questions answered and a review of current controversies in radiotherapy for non-metastatic prostate cancer. Annals of Translational Medicine, 2016;4 (1):14.

Our news journalists report that additional information may be obtained by contacting A. Amini, Dept. of Radiation Oncology, University of Colorado School of Medicine, Aurora, CO 80045, United States. Additional authors for this research include B.D. Kavanagh and C.G Rusthoven.

Oncology - Melanoma

Study Results from University of Debrecen Provide New Insights into Melanoma (PP2B and ERK1/2 regulate hyaluronan synthesis of HT168 and WM35 human melanoma cell lines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Melanoma is now available. According to news reporting originating from Debrecen, Hungary, by NewsRx correspondents, research stated, "Hyaluronan (HA) is the major glycosaminoglycan component of the extracellular matrix in either normal or malignant tissues and it may affect proliferation, motility and differentiation of various cell types. Three isoforms of plasma membrane-bound hyaluronan synthases (HAS 1, 2 and 3) secrete and simultaneously bind pericellular HA."

Our news editors obtained a quote from the research from the University of Debrecen, "HAS enzymes are subjects of post-translational protein phosphorylation which is believed to regulate their enzymatic activity. In this study, we investigated the HA homeostasis of normal human epidermal melanocytes, HT168 and WM35 human melanoma cell lines and melanoma metastases. HAS2 and HAS3 were detected in all the samples, while the expression of HAS1 was not detectable in any case. Malignant tissue samples and melanoma cell lines contained extra-and intracellular HA abundantly but not normal melanocytes. Applying HA as a chemoattractant facilitated the migration of melanoma cells in Boyden chamber. The amount of HA was reduced upon the inhibition of calcineurin with cyclosporine A (CsA), while the inhibition of ERK1/2 with PD098059 elevated it in both cell lines. The signals of Ser/Thr phosphoproteins at 57 kD were stronger after CsA treatment, while a markedly weaker signal was detected upon inhibition of the MAPK pathway. Our results suggest opposing effects of the two investigated enzymes on the HA homeostasis of melanoma cells. We propose that the dephosphorylation of HAS enzymes targeted by PP2B augments HA production, while their phosphorylation by the activity of MAPK pathway reduces HA synthesis. As the expression of the HA receptor RHAMM was also significantly enhanced by PD098059, the MAPK pathway exerted a complex attenuating effect on HA signalling in the investigated melanoma cells."

According to the news editors, the research concluded: "This observation suggests that the application of MAPK-ERK pathway inhibitors requires a careful therapeutic design in melanoma treatment."

For more information on this research see: PP2B and ERK1/2 regulate hyaluronan synthesis of HT168 and WM35 human melanoma cell lines. International Journal of Oncology, 2015;48(3):983-97.

The news editors report that additional information may be obtained by contacting E. Katona, Dept. of Anatomy, Histology and Embryology, Faculty of Medicine, University of Debrecen, H-4032 Debrecen, Hungary. Additional authors for this research include T. Juhasz, C.S. Somogyi, T. Hajdu, C. Szasz, K. Racz, E. Kokai, P. Gergely and R. Zakany.

Study Results from University of Edinburgh Update Understanding of Neurons (E11/Podoplanin Protein Stabilization Through Inhibition of the Proteasome Promotes Osteocyte Differentiation in Murine in Vitro Models)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurons have been published. According to news reporting originating in Midlothian, United Kingdom, by NewsRx journalists, research stated, "The transmembrane glycoprotein E11 is considered critical in early osteoblast-osteocyte transitions (osteocytogenesis), however its function and regulatory mechanisms are still unknown. Using the late osteoblast MLO-A5 cell line we reveal increased E11 protein/mRNA expression (p <0.001) concomitant with extensive osteocyte dendrite formation and matrix mineralization (p <0.001)."

Financial support for this research came from Arthritis Research UK.

The news reporters obtained a quote from the research from the University of Edinburgh, "Transfection with E11 significantly increased mRNA levels (p <0.001), but immunoblotting failed to detect any correlative increases in E11 protein levels, suggestive of post-translational degradation. We found that exogenous treatment of MLO-A5 and osteocytic IDG-SW3 cells with 10 mM ALLN (calpain and proteasome inhibitor) stabilized E11 protein levels and induced a profound increase in osteocytic dendrite formation (p <0.001). Treatment with other calpain inhibitors failed to promote similar osteocytogenic changes, suggesting that these effects of ALLN rely upon its proteasome inhibitor actions. Accordingly we found that proteasome-selective inhibitors (MG132/lactacystin/ Bortezomib/Withaferin-A) produced similar dose-dependent increases in E11 protein levels in MLO-A5 and primary osteoblast cells. This proteasomal targeting was confirmed by immunoprecipitation of ubiquitylinated proteins, which included E11, and by increased levels of ubiquitynlated E11 protein upon addition of the proteasome inhibitors MG132/Bortezomib. Activation of RhoA, the small GTPase, was found to be increased concomitant with the peak in E11 levels and its downstream signaling was also observed to promote MLO-A5 cell dendrite formation. Our data indicate that a mechanism reliant upon blockade of proteasome-mediated E11 destabilization contributes to osteocytogenesis and that this may involve downstream targeting of RhoA."

According to the news reporters, the research concluded: "This work adds to our mechanistic understanding of the factors regulating bone homeostasis, which may lead to future therapeutic approaches."

Our news correspondents report that additional information may be obtained by contacting K.A. Staines, Roslin Institute and R(D)SVS, The University of Edinburgh, Easter
Bush, Midlothian, UK. Additional authors for this research include M. Prideaux, S. Allen, D.J. Buttle, A.A. Pitsillides and C. Farquharson.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/jcp.25282. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Europe, Neurons, Dendrites, Midlothian, Osteoblasts, United Kingdom, Cell Surface Extensions, Connective Tissue Cells.

Pharmacology

Study Results from University of Florida in the Area of Pharmacology Reported (Improving drug safety with a systems pharmacology approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Pharmacology is now available. According to news reporting from Orlando, Florida, by NewsRx journalists, research stated, "Systems pharmacology is used to mechanistically analyze drug-adverse drug reaction (ADRs) pairs and is a promising solution to the complex problem of understanding mechanisms of toxicity. In this research, we have explored the feasibility of retrospectively mapping population-level adverse events from the FDA Adverse Event Reporting System (FAERS) to chemical and biological databases to identify drug safety signals and the underlying molecular mechanisms."

The news correspondents obtained a quote from the research from the University of Florida, "We used an analytic platform - Molecular Analysis of Side Effects (MASETm). For this purpose, we selected the adverse event of severe and potentially fatal cutaneous reactions (SCARs) that are associated with acetaminophen (APAP). SCARs encompass the continuum between Stevens-Johnson Syndrome (SJS) and Toxic Epidermal Necrolysis (TEN). We found a statistically significant association between APAP and TEN, the most severe form of SCARs. We also explored the influence of APAP on other classes of drugs commonly associated with SCARs. We found that APAP significantly reduced the risk of SCARs commonly associated with carbamazepine (CBZ). We used molecular docking simulations to propose a mechanism for APAP's reduction in CBZ-induced SCARs which is competitive inhibition of the binding of CBZ to HLA-B*15:02."

According to the news reporters, the research concluded: "We conclude that systems pharmacology can complement established surveillance methodologies by providing a means to undertake an independent investigation and review of the mechanisms by which drugs cause adverse events."

Our news journalists report that additional information may be obtained by contacting L.J. Lesko, University of Florida, Center Pharmacometr & Syst Pharmacol, Orlando,
Study Results from University of Gothenburg Broaden Understanding of Brain Injuries (Long-term treatment with methylphenidate for fatigue after traumatic brain injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Brain Injuries have been published. According to news reporting out of Gothenburg, Sweden, by NewsRx editors, research stated, "Traumatic brain injury (TBI) may cause long-lasting post-concussive symptoms, such as mental fatigue and concentration difficulties, and this may become the main hindrance for returning to work and studies. There is currently no effective treatment for long-lasting mental fatigue."

Financial support for this research came from The Health & Medical Care Committee.

Our news journalists obtained a quote from the research from the University of Gothenburg, "In this hypothesis generating study, the long-term effects of methylphenidate on mental fatigue, cognitive function, and safety were assessed. Thirty participants who suffered from long-term post-concussion symptoms after a mild TBI or moderate TBI and who had reported positive effects with methylphenidate during an initial phase of this follow-up study were treated with methylphenidate for a further six months. After six-month follow-up, effects on Mental Fatigue Scale (MFS), depression, anxiety, and cognitive function (processing speed, attention, working memory) were significantly improved compared to baseline data (P < 0.001, respectively). Heart rate was significantly increased (P = 0.01), while blood pressure was not changed. Individuals suffering from prolonged symptoms after TBI reported reduced mental fatigue and improved cognitive functions with long-term methylphenidate treatment."

According to the news editors, the research concluded: "It is suggested that methylphenidate can be a treatment option for long-term mental fatigue and cognitive impairment after a TBI, but further randomized control research is warranted."

Our news journalists report that additional information may be obtained by contacting B. Johansson, University of Gothenburg, Inst Neurosci & Physiol, Dept. of Clin Neurosci & Rehabil, Gothenburg, Sweden. Additional authors for this research include A.P.
Central Nervous System Diseases and Conditions – …

Study Results from University of Helsinki Central Hospital Update Understanding of Cerebral Hemorrhage (Symptomatic post-thrombolytic intracerebral hemorrhage is not related to the cause of stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Cerebral Hemorrhage have been published. According to news reporting originating from Helsinki, Finland, by NewsRx correspondents, research stated, "The development of intracerebral hemorrhage following intravenous thrombolysis (IVT) can be influenced by various confounders related to the underlying vessel and tissue conditions. There are some data on association of cause of the stroke and the hemorrhage transformation."

Financial supporters for this research include Helsingin ja Uudenmaan Sairaanhointipiiri, Suomen Laaketieteen Saatio, Finnish Academy.

Our news editors obtained a quote from the research from the University of Helsinki Central Hospital, "We tested the hypothesis that the cause of stroke is associated with the development of symptomatic intracerebral hemorrhage (sICH) following IVT. A consecutive cohort of 2485 IVT-treated patients at the Helsinki University Central Hospital was classified according to the Trial of ORG 10172 in Acute Stroke Treatment (TOAST) criteria. An sICH was classified according to the European Cooperative Acute Stroke Study II criteria. The associations of sICH with nominal, ordinal and continuous variables were analyzed in a univariate binary regression model and adjusted in multivariate binary regression models. In univariate analyses, cardioembolism [odds ratio (OR), 1.14; 95% confidence interval (CI), 0.79-1.64] and large-artery atherosclerosis (OR, 1.30; 95% CI, 0.85-2.00) were not associated with sICH, and small-vessel occlusion was associated with lower odds for sICH (OR, 0.18; 95% CI, 0.06-0.57). When adjusted for previously identified factors associated with sICH, none of the TOAST categories was associated with a higher or lower frequency of sICH."

According to the news editors, the research concluded: "The development of sICH in IVT-treated patients is not related to the cause of stroke."

The news editors report that additional information may be obtained by contacting S. Curtze, Helsinki Univ Hosp, Dept. of Neurol, FI-00029 Helsinki, Finland. Additional authors for this research include G. Sibolt, S. Melkas, S. Mustanoja, E. Haapaniemi, J. Putaala, T. Sairanen, M. Tiainen, T. Tatlisumak and D. Strbian.

Proteins - Glycoproteins

Study Results from University of Helsinki Central Hospital in the Area of Glycoproteins Reported (Abnormal Proteoglycan Synthesis Due to Gene Defects Causes Skeletal Diseases with Overlapping Phenotypes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Glycoproteins. According to news reporting out of Helsinki, Finland, by NewsRx editors, research stated, "In recent years, massively parallel sequencing technologies have helped us to identify novel disease genes and solve the mysteries behind rare diseases. Today, we know that some diseases with many overlapping and distinct clinical features, as presented in this review, can be caused by mutations in genes that encode enzymes playing crucial roles at different steps of the exact same pathway."

Our news journalists obtained a quote from the research from the University of Helsinki Central Hospital, "In this review, we exclusively focused on 5 genes - XYLT1, XYLT2, B4GALT7, B3GALT6, and B3GAT3 - that encode enzymes involved in the biosynthesis of the common tetrasaccharide linker region of proteoglycans and review the associated diseases, also referred to as linkerpatoies, by summarizing the cases reported in literature. Since proteoglycans are essential macromolecules in development, signaling and homeostasis of many tissues and organs, mutations in these genes can affect many organs, including bone, cartilage, eyes, ears, heart, and skin. Short stature, developmental delay, facial dysmorphism, and skeletal dysplasias are some of the common features observed in patients with mutations in these genes. Among these genes, XYLT2 mutations cause a relatively distinct phenotype, the so-called spondyloocular syndrome, which is characterized by clinical presentation of a very severe childhood-onset primary osteoporosis, cataract, and hearing impairment."

According to the news editors, the research concluded: "The full phenotype spectrum of diseases mentioned here is likely to expand with additional clinical reports and further molecular studies."

For more information on this research see: Abnormal Proteoglycan Synthesis Due to Gene Defects Causes Skeletal Diseases with Overlapping Phenotypes. Hormone and Metabolic Research, 2016;48(11):745-754. Hormone and Metabolic Research can be contacted at: Georg
Study Results from University of Kentucky in the Area of Cardiovascular Physiological Processes Reported (Arterial hemodynamics are impaired at rest and following acute exercise in overweight young men)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Physiological Processes. According to news originating from Lexington, Kentucky, by NewsRx correspondents, research stated, "Higher body mass index (BMI) is associated with greater cardiovascular disease (CVD) risk, in part due to aortic stiffening assessed by carotid-femoral pulse wave velocity (cfPWV). Importantly, greater cardiorespiratory fitness (CRF; VO2peak) decreases CVD risk, and is associated with reductions in aortic stiffness."

Our news journalists obtained a quote from the research from the University of Kentucky, "We tested the hypothesis that young adult overweight (OW, n=17) compared with healthy-weight (HW, n=17) men will have greater resting aortic stiffness, reduced CRF and an impaired post-exercise hemodynamic response. Resting cfPWV was greater in OW versus HW individuals (5.81 +/- 0.13 vs 4.81 +/- 0.12 m/sec, p<0.05). Relative CRF (VO2peak; mL/kg/min) was lower in OW compared with HW individuals (49.4 +/- 1.3 vs 57.6 +/- 1.0 mL/kg/min, p<0.05), and was inversely related with cfPWV (p <0.05). However, CRF as absolute VO2peak (L/min) was not different between groups and there was no relation between cfPWV and absolute VO2peak (L/min), indicating reduced relative CRF in OW men is due to greater body mass. Following the maximal treadmill exercise test, cfPWV was greater in OW compared with HW subjects from rest to 60 minutes post-exercise (p <0.05). Compared with HW, OW individuals had higher systolic blood pressure (main effect, p<0.05) and diastolic blood pressure was selectively increased for up to 60 minutes following exercise (p <0.05). Overweight individuals had an attenuated post-exercise decrease in mean arterial pressure (p <0.05)."

According to the news editors, the research concluded: "Collectively, these results indicate that young, apparently healthy, OW men have greater resting aortic stiffening and an impaired post-exercise hemodynamic response."

For more information on this research see: Arterial hemodynamics are impaired at rest and following acute exercise in overweight young men. Vascular Medicine, 2016;21 (6):497-505. Vascular Medicine can be contacted at: Sage Publications Ltd, 1 Olivers Yard, 55 City Road, London EC1Y 1SP, England. (Sage Publications - www.sagepub.com/; Vascular Medicine - vmj.sagepub.com)

Oncology - Lymphoma

Study Results from University of Lausanne Hospital Broaden Understanding of Lymphoma (Primary pituitary lymphoma: an update of the literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Lymphoma is now available. According to news originating from Lausanne, Switzerland, by NewsRx correspondents, research stated, "Primary intracranial lymphomas (Weller et al. in Neuro Oncol 14(12):1481-1484, 2012) are an emerging disease and an isolated localization in the pituitary gland i.e. primary pituitary lymphoma (PPL) represents a rare condition. We present an update of the most recent evidence for PPL through a systematic review of the literature."

Our news journalists obtained a quote from the research from the University of Lausanne Hospital, "A systematic literature review was conducted using PubMed database up to October 2015. The population was defined as immunocompetent patients with a pathologically confirmed diagnosis of PPL. Patients' characteristics, clinical presentation, radiological features, pathology reports, adjuvant treatment and follow-up data were analyzed. We reported one case of PPL and included our data in this analysis. A total of 33 cases of PPL were identified, including ours. A slight not significant female prevalence was evident, with a mean age of 59 years at diagnosis. Visual troubles and headaches were the most common presenting symptoms. About 80 % of patients presented a cranial nerve (CN) deficit. The most frequently involved were the II and III CN. Anterior hypopituitarism was present in 70 % of cases and a diabetes insipidus in 36 % of cases. PPL was rarely limited to the sella and most often extended to the suprasellar and parasellar space. 70 % of cases underwent resection, 21 % a biopsy. A B-cell lymphoma was isolated in 82 % of cases, a T-cell lymphoma in 15 % and a NK/T cell lymphoma in one case. Overall mean survival rate was 14.4 months (95 % confidence interval 9.0-19.8 months) and there was no difference in terms of survival rates when patients were stratified according to the treatment they received. PPL is an emerging clinical entity. Literature data are too scarce to allow the definition of specific protocols of treatment and the management is based on the guidelines present for PCNSL."

According to the news editors, the research concluded: "The role of surgery aiming at a complete resection of PPL should be reevaluated in wider studies including only this
category of patients, to establish the real role of each therapeutic strategy."

The news correspondents report that additional information may be obtained from M. Messerer, Univ Lausanne Hosp, Dept. of Neurosurg, CH-1010 Lausanne, Switzerland. Additional authors for this research include G. Cossu, M. Berhouma, M. Levivier, R.T. Daniel and M. Messerer.

**Cardiology**

**Study Results from University of Leeds Broaden Understanding of Cardiology (Impact of latest generation cardiac interventional X-ray equipment on patient image quality and radiation dose for trans-catheter aortic valve implantations)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiology are presented in a new report. According to news reporting originating in Leeds, United Kingdom, by NewsRx journalists, research stated, "This study aimed to determine the impact on radiation dose and image quality of a new cardiac interventional X-ray system for trans-catheter aortic valve implantation (TAVI) patients compared to the previously-used cardiac X-ray system. Patient dose and image data were retrospectively collected from a Philips AlluraClarity (new) and Siemens Axion Artis (reference) X-ray system."

The news reporters obtained a quote from the research from the University of Leeds, "Patient dose area product (DAP) and fluoroscopy duration of 41 patient cases from each X-ray system were compared using a Wilcoxon test. Ten patient aortograms from each X-ray system were scored by 32 observers on a continuous scale to assess the clinical image quality at the given phase of the TAVI procedure. Scores were dichotomised by acceptability and analysed using a Chi-squared test. Significant reductions in patient dose (p << 0.001) were found for the new system with no significant change in fluoroscopy duration (p = 0.052); procedure DAP reduced by 55%, fluoroscopy DAP by 48% and 'cine' acquisition DAP by 61%. There was no significant difference between image quality scores of the two X-ray systems (p = 0.06). The new cardiac X-ray system demonstrated a very significant reduction in patient dose with no loss of clinical image quality. Advances in Knowledge: The huge growth of TAVI may impact on the radiation exposure of cardiac patients and particularly on operators including anaesthetists; cumulative exposure of interventional cardiologists performing high volume TAVI over 30-40 years may be harmful."
According to the news reporters, the research concluded: "The Phillips Clarity upgrade including improved image enhancement and optimised X-ray settings significantly reduced radiation without reducing clinically acceptable image quality."

Our news correspondents report that additional information may be obtained by contacting A.J. Gislason-Lee, University of Leeds, Div Biomed Imaging, Leeds, W Yorkshire, United Kingdom. Additional authors for this research include C. Keeble, C.J. Malkin, D. Egleston, J. Bexon, S.M. Kengyelics, D. Blackman and L.G. Davies.

**Oncology - Glioblastomas**

**Study Results from University of Lorraine Provide New Insights into Glioblastomas (A quantitative study of shape descriptors from glioblastoma multiforme phenotypes for predicting survival outcome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Glioblastomas. According to news originating from Metz, France, by NewsRx correspondents, research stated, "Predicting the survival outcome of patients with glioblastoma multiforme (GBM) is of key importance to clinicians for selecting the optimal course of treatment. The goal of this study was to evaluate the usefulness of geometric shape features, extracted from MR images, as a potential non-invasive way to characterize GBM tumours and predict the overall survival times of patients with GBM."

Our news journalists obtained a quote from the research from the University of Lorraine, "The data of 40 patients with GBM were obtained from the Cancer Genome Atlas and Cancer Imaging Archive. The T-1 weighted post-contrast and fluid-attenuated inversion-recovery volumes of patients were co-registered and segmented into delineate regions corresponding to three GBM phenotypes: necrosis, active tumour and oedema/invasion. A set of two-dimensional shape features were then extracted slicewise from each phenotype region and combined over slices to describe the three-dimensional shape of these phenotypes. Thereafter, a Kruskal-Wallis test was employed to identify shape features with significantly different distributions across phenotypes. Moreover, a Kaplan-Meier analysis was performed to find features strongly associated with GBM survival. Finally, a multivariate analysis based on the random forest model was used for predicting the survival group of patients with GBM. Our analysis using the Kruskal-Wallis test showed that all but one shape feature had statistically significant differences across phenotypes, with p-value < 0.05, following Holm-Bonferroni correction, justifying the analysis of GBM tumour shapes on a per-phenotype basis. Furthermore, the survival analysis based on the Kaplan-Meier estimator identified three features derived from necrotic regions (i.e. Eccentricity, Extent and Solidity) that were significantly correlated with overall survival (corrected p-value, 0.05; hazard ratios between 1.68 and 1.87)."
In the multivariate analysis, features from necrotic regions gave the highest accuracy in predicting the survival group of patients, with a mean area under the receiver-operating characteristic curve (AUC) of 63.85%. Combining the features of all three phenotypes increased the mean AUC to 66.99%, suggesting that shape features from different phenotypes can be used in a synergic manner to predict GBM survival. Results show that shape features, in particular those extracted from necrotic regions, can be used effectively to characterize GBM tumours and predict the overall survival of patients with GBM. Advances in knowledge: Simple volumetric features have been largely used to characterize the different phenotypes of a GBM tumour (i.e. active tumour, oedema and necrosis).

According to the news editors, the research concluded: "This study extends previous work by considering a wide range of shape features, extracted in different phenotypes, for the prediction of survival in patients with GBM."

The news correspondents report that additional information may be obtained from A. Chaddad, Univ Lorraine, Lab Concept Optimizat & Modeling Syst, Metz, Lorraine, France. Additional authors for this research include C. Desrosiers, L. Hassan and C. Tanougast.

Keywords for this news article include: Metz, France, Europe, Glioblastomas, Oncology, Genetics, University of Lorraine.

**Oncology - Ovarian Cancer**

**Study Results from University of Medicine and Dentistry of New Jersey (UMDNJ) Provide New Insights into Ovarian Cancer (Racial/Ethnic Disparities in Ovarian Cancer Treatment and Survival)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Ovarian Cancer is now available. According to news reporting from New Brunswick, New Jersey, by NewsRx journalists, research stated, "Among patients with ovarian cancer, African American (AA) women experience poorer survival compared with other race/ethnicity groups. This has been attributed to differences in access to health care."

The news correspondents obtained a quote from the research from the University of Medicine and Dentistry of New Jersey (UMDNJ), "We evaluated racial/ethnic differences in chemotherapy dosing and survival in a cohort study among members of Kaiser Permanente Northern California, and thus with equivalent access to health care. Analyses included epithelial-invasive ovarian cancer cases (n = 793) receiving adjuvant first-line therapy of carboplatin and paclitaxel with curative intent, with median follow-up of 50 months. Relative dose intensity (RDI) was computed for carboplatin and paclitaxel separately as dose administered per week divided by expected dose per week, and average RDI (ARDI) was then calculated for the regimen. Proportional hazards regression was used to calculate HRs and 95% confidence intervals (CIs) after adjusting for relevant covariates. Compared with whites, AAs were more likely to have dose reduction (ARDI < 85%), treatment delay, and early
discontinuation. Hispanics were also more likely to have dose reduction, but less likely to have early discontinuation or treatment delay. After controlling for prognostic factors including ARDI, AA women had the worst survival. Compared with whites, adjusted HRs (95% CI) for overall mortality were 1.56 (1.01-2.39) for AAs; 0.89 (0.61-1.31) for Asians; and 1.41 (0.98-2.04) for Hispanics. Findings for ovarian cancer-specific mortality were similar. Disparities in ovarian cancer treatment and survival in AA persisted among women with equal access to care."

According to the news reporters, the research concluded: "These findings warrant further evaluation of biological, personal, and social factors that may be responsible for these differences."

For more information on this research see: Racial/Ethnic Disparities in Ovarian Cancer Treatment and Survival. Clinical Cancer Research, 2016;22(23):5909-5914. Oncology - Prostate Cancer

Study Results from University of Miami Provide New Insights into Prostate Cancer (Is It Time to Revisit the Role of Prostate-specific Antigen Kinetics in Active Surveillance for Prostate Cancer?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Prostate Cancer have been presented. According to news reporting out of Miami, Florida, by NewsRx editors, research stated, "To identify factors that are not available at the time of prostate cancer diagnosis and are associated with the risk of biopsy progression in active surveillance (AS) patients. The study included 314 AS patients who had at least 1 repeat biopsy."

Our news journalists obtained a quote from the research from the University of Miami, "We used logistic regression to analyze the association between prostate-specific antigen (PSA) and its derivatives, including PSA density, PSA velocity (PSAV) and doubling time (PSADT); presence of bilateral disease and number of previous successive negative surveillance biopsies; and the risk of progression on the surveillance biopsies first through fourth. Over a median follow-up of 3.1 years, patients had a mean of 2.4 biopsies. The median time from diagnosis to the last biopsy was 2.3 years. The biopsies were performed at fairly equal intervals. For surveillance biopsies 1 through 3, none of the studied factors was adding significant
prognostic information to the baseline characteristics. PSAV and PSADT were associated with the risk of progression on the fourth biopsy; this association was independent of baseline characteristics. No progression on the fourth biopsy was noted in 23 patients with negative PSAV. Among 54 patients with PSADT of more than 3 years only, 2 progressed whereas 6 out of 9 patients with a PSADT less than 3 years had biopsy progression on the fourth surveillance biopsy."

According to the news editors, the research concluded: "PSA kinetics may be helpful in defining the indications for prostate biopsy in AS patients who are followed with regular biopsies for more than 3-4 years."

For more information on this research see: Is It Time to Revisit the Role of Prostate-specific Antigen Kinetics in Active Surveillance for Prostate Cancer? *Urology*, 2016;95():139-144. *Urology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Urology - www.journals.elsevier.com/urology/)

Our news journalists report that additional information may be obtained by contacting V. Iremashvili, University of Miami, Miller Sch Med, Dept. of Urol, Miami, FL 33136, United States. Additional authors for this research include B.R. Kava, M. Manoharan, D.J. Parekh and S. Punnen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.urology.2016.04.016. This DOI is a link to an online electronic document that is either free or for purchase.

Neoplasia Research

Study Results from University of Michigan Broaden Understanding of Neoplasia Research [Fbxw7 Deletion Accelerates Kras(G12D)-Driven Pancreatic Tumorigenesis via Yap Accumulation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neoplasia Research. According to news reporting out of Ann Arbor, Michigan, by NewsRx editors, research stated, "Pancreatic cancers driven by KRAS mutations require additional mutations for tumor progression. The tumor suppressor FBXW7 is altered in pancreatic cancers, but its contribution to pancreatic tumorigenesis is unknown."

Our news journalists obtained a quote from the research from the University of Michigan, "To determine potential cooperation between Kras mutation and Fbxw7 inactivation in pancreatic tumorigenesis, we generated P48-Cre; LSL-Kras(G12D); Fbxw7(fl/fl) (KFCfl/fl) compound mice. We found that KFCfl/fl mice displayed accelerated tumorigenesis: all mice succumbed to pancreatic ductal adenocarcinoma (PDA) by 40 days of age, with PDA onset
occurring by 2 weeks of age. PDA in KFCfl/fl mice was preceded by earlier onset of acinar-to-ductal metaplasia (ADM) and pancreatic intraepithelial neoplasia (PanIN) lesions, and associated with chromosomal instability and the accumulation of Fbxw7 substrates Yes-associated protein (Yap), c-Myc, and Notch. Using KFCfl/fl and FBXW7-deficient human pancreatic cancer cells, we found that Yap silencing attenuated growth promotion by Fbxw7 deletion."

According to the news editors, the research concluded: "Our data demonstrate that Fbxw7 is a potent suppressor of Kras(G12D)-induced pancreatic tumorigenesis due, at least in part, to negative regulation of Yap."

Our news journalists report that additional information may be obtained by contacting M.A. Morgan, University of Michigan, Sch Med, Dept. of Radiat Oncol, Ann Arbor, MI 48109, United States. Additional authors for this research include Y. Zhang, J.D. Parsels, I. Lohse, T.S. Lawrence, M.P. di Magliano, Y. Sun and M.A. Morgan.

**Surgery - Heart Surgery**

**Study Results from University of Michigan Provide New Insights into Heart Surgery (Congenital Heart Surgery Case Mix Across North American Centers and Impact on Performance Assessment)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Surgery - Heart Surgery. According to news reporting out of Ann Arbor, Michigan, by NewsRx editors, research stated, "Performance assessment in congenital heart surgery is challenging due to the wide heterogeneity of disease. We describe current case mix across centers, evaluate methodology inclusive of all cardiac operations versus the more homogeneous subset of Society of Thoracic Surgeons benchmark operations, and describe implications regarding performance assessment."

Financial support for this research came from National Heart, Lung, and Blood Institute.

Our news journalists obtained a quote from the research from the University of Michigan, "Centers (n = 119) participating in the Society of Thoracic Surgeons Congenital Heart Surgery Database (2010 through 2014) were included. Index operation type and frequency across centers were described. Center performance (risk-adjusted operative mortality) was evaluated and classified when including the benchmark versus all eligible operations. Overall, 207 types of operations were performed during the study period (112,140 total cases). Few operations were performed across all centers; only 25% were performed at least once by 75% or more of centers. There was 7.9-fold variation across centers in the proportion of total cases comprising high-complexity cases STAT 5). In contrast, the benchmark operations made up
36% of cases, and all but 2 were performed by at least 90% of centers. When evaluating performance based on benchmark versus all operations, 15% of centers changed performance classification; 85% remained unchanged. Benchmark versus all operation methodology was associated with lower power, with 35% versus 78% of centers meeting sample size thresholds. There is wide variation in congenital heart surgery case mix across centers. Metrics based on benchmark versus all operations are associated with strengths (less heterogeneity) and weaknesses (lower power), and lead to differing performance classification for some centers.

According to the news editors, the research concluded: "These findings have implications for ongoing efforts to optimize performance assessment, including choice of target population and appropriate interpretation of reported metrics."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.04.034. This DOI is a link to an online electronic document that is either free or for purchase.

**Transplant Medicine - Kidney Transplants**

**Study Results from University of Minnesota Update Understanding of Kidney Transplants (Genotype-guided tacrolimus dosing in African-American kidney transplant recipients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Kidney Transplants is now available. According to news reporting originating in Minneapolis, Minnesota, by NewsRx journalists, research stated, "Tacrolimus is dependent on CYP3A5 enzyme for metabolism. Expression of the CYP3A5 enzyme is controlled by several alleles including CYP3A5*1, CYP3A5*3, CYP3A5*6 and CYP3A5*7."

The news reporters obtained a quote from the research from the University of Minnesota, "African Americans (AAs) have on average higher tacrolimus dose requirements than Caucasians; however, some have requirements similar to Caucasians. Studies in AAs have primarily evaluated the CYP3A5*3 variant; however, there are other common nonfunctional variants in AAs (CYP3A5*6 and CYP3A5*7) that do not occur in Caucasians. These variants are associated with lower dose requirements and may explain why some AAs are metabolically
similar to Caucasians. We created a tacrolimus clearance model in 354 AAs using a development and validation cohort. Time after transplant, steroid and antiviral use, age and CYP3A5*1, *3, *6 and *7 alleles were significant toward clearance.

According to the news reporters, the research concluded: "This study is the first to develop an AA-specific genotype-guided tacrolimus dosing model to personalize therapy. The Pharmacogenomics Journal advance online publication, 15 December."

For more information on this research see: Genotype-guided tacrolimus dosing in African-American kidney transplant recipients. The Pharmacogenomics Journal, 2015:();

Our news correspondents report that additional information may be obtained by contacting K. Sanghavi, Dept. of Experimental and Clinical Pharmacology, College of Pharmacy, University of Minnesota, Minneapolis, MN, United States. Additional authors for this research include R.C. Brundage, M.B. Miller, D.P. Schladt, A.K. Israni, W. Guan, W.S. Oetting, R.B. Mannon, R.P. Remmel, A.J. Matas and P.A Jacobson.

Proteins - Extracellular Matrix Proteins

Study Results from University of Munich Provide New Insights into Extracellular Matrix Proteins (New View on Endothelial Cell Migration Switching Modes of Migration Based on Matrix Composition)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - Extracellular Matrix Proteins have been published. According to news reporting out of Munich, Germany, by NewsRx editors, research stated, "Cell-matrix interactions are crucial for regulating cellular activities, such as migration. This is of special importance for morphogenic processes, such as angiogenesis (the development of new blood vessels)."

Our news journalists obtained a quote from the research from the University of Munich, "Most of our understanding of cell migration relies on 2-dimensional (2D) experiments. However, the awareness that 3D settings might elicit different results has increased. Knowledge about endothelial cell (EC) behavior in 3D environments and the influence of matrix composition on EC migration, in particular, is still limited. Approach and Results-We characterize the migration of single ECs through 2 structurally different hydrogels: spongy Matrigel and fibrillar collagen I. Our observations reveal an elongated migration phenotype in Matrigel and a rounded phenotype with pronounced cell blebs (blebs >2 mu m) in collagen I, which have not previously been described in ECs. Directed migration seems to depend on Rac1 and Cdc42 in collagen, but not in Matrigel (shown using appropriate pharmacological inhibitors). By applying anti-integrin antibodies and supplementing laminin in collagen gels, we identify laminin as the main determinant of the elongated phenotype. Laminin
seems to induce a morphological switch between modes of migration. As an in situ proof of principle, we performed live imaging of EC migration during vascular growth in a murine retina in the absence and presence of anti-integrin antibodies. We show that, surprisingly, ECs can evade the pharmacological inhibition of central signaling pathways involved in migration (contractility, small GTPases, and proteolysis) by shifting gears between modes of migration.

According to the news editors, the research concluded: "This finding indicates an unexpected contextual plasticity of EC behavior."

For more information on this research see: New View on Endothelial Cell Migration Switching Modes of Migration Based on Matrix Composition. Arteriosclerosis Thrombosis and Vascular Biology, 2016;36(12):2346-2357. Arteriosclerosis Thrombosis and Vascular Biology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Our news journalists report that additional information may be obtained by contacting S. Zahler, University of Munich, Dept. of Pharm, Pharmaceut Biol, Munich, Germany. Additional authors for this research include K. Nekolla, M. Rehberg, A.M. Vollmar and S. Zahler.

Study Results from University of Naples Provide New Insights into Beta Thalassemia (Electrocardiographic Presentation, Cardiac Arrhythmias, and Their Management in beta-Thalassemia Major Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematologic Diseases and Conditions - Beta Thalassemia is the subject of a report. According to news reporting originating from Naples, Italy, by NewsRx correspondents, research stated, "Beta-thalassemia major (beta-TM) is a genetic hemoglobin disorder characterized by an absent synthesis of globin chains that are essential for hemoglobin formation, causing chronic hemolytic anemia. Clinical management of thalassemia major consists in regular long-life red blood cell transfusions and iron chelation therapy to remove iron introduced in excess with transfusions."

Our news editors obtained a quote from the research from the University of Naples, "Iron deposition in combination with inflammatory and immunogenic factors is involved in the pathophysiology of cardiac dysfunction in these patients. Heart failure and arrhythmias, caused by myocardial siderosis, are the most important life-limiting complications of iron overload in beta-thalassemia patients. Cardiac complications are responsible for 71% of global death in the beta-thalassemia major patients."

According to the news editors, the research concluded: "The aim of this review was to describe the most frequent electrocardiographic abnormalities and arrhythmias observed in beta-TM patients, analyzing their prognostic impact and current treatment strategies."

For more information on this research see: Electrocardiographic Presentation, Cardiac Arrhythmias, and Their Management in beta-Thalassemia Major Patients. Annals of

The news editors report that additional information may be obtained by contacting V. Russo, University of Naples, Monaldi Hosp, Naples, Italy. Additional authors for this research include A. Rago, A.A. Papa and G. Nigro.

Aromatic Amino Acids

Study Results from University of Nevada in the Area of Aromatic Amino Acids Reported (Acid sphingomyelinase is required for cell surface presentation of Met receptor tyrosine kinase in cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Aromatic Amino Acids. According to news reporting from Las Vegas, Nevada, by NewsRx journalists, research stated, "Receptor tyrosine kinases (RTKs) are embedded in the lipid bilayer of the plasma membrane, but the specific roles of various lipids in cell signaling remain largely uncharacterized. We have previously found that acid sphingomyelinase (ASM; also known as SMPD1) regulates the conserved DAF-2 (the ortholog IGF-1R in mammals) RTK signaling pathway in Caenorhabditis elegans."

Funders for this research include U.S. Department of Defense, National Institutes of Health, National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from the University of Nevada, "How ASM and its catalytic products, ceramides, control RTK signaling pathways remain unclear. Here, we report that ASM regulates the homeostasis of Met, an RTK that is frequently overexpressed in various cancers. Inactivation of ASM led to a rapid loss of Met from the plasma membrane, reduced Met phosphorylation and activation, and induced Met accumulation in the trans-Golgi network (TGN). However, trafficking of integrin beta 3 and vesicular stomatitis virus glycoprotein (VSVG) was largely unaffected. Knockdown of syntaxin 6 (STX6) also blocked the Golgi exit of Met. Depletion of either ASM or STX6 led to aberrant trafficking of Met to lysosomes, promoting its degradation."

According to the news reporters, the research concluded: "Our studies reveal that ASM and ceramides, together with STX6 and cholesterol, constitute a new regulatory mechanism for the exit of Met from the Golgi during its biosynthetic route, which is used to rapidly replenish and regulate the plasma membrane levels of Met in various cancer cells."

Our news journalists report that additional information may be obtained by contacting H. Sun, University of Nevada, Dept. of Chem & Biochem, Las Vegas, NV 89135, United States. Additional authors for this research include X.H. Xiong, Y. Kim, N. Okada, F. Lu, H. Zhang and H. Sun.

Aromatic Amino Acids

Study Results from University of Nice Sophia-Antipolis in the Area of Aromatic Amino Acids Reported (An Evolution-Guided Analysis Reveals a Multi-Signaling Regulation of Fas by Tyrosine Phosphorylation and its Implication in Human Cancers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Aromatic Amino Acids have been published. According to news reporting originating from Nice, France, by NewsRx correspondents, research stated, "Demonstrations of both pro-apoptotic and pro-survival abilities of Fas (TNFRSF6/CD95/APO-1) have led to a shift from the exclusive 'Fas apoptosis' to 'Fas multisignals' paradigm and the acceptance that Fas-related therapies face a major challenge, as it remains unclear what determines the mode of Fas signaling. Through protein evolution analysis, which reveals unconventional substitutions of Fas tyrosine during divergent evolution, evolution-guided tyrosine-phosphorylated Fas proxy, and site-specific phosphorylation detection, we show that the Fas signaling outcome is determined by the tyrosine phosphorylation status of its death domain."

Our news editors obtained a quote from the research from the University of Nice Sophia-Antipolis, "The phosphorylation dominantly turns off the Fas-mediated apoptotic signal, while turning on the pro-survival signal. We show that while phosphorylations at Y232 and Y291 share some common functions, their contributions to Fas signaling differ at several levels. The findings that Fas tyrosine phosphorylation is regulated by Src family kinases (SFKs) and the phosphatase SHP-1 and that Y291 phosphorylation primes clathrin-dependent Fas endocytosis, which contributes to Fas pro-survival signaling, reveals for the first time the mechanistic link between SFK/SHP-1-dependent Fas tyrosine phosphorylation, internalization route, and signaling choice. We also demonstrate that levels of phosphorylated Y232 and Y291 differ among human cancer types and differentially respond to anticancer therapy, suggesting context-dependent involvement of Fas phosphorylation in cancer."

According to the news editors, the research concluded: "This report provides a new insight into the control of TNF receptor multisignaling by receptor phosphorylation and its implication in cancer biology, which brings us a step closer to overcoming the challenge in handling Fas signaling in treatments of cancer as well as other pathologies such as autoimmune and degenerative diseases."
For more information on this research see: An Evolution-Guided Analysis Reveals a Multi-Signaling Regulation of Fas by Tyrosine Phosphorylation and its Implication in Human Cancers. *Plos Biology*, 2016;14(3):e1002401. (Public Library of Science - www.plos.org; Plos Biology - www.plosbiology.org)

**Heart Disorders and Diseases - Heart Failure**

**Study Results from University of North Carolina Broaden Understanding of Heart Failure (Evolving therapies for the management of chronic and acute decompensated heart failure)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Failure. According to news reporting from Chapel Hill, North Carolina, by NewsRx journalists, research stated, "The pharmacology, clinical efficacy, and safety profiles of evolving therapies for the management of chronic heart failure (HF) and acute decompensated heart failure (ADHF) are described. HF confers a significant financial burden despite the widespread use of traditional guideline-directed medical therapies such as angiotensin-converting enzyme inhibitors, angiotensin receptor blockers, beta-blockers, and aldosterone receptor antagonists, and the rates of HF-related mortality and hospitalization have remained unacceptably high."

The news correspondents obtained a quote from the research from the University of North Carolina, "In response to a demand for novel pharmacologic agents, several therapeutic compounds have recently gained approval or are currently under review by the Food and Drug Administration. Sacubitril-valsartan has demonstrated benefit in reducing cardiovascular mortality and HF-related hospitalizations in clinical trials, while ivabradine and ferric carboxymaltose have proven efficacious in reducing HF-related hospitalizations. Lastly, the role of serelaxin in ADHF is currently under investigation in an ongoing Phase III study. While large, outcome-driven clinical trials are fundamental in informing the clinical application of these therapeutic agents, careful patient selection is imperative to ensuring similar outcomes postmarketing. In addition, optimization of current guideline-directed medical therapy remains essential as new therapies emerge and are incorporated into guideline recommendations. Additional therapeutic agents currently undergoing investigation include bucindolol hydrochloride, cimaglermin alfa, nitroxyl, omecamtiv mecarbil, TRV027, and ularitide. Clinical practitioners should remain abreast of emerging literature so that new therapeutic entities are optimally applied and positive patient outcomes are achieved. Recently introduced agents for the treatment of patients with HF include sacubitril valsartan, ivabradine, and ferric
According to the news reporters, the research concluded: "Additional agents worthy of attention include serelaxin and other therapies currently under investigation."

**Oncology - Prostate Cancer**

**Study Results from University of Oxford Broaden Understanding of Prostate Cancer (Altered expression of epithelial-to-mesenchymal transition proteins in extraprostatic prostate cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "Epithelial to mesenchymal transition (EMT) of cancer cells involves loss of epithelial polarity and adhesiveness, and gain of invasive and migratory mesenchymal behaviours. EMT occurs in prostate cancer (PCa) but it is unknown whether this is in specific areas of primary tumours."

Our news journalists obtained a quote from the research from the University of Oxford, "We examined whether any of eleven EMT-related proteins have altered expression or subcellular localisation within the extraprostatic extension component of locally advanced PCa compared with other localisations, and whether similar changes may occur in in vitro organotypic PCa cell cultures and in vivo PCa models. Expression profiles of three proteins (E-cadherin, Snail, and a-smooth muscle actin) were significantly different in extraprostatic extension PCa compared with intra-prostatic tumour, and 18/27 cases had an expression change of at least one of these three proteins. Of the three significantly altered EMT proteins in pT3 samples, one showed similar significantly altered expression patterns in in vitro organotypic culture models, and two in in vivo Pten-/-model samples. These results suggest that changes in EMT protein expression can be observed in the extraprostatic extension component of locally invasive PCa."

According to the news editors, the research concluded: "The biology of some of
these changes in protein expression may be studied in certain in vitro and in vivo PCa models."

For more information on this research see: Altered expression of epithelial-to-mesenchymal transition proteins in extraprostatic prostate cancer. Oncotarget, 2016;7(2):1107-19.

Nervous System Diseases and Conditions ...

Study Results from University of Paris in the Area of Polyneuropathies Reported (Current and Future Treatment Approaches in Transthyretin Familial Amyloid Polyneuropathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nervous System Diseases and Conditions - Polyneuropathies. According to news reporting from Creteil, France, by NewsRx journalists, research stated, "Treatment of transthyretin familial amyloid polyneuropathy (TTR FAP) must be tailored to disease stage. Patients with early stage disease (i.e., without major impairment in walking ability), especially younger patients, should be referred as soon as possible for liver transplantation (LT) in the absence of major comorbid conditions."

The news correspondents obtained a quote from the research from the University of Paris, "LT remains the most effective treatment option to date and should be offered to these patients as early as possible. Bridging therapy with an oral TTR stabilizer (tafamidis or diflunisal, according to local access to these treatments) should be started as soon as the diagnosis of TTR FAP is established. Early stage patients who do not wish to or have contraindications to LT should be treated with an oral TTR stabilizer or get access to the newly developed therapeutic options (IONIS TTR-Rx, patisiran, doxycycline/TUDCA). Late stage patients (presenting with significant walking impairment) are usually older and notoriously difficult to treat. They should be offered an oral TTR stabilizer but are not candidates for LT due to a significant rate of perioperative complications and increased risk of progressive neurological and especially cardiac disease despite LT. Access to the different therapies in development should also be considered depending on respective inclusion and exclusion criteria. The abovementioned treatment options were mostly validated in Val30Met mutation patients, but should also be offered to non-Val30Met patients, although mortality rates after LT are higher in these patients. Treatment decisions should be made on an individual basis. Screening for heart, eye, and renal involvement is mandatory for every patient at disease diagnosis and regularly thereafter, even in transplanted patients. Symptomatic treatment should
be offered as needed, as well as genetic counseling to at-risk family members. Asymptomatic mutation carriers should benefit from regular screening for early symptoms of disease. Current therapeutic management of TTR FAP will hopefully be changed in the near future with data from the ongoing phase 2/3 studies testing the TTR gene silencing agents."

According to the news reporters, the research concluded: "In the longer term, it is likely that combined therapeutic approaches will be necessary to reverse the disease process."

For more information on this research see: Current and Future Treatment Approaches in Transthyretin Familial Amyloid Polyneuropathy. Current Treatment Options in Neurology, 2016;18(12):26-38. Immune System Diseases and Conditions - Allergies

Study Results from University of Paris-Sud Provide New Insights into Allergies (Bioinspired Design and Oriented Synthesis of Immunogenic Site-Specifically Penicilloylated Peptides)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - Allergies. According to news reporting from Chatenay Malabry, France, by NewsRx journalists, research stated, "Beta-Lactam antibiotics allergy is recognized as a public health concern. By covalently binding to serum proteins, penicillins are known to form immunogenic complexes."

Funders for this research include Agence Nationale de la Recherche, Institut National de la Sante et de la Recherche Medicale, Ministere de l'Enseignement Superieur et de la Recherche, Centre National de la Recherche Scientifique, Universite Paris-Sud, Servier Group.

The news correspondents obtained a quote from the research from the University of Paris-Sud, "The latter are recognized and digested by antigen-presenting cells into drug-hapten peptides leading to the immunization of treated persons and IgE-mediated hypersensitivity reactions encompassing anaphylaxis. If type I allergic reactions to drugs are often unpredictable, they are known to be dependent on CD4(+) T-cells. This fundamental study revisits the chemical basis of the benzylpenicillin (BP) allergy with the aim of identifying immunologically relevant biomimetic benzylpenicilloylated peptides through the analysis of BP-conjugated human serum albumin (BP-HSA) profile and the evaluation of the naive CD4(+) T-cell responses to candidate BP-HSA-derived peptides. The chemical structures of BP-HSA bioconjugates synthesized in vitro at both physiological and basic pH were investigated by mass spectrometry. From the ten most representative lysine residues grafted by BP-hapten, HSA-
bioinspired 15-mer peptide sequences were designed and the potential T-cell epitope profile of each peptide was predicted using two complementary in silico approaches, i.e., HLA class II binding prediction tools from the Immune Epitope Database and Analysis Resource (IEDB) and computational alanine scanning mutagenesis. Twelve structurally diversified benzylpenicilloylated peptides (BP-Ps) were selected and synthesized with the aid of a flexible synthesis pathway using an original benzylpenicilloylated lysine monomer as common precursor. In order to corroborate their predicted 'epitope' profile, the naive CD4(+) T-cell response specific to BP was evaluated through a coculture approach. To our knowledge, this study showed for the first time the ability of bioinspired peptides structurally stemming from BP-HSA to be recognized by naive CD4(+) T-cells thus identifying a pre-existing T-cell repertoire for penicillin molecules bound to proteins."

According to the news reporters, the research concluded: "It also established a promising model approach expandable to other most frequently used penicillin classes of antibiotics to reveal biomimetic drug-modified antigenic peptides relevant for qualitative and quantitative drug allergy studies."

Our news journalists report that additional information may be obtained by contacting D. Joseph, Univ Paris Saclay, CNRS, Univ Paris Sud, BioCIS, F-92296 Chatenay Malabry, France. Additional authors for this research include S. Delarue-Cochin, M.E. Azoury, M. Le Mignon, J.A. Chemelle, E. Nony, B. Maillere, R. Terreux, M. Pallardy and D. Joseph.

Graves' Disease

Study Results from University of Pavia Update Understanding of Graves' Disease (Gender Influences The Clinical Presentation And Long-term Outcome Of Graves Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Graves' disease. According to news reporting originating in Pavia, Italy, by NewsRx journalists, research stated, "The outcome of antithyroid drug (ATD) treatment for Graves disease (GD) is difficult to predict. In this study, we investigated whether male gender, besides other factors usually associated with a poor
outcome of ATD treatment, may affect disease presentation and predict the response to medical treatment in subjects with GD."

The news reporters obtained a quote from the research from the University of Pavia, "We studied 294 patients with a first diagnosis of GD. In all patients, ATD treatment was started. Clinical features, thyroid volume, and eye involvement were recorded at baseline. Serum levels of free thyroxine (FT4), free triiodothyronine (FT3), thyroid-stimulating hormone (TSH), and TSH-receptor antibodies (TRAb) were measured at baseline and during the follow-up. Treatment outcome (FT4, FT3, and TSH serum levels and further treatments for GD after ATD withdrawal) was evaluated. When compared to women, men showed a significantly larger thyroid volume and a higher family positivity for autoimmune diseases. During ATD, the mean serum levels of TSH, FT4, FT3, and TRAb did not differ between groups. Within 1 year after ATD discontinuation, relapse of hyperthyroidism was significantly more frequent in men than in women. Within the 5-year follow-up period, the prevalence of men suffering a late relapse was higher compared with that of women. The outcome at the end of the 5-year follow-up period was significantly associated with gender and TRAb levels at disease onset. Male patients with GD have a poorer prognosis when submitted to medical treatment with ATDs."

According to the news reporters, the research concluded: "A larger goiter at presentation and a stronger genetic autoimmune background might explain this gender difference in patients with GD."

For more information on this research see: Gender Influences The Clinical Presentation And Long-term Outcome Of Graves Disease. Endocrine Practice, 2016;22 (11):1336-1342. Endocrine Practice can be contacted at: Amer Assoc Clinical Endocrinologists, 245 Riverside Avenue, Ste 200, Jacksonville, FL 32202, USA.

Liver Diseases and Conditions - Hepatitis C Virus

Study Results from University of Pennsylvania in the Area of Hepatitis C Virus Reported (Hepatitis C virus therapy with peg-interferon and ribavirin in Myanmar: A resource-constrained country)

NewsRx journalists, research stated, "To investigate peg-interferon (peg-IFN) and ribavirin (RBV) therapy in Myanmar and to predict sustained virologic response (SVR). This single-center, open-label, study was conducted in Myanmar between 2009 and 2014."

The news reporters obtained a quote from the research from the University of Pennsylvania, "A total of 288 patients infected with HCV genotypes 1, 2, 3 and 6 were treated with peg-IFN alpha-2a (180 μg/wk) or alpha-2b (50 to 100 μg as a weight-based dose) and RBV as a weight-based dose (15 mg/kg/d). Treatment duration was 48 wk for genotypes 1 and 6, 24 wk for genotype 2, and 24 or 48 wk for genotype 3 based on rapid virologic response (RVR). Those co-infected with hepatitis B received 48 wk of therapy. Overall, SVR was achieved for 82% of patients and the therapy was well tolerated. All patients achieved SVR at equivalent rates regardless of HCV genotype (p = 0.314). Low fibrosis scores (p < 0.001), high baseline albumin levels (p = 0.028) and low baseline viral loads (p = 0.029) all independently predicted SVR. On the other hand, IL-28B TT and CC genotypes were not found to significantly predict SVR (p = 0.634; p = 0.618). Among those who completed treatment, the occurrence of RVR showed a > 96% positive predictive value for achieving SVR. Treatment duration did not significantly impact the likelihood of achieving SVR for patients infected with genotype 3 HCV (p = 0.371). The most common adverse events were fatigue (71%) and poor appetite (60%). Among patients with genotype 3 HCV, more patients in the 48-wk treatment group required erythropoietin than in the 24-wk treatment group (61.1% vs 49.2%). SVR rates were high with peg-IFN and RBV therapy in Myanmar."

According to the news reporters, the research concluded: "Fibrosis scores, baseline albumin, HCV RNA levels and RVR independently predicted SVR."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i43.9613. This DOI is a link to an online electronic document that is either free or for purchase.

Study Results from University of Rochester Update Understanding of Connective Tissue Cells (Human lung fibroblasts produce proresolving peroxisome proliferator-activated receptor-gamma ligands in a cyclooxygenase-2-dependent manner)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Connective Tissue Cells have been presented. According to news originating from Rochester, New York, by NewsRx correspondents, research stated, "Human lung fibroblasts (HLFs) act as innate immune sentinel cells that amplify the inflammatory response to injurious stimuli. Here, we use targeted lipidomics to explore the hypothesis that HLFs also play an active role in the resolution of inflammation."

Our news journalists obtained a quote from the research from the University of Rochester, "We detected cyclooxygenase-2 (COX-2)-dependent production of both proinflammatory and proresolving prostaglandins (PGs) in conditioned culture medium from HLFs treated with a proinflammatory stimulus, IL-1 beta. Among the proresolving PGs in the HLF lipidome were several known ligands for peroxisome proliferator-activated receptor-gamma (PPAR gamma), a transcription factor whose activation in the lung yields potent anti-inflammatory, antifibrotic, and proresolving effects. Next, we used a cell-based luciferase reporter to confirm the ability of HLF supernatants to activate PPAR gamma, demonstrating, for the first time, that primary HLFs activated with proinflammatory IL-1 beta or cigarette smoke extract produce functional PPAR gamma ligands; this phenomenon is temporally regulated, COX-2- and lipocalin-type PGD synthase-dependent, and enhanced by arachidonic acid supplementation. Finally, we used luciferase reporter assays to show that several of the PGs in the lipidome of activated HLFs independently activate PPAR gamma and/or inhibit NF kappa B. These results indicate that HLFs, as immune sentinels, regulate both proinflammatory and proresolving responses to injurious stimuli."

According to the news editors, the research concluded: "This novel endogenous resolution pathway represents a new therapeutic target for globally important inflammatory diseases such as chronic obstructive pulmonary disease."

The news correspondents report that additional information may be obtained from R.P. Phipps, University of Rochester, Sch Med & Dental, Lung Biol & Dis Program, Rochester, NY 14642, United States. Additional authors for this research include C.F. Woeller, T.H. Thatcher, K.R. Maddipati, K.V. Honn, P.J. Sime and R.P. Phipps.

Clinical Research - Clinical Trials and Studies

Study Results from University of Rochester in the Area of Clinical Trials and Studies Reported (Efficacy of periimplant mechanical debridement with and without adjunct antimicrobial photodynamic therapy in the treatment of periimplant diseases ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting out of Rochester, New York, by NewsRx editors, research stated, "The aim was to assess the efficacy of mechanical debridement (MD) with and without adjunct antimicrobial photodynamic therapy (aPDT) in reducing periimplant inflammation among cigarette smokers and non-smokers. Cigarette-smokers and non-smokers were randomly divided into 2 groups."

Financial support for this research came from King Saud University.

Our news journalists obtained a quote from the research from the University of Rochester, "In the test-group, participants underwent full mouth scaling and periimplant MD with adjunct aPDT; and in the control group, the participants underwent full mouth scaling and periimplant MD alone. Periimplant bleeding on probing (BOP), probing depth (PD) and crestal bone loss (CBL) were measured at baseline and at 6- and 12-months follow-up. Statistical analysis was performed using the Kruskal-Wallis test. P-values <0.05 were considered statistically significant. Eighty-four smokers (41 patients in the test group and 43 in the control group) and 82 nonsmokers (40 patients in the test group and 42 in the control group) were included. Among smokers and non-smokers, periimplant PD was significantly higher in the control-group compared with the test-group (P < 0.05) at 6-months of follow-up. There was no statistically significant difference in BOP, PD and CBL among smokers and non-smokers in the test- and control-groups at 12-months of follow-up. BOP was comparable among smokers at all time intervals. In the short-term, MD with adjunct aPDT is more effective in reducing periimplant probing depth than MD alone in smokers and non-smokers."

According to the news editors, the research concluded: "However, in the long-term outcomes of MD either with or without aPDT among smokers and non-smokers are comparable."

For more information on this research see: Efficacy of periimplant mechanical debridement with and without adjunct antimicrobial photodynamic therapy in the treatment of periimplant diseases among cigarette smokers and non-smokers. Photodiagnosis and Photodynamic Therapy, 2016;16():85-89. Photodiagnosis and Photodynamic Therapy can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Study Results from University of Saarland Update Understanding of Cystic Fibrosis (Optimization of ciprofloxacin complex loaded PLGA nanoparticles for pulmonary treatment of cystic fibrosis infections: Design of experiments approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Cystic Fibrosis is the subject of a report. According to news reporting from Saarbrucken, Germany, by NewsRx journalists, research stated, "Design of Experiments (DoE) is a powerful tool for systematic evaluation of process parameters' effect on nanoparticle (NP) quality with minimum number of experiments. DoE was employed for optimization of ciprofloxacin loaded PLGA NPs for pulmonary delivery against Pseudomonas aeruginosa infections in cystic fibrosis (CF) lungs."

The news correspondents obtained a quote from the research from the University of Saarland, "Since the biofilm produced by bacteria was shown to be a complicated 3D barrier with heterogeneous meshes ranging from 100 nm to 500 nm, nanoformulations small enough to travel through those channels were assigned as target quality. Nanoprecipitation was realized utilizing MicroJet Reactor (MJR) technology based on impinging jets principle. Effect of MJR parameters flow rate, temperature and gas pressure on particle size and PDI was investigated using Box-Behnken design. The relationship between process parameters and particle quality was demonstrated by constructed fit functions (R-2 = 0.9934 p< 0.0001 and R-2 = 0.9983 p< 0.0001, for particle size and PDI, respectively). Prepared nanoformulations varied between 145.2 and 979.8 nm with PDI ranging from 0.050 to 1.00 and showed encapsulation efficiencies > 65%. Response surface plots provided experimental data-based understanding of MJR parameters' effect, thus NP quality."

According to the news reporters, the research concluded: "Presented work enables ciprofloxacin loaded PLGA nanoparticle preparations with pre-defined quality to fulfill the requirements of local drug delivery under CF disease conditions."

For more information on this research see: Optimization of ciprofloxacin complex loaded PLGA nanoparticles for pulmonary treatment of cystic fibrosis infections: Design of experiments approach. *International Journal of Pharmaceutics*, 2016;515(1-2):343-351. *International Journal of Pharmaceutics* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www elsevier com; International Journal of Pharmaceutics - www journals elsevier com/international-journal-of-pharmaceutics/)

Our news journalists report that additional information may be obtained by contacting N.G. Tureli, University of Saarland, Dept. of Pharm, Biopharmaceut & Pharmaceut Technol, D-66123 Saarbrucken, Germany. Additional authors for this research include A.E. Tureli and M. Schneider.
Study Results from University of Sydney Broaden Understanding of Cardiology (Effect of corticosteroids on cardiac function in growth-restricted fetuses)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiology are presented in a new report. According to news reporting from Sydney, Australia, by NewsRx journalists, research stated, "To determine the acute effects of corticosteroids on the cardiovascular system in growth-restricted fetuses. This was a prospective cohort study conducted at a tertiary hospital between January 2011 and October 2013."

The news correspondents obtained a quote from the research from the University of Sydney, "Fetal cardiovascular function in fetuses with intrauterine growth restriction (IUGR) was assessed immediately before and 24 h after the first dose of betamethasone, administered in routine management of IUGR. Fetal arterial and venous Dopplers were assessed. Fetal cardiac function was evaluated by tissue Doppler echocardiography, with the assessment of both left and right ventricular function by calculating myocardial performance index (MPI') and E':A' ratios. Values were compared before and after exposure. Seventeen patients were included at a mean gestational age of 34+1 (range, 29+1 to 37+4) weeks. Fifteen fetuses were below the 5th percentile and two were below the 10th percentile for estimated fetal weight and abdominal circumference and all had no interval growth during a 2-week period. There was a decrease in right MPI' (from 0.56 to 0.47; P=0.007) after corticosteroid exposure but no change in left MPI' (from 0.49 to 0.48). Right MPI' was higher than left MPI' before exposure (0.56 vs 0.49, respectively; P=0.001), but not after exposure (P=0.55). There was no change in left or right ventricular E':A' ratios and no difference was detected in umbilical artery, middle cerebral artery or ductus venosus pulsatility index following administration of corticosteroids. Corticosteroids altered right-sided, but not left-sided, tissue Doppler MPI' in IUGR fetuses, with no detectable change in arterial or venous Doppler pulsatility indices. Before exposure, the mean right MPI' was higher than the left. However, after exposure, there was no difference, suggesting that corticosteroids may reverse the negative effect of IUGR on fetal heart function."

According to the news reporters, the research concluded: "Large prospective studies with a larger sample size are needed to confirm this finding."

For more information on this research see: Effect of corticosteroids on cardiac function in growth-restricted fetuses. Ultrasound in Obstetrics & Gynecology, 2016;48(2):204-209. Ultrasound in Obstetrics & Gynecology can be contacted at: Wiley-Blackwell, 111 River
Study Results from University of Sydney Broaden Understanding of Kidney Transplants (Normal saline versus lower-chloride solutions for kidney transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Transplant Medicine - Kidney Transplants. According to news reporting out of Sydney, Australia, by NewsRx editors, research stated, "The ideal intravenous fluid for kidney transplantation has not been defined, despite the common use of normal saline during the peri-operative period. The high chloride content of normal saline is associated with an increased risk of hyperchloraemic metabolic acidosis, which may in turn increase the risk of hyperkalaemia and delayed graft function."

Our news journalists obtained a quote from the research from the University of Sydney, "Balanced electrolyte solutions have a lower chloride content which may decrease this risk and avoid the need for dialysis due to hyperkalaemia in the immediate post-transplant period. Randomised controlled trials (RCTs) addressing this issue have used biochemical outcomes to compare fluids and have been underpowered to address patient-centred outcomes such as delayed graft function. To examine the effect of lower-chloride solutions versus normal saline on delayed graft function, hyperkalaemia and acid-base status in kidney transplant recipients. Search methods We searched the Cochrane Kidney and Transplant's Specialised Register to 26 November 2015 through contact with the Information Specialist using search terms relevant to this review. Selection criteria RCTs of kidney transplant recipients that compared peri-operative intravenous lower-chloride solutions to normal saline were included. Data collection and analysis Two independent investigators assessed studies for eligibility and risk of bias. Data from individual studies were extracted using standardised forms and pooled according to a published protocol. Summary estimates of effect were obtained using a random-effects model, and results were expressed as risk ratios (RR) and their 95% confidence intervals (CI) for dichotomous outcomes, and mean difference (MD) and 95% CI for continuous outcomes. Six studies (477 participants) were included in the review. All participants were adult kidney transplant recipients and 70% of participants underwent live-donor kidney transplantation. The overall risk of bias was low for selection bias and unclear for remaining domains. There was no difference in the risk of delayed graft function (3 studies, 298 participants: RR1.03, 95% CI 0.62 to 1.70) or hyperkalaemia (2 studies, 199 participants: RR 0.48, 95% CI 0.04 to 6.10) for participants who received balanced electrolyte solutions compared to normal saline. Intraoperative balanced electrolyte solutions compared to normal saline were associated with higher blood pH (3 studies, 193 participants: MD 0.07, 95% CI 0.05 to 0.09), higher serum bicarbonate (3 studies, 215 participants: MD 3.02 mEq/L, 95% CI 2.00 to
4.05) and lower serum chloride (3 studies, 215 participants: MD -9.93 mmol/L, 95% CI -19.96 to 0.11). There were four cases of graft loss in the normal saline group and one in the balanced electrolyte solution group, and four cases of acute rejection in the normal saline group compared to two cases in the balanced electrolyte solution group."

According to the news editors, the research concluded: "Authors’ conclusions Balanced electrolyte solutions are associated with less hyperchloraemic metabolic acidosis compared to normal saline, however it remains uncertain whether lower-chloride solutions lead to improved graft outcomes compared to normal saline."

For more information on this research see: Normal saline versus lower-chloride solutions for kidney transplantation. Cochrane Database of Systematic Reviews, 2016;(8):1342-1378. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Oncology - Oral Cancer

Study Results from University of Technology Update Understanding of Oral Cancer (Lymph node management in the treatment of oral cancer: Analysis of a standardized approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Oral Cancer are discussed in a new report. According to news reporting originating from Munich, Germany, by NewsRx correspondents, research stated, "A supraomohyoid neck dissection (SOHND) is part of the surgical management of patients with oral cancer, even in the absence of clinical or radiographic evidence of neck disease. We have investigated a standardized approach to the management of cervical lymph nodes, in patients with a primary oral cancer."

Our news editors obtained a quote from the research from the University of Technology, "A modified surgical technique has been presented and a clinical algorithm has been described and evaluated. SOHND was performed either uni-or bi-laterally. In cases of positive nodes in levels II or III, the dissection was extended in terms of a modified radical neck dissection (MRND) and a SOHND was performed contralaterally. 112 patients were included. 42% had lymph node metastases in any level. Overall, lymph node metastases were found in 2.8% of all examined nodes. Most metastases (34.6%) occurred in level Ib. 12.6% were located in level IIb. No metastases could be detected in levels IV and V. No statistically significant difference could be shown with regard to T-stage, location, or co-factors as gender and age. SOHND is the gold-standard in patients with no preoperative evidence of lymph node metastases. The presented algorithm is able to facilitate dissection and histological analysis and
might improve the surgical care in current treatment concepts."

According to the news editors, the research concluded: "The extension to an MRND facilitates the identification of patients in need of adjuvant therapy."

The news editors report that additional information may be obtained by contacting S. Koerd, Univ Technol Munich, Dept. of Oral & Maxillofacial Surg, D-81675 Munich, Germany. Additional authors for this research include J. Rockl, N. Rommel, T. Mucke, K.D. Wolff and M.R. Kesting.

**Immunology - Cellular Immunology**

**Study Results from University of Tehran Provide New Insights into Cellular Immunology (Cellular and molecular mechanisms of immune dysregulation and autoimmunity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunology - Cellular Immunology. According to news reporting originating from Tehran, Iran, by NewsRx correspondents, research stated, "Primary immunodeficiencies (PIDs) constitute a large group of rare disorders that affect the function of the immune system."

Our news editors obtained a quote from the research from the University of Tehran, "A specific group of PIDs entitled 'diseases of immune dysregulation' are developed due to mutation in the genes which have critical roles in the regulation of immune responses and immunological tolerance. This group of PID patients develop autoimmune and inflammatory disorders as a result of their impaired immunity, therefore they could be considered as a model for analyzing the link between immune dysregulation and autoimmunity."

According to the news editors, the research concluded; "In this article, our aim is to describe the function of the mutated gene, the molecular and cellular mechanisms underlying the immune dysregulation and review the literature in regard with the reported autoimmune disorders in the main types of immunodysregulatory diseases including genetic defects of regulatory T cells, familial hemophagocytic lymphohistiocytosis syndromes, autoimmunity without lymphoproliferation, autoimmune lymphoproliferative syndrome, immune dysregulation with colitis, and type 1 interferonopathies."
For more information on this research see: Cellular and molecular mechanisms of immune dysregulation and autoimmunity. *Cellular Immunology*, 2016;310():14-26. *Cellular Immunology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Drugs and Therapies - Antidiabetic Agents**

**Study Results from University of Texas Broaden Understanding of Antidiabetic Agents [PPAR Modulation of Cytokine-Stimulated MUC16 (CA125) Expression in Breast and Ovarian Cancer-Derived Cells]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antidiabetic Agents. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "CA125 is serum tumor marker consisting of an epitope carried by a portion of the extremely large (>3MDa), heavily glycosylated cell surface transmembrane mucin, MUC16. In malignancies, membrane bound mucins lose their polarized distribution, become aberrantly over-expressed and protect tumor cells from the actions of chemotherapeutic agents as well as the immune system."

Our news editors obtained a quote from the research from the University of Texas, "Previously, we described stimulation of MUC16 expression by the proinflammatory cytokines, tumor necrosis factor (TNF) and interferon (IFN), in breast and ovarian cancer cells and tissues. Herein, we show that PPAR modulates cytokine-stimulated MUC16 in a complex manner: at low concentrations (<10 mu M) rosiglitazone further potentiates cytokine-driven MUC16 expression while at high concentrations (>20 mu M) rosiglitazone antagonizes cytokine stimulation. Rosiglitazone actions were fully reversible by the PPAR antagonist, GW9662. Furthermore, siRNA-mediated PPAR knockdown also prevented a large portion of high dose rosiglitazone suppression of MUC16 expression indicating that rosiglitazone inhibition is largely PPAR-dependent. Cytokines greatly (>75%) suppressed PPAR expression. Conversely, PPAR activation by rosiglitazone at either low or high concentrations greatly (>75%) suppressed NFB/p65 expression. NFB/p65 expression was largely preserved in the presence of cytokines at low, but not high, rosiglitazone concentrations accounting for the different concentration dependent effects on MUC16 expression. Collectively, these studies demonstrate that PPAR is an important modulator of MUC16 expression."

According to the news editors, the research concluded: "The ability to deliver high

Genetics - Genetic Epidemiology

Study Results from University of Texas Provide New Insights into Genetic Epidemiology (Mendelian randomization analysis of a time-varying exposure for binary disease outcomes using functional data analysis methods)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genetics - Genetic Epidemiology have been published. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "A Mendelian randomization (MR) analysis is performed to analyze the causal effect of an exposure variable on a disease outcome in observational studies, by using genetic variants that affect the disease outcome only through the exposure variable. This method has recently gained popularity among epidemiologists given the success of genetic association studies."

The news correspondents obtained a quote from the research from the University of Texas, "Many exposure variables of interest in epidemiological studies are time varying, for example, body mass index (BMI). Although longitudinal data have been collected in many cohort studies, current MR studies only use one measurement of a time-varying exposure variable, which cannot adequately capture the long-term time-varying information. We propose using the functional principal component analysis method to recover the underlying individual trajectory of the time-varying exposure from the sparsely and irregularly observed longitudinal data, and then conduct MR analysis using the recovered curves. We further propose two MR analysis methods. The first assumes a cumulative effect of the time-varying exposure variable on the disease risk, while the second assumes a time-varying genetic effect and employs functional regression models. We focus on statistical testing for a causal effect. Our simulation studies mimicking the real data show that the proposed functional data analysis based methods incorporating longitudinal data have substantial power gains compared to standard MR analysis..."
using only one measurement."

According to the news reporters, the research concluded: "We used the Framingham Heart Study data to demonstrate the promising performance of the new methods as well as inconsistent results produced by the standard MR analysis that relies on a single measurement of the exposure at some arbitrary time point."

Our news journalists report that additional information may be obtained by contacting P. Wei, Univ Texas MD Anderson Canc Center, Dept. of Biostat, Houston, TX 77030, United States. Additional authors for this research include S.S. Rajan and P. Wei.

**Hematology - Plasma**

**Study Results from University of Texas Southwestern Medical Center Broaden Understanding of Plasma (Can an anti-Xa assay for low-molecular-weight heparin be used to assess the presence of rivaroxaban?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematology - Plasma. According to news originating from Dallas, Texas, by NewsRx correspondents, research stated, "Due to the convenience afforded by the lack of required laboratory monitoring, direct oral anticoagulants (DOACs) are increasingly used as alternatives to Vitamin-K antagonists for certain medical conditions. However, there are circumstances in which assessment of DOAC plasma concentrations may be helpful in guiding clinical decisions, including patients presenting with either bleeding or thrombosis, or patients requiring urgent invasive procedures."

Our news journalists obtained a quote from the research from the University of Texas Southwestern Medical Center, "Evaluating the anticoagulant effects of DOACs is often difficult because of the limited availability of DOAC-specific assays in most laboratories. To evaluate the correlation between ex vivo plasma concentrations of rivaroxaban and a chromogenic anti-Xa assay for low-molecular-weight heparin (LMWH) routinely used in our coagulation laboratory. Twenty-nine blood samples from 20 patients anticoagulated with rivaroxaban (dose: 10-20 mg/day) were evaluated using an anti-Xa assay for LMWH and results were correlated with rivaroxaban plasma concentrations using a rivaroxaban specific assay. A linear dose-dependent relationship was demonstrated between plasma concentrations of rivaroxaban and the chromogenic anti-Xa assay for LMWH (R2 = 0.92). PT and PTT demonstrated poor correlations (R2 = 0.03; and R2 = 0.01, respectively) with rivaroxaban plasma concentrations."
According to the news editors, the research concluded: "Findings from this study suggest that if specific assays for rivaroxaban are unavailable, then the chromogenic anti-Xa assay for LMWH may be useful for assessing the anticoagulant effects of rivaroxaban."

The news correspondents report that additional information may be obtained from S.G. Yates, UT Southwestern Med Center, Dept. of Pathol, Div Transfus Med & Hemostasis, Dallas, TX, United States. Additional authors for this research include S. Smith, W. Tharpe, Y.M. Shen and R. Sarode.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.transci.2016.06.005. This DOI is a link to an online electronic document that is either free or for purchase.

**Gastroenterology**

**Study Results from University of Tokyo Broaden Understanding of Gastroenterology (Long-term human primary hepatocyte cultures in a microfluidic liver biochip show maintenance of mRNA levels and higher drug metabolism compared with Petri cultures)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Gastroenterology is the subject of a report. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "Human primary hepatocytes were cultivated in a microfluidic bioreactor and in Petri dishes for 13 days. mRNA kinetics in biochips showed an increase in the levels of CYP2B6, CYP2C19, CYP2C8, CYP3A4, CYP1A2, CYP2D6, HNF4a, SULT1A1, UGT1A1 mRNA related genes when compared with post extraction levels. In addition, comparison with Petri dishes showed higher levels of CYP2B6, CYP2C19, CYP2C8, CYP3A4, CYP1A2, CYP2D6 related genes at the end of culture."

The news reporters obtained a quote from the research from the University of Tokyo, "Functional assays illustrated a higher urea and albumin production over the period of culture in biochips. Bioreactor drug metabolism (midazolam and phenacetin) was not superior to the Petri dish after 2 days of culture. The CYP3A4 midazolam metabolism was maintained in biochips after 13 days of culture, whereas it was almost undetectable in Petri dishes. This led to a 5000-fold higher value of the metabolic ratio in the biochips. CYP1A2 phenacetin metabolism was found to be higher in biochips after 5, 9 and 13 days of culture. Thus, a 100-fold higher metabolic ratio of APAP in biochips was measured after 13 days of perfusion."

According to the news reporters, the research concluded: "These results
demonstrated functional primary human hepatocyte culture in the bioreactor in a long-term culture."

Our news correspondents report that additional information may be obtained by contacting E. Leclerc, University of Tokyo, Inst Ind Sci, CNRS LIMMS UMI 2820, Meguro Ku, Tokyo 1538505, Japan. Additional authors for this research include T. Bricks, S. Jacques, M.J. Fleury, P. Paullier, F. Merlier and E. Leclerc.

**Oncology - Gastric Cancer**

**Study Results from University of Tokyo Update Understanding of Gastric Cancer (Histologic intestinal metaplasia and endoscopic atrophy are predictors of gastric cancer development after Helicobacter pylori eradication)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Gastric Cancer are presented in a new report. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Helicobacter pylori eradication therapy is effective at reducing the incidence of gastric cancer; however, gastric cancer still develops after eradication. We conducted a cohort study to elucidate the risk factors for gastric cancer development after successful H pylori eradication therapy."

Our news journalists obtained a quote from the research from the University of Tokyo, "From June 1998 to December 2012 we assessed histologic and endoscopic findings of gastritis and performed H pylori eradication therapy in 748 patients without a history of gastric cancer. Patients were classified according to the distribution of intestinal metaplasia (IM) as follows: no IM (IM group A), IM in the antrum only (IM group B), and IM in the corpus (IM group C). We assessed atrophy endoscopically according to the Kimura-Takemoto classification system. Gastric cancer incidence was assessed. A total of 573 patients underwent follow-up endoscopy; the mean duration of follow-up was 6.2 +/- 4.8 years. Gastric cancer developed in 21 (20 intestinal type). The cumulative 5-year incidences of gastric cancer were 3.2% overall; 1.5%, 5.3%, and 9.8% in IM groups A, B, and C; and 0.7%, 1.9%, and 10% in the none/ mild, moderate, and severe endoscopic atrophy groups, respectively. Compared with IM group A, the hazard ratio for IM group B was 3.6 (95% confidence interval [CI], 1.2-11), and that for IM group C was 3.7 (95% CI, 1.1-12). Compared with the none/ mild endoscopic atrophy group, the hazard ratio for severe atrophy was 9.3 (95% CI, 1.7-174)."
According to the news editors, the research concluded: "Patients with histologic IM or severe endoscopic atrophy were at increased risk of gastric cancer development after H pylori eradication."

Our news journalists report that additional information may be obtained by contacting Y. Hirata, University of Tokyo, Grad Sch Med, Dept. of Gastroenterol, Tokyo, Japan. Additional authors for this research include Y. Hirata, R. Niikura, Y. Hayakawa, A. Yamada, T. Ushiku, M. Fukayama and K. Koike.

**Enzymes and Coenzymes - Cysteine Endopeptidases**

**Study Results from University of Tokyo in the Area of Cysteine Endopeptidases Reported (Drosophila SETDB1 and caspase cooperatively fine-tune cell fate determination of sensory organ precursor)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Cysteine Endopeptidases have been published. According to news originating from Bunkyo ku, Japan, by NewsRx correspondents, research stated, "Drosophila produce a constant number of mechanosensory bristles called macrochaetae (MC), which develop from sensory organ precursor (SOP) cells within a proneural cluster (PNC). However, what ensures the precise determination of SOP cells remains to be elucidated."

Financial supporters for this research include Japan Society for the Promotion of Science, Basic Research Program of the Japan Science and Technology Agency.

Our news journalists obtained a quote from the research from the University of Tokyo, "In this study, we conducted RNAi screening in PNC for genes involved in epigenetic regulation. We identified a H3K9 histone methyltransferase, SETDB1/eggless, as a regulator of SOP development. Knockdown of SETDB1 in PNC led to additional SOPs. We further tested the relationship between SETDB1 and non-apoptotic function of caspase on SOP development. Reinforcing caspase activation by heterozygous Drosophila inhibitor of apoptosis protein 1 (DIAP1) mutation rescued ectopic SOP development caused by SETDB1 knockdown. Knockdown of SETDB1, however, had little effect on caspase activity. Simultaneous loss of
SETDB1 and caspase activity resulted in further increase in MC, indicating that the two components work cooperatively."

According to the news editors, the research concluded: "Our study suggests the fine-tuning mechanisms for SOP development by epigenetic methyltransferase and non-apoptotic caspase function."

The news correspondents report that additional information may be obtained from N. Shinoda, Dept. of Genetics, Graduate School of Pharmaceutical Sciences, The University of Tokyo, 7-3-1 Hongo, Bunkyo-ku, Tokyo, 113-0033, Japan. Additional authors for this research include F. Obata, L. Zhang and M. Miura.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/gtc.12348. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Prostate Cancer**

**Study Results from University of Toronto Provide New Insights into Prostate Cancer (Cardiovascular and Skeletal-related Events Following Localized Prostate Cancer Treatment: Role of Surgery, Radiotherapy, and Androgen Deprivation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting originating in Toronto, Canada, by NewsRx journalists, research stated, "To examine the impact of androgen deprivation therapy (ADT) and primary treatment modality on cardiovascular and skeletal-related events and to investigate potential effect modification in a contemporary cohort of patients treated for clinically localized prostate cancer. We conducted a retrospective cohort study using Surveillance, Epidemiology, and End Results-Medicare linked databases for men aged 65-79 years who underwent radical prostatectomy or radiotherapy for cT1 or cT2 prostate cancer from 2000 to 2008."

Financial support for this research came from Amjera Family Chair in Urologic Oncology.

The news reporters obtained a quote from the research from the University of Toronto, "We categorized treatment according to primary therapy and receipt of ADT. We described the cumulative incidence of cardiovascular and skeletal-related events. Among 60,156 men, 14,403 underwent surgery and 45,753 underwent radiotherapy. Median follow-up was 6.0 years. After adjusting for baseline differences, treatments with radiotherapy (adjusted hazard ratios [aHR] 1.16-1.28, P< .0001-.04) and ADT (aHR 1.18-1.32, P< .0001-.008) were each independently associated with increased risk of coronary heart disease, sudden cardiac death, fracture, and fracture requiring hospitalization. Radiotherapy was associated with an increased
risk of myocardial infarction (aHR 1.20, P = .02), whereas ADT was not (P = .5). We did not identify a significant statistical interaction between primary and hormonal treatment. Care for cardiovascular and skeletal-related events is an important part of the survivorship phase for a significant proportion of patients with localized prostate cancer."

According to the news reporters, the research concluded: "Increasing use of ADT for patients with localized disease undergoing radiotherapy and the observed higher prevalence of these events in these patients should be considered when discussing the risks and benefits of treatment for localized prostate cancer and when formulating a survivorship plan."

For more information on this research see: Cardiovascular and Skeletal-related Events Following Localized Prostate Cancer Treatment: Role of Surgery, Radiotherapy, and Androgen Deprivation. Urology, 2016;97():145-152. Urology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Urology - www.journals.elsevier.com/urology/)

Our news correspondents report that additional information may be obtained by contacting C.J.D. Wallis, University of Toronto, Dept. of Public Hlth Sci, Toronto, ON, Canada. Liver Diseases and Conditions - Liver Fibrosis

Study Results from University of Twente Provide New Insights into Liver Fibrosis (Clinical Advancements in the Targeted Therapies against Liver Fibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Liver Fibrosis have been published. According to news reporting originating from Enschede, Netherlands, by NewsRx correspondents, research stated, "Hepatic fibrosis, characterized by excessive accumulation of extracellular matrix (ECM) proteins leading to liver dysfunction, is a growing cause of mortality worldwide. Hepatocellular damage owing to liver injury leads to the release of profibrotic factors from infiltrating inflammatory cells that results in the activation of hepatic stellate cells (HSCs)."

Funders for this research include ZonMw, University of Twente.

Our news editors obtained a quote from the research from the University of Twente, "Upon activation, HSCs undergo characteristic morphological and functional changes and are transformed into proliferative and contractile ECM-producing myofibroblasts. Over recent years, a number of therapeutic strategies have been developed to inhibit hepatocyte apoptosis, inflammatory responses, and HSCs proliferation and activation. Preclinical studies have yielded
numerous targets for the development of antifibrotic therapies, some of which have entered clinical trials and showed improved therapeutic efficacy and desirable safety profiles. Furthermore, advancements have been made in the development of noninvasive markers and techniques for the accurate disease assessment and therapy responses. Here, we focus on the clinical developments attained in the field of targeted antifibrotics for the treatment of liver fibrosis, for example, small molecule drugs, antibodies, and targeted drug conjugate."

According to the news editors, the research concluded: "We further briefly highlight different noninvasive diagnostic technologies and will provide an overview about different therapeutic targets, clinical trials, endpoints, and translational efforts that have been made to halt or reverse the progression of liver fibrosis."

For more information on this research see: Clinical Advancements in the Targeted Therapies against Liver Fibrosis. *Meditators of Inflammation*, 2016;():1-16. *Meditators of Inflammation* can be contacted at: Hindawi Publishing Corp, 315 Madison Ave 3RD Flr, Ste 3070, New York, NY 10017, USA. **DNA Research**

**Study Results from University of Ulsan Broaden Understanding of DNA Research (DNA Strand Breaks in Mitotic Germ Cells of Caenorhabditis elegans Evaluated by Comet Assay)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on DNA Research have been presented. According to news reporting originating in Ulsan, South Korea, by NewsRx journalists, research stated, "DNA damage responses are important for the maintenance of genome stability and the survival of organisms. Such responses are activated in the presence of DNA damage and lead to cell cycle arrest, apoptosis, and DNA repair."

The news reporters obtained a quote from the research from the University of Ulsan, "In *Caenorhabditis elegans*, double-strand breaks induced by DNA damaging agents have been detected indirectly by antibodies against DSB recognizing proteins. In this study we used a comet assay to detect DNA strand breaks and to measure the elimination of DNA strand breaks in mitotic germline nuclei of C. elegans. We found that C. elegans brc-1 mutants were more sensitive to ionizing radiation and camptothecin than the N2 wild-type strain and repaired DNA strand breaks less efficiently than N2. This study is the first demonstration of direct..."
measurement of DNA strand breaks in mitotic germline nuclei of C. elegans.

According to the news reporters, the research concluded: "This newly developed assay can be applied to detect DNA strand breaks in different C. elegans mutants that are sensitive to DNA damaging agents."

For more information on this research see: DNA Strand Breaks in Mitotic Germ Cells of Caenorhabditis elegans Evaluated by Comet Assay. *Molecules and Cells*, 2016;39 (3):204-10. (Springer - www.springer.com; Molecules and Cells - www.springerlink.com/content/1016-8478/)

**Oncology - Breast Cancer**

**Study Results from University of Ulsan in the Area of Breast Cancer Reported (Correlation Between MRI and the Level of Tumor-Infiltrating Lymphocytes in Patients With Triple-Negative Breast Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Increased levels of tumor-infiltrating lymphocytes (TILs) positively correlate with the pathologic complete response rate and increased survival in patients with triple-negative breast cancer (TNBC). The purpose of this study was to investigate associations between TIL levels and MRI findings in patients with TNBC."

Our news journalists obtained a quote from the research from the University of Ulsan, "From February 2006 through December 2014, a total of 112 women with TNBC were selected for inclusion in the study. All lesions were evaluated by radiologists in accordance with the BI-RADS lexicon. Lymph node involvement and multifocality were also assessed. Tumors were divided into two groups: those with a TIL level of less than 50% were included in the group with low TIL levels (hereafter referred to as the 'low-TIL group'), and those with a TIL level of 50% or more were included in the group with high TIL levels (hereafter referred to as the 'high-TIL group'). Associations between TIL levels and imaging features were evaluated. Tumors in the high-TIL group had a more round shape (46.0%), a circumscribed margin (76.0%), homogeneous enhancement (32.0%), and absence of multifocality (88.0%) (p < 0.005). Tumors in the low-TIL group had a more irregular shape (69.3%), no circumscribed margin (79.0%), heterogeneous enhancement (75.8%), and multifocality (70.9%) (p < 0.005). The well-known typical features of TNBC on MRI, including a round shape, a circumscribed margin, homogeneous enhancement, and lack of multifocality, are a major pattern of TNBC with high TIL levels."
According to the news editors, the research concluded: "This information could provide added diagnostic benefit for the identification of tumors with a good prognosis, which could further assist in optimal pretreatment planning."

For more information on this research see: Correlation Between MRI and the Level of Tumor-Infiltrating Lymphocytes in Patients With Triple-Negative Breast Cancer. *American Journal of Roentgenology*, 2016;207(5):1146-1151. *American Journal of Roentgenology* can be contacted at: Amer Roentgen Ray Soc, 1891 Preston White Dr, Subscription Fulfillment, Reston, VA 22091, USA.

**Lung Diseases and Conditions - Asthma**

**Study Results from University of Verona Provide New Insights into Asthma (PARP inhibition treatment in a nonconventional experimental mouse model of chronic asthma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Asthma have been published. According to news reporting from Verona, Italy, by NewsRx journalists, research stated, "Allergic asthma is an immunological disease that occurs as a consequence of allergen exposure. Inhibition of poly(ADP-ribose) polymerases (PARPs) in conventional models of asthma-like reaction has emerged as an effective anti-inflammatory and airway remodeling intervention."

The news correspondents obtained a quote from the research from the University of Verona, "In a house dust mite (HDM) exposure mouse model, we investigated the impact of PARP inhibition on allergic airway inflammation, sensitization, and remodeling. Mice were intranasally exposed to a HDM extract for 5 days per week for up to 5 weeks. Mice were administered, or not, by PARP inhibitors 3-aminobenizamide (3-ABA) or 5-aminoisoquinolinone (5-AIQ) during the last 2 weeks of HDM treatment. Mice treated with PARP inhibitors after HDM stimulation showed a significant decrease in the number of total cells and eosinophils detectable in the bronchoalveolar lavage fluid as compared with the HDM-stimulated ones. In vitro HDM-stimulated splenocyte culture produced considerable amounts of the Th2 cytokines that were not affected by treatment with PARP inhibitors. Immunoglobulin levels in the serum were also unchanged. In the lung tissue, collagen deposition was decreased, whereas alpha-smooth muscle actin thickening was not significantly affected. Moreover, in HDM-stimulated PARP inhibitor-treated groups, we found a downregulation in the activation of
signal transducer and activator of transcription-6 (STAT-6) and a significant decrease in the mRNA levels of C-C motif chemokine 11 (CCL11)."

According to the news reporters, the research concluded: "In this mouse model of chronic asthma PARP inhibition treatment, although it does not affect sensitization, it effectively reduces the allergic airway inflammation and affects the remodeling through a mechanism involving STAT6 and CCL11."

For more information on this research see: PARP inhibition treatment in a nonconventional experimental mouse model of chronic asthma. Naunyn-Schmiedebergs Archives of Pharmacology, 2016;389(12):1301-1313. Naunyn-Schmiedebergs Archives of Pharmacology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

Our news journalists report that additional information may be obtained by contacting M. Menegazzi, University of Verona, Biochem Sect, Dept. of Neurosci Biomed & Movement Sci, I-37134 Verona, Italy. Additional authors for this research include R. Di Paola, S. Cuzzocrea and M. Menegazzi.

Genetic Diseases and Conditions - Down Syndrome

Study Results from University of Vigo in the Area of Down Syndrome Reported (Reliability and Validity of Physical Fitness Field-Based Tests in Down Syndrome: A Systematic Review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Genetic Diseases and Conditions - Down Syndrome is the subject of a report. According to news reporting originating from Vigo, Spain, by NewsRx correspondents, research stated, "Physical fitness is an important marker of health that can be measured by means of field-based tests, though research about its psychometric properties when performed by people with Down syndrome is scarce. A systematic review was designed to identify the validity and reliability of the existing physical fitness field-based tests that have been administered to individuals with Down syndrome."

Our news editors obtained a quote from the research from the University of Vigo, "An evidence-based search for peer-reviewed studies was conducted informing about the reliability and/or validity of physical fitness field-based tests that have been administered to individuals with Down syndrome utilizing the PubMed, PEDro, SPORTDiscus, and Scopus databases throughout the period November 2014 to May 2015. Of the 15 studies selected, all provided information about reliability, but only seven included validity measurement for the field tests chosen to assess physical fitness in Down syndrome cohorts. Aerobic resistance field test assessments were the most frequent, totalling 7 studies, while 5 investigations used strength tests instead and 3 of them used balance tests. Only one study used agility as a parameter. There
was a noticeable lack of studies that analyzed the reliability or validity of physical fitness field-based tests in people with Down syndrome, especially in adult and elderly populations."

According to the news editors, the research concluded: "The half-mile run-walk, hand-held dynamometer, and the four square balance tests seem to be the most valid field-based tests when assessing aerobic endurance, muscular strength, and balance respectively in groups of persons with Down syndrome."

The news editors report that additional information may be obtained by contacting C.A. Perez, University of Vigo, Fac Educ & Sports Sci, Vigo, Spain. Additional authors for this research include I. Martinez-Lemos, J. Lago-Ballestros, J.M.C. Carral and N. Loira-Camina.

Keywords for this news article include: Vigo, Spain, Europe, Exercise, Article Review, Diagnostics and Screening, Nervous System Diseases and Conditions, Genetic Diseases and Conditions, Neurobehavioral Manifestations, Neurologic Manifestations, Congenital Abnormalities, Chromosome Disorders, Mental Retardation, Physical Fitness, Down Syndrome, University of Vigo.

Peptides - Cyclic Peptides

Study Results from University of Warmia & Mazury Broaden Understanding of Cyclic Peptides (Intraperitoneal exposure of whitefish to microcystin-LR induces rapid liver injury followed by regeneration and resilience to subsequent exposures)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Peptides - Cyclic Peptides are discussed in a new report. According to news reporting originating from Olsztyn, Poland, by NewsRx correspondents, research stated, "To date, there has been no systematic approach comprehensively describing the sequence of pathological changes in fish during prolonged exposure to microcystin-LR (MC-LR). Towards this aim, juvenile whitefish individuals received an intraperitoneal injection with pure MC-LR, and the injection was repeated every week to maintain continuous exposure for 28 days."

Financial support for this research came from National Science Centre of Poland.

Our news editors obtained a quote from the research from the University of Warmia & Mazury, "During the exposure period, growth and condition of the fish were assessed based on biometric measurements. Additionally, selected biochemical markers were analysed in the fishes' blood, and their livers were carefully examined for morphological, ultrastructural, and molecular changes. The higher dose of MC-LR (100 mu.g.kg(-1)) caused severe liver injury at the beginning of the exposure period, whereas the lower dose (10 mu g.kg(-1)) caused less, probably reversible injury, and its effects began to be observed later in the exposure period. These marked changes were accompanied by substantial MC-LR uptake by the liver. However,
starting on the 7th day of exposure, cell debris began to be removed by phagocytes, then by 14th day, proliferation of liver cells had markedly increased, which led to reconstruction of the liver parenchyma at the end of the treatment. Surprisingly, despite weekly-repeated intraperitoneal injections, MC-LR did not accumulate over time of exposure which suggests its limited uptake in the later phase of exposure. In support, mRNA expression of the membrane transport protein oatp1d was decreased at the same time as the regenerative processes were observed.

According to the news editors, the research concluded: "Our study shows that closing of active membrane transport may serve as one defence mechanism against further MC-LR intoxication."

For more information on this research see: Intraperitoneal exposure of whitefish to microcystin-LR induces rapid liver injury followed by regeneration and resilience to subsequent exposures. Nitrogen

Study Results from University of Warmia & Mazury Provide New Insights into Nitrogen (Microbial structure and nitrogen compound conversions in aerobic granular sludge reactors with non-aeration phases and acetate pulse feeding)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nitrogen have been presented. According to news reporting from Olsztyn, Poland, by NewsRx journalists, research stated, "A technological system was developed for efficient nitrogen removal from real digester supernatant in a single reactor with shortened aeration to increase the economical aspects of wastewater treatment. The supernatant (600 mg TKN/L, low COD/N ratio of 2.2) was treated in batch reactors with aerobic granules (GSBRs) to test how one, two, or three non-aeration phases and acetate pulse feeding in the cycle affect the morphological and microbial properties of biomass."

The news correspondents obtained a quote from the research from the University of Warmia & Mazury, "Introduction of one non-aeration phase in the cycle increased nitrogen removal efficiency by 11 % in comparison with constantly aerated GSBR. The additional non-aeration phases did not diminish the efficiency of ammonia oxidation but did favor nitrification to nitrate. Acetate pulse feeding in the reactor with three non-aeration phases raised the
efficiency of nitrogen removal to 77%; in parallel, the number of denitrifiers possessing nosZ genes and performing denitrification to N-2 increased. Ammonia was oxidized by aerobic and anaerobic ammonia-oxidizing bacteria and heterotrophic nitrifiers (Pseudomonas sp. and Alcaligenes faecalis) that coexisted in granules. Azoarcus sp., Rhizobium sp., and Thauera sp. were core genera of denitrifiers in granules."

According to the news reporters, the research concluded: "An increase in the number of non-aeration phases diminished EPS content in the biomass and granule diameters and increased granule density."

For more information on this research see: Microbial structure and nitrogen compound conversions in aerobic granular sludge reactors with non-aeration phases and acetate pulse feeding. *Environmental Science and Pollution Research*, 2016;23(24):24857-24870.

Algorithms

**Study Results from University of Wisconsin Provide New Insights into Algorithms (PTENpred: A Designer Protein Impact Predictor for PTEN-related Disorders)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Algorithms. According to news originating from Madison, Wisconsin, by NewsRx correspondents, research stated, "Connecting a genotype with a phenotype can provide immediate advantages in the context of modern medicine. Especially useful would be an algorithm for predicting the impact of nonsynonymous single-nucleotide polymorphisms in the gene for PTEN, a protein that is implicated in most human cancers and connected to germline disorders that include autism."

Our news journalists obtained a quote from the research from the University of Wisconsin, "We have developed a protein impact predictor, PTENpred, that integrates data from multiple analyses using a support vector machine algorithm. PTENpred can predict phenotypes related to a human PTEN mutation with high accuracy. The output of PTENpred is designed for use by biologists, clinicians, and laymen, and features an interactive display of the three-dimensional structure of PTEN. Using knowledge about the structure of proteins, in general, and the PTEN protein, in particular, enables the prediction of consequences from damage to the human PTEN gene."

According to the news editors, the research concluded: "This algorithm, which can be accessed online, could facilitate the implementation of effective therapeutic regimens for cancer and other diseases."
For more information on this research see: PTENpred: A Designer Protein Impact Predictor for PTEN-related Disorders. *Journal of Computational Biology*, 2016;23(12):969-975. *Journal of Computational Biology* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. **Digestive System Diseases and Conditions - Gastritis**

**Study Results from V. Bespalov and Colleagues in the Area of Gastritis Reported (Conifer Green Needle Complex in Patients with Precancerous Gastric Lesions: An Observational Pilot Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Digestive System Diseases and Conditions - Gastritis have been presented. According to news reporting originating in St. Petersburg, Russia, by NewsRx journalists, research stated, "Helicobacter pylori infection is common and can lead to precancerous gastric lesions. Standard antibiotic therapy has a failure rate of more than 25% from antibiotic resistance."

Financial support for this research came from Russian Government’s Ministry of Healthcare and Social Development.

The news reporters obtained a quote from the research, "The primary aim of this observational pilot study was to test the feasibility of a large-scale clinical trial of Conifer Green Needle Complex (CGNC) to treat precancerous gastric lesions. Secondary aims were to investigate H. pylori infection, stomach function, and histopathology of the gastric mucosa. A tablet form of CGNC (extracted from Pinus sylvestris and Picea abies (L) Karst) was prescribed to 26 patients with precancerous gastric lesions (two tablets, 100 mg CGNC/tablet, three times per day for six months). Another 24 patients received no treatment. Compared with control patients, CGNC-treated patients showed total or partial regression (using the quantitative Rome III diagnostic criteria) of dyspeptic symptoms (92.3%, p< 0.0001), eradication of H. pylori infection (57.1%, p< 0.03), a reduction in endoscopic signs of gastritis (92.3%, p< 0.001), an increase of pepsinogen-pepsin in the gastric juice (57.7%, p< 0.05), and total regression or reduction in the degree of intestinal metaplasia (46.2%, p< 0.05) and lymphoplasmacytic infiltration (53.8%, p< 0.05)."

According to the news reporters, the research concluded: "This study justifies a randomised-controlled trial with CGNC in patients with atrophic gastritis."

For more information on this research see: Conifer Green Needle Complex in Patients with Precancerous Gastric Lesions: An Observational Pilot Study. *Evidence-Based*
Oncology - Melanoma

Study Results from V. Lucarini et al Provide New Insights into Melanoma (Combining Type I Interferons and 5-Aza-2'-Deoxycytidine to Improve Anti-Tumor Response against Melanoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Melanoma have been published. According to news reporting out of Rome, Italy, by NewsRx editors, research stated, "Resistance to IFN-I-induced antineoplastic effects has been reported in many tumors and arises, in part, from epigenetic silencing of IFN-stimulated genes by DNA methylation. We hypothesized that restoration of IFN-stimulated genes by co-administration of the demethylating drug 5-aza-2'-deoxycytidine (decitabine [DAC]) may enhance the susceptibility to IFN-I-mediated antitumoral effects in melanoma."

Our news journalists obtained a quote from the research, "We show that combined administration of IFN-I and DAC significantly inhibits the growth of murine and human melanoma cells, both in vitro and in vivo. Compared with controls, DAC/IFN-I-treated melanoma cells exhibited reduced cell growth, augmented apoptosis, and diminished migration. Moreover, IFN-I and DAC synergized to suppress the growth of three-dimensional human melanoma spheroids, altering tumor architecture. These direct antitumor effects correlated with induction of the IFN-stimulated gene Mx1. In vivo, DAC/IFN-I significantly reduced melanoma growth via stimulation of adaptive immunity, promoting tumor-infiltrating CD8(+) T cells while inhibiting the homing of immunosuppressive CD11b(+) myeloid cells and regulatory T cells. Accordingly, exposure of human melanoma cells to DAC/IFN-I induced the recruitment of immune cells toward the tumor in a Matrigel (Corning Life Sciences, Kennebunkport, ME)-based microfluidic device."

According to the news editors, the research concluded: "Our findings underscore a beneficial effect of DAC plus IFN-I combined treatment against melanoma through both direct
and immune-mediated anti-tumor effects."

For more information on this research see: Combining Type I Interferons and 5-Aza-2'-Deoxycytidine to Improve Anti-Tumor Response against Melanoma. *Journal of Investigative Dermatology*, 2017;137(1):159-169. *Journal of Investigative Dermatology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Oncology - Breast Cancer**

**Study Results from VIT University Provide New Insights into Breast Cancer [Identification and targeting of microRNAs modulating acquired chemotherapy resistance in Triple negative breast cancer (TNBC): A better strategy to combat chemoresistance]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating from Tamil Nadu, India, by NewsRx editors, the research stated, "Triple negative breast cancer (TNBC) is a heterogeneous form of malignant disease. Due to lack of proper therapeutic target treatment options are restricted and relies primarily on chemotherapeutic modality for treatment of patients."

Our news editors obtained a quote from the research from VIT University, "Despite significant early regression of the disease in response to chemotherapy, complete cure is not assured with development of resistant tumors which is difficult to manage clinically. In the last decades, the regulation and contribution of microRNAs in tumorigenesis including breast cancers have been well-documented. Thus, here it is hypothesized that by identifying the microRNAs responsible for chemoresistance in TNBC and targeting the microRNAs along with chemotherapeutic approaches might exert an improved response. To accomplish this, an in vivo screening has to be performed by transfecting tumor cell line with lentiviral pool of library expressing microRNAs."

According to the news editors, the research concluded: "Following treatment of primary tumors in mice and growth of relapsed tumors, microRNA profile has to be analyzed by qRT-PCR and sequencing to detect the microRNAs contributing to the chemoresistance which can be targeted by anti-microRNA strategies."

For more information on this research see: Identification and targeting of microRNAs modulating acquired chemotherapy resistance in Triple negative breast cancer (TNBC): A better strategy to combat chemoresistance. *Medical Hypotheses*, 2016;96(5):5-8.
**Heart Disorders and Diseases - Heart Failure**

**Study Results from Veterans Affairs Medical Center Update Understanding of Heart Failure [Chronic Oral Study of Myosin Activation to Increase Contractility in Heart Failure (COSMIC-HF): a phase 2, pharmacokinetic, randomised, placebo-controlled ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Failure are discussed in a new report. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "Impaired contractility is a feature of heart failure with reduced ejection fraction. We assessed the pharmacokinetics and effects on cardiac function and structure of the cardiac myosin activator, omecamtiv mecarbil."

Our news editors obtained a quote from the research from Veterans Affairs Medical Center, "In this randomised, double-blind study, done at 87 sites in 13 countries, we recruited patients with stable, symptomatic chronic heart failure and left ventricular ejection fraction 40% or lower. Patients were randomly assigned equally, via an interactive web response system, to receive 25 mg oral omecamtiv mecarbil twice daily (fixed-dose group), 25 mg twice daily titrated to 50 mg twice daily guided by pharmacokinetics (pharmacokinetic-titration group), or placebo for 20 weeks. We assessed the maximum concentration of omecamtiv mecarbil in plasma (primary endpoint) and changes in cardiac function and ventricular diameters. This trial is registered with ClinicalTrials.gov, number NCT01786512. From March 17, 2014, to March 5, 2015, we enrolled 150 patients in the fixed-dose omecamtiv mecarbil group and 149 in the pharmacokinetic-titration and placebo groups. Mean maximum concentration of omecamtiv mecarbil at 12 weeks was 200 (SD 71) ng/mL in the fixed-dose group and 318 (129) ng/mL in the pharmacokinetic-titration group. For the pharmacokinetic-titration group versus placebo group at 20 weeks, least square mean differences were as follows: systolic ejection time 25 ms (95% CI 18-32, p< 0.0001), stroke volume 3.6 mL (0.5-6.7, p= 0.0217), left ventricular end-systolic diameter -1.8 mm (-2.9 to -0.6, p= 0.0027), left ventricular end-diastolic diameter -1.3 mm, (-2.3 to 0.3, p= 0.0128), heart rate -3.0 beats per min (-5.1 to -0.8, p= 0.0070), and N-terminal pro B-type natriuretic peptide concentration in plasma -970 pg/mL (-1672 to -268, p= 0.0069). The frequency of adverse clinical events did not differ between groups."

According to the news editors, the research concluded: "Omecamtiv mecarbil dosing
guided by pharmacokinetics achieved plasma concentrations associated with improved cardiac function and decreased ventricular diameter."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/S0140-6736(16)32049-9. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Melanoma**

**Study Results from Veterans Affairs Medical Center in the Area of Melanoma Reported (Genetic predisposition to melanoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Melanoma. According to news reporting from Salt Lake City, Utah, by NewsRx journalists, research stated, "Malignant melanoma is a rare, often fatal form of skin cancer with a complex multigenic etiology. The incidence of melanoma is increasing at an alarming rate."

The news correspondents obtained a quote from the research from Veterans Affairs Medical Center, "A number of heritable factors contribute to a patient's overall melanoma risk, including response to ultraviolet light, nevus number, and pigmentation characteristics, such as eye and hair color. Approximately 5%-10% of melanoma cases are familial, yet the majority of familial cases lack identifiable germ-line mutations in known susceptibility genes. Additionally, most familial melanomas lack germ-line mutations in genes that are commonly mutated in sporadic melanoma. Candidate and systematic genome-wide association studies have led to an improved understanding of the risk factors for melanoma and the identification of susceptibility genes."

According to the news reporters, the research concluded: "In this review, we provide an overview of the major risk factors and known genes implicated in familial melanoma susceptibility."

For more information on this research see: Genetic predisposition to melanoma. *Seminars in Oncology*, 2016;43(5):591-597. *Seminars in Oncology* can be contacted at: W B Saunders Co-Elsevier Inc, 1600 John F Kennedy Boulevard, Ste 1800, Philadelphia, PA 19103-
2899, USA. (Elsevier - www.elsevier.com; Seminars in Oncology - www.journals.elsevier.com/seminars-in-oncology/)

Our news journalists report that additional information may be obtained by contacting L.J. Meyer, Vet Adm Hosp, Salt Lake City, UT 84149, United States. Additional authors for this research include A. Truong and L.J. Meyer.

Blood Diseases and Conditions - Sepsis

Study Results from Veterans General Hospital Broaden Understanding of Sepsis (Daptomycin antibiotic lock therapy for hemodialysis patients with Gram-positive bloodstream infections following use of tunneled, cuffed hemodialysis catheters: ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Blood Diseases and Conditions - Sepsis is the subject of a report. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "Catheter-related bloodstream infection (CRBSI) is a major complication in hemodialysis patients. We assessed the efficacy of systemic daptomycin (DPT) plus DPT antibiotic lock therapy (DPT-ALT) for catheter salvage in patients with Gram-positive CRBSIs."

The news reporters obtained a quote from the research from Veterans General Hospital, "This is a retrospective study of hemodialysis patients with tunneled and cuffed hemodialysis catheters. All patients were from a single institution in Taipei and received systemic DPT plus DPT-ALT for the treatment of Gram-positive CRBSI. Successful resolution of CRBSI was implemented. Resolution of fever within 48 hours, negative result of repeated blood cultures after resolution of fever, no clinical evidence of CRBSI relapse and no need for catheter removal were measured. Fifteen hemodialysis patients received DPT-ALT for CRBSI, nine with coagulase-negative Staphylococcus (CONS), two with methicillin-resistant Staphylococcus aureus (MRSA), three with methicillin-sensitive Staphylococcus aureus (MSSA) and one with polymicrobial infections. Systemic DPT plus DPT-ALT cured 11 patients (73.3%). Treatment failed in all three MRSA cases (two with MRSA and one with MRSA + Enterococcus faecalis). Retrospective design and small sample size were the limitations of this study. Systemic DPT plus DPT-ALT appears to be a promising treatment for CRBSI from CONS and MSSA, but not for MRSA CRBSI."

According to the news reporters, the research concluded: "Systemic DPT plus DPT-ALT should be considered for patients with CRBSIs caused by certain species."

For more information on this research see: Daptomycin antibiotic lock therapy for hemodialysis patients with Gram-positive bloodstream infections following use of tunneled, cuffed hemodialysis catheters: retrospective single center analysis. Hemodialysis International
Our news correspondents report that additional information may be obtained by contacting H.W. Yen, Division of Nephrology, Dept. of Medicine, Taipei Veterans General Hospital, Taipei, Taiwan. Oncology - Lung Cancer

Study Results from Virginia Commonwealth University Update Understanding of Lung Cancer (Promising Approaches From Behavioral Economics to Improve Patient Lung Cancer Screening Decisions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news reporting from Richmond, Virginia, by NewsRx journalists, research stated, "Lung cancer is a devastating disease, the deadliest form of cancer in the world and in the United States. As a consequence of CMS's determination to provide low-dose CT (LDCT) as a covered service for at-risk smokers, LDCT lung cancer screening is now a covered service for many at-risk patients that first requires counseling and shared clinical decision making, including discussions of the risks and benefits of LDCT screening."

The news correspondents obtained a quote from the research from Virginia Commonwealth University, "However, shared decision making fundamentally relies on the premise that with better information, patients will arrive at rational decisions that align with their preferences and values. Evidence from the field of behavioral economics offers many contrary viewpoints that take into account patient decision making biases and the role of the shared decision environment that can lead to flawed choices and that are particularly relevant to lung cancer screening and treatment."

According to the news reporters, the research concluded: "This article discusses some of the most relevant biases, and suggests incorporating such knowledge into screening and treatment guidelines and shared decision making best practices to increase the likelihood that such efforts will produce their desired objectives to improve survival and quality of life."

Study Results from Washington State University Update Understanding of Neuroglia (Antiprion Activity of DB772 and Related Monothiophene- and Furan-Based Analogs in a Persistently Infected Ovine Microglia Culture System)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neuroglia. According to news originating from Pullman, Washington, by NewsRx correspondents, research stated, "The transmissible spongiform encephalopathies are fatal neurodegenerative disorders characterized by the misfolding of the native cellular prion protein (PrPC) into the accumulating, disease-associated isoform (PrPSc). Despite extensive research into the inhibition of prion accumulation, no effective treatment exists."

Financial supporters for this research include HHS | National Institutes of Health (NIH), U.S. Department of Agriculture (USDA), University of Georgia Office of the Vice President for Research, USDA Animal Health Formula Funds.

Our news journalists obtained a quote from the research from Washington State University, "Previously, we demonstrated the inhibitory activity of DB772, a monocationic phenyl-furan-benzimidazole, against PrPSc accumulation in sheep microglial cells. In an effort to determine the effect of structural substitutions on the antiprion activity of DB772, we employed an in vitro strategy to survey a library of structurally related, monothiophene-and furan-based compounds for improved inhibitory activity. Eighty-nine compounds were screened at 1 μM for effects on cell viability and prion accumulation in a persistently infected ovine microglia culture system. Eleven compounds with activity equivalent to or higher than that of DB772 were identified as preliminary hit compounds. For the preliminary hits, cytotoxicities and antiprion activities were compared to calculate the tissue culture selectivity index. A structure-activity relationship (SAR) analysis was performed to determine molecular components contributing to antiprion activity. To investigate potential mechanisms of inhibition, effects on PrPC and PrPSc were examined. While inhibition of total PrPC was not observed, the results suggest that a potential target for inhibition at biologically relevant concentrations is through PrPC misfolding to PrPSc. Further, SAR analysis suggests that two structural elements were associated with micromolar antiprion activity."

According to the news editors, the research concluded: "Taken together, the described data provide a foundation for deeper investigation into untested DB compounds and in the design of effective therapeutics."
For more information on this research see: Antiprion Activity of DB772 and Related Monothiophene- and Furan-Based Analogs in a Persistently Infected Ovine Microglia Culture System. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5467-5482. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news correspondents report that additional information may be obtained from D.A. Schneider, Washington State University, Anim Dis Res Unit, Pullman, WA 99164, United States. Additional authors for this research include J.B. Stanton, D.W. Boykin, C.E. Stephens, S.A. Madsen-Bouterse and D.A. Schneider.

**Drugs and Therapies - Antidiuretic Hormones**

**Study Results from X. Cao and Colleagues in the Area of Antidiuretic Hormones Reported (Comparison of anti-anginal effect of cilnidipine with those of nicardipine and nifedipine in the vasopressin-induced angina model of rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antidiuretic Hormones. According to news reporting originating in Yamanashi, Japan, by NewsRx journalists, research stated, "We assessed the anti-anginal effects of cilnidipine in comparison with those of nicardipine and nifedipine (1 and 10 Âµg/kg, n = 6 for each drug) or vehicle (n = 6) by using the vasopressin-induced angina model of rats. The administration of vasopressin (0.5 IU/kg, i.v.) to the rats depressed the S-wave level of the electrocardiogram reflecting the presence of subendocardial ischemia, whereas it significantly increased the mean blood pressure, resulting in the decrease of the heart rate and the prolongation of the PR interval possibly through a reflex-mediated increase in vagal tone."

Funders for this research include Project Research Grant of Toho University School of Medicine, JSPS KAKENHI, MEXT KAKENHI, AMED Grant.

The news reporters obtained a quote from the research, "Cilnidipine suppressed the vasopressin-induced depression of the S-wave level in a dose-related manner, which was not observed by nicardipine or nifedipine. In addition, the low dose of cilnidipine hardly affected the vasopressin-induced pressor response, but it attenuated the negative dromotropic effect, suggesting N-type Ca2+ channel inhibition by cilnidipine might have suppressed the parasympathetic nerve activity in vivo like those reported in the sympathetic nerve."

According to the news reporters, the research concluded: "Thus, cilnidipine may become a useful strategy for inhibiting coronary vasospasm-induced anginal attack."

For more information on this research see: Comparison of anti-anginal effect of cilnidipine with those of nicardipine and nifedipine in the vasopressin-induced angina model of rats.

**Neurodegenerative Diseases and Conditions**

**Study Results from Xiamen University Broaden Understanding of Alzheimer Disease (F-18-Labeled Benzyldiamine Derivatives as Novel Flexible Probes for Positron Emission Tomography of Cerebral beta-Amyloid Plaques)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Neurodegenerative Diseases and Conditions - Alzheimer Disease have been presented. According to news originating from Fujian, People's Republic of China, by NewsRx correspondents, research stated, "Early noninvasive visualization of cerebral beta-amyloid (A beta) plaques with positron emission tomography (PET) is the most feasible way to diagnose Alzheimer's disease (AD). In this study, a series of flexible benzyldiamine derivatives (BDA) were proposed for binding to aggregated beta-amyloid 1-42 (A beta(1-42)) with high adaptability, high binding affinity (6.8 +/- 0.6 nM), and rapid body excretion."

Our news journalists obtained a quote from the research from Xiamen University, "The methylthio (12) and ethoxyl (10) derivatives were further labeled with F-18 directly on their benzene ring and examined as PET probes for A beta plaque imaging. [F-18]12 displayed 4.87 +/- 0.52% ID/g initial uptake and prompt washout from normal brain in biodistribution studies. MicroPET-CT imaging indicated sufficient retention of [F-18]12 but lower white matter uptake in the brain of an AD transgenic mouse model compared with that of commercial [F-18] AV-45."

According to the news editors, the research concluded: "Our experimental results provide new insights for developing targeting ligands possessing a flexible framework for use as efficient A beta probes for PET imaging of AD brain."

Oncology - Breast Cancer

Study Results from Y. Su and Colleagues in the Area of Breast Cancer Reported (Development and characterization of two human triple-negative breast cancer cell lines with highly tumorigenic and metastatic capabilities)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Triple-negative breast cancer (TNBC) is a group of cancer with high diversity, limited therapies, and poor prognosis. TNBC cell lines and animal models provide effective tools for studies and drug discovery."

Financial supporters for this research include The Pennsylvania Cancer Cure, National Institutes of Health, National Cancer Institute, Fox Chase Cancer Center.

Our news editors obtained a quote from the research, "Here, we report the development of two TNBC cell lines (XtMCF and LmMCF) based on our existing cell model that consists of normal breast epithelial cell line MCF10F, estradiol-transformed cells trMCF, and Boyden chamber-selected tumorigenic cells bsMCF. The XtMCF and LmMCF cell line were derived from xenograft and lung metastasis of bsMCF cells, respectively. The bsMCF, XtMCF, and LmMCF cells have undergone epithelial-mesenchymal transition (EMT), exhibiting a mesenchymal-like feature. In vivo studies showed XtMCF and LmMCF cells were highly tumorigenic and metastatic. The injection of 5 ? 10(4) cells to CB17/SCID mice mammary fat pad produced xenografts in 9/9 mice and tumors reached 10 millimeters in diameter in 5 weeks. The injection of 1 ? 10(6) XtMCF or 8 ? 10(4) LmMCF cells into the mice tail vein was sufficient to form extensive lung metastases in 4 weeks. The two new cell lines exhibited CD44(+) /CD49f(+) and CD44(+) /EpCAM(+) cancer stem cell (CSC) characteristics, and the EGF-like domain of EpCAM was cleaved off. Together with the normal and early transformed counterparts, herein we provide a complete cancer model for the study of initiation, evolution, and identification of new therapeutics for TNBC."

According to the news editors, the research concluded: "The finding that EGF-like domain of EpCAM was cleaved off in cells which have undergone EMT suggests this cleavage may be involved in the EMT process and the cancer stem cell properties of these cells."

The news editors report that additional information may be obtained by contacting Y. Su, The Irma H Russo, MD Breast Cancer Research Laboratory, Fox Chase Cancer Center-Temple University Health System, Philadelphia, PA, 19111, United States. Additional authors for this research include T.J. Pogash, T.D. Nguyen and J. Russo.

**Kidney Diseases and Conditions - Chronic Kidney**

**Study Results from Yang Ming National University Broaden Understanding of Chronic Kidney Disease (Abnormal Thyroid-Stimulating Hormone and Chronic Kidney Disease in Elderly Adults in Taipei City)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Kidney Diseases and Conditions - Chronic Kidney Disease have been published. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "To examine whether older people with abnormal thyroid function are more likely to develop chronic kidney disease (CKD) over a 5-year follow-up period. Retrospective cohort study."

The news reporters obtained a quote from the research from Yang Ming National University, "Health examination data from the Taipei Databank for Public Health Analysis. Individuals aged 65 and older (N = 41,454). Thyroid-stimulating hormone (TSH) levels were repeatedly measured, and subjects were categorized into four thyroid function groups (hyperthyroid, euthyroid, subclinical hypothyroid, overt hypothyroid). The risk of incident CKD was evaluated using a stepwise Cox proportional hazards regression model adjusted for sex, baseline age, hypertension, diabetes mellitus (DM), dyslipidemia, hyperuricemia, anemia, obesity, liver function, smoking, and alcohol. Higher TSH levels were associated with greater risk of subsequent CKD. Individuals with subclinical hypothyroidism (hazard ratio (HR) = 1.15, 95% confidence interval (CI) = 1.05-1.26) and those with overt hypothyroidism (HR = 1.27, 95% CI = 1.04-1.55) were more likely than those who were euthyroid to have CKD. Women were more likely to have CKD than men (HR = 1.11, 95% CI = 1.06-1.16). When stratified by gender, subclinical hypothyroidism in women was associated with an increased risk of developing CKD (HR = 1.22; 95% CI = 1.08-1.39). When stratified by DM, subclinical hypothyroidism and overt hypothyroidism were associated with an increased risk of developing CKD in nondiabetics (HR = 1.19; 95% CI = 1.07-1.31; and HR = 1.34; 95% CI = 1.08-1.65, respectively)."
According to the news reporters, the research concluded: "This cohort study of elderly persons in Taipei City found a significant association between hypothyroidism and development of CKD in women and individuals without DM."

Our news correspondents report that additional information may be obtained by contacting P. Chou, Yang Ming National University, Community Med Res Center, Taipei 11221, Taiwan. Additional authors for this research include K.M. Liao, Y.M. Hung, P.Y.P. Wang, Y.C. Chou and P. Chou.

**Pharmacokinetics**

**Study Results from Yonsei University in the Area of Pharmacokinetics Reported (Quantitative determination of xanthorrhizol in rat plasma by HPLC-MS/MS and its application to a pharmacokinetic study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacokinetics have been presented. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "Although xanthorrhizol, a sesquiterpenoid oil isolated from the rhizoma of Curcuma xanthorrhiza Roxb. known as Java turmeric, represents a variety of pharmacological activities, to date, there have been no validated determination methods of xanthorrhizol in biological samples. Thus, we developed a liquid chromatographic method using a tandem mass spectrometry for the determination of xanthorrhizol in rat plasma."

The news reporters obtained a quote from the research from Yonsei University, "After simple protein precipitation with acetonitrile including diclofenac (internal standard, IS), the analytes were chromatographed on a reversed-phased column with a mobile phase of 20 mM ammonium acetate aqueous solution and acetonitrile (20:80, v/v). The ion transitions of the precursor to the product ion were principally deprotonated ions [M-H](-) at m/z 216.9 -> 132.8 for xanthorrhizol and 296.1 -> 251.7 for the IS. The accuracy and precision of the assay were in accordance with FDA regulations for the validation of bioanalytical methods."

According to the news reporters, the research concluded: "This analytical method was successfully applied to monitor plasma concentrations of xanthorrhizol over time following intravenous administration in rats."
For more information on this research see: Quantitative determination of xanthorrhizol in rat plasma by HPLC-MS/MS and its application to a pharmacokinetic study. *Journal of Pharmaceutical and Biomedical Analysis*, 2017;132():56-59. *Journal of Pharmaceutical and Biomedical Analysis* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Pharmaceutical and Biomedical Analysis - www.journals.elsevier.com/journal-of-pharmaceutical-and-biomedical-analysis/)

Oncology - Squamous Cell Carcinoma

**Study Results from Zhejiang Cancer Hospital Update Understanding of Squamous Cell Carcinoma (Prechemotherapy neutrophil : lymphocyte ratio is superior to the platelet : lymphocyte ratio as a prognostic indicator for locally advanced esophageal ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Squamous Cell Carcinoma are discussed in a new report. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "The study aimed to evaluate the prognostic significance of prechemotherapy neutrophil to lymphocyte ratio and platelet to lymphocyte ratio, and preoperative neutrophil to lymphocyte ratio and platelet to lymphocyte ratio in locally advanced esophageal squamous cell cancer. We analyzed retrospectively locally advanced esophageal squamous cell cancer patients who had received neoadjuvant chemotherapy before undergoing a radical esophagectomy between 2009 and 2012."

The news reporters obtained a quote from the research from Zhejiang Cancer Hospital, "Neutrophil to lymphocyte ratio and platelet to lymphocyte ratio before chemotherapy and before the surgery were calculated. Univariate analyses showed that prechemotherapy neutrophil to lymphocyte ratio >5 (P = 0.048, hazard ratio = 2.86; 95% confidence interval: 1.01-8.12) and prechemotherapy platelet to lymphocyte ratio >130 (P = 0.025, hazard ratio = 5.50; 95% confidence interval: 1.23-24.55) were associated significantly with overall survival (OS), and prechemotherapy platelet to lymphocyte ratio >130 (P = 0.026, hazard ratio = 3.18; 95% confidence interval: 1.15-8.85) was associated significantly with progression-free survival. However, only prechemotherapy neutrophil to lymphocyte ratio >5 (P = 0.024, hazard ratio = 3.50; 95% confidence interval: 1.18-10.40) remained significantly associated with OS in multivariate analyses. Neither preoperative neutrophil to lymphocyte ratio nor platelet to lymphocyte ratio was associated with OS or progression-free survival. The prechemotherapy neutrophil to lymphocyte ratio >5 to preoperative neutrophil to lymphocyte ratio = 5 group showed significantly worse OS than the prechemotherapy neutrophil to lymphocyte ratio = 5 to preoperative neutrophil to lymphocyte ratio <= 5 group (P = 0.050). The prechemotherapy..."
platelet to lymphocyte ratio >130 to preoperative platelet to lymphocyte ratio ≤ 130 group (P = 0.016) and platelet to lymphocyte ratio >130 to preoperative platelet to lymphocyte ratio >130 group (P = 0.042) showed significantly worse OS than the prechemotherapy platelet to lymphocyte ratio ≤ 30 to preoperative platelet to lymphocyte ratio ≤ 130 group."

According to the news reporters, the research concluded: "Prechemotherapy neutrophil to lymphocyte ratio is an independent prognostic factor for OS in patients with advanced esophageal squamous cell cancer treated with neoadjuvant chemotherapy, and, as an adverse prognostic predictor, increased prechemotherapy neutrophil to lymphocyte ratio is superior to platelet to lymphocyte ratio. Maintaining a low neutrophil to lymphocyte ratio and platelet to lymphocyte ratio throughout treatment is a predictor of better OS."

For more information on this research see: Prechemotherapy neutrophil to lymphocyte ratio is superior to the platelet to lymphocyte ratio as a prognostic indicator for locally advanced esophageal squamous cell cancer treated with neoadjuvant chemotherapy. Diseases of the Esophagus, 2016;29(5):403-411. Diseases of the Esophagus can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Heart Disorders and Diseases - Brugada Syndrome

Study Results from Zhejiang University Broaden Understanding of Brugada Syndrome (Characterization of the epicardial substrate for catheter ablation of Brugada syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Brugada Syndrome are presented in a new report. According to news reporting from Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "Catheter ablation in the right ventricular outflow tract (RVOT) may modify the electrophysiologic substrate for recurrent ventricular tachycardia/ventricular fibrillation (VT/VF) in patients with Brugada syndrome (BrS). The purpose of this study was to investigate the mechanism and arrhythmogenic substrate of VT/VF and to evaluate the long-term outcomes of catheter ablation in patients with BrS."

The news correspondents obtained a quote from the research from Zhejiang University, "Eleven consecutive patients with BrS referred to 2 academic medical centers underwent combined epicardial-endocardial electroanatomic mapping. Catheter ablation was performed in regions of localized conduction slowing. Transmural dispersion of late activation was calculated as the difference between the latest activation between epicardium and
endocardium, and low voltage areas were analyzed. Eleven patients met diagnostic criteria for BrS (spontaneous type 1, n = 9; Na channel provocation = 2). All patients were found to have a localized region in the anterior epicardial RVOT with conduction slowing evidenced by prolonged electrogram duration (78.79 +/- 19.87 ms vs 58.93 +/- 10.11 ms in epicardial right ventricle, and 59.87 +/- 12.61 ms in endocardial RVOT, P<.005, respectively) with variable low voltage (0.97 +/- 0.48 mV; median scar area 19.8 +/- 25.9 cm(2)). Epicardial ablation resulted in normalization of spontaneous type 1 Brugada ECG pattern in all patients, and 73% were free from VT/VF at 25 +/- 11 months. Prolonged electrograms localized to epicardial RVOT with variable low voltage were identified in all patients with BrS. J-point and ST-segment elevation correlated with greater transmural dispersion of late activation and was independent of total low voltage area."

According to the news reporters, the research concluded: "Despite normalization of spontaneous type 1 pattern in all patients after ablation, recurrence was still observed, suggesting the implantable cardioverter-defibrillator as the cornerstone therapy for BrS."

Oncology - Prostate Cancer

Study Results from Zhejiang University Provide New Insights into Prostate Cancer (Reduced risk of prostate cancer in childless men as compared to fathers: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Prostate Cancer. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "The previously reported association between fatherhood status and prostate cancer risk was controversial. We carried out the present meta-analysis of all relevant studies to summarize evidence on this association."

The news reporters obtained a quote from the research from Zhejiang University, "A
A comprehensive literature search of studies was performed in PubMed, Web of Science, and the Chinese National Knowledge Infrastructure (CNKI) databases, covering all the papers published from their inception to September 2015. The combined risk estimates with 95% confidence intervals (CIs) were calculated using a random effects model. Heterogeneity and publication bias were also evaluated. A total of 11 studies were finally included in this meta-analysis. We found a significantly reduced risk of prostate cancer associated with being childless (OR 0.91, 95% CI 0.87-0.96). There was statistically significant heterogeneity across the studies (p <0.001, I(2)=88.2%). In summary, this meta-analysis supports that being fatherless is associated with a lower risk of prostate cancer.

According to the research reporters, the research concluded: "Because of the substantial heterogeneity and residual confounding, using other study designs to further explore this association and the underlying mechanism is warranted."

For more information on this research see: Reduced risk of prostate cancer in childless men as compared to fathers: a systematic review and meta-analysis. *Scientific Reports*, 2016;6():19210. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Drugs and Therapies - Drug Resistance**

**Study unmasks the genetic complexity of cancer cells within the same tumor**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study led by Cedars-Sinai investigators dramatically illustrates the complexity of cancer by identifying more than 2,000 genetic mutations in tissue samples of esophageal tumors. The findings reveal that even different areas of individual tumors have various genetic patterns.

The study results, published in the journal Nature Genetics, help explain why it is so difficult to battle cancer by targeting a specific genetic defect. A surgeon who performs a single biopsy on a patient's tumor can decode only part of the tumor and its genetic variations. Additionally, cancer cells constantly change their makeup.

"A tumor is not a single disease," said Dechen Lin, PhD, assistant professor and research scientist in the Division of Hematology and Oncology in the Cedars-Sinai Department of Medicine. "It's many diseases within the same person and over time. There are millions of cells in a tumor, and a significant proportion of them are different from each other." Lin was the
The cancer that the team studied, esophageal squamous cell carcinoma, is especially difficult to treat. The disease attacks the esophagus, the hollow tube that connects the throat to the stomach. The five-year survival rate for patients with esophageal cancer is about 20 percent, according to the American Cancer Society.

To create their catalog of mutations, the study's investigators called on high-powered computers to compile genetic data on 51 tumor samples taken from 13 patients. Through complex algorithms, they analyzed both the genes and the processes, known as epigenetics, that turned the genes' activities on and off within the cancer cells.

Using these techniques, the investigators identified 2,178 genetic variations in the sampled tumors. Dozens of the variations involved genes known to be associated with enabling the development of cancer. The most striking finding was that many important mutations were detected only in some areas of a tumor, highlighting the complexity of the cancer cells. This finding also demonstrated the potential for inaccurate interpretation of a cancer's genetic makeup using the single-biopsy method, which is the standard approach in the clinic.

Besides cataloging these genetic variations, the study's investigators reconstructed a "biography" of the tumors, showing when some of these variations first appeared in the life cycle of the disease.

"This study is on the leading edge of looking within a tumor for heterogeneity, or variations, across patients and within the same patient. It also is one of the very first studies to look at epigenetic changes from different areas within a single tumor in a global way," said Benjamin Berman, PhD, the study's co-senior author, an associate professor of Biomedical Sciences and co-director of the Cedars-Sinai Center for Bioinformatics and Functional Genomics.

To meet the challenge of integrating this diverse data, Huy Dinh, PhD, a project scientist in Berman's laboratory and one of the study's co-lead authors, developed innovative computational methods.

Looking ahead, the investigators plan to apply their analytic techniques to other cancers and explore the significance of the genetic and epigenetic changes that they have so far identified. They view their work as fundamental to developing effective, individualized therapies to combat the drug resistance that many cancer patients face during the course of their disease.

"Evidence suggests that tumor heterogeneity is one of the major causes of drug resistance and treatment failure in cancer," said H. Phillip Koeffler, MD, professor of Medicine and the Mark Goodson Chair in Oncology Research at Cedars-Sinai. "In light of this situation, deciphering the genomic diversity and evolution of tumors can provide a basis for identifying new targets and designing personalized medicine strategies." Koeffler was the other co-senior author of the study.

Sugar element of keratan sulfate halts the progress of emphysema

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Using a mouse model, scientists from the RIKEN-Max Planck Joint Research Center for Systems Chemical Biology and a number of other institutes have identified a sugar molecule that reduced the inflammatory response and progress of emphysema, a common component of chronic obstructive pulmonary disease (COPD). According to Naoyuki Taniguchi, the leader of the group, this discovery could lead to the development of drugs based on glycans--biological sugar molecules--for the treatment of diseases such as COPD, which is the fourth leading cause of death worldwide.

As part of the research group's work to explore the roles of sugar molecules in health and disease, they found that keratan sulfate, a large negatively charged saccharide found in the small airway of the lung, is decreased in mice that have been exposed to cigarette smoke. They wondered if this decrease might be associated with the damage that smoking causes to the lung. Taniguchi says, "We are not absolutely sure of the mechanism through which smoking leads to a reduction in keratan sulfate, but felt that clearly the reduction is important in thinking about glycan-based strategies for combating emphysema and COPD."

They wondered whether the keratan sulfate might be playing a protective role in COPD. To test the hypothesis, they prepared a repeating disaccharide element of keratan sulfate, named L4, and administered it into two mouse models of emphysema--one a model of emphysema triggered by the enzyme elastase, and the other an exacerbation of smoking-induced emphysema triggered by LPS, a toxin found in bacterial cell walls.

In the first model, they found that that treatment with L4 prevented destruction of the alveoli--the small air sacs in lungs that are used to exchange gases, and in addition that it reduced the infiltration of a type of white blood cell called neutrophils, which is symptomatic of an inflammatory response, as well as levels of inflammatory cytokines and tissue-degrading enzymes. Although L4 was shown to inhibit these enzymes, they did not find any ability of L4 to directly reduce the production of cytokines or reactive oxygen species, so concluded that the action was also being done indirectly, through mechanisms involving the neutrophils.

In the exacerbation model, they found that the L4 administration prevented the influx of neutrophils. According to Taniguchi, "We found that L4 was as effective as dexamethasone in reducing neutrophil infiltration. This is very exciting, because dexamethasone, the treatment currently used for COPD, is a steroid medication that can have serious side effects and can in some cases make the outcome worse. It will be exciting if we can show that L4--a sugar molecule which we found had no adverse effects in the mice even at high doses--can be used as a treatment for this condition, which exerts a tremendous health burden."

According to Taniguchi, there is still work to be done in the area. "We plan now to try to determine exactly how L4 blocks neutrophil migration, by finding a target receptor protein, and how L4 can suppress inflammation in vivo, as this could give us important insights into the mechanism of COPD progression and how it can be halted."

Synthetic stem cells could offer therapeutic benefits, reduced risks

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers from North Carolina State University, the University of North Carolina at Chapel Hill and First Affiliated Hospital of Zhengzhou University have developed a synthetic version of a cardiac stem cell. These synthetic stem cells offer therapeutic benefits comparable to those from natural stem cells and could reduce some of the risks associated with stem cell therapies. Additionally, these cells have better preservation stability and the technology is generalizable to other types of stem cells.

Stem cell therapies work by promoting endogenous repair; that is, they aid damaged tissue in repairing itself by secreting "paracrine factors," including proteins and genetic materials. While stem cell therapies can be effective, they are also associated with some risks of both tumor growth and immune rejection. Also, the cells themselves are very fragile, requiring careful storage and a multi-step process of typing and characterization before they can be used.

Ke Cheng, associate professor of molecular biomedical sciences at NC State University, associate professor in the joint biomedical engineering program at NC State and UNC and adjunct associate professor at the UNC Eshelman School of Pharmacy, led a team in developing the synthetic version of a cardiac stem cell that could be used in off-the-shelf applications.

Cheng and his colleagues fabricated a cell-mimicking microparticle (CMMP) from poly (lactic-co-glycolic acid) or PLGA, a biodegradable and biocompatible polymer. The researchers then harvested growth factor proteins from cultured human cardiac stem cells and added them to the PLGA. Finally, they coated the particle with cardiac stem cell membrane.

"We took the cargo and the shell of the stem cell and packaged it into a biodegradable particle," Cheng says.

When tested in vitro, both the CMMP and cardiac stem cell promoted the growth of cardiac muscle cells. They also tested the CMMP in a mouse model with myocardial infarction, and found that its ability to bind to cardiac tissue and promote growth after a heart attack was comparable to that of cardiac stem cells. Due to its structure, CMMP cannot replicate - reducing the risk of tumor formation.

"The synthetic cells operate much the same way a deactivated vaccine works," Cheng says. "Their membranes allow them to bypass the immune response, bind to cardiac tissue, release the growth factors and generate repair, but they cannot amplify by themselves. So you get the benefits of stem cell therapy without risks."

The synthetic stem cells are much more durable than human stem cells, and can tolerate harsh freezing and thawing. They also don’t have to be derived from the patient's own cells. And the manufacturing process can be used with any type of stem cell.

"We are hoping that this may be a first step toward a truly off-the-shelf stem cell product that would enable people to receive beneficial stem cell therapies when they're needed, without costly delays," Cheng says.

Taro Announces Sale of U.S. Rights to Keveyis(R) to Strongbridge Biopharma plc

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Taro Pharmaceutical Industries Ltd. (NYSE:TARO) ("Taro" or the "Company") announced the sale of U.S. rights to Keveyis® (dichlorphenamide) to Strongbridge Biopharma plc (Strongbridge), a global commercial-stage biopharmaceutical company focused on the development and commercialization of therapies for rare diseases with significant unmet need. Keveyis was approved by the U.S. Food and Drug Administration (the "FDA") in August 2015 to treat primary hyperkalemic and hypokalemic periodic paralysis, a group of rare hereditary disorders that cause episodes of muscle weakness or paralysis. Keveyis has orphan designation status through August 2022.

Under the terms of the purchase agreement, Strongbridge will provide Taro with upfront and deferred payments of $8.5 million in two installments; Taro is also eligible to receive additional future payments upon the achievement of certain sales unit milestones. Strongbridge expects to commercially launch Keveyis in the U.S. in April 2017. Taro has agreed to continue to manufacture Keveyis for Strongbridge, under an exclusive supply agreement at least for the period of Keveyis orphan exclusivity, subject to certain commercial terms and conditions, including minimum supply purchases.

"We are proud of our work in making Keveyis the first FDA-approved treatment option for people living with primary periodic paralysis," said Kal Sundaram, Chief Executive Officer of Taro. "In maintaining our commitment to patients, we have selected a partner in this sale with the expertise to reach the patients and physicians needed to improve patient outcomes and deepen understanding of the disease."

Since ceasing commercialization in May 2016, Taro has been supplying Keveyis to patients through a compassionate use program. Strongbridge is committed to continuing this program through the expected launch in April 2017, and is committed to working with existing U.S. Keveyis patients to ensure continuity of treatment. Keveyis patients may call 1-844-KEVERYS for more information. INDICATION Keveyis is indicated for the treatment of primary hyperkalemic periodic paralysis, primary hypokalemic periodic paralysis, and related variants. IMPORTANT SAFETY INFORMATION In clinical studies, the most common side effects of Keveyis were a burning or pricking sensation, difficulty thinking and paying attention, changes in taste, and confusion. These are not all of the possible side effects you may experience with Keveyis. Talk to your doctor if you have any symptoms that bother you or do not go away.

Autoimmune Diseases and Conditions - Rheumatoid Arthritis

Technical University Describes Findings in Rheumatoid Arthritis [Milk Fat Globule-Epidermal Growth Factor 8 (MFG-E8) Is a Novel Anti-inflammatory Factor in Rheumatoid Arthritis in Mice and Humans]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Rheumatoid Arthritis. According to news originating from Dresden, Germany, by NewsRx correspondents, research stated, "Milk fat globule-epidermal growth factor 8 (MFG-E8) is an anti-inflammatory glycoprotein that mediates the clearance of apoptotic cells and is implicated in the pathogenesis of autoimmune and inflammatory diseases. Because MFG-E8 also controls bone metabolism, we investigated its role in rheumatoid arthritis (RA), focusing on inflammation and joint destruction."

Financial support for this research came from National Cancer Institute.

Our news journalists obtained a quote from the research from Technical University, "The regulation of MFG-E8 by inflammation was assessed in vitro using osteoblasts, in arthritic mice and in patients with RA. K/BxN serum transfer arthritis (STA) was applied to MFG-E8 knock-out mice to assess its role in the pathogenesis of arthritis. Stimulation of osteoblasts with lipopolysaccharide (LPS) and tumor necrosis factor (TNF)-α downregulated the expression of MFG-E8 by 30% to 35%. MFG-E8-deficient osteoblasts responded to LPS with a stronger production of pro-inflammatory cytokines. In vivo, MFG-E8 mRNA levels were 52% lower in the paws of collagen-induced arthritic (CIA) mice and 24% to 42% lower in the serum of arthritic mice using two different arthritis models (CIA and STA). Similarly, patients with RA (n=93) had lower serum concentrations of MFG-E8 (-17%) compared with healthy controls (n=140). In a subgroup of patients who had a moderate to high disease activity (n=21), serum concentrations of MFG-E8 rose after complete or partial remission had been achieved (+67%). Finally, MFG-E8-deficient mice subjected to STA exhibited a stronger disease burden, an increased number of neutrophils in the joints, and a more extensive local and systemic bone loss. This was accompanied by an increased activation of osteoclasts and a suppression of osteoblast function in MFG-E8-deficient mice. Thus, MFG-E8 is a protective factor in the pathogenesis of RA and subsequent bone loss."

According to the news editors, the research concluded: "Whether MFG-E8 qualifies as a novel biomarker or therapeutic target for the treatment of RA is worth addressing in further studies."

Drugs and Therapies - Antipsychotics

Technical University Details Findings in Antipsychotics (Preparation and evaluation of ziprasidone-phospholipid complex from sustained-release pellet formulation with enhanced bioavailability and no food effect)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antipsychotics have been published. According to news reporting originating from Nanjing, People's Republic of China, by NewsRx correspondents, research stated, "The purpose of this work was to develop ziprasidone-phospholipid complex (ZIP-PLC) in sustained-release pellets to enhance the oral bioavailability and overcome the food effect of ziprasidone. Ziprasidone-phospholipid complex was formulated by solvent-evaporation method."

Our news editors obtained a quote from the research from Technical University, "The complexes were characterized by Fourier transform infrared spectroscopy (FTIR), scanning electron microscopy (SEM), differential scanning calorimetry (DSC), powder X-ray diffraction (PXRD) and solubility testing. The optimized ZIP-PLC was used to prepare ZIP-PLC sustained-release pellets via extrusion-spheronization method. The pellets were characterized by in vitro drug-release studies and administered to fasted and fed beagle dogs, and their pharmacokinetics were compared with commercial formulation Zeldox capsule as a control. The results of FTIR, SEM, DSC and PXRD studies confirmed the formation of phospholipid complex. Solubility studies showed there was a higher solubility in water for ZIP-PLC than monohydrate ziprasidone. The in vitro release rate of ziprasidone from the ZIP-PLC sustained-release pellet exhibited controlled-release characteristics with over 95% total release in 12 h. Pharmacokinetic studies in beagle dogs showed ziprasidone with prolong actions, and no food effect was achieved simultaneously in ZIP-PLC sustained-release pellet compared with Zeldox capsule."

According to the news editors, the research concluded: "The results indicated a sustained release with prolonged actions of schizophrenia and bipolar disorder treatment."

The news editors report that additional information may be obtained by contacting Y. Miao, School of Biotechnology and Pharmaceutical Engineering, Nanjing Technical University, Nanjing, People's Republic of China. Additional authors for this research include G. Chen, L. Ren and P. Ouyang.

The neighborhood effect: Sicker patients draw on shared resources

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- In a recent article in JAMA, University of Chicago physicians describe a new concern for patients in the hospital: distractions caused by the misfortune of other patients.

The researchers found that when one patient on a typical 20-bed hospital unit took a turn for the worse - a cardiac arrest, for example, or being transferred to an intensive-care unit - the other patients on that ward were at increased risk for their own setbacks.

In the six hours after a critical-illness event, the odds that a second patient in the same unit would undergo a comparable crisis increased by about 18 percent. If there were two such events during a six-hour time period, the risk of yet another occurrence went up by about 53 percent. Risks were slightly higher when the initial critical illness events occurred at night.

Cardiac arrests, urgent ICU transfers or patient deaths were also associated with delayed discharge from the hospital for the other patients on the same unit.

"This should serve as a wake-up call for hospital-based physicians," said study author Matthew Churpek, MD, MPH, PhD, assistant professor of medicine at the University of Chicago.

"Our data suggests that after caring for a patient who becomes critically ill on the hospital wards, we should routinely check to see how the other patients on the unit are doing," Churpek said.

"Following these high-intensity events, our to-do list should include a thorough assessment of the other patients on the unit, to make sure none of them are at risk of slipping through the cracks."

Luckily, such events were relatively rare. Nearly 84,000 adult patients were admitted to non-ICU beds at the University of Chicago Medicine from 2009 to 2013. About five percent of those patients were subsequently transferred to an intensive-care unit (4,107) or experienced an in-hospital cardiac arrest (179).

Patients who had a cardiac arrest or required ICU transfer tended to be a few years older and male. They had been in the hospital, on average, for 13 days, four times longer than patients who did not have a critical-illness event.

"We suspected this phenomenon based on our own anecdotal experience," said co-author Samuel Volchenboum, MD, PhD, associate professor of pediatrics at the University of Chicago and director of the University's Center for Research Informatics. "But until we had access to a large, well-curated research-data warehouse, we couldn't perform a study like this."

"Very few academic centers have access to the kinds of high-quality data needed to perform this type of investigation," he added.

The study was designed to detect and quantify any increased risk to neighboring patients. The researchers speculate that one potential factor may be that doctors and nurses could...
have been "temporarily diverted to help care for critically ill patients," Volchenboum said. "Further study is needed to determine the causes of this effect."

Peptides and Proteins

Tohoku University Describes Findings in Peptides and Proteins (Effects of N-Methylated Amyloid-b30-40 Peptides on the Fibrillation of Amyloid-b1-40)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Peptides and Proteins have been published. According to news reporting originating in Sendai, Japan, by NewsRx journalists, research stated, "Alzheimer's disease is a neurodegenerative disorder associated with amyloid-b (Ab) fibrillation. N-Methylated amyloid-b peptides are potent inhibitors of amyloid-b fibrillation."

The news reporters obtained a quote from the research from Tohoku University, "We investigated the inhibitory effect of N-Methylated Ab30-40 peptides on Ab1-40 fibrillation. N-Methylated Ab30-40 peptides affected the fibrillation, and this effect was dependent on the concentration of N-Methylated peptide and the number and position of N-Methylated groups. N-Methylated Ab30-40 peptides were co-aggregated with Ab1-40. Spectroscopic technique was adopted to investigate an origin of the observed dependence. Suppression of thioflavin T (ThT) fluorescence count was correlated with the dissociation constant Kd of monomer-dimer equilibrium of each N-Methylated Ab30-40 peptide. Monomeric N-Methylated peptides decreased ThT fluorescence count during Ab1-40 fibrillation. Secondary structure content was not largely different between Ab1-40 fibrils and co-aggregates. These results suggested that N-Methylated Ab30-40 peptides disrupted the regular b-sheet structure of Ab1-40 fibrils and affected the ThT fluorescence count. The monomer-dimer equilibrium of N-Methylated peptides was (partly) responsible for the observed dependence of their inhibitory effect on the concentration of N-Methylated peptide and the number and position of N-Methylated groups."

According to the news reporters, the research concluded: "Our study provides a hint to design new N-Methylated inhibitor peptides of fibrillation."

Our news correspondents report that additional information may be obtained by contacting H. Hiramatsu, Graduate School of Pharmaceutical Sciences, Tohoku University, Sendai, 980-8578, Japan. Tongji University Details Findings in Cancer Gene Therapy (Elderly male smokers with right lung tumors are viable candidates for KRAS mutation screening)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology - Cancer Gene Therapy. According to news reporting from Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Genetic aberrations in tumor driver genes provide specific molecular targets for therapeutic intervention, which can greatly improve therapeutic outcomes. Here, we analyzed the mutational frequency of EGFR and KRAS gene, as well as EML4-ALK rearrangement, and summarized the clinicopathological characters of Chinese lung cancer patients."

The news correspondents obtained a quote from the research from Tongji University, "We detected the mutation spectrum of 1033 primary lung cancer patients. The analyzed clinicopathological parameters included gender, age at diagnosis, smoking status, pathological TNM stage, tumor morphology and location, visceral pleural invasion, and histological type. A total of 618 patients had mutations in EGFR or KRAS gene as well as rearrangement of EML4-ALK. Exon 19 deletions and L858R in the EGFR gene were the most frequent mutations. Left-side lung cancer was more common in female patients carrying the KRAS mutation. Rearrangement of EML4-ALK was more common in non-tobacco-using male patients, who also exhibited a higher likelihood of visceral pleura invasion. Elderly females who never smoked and possessed 1-20 mm stage I adenocarcinomas in the right side exhibited a higher frequency of EGFR mutations."

According to the news reporters, the research concluded: "Elderly male smokers with right lung tumors were viable candidates for KRAS mutation screening."

For more information on this research see: Elderly male smokers with right lung tumors are viable candidates for KRAS mutation screening. Scientific Reports, 2016;6():18566. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Treating cancer with drugs for diabetes and hypertension**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A combination of a diabetes medication and an antihypertensive drug can effectively combat cancer cells. The team of researchers led by Prof. Michael Hall at the Biozentrum of the University of Basel has also reported that specific cancer cells respond to this combination of drugs. The results of the study have now been published in Science Advances.

Metformin is the most widely prescribed drug for the treatment of type 2 diabetes. Besides its blood sugar lowering effect, it also displays anti-cancer properties. The usual therapeutic dose, however, is too low to effectively fight cancer. The research team led by Prof. Michael Hall, at the Biozentrum of the University of Basel, has now made an unexpected discovery: The antihypertensive drug syrosingopine potentiates the anti-cancer efficacy of metformin. Apparently, this drug combination drives cancer cells to programmed "suicide".

**Drug cocktail kills tumor cells**

At higher doses, the antidiabetic drug inhibits the growth of cancer cells but could also induce unwanted side effects. Therefore, the researchers screened over a thousand drugs for whether they can enhance the anticancer action of metformin. A favorite emerged from this screening: Syrosingopine, an antihypertensive drug. As the study shows, the cocktail of these two drugs is effective in a wide range of cancers.

"For example, in samples from leukemia patients, we demonstrated that almost all tumor cells were killed by this cocktail and at doses that are actually not toxic to normal cells", says the first author, Don Benjamin. "And the effect was exclusively confined to cancer cells, as the blood cells from healthy donors were insensitive to the treatment."

**Drugs block "juice" supply to cancer cells**

In mice with malignant liver cancer, enlargement of the liver was reduced after the therapy. Also the number of tumor nodules was less - in some animals the tumors disappeared completely. A glance at the molecular processes in the tumor cells explains the drug combination's efficacy: Metformin lowers not only the blood glucose level, but also blocks the respiratory chain in the energy factories of the cell, the mitochondria. The antihypertensive drug syrosingopine inhibits, among other things, the degradation of sugars.

Thus, the drugs interrupt the vital processes which provide energy for the cell. Due to their increased metabolic activity and rapid growth, cancer cells have a particularly high energy consumption, which makes them extremely vulnerable when the energy supply is reduced.

**Groundbreaking step towards clinical application**

By testing a range of other compounds with the same mode of action, the scientists could demonstrate that the inhibition of the respiratory chain in the mitochondria is a key mechanism. These also reduced cancer cell growth in combination with the antihypertensive drug.

"We have been able to show that the two known drugs lead to more profound effects on cancer cell proliferation than each drug alone," explains Benjamin. "The data from this study support the development of combination approaches for the treatment of cancer patients." This study may have implications for future clinical application of combination scenarios targeting the energy needs of tumor cells.

Neurodegenerative Diseases and Conditions

UTSW identify process cells use to destroy damaged organelles, with links to diseases

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers at UT Southwestern Medical Center have uncovered the mechanism that cells use to find and destroy an organelle called mitochondria that, when damaged, may lead to genetic problems, cancer, neurodegenerative diseases, inflammatory disease, and aging.

Understanding how this process works could potentially lead to new treatments to prevent certain illnesses and even some aspects of aging, said Dr. Beth Levine, Director of the Center for Autophagy Research at UT Southwestern and senior author of the study, published in Cell. The Center for Autophagy Research -- the only one of its kind in the nation - investigates the process called autophagy in which cells rid themselves of damaged or unnecessary components.

Mitochondria are commonly called the "powerhouses of the cell" because these cellular components works like a tiny factory inside cells to convert compounds such as sugars into energy that a cell can use.

But mitochondria also have a dark side: Because of their high-energy function, when they are damaged, they release toxic chemicals called reactive oxygen species into the rest of the cell, said Dr. Yongjie Wei, Assistant Professor of Internal Medicine at UT Southwestern and lead co-first author of the study.

"The removal of damaged mitochondria by autophagy (a process called mitophagy) is important for cellular health," said Dr. Levine, also Professor of Internal Medicine and Microbiology and a Howard Hughes Medical Institute Investigator.

Researchers have to date focused on protein "tags" found on the outer membranes of mitochondria - especially the protein Parkin that attaches these tags -- to explain how the cell's degradative organelles, called autophagosomes, target sick mitochondria, explained Dr. Levine, who holds the Charles Cameron Sprague Distinguished Chair in Biomedical Science. (Autophagosomes are double-membraned vesicles that contain cellular material to be degraded in the process called autophagy.)

But UT Southwestern scientists, working with human and mouse cells, discovered that a receptor on an inner mitochondrial membrane actually is more important in guiding these autophagosomes to their prey.

In the study, researchers found that a protein called prohibitin 2 (PHB2) resides on the inner membrane of mitochondria, but is exposed when an ailing mitochondrion's outer membrane ruptures. Once the break occurs, the protein LC3, which rides on an autophagosome's exterior like a lookout, is drawn to the PHB2.

The LC3 protein then attaches to PHB2, and the autophagosome carries its doomed
cargo to a lysosome - yet another organelle found within cells - that acts like a tiny stomach, with enzymes to break down cell waste.

The study's finding that PHB2 is crucial in targeting mitochondria for autophagic degradation is new, said Dr. Levine.

However, she said, previous research had linked the presence of PHB2 to prevention of cancer, aging effects, neurodegeneration, and inflammation. So, given these beneficial health effects, it makes sense that a key action of PHB2 is to help rid cells of damaging mitochondria that contribute to such disease processes, she said.

"By understanding how cells get rid of damaged mitochondria that contribute to cancer, neurodegenerative diseases, and aging, we may be able to develop treatments to prevent those processes," Dr. Levine said.

The study also found that PHB2 is necessary for the routine elimination of paternal mitochondrial DNA in developing embryos, leaving only mitochondrial DNA from the mother. This work was done in roundworms, but a recent study performed elsewhere using mouse models demonstrated that mitophagy is also used to remove paternal mitochondria in mammalian embryos, said Dr. Wei-Chung "Daniel" Chiang, a postdoctoral researcher at UT Southwestern and co-first author of the study.

Usually, only maternal mitochondrial DNA is passed to offspring, Dr. Levine said. For unknown reasons, the continued presence of paternal mitochondrial DNA signals genetic or health problems in the progeny.

In yet another finding, the UTSW research shows that - despite scientists' greater focus on the Parkin protein's role in supporting autophagy -- PHB2 is required for Parkin to work.

Gram-Negative Bacteria - Acinetobacter baumannii

United States Navy Reports Findings in Acinetobacter baumannii (Personalized Therapeutic Cocktail of Wild Environmental Phages Rescues Mice from Acinetobacter baumannii Wound Infections)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Acinetobacter baumannii is now available. According to news reporting originating from Fort Detrick, Maryland, by NewsRx correspondents, research stated, "Multidrug-resistant bacterial pathogens are an increasing threat to public health, and lytic bacteriophages have reemerged as a potential therapeutic option. In this work, we isolated and assembled a five-member cocktail of wild phages against Acinetobacter baumannii and demonstrated therapeutic efficacy in a mouse full-thickness dorsal infected wound model."

Funders for this research include Military Infectious Disease Research Program, U.S. Department of Homeland Security (DHS).

Our news editors obtained a quote from the research from United States Navy, "The
cocktail lowers the bioburden in the wound, prevents the spread of infection and necrosis to surrounding tissue, and decreases infection-associated morbidity. Interestingly, this effective cocktail is composed of four phages that do not kill the parent strain of the infection and one phage that simply delays bacterial growth in vitro via a strong but incomplete selection event. The cocktail here appears to function in a combinatorial manner, as one constituent phage targets capsulated A. baumannii bacteria and selects for loss of receptor, shifting the population to an uncapsulated state that is then sensitized to the remaining four phages in the cocktail. Additionally, capsule is a known virulence factor for A. baumannii, and we demonstrated that the emergent uncapsulated bacteria are avirulent in a Galleria mellonella model. These results highlight the importance of anticipating population changes during phage therapy and designing intelligent cocktails to control emergent strains, as well as the benefits of using phages that target virulence factors."

According to the news editors, the research concluded: "Because of the efficacy of this cocktail isolated from a limited environmental pool, we have established a pipeline for developing new phage therapeutics against additional clinically relevant multidrug-resistant pathogens by using environmental phages sourced from around the globe."

value for inherited ataxia. However, the need of a rigorous process of analysis and validation remains challenging."

The news reporters obtained a quote from the research from University Hospital, "Moreover, copy number variations (CNV) or dynamic expansions of repeated sequence are classically considered not adequately detected by exome sequencing technique. We applied a strategy of mini-exome coupled to read-depth based CNV analysis to a series of 33 patients with probable inherited ataxia and onset < 50 years. The mini-exome consisted of the capture of 4,813 genes having associated clinical phenotypes. Pathogenic variants were found in 42% and variants of uncertain significance in 24% of the patients. These results are comparable to those from whole exome sequencing and better than previous targeted NGS studies. CNV and dynamic expansions of repeated CAG sequence were identified in three patients. We identified both atypical presentation of known ataxia genes (ATM, NPC1) and mutations in genes very rarely associated with ataxia (ERCC4, HSD17B4). We show that mini-exome bioinformatics data analysis allows the identification of CNV and dynamic expansions of repeated sequence. Our study confirms the diagnostic value of the proposed genetic analysis strategy."

According to the news reporters, the research concluded: "We also provide an algorithm for the multidisciplinary process of analysis, interpretation, and validation of NGS data."

Cardiovascular Diseases and Conditions...

University Hospital Details Findings in Hypertension (Recent Developments and Controversies in the Treatment of Resistant Hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Hypertension are discussed in a new report. According to news reporting from Hamburg, Germany, by NewsRx journalists, research stated, "Resistant hypertension is defined as elevated blood pressure despite the appropriate use of 3 or more antihypertensive drugs, including a diuretic, and constitutes a frequent and important clinical problem with significant disease morbidity and mortality. Several sources of evidence point to the sympathetic nervous system as
a major protagonist in this disease entity."

The news correspondents obtained a quote from the research from University Hospital, "The catheter-based, radiofrequency ablation of renal sympathetic nerves (renal denervation) to treat resistant hypertension has sparked great enthusiasm. However, failure of this interventional approach in the randomized, sham-controlled Symplicity HTN-3 trial to reach its efficacy endpoint of attaining a significant blood pressure reduction has called this intervention into substantial question and fueled an ongoing scientific debate. Electrical stimulation of the carotid baroreceptors (baroreflex activation therapy) represents another technique to modulate sympathetic activity currently being studied in several clinical trials."

According to the news reporters, the research concluded: "This review summarizes and comments the current literature focusing on the invasive treatment of resistant hypertension."

For more information on this research see: Recent Developments and Controversies in the Treatment of Resistant Hypertension. Experimental and Clinical Endocrinology & Diabetes, 2016;124(3):178-86. (Thieme - www.thieme.com)

Our news journalists report that additional information may be obtained by contacting C. Kuhl, All authors from the Dept. of Internal Medicine III (Cardiology and Angiology) University Hospital Schleswig-Holstein, Campus Kiel, Germany and the DZHK (German Centre for Cardiovascular Research), partner site Kiel, Hamburg, Lubeck, Germany. remained relatively stable around 20% from 1979 to 2008 (range 19.9-23.6%). The age-adjusted prevalence of moderate-vigorous LTPA decreased from 23.2% in 1979-80 to 16.0% in 2001, thereafter the prevalence increased to 24.3% in 2007-08 (P < 0.05). The age-adjusted prevalence of being mostly sedentary at work increased gradually from 35.5% in 1979-80 to 53.4% in 2007-08 (P < 0.05). Sex, age, education, and smoking were identified as cross-sectional correlates of LTPA and WPA (P < 0.05). Men had higher odds of engaging in LTPA than women (adjusted OR 1.52 [95% CI 1.39-1.67] in 2007-08), whereas the association between sex and WPA shifted over time. High education level, not being a smoker, and high WPA were associated with high LTPA, whereas low education level, being a smoker, and high levels of LTPA were associated with high WPA (P < 0.05). In general, odds of engaging in LTPA and WPA decreased with age (P < 0.05). Individuals with healthy BMI had higher odds of being in a higher LTPA level than those who were underweight and obese (P < 0.05). Longitudinal analyses identified sex, age, education, smoking, WPA, and LTPA measured in 1979-80 as determinants of LTPA in 2007-08. In Norwegian adults, the proportion of sedentary WPA increased from 1979 to 2008, whereas the proportion of inactive LTPA remained stable.

According to the news reporters, the research concluded: "Being female, older, smoker, obese or underweight, and low education level were associated with low LTPA levels."

**Gram-Positive Bacteria - Staphylococcus epidermidis**

**University Hospital Details Findings in Staphylococcus epidermidis (Efficacy of ceftaroline versus vancomycin in an experimental foreign-body and systemic infection model caused by biofilm-producing methicillin-resistant Staphylococcus ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Positive Bacteria - Staphylococcus epidermidis have been published. According to news reporting originating from Seville, Spain, by NewsRx correspondents, research stated, "In this study, the efficacy of ceftaroline versus vancomycin against biofilm-producing methicillin-resistant Staphylococcus epidermidis (MRSE) in a murine model of foreign-body and systemic infection was compared. Two bacteraemic biofilm-producing MRSE strains were used (SE284 and SE385)."

Our news editors obtained a quote from the research from University Hospital, "The minimum inhibitory concentrations (MICs) for strains SE284 and SE385, were, respectively,
0.25 mg/L and 0.5 mg/L for ceftaroline and 4 mg/L and 2 mg/L for vancomycin. The in vitro bactericidal activities of ceftaroline and vancomycin were evaluated using time-kill curves. A foreign-body and systemic infection model in neutropenic female C57BL/6 mice was used to ascertain in vivo efficacy. Animals were randomly allocated into three groups (n = 15) without treatment (controls) or treated with ceftaroline 50 mg/kg every 8 h or vancomycin 110 mg/kg every 6 h. In vitro, ceftaroline showed concentration-dependent bactericidal activity, whilst vancomycin presented time-dependent activity. In the experimental in vivo model, ceftaroline and vancomycin decreased the liver and catheter bacterial concentrations (P < 0.05) and increased survival (P < 0.05) for both strains.

According to the news editors, the research concluded: "Ceftaroline is as effective as vancomycin in the treatment of experimental foreign-body and systemic infection caused by biofilm-producing MRSE."

The news editors report that additional information may be obtained by contacting J. Dominguez-Herrera, Univ Seville, Univ Hosp Virgen del Rocio, Unit Infect Dis Microbiol & Prevent Med, Inst Biomed Seville IBiSCSIC, Seville 41013, Spain. Additional authors for this research include R. Lopez-Rojas, Y. Smani, G. Labrador-Herrera and J. Pachon.

### Oncology - Head and Neck Cancer

**University Hospital Reports Findings in Head and Neck Cancer (Cytotoxic effects of SMAC-mimetic compound LCL161 in head and neck cancer cell lines)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Head and Neck Cancer have been published. According to news reporting from Wurzburg, Germany, by NewsRx journalists, research stated, "Head and neck squamous cell carcinoma (HNSCC) is one of the most common tumor entities worldwide. Unfortunately, recent drug developments in other fields of oncology have yielded no efficacy in the treatment of oral squamous cell carcinoma."
The news correspondents obtained a quote from the research from University Hospital, "As a new starting point, we investigated the impact of Fas ligand (FasL) and the SMAC-mimetic compound LCL161 in mono- and combination treatment in HNSCC cell lines. Five different cell lines of HNSCC were treated with FasL and LCL161 in mono- and combination treatment. Cytotoxicity was measured via a crystal violet assay. The cell lines were characterized for CD95 (FasL receptor) expression via flow cytometry. The degradation of cellular inhibitor of apoptosis protein 1 (cIAP1) was detected via Western blot. Incubation with FasL led to a significant decrease in three out of five cell lines. Combination treatment with LCL161 enhanced cytotoxicity significantly. Two cell lines were FasL resistant, but one of them could be resensitized with LCL161. In all cell lines, Western blot analysis showed degradation of cIAP1 after LCL161 application. However, one cell line showed only minor vulnerability to the FasL and LCL161 combination. This is the first study investigating combination treatment of FasL and LCL161 in head and neck cancer cell lines. Pro-apoptotic effects of the combination were detected in the majority of the cell lines. Interestingly, one of two FasL-resistant cell lines was sensitive to the combination therapy with FasL and LCL161."

According to the news reporters, the research concluded: "SMAC-mimetic compounds show promising results in the treatment of other tumor entities in vitro and might be useful drugs to improve HNSCC therapy."

For more information on this research see: Cytotoxic effects of SMAC-mimetic compound LCL161 in head and neck cancer cell lines. Clinical Oral Investigations, 2016;20 (9):2325-2332. **Nutritional and Metabolic Diseases and Conditions -…

University Medical Center Reports Findings in Obesity (Performance of the 1 mg dexamethasone suppression test in patients with severe obesity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating in Mannheim, Germany, by NewsRx journalists, research stated, "To analyze the performance of the 1 mg dexamethasone suppression test (DST) in patients with obesity. Special attention was paid to the influence of interfering medication on DST."
The news reporters obtained a quote from the research from University Medical Center, "In this prospective cohort study (Mannheim Obesity Study), patients with obesity were evaluated before bariatric surgery. For evaluation of hypercortisolism, a 1 mg dexamethasone-suppression test (DST) in all subjects was performed. Medication was assessed for possible interference. Two hundred seventy-eight patients with a mean age of 42.3 years (68.8% women) and a mean BMI of 47.9 ± 8.4 kg/m(2) were screened. Insufficient suppression of cortisol after DST was found in 24 patients (8.6%). In two patients hypercortisolism was confirmed. The specificity for DST was calculated at 92.0%. Only CYP3A4 inducers (n=22, 7.9%) and estrogen therapy (n=17, 6.1%) were significantly associated with falsely elevated cortisol after DST. Regression analysis excluded any interrelation between DST and anthropometry. Low prevalence of hypercortisolism (0.7 or <1.8%) was found. Specificity of DST in this cohort typically screened for hypercortisolism was 92.0% ( (<=) 50 nmol/L). DST should be avoided in patients taking CYP3A4 inducers or estrogen therapy, due to their significant interaction."

According to the news reporters, the research concluded: "In summary, the 1 mg DST is an adequate test for screening for hypercortisolism even in patients with extreme obesity."

For more information on this research see: Performance of the 1 mg dexamethasone suppression test in patients with severe obesity. *Obesity, 2016;24(4):850-5. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/obgy/)

**University of Aberdeen Details Findings in Armadillo Domain Proteins**

(Tissue- and stage-specific Wnt target gene expression is controlled subsequent to beta-catenin recruitment to cis-regulatory modules)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Armadillo Domain Proteins. According to news reporting out of Aberdeen, United Kingdom, by NewsRx editors, research stated, "Key signalling pathways, such as canonical Wnt/beta-catenin signalling, operate repeatedly to regulate tissue-and stage-specific transcriptional responses during development. Although recruitment of nuclear beta-catenin to target genomic loci serves as the hallmark of canonical Wnt signalling, mechanisms controlling stage- or tissue-specific transcriptional
responses remain elusive."

Our news journalists obtained a quote from the research from the University of Aberdeen, "Here, a direct comparison of genome-wide occupancy of beta-catenin with a stage-matched Wnt-regulated transcriptome reveals that only a subset of beta-catenin-bound genomic loci are transcriptionally regulated by Wnt signalling. We demonstrate that Wnt signalling regulates beta-catenin binding to Wnt target genes not only when they are transcriptionally regulated, but also in contexts in which their transcription remains unaffected. The transcriptional response to Wnt signalling depends on additional mechanisms, such as BMP or FGF signalling for the particular genes we investigated, which do not influence beta-catenin recruitment. Our findings suggest a more general paradigm for Wnt-regulated transcriptional mechanisms, which is relevant for tissue-specific functions of Wnt/beta-catenin signalling in embryonic development but also for stem cell-mediated homeostasis and cancer. Chromatin association of beta-catenin, even to functional Wnt-response elements, can no longer be considered a proxy for identifying transcriptionally Wnt-regulated genes. dependent mechanisms are crucial for transcriptional activation of Wnt/beta-catenin target genes subsequent to beta-catenin recruitment."

According to the news editors, the research concluded: "Our conclusions therefore also imply that Wnt-regulated beta-catenin binding in one context can mark Wnt-regulated transcriptional target genes for different contexts."

Our news journalists report that additional information may be obtained by contacting S. Hoppler, University of Aberdeen, Inst Med Sci, Aberdeen AB25 2ZD, United Kingdom. Additional authors for this research include E.D. Alves, G.J.C. Veenstra and S. Hoppler.

Keywords for this news article include: Aberdeen, United Kingdom, Europe, Armadillo Domain Proteins, Transcription Factors, Genetics, Genetics, beta Catenin, Catenins, University of Aberdeen.

---

**Oncology - Cholangiocarcinoma**

**University of Amsterdam Reports Findings in Cholangiocarcinoma (Inhibition of hypoxia inducible factor 1 and topoisomerase with acriflavine sensitizes perihilar cholangiocarcinomas to photodynamic therapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Cholangiocarcinoma is now available. According to news reporting originating in Amsterdam, Netherlands, by NewsRx journalists, research stated. "Photodynamic therapy (PDT) induces tumor cell death by oxidative stress and hypoxia but also survival signaling through activation of hypoxia-inducible factor 1 (HIF-1)."
Since perihilar cholangiocarcinomas are relatively recalcitrant to PDT, the aims were to (1) determine the expression levels of HIF-1-associated proteins in human perihilar cholangiocarcinomas, (2) investigate the role of HIF-1 in PDT-treated human perihilar cholangiocarcinoma cells, and (3) determine whether HIF-1 inhibition reduces survival signaling and enhances PDT efficacy.

The news reporters obtained a quote from the research from the University of Amsterdam, "Increased expression of VEGF, CD105, CD31/Ki-67, and GLUT-1 was confirmed in human perihilar cholangiocarcinomas. PDT with liposome-delivered zinc phthalocyanine caused HIF-1a stabilization in SK-ChA-1 cells and increased transcription of HIF-1a downstream genes. Acriflavine was taken up by SK-ChA-1 cells and translocated to the nucleus under hypoxic conditions. Importantly, pretreatment of SK-ChA-1 cells with acriflavine enhanced PDT efficacy via inhibition of HIF-1 and topoisomerases I and II. The expression of VEGF, CD105, CD31/Ki-67, and GLUT-1 was determined by immunohistochemistry in human perihilar cholangiocarcinomas. In addition, the response of human perihilar cholangiocarcinoma (SK-ChA-1) cells to PDT with liposome-delivered zinc phthalocyanine was investigated under both normoxic and hypoxic conditions. Acriflavine, a HIF-1a/HIF-1b dimerization inhibitor and a potential dual topoisomerase I/II inhibitor, was evaluated for its adjuvant effect on PDT efficacy. HIF-1, which is activated in human hilar cholangiocarcinomas, contributes to tumor cell survival following PDT in vitro."

According to the news reporters, the research concluded: "Combining PDT with acriflavine pretreatment improves PDT efficacy in cultured cells and therefore warrants further preclinical validation for therapy-recalcitrant perihilar cholangiocarcinomas."

For more information on this research see: Inhibition of hypoxia inducible factor 1 and topoisomerase with acriflavine sensitizes perihilar cholangiocarcinomas to photodynamic therapy. Oncotarget, 2016;7(3):3341-56.

University of Antwerp Reports Findings in Atherosclerosis (Potential therapeutic effects of mTOR inhibition in atherosclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Atherosclerosis have been presented. According to news originating from Antwerp, Belgium, by NewsRx
correspondents, research stated, "Despite significant improvement in the management of atherosclerosis, this slowly progressing disease continues to affect countless patients around the world. Recently, the mechanistic target of rapamycin (mTOR) has been identified as a pre-eminent factor in the development of atherosclerosis. mTOR is a constitutively active kinase found in two different multiprotein complexes, mTORC1 and mTORC2."

Our news journalists obtained a quote from the research from the University of Antwerp, "Pharmacological interventions with a class of macrolide immunosuppressive drugs, called rapalogs, have shown undeniable evidence of the value of mTORC1 inhibition to prevent the development of atherosclerotic plaques in several animal models. Rapalog-eluting stents have also shown extraordinary results in humans, even though the exact mechanism for this anti-atherosclerotic effect remains elusive. Unfortunately, rapalogs are known to trigger diverse undesirable effects owing to mTORC1 resistance or mTORC2 inhibition. These adverse effects include dyslipidaemia and insulin resistance, both known triggers of atherosclerosis. Several strategies, such as combination therapy with statins and metformin, have been suggested to oppose rapalog-mediated adverse effects. Statins and metformin are known to inhibit mTORC1 indirectly via 5' adenosine monophosphate-activated protein kinase (AMPK) activation and may hold the key to exploit the full potential of mTORC1 inhibition in the treatment of atherosclerosis."

According to the news editors, the research concluded: "Intermittent regimens and dose reduction have also been proposed to improve rapalog's mTORC1 selectivity, thereby reducing mTORC2-related side effects."

The news correspondents report that additional information may be obtained from W. Martinet, University of Antwerp, Lab Physiopharmacol, B-2610 Antwerp, Belgium. Additional authors for this research include G.R.Y. De Meyer and W. Martinet.

**Oncology - Acute Lymphoblastic Leukemia**

**University of Bologna Reports Findings in Acute Lymphoblastic Leukemia (Synergistic cytotoxic effects of bortezomib and CK2 inhibitor CX-4945 in acute lymphoblastic leukemia: turning off the prosurvival ER chaperone BIP/Grp78 and turning on the ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Acute Lymphoblastic Leukemia is the subject of a report. According to news originating from Bologna, Italy, by NewsRx correspondents, research stated, "The proteasome inhibitor bortezomib is a new targeted treatment option for..."
refractory or relapsed acute lymphoblastic leukemia (ALL) patients. However, a limited efficacy of bortezomib alone has been reported."

Our news journalists obtained a quote from the research from the University of Bologna, "A terminal pro-apoptotic endoplasmic reticulum (ER) stress/unfolded protein response (UPR) is one of the several mechanisms of bortezomib-induced apoptosis. Recently, it has been documented that UPR disruption could be considered a selective anti-leukemia therapy. CX-4945, a potent casein kinase (CK) 2 inhibitor, has been found to induce apoptotic cell death in T-ALL preclinical models, via perturbation of ER/UPR pathway. In this study, we analyzed in T-and B-ALL preclinical settings, the molecular mechanisms of synergistic apoptotic effects observed after bortezomib/CX-4945 combined treatment. We demonstrated that, adding CX-4945 after bortezomib treatment, prevented leukemic cells from engaging a functional UPR in order to buffer the bortezomib-mediated proteotoxic stress in ER lumen. We documented that the combined treatment decreased pro-survival ER chaperon BIP/Grp78 expression, via reduction of chaperoning activity of Hsp90. Bortezomib/CX-4945 treatment inhibited NF-kB signaling in T-ALL cell lines and primary cells from T-ALL patients, but, intriguingly, in B-ALL cells the drug combination activated NF-kB p65 pro-apoptotic functions. In fact in B-cells, the combined treatment induced p65-HDAC1 association with consequent repression of the anti-apoptotic target genes, Bcl-xL and XIAP. Exposure to NEMO (IKKg)-binding domain inhibitor peptide reduced the cytotoxic effects of bortezomib/CX-4945 treatment."

According to the news editors, the research concluded: "Overall, our findings demonstrated that CK2 inhibition could be useful in combination with bortezomib as a novel therapeutic strategy in both T-and B-ALL."

For more information on this research see: Synergistic cytotoxic effects of bortezomib and CK2 inhibitor CX-4945 in acute lymphoblastic leukemia: turning off the prosurvival ER chaperone BIP/Grp78 and turning on the pro-apoptotic NF-kB. Oncotarget, 2016;7(2):1323-40.

University of Bologna Reports Findings in Prognathism (Oro-Dental Features of Pallister-Killian Syndrome: Evaluation of 21 European Probands)
Pallister-Killian syndrome (PKS) is a rare sporadic multi-systemic developmental disorder caused by a mosaic tetrasomy of the short arm of chromosome 12. A wide range of clinical characteristics including intellectual disability, seizures, and congenital malformations has previously been described.

Individuals with PKS show a characteristic facial phenotype with frontal bossing, alopecia, sparse eyebrows, depressed nasal bridge, long philtrum, telecanthus, and posteriorly rotated ears. Oro-dental features, such as 'Pallister lip,' macroglossia, delayed eruption of primary teeth, high arched-palate, prognathism, and cleft palate have been occasionally reported in the medical literature. The aim of the study was to assess the orodental phenotype of PKS and to describe the oral health status in a cohort participating in the First European Workshop on PKS. A clinical dental examination was performed in 21 Caucasian probands and data regarding medical and dental history collected. Twelve probands (57%) showed an atypical dental pattern, with multiple missing teeth (primarily the first permanent molars) and 2 (10%) a double teeth. The severity of gingivitis and dental caries increased with age and gingival overgrowth was a common finding. A characteristic occlusive phenotype was found: a high-arched palate with mandibular prognathism associated with an anterior openbite and crossbite and with posterior crossbite (unilateral or bilateral). The prevalence of oral habits (non-nutritive sucking, mouth breathing, bruxism) was high, even in older probands.

According to the news editors, the research concluded: "This study suggests that individuals affected by PKS should be observed closely for oro-dental diseases and a multidisciplinary approach is needed to implement the right preventive measures."

The news editors report that additional information may be obtained by contacting S. Bagattoni, University of Bologna, Unit Dental Care Special Needs Patients & Paediat D, Dept. of Biomed & NeuroMotor Sci DiBiNeM, I-40125 Bologna, Italy. Additional authors for this research include G. D'Alessandro, A. Sadotti, N. Alkhmis, A. Rocca, G. Cocchi, I.D. Krantz and G. Piana.

University of British Columbia Reports Findings in Cardiology  
(Assessment of Paramedic Ultrasound Curricula: A Systematic Review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiology have been presented. According to news reporting originating in Vancouver, Canada, by NewsRx journalists, research stated, "Prehospital ultrasound is being applied in the field. The purpose of this systematic review is to describe evidence pertaining to ultrasound curricula for paramedics specifically, including content, duration, setting, design, evaluation, and application."

The news reporters obtained a quote from the research from the University of British Columbia, "Electronic searches of MEDLINE, Embase, CINAHL, and the Cochrane Center Register of Controlled Trials were conducted following Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidelines. Primary literature describing acute care ultrasound curricula for paramedics were included. Two authors independently extracted data and assessed quality using 2 validated tools. Twelve studies with 187 paramedics were included. Curricula duration varied, with effective curricula teaching focused assessment with sonography for trauma (FAST) in 6 to 8 hours and pleural ultrasound in 25 minutes. FAST, pleural, and fracture-detection ultrasound are being applied in the field by paramedics; however, no literature exists describing application to detect cardiac standstill. Curricula combined didactic and hands-on components including simulation and evaluated competency using sensitivity and specificity of paramedic-performed ultrasound. Paramedic ultrasound curricula in FAST and pleural ultrasound is feasible and time effective with successful application. Although fracture detection ultrasound is being used by the special operations forces, no comprehensive curriculum was described."

According to the news reporters, the research concluded: "Curricula designed to detect cardiac standstill have been too short, and successful application by paramedics has not been shown."

Our news correspondents report that additional information may be obtained by contacting J. McCallum, Student, University of British Columbia MD Undergraduate Program, Vancouver, BC, Canada. Additional authors for this research include E. Vu, D. Sweet and H.D Kanji.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.amj.2015.07.002. This DOI is a link to an online electronic document that is either free or for purchase.

Thiazoles

University of Cairo Reports Findings in Thiazoles [One Pot Single Step Synthesis and Biological Evaluation of Some Novel Bis(1,3,4-thiadiazole) Derivatives as Potential Cytotoxic Agents]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Thiazoles. According to news reporting originating in Giza, Egypt, by NewsRx journalists, research stated, "A novel series of bis(1,3,4-thiadiazole) derivatives were synthesized in one step methodology with good yields by condensation reaction between bis-hydrazoneyl chloride 1 and various reagents."

The news reporters obtained a quote from the research from the University of Cairo, "The structures of the prepared compounds were confirmed by spectral data (IR, NMR, and MS), and elemental analysis. The anticancer activity against human breast carcinoma (MCF-7) cancer cell lines was evaluated in MTT assay."

According to the news reporters, the research concluded: "The results revealed that the bis-thiadiazole derivatives 5c, d, 7b, c and 9c had higher antitumor activity than the standard drug Imatinib."

For more information on this research see: One Pot Single Step Synthesis and Biological Evaluation of Some Novel Bis(1,3,4-thiadiazole) Derivatives as Potential Cytotoxic Agents. Molecules, 2016;21(11):1710-1717. Molecules can be contacted at: Mdp Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. Digestive System Diseases and Conditions --

University of Calgary Details Findings in Inflammatory Bowel Disease (Pregnane X Receptor Activation Attenuates Inflammation-Associated Intestinal Epithelial Barrier Dysfunction by Inhibiting Cytokine-Induced Myosin Light-Chain Kinase ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Inflammatory Bowel Disease. According to news reporting from Calgary, Canada, by NewsRx journalists, research stated, "The inflammatory bowel diseases (IBDs) are chronic inflammatory disorders with a complex etiology. IBD is thought to arise in genetically susceptible individuals in the context of aberrant interactions with the intestinal microbiota and other environmental risk factors."

The news correspondents obtained a quote from the research from the University of
Calgary, "Recently, the pregnane X receptor (PXR) was identified as a sensor for microbial metabolites, whose activation can regulate the intestinal epithelial barrier. Mutations in NR1I2, the gene that encodes the PXR, have been linked to IBD, and in animal models, PXR deletion leads to barrier dysfunction. In the current study, we sought to assess the mechanism(s) through which the PXR regulates barrier function during inflammation. In Caco-2 intestinal epithelial cell monolayers, tumor necrosis factor-alpha/interferon-gamma exposure disrupted the barrier and triggered zonula occludens-1 relocalization, increased expression of myosin light-chain kinase (MLCK), and activation of c-Jun N-terminal kinase 1/2 (JNK1/2). Activation of the PXR [rifaximin and [ 3,5-Bis( 1,1-dimethylethyl)-4-hydroxyphenyl] ethenylidene] bis-phosphonic acid tetraethyl ester (SR12813); 10 mu M] protected the barrier, an effect that was associated with attenuated MLCK expression and JNK1/2 activation. In vivo, activation of the PXR [pregnenolone 16 alpha-carbonitrile (PCN)] attenuated barrier disruption induced by toll-like receptor 4 activation in wild-type, but not Pxr-/-, mice. Furthermore, PCN treatment protected the barrier in the dextran-sulfate sodium model of experimental colitis, an effect that was associated with reduced expression of mucosal MLCK and phosphorylated JNK1/2. Together, our data suggest that the PXR regulates the intestinal epithelial barrier during inflammation by modulating cytokine-induced MLCK expression and JNK1/2 activation."

According to the news reporters, the research concluded: "Thus, targeting the PXR may prove beneficial for the treatment of inflammation-associated barrier disruption in the context of IBD."

Nutritional and Metabolic Diseases and Conditions...

University of Calgary Reports Findings in Dyslipidemias (2016 Canadian Cardiovascular Society Guidelines for the Management of Dyslipidemia for the Prevention of Cardiovascular Disease in the Adult)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Dyslipidemias is the subject of a report. According to news originating from Calgary, Canada, by NewsRx correspondents, research stated, "Since the publication of the 2012 guidelines new literature has emerged to inform decision-making. The 2016 guidelines primary panel selected a number of clinically relevant questions and has produced updated recommendations, on the basis of important new findings."

Our news journalists obtained a quote from the research from the University of Calgary, "In subjects with clinical atherosclerosis, abdominal aortic aneurysm, most subjects with diabetes or chronic kidney disease, and those with low-density lipoprotein cholesterol >= 5 mmol/L, statin therapy is recommended. For all others, there is an emphasis on risk assessment linked to lipid determination to optimize decision-making. We have recommended nonfasting lipid determination as a suitable alternative to fasting levels. Risk assessment and lipid determination should be considered in individuals older than 40 years of age or in those at increased risk regardless of age. Pharmacotherapy is generally not indicated for those at low Framingham Risk Score (FRS; < 10%). A wider range of patients are now eligible for statin therapy in the FRS intermediate risk category (10%-19%) and in those with a high FRS (> 20%). Despite the controversy, we continue to advocate for low-density lipoprotein cholesterol targets for subjects who start therapy. Detailed recommendations are also presented for health behaviour modification that is indicated in all subjects. Finally, recommendation for the use of nonstatin medications is provided. Shared decision-making is vital because there are many areas in which clinical trials do not fully inform practice."

According to the news editors, the research concluded: "The guidelines are meant to be a platform for meaningful conversation between patient and care provider so that individual decisions can be made for risk screening, assessment, and treatment."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cjca.2016.07.510. This DOI is a link to an online electronic document that is either free or for purchase.

Pharyngeal Diseases and Conditions - Pharyngitis
University of Cape Town Details Findings in Pharyngitis (Rationale and design of the African group A streptococcal infection registry: the AFROStrep study)

2017 JAN 14 (NewsRx)-- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Pharyngeal Diseases and Conditions - Pharyngitis is now available. According to news reporting originating in Cape Town, South Africa, by NewsRx journalists, research stated, "Group A b-haemolytic Streptococcus (GAS), a Gram-positive bacterium, also known as Streptococcus pyogenes, causes pyoderma, pharyngitis and invasive disease. Repeated GAS infections may lead to autoimmune diseases such as acute post-streptococcal glomerulonephritis, acute rheumatic fever (ARF) and rheumatic heart disease (RHD)."

The news reporters obtained a quote from the research from the University of Cape Town, "Invasive GAS (iGAS) disease is an important cause of mortality and morbidity worldwide. The burden of GAS infections is, however, unknown in Africa because of lack of surveillance systems. The African group A streptococcal infection registry (the AFROStrep study) is a collaborative multicentre study of clinical, microbiological, epidemiological and molecular characteristics for GAS infection in Africa. The AFROStrep registry comprises two components: (1) active surveillance of GAS pharyngitis cases from sentinel primary care centres (non-iGAS) and (2) passive surveillance of iGAS disease from microbiology laboratories. Isolates will also be subjected to DNA isolation to allow for characterisation by molecular methods and cryopreservation for long-term storage. The AFROStrep study seeks to collect comprehensive data on GAS isolates in Africa. The biorepository will serve as a platform for vaccine development in Africa. Ethics approval for the AFROStrep registry has been obtained from the Human Research Ethics Committee at the University of Cape Town (HREC/REF: R006/2015). Each recruiting site will seek ethics approval from their local ethics' committee. All participants will be required to provide consent for inclusion into the registry as well as for the storage of isolates and molecular investigations to be conducted thereon. Strict confidentiality will be applied throughout."

According to the news reporters, the research concluded: "Findings and updates will be disseminated to collaborators, researchers, health planners and colleagues through peer-reviewed journal articles, conference publications and proceedings."

For more information on this research see: Rationale and design of the African group A streptococcal infection registry: the AFROStrep study. Bmj Open, 2016;6(2):e010248. (BMJ Publishing Group - group.bmj.com/; Bmj Open - bmjopen.bmj.com/)

Our news correspondents report that additional information may be obtained by contacting D.D. Whitelaw, A. Alemseged, W.E. Sadoh, S.K. Ali, S.O. Sow, J. Dale and
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting originating in Cape Town, South Africa, by NewsRx journalists, research stated, "Data on colorectal cancer (CRC) in sub-Saharan Africa is mainly based on hospital series which suggest low incidence and frequent early onset cancers. This study characterises colorectal cancer in a population-based cancer registry in Zimbabwe."

Financial support for this research came from Wellcome Trust.

The news reporters obtained a quote from the research from the University of Cape Town, "Cases of CRC recorded by the Zimbabwe National Cancer Registry between 2003 and 2012 were analysed. Demographic and pathological characteristics were compared according to ethnicity and age. Trends in age standardised incidence rates (ASR) were determined. There were 886 and 216 cases of CRC among black Africans and Caucasians respectively, and 26% of the black Africans were younger than 40 years. Signet ring cell carcinomas were more common among black Africans compared to Caucasians (4% vs 1%, p = 0.027). ASR increased by 1.9%/year and 3.9%/year among black African males and females respectively."

According to the news reporters, the research concluded: "CRC incidence is rising among black Africans and has unique demographic and pathological characteristics."

For more information on this research see: The incidence and histo-pathological characteristics of colorectal cancer in a population based cancer registry in Zimbabwe. Cancer Epidemiology, 2016;44():96-100. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com; Cancer Epidemiology - www.journals.elsevier.com/cancer-epidemiology/)

Our news correspondents report that additional information may be obtained by contacting L. Katsidzira, University of Cape Town, Dept. of Med, Div Gastroenterol, Groote Schuur Hosp, ZA-7925 Cape Town, South Africa. Additional authors for this research include E. Chokunonga, I.T. Ganguidzo, S. Rusakaniko, M. Borok, Z. Matsena-Zingoni, S. Thomson, R. Ramesar and J.A. Matenga.

Liver Diseases and Conditions - Hepatitis

University of Central Lancashire Reports Findings in Hepatitis (Drug-related hepatitis in patients treated with standard antituberculosis chemotherapy over a 30-year period)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Hepatitis. According to news reporting out of Preston, United Kingdom, by NewsRx editors, research stated, "Drug-induced hepatitis is known to occur in a proportion of patients on treatment for active tuberculosis (TB). We prospectively examined the incidence of drug-induced hepatitis in 2070 patients treated for TB with the standard regimen based on 6 months of rifampicin (R, RMP) and isoniazid (H, INH), with 2 months of initial pyrazinamide (Z, PZA) and ethambutol (E, EMB), over a 30-year period from 1981 to 2010, in Blackburn, UK."

Our news journalists obtained a quote from the research from the University of Central Lancashire, "Of the 1031 (49.8%) males and 1039 (50.2%) females studied, 451 (21.8%) were White and 1585 (76.6%) were of South Asian origin. Only 34 (1.6%) were of African or other origins. Of the total number of patients treated, 63 (3.0%) had drug-related hepatitis, 26 (5.8%) of whom were White, 37 (2.33%) Asians and 0 other. Incidence was significantly higher in Whites than Asians (OR 2.13, P = 0.008). Incidence increased with increasing age (OR 1.16, P = 0.02). The presumed causative drug was PZA 57%, RMP 32%, INH 11%, EMB 0%. There was no trend of increased hepatitis rates over time. Rates of drug-induced hepatitis where change of treatment is required are low in patients treated with standard RHZE-based therapy (3%)."

According to the news editors, the research concluded: "Caucasians and older patients were more likely to develop hepatitis than their counterparts."

Our news journalists report that additional information may be obtained by contacting L.R. Ormerod, University of Central Lancashire, Lancashire Postgraduate Sch Med & Hlth, Preston, Lancs, United Kingdom. Additional authors for this research include A.R. Gondker, J. Morris and L.R. Ormerod.

Keywords for this news article include: Preston, United Kingdom, Europe, Digestive System Diseases and Conditions, Infectious Disease and Conditions, Liver Diseases and Conditions, Drugs and Therapies, Gastroenterology, Chemotherapy, Hepatitis, University of Central Lancashire.

University of Copenhagen Reports Findings in Type 2 Diabetes (Review of head-to-head comparisons of glucagon-like peptide-1 receptor agonists)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are presented in a new report. According to news reporting originating in Hvidovre, Denmark, by NewsRx editors, the research stated, "Currently, six glucagon-like peptide-1 receptor agonists (GLP-1RAs) are approved for treating type 2 diabetes. These fall into two classes based on their receptor activation: short-acting exenatide twice daily and lixisenatide once daily; and longer-acting liraglutide once daily, exenatide once weekly, albiglutide once weekly and dulaglutide once weekly."

Financial support for this research came from Novo Nordisk.

The news reporters obtained a quote from the research from the University of Copenhagen, "The phase III trial of a seventh GLP-1RA, taspoglutide once weekly, was stopped because of unacceptable adverse events (AEs). Nine phase III head-to-head trials and one large phase II study have compared the efficacy and safety of these seven GLP-1RAs. All trials were associated with notable reductions in glycated haemoglobin (HbA1c) levels, although liraglutide led to greater decreases than exenatide formulations and albiglutide, and HbA1c reductions did not differ between liraglutide and dulaglutide. As the short-acting GLP-1RAs delay gastric emptying, they have greater effects on postprandial glucose levels than the longer-acting agents, whereas the longer-acting compounds reduced plasma glucose throughout the 24-h period studied. Liraglutide was associated with weight reductions similar to those with exenatide twice daily but greater than those with exenatide once weekly, albiglutide and dulaglutide. The most frequently observed AEs with GLP-1RAs were gastrointestinal disorders, particularly nausea, vomiting and diarrhoea. Nausea occurred less frequently, however, with exenatide once weekly and albiglutide than exenatide twice daily and liraglutide. Both exenatide formulations and albiglutide may be associated with higher incidences of injection-site reactions than liraglutide and dulaglutide. GLP-1RA use in clinical practice should be customized for individual patients, based on clinical profile and patient preference."

According to the news reporters, the research concluded: "Ongoing assessments of novel GLP-1RAs and delivery methods may further expand future treatment options."

Our news correspondents report that additional information may be obtained by contacting S. Madsbad, Dept. of Endocrinology, Hvidovre Hospital, University of Copenhagen, Hvidovre, Denmark.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/dom.12596. This DOI is a link to an online electronic document that is either free or for purchase.

University of Heidelberg Reports Findings in Germ Cell Cancer (Cisplatin-Based Chemotherapy for Testicular Germ Cell Tumors: Complication Rates of Peripheral versus Central Venous Administration)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Germ Cell Cancer are discussed in a new report. According to news reporting from Mannheim, Germany, by NewsRx journalists, research stated, "Despite the low local toxicity of the used agents, Cisplatin-based chemotherapy (CBP) for patients with testicular germ cell tumors (TGCT) is mostly delivered via a central venous access (CVA). Since 2008, CBP is given peripherally in our hospital."

The news correspondents obtained a quote from the research from the University of Heidelberg, "Medical reports of TGCT patients who received CBP between September 1991 and August 2014 were evaluated. Complications regarding the way of administration (CVA vs. peripheral venous catheter [PVC]) were classified according to the Common Terminology Criteria of Adverse Events. The complication rates were compared using chi square test and propensity score matching. During 288 cycles in 109 patients, 85 complications (29.5%) were observed with similar rates for overall (PVC 31.3%, CVA 29.9%; p=0.820) and grade I complications (21.3%, 25.4%; p=0.470). More grade II complications were observed in the PVC group (10.0% vs. 1.5%; p<0.001). Grade III complications requiring invasive treatment were found only in the CVA group (3.0%; p=0.120). Using propensity score matching, no differences in overall (p=0.950), grade I (p=0.540) and grades II/III (p=0.590) complications were seen. The peripheral and central administration of CBP has similar overall complication rates. Despite more grade II complications, the peripheral administration of CBP is a safe alternative for TGCT patients."

According to the news reporters, the research concluded: "Additionally, no severe grade III complications occurred."

For more information on this research see: Cisplatin-Based Chemotherapy for Testicular Germ Cell Tumors: Complication Rates of Peripheral versus Central Venous Administration. Urologia Internationalis, 2015;96(2):177-82. (Karger - www.karger.com; Urologia Internationalis - content.karger.com/ProdukteDB/produkte.asp?Aktion=JournalHome&ProduktNr=224282)

University of Hong Kong Reports Findings in Adenosine Therapy

[Inhibition of human equilibrative nucleoside transporters by 4((4-(2-fluorophenyl)piperazin-1-yl)methyl)-6-imino-N-(naphthalen-2-yl)-1,3,5-triazin-2-amine]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Adenosine Therapy. According to news reporting originating in Hong Kong, People's Republic of China, by NewsRx journalists, research stated, "Equilibrative nucleoside transporters (ENTs) play a crucial role in the transport of nucleoside and nucleoside analogues, which are important for nucleotide synthesis and chemotherapy. In addition, ENTs regulate extracellular adenosine levels in the vicinity of its receptors and hence influence adenosine related functions."

The news reporters obtained a quote from the research from the University of Hong Kong, "The clinical applications of ENT inhibitors in the treatment of cardiovascular diseases and cancer therapy have been explored in numerous studies. However, all ENT inhibitors to date are selective for ENT1 but not ENT2. In the present study, we investigated the novel compound 4((4-(2-fluorophenyl)piperazin-1-yl)methyl)-6-imino-N-(naphthalen-2-yl)-1,3,5-triazin-2-amine (FPMINT) as an inhibitor of ENT1 and ENT2. Nucleoside transporter-deficient PK15NTD cells stably expressing ENT1 and ENT2 showed that FPMINT inhibited [H-3]uridine and [H-3]adenosine transport through both ENT1 and ENT2 in a concentration-dependent manner. The IC50 value of FPMINT for ENT2 was 5-10-fold less than for ENT1, and FPMINT could not be displaced with excess washing. Kinetic studies revealed that FPMINT reduced V-max of [H-3]uridine transport in ENT1 and ENT2 without affecting K-M. Therefore, we conclude that FPMINT inhibits ENTs in an irreversible and non-competitive manner."

According to the news reporters, the research concluded: "Although already selective for ENT2 over ENT1, further modification of the chemical structure of FPMINT may lead to even better ENT2-selective inhibitors of potential clinical, physiological and pharmacological importance."

For more information on this research see: Inhibition of human equilibrative nucleoside transporters by 4((4-(2-fluorophenyl)piperazin-1-yl)methyl)-6-imino-N-(naphthalen-2-yl)-1,3,5-triazin-2-amine. European Journal of Pharmacology, 2016;791():544-551.

University of Maryland Reports Findings in Biopharmaceuticals (Supramolecular PEGylation of biopharmaceuticals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Biopharmaceuticals have been presented. According to news reporting originating in College Park, Maryland, by NewsRx journalists, research stated, "The covalent modification of therapeutic biomolecules has been broadly explored, leading to a number of clinically approved modified protein drugs. These modifications are typically intended to address challenges arising in biopharmaceutical practice by promoting improved stability and shelf life of therapeutic proteins in formulation, or modifying pharmacokinetics in the body."

Financial supporters for this research include Leona M. and Harry B. Helmsley Charitable Trust (Helmsley Charitable Trust), National Science Foundation (NSF), National Institute of Health Ruth L. Kirschstein National Rsch Service Award, Wellcome Trust - MIT Postdoctoral Fellowship, Margaret A. Cunningham Award, Millard and Lee Alexanderson Fellowship.

The news reporters obtained a quote from the research from the University of Maryland, "Toward these objectives, covalent modification with poly(ethylene glycol) (PEG) has been a common direction. Here, a platform approach to biopharmaceutical modification is described that relies on noncovalent, supramolecular host-guest interactions to endow proteins with prosthetic functionality. Specifically, a series of cucurbit[7]uril (CB[7])-PEG conjugates are shown to substantially increase the stability of three distinct protein drugs in formulation. Leveraging the known and high-affinity interaction between CB[7] and an N-terminal aromatic residue on one specific protein drug, insulin, further results in altering of its pharmacological properties in vivo by extending activity in a manner dependent on molecular weight of the attached PEG chain. Supramolecular modification of therapeutic proteins affords a noncovalent route to modify its properties, improving protein stability and activity as a formulation excipient."

According to the news reporters, the research concluded: "Furthermore, this offers a modular approach to append functionality to biopharmaceuticals by noncovalent modification with other molecules or polymers, for applications in formulation or therapy."

Our news correspondents report that additional information may be obtained by contacting L. Isaacs, University of Maryland, Dept. of Chem & Biochem, College Park, MD 20742, United States. Additional authors for this research include E.A. Appel, B. Vinciguerra, A.B. Cortinas, L.S. Thapa, S. Jhunjhunwala, L. Isaacs, R. Langer and D.G. Anderson.
Vascular Diseases and Conditions - Giant Cell Arteritis

University of Melbourne Details Findings in Giant Cell Arteritis (Giant cell arteritis: ophthalmic manifestations of a systemic disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Vascular Diseases and Conditions - Giant Cell Arteritis. According to news originating from Melbourne, Australia, by NewsRx correspondents, research stated, "Giant cell arteritis (GCA) is a systemic granulomatous vasculitis, primarily affecting medium-large arteries. It has a predilection for the aorta and its major branches, including the carotid and vertebral arteries."

Our news journalists obtained a quote from the research from the University of Melbourne, "Ophthalmic artery involvement frequently leads to irreversible visual loss, and therefore GCA is one of the few true ophthalmic emergencies. GCA, although classified as a large vessel vasculitis, is known to affect smaller-sized vessels, resulting in a multiplicity of signs in the eye, some of which are often missed. We set out to highlight some of the less frequently observed clinical signs, which may provide clues to clinically diagnosing GCA in patients presenting with non-classical features and inconclusive inflammatory markers. We review the literature and describe the diverse ocular features and some of the systemic findings that can be associated with GCA. Although the most common ocular manifestation of GCA is anterior ischaemic optic neuropathy, the clinical presentation of GCA can vary dramatically. In the absence of obvious oculor involvement, more subtle ophthalmic signs of anterior segment ischaemia, such as hypotony and anisocoria, may be present at the time of initial clinical examination. There are no specific biomarkers for disease to date; therefore, pertinent history and clinical examination can guide towards diagnosis in the acute setting."

According to the news editors, the research concluded: "The diagnostic process is not always straightforward, yet appropriate and prompt diagnosis is critical to enable timely intervention and prevent significant morbidity."

For more information on this research see: Giant cell arteritis: ophthalmic manifestations of a systemic disease. Graefes Archive for Clinical and Experimental Ophthalmology, 2016;254(12):2291-2306. Graefes Archive for Clinical and Experimental Ophthalmology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

Life Science Research - Chemical Biology

University of Michigan Describes Findings in Chemical Biology (Metal-dependent Deacetylases: Cancer and Epigenetic Regulators)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Life Science Research - Chemical Biology have been presented. According to news reporting originating in Ann Arbor, Michigan, by NewsRx journalists, research stated, "Epigenetic regulation is a key factor in cellular homeostasis. Post-translational modifications (PTMs) are a central focus of this regulation as they function as signaling markers within the cell."

Financial supporters for this research include Horace H. Rackham School of Graduate Studies, University of Michigan, National Institute of General Medical Sciences.

The news reporters obtained a quote from the research from the University of Michigan, "Lysine acetylation is a dynamic, reversible PTM that has garnered recent attention due to alterations in various types of cancer. Acetylation levels are regulated by two opposing enzyme families: lysine acetyltransferases (KATs) and histone deacetylases (HDACs). HDACs are key players in epigenetic regulation and have a role in the silencing of tumor suppressor genes. The dynamic equilibrium of acetylation makes HDACs attractive targets for drug therapy. However, substrate selectivity and biological function of HDAC isozymes is poorly understood."

According to the news reporters, the research concluded: "This review outlines the current understanding of the roles and specific epigenetic interactions of the metal-dependent HDACs in addition to their roles in cancer."

For more information on this research see: Metal-dependent Deacetylases: Cancer and Epigenetic Regulators. Acsc Chemical Biology, 2016;11(3):706-16. (American Chemical Society - www.acs.org; Acs Chemical Biology - www.pubs.acs.org/journal/acsbct)

Our news correspondents report that additional information may be obtained by contacting J.E. Lopez, Interdepartmental Program in Chemical Biology, University of Michigan, 210 Washtenaw Avenue, Ann Arbor, Michigan 48109-2216, United States. Additional authors for this research include E.D. Sullivan and C.A Fierke.

Biotechnology - Molecular Pharmaceutics

University of Michigan Reports Findings in Molecular Pharmaceutics
(Mechanistic Analysis of Cocrystal Dissolution as a Function of pH and Micellar Solubilization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biotechnology - Molecular Pharmaceutics have been published. According to news reporting originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "The purpose of this work is to provide a mechanistic understanding of the dissolution behavior of cocrystals under the influence of ionization and micellar solubilization. Mass transport models were developed by applying Fick's law of diffusion to dissolution with simultaneous chemical reactions in the hydrodynamic boundary layer adjacent to the dissolving cocrystal surface to predict the pH at the dissolving solid-liquid interface (i.e., interfacial pH) and the flux of cocrystals."

Financial supporters for this research include College of Pharmacy, University of Michigan, National Institute of General Medical Sciences.

Our news editors obtained a quote from the research from the University of Michigan, "To evaluate the predictive power of these models, dissolution studies of carbamazepine-saccharin (CBZ-SAC) and carbamazepine-salicylic acid (CBZ-SLC) cocrystals were performed at varied pH and surfactant concentrations above the critical stabilization concentration (CSC), where the cocrystals were thermodynamically stable. The findings in this work demonstrate that the pH dependent dissolution behavior of cocrystals with ionizable components is dependent on interfacial pH."

According to the news editors, the research concluded: "This mass transport analysis demonstrates the importance of pH, cocrystal solubility, diffusivity, and micellar solubilization on the dissolution rates of cocrystals."

For more information on this research see: Mechanistic Analysis of Cocrystal Dissolution as a Function of pH and Micellar Solubilization. Molecular Pharmaceutics, 2016;13 (3):1030-46. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

The news editors report that additional information may be obtained by contacting F. Cao, College of Pharmacy, University of Michigan, Ann Arbor, Michigan 48109-1065, United States. Additional authors for this research include G.L. Amidon, N. Rodriguez-Hornedo and G.E. Amidon.

University of Nebraska Reports Findings in Protein-Tyrosine Kinases [Generation of Janus kinase 1 (JAK1) conditional knockout mice]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - Protein-Tyrosine Kinases. According to news originating from Omaha, Nebraska, by NewsRx correspondents, research stated, "The biological functions of the Janus kinase 1 (JAK1) are suggested to be pleiotropic since this signal transducer is ubiquitously expressed and coupled to a variety of cytokine receptors. Consequently, mice that are deficient in this tyrosine kinase were reported to die shortly after birth."

Our news journalists obtained a quote from the research from the University of Nebraska, "To facilitate studies that address the biological and molecular functions of JAK1 during postnatal development, we performed gene targeting in embryonic stem cells and generated a Cre/lox-based conditional knockout mouse model. Expression of Cre recombinase in the germline converted the Jak1 conditional knockout allele (Jak1(fl)) into a null allele (Jak1(-)) that when subsequently crossed into homozygosity led to a complete absence of the JAK1 protein in developing embryos. JAK1 deficient embryos were visibly smaller starting at E15.5. Newborn pups exhibited signs of apnea and died within hours after birth."

According to the news editors, the research concluded: "The examination of fibroblasts from conditional knockout embryos and their littermate wildtype controls expressing JAK1 showed that lack of this Janus kinase resulted in an impaired tyrosine phosphorylation and activation of the downstream Signal Transducers and Activators of Transcription (STATs) 1, 3, and 6. JAK1 conditional knockout mice will be an invaluable tool to study cytokine signaling during normal development and disease progression in adult animals."

The news correspondents report that additional information may be obtained from K.U. Wagner, Univ Nebraska Med Center, Dept. of Genet Cell Biol & Anat, Omaha, NE 68198, United States. Additional authors for this research include B.L. Wehde, P.D. Radler, A.A. Triplett and K.U. Wagner.

Three Alcohol Clinical Trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Clinical Research - Clinical Trials and Studies are presented in a new report. According to news reporting out of Albuquerque, New Mexico, by NewsRx editors, research stated, "This secondary data analysis examined patterns of drinking during alcohol treatment and associated drinking outcomes during the first year following treatment. The goal was to provide clinicians with guidance on which patients may be most at risk for negative long-term outcomes based on drinking patterns during treatment."

Our news journalists obtained a quote from the research from the University of New Mexico, "This study was an analysis of existing data (N = 3,851) from three randomized clinical trials for alcohol use disorder: the COMBINE Study (n = 1,383), Project MATCH (n = 1,726), and the United Kingdom Alcohol Treatment Trial (n = 742). Indicators of abstinence, non-heavy drinking, and heavy drinking (defined as 4/5 or more drinks per day for women/men) were examined during each week of treatment using repeated-measures latent class analysis. Associations between drinking patterns during treatment and drinking intensity, drinking consequences, and physical and mental health 12 months following intake were examined. Seven drinking patterns were identified. Patients who engaged in persistent heavy drinking throughout treatment and those who returned to persistent heavy drinking during treatment had the worst long-term outcomes. Patients who engaged in some heavy drinking during treatment had better long-term outcomes than persistent heavy drinkers. Patients who reported low-risk drinking or abstinence had the best long-term outcomes. There were no differences in outcomes between low-risk drinkers and abstainers. Abstinence, low-risk drinking, or even some heavy drinking during treatment are associated with the best long-term outcomes."

According to the news editors, the research concluded: "Patients who are engaging in persistent heavy drinking are likely to have the worst outcomes and may require a higher level of care."

For more information on this research see: How Much Is Too Much? Patterns of Drinking During Alcohol Treatment and Associations With Post-Treatment Outcomes Across Three Alcohol Clinical Trials. Journal of Studies on Alcohol and Drugs, 2017;78(1):59-69. DNA Research

University of New Mexico Details Findings in DNA Research [Editor's Highlight: Interactive Genotoxicity Induced by Environmentally Relevant Concentrations of Benzo(a)Pyrene Metabolites and Arsenite in Mouse Thymus Cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on DNA Research are discussed in a new report. According to news reporting originating in Albuquerque, New Mexico, by NewsRx journalists, research stated, "Arsenic and polycyclic aromatic hydrocarbon (PAH) exposures affect many people worldwide leading to cancer and other diseases. Arsenite (As+3) and certain PAHs are known to cause genotoxicity."

The news reporters obtained a quote from the research from the University of New Mexico, "However, there is limited information on the interactions between As+3 and PAHs at environmentally relevant concentrations. The thymus is the primary immune organ for T cell development in mammals. Our previous studies showed that environmentally relevant concentrations of As+3 induce genotoxicity in mouse thymus cells through Poly(ADP-ribose) polymerase (PARP) inhibition. Certain PAHs, such as the metabolites of benzo(a)pyrene (BaP), are known to cause DNA damage by forming DNA adducts. In the present study, primary mouse thymus cells were examined for DNA damage following 18 hr in vitro treatments with 5 or 50 nM As+3 and 100 nM BaP, benzo[a]pyrene-7,8-dihydrodil (BP-Diol), or benzo[a]pyrene-7,8-dihydrodil-9,10-epoxide (BPDE). An interactive increase in genotoxicity and apoptosis were observed following treatments with 5 nM As (+) (3) + 100 nM BP-diol and 50 nM As (+) (3) + 100 nM BPDE. We attribute the increase in DNA damage to inhibition of PARP inhibition leading to decreased DNA repair. To further support this hypothesis, we found that a PARP inhibitor, 3,4-dihydro-5-[4-(1-piperidinyl) butoxy]-1(2H)-isoquinoline (DPQ), also interacted with BP-diol to produce an increase in DNA damage. Interestingly, we also found that As+3 and BP-diol increased CYP1A1 and CYP1B1 expression, suggesting that increased PAH metabolism may also contribute to genotoxicity."

According to the news reporters, the research concluded: "In summary, these results show that the suppression of PARP activity and induction of CYP1A1/CYP1B1 may act together to increase DNA damage produced by As+3 and PAHs."

Our news correspondents report that additional information may be obtained by contacting S.W. Burchiel, University of New Mexico, Coll Pharm, Dept. of Pharmaceut Sci, Albuquerque, NM 87131, United States. Additional authors for this research include F.T. Lauer, K.J. Liu, L.G. Hudson and S.W. Burchiel.

Keywords for this news article include: Albuquerque, New Mexico, United States, North and Central America, Deoxyribonucleic Acid, Benzo(a)pyrene, DNA Research, Benzopyrenes, Arsenicals, Proteomics, DNA Damage, Arsenites, Genetics, Anions, University of New Mexico.
University of North Carolina Reports Findings in Antiretrovirals (Antiretroviral activity and safety of once-daily etravirine in treatment-naive HIV-infected adults: 48-week results)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antiretrovirals are presented in a new report. According to news reporting from Chapel Hill, North Carolina, by NewsRx journalists, research stated, "Etravirine (ETR), a non-nucleoside reverse transcriptase inhibitor approved for 200 mg twice-daily dosing in conjunction with other antiretrovirals (ARVs), has pharmacokinetic properties which support once-daily dosing. In this single-arm, open-label study, 79 treatment-naive HIV-infected adults were assigned to receive ETR 400 mg plus tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) 300/200 mg once daily to assess antiviral activity, safety and tolerability."

The news correspondents obtained a quote from the research from the University of North Carolina, "ARV activity at 48 weeks was determined by proportion of subjects with HIV-1 RNA <50 copies/ml (intention-to-treat, missing = failure). Of 79 eligible subjects, 90% were men, 62% African-American and 29% Caucasian. At baseline, median (Q1, Q3) age was 29 years (23, 44) and HIV-1 RNA 4.52 log(10) copies/ml (4.07, 5.04). A total of 69 (87%) completed a week 48 visit and 61 (77%, 95% CI 66%, 86%) achieved HIV-1 RNA <50 copies/ml at week 48. At time of virological failure, genotypic resistance-associated mutations were detected in three participants, two with E138K (one alone and one with additional mutations). Median (95% CI) CD4(+) cell count increase was 163 (136, 203) cells/μl. Fifteen (19.0%) participants reported a new sign/symptom or lab abnormality >= Grade 3 and three participants (3.8%) permanently discontinued ETR due to toxicity. Two participants had psychiatric symptoms of any grade. There were no deaths. In this study of ARV-naive HIV-positive adults, once-daily ETR with TDF/FTC had acceptable antiviral activity and was well-tolerated."

According to the news reporters, the research concluded: "Once-daily ETR may be a plausible option as part of a combination ARV regimen for treatment-naive individuals."

Our news journalists report that additional information may be obtained by contacting M.A. Floris-Moore, University of North Carolina, Sch Med, Div Infect Dis, Chapel Hill, NC 27514, United States. Additional authors for this research include K. Mollan, A.M. Wilkin, M.A. Johnson, A.D.M. Kashuba, D.A. Wohl, K.B. Patterson, O. Francis, C. Kronk and J.J. Eron.

University of Notre Dame Reports Findings in Molecular Ecology (Chromosomal inversions and ecotypic differentiation in Anopheles gambiae: the perspective from whole-genome sequencing)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Ecology - Molecular Ecology have been published. According to news originating from Notre Dame, Indiana, by NewsRx correspondents, research stated, "The molecular mechanisms and genetic architecture that facilitate adaptive radiation of lineages remain elusive. Polymorphic chromosomal inversions, due to their recombination-reducing effect, are proposed instruments of ecotypic differentiation."

Our news journalists obtained a quote from the research from the University of Notre Dame, "Here, we study an ecologically diversifying lineage of Anopheles gambiae, known as the Bamako chromosomal form based on its unique complement of three chromosomal inversions, to explore the impact of these inversions on ecotypic differentiation. We used pooled and individual genome sequencing of Bamako, typical (non-Bamako) An. gambiae and the sister species Anopheles coluzzii to investigate evolutionary relationships and genomewide patterns of nucleotide diversity and differentiation among lineages. Despite extensive shared polymorphism and limited differentiation from the other taxa, Bamako clusters apart from the other taxa, and forms a maximally supported clade in neighbour-joining trees based on whole-genome data (including inversions) or solely on collinear regions. Nevertheless, FST outlier analysis reveals that the majority of differentiated regions between Bamako and typical An. gambiae are located inside chromosomal inversions, consistent with their role in the ecological isolation of Bamako. Exceptionally differentiated genomic regions were enriched for genes implicated in nervous system development and signalling. Candidate genes associated with a selective sweep unique to Bamako contain substitutions not observed in sympatric samples of the other taxa, and several insecticide resistance gene alleles shared between Bamako and other taxa segregate at sharply different frequencies in these samples."

According to the news editors, the research concluded: "Bamako represents a useful window into the initial stages of ecological and genomic differentiation from sympatric populations in this important group of malaria vectors."

The news correspondents report that additional information may be obtained from N.J. Besansky, University of Notre Dame, Dept. of Biol Sci, Galvin Life Sci Center, Notre Dame, IN 46556, United States. Additional authors for this research include A.M. Steele, M.B. Coulibaly, S.F. Traore, S.J. Emrich, M.C. Fontaine and N.J. Besansky.
University of Occupational and Environmental Health Reports Findings in Mitral Valve Prolapse (Left Atrial Remodeling in Segmental vs. Global Mitral Valve Prolapse - Three-Dimensional Echocardiography)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Mitral Valve Prolapse is now available. According to news reporting out of Kitakyushu, Japan, by NewsRx editors, research stated, "Segmental and global mitral valve prolapse (MVP) comprise 2 representative phenotypes in this syndrome. While mitral regurgitation (MR) severity is a major factor causing left atrial (LA) remodeling in MVP, prominent mitral valve (MV) annulus dilatation in global MVP may specifically cause inferiorly predominant LA remodeling."

Our news journalists obtained a quote from the research from the University of Occupational and Environmental Health, "We compared MV annulus and LA geometry in patients with segmental and global MVP. LA volume as well as inferior, middle, and superior LA cross-sectional areas (CSA) were measured on 3-D echocardiography in 20 controls, in 40 patients with segmental MVP, and in 18 with global MVP. On multivariate analysis, MR severity was primarily associated with LA dilatation in segmental MVP (P <0.001), while MV annular dilatation was primarily associated with LA dilatation in global MVP (P <0.001). Although there was no regional predominance in LA dilatation in segmental MVP, inferior predominance of LA dilatation was significant in global MVP (increase in inferior, middle, and superior LA-CSA relative to mean of the controls: +220 +/- 70% vs. +171 +/- 55% vs. + 137 +/- 37%, P<0.001). LA remodeling in segmental and global MVP is considerably different regarding its association with MR volume or MV annular dilatation and its regional predominance."

According to the news editors, the research concluded: "While MR volume may mainly contribute to LA remodeling in segmental MVP, MV annular dilatation seems to have an important role in LA remodeling in global MVP."

Our news journalists report that additional information may be obtained by contacting Y. Otsuji, University of Occupational & Environmental Health, Sch Med, Dept. of Internal Med 2, Kitakyushu, Fukuoka, Japan. Additional authors for this research include S. Fukuda, K. Mahara, S. Hei, T. Onoue, Y. Kado, Y. Nagata, M. Iwataki, K. Otani, T. Miyamoto, Y. Oginosawa, S. Sonoda, M. Eto, Y. Nishimura, S. Takanashi, R.A. Levine and Y. Otsuji.

Oncology - Cancer Care

University of Ostrava Details Findings in Cancer Care (Assessing needs of family members of inpatients with advanced cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Cancer Care are discussed in a new report. According to news reporting originating from Ostrava, Czech Republic, by NewsRx correspondents, research stated, "To provide high-quality and effective cancer care, problems and unmet needs of family members during their relatives' hospitalisation have to be identified as well. The aims were to determine how needs of family members of patients with terminal cancer are met and to analyse factors that influence them."

Our news editors obtained a quote from the research from the University of Ostrava, "The needs were assessed with the Family Inventory of Needs. Each item (n = 20) represents one need of family members, for which the importance and satisfaction are rated. The study comprised 270 family members of hospitalised advanced cancer patients staying in the University Hospital Ostrava who were receiving palliative care. The family members preferred sufficient basic information and patient comfort. The unmet needs were support of hope (73%) and provision of information (65%). The unmet needs were more frequently identified by women, individuals with lower education, younger persons, unemployed, patients' children and family members of patients with generally unfavourable health status (P < 0.05). There was a correlation between lower quality of life and higher numbers of unmet needs."

According to the news editors, the research concluded: "Targeted interventions aimed at meeting important needs of the family members may improve their quality of life."

The news editors report that additional information may be obtained by contacting R. Buzgova, Univ Ostrava, Dept. of Nursing & Midwifery, Fac Med, Ostrava 70030, Czech Republic. Additional authors for this research include N. Spatenkova, E. Fukasova-Hajnova and D. Feltl.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ecc.12441. This DOI is a link to an online electronic document that is either free or for purchase.

University of Pennsylvania Hospital Reports Findings in Aneurysm
(Bicuspid Aortic Insufficiency With Aortic Root Aneurysm: Root Reimplantation Versus Bentall Root Replacement)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurysm. According to news originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "In patients with a bicuspid aortic valve presenting with aortic insufficiency (AI) and root aneurysm, we assessed whether outcomes with primary cusp repair with root reimplantation were equivalent to the gold standard Bentall procedures. From 2002 to 2014, 710 patients with bicuspid aortic valve underwent aortic root procedures."

Our news journalists obtained a quote from the research from the University of Pennsylvania Hospital, "Of these, only patients presenting with noncalcified type I bicuspid aortic valve with AI (n = 165) were included to maintain anatomic and physiologic homogeneity between the groups. Aortic stenosis, endocarditis, redo root, and emergency cases were excluded. Patients undergoing valve-sparing root reimplantation (VSRR group, n = 45) were retrospectively compared with those undergoing Bentall root replacement (Bentall group, n = 120). Patients in the Bentall group were older (52 +/- 13 vs 46 +/- 12 years; p<= 0.01) and had a lower ejection fraction (0.53 +/- 0.12 versus 0.58 +/- 0.08; p< 0.01), but left ventricular diastolic diameter was similar (58 +/- 10 mm versus 57 +/- 9 mm; p = 0.5). Thirty-day and in-hospital mortality was zero; in-hospital stroke rate was 0.8% (n = 1) in the Bentall group (0 in the VSRR group; p = 0.54). Permanent pacemaker rate was 6% (n = 7) in the Bentall group (0 in the VSRR group; p = 0.2). On discharge echocardiography, AI grade <= 1+ (100%; p= 1) and transvalvular gradients (mean gradient 7 +/- 3 versus 6 +/- 3 mm Hg; p = 0.14) were similar. Mean follow-up was 7.5 +/- 3.2 and 3.4 +/- 2.9 years (p < 0.001). There were 14 transient ischemic attacks or stroke events in the Bentall group, and none in the VSRR group. One patient in each group exhibited AI >= 3+. Five-year actuarial survival (100% versus 98% +/- 2%; p = 0.8) and freedom from aortic reoperation (98% +/- 2% versus 100%; p = 0.8) were similar."

According to the news editors, the research concluded: "In patients with bicuspid aortic valve AI with root aneurysm, primary cusp repair with root reimplantation achieves equivalent midterm outcomes compared with Bentall root replacement."

The news correspondents report that additional information may be obtained from P. Vallabhajosyula, University of Pennsylvania Hospital, Div Cardiovasc Surg, Philadelphia, PA 19104, United States. Additional authors for this research include W.Y. Szeto, A. Habertheuer, C. Komlo, R.K. Milewski, F. McCarthy, N.D. Desai and J.E. Bavaria.

University of Pennsylvania Reports Findings in Lung Cancer (Detection of Therapeutically Targetable Driver and Resistance Mutations in Lung Cancer Patients by Next-Generation Sequencing of Cell-Free Circulating Tumor DNA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting originating in Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "The expanding number of targeted therapeutics for non-small cell lung cancer (NSCLC) necessitates real-time tumor genotyping, yet tissue biopsies are difficult to perform serially and often yield inadequate DNA for next-generation sequencing (NGS). We evaluated the feasibility of using cell-free circulating tumor DNA (ctDNA) NGS as a complement or alternative to tissue NGS."

The news reporters obtained a quote from the research from the University of Pennsylvania, "A total of 112 plasma samples obtained from a consecutive study of 102 prospectively enrolled patients with advanced NSCLC were subjected to ultra-deep sequencing of up to 70 genes and matched with tissue samples, when possible. We detected 275 alterations in 45 genes, and at least one alteration in the ctDNA for 86 of 102 patients (84%), with EGFR variants being most common. ctDNA NGS detected 50 driver and 12 resistance mutations, and mutations in 22 additional genes for which experimental therapies, including clinical trials, are available. Although ctDNA NGS was completed for 102 consecutive patients, tissue sequencing was only successful for 50 patients (49%). Actionable EGFR mutations were detected in 24 tissue and 19 ctDNA samples, yielding concordance of 79%, with a shorter time interval between tissue and blood collection associated with increased concordance (P = 0.038). ctDNA sequencing identified eight patients harboring a resistance mutation who developed progressive disease while on targeted therapy, and for whom tissue sequencing was not possible."

According to the news reporters, the research concluded: "Therapeutically targetable driver and resistance mutations can be detected by ctDNA NGS, even when tissue is unavailable, thus allowing more accurate diagnosis, improved patient management, and serial sampling to monitor disease progression and clonal evolution."

For more information on this research see: Detection of Therapeutically Targetable Driver and Resistance Mutations in Lung Cancer Patients by Next-Generation Sequencing of Cell-Free Circulating Tumor DNA. Clinical Cancer Research, 2016;22(23):5772-5782. Clinical Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. University of Sherbrooke Details Findings in Colon Cancer (Subcellular proteomics analysis of different stages of colorectal cancer cell lines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Colon Cancer is the subject of a report. According to news reporting out of Sherbrooke, Canada, by NewsRx editors, research stated, "Studying cell differentiation and transformation allows a better understanding of the mechanisms involved in the initiation and the evolution of cancer. The role of proteins which participate in these processes is dependent on their location within the cell."

Financial support for this research came from Natural Sciences and Engineering Research Council of Canada.

Our news journalists obtained a quote from the research from the University of Sherbrooke, "Determining the subcellular localization of proteins or the changes in localization is, therefore, paramount in elucidating their role. Using quantitative mass spectrometry, we characterized the protein expression and subcellular localization of nearly 5000 proteins from seven different colorectal cancer (CRC) cell lines, as well as normal colon fibroblasts and intestinal epithelial cells. This cellular characterization allowed the identification of colon cancer-associated proteins with differential expression patterns as well as deregulated protein networks and pathways. Indeed, our results demonstrate differential expression of proteins involved in cell adhesion, cytoskeleton, and transcription in colon cancer cells compared to normal colon-derived cells. Pathway analyses identified different cellular functions, including endocytosis and eIF2 signaling, whose deregulation correlates with mutations found in the different CRC phenotypes."

According to the news editors, the research concluded: "Our results provide an unbiased, quantitative and high-throughput approach to measure changes in protein expression and subcellular protein locations in different CRC cell lines."

For more information on this research see: Subcellular proteomics analysis of different stages of colorectal cancer cell lines. *Proteomics*, 2016;16(23):3009-3018.

Our news journalists report that additional information may be obtained by contacting F.M. Boisvert, University of Sherbrooke, Dept. of Anat & Cell Biol, Sherbrooke, PQ J1E 4K8, Canada. Additional authors for this research include E. Ohl-Seguy, M.L. Dubois, D.
Jean, C. Jones, F. Boudreau and F.M. Boisvert.

Adenocarcinomas
University of Siena Details Findings in Adenocarcinomas (Recurrence after surgery in esophago-gastric junction adenocarcinoma: Current management and future perspectives)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Adenocarcinomas have been published. According to news reporting from Siena, Italy, by NewsRx journalists, research stated, "Recurrent esophago-gastric junction adenocarcinoma is not a rare event and its correct management is still debated. Many approaches for the treatment of these patients exist, but only few studies compare the different techniques."

The news correspondents obtained a quote from the research from the University of Siena, "Most of the studies are retrospective series and describe the experiences of single institutions in the treatment of recurrent esophageal and esophago-gastric junction cancers. Nowadays surgery is still the main and only curative treatment. Other alternative palliative therapies could be endoscopic stent placement and balloon dilation, photodynamic therapy, thermal tumor ablation (laser photoablation and Argon plasma coagulation), radiation therapy and brachytherapy, and chemotherapy."

According to the news reporters, the research concluded: "The aim of this review is to investigate the different rates, patterns and timings of recurrence of this tumor, and to explain the various approaches used for the treatment of recurrent esophago-gastric junction cancer."

Our news journalists report that additional information may be obtained by contacting C. Voglino, University of Siena, Dept. of Med Surg & Neurosci, Policinico Le Scotte, Unit Gen Surg & Surg Oncol, I-53100 Siena, Italy. Additional authors for this research include D. Marrelli, C. Voglino, G. Di Mare, F. Ferrara, M. Marini and F. Roviello.

University of Siena Reports Findings in Cardiology (Correlation of Left Atrial Strain and Doppler Measurements with Invasive Measurement of Left Ventricular End-Diastolic Pressure in Patients Stratified for Different Values of Ejection Fraction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiology are discussed in a new report. According to news originating from Siena, Italy, by NewsRx correspondents, research stated, "This study aimed at exploring the correlation of left atrial longitudinal function by speckle tracking echocardiography (left atrial strain) and Doppler measurements (E/E' ratio) with direct measurements of left ventricular (LV) end-diastolic pressure (LVEDP) in patients stratified for different values of ejection fraction. The study population was 80 stable patients with sinus rhythm undergoing cardiac catheterization."

Our news journalists obtained a quote from the research from the University of Siena, "This population was selected in order to have four groups of 20 patients each with different LV ejection fraction (>55%, 45-54%, 30-44%, and <30%). LVEDP was obtained during cardiac catheterization; peak atrial longitudinal strain (PALS) and mean E/E' ratio were measured in all subjects. Similar correlations with LVEDP of global PALS and E/E' ratio were recorded in patients with preserved (r=-0.79 vs. r=0.72, respectively; p<0.0001 for both) or mildly reduced ejection fraction (r=-0.75 vs. r=0.73, respectively; p<0.0001 for both). A closer correlation of global PALS compared to E/E' ratio was evident in patients with moderate (r=-0.78 p<0.0001; vs. r=0.47 p=0.01, respectively) and severe reduction (r=-0.74 p<0.0001; vs. r=0.19 ns, respectively) of LV ejection fraction. In multivariate analysis of all measurements, global PALS emerged as a determinant of the LVEDP, independent on other confounding factors and, with the cutoff value of 18.0% presented the best diagnostic accuracy to predict a LVEDP above 12 mmHg (AUC 0.87). In patients with preserved or mildly reduced LV ejection fraction, global PALS and mean E/E' ratio presented good correlations with LVEDP. In patients with moderate or severe reduction of ejection fraction, E/E' ratio correlated poorly with invasively obtained LV filling pressures."

According to the news editors, the research concluded: "Global PALS provided an overall better estimation of LV filling pressures."

For more information on this research see: Correlation of Left Atrial Strain and Doppler Measurements with Invasive Measurement of Left Ventricular End-Diastolic Pressure in Patients Stratified for Different Values of Ejection Fraction. Echocardiography, 2015;33 (3):398-405. Echocardiography can be contacted at: Blackwell Publishing Inc, 350 Main St, Malden, MA 02148, USA. Clinical Research - Clinical Trials and Studies

University of Texas Southwestern Details Findings in Clinical Trials and Studies (Statins in Primary Prevention: Uncertainties and Gaps in Randomized Trial Data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news reporting from Dallas, Texas, by NewsRx editors, the research stated, "Randomized controlled trials (RCTs) have provided evidence of the usefulness of statin primary prevention in lowering cardiovascular morbidity and mortality, yet uncertainties and gaps remain. The objective of this article was to perform a narrative review of RCTs of statins for primary prevention and identify uncertainties and gaps resulting from the design of individual studies."

The news correspondents obtained a quote from the research from the University of Texas Southwestern, "Such knowledge is important for informed physician-patient decisions. A literature search was conducted for RCTs of statins in primary prevention that included > 1000 general patients and clinical outcomes as a primary endpoint. A total of 11 RCTs were identified; target population baseline characteristics, outcomes measures, statistical methods, and limitations regarding follow-up were reported. RCTs of statins in primary prevention show consistent overall beneficial effects on cardiovascular morbidity and mortality. Caveats involve the characteristics of individual study populations since target populations often differ from what is currently considered primary prevention. Only middle aged and older populations were adequately represented in these RCTs; women were under-represented. Only one study included total mortality as the primary endpoint; all other RCTs used composite major adverse cardiac events as the primary endpoint, which occasionally included a hard outcome such as death and a soft outcome such as hospitalization for angina. The use of Cox proportional hazard analysis in RCTs poses some challenges, and intention-to-treat analysis may mask adverse events."

According to the news reporters, the research concluded: "An understanding of the deficiencies of individual RCTs of statins in primary prevention is important in creating a patient-specific therapeutic clinical decision and in tailoring future research."

Our news journalists report that additional information may be obtained by contacting I.A. Mansi, Univ Texas Southwestern, Div Outcomes & Hlth Serv Res, Dept. of Med & Clin Sci, Dallas, TX 75390, United States.

University of Texas Southwestern Details Findings in Wound Infections (Risk factors for deep sternal wound infection after cardiac surgery: Influence of red blood cell transfusions and chronic infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Bacterial Infections and Mycoses - Wound Infections have been presented. According to news reporting originating from Dallas, Texas, by NewsRx correspondents, research stated, "Deep sternal wound infection (DSWI) following cardiac surgery is a serious complication, but risk factors associated with DSWI have not been fully elucidated. We analyzed all DSWI cases at our institution from 2010-2013 in adult cardiac median sternotomy cases, based on Society of Thoracic Surgeons or National Healthcare Safety Network definitions, but with 1-year surveillance postsurgery."

Our news editors obtained a quote from the research from the University of Texas Southwestern, "Controls were matched 3:1 per case for procedure, age, and year of surgery. Demographic and operative data were pulled from Society of Thoracic Surgeons database and chart review. Potential variables were evaluated using univariate and multivariate conditional logistic regression. Out of 1,894 surgeries performed, 39 DSWI cases (2%) and 117 controls were identified. In univariate analyses, patients with red blood cell (RBC) transfusion >= 4 units, any platelet transfusion, previous infections, and chronic infections were associated with higher DSWI. RBC transfusion >= 4 units (P = .037) and chronic infections (P = .029) remained significant risk factors for DSWI in multivariate analysis. Preoperative anemia alone was not associated with more DSWI, but its interaction with RBC transfusion >= 4 units was significant."

According to the news editors, the research concluded: "High-volume RBC transfusions and chronic infections were strongly associated with DSWI in our population and represent potentially modifiable areas for improvement."

The news editors report that additional information may be obtained by contacting P.E. Greilich, Univ Texas Southwestern Med Center Dallas, Dallas, TX 75390, United States. Additional authors for this research include N. Barros, M. McBroom, J. Luby, A. Minhajuddin, W.S. Ring and P.E. Greilich.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajic.2016.03.027. This DOI is a link to an online electronic document that is either free or for purchase.
Enzymes and Coenzymes - Prostate-Specific Antigen

University of Tokyo Details Findings in Prostate-Specific Antigen (Porous silicon microarray for simultaneous fluorometric immunoassay of the biomarkers prostate-specific antigen and human glandular kallikrein 2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - Prostate-Specific Antigen. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "The authors have developed a porous silicon (P-Si) based duplex antibody microarray platform for simultaneous quantitation of the biomarkers prostate-specific antigen (PSA) and human glandular kallikrein 2 (hK2) in serum. Pore size-controlled P-Si surfaces have an extremely enlarged surface area that enables high-density immobilization of fluorescently labeled antibodies by physical adsorption."

Funders for this research include RIKEN, JSPS Kakenhi, Korean ministry of environment.

Our news journalists obtained a quote from the research from the University of Tokyo, "Automated microarraying of the antibodies provides a fast and reproducible duplex format of antibody arrays on the P-Si chips placed in the wells of a microtiter plate. The assay platform showed a 100 fg center dot mL(-1) limit of detection for both PSA and hK2, and a dynamic range that extends over five orders of magnitude. After optimization of the density of both capture antibodies, neither the PSA nor the hK2 array showed cross-sensitivity to non-target proteins or other plasma proteins. The microarray was evaluated by titration of PSA and hK2, respectively, in the same serum samples."

According to the news editors, the research concluded: "In our perception, this highly sensitive and selective platform holds promise for improved detection of tumor markers in an early diagnostic stage, but also to monitor the recurrence of prostate cancer."

For more information on this research see: Porous silicon microarray for simultaneous fluorometric immunoassay of the biomarkers prostate-specific antigen and human glandular kallikrein 2. Microchimica Acta, 2016;183(12):3321-3327. Microchimica Acta can be contacted at: Springer Wien, Sachsenplatz 4-6, PO Box 89, A-1201 Wien, Austria. (Springer - www.springer.com; Microchimica Acta - www.springerlink.com/content/0026-3672/)

The news correspondents report that additional information may be obtained from S. Lee, University of Tokyo, Dept. of Chem, Tokyo 1130033, Japan. Additional authors for this research include K. Hosokawa, S. Kim, O.C. Jeong, H. Lilja, T. Laurell and M. Maeda.

Cyclohexanes

University of Verona Describes Findings in Cyclohexanes (The ketamine analogue methoxetamine generalizes to ketamine discriminative stimulus in rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cyclohexanes. According to news reporting originating in Cagliari, Italy, by NewsRx journalists, research stated, "Methoxetamine (MXE) is a chemical analogue of ketamine. Originally proposed as a ketamine-like fast-acting antidepressant, owing to similar N-methyl-D-aspartate blocker properties, it is now scheduled for reports of hallucinations and psychosis similar to ketamine and lysergic acid."

The news reporters obtained a quote from the research from the University of Verona, "As little is known about the addictive properties of MXE, the aim of this study was to investigate the similarity between discriminative stimuli of MXE and ketamine, as well as to provide data and protocols that could be used in the future for the characterization of novel ketamine-like drugs. The paradigm used was a two-lever operant conditioning paradigm in which rats were trained to discriminate ketamine (7.5 mg/kg/ml, intraperitoneal) from vehicle. Generalization tests were performed with MXE (0.0625, 0.125, 0.25, 0.5, or 1.0). We also tested the N-methyl-D-aspartate channel blocker MK-801 (0.005-0.1), lysergic acid (0.025-0.30), a serotonergic drug that had similar hallucinogenic effects as ketamine and methamphetamine (0.15-0.60) a drug with no generalization with ketamine, injected intraperitoneally presession (mg/kg). MXE and MK-801 fully generalized to ketamine. Lysergic acid and methamphetamine partially substituted for the ketamine stimulus, although the highest lysergic acid dose showed a 77.7% generalization."

According to the news reporters, the research concluded: "The present findings suggest that investigation of 'ketamine-like compounds' should explore not only substances with chemical analogy and common molecular mechanisms with ketamine, but also with similar psychopharmacological effects."

For more information on this research see: The ketamine analogue methoxetamine generalizes to ketamine discriminative stimulus in rats. Behavioural Pharmacology, 2016;27(2-3 Spec I):204-10. (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology - journals.lww.com/behaviouralpharm/pages/default.aspx)

Gram-Negative Bacteria - Sinorhizobium meliloti

University of Waterloo Reports Findings in Sinorhizobium meliloti
[Genome-engineered Sinorhizobium meliloti for the production of poly(lactic-co-3-hydroxybutyric) acid copolymer]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Sinorhizobium meliloti. According to news reporting out of Waterloo, Canada, by NewsRx editors, research stated, "Economically competitive commercial production of biodegradable bioplastics with desirable properties is an important goal. In this study, we demonstrate the use of chromosome engineering of an alternative bacterial host, Sinorhizobium meliloti, for production of the copolymer, poly(lactate-co-3-hydroxybutyrate)."

Our news journalists obtained a quote from the research from the University of Waterloo, "Codon-optimized genes for 2 previously engineered enzymes, Clostridium propionicum propionate CoA transferase (Pct532Cp) and Pseudomonas sp. strain MBEL 6-19 polyhydroxyalkanoate (PHA) synthase 1 (PhaC1400Ps6-19), were introduced into S. meliloti Rm1021 by chromosome integration, replacing the native phbC gene. On the basis of phenotypic analysis and detection of polymer product by gas chromatography analysis, synthesis and accumulation of the copolymer was confirmed. The chromosome integrant strain, with the introduced genes under the control of the native phbC promoter, is able to produce over 15% cell dry mass of poly(lactate-co-3-hydroxybutyrate), containing 30 mol% lactate, from growth on mannitol. We were also able to purify the polymer from the culture and confirm the structure by NMR and GC-MS. To our knowledge, this is the first demonstration of production of this copolymer in the Alphaproteobacteria."

According to the news editors, the research concluded: "Further optimization of this system may eventually yield strains that are able to produce economically viable commercial product."

Our news journalists report that additional information may be obtained by contacting T.T. Tran, Dept. of Biology, Faculty of Science, University of Waterloo, 200 University Avenue West, Waterloo, ON N2L 3G1, Canada.

Oncology - Mantle Cell Lymphoma

University of Wisconsin Details Findings in Mantle Cell Lymphoma (FBXO10 deficiency and BTK activation upregulate BCL2 expression in mantle cell lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Mantle Cell Lymphoma. According to news reporting originating from Madison, Wisconsin, by NewsRx correspondents, research stated, "Targeting Bruton tyrosine kinase (BTK) by ibrutinib is an effective treatment for patients with relapsed/refractory mantle cell lymphoma (MCL). However, both primary and acquired resistance to ibrutinib have developed in a significant number of these patients."

Our news editors obtained a quote from the research from the University of Wisconsin, "A combinatory strategy targeting multiple oncogenic pathways is critical to enhance the efficacy of ibrutinib. Here, we focus on the BCL2 anti-apoptotic pathway. In a tissue microarray of 62 MCL samples, BCL2 expression positively correlated with BTK expression. Increased levels of BCL2 were shown to be due to a defect in protein degradation because of no or little expression of the E3 ubiquitin ligase FBXO10, as well as transcriptional upregulation through BTK-mediated canonical nuclear factor-kappa B activation. RNA-seq analysis confirmed that a set of anti-apoptotic genes (for example, BCL2, BCL-XL and DAD1) was downregulated by BTK short hairpin RNA. The downregulated genes also included those that are critical for B-cell growth and proliferation, such as BCL6, MYC, PIK3CA and BAFF-R. Targeting BCL2 by the specific inhibitor ABT-199 synergized with ibrutinib in inhibiting growth of both ibrutinib-sensitive and -resistant cancer cells in vitro and in vivo."

According to the news editors, the research concluded: "These results suggest co-targeting of BTK and BCL2 as a new therapeutic strategy in MCL, especially for patients with primary resistance to ibrutinib."

The news editors report that additional information may be obtained by contacting

Hematologic Diseases and Conditions - Anemia

Uppsala University Hospital Reports Findings in Anemia (A Randomized Noninferiority Trial of Intravenous Iron Isomaltoside versus Oral Iron Sulfate in Patients with Nonmyeloid Malignancies and Anemia Receiving Chemotherapy: The PROFOUND Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hematologic Diseases and Conditions - Anemia have been presented. According to news reporting from Uppsala, Sweden, by NewsRx journalists, research stated, "A safe alternative to erythropoiesis-stimulating agents to treat anemia is warranted in patients with cancer and anemia; thus the objective of this trial was to compare the efficacy and safety of intravenous (IV) iron isomaltoside with oral iron in patients with cancer and anemia by testing the noninferiority of IV versus oral iron. Phase III, prospective, open-label, comparative, randomized, noninferiority, multicenter trial."

Financial support for this research came from Pharmacosmos A/S.

The news correspondents obtained a quote from the research from Uppsala University Hospital, "Forty-seven hospitals or private cancer clinics in Asia, the United States, and Europe. A total of 350 patients with cancer and anemia. Patients were randomized in a 2:1 ratio to either intravenous iron isomaltoside or oral iron sulfate. Patients in the iron isomaltoside group were then randomized into an infusion subgroup (single intravenous infusions of a maximum dose of 1000 mg over 15 min) or a bolus injection subgroup (bolus injections of 500 mg over 2 min). The primary efficacy outcome was change in hemoglobin concentration from baseline to week 4. Changes in other relevant hematology variables, effect on quality of life, and safety outcomes were also assessed. The primary efficacy outcome was tested for noninferiority, whereas the remaining outcomes were tested for superiority. Iron isomaltoside was noninferior to oral iron in change in hemoglobin concentration from baseline to week 4 (difference estimate 0.016, 95% confidence interval -0.26 to 0.29, p<0.001). A faster onset of the hemoglobin response was observed with infusion of iron isomaltoside (superiority test: p=0.03 at week 1), and a sustained effect on hemoglobin level was shown in both the iron isomaltoside and oral iron treatment groups until week 24. A significant mean decrease in fatigue score was observed from baseline to week 12 in the iron isomaltoside group (p <0.001) but not in the oral iron group (p=0.057). A higher proportion of patients treated with oral iron experienced adverse drug
reactions (18.8% vs 6.6%, p<0.001) and discontinued the trial due to intolerance (8.0% vs 0.9%,
p=0.001). Transient hypophosphatemia (phosphate level less than 2 mg/dl) was reported at
similar low frequencies among the groups: 7.1% in the iron isomaltoside infusion subgroup
versus 8.5% in the iron isomaltoside bolus injection subgroup versus 5.4% in the oral iron
group. This trial demonstrated comparable sustained increases in hemoglobin concentration over
time with both iron isomaltoside and oral iron. Iron isomaltoside was better tolerated than oral
iron, and fatigue was significantly decreased with iron isomaltoside."

According to the news reporters, the research concluded: "Low rates of clinically
insignificant hypophosphatemia were reported in patients receiving both treatments."

For more information on this research see: A Randomized Noninferiority Trial of
Intravenous Iron Isomaltoside versus Oral Iron Sulfate in Patients with Nonmyeloid
Malignancies and Anemia Receiving Chemotherapy: The PROFOUND Trial.

**Ethylamines**

**Urmia University Details Findings in Ethylamines (The role of histamine H-1, H-2 and H-3 receptors of ventral posteromedial nucleus of thalamus in modulation of trigeminal pain)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Ethylamines. According to news reporting originating in Orumiyeh, Iran, by NewsRx journalists, research stated, "Histamine receptors are involved in supraspinal modulation of pain. In the present study, we investigated the effects of microinjection of histamine H-1, H-2 and H-3 receptor antagonists and agonists into the ventral posteromedial (VPM) nucleus of the thalamus on two models of trigeminal pain."

The news reporters obtained a quote from the research from Urmia University, "Right and left sides of VPM were implanted with two guide cannulas. Corneal pain was induced by local corneal surface application of hypertonic saline and the number of eye wipes..."
was recorded. The duration of face rubbing, as an orofacial pain measure, was recorded after subcutaneous (s.c.) injection of capsaicin into the vibrissa pad. 2-pyridylethylamine (2-PEA, a histamine H-1 receptor agonist, 4 μg/site) and dimaprit (a histamine H-2 receptor agonist, 1 and 4 μg/site) suppressed corneal and orofacial pains. Mepyramine (a histamine H-1 receptor antagonist) and ranitidine (a histamine H-2 receptor antagonist) at the similar doses of 0.5, 2 and 8 μg/site alone had no effects on trigeminal pain. Prior microinjection of mepyramine and ranitidine at a similar dose of 8 μg/site inhibited the antinociceptive effects of 2-PEA (4 μg/site) and dimaprit (4 μg/site), respectively. Immepip (a histamine H-3 receptor agonist, 1 and 4 μg/site) increased, and thioperamide (a histamine H-3 receptor antagonist, 2 and 8 μg/site) attenuated nociceptive responses. Prior microinjection of thioperamide (8 μg/site) prevented immepip (4 μg/site)-induced nociception. These chemicals did not change locomotor behavior.

According to the news reporters, the research concluded: "It is concluded that post-synaptic histamine H-2, and to a lesser extent H-1, receptors and pre-synaptic histamine H-3 receptor may be involved in VPM modulation of trigeminal pain."

Our news correspondents report that additional information may be obtained by contacting E. Tamaddonfard, Urmia Univ, Fac Vet Med, Dept. of Basic Sci, Div Physiol, Orumiyeh 5756151818, Iran. Immunology - Immune System

Vanderbilt University Details Findings in Immune System (Biogenesis and Transcriptional Regulation of Long Noncoding RNAs in the Human Immune System)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immunology - Immune System are discussed in a new report. According to news reporting out of Nashville, Tennessee, by NewsRx editors, research stated, "The central dogma of molecular biology states that DNA makes RNA makes protein. Discoveries over the last quarter of a century found that the process of DNA transcription into RNA gives rise to a diverse array of functional RNA species, including genes that code for protein and noncoding RNAs."

Our news journalists obtained a quote from the research from Vanderbilt University, "For decades, the focus has been on understanding how protein-coding genes are regulated to
influence protein expression. However, with the completion of the Human Genome Project and follow-up ENCODE data, it is now appreciated that only 2-3% of the genome codes for protein-coding gene exons and that the bulk of the transcribed genome, apart from ribosomal RNAs, is at the level of noncoding RNA genes.

According to the news editors, the research concluded: "In this article, we focus on the biogenesis and regulation of a distinct class of noncoding RNA molecules termed long, noncoding RNAs in the context of the immune system."

For more information on this research see: Biogenesis and Transcriptional Regulation of Long Noncoding RNAs in the Human Immune System. *Journal of Immunology*, 2016;197(12):4509-4517. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. (The American Association of Immunologists - www.aai.org; Journal of Immunology - www.jimmunol.org)

Our news journalists report that additional information may be obtained by contacting T.M. Aune, Vanderbilt University, Dept. of Med, Sch Med, Nashville, TN 37232, United States. Additional authors for this research include P.S. Crooke and T.M. Aune.

Vanderbilt University Reports Findings in Pulmonary Hypertension (Clinical and Biological Insights Into Combined Post- and Pre-Capillary Pulmonary Hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lung Diseases and Conditions - Pulmonary Hypertension are presented in a new report. According to news reporting from Nashville, Tennessee, by NewsRx journalists, research stated, "Pulmonary hypertension (PH) is a common and morbid complication of left heart disease with 2 subtypes: isolated post-capillary pulmonary hypertension (Ipc-PH) and combined post-capillary and pre-capillary pulmonary hypertension (Cpc-PH). Little is known about the clinical or physiological characteristics that distinguish these 2 subphenotypes or if Cpc-PH shares molecular similarities to pulmonary arterial hypertension (PAH)."

The news correspondents obtained a quote from the research from Vanderbilt University, "The goal of this study was to test the hypothesis that the hemodynamic and genetic profile of Cpc-PH would more closely resemble PAH than Ipc-PH. Vanderbilt University's electronic medical record linked to a DNA biorepository was used to extract demographic characteristics, clinical data, invasive hemodynamic data, echocardiography, and vital status for all patients referred for right heart catheterization between 1998 and 2014. Shared genetic variants between PAH and Cpc-PH compared with Ipc-PH were identified by using pre-existing single-nucleotide polymorphism data. A total of 2,817 patients with PH (13% Cpc-PH, 52% Ipc-...
PH, and 20% PAH) were identified. Patients with Cpc-PH were on average 6 years younger, with more severe pulmonary vascular disease than patients with Ipc-PH, despite similar comorbidities and prevalence, severity, and chronicity of left heart disease. After adjusting for relevant covariates, the risk of death was similar between the Cpc-PH and Ipc-PH groups (hazard ratio: 1.14; 95% confidence interval: 0.96 to 1.35; p = 0.15) when defined according to diastolic pressure gradient. We identified 75 shared exonic single-nucleotide polymorphisms between Cpc-PH and PAH enriched in pathways involving cell structure, extracellular matrix, and immune function. These genes are expressed, on average, 32% higher in lungs relative to other tissues. Patients with Cpc-PH develop pulmonary vascular disease similar to patients with PAH, despite younger age and similar prevalence of obesity, diabetes mellitus, and left heart disease compared with patients with Ipc-PH."

According to the news reporters, the research concluded: "An exploratory genetic analysis in Cpc-PH identified genes and biological pathways in the lung known to contribute to PAH pathophysiology, suggesting that Cpc-PH may be a distinct and highly morbid PH subphenotype."

For more information on this research see: Clinical and Biological Insights Into Combined Post- and Pre-Capillary Pulmonary Hypertension. Journal of the American College of Cardiology. 2016;68(23):2525-2536. Journal of the American College of Cardiology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jacc.2016.09.942. This DOI is a link to an online electronic document that is either free or for purchase.

of patients benefit despite patient selection for RAS wild type (wt) tumors."

Our news journalists obtained a quote from the research from Virginia University Medical Center, "Based on the hypothesis that tumor targeting is required for clinical benefit of anti-EGFR treatment, biodistribution and tumor uptake of (89)Zr-cetuximab by Positron Emission Tomography (PET), combining the sensitivity of PET with the specificity of cetuximab for EGFR was evaluated. Ten patients with wt K-RAS mCRC received 37 ? 1 MBq (89)Zr-cetuximab directly (<2 h) after the first therapeutic dose of cetuximab. PET-scans were performed from 1 hour to 10 days post injection (p.i.). Biodistribution was determined for blood and organs. Uptake in tumor lesions was quantified by Standardized Uptake Value (SUV) and related to response. In 6 of 10 patients (89)Zr-cetuximab uptake in tumor lesions was detected. Four of 6 patients with (89)Zr-cetuximab uptake had clinical benefit, while progressive disease was observed in 3 of 4 patients without (89)Zr-cetuximab uptake. Taken together, tumor uptake of 89Zr-cetuximab can be visualized by PET imaging."

According to the news editors, the research concluded: "The strong relation between uptake and response warrants further clinical validation as an innovative selection method for cetuximab treatment in patients with wt RAS mCRC."

For more information on this research see: 89Zr-cetuximab PET imaging in patients with advanced colorectal cancer. Oncotarget, 2015;6(30):30384-93.

Membrane Proteins - Porins

Visualizing gene expression with MRI

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Genes tell cells what to do -- for example, when to repair DNA mistakes or when to die--and can be turned on or off like a light switch. Knowing which genes are switched on, or expressed, is important for the treatment and monitoring of disease. Now, for the first time, Caltech scientists have developed a simple way to visualize gene expression in cells deep inside the body using a common imaging technology.

Researchers in the laboratory of Mikhail Shapiro, assistant professor of chemical engineering and Heritage Medical Research Institute Investigator, have invented a new method to link magnetic resonance imaging (MRI) signals to gene expression in cells--including tumor cells--in living tissues. The technique, which eventually could be used in humans, would allow gene expression to be monitored non-invasively, requiring no surgical procedures such as
biopsies.

The work appears in the December 23 online edition of the journal *Nature Communications*.

In MRI, hydrogen atoms in the body--atoms that are mostly contained in water molecules and fat--are excited using a magnetic field. The excited atoms, in turn, emit signals that can be used to create images of the brain, muscle, and other tissues, which can be distinguished based on the local physical and chemical environment of the water molecules. While this technique is widely used, it usually provides only anatomical snapshots of tissues or physiological functions such as blood flow rather than observations of the activity of specific cells.

"We thought that if we could link signals from water molecules to the expression of genes of interest, we could change the way the cell looks under MRI," says Arnab Mukherjee, a postdoctoral scholar in chemical engineering at Caltech and co-lead author on the paper.

The group turned to a protein that naturally occurs in humans, called aquaporin. Aquaporin sits within the membrane that envelops cells and acts as a gatekeeper for water molecules, allowing them to move in and out of the cell. Shapiro's team realized that increasing the number of aquaporins on a given cell made it stand out in MRI images acquired using a common clinical technique called diffusion-weighted imaging, which is sensitive to the movement of water molecules. They then linked aquaporin to genes of interest, making it what scientists call a reporter gene. This means that when a gene of interest is turned on, the cell will overexpress aquaporin, making the cell look darker under diffusion-weighted MRI.

The researchers showed that this technique was successful in monitoring gene expression in a brain tumor in mice. After implanting the tumor, they gave the mice a drug to trigger the tumor cells to express the aquaporin reporter gene, which made the tumor look darker in MRI images.

"Overexpression of aquaporin has no negative impact on cells because it is exclusive to water and simply allows the molecules to go back and forth across the cell membrane," Shapiro says. Under normal physiological conditions the number of water molecules entering and exiting an aquaporin-expressing cell is the same, so that the total amount of water in each cell does not change. "Aquaporin is a very convenient way to genetically change the way that cells look under MRI."

Though the work was done in mice, it has the potential for clinical translation, according to Shapiro. Aquaporin is a naturally occurring gene and will not cause an immune reaction. Previously developed reporter genes for MRI have been much more limited in their capabilities, requiring the use of specific metals that are not always available in some tissues.

"An effective reporter gene for MRI is a 'holy grail' in biomedical imaging because it would allow cellular function to be observed non-invasively," says Shapiro. "Aquaporins are a new way to think about this problem. It is remarkable that simply allowing water molecules to more easily get into and out of cells in a tissue gives us the ability to remotely see those cells in the middle of the body."

**Wayne State University leads groundbreaking research on preterm birth**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- DETROIT - Preterm birth -- birth before 37 weeks of pregnancy -- affects up to one in every six births in the United States and many other countries. It is the number one cause of infant death and long-term illnesses and imposes heavy social and economic burdens. Although preterm birth is a complex condition, infection of the mother and ensuing inflammation in pregnancy are very common triggers.

In a recent study published in the premier biomedical research journal Nature Medicine, a team of researchers led by Wayne State University's Kang Chen, Ph.D., assistant professor of obstetrics and gynecology in the School of Medicine, discovered the critical function of a type of mother's immune cells -- B lymphocytes -- in resisting preterm birth triggered by inflammation.

According to Chen, B lymphocytes make antibodies to defend the body against infections, but scientists and clinicians have always thought these cells are rare or absent in the uterine lining and not important for pregnancy.

Chen's lab discovered that in late pregnancy, mothers' B lymphocytes not only reside in the uterine lining in both humans and mice, but also detect inflammation and uterine stress, which are major causes of preterm birth, and in turn, produce molecules -- including one called PIBF1 -- to suppress uterine inflammation and premature birth.

"This study not only reveals the long-neglected function of B lymphocytes in promoting healthy pregnancy, but also supports therapeutic approaches of using B lymphocyte-derived molecules -- such as PIBF1 -- to prevent or treat preterm birth," said Chen.

Chen's team has performed proof-of-concept and efficacy studies in animal models, and with the help of the Wayne State University's Technology Commercialization Office, filed a patent for this potential therapeutic approach.

"It is truly remarkable that Kang has independently convened and led a team of outstanding scientists to accomplish this original and impressive tour de force, especially considering the many challenges he has encountered in the process," said Chen's collaborators, who included scientists and clinicians from Wayne State University, Beaumont Hospital Dearborn, Yale University, Memorial Sloan-Kettering Cancer Center, Washington University in St. Louis and Icahn School of Medicine at Mount Sinai. The lead authors are Wayne State postdoctoral fellows Bihui Huang and Azure Faucette, who have both assumed independent positions in academia.

Weight loss reduces psoriasis symptoms

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Weight loss has a significant and prolonged positive impact on psoriasis symptoms and quality of life. The findings stem from a study conducted by Herlev and Gentofte Hospital, in collaboration with the University of Copenhagen's Department of Nutrition, Exercise and Sports and other participants. The results are published in The American Journal of Clinical Nutrition, an internationally renowned scientific journal.

Sixty test-subjects, obese and affected by psoriasis, lost an average of fifteen kilos over a sixteen-week period while improving their quality of life and reducing the severity of their psoriasis. Upon follow up, one year later, the subjects remained ten kilos below their starting weights, and improvements in their psoriasis symptoms and quality of life were maintained.

"150,000 Danes suffer from varying degrees of psoriasis," explains the study's project manager, Professor and Senior Physician Lone Skov, Herlev and Gentofte Hospital, Department of Dermatology and Allergy, University of Copenhagen. We know that there is a connection between being overweight and psoriasis; being more overweight makes the disease worse.

Skov is supported by article co-author, Professor Arne Astrup, of the University of Copenhagen's Department of Nutrition, Exercise and Sports: "We know that both psoriasis and obesity are linked with an increased incidence of coronary heart disease, high blood pressure, high cholesterol and diabetes. If we could get obese psoriasis patients to lose weight and keep the weight off, we could potentially derive positive effects on their overall health and quality of life as well."

A study conducted in 2012 lead to obese test subjects with psoriasis losing between 10-15% of their starting weights. The study demonstrated that there was a tendency for weight loss to reduce the severity of psoriasis among the subjects. Furthermore, the study clearly demonstrated that weight loss lead to a significantly better quality of life - with a lasting effect.

"When we revisited test subjects one year later, they had only regained five kilos. Thus, they remained ten kilos beneath their starting weights. This was impressive in and of itself, but it was even more positive that they had maintained the effects of their initial weight loss with regards to the diminished severity of their psoriasis and quality of life," explains Dr. Peter Jensen, senior resident, ph.d. at Herlev and Gentofte Hospital, University of Copenhagen.

Professor Arne Astrup points to the relevance of the results for psoriasis treatment: "The results underscore the importance of focusing on weight loss as one element in a broad spectrum approach to effective psoriasis treatment for overweight patients. A by-product of weight loss might be a reduction of the complications associated with obesity. This results in a significant effect on the overall well-being of patients."

Whitestone Feeds, Inc.

Whitestone Feeds, Inc. Announces Voluntary Recall of all JES Premium 40 Tubs due to Potential Health Risk

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Whitestone Feeds, Inc. has initiated a voluntary recall of a single product from its beef cattle feed line. Effective immediately, all JES Premium 40 Tubs are being recalled. A farm located in Alabama reported that five of its beef cows died after having access to the subject batch of cattle tubs. Samples from the subject batch were assayed following a customer complaint.

While the exact cause of the death remains under investigation, elevated levels of non-protein nitrogen (NPN) may be the cause. Cattle exposed to elevated NPN may exhibit rapid breathing, tremors and slight incoordination followed by severe incoordination, excessive salivation and labored breathing. Eventually, afflicted animals lose the ability to stand. Generally, if not treated, animals may die within four hours. If producers have animals that have consumed this product and have any of these symptoms, producers should contact their local veterinarian for assistance. In a precautionary move to prevent any further loss of livestock, this particular product will be removed from the line and unavailable for purchase until further notice.

The beef cattle product subject to this recall was purchased by two distributors, one in Georgia and one in Alabama, who resold the product to farm supply dealers and ranchers located in Mississippi, Alabama, Georgia, Florida and Illinois.

The cattle feed subject to this recall can be identified by its label, which describes the product as "JES Premium 40 Tub" and includes the product number JES 3104-8. The subject batch was manufactured between September 29 to December 15, 2016, and packaged in 250-pound blue plastic tubs.

Cattle producers who have purchased JES Premium 40 Tub labeled as product number JES 3104-8 should discontinue use of the product and return any unused tubs to the place of purchase for a refund of the purchase price. Producers should contact their veterinarian for assistance if their cattle have consumed from tubs of product number JES 3104-8.

Cattle producers with questions concerning this recall may contact Whitestone Feeds, Inc. at HYPERLINK "mailto:hardin@integrityfeeds.com" hardin@integrityfeeds.com or by calling (270) 970-0787 Monday through Friday 8 am - 5 pm, Central Time.

This voluntary recall is being made with the knowledge of the Food and Drug Administration.

Heart Disorders and Diseases - Heart Failure

With $8.6 million grant from NIH, UCLA-led consortium will map the heart’s nervous system

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A consortium directed by UCLA’s Dr. Kalyanam Shivkumar has received a
three-year, $8.6 million grant from the National Institutes of Health to map the heart's nervous system. The group's goal: To conduct research that leads to new ways to treat cardiovascular disease by targeting nerves in the heart's nervous system.

More than 800,000 people in the U.S. die each year from cardiovascular diseases such as heart failure, arrhythmia and hypertension. These problems often are linked to the autonomic nervous system, the part of the nervous system that signals the heart to beat and controls breathing, digestion and other body processes that typically happen without conscious effort.

Researchers believe that modulating those electrical signals holds promise as a way to treat heart failure and other common cardiovascular problems.

"Understanding the nervous system's control of the heart is such a complex problem that it requires a collaborative approach, and we're pleased that so many experts are coming together for this initiative," said Shivkumar, the study's lead investigator and director of the UCLA Cardiac Arrhythmia Center and Electrophysiology Programs. "Our goal is to precisely map the heart's anatomy and code the function of the nerves that control the heart from a very basic level all the way to clinical studies in humans."

UCLA is one of seven institutions participating in the project. Principal investigators at the other universities are Dr. Viviana Gradinaru of Caltech, Dr. Stephen Liberles of Harvard University, Dr. Charless Fowlkes of UC Irvine, Dr. Irving Zucker of the University of Nebraska Medical Center, Dr. Beth Habecker of Oregon Health and Science University and Dr. David Paterson of Oxford University.

The information the consortium produces could point the way to new therapies that target neural structures, and it could suggest ways for scientists to create more effective electrical stimulation therapies based on the methods being used today, said Shivkumar, who is also chief of the UCLA Cardiovascular Interventional programs and a professor of medicine, radiology and bioengineering at the David Geffen School of Medicine at UCLA.

"Understanding how the nervous system controls the heart offers researchers a tremendous opportunity to open up new paths to treat cardiac disease," said Dr. Kelsey Martin, dean of the David Geffen School of Medicine. "We are thrilled that our UCLA team is leading the charge on this exciting new research."

The award is from an NIH program called Stimulating Peripheral Activity to Relieve Conditions, or SPARC, which supports research on how the electrical signals of the peripheral nerves that connect the brain and spinal cord to the rest of the body control internal organ function. The UCLA-led consortium is one of 27 multidisciplinary research teams that received SPARC awards in 2016; the grants totaled more than $20 million.

Enzymes and Coenzymes - Phosphotransferases…

Yeungnam University Reports Findings in Phosphotransferases (Alcohol Group Acceptor) (Activated protein C prevents methylglyoxal-induced endoplasmic reticulum stress and cardiomyocyte apoptosis via...
regulation of the AMP-activated protein kinase ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Enzymes and Coenzymes - Phosphotransferases (Alcohol Group Acceptor) is now available. According to news reporting out of Daegu, South Korea, by NewsRx editors, research stated, "Previous epidemiological studies have shown that methylglyoxal (MGO) levels are highly regulated in diabetic cardiovascular diseases. We have also previously reported that MGO mediates ER stress and apoptosis in cardiomyocytes."

Financial supporters for this research include Medical Research Center Program, Basic Science Research Program, National Research Foundation of Korea, Ministry of Science, ICT and Future Planning.

Our news journalists obtained a quote from the research from Yeungnam University, "Furthermore, activated protein C (APC) has recently been shown to play a protective role against ER stress, as well as a cardioprotective role against ischemia and reperfusion injury by augmenting the AMP-activated protein kinase (AMPK) signaling pathway. Therefore, we hypothesized that APC protects against MGO-induced cardiomyocyte apoptosis through the inhibition of ER stress. Our results showed that APC inhibited MGO-induced cardiomyocyte apoptosis and ER stress related gene expression. Additionally, APC inhibited MGO-induced Ca2+ mobilization and the generation of reactive oxygen species. In contrast, inhibitors of AMPK signaling abolished the cytoprotective effects of APC. Collectively, these data depict a pivotal role for AMPK signaling in inhibiting ER stress responses via the activation of APC during MGO-induced cardiomyocyte apoptosis."

According to the news editors, the research concluded: "Thus, APC may be a potential novel therapeutic target for the management of diabetic cardiovascular complications such as diabetic cardiomyopathy."

For more information on this research see: Activated protein C prevents methylglyoxal-induced endoplasmic reticulum stress and cardiomyocyte apoptosis via regulation of the AMP-activated protein kinase signaling pathway. Yonsei University Reports Findings in Anemia [Albuminuria as a Risk Factor for Anemia in Chronic Kidney Disease: Result from the KoreaN Cohort Study for Outcomes in Patients With Chronic Kidney Disease (KNOW-CKD)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematologic Diseases and Conditions - Anemia. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Anemia is a common complication among patients with chronic kidney disease (CKD), and it is associated with unfavorable clinical outcomes in patients with CKD independent of the estimated glomerular filtration rate (eGFR). We assessed the association of the urinary albumin-to-creatinine ratio (ACR) and eGFR with anemia in CKD patients."

Our news journalists obtained a quote from the research from Yonsei University, "We conducted a cross-sectional study using baseline data from the KoreaN Cohort Study for Outcome in Patients With Chronic Kidney Disease (KNOW-CKD). Multiple regression analysis was performed to identify the independent association of albuminuria with anemia. Furthermore, odds ratios for anemia were calculated by cross-categorization of ACR and eGFR. Among 1,456 patients, the mean age was 53.5 ± 12.4 years, and the mean eGFR and ACR were 51.9 ± 30.5 mL/min per 1.73 m2 and 853.2 ± 1,330.3 mg/g, respectively. Anemia was present in 644 patients (40.5%). Multivariate analysis showed that the odds ratio of anemia increased according to ACR levels, after adjusting for age, sex, eGFR, body mass index, pulse pressure, cause of CKD, use of erythropoiesis stimulating agents, serum calcium and ferritin (ACR <30 mg/g as a reference group; 30-299 mg/g, adjusted odds ratio (OR)=1.43, 95% confidence interval (CI)=0.88-2.33; (>)300 mg/g, adjusted OR=1.86, 95% CI=1.12-3.10). In addition, graded associations were observed in cross-categorized groups of a higher ACR and eGFR compared to the reference group with an ACR <30 mg/g and eGFR (>)60 mL/min per 1.73 m2."

According to the news editors, the research concluded: "The present study demonstrated that albuminuria was a significant risk factor for anemia in CKD patients independent of the eGFR."

For more information on this research see: Albuminuria as a Risk Factor for Anemia in Chronic Kidney Disease: Result from the KoreaN Cohort Study for Outcomes in Patients With Chronic Kidney Disease (KNOW-CKD). "Detection Kit for Identifying Genotype in Depression Patients and Method of Using the Same" in Patent Application Approval Process (USPTO 20160369341)

By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A patent application by the inventors E, Wen (Beijing, CN); Kong, Qingmei (Beijing, CN); Zhang, Xiaojing (Beijing, CN); Shao, Hong (Beijing, CN); Zhao, Zhenguo (Beijing, CN); Liu, Shuping (Beijing, CN); Li, Maomao (Beijing, CN); Tian, Xinxia (Beijing, CN), filed on December 16, 2015, was made available online on December 29, 2016, according to news reporting originating from Washington, D.C., by NewsRx correspondents.

This patent application has not been assigned to a company or institution.

The following quote was obtained by the news editors from the background information supplied by the inventors: "A common problem in treating depression patients is that an antidepressant drug may be very effective on some patients, but much less effective or completely ineffective on others, due to the reason of their genome differences. There are many manifestations of human genome on a single base mutation, i.e., a single nucleotide polymorphism (SNP). Single nucleotide polymorphism on the genome is a single nucleotide mutation on the formation of genetic markers. There are many forms of polymorphisms. Therefore, SNP became the third generation of genetic markers. Many human phenotypic differences, drug or disease susceptibility, etc., may be associated with SNP.

"Depression is currently the world's fourth largest disease. By 2020, it could become the second largest disease after heart disease and is becoming a serious global problem. Studies suggest that depression may be related to low content of central noradrenaline (NA), 5-hydroxytryptamine (5-HT), dopamine (DA), monoamine oxidase (MAO) and other chemicals or a receptor dysfunction. Since 1950's, development in antidepressant drugs has grown rapidly. Clinical treatment of depression has also made great progress. Stahl divided antidepressants into seven categories. Among them, serotonin reuptake inhibitors (SSRI) are the most widely used first-line antidepressant drugs in Europe and the United States to treat depression. (Stahl, 1998)

"In 1988, Eli Lilly Company introduced the first selective SSRI-fluoxetine. The mechanism of SSRIs is mainly through selective inhibition of presynaptic neurons serotonin (5-HT) pump in 5-HT reuptake, thereby increasing the synaptic concentration of 5-HT, to enhance 5-HT system function and achieve an antidepressant effect. SSRIs almost does not affect other nerve receptors (such as histamine receptors, acetylcholine receptors, adrenergic receptors, fast sodium channel, NE reuptake pumps, etc.), so action sites of SSRIs, compared to other conventional antidepressants, make them markedly faster, with smaller dosage, and significantly lower side effects (Kessler 2003, Nememff 2004, Finchfeld 2004, Masand 2002). Currently, SSRIs have reached more than 30 kinds, including fluoxetine, fluvoxamine, paroxetine (Paxil), sertraline (Zoloft), zimeldine, citalopram, and trazodone. Although there is no common chemical structure, they have common pharmacological characteristics: inhibit neuronal reuptake of 5-HT, while having almost no significant impact on the other neurotransmitters.

"SSRIs commonly used clinical dosage

"Sertraline treatment of depression: 1 time a day, 50 mg/time. The therapeutic dose range is 50 mg.about.100 mg for a day.
"Daily doses of fluoxetine hydrochloride is 20 mg:

"Paroxetine daily dose is 20 mg, taken once in the morning; adjustment in 10 mg increments 2 to 3 weeks after initial dose according to the disease; maximum daily dose is 50 mg. Elderly patients should not exceed the maximum dose of 40 mg daily. If taken for long term, a gradual reduction is needed with no abrupt stop.

"Fluvoxamine daily dose is 100mg; 1 to 2 times daily with meals or after meals; dose adjustment should not exceed 300 mg daily.

"Citalopram, initial dose 20 mg for adults; may be increased to 40 mg; if necessary, may be increased to 60 mg; Halved in patients below 65 years of age;

"Escitalopram, initial dose is 10 mg daily; may increase to 20 mg daily after a week; orally in the morning or in the evening. Under normal circumstances a full therapy should take months or even longer. Elderly patients or hepatic dysfunction once 10 mg daily; no need for dose adjustment for mild or moderate renal insufficiency patients. Severe renal insufficiency should take caution.

"Although SSRIs made great progress in the clinical treatment of depression, the long-term efficacy in a large number of patients showed that there is a big difference using SSRIs alone in the clinical treatment of depression patients. For patients that SSRIs treatment effect was not obvious, clinically they were treated with low dose (0.5-1.5 mg/day) risperidone, combined with SSRIs treatment for a short term (1-2 days). Most patients treated with this method showed a very good therapeutic effect (O'Connor and Silver, 1998; Ostroff and Nelson, 1999). Adding risperidone can improve the efficacy of antidepressant SSRIs. But this remarkable efficacy is not shown in all patients (Gerard J Marek, 2003). Researchers conducted genomics study and suggested that this phenomenon is associated closely with the patient gene polymorphisms, such as cytochrome P450 enzyme polymorphism, serotonin receptor gene polymorphism and so on.

"5-HT.sub.2A receptor gene is located on chromosome 13q14.21. It has three exons and two introns. Turechi and other researchers suggested that brain 5-HT.sub.2A receptor density is correlated with 5-HT.sub.2A receptor gene polymorphism. Currently found in a variety of polymorphism in the gene, 1438G/A (rs6311C/T) polymorphism is the only 5-HT.sub.2A receptor in the promoter region of the structural gene polymorphic variation, affecting the promoter activity. The promoter is a key transcription site. The difference in its sequence may result in different transcriptional changes, affecting the number of receptors, conformation, and binding function, leading to the central nervous system neurotransmitters and receptors changes and presynaptic changes, such as neurotransmitter synthesis, release, metabolism, and (or) re-uptake, and postsynaptic changes, such as receptors, conversion agent (G-protein), second messenger (phosphatidylinositol cyclase system) changes and ion transport abnormalities, which in turn will affect the efficacy of SSRIs.

"In recent years, there have been many studies on rs6311 polymorphism and mood disorders, but the results lack of consistency. In a study in Asia, it was found that 5-HT.sub.2A receptor gene 1438G/A polymorphism is correlated with paroxetine and fluoxetine treatment response. The treatment has better effects on 1438G/G genotype patients. In a study in Korea, 1438G/G genotype patients showed better response to citalopram. Moreover, this result was validated in a study in the Chinese Han population. In 2009, it was reported the 5-HT.sub.2A rs6311 frequency increases at C allele and decreases at T allele in neurological disorders in Han population, and the frequency increase in patients with depression are prevalent. There are a lot of data to suggest 5-HT.sub.2A receptor gene rs6311 polymorphism is associated with SSRIs efficacy and it is speculated that T allele, TT genotype may be a predictor of poor efficacy. In a Beijing Han population survey, T allele frequency is 48.8%; TT and TC genotypes were 69.8%
among the population. (See rs6311 polymorphism population distribution in FIG. 1)

"A study found that, SSRIs reduced 5-HT.sub.2A receptor expression (Yatham et al., 1999). Meanwhile, other studies indicated that long-term use of blocking presynaptic membrane on 5-HT reuptake effects of SSRIs can cause a decrease in cortical 5-HT.sub.2A receptor density. Glennon and Dukat reported SSRIs is correlated with a reduction in 5-HT.sub.2A receptor reaction rate (Glennon et al., 1995). Accordingly, it is hypothesized that locus in rs6311 T allele. TT genotype may reduce 5-HT.sub.2A receptor expression or its reactivity with SSRIs. The use of specific 5-HT.sub.2A receptor antagonist agent may improve the treatment of depression.

"SSRIs in combination with low-dose risperidone (0.5-1 mg/day) can significantly improve most of the patient's symptoms in 1-2 days. (O'Connor and Silver, 1998; Ostroff and Nelson, 1999). Risperidone may be completely digested after oral administration, reach peak plasma concentration within 1-2 hours, and its digestion is not affected by food. Risperidone is a monoaminergic antagonist with unique selectivity properties, which has high affinity with 5-HT.sub.2A receptors. Risperidone binding capacity with 5-HT.sub.2A receptor is far greater than with 5-HT.sub.1A and 5-HT.sub.2c receptors, which is about 1,000 times higher than binding capacity with 5-HT.sub.1A receptor. It can also bind with the adrenergic receptor and the low affinity H1-histamine receptors and .alpha.2-adrenergic receptors. Risperidone does not bind with cholinergic receptors. Effective dose of risperidone in treatment of depression is 0.5-1 mg/day. The dose for the treatment of schizophrenia was 6 mg/day. This depends on the different receptors at different concentrations that risperidone selectively hinders. Risperidone of 4 mg dose blocks 70-80% striatal dopamine D2 receptors (Nyberg et al., 1999). Further increase in plasma concentration may cause increase in extrapyramidal side effects. Risperidone of 0.5-1 mg dose may saturate and close 5-HT.sub.2A receptor, and reduce the extrapyramidal side effects to a minimum.

"5-HT.sub.2A receptors are the main targets for SSRIs and risperidone, which belong to the G protein-coupled receptor family, mainly in the frontal cortex (Arora R C et al. 1989; Yates M et al. 1990). 5-HT.sub.2A receptor can activate non-5-HT.sub.2A receptor during treatment of antagonist depression and other neuropsychiatric diseases (Gerard J Marek, 2003). Researchers in experimental animal models of depression found that 5-HT.sub.2A may regulate the body's response to drugs. Black and Goodwin's study found that antidepressant treatment can reduce 5-HT.sub.2A receptor density in animal brains (Goodwin G M et al. 1985). Biegon et al. reported that 5-HT.sub.2A receptor binding capacity on platelet membranes in patients with depression is correlated with the patients' clinical symptoms. When the patients showed clinical improvement, the 5-HT.sub.2A receptor binding capacity decreased significantly; when patients' clinical symptoms do not improve, 5-HT.sub.2A receptor binding capacity does not change (Biegon A Essar N et al. 1990). These findings strongly suggest there is a close correlation between 5-HT.sub.2A receptor and antidepressant drug response. Low dose risperidone can selectively block 5-HT.sub.2A receptor. Given that in the treatment of depression of 5-HT system plays a very complex role, a variety of 5-HT receptor activation in the treatment will affect SSRIs efficacy. 5-HT.sub.2A receptor-specific closure may have brought new ways for the treatment of depression. (Ostroff and Nelson, 1999; Ansoms et al, 1977).

"In order to accurately use SSRIs, the present invention designs and synthesizes specific probes and primers to detect human genome rs6311 loci polymorphism (See rs6311 polymorphism genome sequences in FIG. 2). The patients are divided into normal metabolic group (CC genotype) and slow metabolic group (CT and TT genotype). Normal metabolic group is routinely administration SSRIs. For CT and TT groups, with the combination of SSRIs drugs, there is a simultaneous administration of low doses of risperidone (0.5-1 mg/day), to obtain a
good therapeutic effect, while greatly reduce the side effects of the drugs."

In addition to the background information obtained for this patent application, NewsRx journalists also obtained the inventors' summary information for this patent application: "The present invention comprises of an individualized detection kit, which contains a primer, a probe, and other reagents. The probe is specifically design for the detection of human metabolism genotypes. The components in the detection kit can be used in combination of extracted DNA from a depression patient to carry out polymerase chain amplification reaction such that the genotypes can be determined.

"The present invention comprises of the following detection method.

"Selectively enroll patients based on evaluation criteria, according to research method flow diagram (FIG. 3), in accordance with the technical plan (FIG. 4). Take 2 ml peripheral blood (EDTA anticoagulant) from a patient. Extract genomic DNA from whole blood. Bi-directional sequencing methods and real-time fluorescence analysis, such as Taqman probe techniques, are used to determine the genotype of the patient. Patients are then randomly divided into two groups; one group is administered drugs by conventional means and the effect is evaluated. Another group undergoes Set A treatments: a group with CC genotype is administered in accordance with common clinical practice; genotype CT/TT groups are given clinical dose of SSRIs, combined with low dose risperidone. According to the clinical evaluation of effects of this group, Set B treatment can be further carried out: CC genotype is administered in accordance with conventional regimens. CT/TT genotypes are administered in accordance with reduced dose of SSRIs. Severity of symptoms of depression is evaluated. Initial dosing regimen can be derived based on the above experimental results.

"Re-evaluation after the treatments to determine whether to exclude a patient or continue the treatment. The proportional relationship of ketanserin in combination with SSRIs for treatments of mild, moderate, and severe depression is further determined.

"According to the above treatment plan, the present invention can achieve the following objectives: To provide a detection kit for the classification of depression patients. To adjust the ratio of risperidone and SSRIs in patients with depression medication. Use two drugs that have different targets in order to improve the treatment.

BRIEF DESCRIPTION OF DRAWINGS

"FIG. 1 is an rs6311 polymorphism population distribution.

"FIG. 2 is an rs6311 polymorphism genome sequence.

"FIG. 3 is the method to classify patients.

"FIG. 4 is technical plan for patient treatment."

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A patent application by the inventors VIDLUND, Robert M. (Forest Lake, MN); EKVALL, Craig A. (East Bethel, MN), filed on August 30, 2016, was made available online on December 29, 2016, according to news reporting originating from Washington, D.C., by NewsRx correspondents.

This patent application is assigned to Tendyne Holdings, Inc.

The following quote was obtained by the news editors from the background information supplied by the inventors: "Embodiments are described herein that relate to devices and methods for anchoring medical device such as a prosthetic heart valve replacement, and more particularly to devices and methods for the post-deployment adjustment and/or re-positioning of such a medical device.

"Some known prosthetic heart valves, such as prosthetic mitral valves, include one or more tethers that extend from the valve to the exterior of the heart, and are secured to an outer ventricular wall of the heart with an epicardial anchor device. During such procedures, positioning the anchor device and providing a desired tension to the securing tether can be challenging. Many known devices do not have the ability to make adjustments to the anchor device or to the tension of the tether after initial placement. Further, known devices do not have the ability to measure and monitor the tension on the tether during deployment of the valve to assist in providing an optimal tension and position.

"Some problems associated with improper tensioning of a securing tether can include, for example, the tether becoming progressively slack over time, a tether which has been overtightened and is deforming the positioning of the deployed valve, and a tether which has been deployed in a less than optimal angular configuration or has migrated such that the valve axis is no longer orthogonal to the plane of the native valve's annulus.

"Accordingly, there is a need for devices and methods for adjusting and/or repositioning a prosthetic heart valve after its initial deployment and for monitoring the tension on a securing tether extending from the prosthetic heart valve."

In addition to the background information obtained for this patent application, NewsRx journalists also obtained the inventors' summary information for this patent application: "Apparatus and methods are described herein for positioning an epicardial anchor device and measuring the load of a tether extending from a prosthetic heart valve and coupled to the epicardial anchor device. In some embodiments, an apparatus includes a handle assembly coupled to an elongate member and a docking member coupled to a distal end of the elongate member. The docking member can be releasably coupled to an epicardial anchor device configured to secure a tether extending from a prosthetic heart valve implanted with a heart at a location on an exterior of a ventricular wall of the heart. A force sensor device is coupled to the handle assembly and can measure a force exerted on the force sensor device. The force is associated with a tension of the tether extending through the elongate member, handle assembly
and force sensor device.

BRIEF DESCRIPTION OF THE DRAWINGS

"FIG. 1 is a schematic cross-sectional illustration of portion of a heart with a prosthetic mitral valve implanted therein and an epicardial anchor device anchoring the mitral valve in position.

"FIG. 2 is a schematic illustration of an epicardial anchor device, according to an embodiment.

"FIG. 3 is a schematic illustration of a positioning device, according to an embodiment.

"FIG. 4 is a top perspective view of an epicardial anchor device, according to another embodiment.

"FIG. 5 is a top view of the epicardial anchor device of FIG. 4.

"FIG. 6 is an exploded view of the epicardial anchor device of FIG. 4.

"FIG. 7 is a cross-sectional perspective view of the epicardial anchor device of FIG. 4 with a locking pin of the device shown in a first position.

"FIG. 8 is a cross-sectional side view of the epicardial anchor device of FIG. 4 with the locking pin of the device shown in the first position.

"FIG. 9 is a cross-sectional bottom perspective view of the epicardial anchor device of FIG. 4 with the locking pin shown in a second position.

"FIGS. 10 and 11 are a top perspective and a bottom perspective view, respectively, of a hub member of the epicardial anchor device of FIG. 4.

"FIG. 12 is an enlarged top view of a portion of the epicardial anchor device of FIG. 4.

"FIG. 13 is a perspective view of a positioning device, according to an embodiment.

"FIG. 14 is a top view of a portion of the positioning device of FIG. 13.

"FIG. 15 is a cross-sectional view of the portion of the positioning device of FIG. 14.

"FIG. 16A is a perspective view and FIG. 16B is a top view of a portion of the positioning device of FIG. 13.

"FIG. 17A is a perspective view of a portion of the positioning device of FIG. 13 shown partially exploded.

"FIG. 17B is a perspective view of the portion of the positioning device of FIG. 17A.

"FIG. 18 is a top view of a positioning device, according to another embodiment.

"FIG. 19 is a perspective view of a portion of the positioning device of FIG. 18 shown partially exploded.

"FIG. 20 is a perspective view of the portion of the positioning device of FIG. 19.

"FIG. 21 is a schematic illustration of a portion of the positioning device of FIG. 18.

"FIG. 22 is a perspective view of a positioning device, according to another embodiment, shown coupled to an epicardial anchor device.

"FIG. 23 is a top view of the positioning device of FIG. 22.

"FIG. 24 is a cross-sectional view of a portion of the positioning device of FIG. 22, taken along line 24-24 in FIG. 23.

"FIG. 25 is a perspective view of a portion of the positioning device of FIG. 22.

"FIG. 26 is a perspective view of a force sensor device of the positioning device of
FIG. 22.

"FIG. 27 is an exploded perspective view of the force sensor device of FIG. 26.
"FIG. 28 is a perspective view of a portion of the force sensor device of FIG. 26.
"FIG. 29 is a perspective view of a portion of the positioning device of FIG. 22.
"FIG. 30 is a side view of the positioning device of FIG. 22.
"FIG. 31 is a partial cross-sectional side view of a tension limiting device according to an embodiment.
"FIG. 32 is a top view of a tether release tool, according to an embodiment.
"FIG. 33 is a perspective view of an end portion of the tether release tool of FIG. 32.
"FIG. 34 is a perspective view of a portion of the tether release tool of FIG. 32 shown being coupled to an epicardial anchor device.
"FIG. 35 is a perspective view of a portion of the tether release tool of FIG. 32 shown coupled to the epicardial anchor device of FIG. 34.
"FIG. 36 is a perspective view of a force sensor device according to an embodiment.
"FIG. 37 is an exploded perspective view of the force sensor device of FIG. 36.
"FIG. 38 is a cross-sectional perspective view of the force sensor device of FIG. 36.
"FIG. 39 is a side view of a portion of a tether with a marker band according to an embodiment."
inhibition of viral propagation (Andino, R., 2003). RNAi has emerged as an immensely important and popular method to elicit post-transcriptional, sequence-specific silencing of gene expression and is a major new genetic tool for investigating mammalian cells. RNAi is initiated by exposing cells to dsRNA either via transfection or endogenous expression. Long double-stranded (ds) RNAs are processed into siRNAs by dicer, a ribonuclease of the Rnase III family. These siRNAs form a complex known as the RNA Induced Silencing Complex or RISC, which functions in homologous target RNA destruction (Montgomery, M. K., 2004).

"The use of exogenously supplied siRNAs for targeted RNA knockdowns has become widespread (Elbashir, S. M., et al., 2001). The exogenous RNAs can be manufactured synthetically. However, when synthetic siRNAs are used for gene silencing, the costs can be substantial because of variations in siRNA efficacies. An alternative to chemically synthesized siRNAs are siRNAs produced by bacteriophage T7 RNA polymerase. These siRNAs are made by in vitro transcription mediated by bacteriophage promoters from linearized DNA templates. In vitro transcription using bacteriophage T7 RNA polymerase has been shown to produce highly active siRNAs (Sohail, M., et al., 2003; Donze, O. and Picard, D., 2002).

"The interferon (IFN) system is one of the body's first lines of defense against viruses (Samuel, C. E., 2004). IFN was discovered as an antiviral agent by Isaacs and Lindenmann during studies on virus interference, where they observed that cells infected with influenza virus secrete a factor that mediates the transfer of a virus-resistant state active against both the inducing virus and other viruses as well (Samuel, C. E., 2004). Double-stranded RNA (dsRNA) is known to play an important role in the IFN system (Samuel, C. E., 2001). It is known that synthetic dsRNAs and RNAs with double-stranded character produced during viral infections have the capacity to be potent inducers of IFN (Stewart, W. E., 1979; Marcus, P. I., 1983).

"The early recognition of invasive pathogens by innate sensing is the most important defense mechanism of the immune system (Beutler, B., 2004a; Boehme, K. W. and Compton, T., 2004). Viral infection of mammalian cells results in activation of an innate immune response which is mediated by interferons and cytokines that concomitantly inhibit viral replication (Malmgaard, L., 2004). Several Toll-Like Receptors (TLRs) have been identified in humans and mice and are known to be expressed predominantly on cell types which are first to encounter intracellular pathogens (Boehme, K. W. and Compton, T., 2004). Double stranded RNA (dsRNA), including the synthetic analog poly inosine-poly cytosine (Poly IC), is known to activate TLR3, a cellular receptor that recognizes and initiates a potent anti-viral response by producing interferons (Alexopoulou, L., et al., 2001). Similarly, single stranded RNA (ssRNA), which includes the genomes of several viral RNA species, has been shown to interact with and activate TLR7 and TLR8 (Lund, J. M., et al., 2004; Diebold, S. S., et al., 2004; Heil, F., et al., 2004; Hornung, V., et al., 2005). dsRNAs can be easily distinguished intracellularly as viral replication intermediates, however, it remains elusive how a simple ssRNA motif recognized by TLR7 and 8 is discerned by the cell to be either viral (exogenous) or endogenous in origin (Boehme, K. W. and Compton, T., 2004). Considering that TLRs are cell type specific and are present within unique localized intracellular compartments, recognition of dsRNA and/or ssRNA offers an important innate defense mechanism against viral infection along with the recognition of CpG DNA motifs and/or envelope glycoproteins (Boehme, K. W. and Compton, T., 2004; Beutler, B., 2004b).

"RNAi-mediated gene silencing in mammalian cells requires siRNAs of sufficiently small size to circumvent potential sequence-independent, nonspecific changes in gene expression attributable to the induction or action of interferons. Sledz, C. A., et al. (2003) found that transfection of siRNAs results in interferon (IFN)-mediated activation of the Jak-Stat pathway and global upregulation of IFN-stimulated genes. The authors showed that by using cell lines deficient in specific components mediating IFN action that the RNAi mechanism itself is
independent of the interferon system. The authors characterized their finding as showing the 'broad and complicating effects' of siRNAs beyond the selective silencing of target genes when introduced into cells. Similarly, Bridge, A. J., et al. (2003) reported that although siRNAs were thought to be too short to induce interferon expression, a commonly used shRNA construct was found to induce an interferon response. The authors advise as a 'simple precaution to limit the risk of inducing an interferon response' to use the lowest effective dose of shRNA vector.

"Although the anti-viral activities of interferons are well studied (Samuel, C. E., 2001), nobody has recognized in connection with RNAi the uses and advantages, as opposed to the risks, of interferon induction by RNAi molecules, independent of the RNAi effect, to provide anti-viral and other effects, such as anti-cancer effects. Moreover, until now, nobody is believed to have discovered the role of the triphosphate, in particular the 5'-triphosphate produced on RNAi molecules in vitro, for inducing interferon and eliciting anti-viral and other medically useful responses."

In addition to the background information obtained for this patent application, NewsRx journalists also obtained the inventors' summary information for this patent application: "The present invention is believed to be first to show that the presence of an initiating triphosphate on in vitro transcribed-RNAs can potently induce interferon .alpha. and .beta., as well as elicit a strong, non-sequence-specific antiviral response to viral challenge.

"The present invention relates in one aspect to double-stranded RNA molecules, including RNAi molecules, and in another aspect to single-stranded RNA molecules, on which one or more triphosphates, preferably one or more 5'-triphosphates, are maintained in order to exploit the interferon induction properties of such molecules, in order to provide anti-viral and other medically useful (e.g., anti-cancer) effects.

"The present invention relates in one embodiment to a method for inducing interferon in a cell, comprising exposing or introducing into the cell an effective amount of an RNAi molecule having one or more triphosphates, preferably a 5'-triphosphate, wherein said RNAi molecule induces said interferon. The RNAi molecule also can have an anti-viral effect, and preferably, is introduced into the cell prior to viral infection, wherein the RNAi molecule inhibits or prevents viral infection. The RNAi molecule also can have other medically useful effects, such as an anti-cancer effect.

"In another embodiment, the invention provides a composition for inducing interferon in a cell comprising an effective amount of an RNAi molecule having one or more triphosphates, preferably a 5'-triphosphate, wherein the RNAi molecule can induce interferon in the cell. In a preferred embodiment, the RNAi molecule can also have an anti-viral or anti-cancer effect.

"In another embodiment, the invention provides an anti-viral reagent comprising an effective amount of an RNAi molecule having one or more triphosphates, preferably a 5'-triphosphate, wherein the RNAi molecule in addition to inducing interferon also has an anti-viral effect. In one embodiment, the anti-viral effect is the result of interferon induced by the RNAi molecule in a non-sequence dependent manner. In another embodiment, the anti-viral effect is the result of a synergy between an RNAi effect mediated by the RNAi molecule (i.e., as a result of homology between the RNAi molecule and its target molecule) and an immune response mediated by interferon induction.

"In another embodiment, the invention provides a method for inducing an anti-viral response in a cell, comprising introducing into a cell an effective amount of an RNAi molecule having one or more triphosphates, preferably a 5'-triphosphate, and which exhibits one of the above anti-viral effects.

"The cell can be any cell and is preferably a eukaryotic or vertebrate cell, more
preferably a mammalian cell, and most preferably a human cell.

"In a preferred embodiment, the RNAi molecule is an siRNA or an shRNA.

"In another aspect, the present invention provides a method for inducing interferon in
a cell, comprising introducing into the cell an effective amount of a short single-stranded RNA
(ssRNA) having one or more triphosphates, preferably a 5'-triphosphate, wherein the ssRNA
molecule induces interferon, and preferably also has an anti-viral or other medically useful (e.g.,
anti-cancer) effect, as described above.

"In a more preferred embodiment of each of the above embodiments, the RNAi
molecule and ssRNA molecule are produced in vitro by a phage polymerase. In a preferred
embodiment, the phage polymerase is T7 RNA polymerase, T3 RNA polymerase or Sp6 RNA
polymerase. In an even more preferred embodiment, the polymerase is T7 RNA polymerase.

"In the present invention, the 5'-triphosphate of an RNAi or ssRNA molecule
produced in vitro has been discovered to be an active inducer of interferon, as well as a potent
anti-viral agent. On the other hand, the present invention also recognizes advantages of
removing the 5' triphosphate from in vitro transcribed RNAi molecules, and thus reducing or
inhibiting interferon induction. This additional aspect of the invention should be useful for
controlling, reducing or inhibiting interferon induced during gene silencing using such RNAi
molecules.

"In yet another aspect, the present invention thus provides an in vitro method for
producing or synthesizing an RNAi molecule which reduces or alleviates the interferon response
exhibited by a double-stranded, preferably an RNAi, molecule or ssRNA molecule produced in
vitro, while maintaining the efficacy of the molecule. In one embodiment, the method comprises
removing one or more 5'-triphosphates from the molecule, wherein the removal reduces or
alleviates the interferon response while maintaining the efficacy of the molecule.

BRIEF DESCRIPTION OF THE FIGURES

"FIG. 1A are photographs showing anti-HSV-1 activities of T7 transcribed siRNAs. The siRNA
transfected HEK-293 cells were infected with HSV-1-EGFP. Top panel, mock or
chemically synthesized siRNA transfected samples (anti-La#2 and anti-Ro #1); middle panel,
T7 siRNA transfected samples; lower panel, the anti-La #2 siRNAs were prepared by T7 RNA
polymerase using the Silencer siRNA Construction Kit (Ambion).

"FIG. 1B are photographs showing the cytotoxic effect of T7 transcribed siRNAs. HEK-293 cells
were transfected with 20 nM of synthetic or T7 transcribed siRNA and
monitored microscopically on day 5 post transfection.

"FIGS. 2A-2D show interferon induc
tion by transcribed siRNAs.

"FIG. 2A is a graph showing that the anti-HSV-1 activity is mediated by induction of
interferon .alpha. and .beta.. The anti-HSV-1 activity was assayed using the medium from
siRNA-transfected cells. Either a single (col. 3 or 4) or both neutralizing antibodies (col. 5) were
tested.

"FIG. 2B is a graph showing anti-HSV-1 activity of T7-transcribed siRNAs in HEK-
293, HeLa and CV1 cell lines. 20 nM of T7-transcribed siRNA was transfected into the three
different cell lines and HSV-1 infection was monitored.

"FIG. 2C are graphs showing that RNAi and interferon induction are independent
phenomena. Two different siRNAs, one targeting a susceptible site and the other a
nonsusceptible site in EGFP, were synthesized chemically or transcribed by T7RNA polymerase
and tested for RNAi efficacy (top) and interferon induction (bottom). The RNAi assay
represents the average of three independent assays. The interferon results are the average of two
independent experiments.

"FIG. 2D is a graph showing the potency of the RNA-mediated anti-HSV-1 activity. The inhibition of HSV-1 infection was tested after transfection using the indicated amounts of synthetic or T7-transcribed siRNAs. The average of two independent experiments is presented.

"FIG. 3A are photographs showing the anti-EMCV activities of T7 transcribed siRNAs, produced in accordance with the present invention, compared with the anti-EMCV activities of Poly IC. Top panel, cells; Second panel from top, Cells infected with EMCV; Third panel from top, T7 siRNA transfected cells infected with EMCV (triphosphate containing anti-EMCV T7 siRNAs stimulate interferon, thus, protecting cells from EMCV infection); Bottom panel, Poly IC transfected cells infected with EMCV (poly IC is toxic and cells are expressing EGFP, so toxicity results in cell death and loss of EGFP signal.)

"FIG. 3B are photographs showing anti-EMCV activities of T7 transcribed siRNAs, produced in accordance with the present invention, compared with the anti-EMCV activities of various endoribonuclease prepared siRNAs (EsiRNA I, II, and III).

"FIG. 3C are photographs showing anti-EMCV3 activities of T7 transcribed siRNAs, produced in accordance with the present invention. Top panel, irrelevant T7 siRNA; Middle panel, EMCV3 T7 siRNA; Bottom panel, EMCV3 T7 siRNA in the presence of CIP.

"FIG. 4 is a schematic showing a T7 siRNA having a 5’-triphasphate produced in accordance with the present invention. The schematic shows the non-base paired nucleotide (G) to which the 5’triphasphate is attached. The schematic also shows the synergistic effects of the 5’-triphasphate mediated innate immune response and the siRNA mediated RNAi effect.

"FIG. 5A is a graph showing the synergistic effect of siRNAs and triphosphates in protecting cells from cytopathic effects of EMCV infection at a MOI of 3.

"FIG. 5B is a graph showing the synergistic effect of siRNAs and triphosphates in protecting cells from cytopathic effects of EMCV infection at a MOI of 10.

"FIG. 6 is a schematic of the 5’UTR of a EMCV viral genome (SEQ ID NO:1). Also shown are the regions where siRNAs, produced in accordance with the present invention, bind the EMCV viral genome.

"FIGS. 7A-7C show the role of the initiating triphosphate in interferon induction.

"FIG. 7A shows siRNAs synthesized in accordance with the invention. (i) The EGFP #2 synthetic I (SEQ ID NOs:2 and 3), chemically synthesized siRNA against the EGFP #2 site, EGFP #2 synthetic II; (ii) the EGFP #2 synthetic II (SEQ ID NOs:4 and 5) with 5’ OH-GGG; (iii) the EGFP #2 T7 (SEQ ID NOs:4 and 5), T7 RNA polymerase-transcribed siRNA against EGFP #2 containing 5’ pppGGG; (iv) the EGFP #2 T7 (19-AA) (SEQ ID NOs:6 and 7), the same as EGFP #2 T7 RNA polymerase-transcribed siRNA except for replacing the 3’ UU with 3’ AA; (v) the EGFP #2 T7 (21-AA) (SEQ ID NOs:8 and 9), T7 RNA polymerase-transcribed siRNA with 21 nt complementary to the EGFP #2 site but including the 3’ AA. The potential cleavage site for RNAse T1 is boldface. The 3’ AA replacing the 3’ UU is in italics. The AA complementary to UU is underlined.

"FIG. 7B are a graph and gel photograph showing triphosphate-mediated interferon induction. [gamma.-sup.32P] GTP-labeled siRNAs were treated using each of the conditions described below and electrophoresed in a native gel (top). RNAs (1 .mu.g) were electrophoresed in a 15% polyacrylamide gel and stained with ethidium bromide (middle). 20 nM of siRNAs was transfected into HEK-293 cells and assayed for interferon 3 (bottom panel). Column 1, the EGFP #2 T7 siRNA without T1 treatment; column 2, with T1 treatment; column 3, with T1 and CIP treatment. Column 4, EGFP #2 T7 (19-AA) siRNA without T1 treatment; column 5, with T1 digestion; column 6, with T1 and CIP treatment.
"FIG. 7C is a graph showing that T7 siRNAs (21-AA) in accordance with the invention are effective in RNAi. HEK-293 cells were cotransfected with the EGFP reporter plasmid and each of the siRNAs. The percentages of EGFP expression relative to the non-ssRNA-treated controls were used as the assay for RNAi. Each value is the average of two independent assays.

"FIGS. 8A-8C show induction of interferon by in vitro transcribed ssRNAs. 

"FIG. 8A is a graph showing that ssRNAs transcribed in vitro elicit the anti-HSV-1 effect. Mock 1: before transfection, the RNA sample was mixed with 1 µg of RNase A. Mock 2: transfection of RNA containing triphosphate done in the absence of a transfection reagent. T7 siRNA1 and 2 are the T7 siRNAs for HSV #1 and anti-SF3A3 #1, respectively. The T7 ssRNA is the sense RNA strand of HSV #1. The T7 EGFP was RNA-transcribed from an EGFP-encoding DNA template. T7 (CUG).sub.130 is a T7-transcribed RNA harboring 130 repeats of CUG. All RNAs were used at a concentration of 20 nM.

"FIG. 8B is a graph showing the anti-HSV-1 activities of ssRNAs transcribed from T7, T3 and Sp6 polymerases. The templates of T3 ssRNA 1 and 2 were created from the pBluescript II SK vector digested with EcoRI and BamHI, respectively. The templates of SP6 ssRNA 1 and 2 were created by the EcoRI and SalI digestion of the pGEM 9Df(-) vector. The ssRNA is the sense sequence of HSV #1.

"FIG. 8C is a graph and gel photographs showing that the 5' triphosphate of the transcribed ssRNA is essential for the induction of interferon. The EGFP RNA was transcribed in the presence of [γ-32P]GTP and transfected into cells without any further modification (col. 2 and 3), after gel purification (col. 4 and 5), and after gel purification and CIP treatment (col. 6 and 7). The induced levels of interferon β were determined by an ELISA (top). Transcribed RNAs used for transfection reactions were analyzed in a nondenaturing agarose gel (middle). Removal of the triphosphate by CIP was monitored on the bottom gel. The ELISA determinations represent the average of two independent experiments.

"FIG. 9 is a graph showing induction of interferon α in 4 mice samples which were injected with 70 µM triphosphate T7 siRNAs produced in accordance with the present invention. Interferon α induction is shown in mice using mouse ELISA kit at day 1, day 3 and day 7 following injection of T7 siRNA.

"FIGS. 10A-10D show that the 5' triphosphate label of RNA is a novel motif for stimulating the innate immune response.

"FIG. 10A shows total RNA that was purified from influenza viral RNA and treated without (-CIP) or with (+CIP) calf intestinal phosphatase.

"FIG. 10B shows HEK293 cells that were transfected with no RNA (mock), influenza viral RNA without CIP treatment (Flu RNA-CIP), or the RNA with CIP treatment (Flu RNA+CIP) and sequentially challenged by EGFP-labeled HSV. The infection of virus was monitored by florescence microscopy.

"FIG. 10C shows HEK293 cells that were transfected with influenza viral RNAs without CIP pretreatment (second column) or with pretreatment at 10 (third) and 60 minutes (fourth column).

"FIG. 10D shows NIH3T3 cells stably expressing EGFP that were treated with no RNA (mock), 1 nM of T7 RNA (T7 RNA), 0.5 µg of influenza viral RNA without CIP pretreatment (Flu RNA-CIP), and the viral RNA with CIP pretreatment (Flu RNA+CIP). The next day (24 hours), cells were challenged with EMCV infection. On day 3, the viral infection mediated cytotoxic effect was monitored under light (the first panel) or fluorescence microscopy (the second panel).

"FIGS. 11A-11C shows that the nuclear derived nascent RNAs indicate the
dependence of the 5’ triphosphate motif for antiviral activity.

"FIG. 11A shows cytoplasmic and nuclear extracts that were prepared from HEK293 cells and tested by Western blot for the cytoplasmic protein enolase or nuclear protein hnRNP H.

"FIG. 11B shows cytoplasmic (the first lane) and nuclear RNAs (second and third lanes) that were purified from each extract and analyzed on a 1% agarose gel in the absence (second lane) or presence of CIP pre-treatment (third lane).

"FIG. 11C shows HEK293 cells that were transfected with each indicated RNAs and sequentially infected with EGFP-labeled HSV. The pictures were taken under florescence microscopy on day 3.

"FIGS. 12A-12C show that the T7 RNA and poly IC activate the TLR3 receptor and share similar expression profiles.

"FIG. 12A shows total cDNA from NIH3T3 cells transfected by the T7 RNA or poly IC that were detected and quantitated by microarray analysis. The expression profiles were compared between mock treated vs. T7 RNA (the first column), mock vs. poly IC (the second column), and T7 RNA vs. poly IC (the third column). The bar represents the total number of genes where were up or down-regulated by more than three-fold using a total of 16,281 elopements and an average of two independent trials.

"FIG. 12B shows that TLR3 is upregulated by poly IC as well as by T7 RNA. Total RNA of NIH3T3 cells were harvested after transfection with no RNA, T7 RNA, and poly IC. Based on the microarray data in FIGS. 14A-14D, the expression level of TLR3 was compared. TLR7 and beta-actin were used as internal controls.

"FIG. 12C shows that TLR3 is required for the T7 RNA mediated innate immune response. MRC-5 cells were pre-incubated in the presence of anti-TLR2 or TLR3 antibodies and incubated in the presence of the indicated RNAs. The secreted interferon beta in the media was determined by ELISA in three independent assays.

"FIGS. 13A-13B show that all 86 genes upregulated by the T7 transcribed RNA were also upregulated by poly IC.

"FIGS. 14A-14D show that poly IC activated a large number of additional genes in comparison to genes activated by T7 transcribed RNA."

City University of Hong Kong

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A patent application by the inventors YANG, Mengsu (Hong Kong, HK); LIU, Dandan (Baoding, CN), filed on June 22, 2015, was made available online on December 29, 2016, according to news reporting originating from Washington, D.C., by NewsRx correspondents.

This patent application is assigned to City University of Hong Kong.

The following quote was obtained by the news editors from the background information supplied by the inventors: "Different approaches have been proposed to treat different types of cancers. There have been proposals to treat cancers by way of specially targeting cancer cells. However, targeting cancer cells superficially has been a challenge because it is generally difficult to effect such treatment with high specifically. If a proposed treatment approach cannot effectively target cells in issue, the efficacy of the treatment would be impaired, and worse yet, the treatment would cause undesirable side effects.

"The present invention seeks to address the above problems, or at least to provide a useful alternative to the public."

In addition to the background information obtained for this patent application, NewsRx journalists also obtained the inventors' summary information for this patent application: "According to a first aspect of the present invention, there is provided a nanoparticle composition comprising a central core portion including magnetic nanoparticles adapted to act as a heat source and a chemotherapeutic agent configured to treat cancer tissues in issue, a shell portion including a shell member encapsulating said core portion, and antibodies configured to target cancer stem cells in issue and adhered to surface of the shell member. In a specific embodiment, the composition may comprise fluorescent dyes for in vivo localization"

"Preferably, the shell member may be made of silica or a silica based material. Diameter or width of the composition may range from substantially 5 to 500 nanometers. The shell member may have a thickness from 10 to 100 nanometers. The magnetic nanoparticles may have a diameter or width from 1 to 50 nanometers.

"Suitably, the magnetic nanoparticles may be magnetically responsive, and may comprise or may be super-paramagnetic nanoparticles. The magnetic nanoparticles may be configured to be responsive to alternating magnetic field. The magnetic nanoparticles may comprise Fe.sub.3O.sub.4 particles.

"Advantageously, the chemotherapeutic agent may comprise or may be a heat shock protein inhibitor. In this embodiment, the heat shock protein inhibitor may be a clinically approved drug although in other embodiments, others chemotherapeutic agent may be used. The antibodies may be coated on outwardly facing surface of the shell member. The antibodies may be able to bind to clusters of differentiation molecules or other surface molecules specific on cancer stem cells.

"According to a second aspect of the present invention, there is provided a method of treatment of cancer by way of targeting cancer stem cells, comprising administering a nanoparticle composition as described above.

"Preferably, the method may comprise a step of forming a complex of the
composition and the target cancer stem cells.

"Advantageously, the method may comprise a step of exposing a target site in which the cancer cells reside to an energy source for effecting elevation of temperature of the magnetic nanoparticles, and release of the chemotherapeutic agent from the shell portion for destroying the cancer cells of the composition-cancer cell complex in the target site, wherein the energy source is an alternating magnetic field whereby extent of elevation of temperature and release of the chemotherapeutic agent is controllable by the alternating magnetic field.

"Suitably, the method may comprise a step of elevating temperature of the target site to 40.degree. C. to 52.degree. C.

"In an embodiment, the method may comprise a step of administering the nanoparticle composition intravenously, or at a dose of 10 .mu.g to 500 mg of said nanoparticle composition intravenously per kg of body weight. The method may comprise administering the nanoparticle composition at least once a week.

"According to a third aspect of the present invention, there is provided a use of a composition described above for treatment of cancer.

"According to a fourth aspect of the present invention, there is provided a method of treatment of cancer in an organism, comprising a step of applying a combinational thermotherapy and chemotherapy treatment to the organism at least once per week. Preferably, the method may comprise a step of subjecting target tissues of the organism to fluorescence imaging or magnetic resonance imaging while undergoing the combinational thermotherapy and chemotherapy. Advantageously, the method may comprise a step of making use of a processor in regulating temperature rise of target issues by controlling the power and frequency of alternating magnetic field.

BRIEF DESCRIPTION OF DRAWINGS

"Some embodiments of the present invention will now be explained, with reference to the accompanied drawings, in which:--

"FIG. 1A is a schematic illustration of an embodiment of a nanoparticle composition according to the present invention;

"FIG. 1B is a schematic illustration of an embodiment of a treatment method of the present invention by targeting lung cancer stem cells (LCSCs) by way of simultaneous thermotherapy and chemotherapy by applying an alternating magnetic field (AMF);

"FIGS. 1C, 1D and 1E are transmission electron microscopic (TEM) images showing Fe.sub.3O.sub.4@SiNPs, CD20-Fe.sub.3O.sub.4@SiNPs, and CD20-Fe.sub.3O.sub.4@SiNPs, respectively;

"FIG. 1F is a graph showing size distribution of the CD20-Fe.sub.3O.sub.4@SiNP by dynamic light scattering (DLS);

"FIG. 1G is graph showing zeta potential of the Fe.sub.3O.sub.4@SiNPs (green) and CD20-Fe.sub.3O.sub.4@SiNPs (red);

"FIG. 1H is a graph showing fluorescence spectra of the Phycoerythrin (PE)-labeled CD20-Fe.sub.3O.sub.4@SiNPs;

"FIGS. 2A, 2B, 2C and 2D are graphs showing magnetic hysteresis loops of i) Fe.sub.3O.sub.4@SiNPs, ii) Fe.sub.3O.sub.4 NPs, time course of the raised temperature of PBS, iii) SiNPs, and Fe.sub.3O.sub.4@SiNPs, and iv) in vitro release curve of HSPI-loaded Fe.sub.3O.sub.4@SiNPs, respectively;

"FIG. 3 are confocal fluorescence and transmission electron microscopic (TEM) images showing in vitro cellular uptake and internalization of CD20-Fe.sub.3O.sub.4@SiNPs
and Fe$_3$O$_4$@SiNPs by a type of lung cancer stem cells (LCSCs);

"FIG. 4A is a graph showing relative survival rate of LCSC after heat treatment;

"FIG. 4B is a graph showing relative survival rate of LCSC after nanoparticle-mediated thermotherapy and chemotherapy;

"FIG. 4C is representative dot plots of LCSCs showing 7-AAD uptake and YO-PRO1 labeling as a function of time post heat treatment;

"FIG. 5 are in vivo and ex vivo images of mice after intravenous injection of (PE)-labeled CD20-Fe$_3$O$_4$@SiNPs;

"FIGS. 6A, 6B, 6C, and 6D are images and graphs showing in vivo simultaneous thermotherapy and chemotherapy targeting LCSCs in which FIG. 6A shows relative tumor volumes of different groups of mice (8 mice in each group) under different treatment conditions; FIG. 6B shows survival rates of different groups of mice (8 mice in each group) under different treatment conditions; FIG. 6C shows relative tumor volumes of different groups of mice (8 mice in each group) under different treatment conditions; and FIG. 6D shows representative tumor sizes from different groups of mice after different treatment conditions;

"FIG. 7A are images showing H&E stained tumor tissue sections of control and CD20-HSPI&Fe$_3$O$_4$@SiNPs treated mice at 36 days after AMF treatment;

"FIG. 7B are images showing IHC staining for CD20 on xenografts showing a complete ablation of LCSC by treatment of CD20-HSPI&Fe$_3$O$_4$@SiNPs;

"FIG. 7C and FIGS. 7D-7F are TEM images of tumor tissue in mice treated with i) PBS and ii) CD20-HSPI&Fe$_3$O$_4$@SiNPs (D-F) by retro-orbital sinus injection, respectively;

"FIG. 8 are histological images of different organs in nude mouse;

"FIGS. 9A, 9B, 9C and 9D are graphs showing i) WBC counts and ii) B-cell changes in mice after CD20-HSPI&Fe$_3$O$_4$@SiNP-mediated AMF treatment, iii) percentage of WBC and B-cells in mice with CD20-HSPI&Fe$_3$O$_4$@SiNPs after 7 days recovery, iv) percentage of WBC and B-cells in mice without CD20-HSPI&Fe$_3$O$_4$@SiNPs after 7 days recovery, and iv) CD20-HSPI&Fe$_3$O$_4$@SiNPs uptake in blood cells of mouse;

"FIG. 9E shows CD20-HSPI&Fe$_3$O$_4$@SiNPs uptake in mouse MSCs monitored in the bone marrow by flow cytometry;

"FIG. 10A and FIG. 10B are results of evaluation of hemolysis of CD20-HSPI&Fe$_3$O$_4$@SiNPs at concentrations of 1 mg/mL in PBS, using water as a positive control and PBS as a negative control; and flow cytometry analysis of lymphocytes, monocytes and macrophages, and neutrophils in white blood cell populations by forward and side scatter analysis, respectively;

"FIG. 11 illustrates morphology of 3.sup.rd generation LCSCs (portion A in FIG. 11) and 10th generation LCSCs (portion F in FIG. 11); immunofluorescence detection of stemness markers expression in 3.sup.rd generation LCSCs (portions B-E in FIG. 11) and 10.sup.th generation LCSCs (portions G-J in FIG. 11), scale bar=25 .mu.m; and quantitative RT-PCR analysis of stemness genes expression in LCSCs with different generations (graph in portion K in FIG. 11) (data are mean.+-.SD, *p<0.05 and p<0.01 indicate significant difference, n=3);

"FIG. 12 includes images of primary tumor sphere formation by the 3.sup.rd generation LCSCs (portion A in FIG. 12) and 10th generation LCSCs (portion B in FIG. 12), and a graph showing time course of sequential primary, secondary, and tertiary tumor sphere formation, n=3 (portion C in FIG. 12);

"FIG. 13 illustrates migration in LCSCs evaluated using wound healing assays, and includes images from the same area captured at time 0, 24, and 48 h after wounding 9 portion
A of FIG. 13); and graphs showing migratory and invasive capacities of LCSCs assessed by wound healing assay (portion B in FIG. 13) and matrigel transwell invasion assay (portion C in FIG. 13) (data represent the mean.+-.SD, *p<0.05 and p<0.01 indicate significant difference, n=3); and

"FIG. 14 illustrates in vivo tumorigenicity of LCSCs and dLCSCs in which portion A in FIG. 14 are representative images of xenograft tumors formed after subcutaneous injection with 1.times.10.sup.4 LCSCs and dLCSCs, separately; and portion B in FIG. 13 shows tumor volume of LCSC and dLCSC xenograft-bearing nude mice (n=3) (data represents the mean. +-.SD)."

Patents

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A patent application by the inventors SUMIDA, Naomi (Odawara-shi, JP); YANAI, Koji (Minamiashigara-shi, JP); TANI, Masato (Kawasaki-shi, JP); FUKUSHIMA, Takayoshi (Odawara-shi, JP); OTA, Yasumasa (Odawara-shi, JP); GOMI, Shuichi (Tokyo-to, JP); NAKANE, Akitaka (Kawasaki-shi, JP), filed on September 6, 2016, was made available online on December 29, 2016, according to news reporting originating from Washington, D.C., by NewsRx correspondents.

This patent application has not been assigned to a company or institution.

The following quote was obtained by the news editors from the background information supplied by the inventors: "The present invention relates to novel aminoglycoside antibiotics, a process for producing the same, and pharmaceutical use thereof.

"Aminoglycoside antibiotics are a generic term for glycoside antibiotics containing amino sugar or aminocyclitol and exclude a group of antibiotics such as macrolides, nucleosides, and anthracyclines. Up to now, a number of aminoglycoside antibiotics have been discovered from culture of actinomycetes or bacteria. Among them, streptomycin, neomycin, kanamycin, gentamicin, ribostamycin, tobramycin and the like have been used as useful
chemotherapeutic agents. On the other hand, the widespread use of these aminoglycoside antibiotics in clinical practice has led to a problem of the appearance of bacteria resistant to aminoglycoside antibiotics.

"Kanamycins (kanamycin A, kanamycin B, and kanamycin C) are aminoglycoside antibiotics produced by Streptomyces kanamyceticus. Kanamycins have a wide spectrum of antimicrobial activity. Since, however, many infecting bacteria become rapidly resistant to kanamycins, in recent years, the clinical adaptation of kanamycins is limited to diseases, mainly tuberculosis.

"In kanamycins, kanamycin derivatives such as dibekacins, amicacins, and arbekacins effective also against resistant bacteria have been developed based on studies on a resistant mechanism. However, bacteria resistant to these agents are appearing. Under such circumstances, the development of novel aminoglycoside antibiotics that are effective against resistant bacteria and can reduce nephrotoxicity that is a problem common to aminoglycoside antibiotics has been expected.

"Regarding aminoglycoside antibiotics comprising 2-deoxystreptamine as one constituent sugar, studies have been made on the production of novel aminoglycoside antibiotics by acquiring a mutant strain which produces an aminoglycoside antibiotic 2-deoxystreptamine-dependently, adding a 2-deoxystreptamine analog to the mutant strain, and cultivating the mixture. Also in kanamycins, there is a report that antibiotics different from kanamycins are produced by acquiring a mutant strain having a phenotype of 2-deoxystreptamine-dependent kanamycin production, adding 2-epistreptamine to the mutant strain, and cultivating the mixture (U.S. Pat. No. 3,669,838). Further, there is a report that 4-O-(alpha-D-glucopyranosyl)6-O-(3-amino-3-deoxy-.alpha.-D-glucopyranosyl)1-N-methyl-2-deoxystreptamine or 4-O-(alpha-D-glucopyranosyl)6-O-(3-amino-3-deoxy-.alpha.-D-glucopyranosyl)2-epi-streptamine is produced by adding 1-N-methyl-deoxystreptamine or myo-inosadiamine-1,3(2-epistreptamine) to a mutant strain having a phenotype of 2-deoxystreptamine-dependent kanamycin production and cultivating the mixture (Kojima, M. and Satoh, A., 'Journal of Antibiotics', (Japan), 1973, Vol. 26, p. 784-786). Furthermore, there is a report that 4-O-(6-amino-6-deoxy-.alpha.-D-glucopyranosyl)2-streptamine (LL-BM2713) are produced by adding streptamine to a mutant strain having a phenotype of 2-deoxystreptamine-dependent kanamycin production and cultivating the mixture (Borders, D. B. et al., 'Journal of Antibiotics', (Japan), 1972, Vol. 35, p. 1107-1110). Here LL-BM2713 is synonymous with 2-hydroxykanamycin A.

"The amounts of aminoglycoside antibiotics produced by the addition of the substances and cultivation of the mixture are so small that the industrial applicability of the aminoglycoside antibiotics is low. Accordingly, it can be said that novel aminoglycoside antibiotics which are clinically useful and have potent antimicrobial activity are still demanded."

In addition to the background information obtained for this patent application, NewsRx journalists also obtained the inventors' summary information for this patent application: "The present inventors have now found that novel aminoglycoside antibiotics having potent antimicrobial activity can be produced by cultivating a kanamycin producing strain derived from the genus Streptomycine together with a specific 2-deoxystreptamine analog. The present invention has been made based on such finding.

"Accordingly, an object of the present invention is to provide novel aminoglycoside antibiotic agents possessing potent antimicrobial activity and a process for producing the same.

"According to the present invention, there are provided aminoglycoside antibiotics that are compounds represented by formula (I) or their pharmacologically acceptable salts or
their solvates.

"##STR00002##

"wherein R represents amino or hydroxyl.

"According to another aspect of the present invention, there is provided a process for producing compounds represented by formula (I), the process comprising cultivating a kanamycin producing strain of the genus Streptomyces in a medium which comprises streptamine and/or myo-inositol to produce the compound.

"The compounds according to the present invention have potent antimicrobial activity against bacteria causative of various infectious diseases and can be advantageously utilized in the treatment of infectious diseases. Further, the production process according to the present invention can simply and stably supply the above compounds.

DETAILED DESCRIPTION OF THE INVENTION

"Deposit

"The strain S. Kanamyceticus-DOS according to the present invention has been deposited with International Patent Organism Depositary, National Institute of Advanced Industrial Science and Technology (address: Tsukuba Central 6 Tsukuba-shi, Higashi 1-1-1, Ibaraki, 305-8566 Japan) (original deposited date: Nov. 1, 2007) under accession number FERM BP-11052."

"T Cell Inducing Vaccine Containing an Interepitope Sequence That Promotes Antigen Presentation" in Patent Application Approval Process (USPTO 20160367651)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A patent application by the inventors SHIKU, Hiroshi (Tsu-shi, JP); HARADA, Naozumi (Tsu-shi, JP); MURAOKA, Daisuke (Tsu-shi, JP); AKIYOSHI, Kazunari (Kyoto-shi, JP), filed on October 1, 2014, was made available online on December 29, 2016, according to news reporting originating from Washington, D.C., by NewsRx correspondents.

This patent application has not been assigned to a company or institution.

The following quote was obtained by the news editors from the background information supplied by the inventors: "The importance of cell-mediated immunity in tumor
rejection by a cancer host has been revealed as a result of long years of research related to immune responses against cancer. In particular, it has been revealed that CD8.sup.+ killer T cells (CD8.sup.+ cytotoxic T cells) are effector cells having an action of directly destroying tumors, that CD4.sup.+ helper T cells are important regulatory cells that enhance the functions of CD8.sup.+ killer T cells and antigen-presenting cells, and that professional antigen-presenting cells, such as dendritic cells and macrophages, stimulate T cells by presenting antigens thereto and activate T cells via costimulatory molecules, such as CD80, CD86, and cytokines, etc., and the roles and positioning of the respective cells responsible for cellular immune responses against tumors have been established as described below (Non-Patent Document 1).

"Tumor cell derived proteins, after being phagocytosed by antigen-presenting cells, are cleaved into peptides of various lengths by proteasomes, proteases, and peptidases within the cells. Among the resulting peptides, peptides of 8-10 amino acids are loaded as antigen epitope peptides onto major histocompatibility complex (MHC) class I molecules and can be presented on the surfaces of the antigen-presenting cells. CD8.sup.+ killer T cells use T cell receptors (TCRs) to specifically recognize the MHC class I/antigenic peptide complexes and become activated. The activated CD8.sup.+ killer T cells detect MHC class I/antigenic peptide complexes that are also present on tumor cells and destroy the tumor cells using effector molecules, such as granzymes and perforin.

"The function of CD4.sup.+ helper T cells is important for sufficient activation of CD8.sup.+ killer T cells (Non-Patent Document 2). Antigenic proteins taken up by the antigen-presenting cells are cleaved into various lengths by proteases and peptidases within the cells and among the resulting antigenic peptides, those of 15-20 amino acids form complexes with MHC class II molecules and can be presented on the antigen-presenting cells. CD4.sup.+ helper T cells recognize these specifically and are activated. The activated CD4.sup.+ helper T cells enhance differentiation, growth, and functions of CD8.sup.+ killer T cells via secretion of cytokines, such as interferon (IFN)-gamma. and interleukin (IL)-2. The CD4.sup.+ helper T cells also have a function of activating antigen-presenting cells via a CD40 ligand/CD40 pathway, and the antigen-presenting cells activated by the CD4.sup.+ helper T cells are improved in the capability to stimulate CD8.sup.+ killer T cells (Non-Patent Document 3). It is well known from before that CD4.sup.+ helper T cells also have an action of enhancing antigen-specific IgG antibody production in B cells.

"Based on the above understanding of T-cell immune response, a cancer vaccine therapy has been conceived where a tumor specific antigen is repeatedly administered as a vaccine antigen to induce tumor-specific CD8.sup.+ killer T cells within a patient's body to suppress the growth, metastasis, and recurrence of cancer. Various forms of the antigen of the cancer vaccines are known, such as synthetic peptides, recombinant proteins, processed cells. The present inventors have previously prepared a cancer vaccine using a full-length recombinant protein of a tumor antigenic protein as the antigen. The full-length protein includes diverse antigenic peptides recognized by CD8.sup.+ killer T cells and CD4.sup.+ helper T cells and is expected to activate both types of T cells at the same time. However, with an exogenous (extracellular) antigenic protein, although the activation of CD4.sup.+ helper T cells via the MHC class II pathway proceeds readily, the activation of CD8.sup.+ killer T cells via the MHC class I pathway does not proceed readily. This is due to reasons of mechanisms of uptake and antigen processing of exogenous antigenic proteins in antigen-presenting cells (Non-Patent Document 4).

"Therefore many attempts are being made in and outside Japan to chemically synthesize short chain peptides, mainly, epitope peptides of 8 to 10 residues recognized by CD8.sup.+ killer T cells and clinically apply vaccines using these peptides as antigens. With short peptide antigens, presentation to T cells occurs readily because such peptides bind directly
to MHC molecules on cell surfaces without undergoing uptake and antigen processing within antigen-presenting cells. Also, short chain peptides can be manufactured by chemical synthesis and has the advantage of being simpler to manufacture than recombinant proteins, which requires the use of genetically modified organisms.

"However, immunological problems have been pointed out in regard to the direct binding of short peptide antigens to MHC molecules on cell surfaces without undergoing uptake and antigen processing within antigen-presenting cells (Non-Patent Document 5). Exogenous antigenic proteins are phagocytosed by professional antigen-presenting cells, such as dendritic cells and macrophages, that are provided with costimulatory molecules (CD80, CD86, etc.) and are processed within the cells, and antigen presentation to T cells is performed in a mode with appropriate concentration and costimulation. On the other hand, short peptide antigens bind directly to MHC molecules on cell surfaces and therefore even general somatic cells, which do not have uptake ability (phagocytic ability) and do not express costimulatory molecules, can present the short peptide antigens in a massive, inappropriate mode that lacks costimulation. In this case, the T cells that recognize the complexes of the short peptide antigens and MHCs become prone to depletion and apoptosis and this can consequently lead to immunological tolerance to the targeted antigen.

"In view of such problems of short chain peptide vaccines, the usefulness of long chain synthetic peptide antigens is attracting attention (Non-Patent Document 5). Along chain peptide antigen is a polypeptide having several dozen residues such that include two or more T cell recognition epitope peptides. Unlike a short chain peptide, a long chain peptide antigen cannot bind directly in intact form to an MHC molecule. As with protein antigens, long chain peptide antigens undergo uptake and intracellular processing by professional antigen-presenting cells with phagocytic ability, such as dendritic cells and macrophages, and the T cell epitope peptides included in the long chain peptide antigens form complexes with MHC molecules only thereafter and are thus presented to T cells in a mode with appropriate concentration and costimulation. Long chain peptide antigens do not function as vaccine antigens with general somatic cells lacking antigen phagocytic ability and therefore, unlike short chain peptide vaccines, do not give rise to inappropriate antigen presentation to T cells. Moreover, chemical synthetic methods can be used to manufacture long chain peptide antigens and therefore, as with short peptide antigens, the advantage of being comparatively easy to manufacture is also provided.

"Long chain peptide antigens manufactured by chemical synthesis also have a major advantage in that it is possible to freely design the sequence. A long chain peptide antigen is designed so that two or more T cell epitopes are included within a single peptide, and these T cell epitopes may be derived from a single cancer antigenic protein or may be derived from a plurality of cancer antigenic proteins. Also, the T cell epitopes may be restrictive to a single MHC or may be restrictive to a plurality of MHCs. It is also possible to design so that a long chain peptide antigen includes an epitope recognized by a CD8.sup.+. killer T cell and an epitope recognized by a CD4.sup.+. helper T cell at the same time. Long chain peptide antigens can thus serve as high performance vaccine antigens that can induce diverse T cells. However, for the set of epitopes contained in a long chain peptide antigen to be presented to T cells efficiently, the epitopes must be cut out as epitope peptides of lengths and sequences enabling binding with MHC molecules by sequences between the respective epitopes on the long chain peptide antigen being cleaved appropriately by proteasomes, proteases, and peptidases in an antigen-presenting cell based on the mechanism of antigen presentation reactions.

"In regard to MHC class II binding epitope peptides recognized by CD4.sup.+. helper T cells, the terminuses of the epitope peptide binding groove on an MHC class II molecule are in an open state and epitope peptides of various lengths can bind to the MHC class II molecule
Therefore, with MHC class II binding epitope peptides, the restriction of length is comparatively relaxed. On the other hand, in regard to MHC class I binding epitope peptides recognized by CD8.sup.+ killer T cells, the terminuses of the epitope peptide binding groove on an MHC class I molecule are in a closed state and only epitope peptides, strictly restricted to 8 to 10 residues, can bind to the MHC class I molecule. It is thus especially important with MHC class I binding epitope peptides that peptides of appropriate lengths are produced in antigen-presenting cells.

"The lengths and sequences of the epitope peptides that bind to MHC molecules are determined by complex cleavage reactions involving intracellular proteasomes and various proteases and peptidases. In the production of MHC class I binding epitope peptides, proteasomes present in the cytoplasm first perform rough cleavage of the antigenic protein or long chain peptide antigen. The terminuses of the resulting peptide fragments are cleaved by other proteases and peptidases based on certain substrate sequence specificities and trimmed to appropriate lengths (trimming reactions). Although a group of enzymes that trim the N-terminuses of the peptide fragments in this process exists, enzymes that trim the C-terminuses are unknown, and determination of the C-terminuses of the MHC class I binding epitope peptides is dependent only on the initial cleavage reactions by the proteasomes (Non-Patent Document 7). However, the substrate sequence specificities of proteasomes have not been revealed in detail and it is difficult to predict peptide sequences that can be cleaved readily by proteasomes.

"In view of the above epitope production mechanism, how the sequences between the epitopes included in the long chain peptide antigen are cleaved by the intracellular proteasomes, proteases, and peptidases strongly influences the production of the preceding and subsequent epitope peptides and is consequently considered to be an extremely important factor that defines the induction of T cells by vaccines using long chain peptide antigens."

In addition to the background information obtained for this patent application, NewsRx journalists also obtained the inventors’ summary information for this patent application: "Problem to be Solved by the Invention

"For the T cell epitope peptides included in a certain long chain peptide or protein to be efficiently presented as antigens, the epitope peptide sequences must be cut out appropriately from the long chain peptide or protein by intracellular proteasomes, proteases, and peptidases. For this purpose, it is necessary for the sequences between the epitopes to aptly include recognition sites for the proteasomes, proteases, and peptidases.

"In conventional arts, it was hardly examined what sort of interepitope sequence would satisfy the above condition. Therefore, with a vaccine using a long chain peptide antigen designed without examining the interepitope sequence, the induction of T cells that recognize the included epitope peptides is weak or cannot be confirmed in some cases.

"The present invention has been made in view of the circumstances described above, and an object thereof is to provide, in a long chain peptide antigen containing a plurality of epitope peptides, an interepitope sequence that effectively achieves antigen presentation of the respective epitope peptides.

"Means for Solving the Problem

"In a vaccine including a long chain peptide antigen having a plurality of epitopes according to the present invention for achieving the above object, each interepitope sequence is one selected from a group consisting of two to ten consecutive tyrosines, two to ten consecutive threonines, two to ten consecutive alanines, two to ten consecutive histidines, two to ten consecutive glutamines, and two to ten consecutive asparagines and it is especially preferable for the sequence to be tyrosines, glutamines, or asparagines. Here, the number of consecutive
tyrosines, consecutive threonines, consecutive histidines, consecutive glutamines, or consecutive asparagines is preferably four to eight, more preferably four to six, and especially six.

"By having the above arrangement, the long chain peptide antigen is cleaved inside a body by enzymes within a living body so that the respective epitopes can perform antigen presentation and the respective epitopes thus exhibit antigen presenting abilities effectively. Also, with a vaccine using along chain peptide antigen having an interepitope sequence constituted of consecutive tyrosines, uptake into antigen-presenting cells is also improved.

"The vaccine is preferably one selected from the group consisting of anticancer vaccines (including dendritic cell vaccines), antibacterial vaccines, and antiviral vaccines.

"Also, the vaccine is preferably at least one selected from the group consisting of peptide vaccines, DNA vaccines, mRNA vaccines, and dendritic cell vaccines. In a case of a dendritic cell vaccine, a peptide antigen or mRNA is added.

"Also in a case where the vaccine is a peptide vaccine, it is preferably arranged as a vaccine in combination with a hydrophobized polysaccharide, especially, cholesterol-modified pullulan (CHP) as a delivery system.

"Effect(s) of the Invention

"With the present invention, the plurality of epitopes within the vaccine can perform antigen presentation effectively and therefore a vaccine having a high effect can be provided.

BRIEF DESCRIPTION OF THE DRAWINGS

"FIG. 1 The influences of differences in interepitope sequence of long chain peptide vaccines, containing a plurality of CD8.sup.+ T cell epitopes, on specific CD8.sup.+ T cell induction by the vaccines were examined. Long chain peptide antigens MEN, all containing three types of mouse CD8.sup.+ T cell epitope sequences (MA p265, NY p81, and mERK2 9m), were synthesized. The sequence between the respective epitopes was set to one of six consecutive tyrosines (Y.sub.6), glycines (G.sub.6), prolines (P.sub.6), or threonines (T.sub.6). Each long chain peptide antigen was complexed with CHP, which is a type of delivery system, and administered as a vaccine to a mouse. In the process of administration, CpG oligo DNA was coadministered as an adjuvant. Spleen cells were collected one week after the final administration and the frequencies of CD8.sup.+ T cells specific to the respective epitope sequences were measured by an intracellular cytokine staining method.

"FIG. 2 The influences of differences in interepitope sequence of long chain peptide vaccines, containing a plurality of CD8.sup.+ T cell epitopes, on therapeutic effects of the vaccines were examined. Long chain peptide antigens MEN, all containing three types of mouse CD8.sup.+ T cell epitope sequences (MA p265, NY p81, and mERK2 9m), were synthesized. The sequence between the respective epitopes was set to one of six consecutive tyrosines (Y.sub.6), glycines (G.sub.6), or prolines (P.sub.6). Each long chain peptide antigen was complexed with CHP and administered in a single dose as a vaccine to a mouse. As a control, a short chain peptide vaccine, constituted of just the mERK2 9m peptide, was mixed with Freund's incomplete adjuvant and administered. In the process of administration, CpG oligo DNA was coadministered as an adjuvant. On the day after administration, a mouse fibrosarcoma cell line CMS5a, expressing mERK2 as a tumor antigen and presenting the CD8.sup.+ T cell epitope mERK2 9m derived from the same antigen, was implanted subcutaneously and its growth was recorded over time.

"FIG. 3 The influences of differences in interepitope sequence of long chain peptide vaccines, containing a plurality of CD8.sup.+ T cell epitopes, on specific CD8.sup.+ T cell induction by the vaccines were examined. Long chain peptide antigens NME, all containing three types of mouse CD8.sup.+ T cell epitope sequences (MA p265, NY p81, and mERK2 9m),
were synthesized. The antigens differ from the MEN in FIG. 1 in the order of the three types of epitopes. The sequence between the respective epitopes was set to one of six consecutive tyrosines (Y.sub.6), glycines (G.sub.6), or prolines (P.sub.6). Vaccines containing the respective long chain peptide antigens were administered to mice in the same manner as in FIG. 1 and the frequencies of CD8.sup.+ T cells specific to the respective epitope sequences were measured by the intracellular cytokine staining method.

"FIG. 4 Whether or not the usefulness of an interepitope sequence, constituted of consecutive tyrosines, is influenced by preceding and subsequent epitope sequences was examined. Long chain peptide antigens MEN, ENM, and NME, all containing three types of mouse CD8.sup.+ T cell epitope sequences (MA p265, NY p81, and mERK2 9m), were synthesized. MEN, ENM, and MEN differ in the order of the three types of epitopes. The sequence between the respective epitopes was set to six consecutive tyrosines (Y.sub.6). Vaccines containing the respective long chain peptide antigens were administered to mice in the same manner as in FIG. 1 and the frequencies of CD8.sup.+ T cells specific to the respective epitope sequences were measured by the intracellular cytokine staining method.

"FIG. 5 The influences of the difference between a native sequence and a consecutive tyrosine sequence as the interepitope sequence on specific CD8.sup.+ T cell induction and specific CD4.sup.+ T cell induction by vaccines were examined. A long chain peptide antigen ESO1 LP (native type) and a long chain peptide antigen ESO1 LP (Y.sub.6), both containing a mouse CD8.sup.+ T cell epitope sequence (NY p81) and a mouse CD4.sup.+ T cell epitope sequence (NY p91) that are derived from human NY-ESO-1 antigen, were synthesized. As the sequence between epitopes, the native amino acid sequence of NY-ESO-1 was retained with ESO1 LP (native type) and the sequence of six consecutive tyrosines (Y.sub.6) was used with ESO1 LP (Y.sub.6). Vaccines containing the respective long chain peptide antigens were administered to mice in the same manner as in FIG. 1 and the frequencies of CD8.sup.+ T cells and CD4.sup.+ T cells specific to the respective epitope sequences were measured by the intracellular cytokine staining method.

"FIG. 6 For interepitope sequences constituted of consecutive tyrosines, the relationship between the number of tyrosines and specific T cell induction by vaccines were examined. Long chain peptide antigens MEN, all containing three types of mouse CD8.sup.+ T cell epitope sequences (MA p265, NY p81, and mERK2 9m), were synthesized. The sequence between the respective epitopes was set to one to six consecutive tyrosines. Vaccines containing the respective long chain peptide antigens were administered to mice in the same manner as in FIG. 1 and the frequencies of CD8.sup.+ T cells specific to the respective epitope sequences were measured by the intracellular cytokine staining method.

"FIG. 7 For interepitope sequences constituted of consecutive tyrosines, the relationship between the number of tyrosines and specific T cell induction by vaccines were examined. Long chain peptide antigens MEN, all containing three types of mouse CD8.sup.+ T cell epitope sequences (MA p265, NY p81, and mERK2 9m), were synthesized. The sequence between the respective epitopes was set to five to ten consecutive tyrosines. Vaccines containing the respective long chain peptide antigens were administered to mice in the same manner as in FIG. 1 and the frequencies of CD8.sup.+ T cells specific to the respective epitope sequences were measured by the intracellular cytokine staining method.

"FIG. 8 The influences of differences in interepitope sequence of long chain peptide vaccines on uptake of the vaccines into antigen-presenting cells were examined. Long chain peptide antigens MEN, all containing three types of mouse CD8.sup.+ T cell epitope sequences (MA p265, NY p81, and mERK2 9m), were synthesized. The sequence between the respective epitopes was set to one of six consecutive tyrosines (Y.sub.6), glycines (G.sub.6), or prolines (P.sub.6). Each long chain peptide antigen, labeled with the fluorescent dye FAM, was
complexed with CHP and administered in vitro to mouse dendritic cells and mouse macrophages. After 60 minutes, the fluorescence uptakes into the respective cells were measured by flow cytometry with the P5 fraction in the figure being deemed to correspond to the dendritic cells and the P.sub.6 fraction in the figure being deemed to correspond to the macrophages.

"FIG. 9 The influences of differences in interepitope sequence of long chain peptide vaccines on uptake of the vaccines into antigen-presenting cells were examined. The same FAM-labeled long chain peptide antigens as those in FIG. 8 were complexed with CHP and administered subcutaneously to mice. After 16 hours, cells were collected from a regional lymph node of the administration site, and the fluorescence uptakes into dendritic cells and mouse macrophages were measured by flow cytometry with the P4 fraction in the figure being deemed to correspond to the dendritic cells and the P5 fraction in the figure being deemed to correspond to the macrophages.

"FIG. 10 The influences of differences in interepitope sequence of long chain peptide vaccines, containing a plurality of CD8.sup.+ T cell epitopes, on specific CD8.sup.+ T cell induction by the vaccines were examined. Long chain peptide antigens NMW, all containing three types of human CD8.sup.+ T cell epitope sequences (NY p157:HLA-A0201 restrictive, MA4 p143:HLA-A2402 restrictive, and WT1: HLA-A2402 restrictive p235), were synthesized. The sequences between the respective epitopes were set to those of six consecutive amino acids shown in the figure. Each long chain peptide antigen was complexed with cholesterol-modified pullulan (CHP), which is a type of delivery system, and administered in vitro as a vaccine to an immortalized human B cell line (LCL). Using this as the antigen-presenting cells, co-culturing with CD8.sup.+ T cell clone 1G4 cells specific to NY p157 was performed and the activation of the 1G4 cells due to antigen presentation was measured by an IFN-.gamma. ELISPOT method. As a positive control, LCL administered with an NY p157 short chain peptide was used as antigen-presenting cells, and as a negative control, LCL without antigen added was used as antigen-presenting cells.

"FIG. 11 The influences of differences in interepitope sequence of RNA vaccines, containing a plurality of CD8.sup.+ T cell epitopes, on specific CD8.sup.+ T cell induction by the vaccines were examined. mRNAs encoding long chain peptide antigens NMW, all containing three types of human CD8.sup.+ T cell epitope sequences (NY p157:HLA-A0201 restrictive, MA4 p143:HLA-A2402 restrictive, and WT1: HLA-A2402 restrictive p235), were synthesized. The sequences between the respective epitopes were set to those of six consecutive amino acids shown in the figure. Each mRNA was introduced in vitro as a vaccine into LCL by an electroporation method. Using this as the antigen-presenting cells, co-culturing with CD8.sup.+ T cell clone 1G4 cells specific to NY p157 or CD8.sup.+ T cell clone RNT007#45 cells specific to M4A p143 was performed and the activation of the CD8.sup.+ T cells due to antigen presentation was measured by the IFN-.gamma. ELISPOT method."

AndroScience Corporation

Patent Application Titled "Compositions Including Androgen Receptor Degradation (ARD) Enhancers and Methods of Prophylactic Or Therapeutic Treatment of Skin Disorders and Hair Loss" Published Online (USPTO 20160367513)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors Shih, Charles (Solana Beach, CA); Su, Ching-Yuan (Del Mar, CA); Wang, Hui-Kang (San Diego, CA); Shi, Qian (Chapel Hill, NC), filed on August 11, 2016, was made available online on December 29, 2016.

The assignee for this patent application is AndroScience Corporation.

Reporters obtained the following quote from the background information supplied by the inventors: "Reduced self-esteem and depression is often present among those suffering from skin disorders and hair loss. In some instances psychological effects can be dramatic. Thus, the development of therapeutics to treat each medical condition is underway. The present invention addresses current therapies and provides new compositions that have promising results.

"Acne (acne vulgaris) is a common inflammatory disease of the skin, caused by changes in the pilosebaceous units (skin structures including a hair follicle and its associated sebaceous gland) in response to sexual hormones. Acne is most often found on the face, chest and back. The condition is most common at puberty and generally tends to disappear, or decrease when the individual reaches the early twenties. However, acne can remain problematic into the third to fifth decade of life and in some instances even longer.

"The basic acne lesion, called a comedo or comedone is an enlarged hair follicle plugged by excess oil secreted from the sebaceous gland in response to androgen. In addition, dead skin cells and the build up of the bacteria Propionibacterium acnes also contribute to enlarging hair follicles. P. acnes produce lipases which can split triglycerides into free fatty acids, which can irritate the follicular cells. The severity of acne can range from mild to severe. In addition to comedones, papules, pustules, nodules and inflammatory cysts are also lesions associated with acne. Non-inflamed sebaceous cysts, also called epidermoid cysts, may occur in association with inflammatory acne or alone but are not usually a constant feature, After resolution of acne, unsightly scars may remain.

"Many products are available for the treatment of acne, the most popular including exfoliation products, antibiotics, topical bactericides, retinoids, and oral hormonal treatments. However each has potential drawbacks. More recently compounds capable of inducing degradation of the androgen receptor are under investigation as potential treatment for androgen receptor associated disorders.

"Exfoliation either manually or chemically attempts to remove dead skins cells from the skin therefore reducing the likelihood of blocked pores. Exfoliation may be performed manually by using scrubbing products or may be performed chemically. The chemical exfoliation products salicylic acid and glycolic acid are available as a chemical peel. Exfoliation may result in flaking of the skin or irritation.
Antibiotics, either oral or topical, are commonly used to attack the bacteria P. acnes. Erythromycin, clindamycin, cotrimoxazole and numerous tetracycline derivatives (such as doxycycline, oxytetracycline, tetracycline chloride, limecyline and minocyline) are commonly prescribed as treatments for acne. Although antibiotics are effective at reducing bacterial colonies, reducing the presence of bacteria does not affect the oil secretion from the sebaceous gland, and the potential development of bacterial strains resistant to antibiotics is also a concern.

Like antibiotics, topical bactericides such as benzoyl peroxide attack bacteria Propionibacterium acnes. Although topical bactericides have the added benefit over antibiotics in that bacterial resistance is not found, the powerful oxidizer benzoyl peroxide can cause skin dryness, redness and can bleach clothing. Therefore methods to reduce the frequency of use or decreased concentrations of the powerful oxidizer would be a significant benefit over current therapies.

Retinoids such as the topical retinoids tretinoin (brand name Retin-A), adapalene (brand name Differin) and tazarotene (brand name Tazorac) are related to vitamin A and may regulate the cell cycle in the follicle lining. Topical retinoids can cause significant irritation of the skin. Oral retinoids such as the vitamin A derivative isotretinoin (brand name Accutane and Sotret) are believed to reduce oil secretion from the sebaceous gland but are also believed to have adverse side effects.

Androgenetic Alopecia is the most common form of hair loss in men. This condition is also commonly known as male-pattern baldness. Hair is lost in a well-defined pattern, beginning above both temples. Over time, the hairline recedes to form a characteristic 'M' shape. Hair also thins at the crown of the head, often progressing to partial or complete baldness. The pattern of hair loss in women differs from male-pattern baldness. In women, the hair becomes thinner all over the head, and the hairline does not recede. Androgenic alopecia in women rarely leads to total baldness. Minoxidil is the only FDA-approved treatment for androgenetic alopecia; however, it is not targeted at the function of androgen and effectiveness is not widespread.

Higher serum androgen levels have been correlated with the presence of acne, androgenetic alopecia and hair loss in some women. Androgens are known for their effects on sebum excretion, and terminal sebocyte differentiation is assisted by peroxisome proliferator-activated receptor ligands. Hormonal treatments have been identified as having a potential effect on acne and androgenetic alopecia. Compounds with anti-androgenic properties include estrogens combined with progestins, such as ethinyl estradiol with cyproterone acetate, chlormadinone acetate, desogestrel, drospirenone, levonogestrel, norethindrone acetate, norgestimate. Other compounds used as anti-androgens include those that directly blocking the androgen receptor (such as flutamide) or inhibit androgen activity at various levels such as corticosteroids, spironolactone, cimetidine and ketoconazole. However androgens are involved in many biological processes; therefore, blocking or inhibiting androgen binding to its corresponding receptor results in increased levels of available androgen in the surrounding environment, which affects other androgen associated biological processes and can lead to undesirable side effects.

A new group of anti-androgenic compounds have been proposed that induce degradation of the androgen receptor. These compounds differ from conventional anti-androgens that block androgen receptor and ligand (androgen) binding. Unlike widely used anti-androgen therapies, these new compounds prevent the accumulation of excess ligands (androgen) to act on androgen receptor and thus are predicted to have fewer adverse effects. Although a variety of compounds are proposed, the technology is not yet clinically available and the long term effects are not yet known.
"Although the majority of treatments for skin disorders utilize a single active compound or pharmaceutical, a combination of therapies including a topical retinoid combined with oral antibiotics has been explored in mild to moderate inflammatory acne. These combinations are believed to lead to a rapid dose reduction and quicker discontinuation of oral antibiotics increasing the effectiveness and reducing the development of bacterial resistance to antibiotics. Although combinations of therapies have been proposed, current therapies attempt to reduce symptoms associated with skin disorders and do not selectively target the cause of the disorder. Therefore there remains a need to develop methods and compositions that selectively target pathways that lead to the skin disorders while also treating associated symptoms."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "The present invention addresses deficiencies in current treatments of skin disorders and hair loss and provides related benefits. Currently there are no androgen-associated topical therapies that attempt to block androgen activity and the only oral treatment for androgenetic alopecia, finasteride, is used to block the conversion of testosterone into DHT; there is no method to modulate the presence or availability of the underlying androgen receptor and thus do not target the cause of the disorder. The present invention addresses this deficiency by providing compositions and methods that at least in part modulate the presence of the androgen receptor itself and thus provides a more effective treatment. In some embodiments, a combined modulation approach is provided, wherein at least one compound is an ARD enhancer as described herein.

"The methods and compositions of the present invention treat or prevent a variety of skin disorders and hair disorders by administering one or more of the disclosed compounds or derivatives thereof. The ARD enhancers included herein include but are not limited to those provided in FIGS. 1 and 2. Among the ARD enhancers included herein include but are not limited to those provided in FIGS. 1 and 2. Among the ARD enhancers include ASC-J9, ASC-J15, ASC-Q9, ASC-Q44, ASC-Q49, ASC-Q77, ASC-Q98, ASC-Q99, ASC-Q101, ASC-Q102, ASC-Q103, ASC-Q110 or ASC-Q111, ASC-Q113, ASC-Q116, ASC-JM1, ASC-JM2, ASC-JM4, ASC-JM5, ASC-JM6, ASC-JM7, ASC-JM12, ASC-JM13, ASC-JM14, ASC-JM16, ASC-JM17, ASC-JM18 and ASC-JM19.

"In one aspect of the present invention compositions for the prevention or treatment of a skin disorder is provided. In this aspect, the first compound is an androgen receptor degradation (ARD) enhancer. ARD enhancers are compounds that modulate the degradation of the androgen receptor, which is different from conventional anti-androgens that interfere the receptor-ligand (androgen) binding. In one embodiment, the ARD enhancer induces degradation of the androgen receptor. In another embodiment, the ARD enhancer increases the rate of androgen receptor degradation compared to the absence of an ARD enhancer. In yet another embodiment, the ARD enhancer prevents the aggregation of mutant androgen receptors. In still another embodiment, an ARD enhancer prevents androgen and androgen receptor (a transcription factor)-mediated gene activation. The second compound is selected from at least one of variety of compounds including a bactericide, an antibiotic, an anti-microbial peptide, Vitamin A, a Vitamin A derivative, or a retinoid, and an inflammatory compound. The combination of such compounds will provide more effective treatments for skin disorders while reducing adverse effects in comparison to current treatments. Though nonlimiting the inventors believe the ARD enhancer decrease oil secretion from a sebaceous gland, reduce proliferation of sebocytes or inhibit or reducing sebocyte differentiation. The inventors believe the second compound may target bacteria colonies or will provide additional anti-inflammatory assistance as needed when treating a variety of skin disorders. Thus, the present invention allows for the treatment of symptoms as well as modulation of a pathway to prevent or limit the occurrence of the skin disorders."
"In another aspect of the present invention a pharmaceutical composition is disclosed, the pharmaceutical composition including an androgen receptor degradation (ARD) enhancer, a bactericide and a pharmaceutically acceptable carrier. The pharmaceutical may be topically applied, injected and the like depending on the desired route of administration. In the preferred embodiment the bactericide is benzoyl peroxide.

"In yet another aspect of the present invention a pharmaceutical composition is disclosed, the pharmaceutical composition including an androgen receptor degradation (ARD) enhancer, an antibiotic and a pharmaceutically acceptable carrier.

"In still another aspect of the present invention a pharmaceutical composition is disclosed, the pharmaceutical composition including an androgen receptor degradation (ARD) enhancer, an antimicrobial peptide, and a pharmaceutically acceptable carrier.

"In still another aspect of the present invention a pharmaceutical composition is disclosed, the pharmaceutical composition including an androgen receptor degradation (ARD) enhancer, Vitamin A, a Vitamin A derivative or a retinoid, and a pharmaceutically acceptable carrier.

"In still another aspect of the present invention a pharmaceutical composition is disclosed, the pharmaceutical composition including an androgen receptor degradation (ARD) enhancer, an anti-inflammatory compound, and a pharmaceutically acceptable carrier.

"In still another aspect of the present invention a method of treating or preventing a skin disorder is provided including administering to an individual in need thereof a therapeutically effective amount of a pharmaceutical composition of the present invention. In one embodiment the pharmaceutical composition includes an ARD enhancer and a bactericide. In another embodiment the pharmaceutical composition includes an ARD enhancer and an antibiotic. In yet another embodiment the pharmaceutical composition includes an ARD enhancer and an anti-microbial peptide. In still another embodiment the pharmaceutical composition includes and ARD enhancer and Vitamin A, a Vitamin A derivative or a retinoid. In still another embodiment the pharmaceutical composition includes an ARD enhancer and an anti-inflammatory compound. In various embodiments, nonlimiting examples of skin disorders are acne, alopecia, atopic dermatitis, rosacea, lupus, axillary osmidrosis, a wound and the like.

"In still other aspects of the present invention, the combinations of compounds are provided as a cosmetic in a cosmetic formulation. The invention including a cosmetic composition including, in a cosmetically acceptable carrier, an ARD enhancer and a compound such as but not limited to a bactericide, an antibiotic, an anti-microbial peptide, Vitamin A, a Vitamin A derivative or a retinoid, and an anti-inflammatory compound.

"In still other aspects of the present invention an ARD enhancer is combined with at least one composition or compound for the treatment or prevention of hair loss. The ARD enhancer may be combined with oligopeptides, peptides, extracts, nucleotides and the like. In some embodiments, the compositions of the present invention treat androgenetic alopecia. In some embodiments, a compound suspected of preventing hair loss is provided in combination with a compound suspected of stimulating hair growth.

BRIEF DESCRIPTION OF THE DRAWINGS

"FIG. 1 depicts a structural formula of ASC-J15 and ASC-J9, exemplary ARD enhancers.

"FIGS. 2A, 2B, 2C, 2D, and 2E depict a table of structural formulas of various ARD enhancers with corresponding values for relative potency (corresponding to percent AR reduction, compared to vehicle control) Anti-AR activity was assayed by western blot analysis after 48 hours of incubation of the human prostate cancer cell line LNCaP in the presence of the
corresponding ARD enhancer. The value indications for activity can be found in Table 1 provided within Example 2.

"FIGS. 3A and 3B depict western blot analysis demonstrating the reduction of Androgen Receptor (AR) protein expression in human prostate cancer cells (LNCaP) after exposure to compounds (3A) ASC-Q49, ASC-Q103, ASC-JM12, ASC-JM14; and (3B) ASC-Q49, ASC-Q77, ASC-JM4, and ASC-JM5.

"FIG. 4 depicts a graphical representation of cell growth (proliferation) and androgen receptor expression levels in ASC-J9-treated LNCaP cells. LNCaP cells were plated and incubate for two days. ASC-J9 was added to the medium at a final concentration of 5 uM with and without DHT. Referring to FIG. 4A, the results demonstrate that while DHT promote LNCaP cell growth in culture, ASC-J9 significantly inhibits cell growth regardless in the presence or absence of DHT, FIG. 4B depicts normalized androgen receptor signals for the ASC-J9 sample as a percentage of baseline (Day 0) value. Cell lysates collected from cell cultured with ASC-J9 (FIG. 4A) and AR expression was detected by Western Blot. Data indicated that the inhibition of AR expression in LNCaP cells, induced by ASC-J-9, is in correlation with cell growth inhibition.

"FIG. 5 depicts a western blot analysis of LNCaP cell lysates that were cultured with ASC-J9 for 48 hr. in the presence or absence of DHT. Data demonstrated that ASC-J9 reduced AR, PR proteins expression regardless in the presence or absence of DHT, but did not affect expression of other proteins, such as ER, PPAR, RXR, HSP and Actin.

"FIG. 6 depicts a western blot analysis of T47D (a human breast cancer) cell lysates demonstrating the specificity of ASC-J9's ability to degrade the androgen receptor. Data demonstrated that ASC-J9 selectively reduced expression of androgen receptor (AR). The expression of other receptor proteins, Peroxisome proliferator-activated receptors gamma and beta (PPAR.gamma., PPAR.beta.), retinoid X receptor alpha (RXR.alpha.), estrogen receptor alpha and beta (ER.alpha. and Er.beta.), extracellular signal-related kinase (ERK), heat shock protein 70 (HSP70) and actin, was not affected.

"FIG. 7A depicts a western blot analysis of LNCaP cell lysates upon exposure to compound ASC-J9 and cyclohexamide, a protein synthesis inhibitor. The reduction of androgen receptor over time in the presence of a protein synthesis inhibitor indicates ASC-J9 enhances degradation of AR protein. FIG. 7B is a western blot demonstrating that ASC-J9 is the only anti-androgen that is capable of reducing AR protein expression, and not the conventional anti-androgens, such as CPA (cyproterone acetate), HF (hydroxyflutamide), or finasteride.

"FIG. 8A depicts fluorescence micrographs of monkey kidney COS-1 cells transfected with the plasmid GFPAR (which contained a green fluorescent protein gene and wild type androgen receptor gene). Transfected cells were treated with vehicle only (control) or with the test compound ASC-J9. Micrographs were taken under fluorescent imaging conditions for green fluorescent protein (GFPAR). Control cells contained dense quantity of fluorescence in nucleus (i.e., the wild type AR) and dimmer fluorescence in the cytoplasm. Cells that had been treated with ASC-J9 dim fluorescent was detected in both nucleus and cytoplasm, indicated ASC-J9 reduces (or degrades) the expression of AR. FIG. 8 depicts fluorescence micrographs of monkey kidney COS-1 cells transfected with the plasmid GFPARQ49 (which contained a green fluorescent protein and a mutant androgen receptor poly Q49 gene) as described in detail in Example 5. Transfected cells were treated with vehicle only (control) or with the test compound ASC-J9, Micrographs were taken under fluorescent imaging conditions for green fluorescent protein (GFPARQ49). Control cells contained large amounts of fluorescent inclusions or aggregates (i.e., the aggregated mutant poly Q49) in cytoplasm. Cells that had been treated with ASC-J9 contained substantially smaller amounts of fluorescent inclusions,
suggesting that the expression of mutant poly Q49 androgen receptor was inhibited or degraded by ASC-J9 treatment.

"FIG. 9 depicts representative photographs of Fuzzy rats treated as described in detail in Example 6. Fuzzy rats were treated with topical creams containing vehicle only (left side animal) or ASC-J9 (25 micromolar, right side animal) for the times indicated. The photographs show that bands of sebaceous glands and sebum secretion (skin color) were reduced within 4-5 weeks in the Fuzzy rats treated with ASC-J9 (right side animal).

"FIG. 10 depicts representative photographs (FIGS. 10A-C) and graphical representations of duct and lobe size (FIGS. 10D, 10E) of sebaceous glands in Fuzzy rat skin. Skin tissue samples (split skin) were prepared and examined by microscopy, FIG. 10A-C are photographs depicting the duct and lobe of the sebaceous gland (of a split skin sample) upon treatment with a vehicle control (8A) or compound ASC-J9 (8B) and a castrated animal (8C). In FIG. 10D, size of glandular lobes were measured by tracing the edges of the well-preserved glandular lobules, and then quantified with Image J software, and expressed as pixel counts contained within the traced areas. The data obtained showed topical treatment with the vehicle only (control cream) did not produce a significant change in glandular lobe size. Topical treatment of male rats with the various concentration of test compounds ASC-J9 resulted in a significant reduction in the size of the sebaceous glandular lobe, though not to the extent caused by castration, but are better than the conventional anti-androgen flutamide. FIG. 10E depicts representative data showing that ASC-J9 applied to skin significantly reduced the size of ducts of sebaceous glands in male Fuzzy rats comparable to the castration effect and better than flutamide.

"FIG. 11A depicts results from studies of an animal model of alopecia (hair loss or baldness), as described in detail in EXAMPLE 7. Six-week-old male C57BL/6J mice were shaved with an electric clipper, and then treated with a hair-removal cream. One group of mice, represented by the two left-most animals (marked ‘vehicle #1’ and ‘vehicle #2’) were shaved and treated only with ethanol. A second group of mice, represented by the two right-most animals (marked ‘testosterone #1’ and ‘testosterone #2’) were shaved and treated with a testosterone/ethanol solution in the morning and a control solution in the afternoon. The animals were photographed at the end of the 20-day treatment period. Mice treated with the ethanol vehicle alone (without testosterone) showed rapid re-growth of hair in the shaved areas after 20 days of topical treatment. Mice treated with testosterone showed little or no re-growth of hair in the shaved areas after 20 days of topical treatment. FIG. 11 depicts further results from studies of an animal model of alopecia (hair loss or baldness), as described in detail in EXAMPLE 7. Six-week-old male C57BL/6J mice were shaved with an electric clipper, and then treated with a hair-removal cream. One group of mice, (represented by the animals marked ‘testosterone #1’ and ‘testosterone #2’) were shaved and treated topically with testosterone in the morning and control solution in the afternoon for twenty days. A second group of mice (represented by the animals marked ‘ASC-J9/testosterone #1’ and ‘ASC-J9/testosterone #2’) were shaved and treated topically with testosterone in the morning and ASC-J9 in the afternoon for twenty days. Mice that received topical morning applications of testosterone and afternoon applications of the control solution only showed little or no re-growth of hair in the shaved areas after 20 days of treatment. Mice that received topical morning applications of testosterone and afternoon applications of ASC-J9 showed hair growth on day 8 and fully re-growth of hair in the shaved areas after 20 days of topical ASC-J9 treatment. These results demonstrate that topical application of ASC-J9, is able to overcome testosterone-induced hair growth suppression in an animal model.

"FIG. 12 depicts a photograph demonstrating the reduction of LNCaP growth in nude mice. The ASC-J9 mouse received 100 mg/kg, 3 times per week via IP injection for 7 weeks.
The tumor weight reduced 75% and serum PSA level reduced 90% as compared to the vehicle control animal.

"FIG. 13 demonstrates the ability of ASC-J9 to hasten wound healing in an animal model using Balb/c mice. Data depicts the results of treating artificial wounds on animal skin. Artificial skin wounds were created using a skin puncher on the neck area of retired breeder male Balb/c mice. Animals were then treated with vehicle cream or cream with ASC-J9 (25 \( \mu \text{M} \)) twice per day at the wound areas. Data in FIG. 13 show ASC-J9 treated animals have smaller wound openings at day 5, as compare to vehicle treated animals; and wounds were completely healed in ASC-J9 treated mice on day 10; whereas in vehicle treated animals, wound scarring remained visible. This data indicates that an ARD enhancer, ASC-J9, is capable of hastening wound healing.

"FIG. 14A depicts photographs demonstrating a representative visible improvement to skin condition resulting from topical application of the test compound ASC-J9 (2.5 micromolar in a carrier base) to the forehead of an acne-affected male volunteer and in another acne-affected male (back is shown in FIG. 14B) with ASC-J9 (625 \( \mu \text{M} \)), as described in detail in Example 10."

Patents

**Patent Application Titled "Delivery of Particles Using Hygroscopic Excipients" Published Online (USPTO 20160368181)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors LONGEST, Philip Worth (Midlothian, VA); HINDLE, Michael (North Chesterfield, VA); PHILLIPS, Elaine M. (San Diego, CA), filed on September 19, 2014, was made available online on December 29, 2016.

No assignee for this patent application has been made.

Reporters obtained the following quote from the background information supplied by the inventors: "Minimally-invasive or percutaneous techniques for implanting bioprosthetic implants are commonly used in vascular and cardiovascular procedures. Such techniques involve the use of a delivery device, such as a catheter, to access a desired location via the patient’s vasculature rather than using an open surgical approach where internal organs or tissue are exposed. The benefit of percutaneous procedures is in the ease of introducing devices into
the patient without large cut downs, which can lead to long recovery times for patients.

"One limitation of percutaneous procedures is the delivery profile of the bioprosthetic implant and delivery device. Because access to the desired implantation site is gained via the patient’s vasculature, the delivery profile of the bioprosthetic implant and the delivery device, combined, must be sufficiently small so as to permit passage.

"One method of reducing the delivery profile is to crimp the bioprosthetic implant about the delivery device. Crimping, however, may not reduce the delivery profile to a desired size due to the inherent bulk or configuration of the bioprosthetic implant. Therefore, changes are often required to the material and/or construction of the implantable bioprosthesis to permit crimping to yet smaller delivery profiles.

"Replacement heart valves, for example, comprise a leaflet structure and a support structure. The leaflet structure is typically made from biological tissue, such as bovine pericardium, and the thickness of the tissue that makes up the leaflet structure limits the extent to which the heart valve can be crimped. Additionally, biological tissue will typically exhibit variations in thicknesses and these variations often produce unpredictable results with respect to the delivery profile of the crimped valves.

"While the use of artificial or polymeric materials can offer a greater degree of control and flexibility to the resulting thickness of the material used for bioprosthetic implants, such materials may not always be desirable from at least a hemodynamic standpoint and may require the patient to take anticoagulants to prevent adverse effects from the interaction of the artificial material and the blood.

"Another option is to remove excess portions of biological tissue so as to provide a thinner tissue having a consistent thickness throughout. The loss of tissue, however, can undesirably compromise the fiber structure and therefore the strength of the tissue. Compression of the tissue to produce a thinner tissue may be desirable. The compressed tissue, however, may spring back to its original and uneven thickness after compressive forces are released.

"Therefore, what is needed are methods and devices for preparing a biological tissue adapted for a bioprosthetic implant and which reliably reduces the delivery profile for use in minimally-invasive and percutaneous procedures."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors’ summary information for this patent application: "The preferred embodiments described herein are directed to methods for treating biological tissue for use in connection with an implantable bioprosthesis. The entire disclosure of U.S. Patent Pub. No. 2011/0238167, published Sep. 29, 2011, to Edwards Lifesciences, Inc. is incorporated herein by reference in its entirety.

"In one embodiment, an assembly for providing a contoured biological tissue is provided. The assembly comprises a first plate and a second plate. The first plate is configured to receive a biological tissue. The second plate comprises a surface and is configured to apply a compressive force on the biological tissue that is disposed on the first plate. One or both of the first and second plates comprise a defined shape and a contoured area within the defined shape. The contoured area comprises at least first and second elevations and a continuous transition between the first and second transitions. One or more energy sources is associated with one or both of the first and second plates. The one or more energy sources delivers energy while the second plate applies the compressive force on the biological tissue. The second plate can contact the biological tissue directly or indirectly.

"In accordance with a first aspect, one or both of the first and second plates are porous.

"The defined shape can be one or a plurality of heart valve leaflets, having a
substantially straight free edge and an arcuate cusp edge. "The first elevation can be defined along the arcuate cusp edge and the second elevation can be located between the arcuate cusp edge. "The first elevation can be higher relative to the second elevation, or the second elevation can be higher relative to the first elevation. "The assembly can further comprise a spacer disposed between the first and second plates, the spacer controlling a thickness of the compressed biological tissue. A blade corresponding substantially to the defined shape on the first plate can also be included. The energy delivered by the one or more energy sources is preferably one or a combination selected from the group consisting of: thermal, ultrasound, electromagnetic, vibrational, hydraulic, piezoelectric, pneumatic, and acoustic and sound energy. In one embodiment, the energy is thermal energy and the one or more energy sources is one or a combination selected from the group consisting of: thermal coils disposed within the first plate, thermal coils disposed within the second plate, and a liquid bath. In another embodiment, the energy is electromagnetic energy and the one or more energy sources is a RF or microwave antenna embedded in a non-conducting plate or a printed circuit antenna insulated from the tissue. In yet another embodiment, the energy is vibrational energy and the one or more energy sources is a clamp coupled to one or both of the first and second plates, a platform in contact with one or both of the first and second plates, or an actuator coupled to one or both of the first and second plates. "In some embodiments, the first plate comprises the defined shape and contoured area and the second plate comprises a substantially flat surface. Alternatively, the first and second plates can each comprise the defined shape and the contoured area within the defined shape. "In another embodiment, a method for preparing a contoured biological tissue is provided. The method comprises compressing a layer of biological tissue to reduce a thickness of at least a portion of the tissue and delivering energy from an energy source to one or both of the first and second plates during the compressing. The tissue following the compressing has at least two areas of different thicknesses and a continuous transition within the defined shape. "The method can further comprise treating the tissue with a first fixative to at least partially fix the tissue before, during and/or after the compressing. The first fixative can be glutaraldehyde. "The method can also include treating the tissue with a second fixative, the second fixative being one or a combination selected from the group consisting of: polyvinyl alcohols, polyetheramines, polyethyleneimine, di- or poly-amines, polyurethanes, polyepoxies, polysiloxanes, polyacrylates, polyesters, poly block isobutylene-co-maleic acid, collagen, elastin, fibrin, hyaluronic acid, dextrin, genapin, di- or poly-alkynes, di- or poly-azides, and tannins. The fixative is a 0.1% polyetheramine solution having an average molecular weight of about 600 and a pH of about 6 to 9. "Other objects, features and advantages of the described preferred embodiments will become apparent to those skilled in the art from the following detailed description. It is to be understood, however, that the detailed description and specific examples, while indicating preferred embodiments of the present disclosure, are given by way of illustration and not limitation. Many changes and modifications within the scope of the present disclosure may be made without departing from the spirit thereof, and the disclosure includes all such modifications.

BRIEF DESCRIPTION OF THE DRAWINGS

"Illustrative embodiments of the present disclosure are described herein with
reference to the accompanying drawings, in which:

"FIG. 1A is an exploded perspective view of an embodiment of an energized tissue compression assembly;
"FIG. 1B is a perspective view of the bottom surface of the top compression plate of FIG. 1A;
"FIG. 1C is a perspective view of the top surface of the bottom compression plate of FIG. 1A;
"FIG. 1D is a cross-sectional view of an embodiment of a coupled first and second compression plates along axis 1D-1D of FIG. 1C;
"FIG. 1E is a cross-sectional view of an embodiment of a coupled first and second compression plates along axis 1E-1E of FIG. 1C;
"FIG. 2A is an exploded perspective view of an embodiment of a tissue compression assembly comprising spacers;
"FIG. 2B is a perspective view of a bottom surface of the top plate of FIG. 2A;
"FIGS. 3A and 3B are exploded perspective views of an embodiment of a tissue compression assembly and cutting plate;
"FIG. 4A is a perspective view of one of a pair of tissue compression plates having a defined rectilinear shape;
"FIG. 4B is a perspective view of the pair of tissue compression plates coupled together with energized clamps;
"FIG. 5 is a perspective view of a further embodiment of a tissue compression plate having a rectilinear defined shape;
"FIG. 6 is a perspective view of yet a further embodiment of a tissue compression plate having a rectilinear defined shape;
"FIG. 7A is a plan view of a prosthetic heart valve leaflet having a thickened peripheral edge in areas where sutures penetrate for attachment to a structural stent;
"FIGS. 7B and 7C are sectional views through a radial midline of the leaflet of FIG. 7A showing two different profiles;
"FIG. 8A is a plan view of a prosthetic heart valve leaflet having a thickened peripheral edge in areas where sutures penetrate for attachment to a structural stent as well as a thickened free edge to reduce the risk of elongation at that location;
"FIGS. 8B and 8C are sectional views through a radial midline of the leaflet of FIG. 8A showing two different thickness profiles;
"FIG. 9A is a plan view of a prosthetic heart valve leaflet having thickened peripheral edge in areas where sutures penetrate for attachment to a structural stent as well as a thickened triple point area in the free edge simulating nodules of Arantius;
"FIGS. 9B and 9C are sectional views through a radial midline of the leaflet of FIG. 9A showing two different thickness profiles; and
"FIG. 10 illustrates in plan view an alternative leaflet having a thickened peripheral edge region, a thickened strip along the free edge, and a plurality of thickened radial strips extending from the free edge to the cusp edge.

"Like numerals refer to like parts throughout the several views of the drawings."

Patents

**Patent Application Titled "Detecting MicroRNA and Iso-MicroRNA to Evaluate Vascular and Cardiac Health" Published Online (USPTO 20160369344)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors Searles, Charles (Atlanta, GA); James, Amanda Marie (Decatur, GA), filed on June 16, 2016, was made available online on December 29, 2016.

No assignee for this patent application has been made.

Reporters obtained the following quote from the background information supplied by the inventors: "Cardiovascular disease continues to be a major public health problem worldwide as individuals continue to experience unexpected heart attacks and succumb to cardiovascular disease. Therefore, there is a need to identify improved therapies and methods to diagnose and monitor cardiac and vascular health.

"MicroRNAs (miRNAs) are non-coding RNAs that modulate gene expression typically by targeting mRNAs. MicroRNAs are generated as a family of related isomers that typically differ by a few bases at the 5' and 3' end of the miRNA, termed iso-miRs. Cloonan et al. report that miRNAs and iso-miRs function cooperatively to target common biological pathways. Genome Biol., 2011, 15, R126. Manzano et al. report that miRNA 5'-end variation sometimes leads to differential targeting. RNA 2015. 21: 1606-1620. MicroRNA may be packed into extracellular vesicles such as microvesicles contained in whole blood. Extracellular miRNAs have also been identified in high-density lipoprotein (HDL) or bound by the AGO2 protein.

References cited herein are not an admission of prior art."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "This disclosure relates to diagnosing or evaluating the state of vascular or cardiac health of a subject by detecting alterations in the microRNA and/or iso-microR profile contained in a sample derived from the subject. Typically, the sample is derived from blood such as a plasma sample or portions further isolated therefrom. In certain embodiments, the sample is plasma from which microvesicles have been removed or the sample is enriched with plasma derived microvesicles.

In certain embodiments, the methods disclosed herein will aid in the diagnosis or treatment of, or indicate an increased risk of developing, or monitoring the status of a cardiovascular disease or related conditions such as coronary artery disease, peripheral artery disease, atherosclerosis, ischemia, angina, myocardial infarct, arrhythmia, ischemic stroke, hemorrhagic stroke, leg pain, cramps, hypertension, heart failure, aneurysm, renal artery disease, Reynaud's phenomenon, Buerger's disease, peripheral venous disease, varicose veins, blood clots, deep vein thrombosis, or lymphedema.

In certain embodiments, the disclosure relates to methods for diagnosing a subject as being at risk or having vascular, cardiovascular disease, or coronary artery disease, or of having higher concentrations of whole blood circulating microvesicles or other extracellular vesicles, or of having increased likelihood of having or having had a myocardial infarction comprising measuring in a sample the presence of one or more of the following microRNA (miRNA) and/or iso-microRNA (iso-miR) selected from miR-10b, miR-30d, miR-93, miR-143, miR-181a, miR-182, miR-744, or combinations thereof and correlating an increase or decrease in the amount of miRNA and/or iso-miR compared to a normal or reference value as being at risk or having cardiovascular disease or significant coronary artery disease, or of high plasma microvesicles, or increased likelihood of having or having had a myocardial infarction.

In certain embodiments, the miRNA and/or iso-miR is measured in a sample selected from whole plasma, microvesicles isolated from plasma, or plasma from which microvesicles have been removed.

In certain embodiments, the miRNA and/or iso-miR are iso-miR-93 and iso-miR-181a, wherein an increase of iso-miR-93 in whole plasma and a decrease of iso-miR181a in microvesicles isolated from plasma indicates having cardiovascular disease.

In certain embodiments, the miRNA and/or iso-miR are iso-miR-10b and iso-miR-93, wherein an increase of iso-miR-10b in whole plasma and a decrease of iso-miR-93 in microvesicles isolated from plasma indicates having high plasma microvesicles.

In certain embodiments, the miRNA and/or iso-miR are iso-miR-10b and iso-miR-93, wherein no change of iso-miR-10b in plasma from which microvesicles have been removed and a decrease of iso-miR-93 in microvesicles isolated from plasma indicates an increased likelihood of having had a myocardial infarction.

In certain embodiments, the miRNA and/or iso-miR measurements or correlations are recorded on a computer or computer readable medium. In certain embodiments, the method further comprises recording the similarities or differences to a normal or reference value on a computer readable medium. In certain embodiments, the miRNA and/or iso-miR measurements or correlations are displayed on a digital display. In certain embodiments, the methods disclosed herein further comprises the step of communicating the measurements or correlations to a medical professional or the subject.

In certain embodiments, the disclosure relates to a therapeutic strategy of identifying a subject is having or is at risk of a cardiovascular conditions using methods disclosed herein.
and administering a therapeutic agent to the subject based on the diagnosis.

**BRIEF DESCRIPTION OF THE FIGURES**

"FIG. 1 schematically illustrates embodiments of methods disclosed herein.

"FIG. 2A shows data indicating a correlation of cardiovascular disease severity (CAD versus RF) with microvesicle counts. Cardiovascular disease has been noted to alter the abundance of circulating microvesicles (MV). Statistical modeling was performed based on cardiovascular disease severity bases on angiogram results: [Gensini Score] (RF vs CAD) and microvesicle counts.

"FIG. 2B shows data indicating microvesicle counts correlate with myocardial infarction. Microvesicle counts in relation to the occurrence of a cardiac event (No MI vs MI). Together, these data indicate a relationship between angiogram results, cardiac events and MV counts as an indicator of disease progression.

"FIG. 3 shows data indicating predominance of iso-miRs relative to consensus or archetypal miRNAs for specific miRNAs in RNA sequencing experiment. Deep sequencing analysis was performed on pooled blood samples matched by angiogram results, age, gender, and race. The percentage of iso-miR relative to consensus miRNA was calculated by dividing iso-miR reads by the total number of reads for a particular miRNA (consensus miRNA plus iso-miR).

"FIG. 4 shows qRT-PCR data on the concentration (femtomolar) of different iso-miRs in plasma from Cohort 1 (risk factor-blue versus CAD-red). Each isomiR has a uniquely designed and validated RT/PCR Primer set.

"FIG. 5A shows data indicating changes in iso-miR levels is altered by coronary artery disease severity. The arrows indicate relative concentration differences of certain biomarkers between isomiR in whole plasma, plasma w/o MVs and MVs when the patients were stratified by angiogram results. The arrows indicate increased (up arrow) or decreased (down arrow) concentration of iso-miRs in patients indicated by header relative to the other group of patients. For example, in whole plasma, isomiR-10b has increased concentration in CVD patients relative to RF patients and vice versa.

"FIG. 5B shows data when the patients were stratified by MV Count. Arrows show relative differences in isomiR concentrations for patients with high MV counts versus low MV counts.

"FIG. 5C shows data when the patients were stratified by cardiac events. Arrows show relative differences in iso-miR concentrations for patients with MI versus those who did not have MI.

"FIG. 6 shows data where random forest modeling was used to assess the accuracy of combinations of two iso-miRs (isomiR-93 and 181a or isomiR-10b and -93) in predicting significant coronary artery disease or MI. Iso-miRs were measured in different plasma fractions (whole plasma, plasma w/o MVs or MVs)."

Mico-tech (nanjing) Co., Ltd.

Patent Application Titled "Hemostatic Clip" Published Online (USPTO 20160367258)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors JIN, Hongyan (Nanjing, Jiangsu, CN); TANG, Zhi (Nanjing, Jiangsu, CN); FAN, Mingqiao (Nanjing, Jiangsu, CN); SONG, Ran (Nanjing, Jiangsu, CN), filed on June 30, 2014, was made available online on December 29, 2016.

The assignee for this patent application is Mico-tech (nanjing) Co., Ltd.

Reporters obtained the following quote from the background information supplied by the inventors: "In recent years, endoscopic hemostatic clips have become the most effective and most clinically valuable equipment for non-operational treatment of acute gastrointestinal tract hemorrhage of critical patients owing to the characteristics of low wound, high hemostatic speed, low re-bleeding rate, few complications, exact effect and the like. Hemostasis with a metal clip under an endoscope is one of the widely applicable hemostasis means, and the skilled metal clip operation for appropriate cases can effectively stop bleeding and prevent re-bleeding, reduce adverse response and greatly improve the safety and the cure rate of endoscopic therapy for gastrointestinal tract hemorrhage. The hemostatic mechanism of the metal hemostatic clip is the same as that of surgical vascular ligation or suture and is a physical and mechanical method, namely, a bleeding vessel and surrounding tissues thereof are ligated together by utilizing a mechanical force produced when the hemostatic clip is closed, so that the bleeding vessel is closed to block blood and fulfill the purpose of hemostasis; and the metal hemostatic clip is suitable for hemostatic therapy of non-variceal active bleeding and visible blood vessel stump lesions.

"However, the existing hemostatic clip is inconvenient to place and fix, so a hemostatic clip convenient to use is urgently needed."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "The aim of the present invention: the technical problem to be solved by the present invention is to provide a hemostatic clip for overcoming the defects of the prior art.

"In order to solve the above technical problem, the present invention discloses a hemostatic clip, including a clamping assembly and a clip base, wherein the clamping assembly includes a clip body and a steel wire buckle which are sequentially connected; a fixed hinge pin is arranged at the front end of the clip base, the clip body is composed of two clamping arms, the tail ends of the two clamping arms are connected through a movable hinge pin, the middle part of each of the two clamping arms is provided with a chute, the fixed hinge pin penetrates through the chutes, and the two clamping arms reciprocate along the chutes so that the clip body can be opened and closed; a bent structure is arranged at the tail end of each chute; and when the clamping arms move to make the fixed hinge pin be located in the bent structures, the two clamping arms are located in the locked and closed position."
"In the present invention, the steel wire buckle is wound on the movable hinge pin, and when the tension applied to the steel wire buckle reaches a predefined value (35-40N), the steel wire buckle is straightened and separated from the movable hinge pin; and after the steel wire buckle is separated from the movable hinge pin, the rear part of the clip body is fixed in the clip base.

"In the present invention, a hook structure is arranged at the tail end of each of the two clamping arms, and the clip base is provided with protrusions matched with the hook structures; and when the two clamping arms are located in the locked and closed position, the hook structures at the tail ends of the two clamping arms are buckled on the protrusions. Thus, double insurance is formed, and the hemostatic clip is stable in the locked state and is not suddenly released again.

"In the present invention, the engaged distal ends of the two clamping arms are matched in a serrated shape, so that two forceps heads are engaged synchronously to ensure the effectiveness after the clip is closed. After the engaged distal ends of the two clamping arms are closed, the end surfaces are spherical ones, so that the clip better passes through curves and protects the endoscopic tract.

"In the present invention, the side walls of the two clamping arms are gradually widened from the distal ends to the proximal ends, so that the root strength of the clip can be improved, and the smoothness and the curve passing property of the clip are also ensured.

"In the present invention, the engaged distal ends of the two clamping arms are matched in a serrated shape, so that two forceps heads are engaged synchronously to ensure the effectiveness after the clip is closed. After the engaged distal ends of the two clamping arms are closed, the end surfaces are spherical ones, so that the clip better passes through curves and protects the endoscopic tract.

"In the present invention, the clip base is sequentially connected with a transition cap, a fixed cap and a distal end spring tube to form an outer sleeve assembly, the clamping assembly includes a connector connected with the steel wire buckle, the connector is provided with an elastic pawl, more than two deformable buckles are arranged on the pawl, the clip base is partially nested with the transition cap, the mutually nested part is provided with a clamping groove capable of accommodating the buckles, and the buckles connect the clip base with the transition cap; and when the tension applied to the pawl reaches a preset value (20-30N), the buckles produce elastic deformation and are straightened, so that the buckles are separated from the clamping groove and the clip base is separated from the transition cap.

"A transition cap insert is arranged at the tail end of the transition cap, so that an annular groove is formed in the outer wall of the transition cap; one end of the fixed cap is fixedly connected with the distal end spring tube, and the other end of the fixed cap is provided with an annular protrusion matched with the annular groove, so that the transition cap can rotate relative to the fixed cap.

"In the present invention, the inside diameters of the fixed cap and the distal end spring tube are greater than the maximum outside diameters of the steel wire buckle, the connector and the pawl, so that the hemostatic clip in the present invention is different from a traditional device, and the separated steel wire buckle, connector and pawl can enter the distal end spring tube under the traction of an operation rope to reduce secondary harm to human bodies.

"In the present invention, a spring tube transition piece is arranged in the distal end spring tube, the connector is connected with the operation rope, and the spring tube transition piece is provided with a through hole through which only the operation rope passes, so that the spring tube transition piece forms a stop.

"In the present invention, holes, through which the movable hinge pin passes, of the clamping arms are kidney-shaped, so that the buckles are easily staggered and reduced to enter the clip base hole and can be bounced off again to clamp the clip, the closing resistance can be effectively reduced, the clamping force can be improved, and the clip can complete clamping and closure without dropping off.
"In the present invention, the chute has radian. The chute is designed in an arc or straight shape, so that the clip moves smoothly and achieves the designed opening size.

"Beneficial effects: the hemostatic clip of the present invention is simple and convenient to operate, and can rotate conveniently inside the human body according to the requirement of various angles; meanwhile, after the hemostatic clip is positioned successfully, it can be released through the operation rope, so that the hemostatic clip body is left inside the human body.

BRIEF DESCRIPTION OF THE DRAWINGS
"The present invention will be further specifically described below in combination with the accompanying drawings and the specific embodiments, and the above-mentioned and other advantages of the present invention will be clearer.

"FIG. 1 is a schematic diagram of an overall structure of the present invention.
"FIG. 2 is a partial enlarged diagram of part I in FIG. 1.
"FIG. 3 is a schematic diagram of a first change state in FIG. 2.
"FIG. 4 is a schematic diagram of a second change state in FIG. 2.
"FIG. 5 is a schematic diagram of a third change state in FIG. 2.
"FIG. 6 is a partial enlarged diagram of part II in FIG. 1.
"FIG. 7 is a structural schematic diagram of a clamping arm."

Patents
Patent Application Titled "Instrumentation with Embedded Imaging Systems" Published Online (USPTO 20160367311)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventor Gerrans, Lawrence J. (San Anselmo, CA), filed on June 16, 2015, was made available online on December 29, 2016.

No assignee for this patent application has been made.

Reporters obtained the following quote from the background information supplied by the inventors: "There are many medical devices currently available for performing a variety of medical procedures. Typically, the medical devices are used together with a separate endoscope or another type of an imaging device to visualize the medical procedure in vivo. However, such devices suffer from a number of drawbacks. First, the need for insertion of a separate imaging device makes the procedure more complex, requiring additional steps, bulkier working channels, and larger incisions."
Additionally, the imaging devices often get foggy or dirty because of contact with various bodily tissues and fluids, which impairs their imaging capabilities, and need to be withdrawn from the patient's body to be cleaned and then reinserted. This makes the procedure more complicated and traumatic for the patient.

Furthermore, often it is desirable to perform diagnostic tests simultaneously with a medical procedure. In order to perform such tests, a separate diagnostic device needs to be inserted into the patient's body, in addition to the working medical device and the imaging device. Again, this leads to longer and more complicated procedures, requiring a physician to insert and operate multiple devices, and also makes the procedure more difficult for the patient.

What is desired, therefore, is a medical instrument, such as a biopsy device, that can also perform diagnostic functions to eliminate the need for a separate procedure. What is also desired is a medical device with an imaging system that facilitates proper insertion of the medical device into a bodily cavity and assists in performing a medical procedure via the medical device. What is further desired in a medical device with imaging and/or diagnostic capabilities that includes a cleaning system that allows a user to efficiently clean the imaging/diagnostic device lenses without the need to remove the device from a patient's body. It is also desired to provide a medical device with imaging and/or diagnostic capabilities that is more cost effective, reusable with various existing devices, and simpler in design.

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventor's summary information for this patent application: "Therefore, it is an objective of this invention to provide a medical instrument that performs a medical procedure, such as biopsy, and also performs diagnostic functions to eliminate the need for a separate procedure.

It is also an objective of this invention to provide a medical device with an imaging system that facilitates proper insertion of the medical device into a bodily cavity and assists in performing a medical procedure via the medical device.

It is further an objective of this invention to provide a medical device with imaging and/or diagnostic capabilities that includes a cleaning system that allows a user to efficiently clean the imaging/diagnostic device lenses without the need to remove the device from a patient's body.

It is yet a further objective of the present invention to provide a medical device with imaging and/or diagnostic capabilities that is more cost effective, reusable with various existing devices, and simpler in design.

In order to overcome the deficiencies of the prior art and to achieve at least some of the objectives and advantages listed, the invention comprises a medical instrument, including a shaft having a proximal end, a distal end and a longitudinal axis, a working member at the distal end of the shaft and having a first arm and a second arm, wherein each of the first and second arms has a proximal end and a distal end, and wherein at least one of the first and second arms pivots relative to the longitudinal axis of the shaft, a first diagnostic device positioned in the first arm adjacent the distal end of the first arm, a second diagnostic device positioned in the second arm adjacent the distal end of the second arm, and a third diagnostic device positioned adjacent the proximal ends of the first and second arm.

In some embodiments, at least one of the first arm and the second arm has a cutting surface. In additional embodiments, at least one of the first arm and the second arm comprises a grasping surface.

In certain embodiments, at least one of the first arm and the second arm has a storage compartment for retaining a tissue sample.

In some embodiments, the working member includes an electrically conductive
member coupled to a source of electrical current for delivering electric current to tissue.

"In some cases, the working device is removably attached to the shaft.

"In certain embodiments, the medical instrument further includes an actuator positioned at the proximal end of the shaft that actuates the working device.

"In some embodiments, at least one of the first, second and third diagnostic devices has a sensor that detects and measures at least one characteristic of bodily tissue.

"In certain advantageous embodiments, at least one of the first, second and third diagnostic devices is a camera. In some of these embodiments, the camera has at least one lens and at least one imaging sensor. In certain of these embodiments, the imaging sensor is a CMOS sensor.

"In some embodiments, at least one of the first, second and third diagnostic devices further includes at least one illumination device positioned adjacent the camera. In certain of these embodiments, the at least one illumination device has a light source emitting light with a visible spectrum. In additional embodiments, the at least one illumination device has a light source emitting light with a non-visible spectrum.

"In certain embodiments, the medical instrument further includes a processor connected to the first, second and third diagnostic devices that receives and processes data captured by the diagnostic devices. In some of these embodiments, the processor is connected to the first, second and third diagnostic devices via a wired connection. In additional embodiments, the processor is connected to the first, second and third diagnostic devices via a wireless connection.

"In some cases, the working device includes an opening positioned adjacent the proximal ends of the first and second arms, wherein the third diagnostic device moves through the opening.

"In certain embodiments, the first arm has an opening at its distal end and the first diagnostic device moves through the opening. In additional embodiments, the second arm has an opening at its distal end and the second diagnostic device moves through the opening.

"In some embodiments, the medical device further includes a control device that actuates at least one of the first, second and third diagnostic devices.

"In certain embodiment, a fluid source is also provided positioned in at least one of the first arm and the second arm. In some of these embodiments, the fluid source delivers at least one of cleaning fluid, irrigation fluid and a therapeutic and/or diagnostic agent.

"In some embodiments, the medical instrument further includes at least one cleaning device for cleaning at least one of the first, second and third diagnostic devices, wherein the at least one cleaning device is removably positioned inside the working device.

"In certain embodiments, the medical instrument further includes at least one additional arm positioned between the first and second arms, wherein the third diagnostic device is movable between a first position wherein it extends between the first arm and the at least one additional arm and a second position wherein it extends between the second arm and the at least one additional arm.

"A method of performing a medical therapeutic and/or diagnostic procedure is also provided, including inserting a medical instrument into a bodily cavity, the medical instrument comprising a shaft with a longitudinal axis and a working member at a distal end of the shaft, wherein the working device has a first arm and a second arm, wherein each of the first and second arms have a proximal end and a distal end, and wherein at least one of the first and second arms pivots relative to the longitudinal axis of the shaft, a first diagnostic device positioned in the first arm adjacent the distal end of the first arm, a second diagnostic device...
positioned in the second arm adjacent the distal end of the second arm, and a third diagnostic device positioned adjacent the proximal ends of the first and second arm, visualizing surrounding tissue via at least one of the first, second and third diagnostic devices, and actuating the working device to perform the procedure.

"In some embodiments, the step of actuating the working device includes cutting bodily tissue.

"In certain embodiments, the method further includes the step of measuring at least one characteristic of bodily tissue via at least one of the first, second and third diagnostic device.

"In some embodiments, the working device further comprises at least one leaning device, and wherein the method further comprises the step of cleaning at least one of the first, second and third diagnostic device by displacing it through the at least one cleaning device.

"In certain embodiments, the step of actuating the working device comprises actuating the first arm to contact and move a first layer of tissue and actuating the second arm to contact and move a second layer of tissue, such that first and second layers of tissue are moved away from each other.

"Other objects of the invention and its particular features and advantages will become more apparent from consideration of the following drawings and accompanying detailed description.

BRIEF DESCRIPTION OF THE DRAWINGS

"FIG. 1A is a perspective view of a medical instrument with embedded imaging and/or diagnostic systems in accordance with the invention.

"FIG. 1B is a cross-sectional view of the medical instrument of FIG. 1A, taken along the line '1B-1B'.

"FIG. 2 is side view of a proximal end of the medical instrument of FIG. 1A, showing an actuation device.

"FIG. 3A is an exploded perspective view of a camera used in the medical instrument of FIG. 1A.

"FIG. 3B is an exploded side view of a camera used in the medical instrument of FIG. 3A.

"FIGS. 4A and 4B illustrate the medical instrument of FIG. 1A being used in a bodily cavity.

"FIGS. 5A and 5B illustrate a method of using at least one cleaning member of the medical instrument of FIGS. 4A and 4B.

"FIG. 6 illustrates a method of using the medical instrument of FIG. 1A to deliver electrical current to tissue.

"FIG. 7 illustrates a method of using the medical instrument of FIG. 1A to separate tissue layers.

"FIG. 8 illustrates is a perspective view of a medical instrument of FIG. 1A with an additional arm."

Patents

**Patent Application Titled "Method for Diagnosing, Quantifying, Treating, Monitoring Or Evaluating Conditions, Diseases Or Disorders Associated with Human Papilloma Virus (Hpv) Infection" Published Online (USPTO 20160369357)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors Taylor, Donald Charles (Comox, BC, CA), filed on June 22, 2016, was made available online on December 29, 2016.

No assignee for this patent application has been made.

Reporters obtained the following quote from the background information supplied by the inventors: "Human papillomaviruses (HPVs) are a group of double-stranded, nonenveloped, small DNA viruses that are widely prevalent among human populations (See FIG. 1). To date, over 180 types of HPV have been isolated and identified from different body sites and have been collected in two HPV databases (See: http:// pave.niaid.nih.gov, http://www.hpvcenter.se), and the number is growing (See: Ma et al. J. Virol. May 2014 vol. 88 no, 9 4786-4797).

"The HPV genome is double-stranded DNA that codes for eight proteins. These proteins are named for when they are expressed during the virus' occupation of its host: early (E) and late (L). E1, 2, 4, and 5 are important to genome replication. E1 also prevents the virus' genome from integrating into the host's genome, and initiates gene expression when complexed with E2, E6 and E7 are oncogenes, and, unchecked, can cause tumorous growth of the host cell. E2 and E4 normally inhibit this action. The late proteins, L1 and L2, are capsid proteins and are thus only expressed when the virus copies are repackaged to be released from the host cell (See: Doorbar 2005; J Clin. Virol. 32:S7-15).

"HPVs are divided into five genera: alpha (also known as A supergroup), beta (also known as B supergroup), gamma, mu, or nu (See FIG. 2). Mu and nu-papillomaviruses are also classified as E supergroup. Supergroup A encompasses all genitally transmitted papillomaviruses, as well as some cutaneous viruses. The genital transmitted viruses present as mucosal lesions, while the cutaneous variety are the primary cause of skin warts. Viruses in supergroup B also form cutaneous warts similar to those from group A, and they are one cause of non-melanoma skin cancer. Supergroup E is comprised of a third type of virus that causes cutaneous warts. HPV types belonging to different genera have less than 60% similarity, based on the nucleotide sequence of the capsid protein L1. Different viral species within a genus share between 60 and 70% similarity (See: Bzhalava et al. Virology Volume 445, issues 1-2, October 2013, Pages 224-231).

"All HPVs develop and reproduce solely in keratinocytes, or keratin-producing epithelial cells, the differentiation of which is critical to the papillomavirus's own development. The virus first infects keratinocyte stem cells, which live in the basal layer of the epithelium, through a breach in the upper layers of the epithelium. Upon infection, the virus takes advantage of the cell's replication machinery to reproduce its genome several times, so that each infected cell contains a low viral load of about 50 copies. As the cells proliferate, they move towards the outer layers of the epithelium; the viruses proliferate as well, but do not amplify their genome to
escape detection by the immune system. When the host keratinocyte reaches S-phase in the differentiation compartment of the epithelium, the papillomavirus replicates its genome to the critical limit of about 1000 copies. In fact, the virus releases growth promoters E6 and E7 at this stage in order to stimulate the host's movement into this phase. When the keratinocyte reaches the superficial epithelium and dies, the genomes are repackaged into capsids and shed from the cell (See: Doorbar 2005; J Virol. 32:S7-15).

"Infection with HPV can present a wide variety of clinical manifestations of the skin and mucosa, most commonly as warts, either skin or genital, although many HPV infections, especially those of the skin, are often present without clinical symptoms. The most important HPV-associated disease is undoubtedly cancer. Cervical cancer and many other anogenital cancers are caused by HPV infections, and many other cancer forms have either been proven or are suspected to be linked to HPV.

"In the case of immunocompromised patients, the risk of HPV infection was reported to be much greater than the general population due to high-load, persistent infection with oncogenic HPV genotypes. The prevalence of HPV infection was shown to increase in organ transplant recipients, human immunodeficiency virus (HIV)-infected women, and patients with systemic autoimmune diseases such as systemic lupus erythematosus (SLE). Furthermore, it has been found that patients with active SLE had greater prevalence of high-risk HPV infection and of abnormal cervical cytology compared with controls, and that SLE itself was identified with independent risk factors for high risk HPV infection among Korean women, and Pap smear abnormalities (See: Lee et al 2010 (J Korean Med Sci. 2010 October; 25(10); 1431-1437).

"Infection with HPV has also been linked with an increased risk of cardiovascular disease (See: Kuo H K, Fujise Journal of the American College of Cardiology 58 (19): 2001-6.). Furthermore, it has been shown that there is an association between human papillomavirus DNA and temporal arteritis (See: Mohammadi et al. (BMC Musculoskeletal Disorders 2012, 13:132).

"It has been reported that human papillomavirus 16 (HPV16) can be linked to a common form of childhood epilepsy (See: Chen et al. 2012 (Ann Neurol. 2012 December; 72 (6):881-92). It was shown that HPV16 may be present in the human brain, and they found that when they added a viral protein to the brains of fetal mice, the mice all demonstrated the same developmental problems in the cerebral cortex associated with this type of epilepsy, called focal cortical dysplasia type IIB (FCDIIB). The findings suggest that HPV could play a role in the development of epilepsy.

"Studies have reported HPV findings in cancers that occur at sites where direct HPV infection is usually not seen, including colorectal, and lung and breast cancer. Detection of HPV in cancers like this raises the question how HPV got to the site of cancer. It has long been believed that papillomavirus cannot be spread to different body sites through blood, as papillomaviruses do not give rise to viremia. One possibility is that it was transported in blood, and HPV DNA has indeed been reported to be found in circulating blood, including peripheral blood mononuclear cells (PBMCs), sera, plasma, and arterial cord blood (See: Dong et al., 2002, Cancer Epidemiol Biomarkers Prev 11:3-6., 9). It has also been reported that 8.3% of healthy male blood donors in their study were positive for HPV (See: Chen et al., 2009, Med Virol. 2009 Oct; 81(10):1792-61. Chen et al. isolated a wide variety of different HPV types from PBMCs, belonging to the cutaneous beta and gamma papillomavirus genera and mucosal alpha papillomaviruses. High-risk HPV types that are linked to cancer development were detected in 1.7% of the PBMCs.

"All papillomaviruses, including HPV, are obligatory intranuclear organisms with specific tropism for keratinocytes and lymphatic cells. Three possible courses of events can follow upon HPV entry into cells: (1) viral DNA are maintained as intranuclear,
extrachromosomal, circular DNA episomes, which replicates synchronously with the host cell, establishing a latent infection; this period usually last an average of 1 to 8 months; although, in some patients this latency may last for many years or decades (2) conversion from latent into productive infection with assembly of complete infective virions; and, (3) integration of viral DNA into host cellular genome, a phenomenon seen in HPV infections associated with malignant transformation.

"Like other viruses, HPV has the ability to establish a chronic, dormant (latent) infection and the ubiquity of latent papillomavirus infections is emphasized by the frequent, often acute outbreak of warts in immunosuppressed patients and pregnant women. In latency, viral DNA replication and transcription are maintained at very low levels and regulated by negative cellular factors (e.g., NF-IL6, p53, Oct-1, YY1) and low levels of early viral proteins (E1 and E2). For example, the viral E1 replication protein functions as an E2 co-repressor when bound to the origin of DNA replication. Persistent HPV infections are associated with a number of skin and cervical cancers, but could be associated with other conditions.

"Many viruses establish persistent infections that are characterized by continuous low or high levels of viral replication example human immunodeficiency virus and hepatitis B virus) or by periodic reactivation of a latent infection following apparently disease-free intervals (for example herpes simplex virus) (See: Tyler, K. and Nathanson, N. in Fields Virology 4th edn (eds Fields B N, Knipe, D. M., and Howley, P. M.), 220-222 (Lippincott Williams & Wilkins, Philadelphia, 2001) (FIG. 3). As illustrated therein, acute infection is associated with clinical symptoms and the release of an infectious virus, (e.g. influenza virus). Persistent infection is associated with the production of an infectious virus, HBV for example, for the lifetime of the host. Latent infection as seen in herpes simplex virus (HSV) infection is a variation of persistent infection in which the acute infection is followed by a quiescent phase in which the virus productive cycle is absent or significantly reduced. The viral genome remains in a 'silent' state but can be intermittently reactivated into bouts of productive infection. Slow virus infection, as seen with HIV is yet another version of persistent infection typified by long periods (years) between primary infection and the development of fatal symptoms: production of an infectious virus is either continuous at a low level or absent until failing immune control results in overwhelming virus production.

"A number of viruses are capable of invading and establishing latent infections in nervous tissue. Such viruses have been shown to produce slow, chronic, or progressive nervous system diseases (See: Boldogh et al. Medical Microbiology, 4th edition. Chapter 46). Many chronic, degenerative nervous system diseases are related to viral persistence. Persistence in the nervous system probably involves some unique mechanisms that take advantage of the many types of specialized cells and the immunologically privileged status of the central nervous system. For example during acute HSV infection, virus and/or viral components (e.g., nucleocapsids) containing viral genetic material ascend in nerve axons from the initial site of infection to the sensory ganglia mainly the trigeminal ganglia HSV-1, and the lumbar and sacral ganglia for HSV-2. In the sensory ganglia, the virus may cause a cytolytic infection or establish a latent, noncytolytic infection. Sympathetic ganglia and other cell types of the central nervous system may also serve as sites of virus latency.

"In the case of Varicella-Zoster Virus infection, after recovery from acute varicella (chickenpox), the virus establishes latency in multiple ganglia of the human neuraxis. Years later, the virus may reactivate, and the distribution of lesions in the skin corresponds closely to areas of innervation (dermatome) from an individual dorsal root ganglion. In immunocompromised patients, life-threatening disseminated infections can occur.

"Measles is normally an acute self-limited disease in which the virus appears to be eliminated. In some individuals, however, the virus persists in the brain despite apparent
humoral and cellular immune responses. Possible mechanisms of persistence include the immunologically privileged status of the brain, antiviral antibody-induced internalization of viral antigens, altered and restricted virus expression and replication as a result of mutations in the virus genome.

"Furthermore, viral infection has also been linked to neurodegenerative and neurobehavioral diseases (See: Nicolson, Lab Med. 2008; 39(5):291-299). For example HSV infections have been found in Alzheimer's disease (AD), and an interesting relationship has developed between the presence of HSV in AD. It had been noted in HSV but not a related neurotrophic virus, varicella zoster virus, was found often in AD brains and may be linked to patients who have the AD risk factor ApoE e4 allele."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "The present disclosure relates to a method of diagnosing, quantifying, treating, monitoring or evaluating a condition in a subject comprising determining the presence or quantity of one or more than one human papilloma virus (HPV) in a sample from the subject, wherein the presence or quantity of the one or more than one HPV is indicative of the presence of the condition in the subject or indicative of a predisposition to the condition when compared to a control.

"The quantity of the one or more than one HPV may comprise the viral load of one or more than one HPV in a sample from the subject. The condition may comprise an autoimmune disorder, a chronic neurodegenerative disease, a neurodevelopmental disorder, neoplasm, blood cancers such as lymphoma or leukemia, Chronic Fatigue Syndrome or Fibromyalgia. The autoimmune disorder may be Systemic lupus erythematosus (SLE) or Multiple Sclerosis (MS). The chronic neurodegenerative disease may be Dementia such as for example, Alzheimer's disease, Parkinson's disease or Amyotrophic lateral sclerosis (ALS), and the neurodevelopmental disorder may be Autism or autism spectrum disorders such as Asperger syndrome. The method may further comprise treating the subject for one or more than one HPV infection or may comprise vaccinating the subject against one or more than one HPV. The sample from the subject may be blood, plasma, peripheral blood mononuclear cells (PBMC), or other blood compartment or fluid such as cerebrospinal fluid or saliva.

"The viral load may be determined by quantifying the genome numbers of the one or more than one HPV and the HPV genome numbers in the sample may be greater than the genome numbers in a sample of the control. The genome numbers may be determined by quantitative polymerase chain reaction (PCR). The genome numbers may be greater than 4 copies per .mu.l as measured by HPV-DNA quantitative PCR using universal primer SPF10. The viral load may be above a threshold amount; the threshold amount being indicative of the presence of the condition in the subject or an increased likelihood of the subject developing the condition when compared to a control subject. The threshold amount may be a copy number greater than 4 copies per as measured by HPV-DNA quantitative PCR using universal primer SPF10.

"The one or more than one HPV may be one or more beta, gamma or alpha HPV or a combination thereof. Furthermore, the one or more HPV may comprise one or more high risk HPV type, one or more low risk HPV type HPV or a combination thereof. The HPV may comprise one or more HPV type 1, 2, 4, 6, 11, 16, 18, 26, 30, 31, 33, 34, 35, 39, 40, 41, 42, 43, 44, 45, 51, 52, 54, 55, 56, 57, 58, 59, 61, 62, 64, 67, 68, 69, 70 or a combination thereof.

"Furthermore, the present disclosure also relates to a method of comparing the incidence of a HPV infection among more than one population of subjects with a condition, the method comprising

"a) determining the viral load of one or more HPV in a representative number of
subjects of each population;

"b) calculating the percentage of subjects in each population having a viral load above a threshold; and

"c) correlating the percentage of subjects in each population to the relative incidence of HPV infection. The condition may comprise an autoimmune disorder, a chronic neurodegenerative disease, a neurodevelopmental disorder, neoplasm, blood cancers such as lymphoma or leukemia, Chronic Fatigue Syndrome or Fibromyalgia. The autoimmune disorder may be Systemic lupus erythematosus (SLÉ) or Multiple Sclerosis (MS). The chronic neurodegenerative disease may be Alzheimer's disease, Parkinson's disease or Amyotrophic lateral sclerosis (ALS) and the neurodevelopmental disorder may be Autism or autism spectrum disorders such as Asperger syndrome.

"The disclosure further relates to a method for predicting the development of a condition in a human subject, comprising contacting a biological sample of the human subject with a diagnostic reagent that can detect one or more than one HPV or an antigen thereof, or a humoral or cell-mediated response to HPV or an antigen thereof, in the biological sample,

"wherein the presence of one or more than one HPV or an antigen thereof or a humoral or cell-mediated response to HPV or an antigen thereof is associated with an increased risk of developing the condition, wherein the condition comprises an autoimmune disorder, a chronic neurodegenerative disease, a neurodevelopmental disorder, Chronic Fatigue Syndrome or Fibromyalgia.

"The disclosure also relates to a method of treating an condition related to HPV comprising: administering a therapeutically effective amount of an anti-retroviral agent to a to a subject in need thereof, wherein the condition comprises an autoimmune disorder, a chronic neurodegenerative disease, a neurodevelopmental disorder, neoplasm, blood cancers such as lymphoma or leukemia, Chronic Fatigue Syndrome or Fibromyalgia.

"This summary of the invention does not necessarily describe all features of the invention.

BRIEF DESCRIPTION OF THE DRAWINGS

"These and other features of the invention will become more apparent from the following description in which reference is made to the appended drawings wherein:

"FIG. 1a shows a schematic drawing of a Papilloma Virion. A single molecule of circular dsDNA is contained within the icosahedral capid, which is composed of 72 pentamers of the capsid protein L1.

"FIG. 1b shows a transmission electron microscopy (TEM) image of a human papillomavirus.

"FIG. 2 shows a phylogenetic tree and the placement of the HPV types found in different organs (See: Ma et al. J. Virol. 2014; 88:4786-4797).

"FIG. 3 shows the general pattern of infection for different viruses. To illustrate different patterns of persistent infection, the replication of herpes simplex virus (HSV), hepatitis B virus (HBV) and human immunodeficiency virus (HIV) is plotted as a function of time after infection.

"FIG. 4 shows the schematic representation of the locations of the different universal primer sets (MY09/11, GP5+/6+ and SPF 10) on the HPV genome. The circular HPV DNA genome is represented by a single line, and boxes show the positions of the various early (E) and late (L) genes. Within the L1 region, the positions of the amplification targets as well as the expected amplimer sizes for each of the primer sets are indicated (adapted from Meter et al. J
"FIG. 5 shows the standard curve for HPV assay using primer pair GP5+/GP6+ generated as a plot of the threshold cycle (y axis) against quantity of standard (log scale). The correlation coefficient R sub 2 is 0.978.

"FIG. 6 shows the standard curve for HPV assay using primer pair SPF 10 generated as a plot of the threshold cycle (y axis) against quantity of standard (log scale). The correlation coefficient R sub 2 is 0.9905."

Patent Application Titled "Method of Inhibiting Mutant C-Kit" Published Online (USPTO 20160367545)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventor Jain, Vinay K. (Dallas, TX), filed on September 2, 2016, was made available online on December 29, 2016.

No assignee for this patent application has been made.

Reporters obtained the following quote from the background information supplied by the inventors: "Without limiting the scope of the invention, its background is described in connection with its ability to inhibit the mutant form of KIT in the treatment of KIT dependent diseases.

"The c-kit gene is located on locus q11-q12 of the human fourth chromosome and encodes the protein KIT (also known as CD 117), which is a cytokine receptor that is expressed on the surface of a number of different cells. See Rulina et al., Biochemistry (Moscow). Activated Leukemic Oncogenes AML1-ETO and c-kit: Role of Development of Acute Myeloid Leukemia and Current Approaches for Their Inhibition. 2010; 75(13): 1650-1666. KIT is a type III receptor tyrosine kinase of the monomeric receptor family and the transmembrane receptor for stem cell factor. See Tefferi and Pardanani. Leukemia and Lymphoma, March 2010; 51(3): 360-362.

"KIT is notably expressed by mast cells, hematopoietic progenitor cells, germ cells, melanocytes, and interstitial cells of Cajal in the gastrointestinal tract and is relevant for normal mast cell development, hematopoiesis, gametogenesis, melanogenesis, and regulation of slow gastric waves. See Miettinen et al. KIT (CD117): A Review on Expression in Normal and

"Activating mutations that give rise to ligand-independent activation of KIT occur in the juxtamembrane and kinase domains of the gene. See Hug et al. ETO Interacting Proteins. Oncogene. 2004; 23(24): 4270-4274. Mutations that lead to an activated form of KIT have been shown to play a role in proliferative disease such as mastocytosis, acute myeloid leukemia, gastrointestinal stromal tumors, sinonasal NK/T-cell lymphoma, seminomas, dysgerminomas, melanomas, and thymic carcinomas.

"The currently used targeted agent for the treatment of diseases associated with both wild-type and mutated KIT is Imatinib mesylate (also known as GLEEVEC or GLIVIC; Novartis, Basel, Switzerland). Imatinib demonstrates activity against certain transmembrane and juxta-membrane KIT mutants, namely F522C and V560G, respectively, but this activity is significantly lowered in common kinase domain mutants, including D816V. See Akin et al. A Novel Form of Mastocytosis Associated with a Transmembrane C-KIT Mutation and Response to Imatinib. Blood. 2004; 103: 3222-3225; Zermati et al. Effect of Tyrosine Kinase Inhibitor STI571 on the Kinase Activity of Wild-type and Various Mutated C-KIT Receptors Found in Mast Cell Neoplasms. Oncogene. 2003; 22: 660-664; Akin et al. Effects of Tyrosine Kinase Inhibitor STI571 on Human Mast Cells Bearing Wild-type or Mutated C-KIT. Exp Hematol. 2003; 31: 686-692; Ma et al. The C-KIT Mutation Causing Human Mastocytosis is Resistant to STI571 and Other KIT Kinase Inhibitors; Kinases with Enzymatic Site Mutations Show Different Inhibitor Sensitivity Profiles than Wild-type Kinases and Those with Regulatory-type Mutations. Blood. 2002; 99: 1741-1744. Other investigational inhibitors of KIT mutated kinases in the art include Dasatinib (Bristol-Myers Squibb (BMS), New York, N.Y.), Midostaurin (also known as PKC412; Novartis, Basel, Switzerland), and Masatinib (also known as AB1010; AB Science, France).

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventor's summary information for this patent application: "The present invention relates to the inhibition of domain mutated KIT and correlates with the treatment of such diseases driven by mutated KIT. The present invention includes a method of inhibiting or reducing mutated C-KIT tyrosine kinase activity or expression in a subject suffering from a proliferative disease driven by mutant C-KIT which comprises administering to the subject having a proliferative disease, a therapeutically effective amount of the compound of Formula I:

"##STR00002##

"or a pharmaceutically acceptable salt or solvate thereof. In one aspect, the therapeutically effective amounts of the present invention are from about 15 to 500 mg per day. In another aspect, the compound is administered at least one of continuously, intermittently, systemically, or locally. In another aspect, the mutated C-KIT is defined further as a mutated C-KIT that is constitutively active. In another aspect, the compound is administered orally, intravenously, or intraperitoneally. In another aspect, the Crenolanib is Crenolanib Besylate, Crenolanib Phosphate, Crenolanib Lactate, Crenolanib Hydrochloride, Crenolanib Citrate, Crenolanib Acetate, Crenolanib Toluenesulphonate and Crenolanib Succinate. In another aspect, the C-KIT mutation is at least one of D816F, D816H, D816N, D816Y, D816V, K642E, Y823D,
Del 550-558, Del 557-561, N822K, V654A, N822H, Del 550-558+V654A, Del557-561 +V654A, Ins503AY, V560G, 55bNP, Del557-558, Del W559-560, F522C, Del579, R634W, K642E, T801I, C809G, D820Y, N822K, N822H, Y823D, Y823C and T670I. In another aspect, the therapeutically effective amount of the compound is administered up to three times or more for as long as the subject is in need of treatment for the C-KIT mutant activated proliferative disease. In another aspect, the composition is provided at least one of sequentially or concomitantly, with another pharmaceutical agent in a newly diagnosed proliferative disease subject, or a relapsed/refractory proliferative disease subject. In another aspect, the compound is provided as a single agent or in combination with another pharmaceutical agent in a newly diagnosed proliferative disease subject, or a relapsed/refractory proliferative disease subject. In another aspect, the compound is provided as a single agent or in combination with another pharmaceutical agent in a newly diagnosed proliferative disease pediatric subject, or a relapsed/refractory proliferative disease pediatric subject. In another aspect, the subject is relapsed/refractory to Interferon alpha, 2-chloroxyadenosine, or Imatinib Mesylate.

"In another embodiment, the present invention includes a method for treating a subject suffering from a C-KIT mutant driven proliferative disease comprising: administering to the subject in need of such treatment a therapeutically effective amount of the present invention or a salt thereof, wherein the cell proliferative disorder is characterized by C-KIT mutant receptor tyrosine kinase activity, the proliferative disease is selected from at least one of mastocytosis, acute myeloid leukemia, gastrointestinal stromal tumors, sinonasal NK/T-cell lymphoma, seminomas, dysgerminomas, melanomas, and thymic carcinomas. In another aspect, the Crenolanib is Crenolanib Besylate, Crenolanib Phosphate, Crenolanib Lactate, Crenolanib Hydrochloride, Crenolanib Citrate, Crenolanib Acetate, Crenolanib Toluenesulphonate and Crenolanib Succinate. In another aspect, the C-KIT mutation is one of D816F, D816H, D816N, D816Y, D816V, K642E, Y823D, Del 550-558, Del 557-561, N822K, V654A, N822H, Del 550-558+V654A, Del557-561+V654A, Ins503AY, V560G, 55bNP, Del557-558, Del W559-560, F522C, Del579, R634W, K642E, T801I, C809G, D820Y, N822K, N822H, Y823D, Y823C and T670I. In another aspect, Crenolanib is provided at least one of sequentially or concomitantly, with another pharmaceutical agent in a newly diagnosed proliferative disease, or a relapsed/refractory proliferative disease. In another aspect, Crenolanib is provided as a single agent or in combination with another pharmaceutical agent for treatment of a pediatric subject with the proliferative disease. In another aspect, Crenolanib is provided as a single agent either concomitantly or sequential with a chemotherapeutic or targeted therapy, in newly diagnosed proliferative disease. In another aspect, Crenolanib is provided as a single agent in treatment of a subject with the proliferative disease that is either refractory to, or has relapsed after, chemotherapeutic or targeted therapy. In another aspect, the subject is refractory to at least one of interferon alpha, 2-chloroxyadenosine or Imatinib Mesylate.

"The present invention provides methods of reducing or inhibiting the kinase activity of mutant C-KIT in a cell or a subject, and the use of such methods treating cell proliferative disorder (s) driven by mutant C-KIT. Other features and advantages of the invention will be apparent from the following detailed description of the invention and from the claims.

BRIEF DESCRIPTION OF THE DRAWINGS

"For a more complete understanding of the features and advantages of the present invention, reference is now made to the detailed description of the invention along with the accompanying figures and in which:

"FIG. 1 shows the replicates of standard dose-response curves for Kd determination of the besylate salt of the present invention for FLT3 D816H (left and right panels are separate
replicates). The amount of kinase measured by qPCR (signal; y-axis) is plotted against the corresponding crenolanib concentration in nanomolar in log 10 scale (x-axis);

"FIG. 2 shows the replicates of standard dose-response curves for Kd determination of the besylate salt of the present invention for FLT3 D816V (left and right panels are separate replicates). The amount of kinase measured by qPCR (signal; y-axis) is plotted against the corresponding crenolanib concentration in nanomolar in log 10 scale (x-axis);

"FIG. 3 shows the binding constants of the besylate salt of the present invention compared to other KIT tyrosine kinase inhibitors for the constitutively active KIT D816H mutation;

"FIG. 4 shows the binding constants of the besylate salt of the present invention compared to other KIT tyrosine kinase inhibitors for the constitutively active FLT3 D816H mutation; and

"FIG. 5 shows the dose-response curve (n=2) for IC50 determination of the besylate salt of the present invention for FLT3 D835Y. The activity of the besylate salt of crenolanib is plotted against the corresponding molar concentration in log 10 scale."

X-Chem, Inc.

Patent Application Titled "Methods of Creating and Screening DNA-Encoded Libraries" Published Online (USPTO 20160369267)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventor WAGNER, Richard W. (Cambridge, MA), filed on May 5, 2016, was made available online on December 29, 2016.

The assignee for this patent application is X-Chem, Inc.

Reporters obtained the following quote from the background information supplied by the inventors: "The burgeoning cost of drug discovery has led to the ongoing search for new methods of screening greater chemical space as inexpensively as possible to find molecules with greater potency and little to no toxicity. Combinatorial chemistry approaches in the 1980s were originally heralded as being methods to transcend the drug discovery paradigm, but largely failed due to insufficient library sizes and inadequate methods of deconvolution. Recently, the use of DNA-displayed combinatorial libraries of small molecules has created a new paradigm shift for the screening of therapeutic lead compounds.

"Morgan et al. (U.S. Patent Application Publication No. 2007/0224607, hereby
incorporated by reference) identifies the major challenges in the use of DNA-displayed combinatorial approaches in drug discovery: (1) the synthesis of libraries of sufficient complexity and (2) the identification of molecules that are active in the screens used. In addition, Morgan et al. states that the greater the degree of complexity of a library, i.e., the number of distinct structures present in the library, the greater the probability that the library contains molecules with the activity of interest. Thus, the chemistry employed in library synthesis must be capable of producing vast numbers of compounds within a reasonable time frame. This approach has been generally successful at identifying molecules with diverse chemotypes and high affinity. However, a number of issues have surfaced with respect to generating libraries of enormous complexity and evaluating the sequencing output on the scale that has been described. For example, purification of a library following multiple chemical transformations (e.g., usually 3 or 4 steps) and biological transformations (e.g., enzymatic ligation of DNA tags) is cumbersome and results in a significant amount of 'noise' in the library due either to incomplete synthesis of molecules or to mis-tagging during the ligation step. Furthermore, the amount of sequencing that is required to interrogate selected populations is striking, usually requiring 'next generation' sequencing methods. The latter is due to the fact that sophisticated genetic tagging schemes embedded in the DNA portion of the library, together with bioinformatics algorithms for analyzing the 'next generation' sequencing output, are required to sift through the noise and identify hits in the library. As a result, even with these methodologies, the sequencing is still not advanced enough to fully capture the diversity of sequences (representing both real hits and 'noise') from a given screen.

"DNA display of combinatorial small molecule libraries relies on multistep, split-and-pool synthesis of the library, coupled to enzymatic addition of DNA tags that encode both the synthetic step and building block used. Several (e.g., 3 or 4) synthetic steps are typically carried out and encoded, and these include diversity positions (described herein as A, B, and C (FIG. 1)), such as those formed by coupling building blocks with, e.g., amine or carboxylate functional groups onto a chemical scaffold that displays the attached building blocks in defined orientations. One example of a scaffold (S) that is often used in combinatorial libraries is a triazine moiety, which can be orthogonally derivatized in three positions about its ring structure.

"The process of library formation can be time consuming, products are often inefficiently purified, and the result is that unknown reactions may occur that create unwanted and/or unknown molecules attached to the DNA. Furthermore, incomplete purification of the library can result in tags cross-contaminating during the ligation steps, resulting in mis-tagging. The end result for screening and sequencing hits from the library is that massively parallel sequencing has to be employed due the inherent 'noise' of both DNAs that are attached to molecules that are unintended (e.g., unreacted or side products) or that are mis-tagged. Thus, the efficiency of sequencing is lost.

"In some instances, an initiator oligonucleotide, from which the small molecule library is built, contains a primer-binding region for polymerase amplification (e.g., PCR) in the form of a covalently-closed, double-stranded oligonucleotide. This construct is very problematic for performing polymerase reactions, owing to the difficulty of melting the duplex and allowing a primer oligonucleotide to bind and initiate polymerization, which results in an inefficient reaction, reducing yield by 10- to 1000-fold or more.

"There exists a need for a more step-wise approach to screening and identifying small molecules that have greater potency and little to no toxicity."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventor's summary information for this patent application: "The present invention features a method for creating and screening simplified DNA-encoded libraries, owing to fewer synthetic steps (e.g., no enzymatic ligation or no covalently closed"
initiator double-stranded oligonucleotides) and, therefore, substantially less 'noise' during the analysis of the encoded oligomers (herein termed 'identifier regions'). Thus, sequencing becomes much more efficient, or alternatively, microarray analysis becomes possible, taking into account the inherent biases that can confound interpretation of the data that can be introduced by amplification of the encoding region. We also have identified methods for creating a greater diversity of chemical reactions rather than those simply limited to aqueous conditions to render the DNA-encoded library more hydrophobic and soluble in organic solvents for subsequent steps of library synthesis. In this manner, chemical reactions can be carried out with potentially higher yield, a greater diversity of building blocks, and improved fidelity of the chemical reactions.

"Accordingly, the present invention features a method of tagging DNA-encoded chemical libraries by binding a first functional group of a bifunctional linker to an initiator oligonucleotide at the 5' end of the initiator oligonucleotide, wherein the initiator oligonucleotide forms a hairpin structure, and binding a second functional group of the bifunctional linker to a component of the chemical library. The initiator oligonucleotide may include a first identifier region and a second identifier region, such that the second identifier region hybridizes to the first identifier region of the initiator oligonucleotide. The second identifier region may include a fluorescent tag (e.g., a fluorophore or GFP) or biotin label. In addition, the second identifier region is not amplified prior to analysis following a selection step.

"In another embodiment, the invention features a method of creating DNA-encoded libraries by (a) creating a first diversity node, (b) encoding the first diversity node in separate vessels, © pooling the first diversity node, and (d) splitting the pooled first diversity node into a second set of separate vessels, wherein the first diversity node reacts to form a second diversity node. In certain embodiments, the second diversity node is not encoded and pooled.

"In another embodiment, the present invention features a method for creating libraries using semi- or non-aqueous (e.g., organic) chemical reactions with higher yield, a greater diversity of building blocks, and a greater number of chemical reactions that can be used to create more DNA-tagged combinatorial libraries than previously achieved.

"In general, the methods of the present invention provide a set of libraries containing, e.g., one or two diversity positions on a chemical scaffold that can be efficiently generated at high yield, screened to identify preferred individual building blocks or combinations of building blocks that reside at the, e.g., one or two diversity positions, and iteratively diversified at, e.g., a second, third, and/or fourth diversity position to create molecules with improved properties. In addition, the methods described herein allow for an expansive and extensive analysis of the selected compounds having a desired biological property, which, in turn, allows for related compounds with familial structural relationships to be identified (e.g., structure-activity relationships).

"By 'scaffold' is meant a chemical moiety which displays diversity node(s) in a particular special geometry. Diversity node(s) are typically attached to the scaffold during library synthesis, but in some cases one diversity node can be attached to the scaffold prior to library synthesis (e.g., addition of identifier regions). In some embodiments, the scaffold is derivatized such that it can be orthogonally deprotected during library synthesis and subsequently reacted with different diversity nodes (e.g., using identifier tagging at each step).

"By 'identifier region' is meant the DNA tag portion of the library that encodes the building block addition to the library.

"By 'initiator oligonucleotide' is meant the starting oligonucleotide for library synthesis which also contains a covalently attached linker and functional moiety for addition of
a diversity node or scaffold. The oligonucleotide can be single- or double-stranded. The oligonucleotide can consist of natural or modified bases.

"By 'functional moiety' is meant a chemical moiety comprising one or more building blocks that can be selected from any small molecule or designed and built based on desired characteristics of, for example, solubility, availability of hydrogen bond donors and acceptors, rotational degrees of freedom of the bonds, positive charge, negative charge, and the like. The functional moiety must be compatible with chemical modification such that it reacts with the headpiece. In certain embodiments, the functional moiety can be reacted further as a bifunctional or trifunctional (or greater) entity. Functional moieties can also include building blocks that are used at any of the diversity nodes or positions. Examples of building blocks and encoding DNA tags are found in Tables 1 and 2. See, e.g., U.S. Patent Application Publication No. 2007/0224607, hereby incorporated by reference.

"By 'building block' is meant a chemical structural unit which is linked to other chemical structural units or can be linked to other such units. When the functional moiety is polymeric or oligomeric, the building blocks are the monomeric units of the polymer or oligomer. Building blocks can also include a scaffold structure (e.g., a scaffold building block) to which is, or can be, attached one or more additional structures (e.g., peripheral building blocks). The building blocks can be any chemical compounds which are complementary (i.e., the building blocks must be able to react together to form a structure comprising two or more building blocks). Typically, all of the building blocks used will have at least two reactive groups, although some of the building blocks used will have only one reactive group each. Reactive groups on two different building blocks should be complementary, i.e., capable of reacting together to form a covalent bond.

"By 'linker' is meant a molecule that links the nucleic acid portion of the library to the functional displayed species. Such linkers are known in the art, and those that can be used during library synthesis include, but are not limited to, 5'-O-Dimethoxytrityl-1',2'-Dideoxyribose-3'-(2-cyanoethyl)-(N,N-diisopropyl)-phosphoramidite; 9-O-Dimethoxytrityl-triethylene glycol, 1-[(2-cyanoethyl)-(N,N-diisopropyl)]-phosphoramidite; 3-(4,4'-Dimethoxytrityloxy)propyl-1-[(2-cyanoethyl)-(N,N-diisopropyl)]-phosphoramidite; and 18-O-Dimethoxytritylhexaethyleneglycol, 1-[(2-cyanoethyl)-(N,N-diisopropyl)]-phosphoramidite. Such linkers can be added in tandem to one another in different combinations to generate linkers of different desired lengths. By 'branched linker' is meant a molecule that links the nucleic acid position of the library to 2 or more identical, functional species of the library. Branched linkers are well known in the art and examples can consist of symmetric or asymmetric doublers (1) and (2) or a symmetric trebler (3). See, for example, Newcome et al., Dendritic Molecules: Concepts, Synthesis, Perspectives, VCH Publishers (1996); Boussif et al., Proc. Natl. Acad. Sci. USA 92: 7297-7301 (1995); and Jansen et al., Science 266: 1226 (1994).

"As used herein, the term 'oligonucleotide' refers to a polymer of nucleotides. The oligonucleotide may include DNA or any derivative thereof known in the art that can be synthesized and used for base-pair recognition. The oligonucleotide does not have to have contiguous bases, but can be interspersed with linker moieties. The oligonucleotide polymer may include natural nucleosides (e.g., adenosine, thymidine, guanosine, cytidine, uridine, deoxyadenosine, deoxythymidine, deoxyguanosine, and deoxycytidine), nucleoside analogs (e.g., 2-aminoadenosine, 2-thiathymidine, inosine, pyrrolo-pyrimidine, 3-methyl adenosine, C5-propynylcytidine, C5-propynyluridine, C5-bromouridine, C5-fluorouridine, C5-iodouridine, C5-methylcytidine, 7-deazaadenosine, 7-deazaguanosine, 8-oxoadenosine, 8-oxoguanosine, O(6)-methylguanine, and 2-thiocytidine), chemically modified bases, biologically modified bases (e.g., methylated bases), intercalated bases, modified sugars (e.g., 2'-fluororibose, ribose, 2'-deoxyribose, arabinose, and hexose), and/or modified phosphate groups (e.g., phosphorothioates
and 5'-N-phosphoramidite linkages).

"By 'operatively linked' is meant that two chemical structures are linked together in such a way as to remain linked through the various manipulations they are expected to undergo. Typically, the functional moiety and the encoding oligonucleotide are linked covalently via an appropriate linking group. For example, the linking group may be a bifunctional moiety with a site of attachment for the encoding oligonucleotide and a site of attachment for the functional moiety.

"By 'small molecule' is meant a molecule that has a molecular weight below about 1000 Daltons. Small molecules may be organic or inorganic, and may be isolated from, e.g., compound libraries or natural sources, or may be obtained by derivatization of known compounds.

"Other features and advantages of the invention will be apparent from the following detailed description, the drawings, the examples, and the claims.

BRIEF DESCRIPTION OF THE DRAWINGS

"FIG. 1 is a schematic illustrating the diversity positions A, B, and C.

"FIG. 2 is a schematic of a DNA-encoded chemical library member of Mode 1, showing, in part, the initiator oligonucleotide, which includes a hairpin structure complementary at the identifier region, which has been reacted with A and B diversity nodes. The identifier region for B is being added. In this figure, the 'C' diversity node is the potential position for an additional diversity position to be added following the addition of B identifier region.

"FIG. 3 is a schematic of a DNA-encoded chemical library member of Mode 1, showing, in part, the initiator oligonucleotide, which includes a sequence in the loop region of the hairpin structure that can serve as a primer binding region for amplification.

"FIG. 4 is a schematic of a DNA-encoded chemical library member of Mode 1, showing, in part, the initiator oligonucleotide, which includes a non-complementary sequence on the 3' end of the molecule that can serve to bind a second identifier region for either polymerization or for enzymatic ligation.

"FIG. 5 is a schematic of a DNA-encoded chemical library member of Mode 1, showing, in part, the initiator oligonucleotide, wherein the loop region of the initiator oligonucleotide and at least the identifier region on the 3' side of the loop region can serve to hybridize to a complementary oligonucleotide that also contains a second identifier region.

"FIG. 6 is a schematic of PCR amplification of the hairpin model, as presented in FIG. 5.

"FIG. 7 is a schematic of a DNA-encoded chemical library member of Mode 2, showing a hairpin oligonucleotide that is covalently closed (e.g., via a hairpin or chemically) on the distal end to the linker.

"FIG. 8 is a schematic of a DNA-encoded chemical library member of Mode 2, showing the inclusion of additional diversity nodes.

"FIG. 9 is a schematic of a DNA-encoded chemical library member of Mode 2, showing the steps for screening of libraries and methods for deconvoluting the identifier regions.

"FIG. 10 is a schematic showing oligonucleotides used in library synthesis. Headpiece (HP) was synthesized by IDT DNA and HPLC purified. Arrows indicate the site for BbvCI restriction (underlined) or Nb.BbvCI or Nt.BbvCI nicking digest. Sequences of the DNA tags A1, B1, and C1 (top and bottom strands), the 5' and 3' PCR primers, and the 3' end of the HP are also shown.
"FIG. 11 is an electrophoretic gel (TBE-urea (15%) gel electrophoresis; UV shadowing on a TLC plate) of the headpiece at different steps of its synthesis. Headpiece HP (IDT DNA) was acylated by Fmoc-amino-PEG2000-NHS (JenKem Technology USA). Lane 1 is the HP (IDT DNA) oligonucleotide (42 nts). Lane 2 is HP acylated with Fmoc-amino-PEG2000-NHS. Following Tris-HCl addition, some deprotection of Fmoc is observed. Lane 3 is the crude reaction with piperidine, showing complete deprotection of Fmoc. Lane 4 is the same as Lane 3 after desalting on a NAP-5 column and lyophilization. (XC: xylene cyanol (migrates as 60 nt DNA); BPB: bromophenol blue (migrates as 15 nt DNA))

"FIG. 12 is a schematic showing the steps in model library synthesis. DTAF was conjugated to amino-PEG modified headpiece (HP-1) in the first step. Following this step, a portion of HP-1-DTAF was further acylated with pentylamino-biotin.

"FIG. 13A is a scheme of the ligation of the DNA tags. FIG. 13B illustrates a 4% agarose gel of HP-1-DTAF-biotin library at different steps of the DNA tag ligation. M: marker; Lane 1: HP-1-DTAF-biotin; Lane 2: 1+ Tag A only; Lane 3: 1 + Tags A, B, and C, as well as 3'-end oligo ligated. Arrow indicates bright green fluorescence (DTAF). No substantial separation is observed on the gel. FIG. 13C illustrates PCR amplification (24 cycles) of the ligation reactions. M: marker (lowest band is 100); Lane 1: PCR amplification of the green fluorescent band from Lane 1 of FIG. 14B (HP-1-DTAF-biotin+Tag A); Lane 2: PCR amplification of the green fluorescent band from Lane 2 of FIG. 14B (HP-1-DTAF-biotin+all 3 tags and 3'-end oligo); Lane 3: PCR amplification of the crude ligation reaction HP-1-DTAF-biotin+all 3 tags; Lane 4: no template control.

"FIGS. 14A-D are a set of electrophoretic gels showing the purification of the XChem model compound and model selection (via a binding interaction between the biotin moiety of the XChem model compound and streptavidin). The gels are 4-12% SDS NuPage gels with MES running buffer. Gels were scanned for green fluorescence using a 450-nm laser. FIG. 14A is a gel showing synthesis and purification steps. Samples were mixed with loading buffer and boiled. M: marker; Lane 1: HP-1 + DTAF; Lanes 2 and 2a: HP-1-DTAF+biotin (two independent reactions); Lanes 3-6 (steps of purification/model selection using streptavidin Dynal beads): Lane 3: flow-through; Lane 4: last wash (washed with water at 80.degree. C. for 10 minutes); Lanes 5 and 5': elution with 25 mM EDTA at 90.degree. C. (1.sup.st and 2.sup.nd); Lanes 6 and 6': elution with 25 mM EDTA and 5 mM NaOH at 90.degree. C. (1.sup.st and 2.sup.nd). FIG. 14B is a gel showing binding of HP-1-DTAF-biotin (library of 1) to streptavidin. Samples were mixed with gel loading buffer and directly loaded onto the gel without boiling. Samples, as in the gel of FIG. 14A, were incubated with an excess of streptavidin in 50 mM NaCl/10 mM Tris HCl, pH 7.0, for 10 minutes. 'S' indicates the addition of streptavidin. Samples 5 and 6 were pooled together. Lane 1: HP-1-DTAF; Lane 15: HP-1-DTAF+streptavidin; Lane 2: HP-1-DTAF-biotin (desalted); Lane 2S: HP-1-DTAF-biotin+streptavidin; Lane 4: last wash (washed with water at 80.degree. C. for 10 minutes); Lane 4S: last wash sample+streptavidin; Lane 5+6: pooled samples 5, 5', 6 and 6' (elution fractions from streptavidin beads, purified and selected HP-1-DTAF-biotin; Lane 5+6S': purified and selected HP-1-DTAF-biotin+streptavidin. Note that there is no noticeable difference in migration between different steps of 'library of 1' synthesis. FIG. 14C is a 4% agarose gel of headpiece (Trilink) HP-T, reacted with DTAF. Lane 1: Marker; Lane 2: DTAF; Lane 3 HP-T-DTAF. Left panel: UV visualization of the gel (ethidium bromide staining); Right panel: same gel scanned for fluorescence at excitation wavelength 450 nm (green, fluorescein). FIG. 14D is a 4-12% SDS NuPage gel with MES running buffer, showing binding of HP-T-DTAF-biotin to streptavidin. Samples were mixed with gel loading buffer and directly loaded onto the gel without boiling. Samples, as in the gel of FIG. 14A, were incubated with an excess of streptavidin in 50 mM NaCl/10 mM Tris HCl, pH 7.0, for 10 minutes. Lane 1: DTAF; Lane 2:
HP-T-DTAF; Lane 3: HP-T-DTAF+streptavidin; Lane 4: HP-T-DTAF-biotin (desalted); Lane
5: HP-T-DTAF-biotin+streptavidin; Lane 6: pooled samples 5, 5', 6 and 6' (elution fractions
from streptavidin beads, purified and selected HP-1-DTAF-biotin; Lane 7: purified and selected
HP-1-DTAF-biotin+streptavidin.

"FIG. 15A is a scheme of the synthesis of the construct for the T7 RNAP
intracellular delivery experiment. The VH dsDNA clone was PCR amplified to append a BsmI
site at the 5' end upstream of the T7 promoter. Following restriction digestion and purification,
the construct was ligated to HP-1-DTAF-R7 (headpiece modified with DTAF and (-
Arg.-epsilon.Ahx)6-Arg peptide). FIG. 15B is an electrophoretic gel of the ligation reaction.
Lanes 1 and 2 show different HP-1 samples ligated to VH; Lane 3 shows unligated VH PCR
product; and M is the marker. FIG. 15C is an electrophoretic gel showing validation for T7
promoter activity. The gel shows a T7 Megascript (Ambion, Inc.) reaction using samples from
Lanes 1-3 of FIG. 15B.

"FIGS. 16A-C are agarose gel electrophoretoses of the steps in library 10.times.10
synthesis FIG. 16A is a 4% agarose gel of headpiece (Trilink) HP-T ligated with tag A. Lane 1:
Marker; Lane 2: HP-T; Lane 3: Tag A annealed; Lane 4: HP-T ligated with tag A; Lane 5: HP-T
ligated with tag A and desalted on Zeba column. FIG. 16B is a 2% agarose gel of HP-T-A
ligation with 12 different tags B. Lane M: Marker, Lanes 1 and 9: HP-T-A; Lanes 3, 4, 5, 6, 7, 8,
11, 12, 13, 14, 15 and 16: HP-T-A ligation with tags B1-B12. FIG. 16C is a 4% agarose gel of
the pooled library (library B), with tags A and B1-B12 ligated, after reaction with cyanouric
chloride and amines B1-B12. Lane 1: Marker; Lane 2: HP-T-A; Lane 3: Library-B pooled and
desalted on Zeba columns."

Patent Application Titled "Modulation of Cellular Localization of Cyclin C" Published Online (USPTO 20160367630)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- According to news reporting originating from Washington, D.C., by
NewsRx journalists, a patent application by the inventors Strich, Randy (Medford Lakes, NJ);
Cooper, Katrina (Medford Lakes, NJ), filed on January 16, 2015, was made available online on
December 29, 2016.

The assignee for this patent application is Rowan University.

Reporters obtained the following quote from the background information supplied by
the inventors: "Current therapeutic interventions for treating cancerous conditions focus on
inhibiting cancer cell propagation by killing, extracting or retarding their growth. The role of
mitochondria in promoting cell death has drawn much attention as a potential target for the next
Mitochondria are a key regulatory node for the stress-activated intrinsic programmed cell death (PCD). Mitochondria are dynamic organelles undergoing constant fusion and fission during normal cell division. The equilibrium between fission and fusion is controlled by the activity of conserved molecular machines driven by dynamin-like GTPases (Westermann, 2010). In response to cytotoxic damage, the mitochondria may undergo extensive fission accompanied by mitochondrial outer membrane permeability (MOMP) which releases sequestered pro-apoptotic proteins into the cytoplasm. In budding yeast, mitochondrial fission requires the GTPase Dnm1p that forms atypical helical filaments that first encircle, then constrict, mitochondria until scission is achieved (Mears et al., 2011). Recruitment of Dnm1p to the mitochondria requires the outer membrane protein Fis1p (Mozdy et al., 2000; Tieu et al., 2002) and one of two adaptor proteins, Mdv1p (Mozdy et al., 2000; Tieu and Nunnari, 2000) or Caf4p (Griffin et al., 2005). On the other side of the equation, the fusion of the inner and outer mitochondrial membranes requires the Mgm1p and Fzo1p GTPases, respectively (Meeusen et al., 2006; Rapaport et al., 1998). Several studies have demonstrated that the proper balance of fission and fusion is required for normal mitochondrial function (Ishihara et al., 2009; Wakabayashi et al., 2009).

"The balance between fission and fusion is shifted dramatically toward fission in cells exposed to exogenous stress (Westermann, 2010). Mitochondrial hyper-fission is a conserved hallmark of the stress response (Igaki et al., 2000; Karbowski et al., 2002; Vieira et al., 2002) and is associated with the release of sequestered programmed cell death (PCD) inducing factors from this organelle (Breckenridge et al., 2003; Frank et al., 2001).

"At least one underlying mechanism allowing tumor progression and resistance to anti-cancer therapies is the ability of cancerous cells to inhibit the intrinsic PCD pathway. For example, overexpression of the B Cell lymphocyte 2 (Bcl-2) pro-survival BH3 protein prevents MOMP. Such overexpression is observed in a high percentage of chronic lymphocytic leukemia (CLL) patients. However, efforts to design therapies that inactivate pro-survival proteins or stimulate pro-death components have been hampered due to a fundamental lack of understanding about how other pathways impinge on mitochondrial function and PCD induction. As such there is a need in the art to further identify the correlation among various components that activate or deactivate the cell death system in patients suffering from cancer and thereby improve or supplement available methods of treatment in the fight against cancer. Such knowledge can further lead to discovery of new therapeutic compositions and methods of applying or administering the same to treat hyperplasia or cancerous conditions in subjects in need of such treatment."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "In one aspect, the present invention provides a method of inhibiting tumor growth or sensitizing a tumor cell to a therapeutic agent comprising contacting a tumor cell with a compound capable of inducing the nuclear to cytoplasmic translocation of cyclin C.

"In another aspect, the present invention provides a compound capable of inducing the nuclear to cytoplasmic translocation of cyclin C.

"In another aspect, the present invention provides a compound comprising the holoenzyme association domain (HAD) of cyclin C or a fragment or mimetic thereof.

"In another aspect, the present invention provides a method of identifying a combination of a tumor cell type and an anti-tumor agent whose action is susceptible to enhancement by cyclin C translocation.

BRIEF DESCRIPTION OF THE DRAWINGS
"FIGS. 1 A-D provides stress-induced mitochondrial localization of cyclin C. (A) Fluorescence microscopy was conducted on mid-log phase cells expressing cyclin C-YFP and the DsRed mitochondrial targeting plasmid (mt-DsRed) before (0 h) and following (2 h) 1 mM H₂O₂ treatment. Arrows indicate sites of cyclin C-YFP and mitochondrial co-localization. (B) As in (A) except that living cells were visualized omitting DAPI staining. (C) Western blot analysis of cyclin C-TAP in whole cell extracts (WCE) or mitochondrial enriched fractions prepared from cultures with the indicated genotypes before and after H₂O₂ exposure (0.8 mM). The blot was stripped and reprobed for the presence of Npl3p (nuclear) and Pori p (mitochondria) markers. (D) Western blot analysis of cyclin C-TAP in the 1 hr VVT mitochondrial fraction described in (C) with (+) and without (-) Proteinase K treatment. Molecular weight markers (kDa) are indicated on the left of the panel. This blot was stripped and probed for components of the outer (Porlp) and inner (Mam33p) mitochondrial membranes. (E) WT cells expressing cyclin C-YFP, Dnm1-cherry and mt-CFP expression plasmids were grown to mid-log phase then treated with 1 mM H₂O₂ as indicated. Co-localization (arrows) of the mitochondria, Cyclin C-YFP and Dnm1p-cherry was visualized by fluorescence microscopy. In all figures, the bars=5 μM unless otherwise stated. The enlarged regions are indicated by the blue boxes in all panels.

"FIGS. 2 A-G provides that Cdk8p and cyclin C are required for stress-induced mitochondrial fission. (A) Representative images of reticular or fragmented mitochondria are shown. (B) Representative images of wild type and cnc1A Nomarski (Nom.) or mt-DsRed are shown following exposure to H₂O₂. (C) The percent of cells (mean.+-.s.e.m.) within the population displaying mitochondrial fission is given before and following H₂O₂ (1 mM) or ethanol (10% vol/vol) treatment for 2 h or 30 min, respectively. * p<0.05. (D) Confocal microscopic images of WT and cnc1A strains expressing mt-DsRed following exposure to ethanol (10% vol/vol) for 30 min. (E) Combined Nomarski and fluorescence images were obtained from WT and cnc1A cultures expressing mt-DsRed before and following exposure to H₂O₂ for 2 h. The percent of the population exhibiting fragmented mitochondria was calculated from three independent cultures (average.+-.s.e.m indicated). (F) A cdk8A strain (RSY1726) transformed with cyclin C-YFP and RFP-Noplp expressing plasmids was visualized by fluorescence microscopy before and 2 h following H₂O₂ exposure (1 mM). DAPI staining indicates nuclear location. The arrows indicate the cyclin C-YFP foci observed in the stressed cdk8A cells. The frequency of cells containing a single focus associated with the nucleus is given on the right (mean.+-.s.e.m. n=3). The remainder of the culture exhibited either a diffuse nuclear signal or contained Z2 nuclear associated foci. (G) The percentage of cells displaying fission (mean.+-.s.e.m.) in a cnc1A strain transformed with either the vector, wild type CNC1 or CNC1 Array 2 h following H₂O₂ treatment (1 mM). *=p<0.01 compared to the CNC1 expressing plasmid

"FIGS. 3 A-E show that Cytoplasmic cyclin C is sufficient to induce fission. (A) Extracts prepared from a wild-type strain expressing endogenously tagged MED13-myc allele, GFP-cyclin C or the HADA derivative as indicated were immunoprecipitated with GFP antibodies and the resulting immunoprecipititates probed for the presence of Med13-13myc. This blot was stripped and reprobed for GFP to ensure similar expression levels between the two GFP-cyclin C proteins. Extracts immunoprecipitated with myc or whole cell extracts (WCE) directly probed for myc controlled for the presence of Med13-13myc in the extracts. [] indicates no antibody control lanes. (B) Fluorescence microscopy monitoring the location of cyclin C.sup.HAD.degree., the nucleus (DAPI) and mitochondria (mt-DsRed). Arrows indicate sites of mitochondria-cyclin C.sup.HADA interaction. Bar=5 μM. (C) A cnc1A mutant expressing either wild type or cyclin C.sup.HAD.degree. and mt-DsRed were grown to mid-log phase then examined by fluorescence microscopy. The cells were scored based on the mitochondria

Obesity, Fitness & Wellness Week - January 14, 2017 - Page 9351
exhibiting a fusion, fission or mixed morphology (see Materials and methods for scoring metric). The mean values obtained from three independent transformants are presented (+–s.e.m.) along with the p value. (D) The experiment in (C) was repeated with a dnm1A cnc1A mutant strain. (E) A wild-type strain (RSY10) harboring either myc-cyclin C or myc-cyclin C.sup.HAD.degree. expression plasmids was subjected to an oxidative stress timecourse. Extracts prepared from these samples were probed for cyclin C and cyclin C.sup.HADA levels by Western blot analysis. Tub1p levels were used as a loading control.

"FIGS. 4 A-D provides that mitochondrial localization of cyclin C requires the fission complex. (A) Log phase fis1A cells harboring cyclin C-YFP and the mt-DsRed expression plasmids were treated with 1 mM H.sub.2O.sub.2 as indicated then examined by fluorescence microscopy. Arrows indicate cyclin C-YFP signals that do not associate with the mitochondria. Quantitation of the number of cyclin C-YFP foci associated with the mitochondria is given on the right (mean.±–s.e.m. n=3). Asterisks indicate p<0.01 from wild type value. (B) A dnm1A strain harboring cyclin C-YFP and mt-DsRed constructs was grown and analyzed as described in (A). White and blue arrows indicate cyclin C-YFP foci either not associating or associating with the mitochondria, respectively. (C) The experiment described in (B) was repeated with an mdv1A mutant. (D) Wild type, cnc1A, fis1A and cnc1A fis1A mid-log phase cultures were treated with 1 or 2 mM H.sub.2O.sub.2 for 2 h then serially diluted (1:10) and plated onto rich growth medium. Plates were incubated three days prior to image collection.

"FIGS. 5 A-C provides that Cyclin C is required for functional Dnm1p filament formation. Dnm1p-GFP subcellular localization was visualized by confocal microscopy before and following H.sub.2O.sub.2 stress (1 mM) for the times indicated in (A) WT, (B) cnc1A or (C) mdv1A cells harboring Dnm1p-GFP and mt-DsRed plasmids. Arrows indicate functional Dnm1p-GFP foci as determined by their centered location with respect to the mitochondrial axis and the constriction of the mitochondrial diameter. Arrowheads indicate non-functional aggregates as indicated by their association with the edge of the mitochondria and the lack of mitochondrial constriction.

"FIGS. 6 A-F further show that stress-induced Mdv1p mitochondrial localization requires cyclin C. (A) A wild-type strain transformed with Mdv1-GFP and mt-DsRed expressing plasmids were analyzed by confocal microscopy before and following H.sub.2O.sub.2 treatment (1 mM for 2 h). White arrows indicate sites of active fission, blue arrows identify Mdv1p foci not associated with the mitochondria. (B) Mdv1p subcellular localization patterns in WT and cnc1A strains before and following H.sub.2O.sub.2 stress (1 mM for 2 h) were determined by confocal microscopy. The categories for Mdv1-GFP localization patterns are provided on the left. Values are mean.±–s.e.m. **=p<0.01. (C) Wild-type strain expressing cyclin C-YFP, Mdv1p-DsRed and mt-CFP was subjected to H.sub.2O.sub.2 stress (1 mM for 2 h). Subcellular localization of the proteins and mitochondria was monitored by fluorescence microscopy. The percentage of cyclin C-YFP foci associating with Mdv1p-DsRed is indicated (n=3). Arrows indicate regions of co-localization between cyclin C-YFP and Mdv1p in the enlarged images. (D) and (E) A two-hybrid reporter strain (gall-HIS3, PJ69-4A) transformed with Gal4p DNA binding domain (DBD) and activator fusion protein combinations as indicated was patched onto medium selecting for reporter gene activation (-His). The previously reported Mdv1-DBD and Fis1-AD interaction (Griffin et al., 2005) was used as a positive control. Vec=vector control. (F) Extracts prepared from unstressed and stressed wild-type strain expressing endogenous cyclin C-TAP and Mdv1p-HA were incubated with aTAP or aHA antibodies then probed for the presence of cyclin C-TAP (top panel). Control immunoprecipitation of Mdv1p-HA is shown in the bottom panel. The control extracts not expressing endogenous Mdv1p-HA (-) are indicated. (G) A wild-type strain expressing mt-CFP, cyclin C.sup.HADA YFP and Mdv1p-dsRed was grown to mid-log phase then examined by fluorescence microscopy. The arrows indicate areas
of co-localization between the two proteins and the mitochondria.

"FIGS. 7 A-D provides that Cyclin C is required for stress-elevated Dnm1p-Mdv1p interaction. (A) WT and cnc1A strains expressing MET25-Mdv1p-HA and MET25-Mdv1-myc were grown under non-inducing conditions for the MET25 promoter. Extracts prepared from samples taken before and following H.sub.2O.sub.2 addition were immunoprecipitated with amyc then the immunoprecipitates probed for the presence of Mdv1p-HA. (B) Extracts prepared from stressed and unstressed wild type and cnc1A strains expressing Mdv1p-GFP and Dnm1p-myc were subjected to co-immunoprecipitation experiments as indicated (top panel). Bottom two panels control for Dnm1p-myc and Mdv1p-GFP expression levels in these extracts. [] indicate no antibody controls. (C) Co-localization of Mdv1p-GFP and Dnm1-cherry was examined in wild type and cnc1A strains before and following H.sub.2O.sub.2 treatment (1 mM) as indicated. Bar=5 μM. (D) A two-step model for cyclin C regulation of mitochondrial morphology and PCD. In unstressed cells, cyclin C (CC) and Cdk8 repress stress responsive genes. The mitochondria exhibit fused morphology in the majority of cells with Dnm1p and Mdv1p being located both in the cytoplasm and at the mitochondria. Step 1. Stress-induced translocated cyclin C associates with Mdv1p promoting Mdv1p-Dnm1p complex formation and extensive mitochondrial fragmentation. Step 2. Cyclin C dissociates from the fission complex and is destroyed by ubiquitin-mediated degradation. An additional stress signal, in combination with hyper-fission, is needed to complete the PCD pathway.

"FIGS. 8 A-C demonstrate that cyclin C is required for mitochondrial fission and PCD. (A) Mitochondrial morphology in WT and CNCC-/- MEFs before and after cisplatin treatment. % cells exhibiting hyper-fission is indicated. (B) PCD execution was determined in the cell lines indicated including a null MEF line expressing EGFP-cyclin C. (C) MOMP was monitored using the mitochondrial stain TMRM staining before (control) and following H.sub.2O.sub.2 treatment as indicated. Reduction TMRM staining indicates MOMP has occurred.

"FIGS. 9 A-B demonstrate that cyclin C suppresses hyperplasia in a mouse thyroid cancer model. (A) Mice harboring floxed alleles of PTEN and CCNC expressing a thyroid-specific cre recombinase. Representative thyroids dissected from 20 wk old mice with the indicated genotypes. Thyroid/trachea weights are shown on the left. (B) Kaplan-Meyer survival plot for mice with the indicated genotype. n=6/genotype.

"FIGS. 10 A-C show a two-step model for cyclin C-induced cell death. (A) Step 1: cyclin C disassociates from Med13 in response to stress. Step 2: cyclin C associates with Drp1 to induce mitochondrial fission which sensitizes the cell to anti-cancer drugs. (B) Deleting MED13 in yeast results in cyclin C cytoplasmic localization and mitochondrial fission without added stress. (C) Aberrant cytoplasmic localization sensitizes cells to ROS. Yeast cells with the indicated genotypes were treated with low dose H.sub.2O.sub.2 as indicated. Mid-log cultures before and after ROS stress were diluted 1:10 then spotted on growth medium lacking H.sub.2O.sub.2.

"FIGS. 11 A-B demonstrate the disruption of the holoenzyme association domain (HAD)-Med13 interaction. The amino terminal sequences of cyclin C from the indicated organisms. Homologies are shaded. Boxed region is targeted using the HIV TAT basic domain fused to the 19 aa peptide indicated by the line above the sequence. (B) Representative images of MEF cells incubated with TAT-HAD peptide or control (25 .mu.M) for three hours then fixed and stained for the nucleus (DAPI), mitochondria (MitoTracker Red) and cyclin C (.alpha.-cyclin C). Arrows indicate regions of interaction between cyclin C and mitochondria.

"FIG. 12 shows the design of a stapled-HAD (S-HAD) peptide. The primary sequence of the human cyclin C HAD domain is presented. Green boxes indicate alpha helix
structures from both prediction algorithms and crystal structure analysis. Helical wheels generated from the Helix 1 or Helix 2 sequences are indicated. The start of each plot (n) and end © are indicated. Predictive interactive interfaces of the two alpha helixes indicated by the arc were derived from both RASMOL modeling and yeast genetic data. Initial sites for introducing staples are indicated on each helix and the primary sequence below.

"FIGS. 13 A-B show a proposed Med13 binding region on cyclin C. (A) Space filling model of cyclin C illustrating the HAD and hydrophobic Helix 2', 3' and 4' comprising the second cyclin box fold domain. The position of the yeast Ser266 on the loop between helix 3' and 4' is indicated. Cdk8 binding site is on the backside of this image. (B) Ribbon model rotated 90. degree. with the same features described in (A).

"FIGS. 14 A-C demonstrate that the cyclin C regulatory system is intact in HeLa cells. (A) cyclin C localization in H2O2 stressed cultures as indicated. See (B) for enlarged images for 6 hr+H.sub.2O.sub.2 cells. (C) Knockdown efficiency of cyclin C by siRNA. con=scrambled siRNA control. Annexin V studies in the cultures described in (C). Error bars=s.e.m. Three independent cultures were assayed for each sample.

"FIGS. 15 A-B demonstrate cyclin C regulation in breast cell lines. (A) cyclin C localization was followed in MCF-7 or MCF-10A cells exposed to H.sub.2O.sub.2 (0.4 mM) for 4 h. (B) cyclin C levels were monitored by Western blot in MCF-7 cells treated with (+) or without (-) CCNC specific siRNAs. .beta.-tubulin levels were followed as a loading control. (C) Viability was measured (viable stain assays) in the cell lines described in (B) following 4 h H.sub.2O.sub.2 exposure as indicated."

Patent Application Titled "Novel Anti-Transferrin Receptor Antibody That Passes through Blood-Brain Barrier" Published Online (USPTO 20160369001)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors SONODA, Hiroyuki (Hyogo, JP); MORIMOTO, Hideto (Hyogo, JP); KOSHIMURA, Yuri (Hyogo, JP); KINOSHITA, Masafumi (Hyogo, JP); TAKAGI, Haruna (Hyogo, JP); YOSHII, Yoshiko (Hyogo, JP), filed on December 24, 2014, was made available online on December 29, 2016.

No assignee for this patent application has been made.
Reporters obtained the following quote from the background information supplied by the inventors: "Unlike the capillaries in such tissues as muscles and the like, the capillaries that supply the blood to most of the brain tissues except some areas including the circumventricular organs (pineal gland, pituitary body, area postrema, etc.) differ in that their endothelial cells are connected by tight intercellular junctions. Thus, passive transfer of substances from the blood to the brain is restricted, and although there are some exceptions, substances generally are unlikely to move into the brain from the capillaries except such compounds as are lipid-soluble or of low molecular weight (less than 200-500 Dalton) and electrically neutral around the physiological pH. This system, which restricts exchanges of substances between the blood and the tissue fluid of the brain through the endothelial cells of capillaries in the brain, is called blood-brain barrier or BBB. The blood-brain barrier restricts exchanges of substances not only between the blood and the brain but also between the blood and the tissue fluid of the central nervous system including the brain and the spine.

"Owing to the blood-brain barrier, most of the cells of central nervous system escapes the effect of fluctuating concentrations of hormones and lymphokines in the blood, and thus are able to maintain their biochemical homeostasis.

"The blood-brain barrier, however, imposes a problem when it comes to develop a medical drug. For example, although nerve growth factor (NGF), which is thought to be acting on cholineric neurons in the central nervous system and working to maintain the viability of the cells by preventing apoptotic cell death, was expected to become a therapeutic drug for dementia caused by Alzheimer's disease, it was concluded that nerve growth factor would not function as a therapeutic drug for Alzheimer's disease because it, being unable to pass through the blood-brain barrier due to its molecular weight of over 10 kD, could not reach the affected site within the brain. Further, whereas an enzyme replacement therapy is carried out by intravenous supplementation with recombinant .alpha.-L-iduronidase as a therapy of mucopolysaccharide storage disease type 1 (Hurler syndrome), an inherited disease caused by .alpha.-L-iduronidase deficiency, the therapy is not effective for abnormality in the central nervous system (CNS) which is notable in Hurler syndrome because the enzyme cannot pass through the blood-brain barrier.

"Development of various methods has been tried to enable the passage, through the blood-brain barrier, of such macromolecular compounds as proteins or the like necessary to be brought into function in the central nervous system. In the case of nerve growth factor, for example, attempts have been made for a method to cause the factor to pass through the blood-brain barrier by preparing it in a liposome-encapsulated form and letting those liposomes fuse with the cell membrane of endothelial cells in brain capillaries, but the attempts have failed to make the method materialize (Non-patent Document 1). In the case of .alpha.-L-iduronidase, an attempt was made to enhance the passive transfer of the enzyme through the blood-brain barrier by raising its blood concentration through an increased single dose of the enzyme, and it was demonstrated, using a Hurler syndrome animal model, that the abnormality in the central nervous system was ameliorated by the method (Non-patent Document 2).

"Furthermore, an attempt has also been made to administer a macromolecular compound directly in the spinal cavity or into the brain. For example, reports have been made about a method in which human .alpha.-L-iduronidase was administered into the spinal cavity of a patient with a Hurler syndrome (mucopolysaccharide storage disease type 1)(Patent Document 1), a method in which human acid sphingomyelinase was administered into the brain ventricles of a patient with Niemann-Pick disease (Patent Document 2), and a method in which iduronate 2-sulfatase (I2S) was administered into the brain ventricles of Hunter syndrome model animals (Patent Document 3). While it seems possible by one of such methods to definitely let a medical drug act in the central nervous system, they are highly invasive.
"There have been reported various methods to let a macromolecular compound get to the brain through the blood brain barrier, in which the macromolecular compound is modified to give it an affinity to a membrane protein occurring on the endothelial cells of brain capillaries, thereby inducing formation of its complex with the membrane protein, so that it then passes through the blood-brain barrier by endocytosis. Examples of those membrane proteins occurring on the endothelial cells of the brain capillaries include insulin, transferrin, insulin-like growth factor (IGF-I, IGF-II) as well as receptors for LDL and leptin.

"For example, a technique has been reported in which nerve growth factor (NFG) is synthesized into the form of a fusion protein with insulin, and with the help of its binding to the insulin receptor, this fusion protein is allowed to pass through the blood-brain barrier (Patent Documents 4-6). Further, a technique has been reported in which nerve growth factor (NGF) is synthesized in the form of a fusion protein with anti-insulin receptor antibody, and with the help of its binding to the insulin receptor, this fusion protein is allowed to pass through the blood brain barrier (Patent Documents 4 and 7). Further, a technique has been reported in which nerve growth factor (NGF) is synthesized in the form of a fusion protein with transferrin, and with the help of its binding to transferrin receptor (TfR), this fusion protein is allowed to pass through the blood brain barrier (Patent Document 8). Further, a technique has been reported in which nerve growth factor (NGF) is synthesized in the form of a fusion protein with anti-transferrin receptor antibody (anti-TfR antibody), and with the help of its binding to transferrin receptor, this fusion protein is allowed to pass through the blood brain barrier (Patent Documents 4 and 9).

"Looking further into the techniques that utilize anti-transferrin receptor antibody, there has been reported in the field of a technique to make a drug pass through the blood-brain barrier by binding it to an anti-TfR antibody, that a single-chain antibody can be used consisting of the heavy chain of an anti-TfR antibody on whose C-terminal side is bound, through a linker, its light chain (Non-patent Document 3). Further, an anti-hTfR antibody exhibiting a dissociation constant of 30 nM to 1 μM with hTfR can be used profitably in a technique to make a drug pass through the blood-brain barrier (Patent Document 10). Furthermore, it has been reported that a lysosomal enzyme such as I2S can be allowed to pass through the blood-brain barrier by preparing it into a fusion protein in which it is bound to an anti-TfR antibody (Patent Document 11). There also are reports of techniques based on an anti-hTfR antibody and liposomes in combination, in which a drug is led to pass through the blood-brain barrier by preparing it into an encapsulated form in liposomes that carry the anti-hTfR antibody on their surface (Patent Documents 12 and 13).

"To consider utilization, as medicine, of a fusion protein constructed with the above antibody, there is a possibility that a hyper reaction like an immune response to the antibody could take place after the administration of the fusion protein, thus making its further administration difficult. Therefore, to prepare for such an event, it would be highly meaningful to provide fusion proteins in advance that are constructed with some antibodies different from those currently employed, in order to avoid termination of treatment because of such a hyper reaction."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "Technical Problem

"Against the above background, the objective of the present invention is to provide a novel anti-transferrin receptor antibody that can pass through the blood-brain barrier, and a fusion protein comprising a protein necessary to be brought into function in the central nervous system after administration into the blood and such an antibody, as well as a method for their production or use."
"Solution to Problem

As a result of intense studies addressed to the above objective, the present inventors found a novel anti-human transferrin receptor antibody that can make lysosomal enzymes pass through the blood-brain barrier in a fused form with it, and thus completed the present invention. Consequently, the present invention provides what follows.

1. An anti-human transferrin receptor antibody that recognizes an amino acid sequence selected from the group consisting of SEQ ID NOs: 1, 2, and 3.

2. The anti-human transferrin receptor antibody according to 1 above that recognizes a partial sequence consisting of at least ten consecutive amino acid residues occurring in the amino acid sequence selected from the group consisting of SEQ ID NOs: 1, 2, and 3.

3. The anti-human transferrin receptor antibody according to 1 or 2 above, wherein the anti-human transferrin receptor antibody is a single-chain antibody comprising

an amino acid sequence comprising the whole or part of the variable region of the light chain,

an amino acid sequence that is bound thereto on the C-terminal side and consists of 15-25 amino acid residues as a first linker sequence, and further an amino acid sequence that is bound thereto on the C-terminal side and comprises the whole or part of the variable region of the heavy chain.

4. The anti-human transferrin receptor antibody according to 3 above comprising an amino acid sequence selected from the group consisting of SEQ ID NOs: 4, 5, 6 and 7.

5. A fusion protein comprising an anti-human transferrin receptor antibody according to one of 1 to 4 above and an amino acid sequence of other protein that is bound thereto on the C-terminal side.

6. A fusion protein comprising an anti-human transferrin receptor antibody according to one of 1 to 4 above and an amino acid sequence that is bound thereto on the C-terminal side and consists of 3-50 amino acid residues as a second linker sequence, and further

an amino acid sequence of the said other protein that is bound thereto on the C-terminal side.

7. The fusion protein according 5 or 6 above, wherein the said other protein is a lysosomal enzyme.

8. The fusion protein according to 7 above, wherein the lysosomal enzyme is human iduronate 2-sulfatase

9. A DNA encoding an anti-human transferrin receptor antibody according to one of 1 to 4 above.

10. A DNA encoding the fusion protein according to one of 5 to 8 above.

11. A mammalian expression vector comprising the DNA according to 10 above incorporated therein.

12. A mammalian cell transformed with the mammalian expression vector according to 11 above.

13. The cell according to 12 above, wherein the mammalian cell is a CHO cell.

"Effects of Invention

The present invention enables provision of proteins that are intended to be brought into function in the central nervous system (CNS), in particular, physiologically active proteins, in the form that allow them to pass through the blood-brain barrier, by preparing them as a fusion proteins with an anti-human transferrin receptor antibody, thus making it possible that
such physiologically active proteins function directly in the brain after their administration into the blood.

BRIEF DESCRIPTION OF DRAWINGS

"FIG. 1A illustrates the result of brain distribution test of hI2S-sc-anti-hTfR antibody fusion protein produced by transformed E. coli Clone M11, after it was injected into the tail vein of a mouse, along with the result with rhI2S. The vertical axis indicates the I2S concentration in brain homogenate (pg/wet weight)(mean of two animals per group).

"FIG. 1B illustrates the result of brain distribution test of hI2S-sc-anti-hTfR antibody fusion protein produced by transformed E. coli Clone M27, after it was injected into the tail vein of a mouse, along with the result with rhI2S. The vertical axis indicates the I2S concentration in brain homogenate (pg/wet weight)(mean of two animals per group).

"FIG. 1C illustrates the result of brain distribution test of hI2S-sc-anti-hTfR antibody fusion protein produced by transformed E. coli Clone B84, after it was injected into the tail vein of a mouse, along with the result with rhI2S. The vertical axis indicates the I2S concentration in brain homogenate (.mu.g/wet weight)(mean of two animals per group).

"FIG. 2 illustrates the result of assessment of the pharmacological effect of hI2S-sc-anti-hTfR antibody fusion protein using model mice for the pathology of Hunter syndrome. The vertical axis indicates the amount of accumulated glycosaminoglycans (%) in the brain of mice administered with rhI2S and of the mice administered with hI2S-sc-anti-hTfR antibody fusion protein, in comparison with the amount of accumulated glycosaminoglycans, 100%, in the brain of mice administered with the vehicle (values, mean of three animals per group)."

Patent Application Titled "Process" Published Online (USPTO 20160368970)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors EL MENYAWI, Ibrahim (Bern, CH); SIEGEMUND, Doreen (Aarwangen, CH), filed on July 1, 2014, was made available online on December 29, 2016.
The assignee for this patent application is CSL Behring AG.

Reporters obtained the following quote from the background information supplied by the inventors: "As is well known, immunoglobulins play an important role in the immune system of mammals. They are produced by B-lymphocytes, found in blood plasma, lymph and other body secretions. Immunoglobulins constitute approximately 20% of the plasma proteins in humans. The basic unit of immunoglobulins is a heterotetramer, containing 2 heavy chains and two light chains, linked by disulphide bonds. Each of these chains have a variable region at their N-terminus which form the antigen binding site, and constant regions, which are responsible for the effector functions of the immunoglobulins.

"There are five major classes of immunoglobulins with differing biochemical and physiological properties: IgG (gamma heavy chain), IgA (alpha), IgM (mu), IgD (delta) and IgE (epsilon). Human IgG represents the most abundant immunoglobulin in plasma, whereas IgA represents the main antibody class in external secretions such as saliva, tears and mucus of the respiratory and intestinal tracts. IgM is by far the physically largest antibody in the human circulatory system, usually being present as a pentamer of the basic immunoglobulin unit, and appears early in the course of an infection.

"Initially, IgG preparations from human plasma were successfully used for the prophylaxis and treatment of various infectious diseases. The early products were produced by relatively crude processes (ethanol fractionation), and contained impurities and aggregates to an extent that they could only be administered intramuscularly. Improvements in the purification processes have led to IgG preparations that were suitable for intravenous administration (called IVIG) due to their improved purity and quality, and preparations for subcutaneous administration (called SCIG) have also been developed.

"The industrial processes commonly used to purify IgG from plasma are based on the original method devised by Cohn (Cohn E., et al., (1946), J Am Chem Soc, 68, 459-475, Oncley et al., (1949), J Am Chem Soc, 71, 541-550), which dates back to the 1940s and rely on the cold fractionated precipitation of plasma proteins. After progressive additions of ethanol under controlled conditions of ionic strength, pH and temperature, this plasma fractionation process obtains enriched or concentrated fractions of therapeutically useful plasma proteins (coagulation factors, albumin, immunoglobulin, antithrombin III). Applying Cohn's fractionation, IgG is obtained from fractions II+III, I+II+II or the equivalent precipitate A (called NA precipitate) according Kistler and Nitschmann, who developed a modified ethanol fractionation method (Kistler P and Nitschmann H S, (1952), Vox Sang, 7, 414-424).

"In the 1960s it was shown that short fatty acids (C6-C12) form insoluble complexes with alpha- and beta-globulins whereas gamma-globulins are not as readily precipitated (Chanutin et al., (1960) Arch. Biochem. Biophys. 89; 218).

"Steinbuch & Audran ((1969) Arch. Biochem. Biophys. 134, 279-294) described a purification process for IgG with caprylate (i.e. octanoate, a C8-saturated fatty acid) as precipitating agent. Non-immunoglobulins were precipitated from human plasma after dilution with an acetate buffer to reach a final pH of 4.8. After addition of caprylate under vigorous stirring an IgG enriched solution was obtained. The purity and yield depended on the amount of caprylic acid, the pH, the molarity of the buffer and the dilution factor.

"Extensive non-immunoglobulin precipitation was best obtained at slightly acidic pH, but not below pH 4.5. Plasma was diluted 2:1 with 0.06 M acetate buffer, pH 4.8, and then treated with 2.5 wt. % caprylate to initiate precipitation. Batch adsorption of the supernatant on DEAE-cellulose was used to clear additional impurities from the isolated IgG fraction. Later work by Steinbuch et al. showed the use of caprylic acid to precipitate most proteins and lipoproteins (other than the immunoglobulins) present in Cohn ethanol Fraction III (Steinbuch et

"The same method was applied to diluted human plasma using 2.16 wt. % caprylate. (Habeeb et al., (1984) Prep. Biochem. 14, 1-17). Habeeb et al. followed the caprylic acid precipitation with fractionation on DEAE cellulose. The resulting plasma-derived IgG was essentially free of aggregates, plasmin and plasminogen. In addition, the IgG obtained was low in anticomplement activity and relatively stable during storage. The caprylate precipitation step was therefore recognized as very useful, and was introduced into many modern processes for IgG production from plasma.

"In addition to the alcohol, PEG and caprylic acid fractionation methods, several chromatographic methods were used in combination with basic fractionation methods for the purification of IVIG.

"The most commonly used chromatographic method is ion exchange chromatography which takes advantage of surface distribution and charge density on both the protein and the ion exchange media. The anion exchange resin presents a positively charged surface. The charge density is specific to the resin and generally is independent of pH (within the working range of the resin). A typical anion exchanger will bind proteins which have a net negative charge (i.e. when the pH of the solution is above the isoelectric point of the protein). In reality, the surface of a protein does not present a singular charge; rather it is a mosaic of positive and negative charges, and neutral areas. Surface structure is specific to a given protein and will be affected by solution conditions such as ionic strength and pH. This uniqueness can be exploited to establish specific conditions where individual proteins will bind or release from the anion exchange resin. By establishing these conditions, proteins with only slightly differing surface or charge properties can be effectively separated with high yield (>95%).

"Improvements in the structure of chromatography resin supports have made large scale chromatography a practical alternative to more conventional purification methods. Rigid resins allow large volumes to be processed rapidly (<5 hours), and high ligand density gives the increased capacity necessary for large volume processing. These factors coupled with high yields, product purity and process simplicity favor the use of chromatography in large scale manufacturing.

"In particular, cation and/or anion exchange chromatography, sometimes combined in separate steps or in series, have been used for purifying IgG from plasma or fractions thereof (e.g. as described in WO 99/64462). In the majority of the methods, anion exchange chromatography is used in negative mode, i.e. conditions are used to enable the binding of the contaminant proteins, e.g. IgA, IgM, albumin, fibrinogen, transferrin, while the IgG is recovered in the non-adsorbed fraction.

"The combination of caprylate precipitation followed by ion-exchange chromatography for the purification of IgG was described in many publications. Steinbuch & Audran ((1969) Arch Biochem Biophys 134, 279-284) described the further purification of IgG after precipitation of caprylate with DEAE-cellulose. Lebing et al. (U.S. Pat. No. 5,886,157) described two anion-exchange columns used in series for the removal of IgM, IgA, albumin and other impurities. Lebing et al. combined both caprylate mediated effects, namely the essential reduction of non-IgG proteins by precipitation, thereby using the virus partitioning, and the enveloped virus inactivation properties of the fatty acid in a separate incubation step. The importance of the so-called 'pH-swing' starting from the reconstitution of an IgG containing paste/precipitate at pH 4.2 and the subsequent addition of caprylate upon adjusting the pH 5.2 is stressed to be essential for the IgG enriching procedure, thus needed to effectively reduce non-IgG proteins. A few other impurities, like IgA and IgM, as well as the caprylate were subsequently reduced by the mentioned ion exchange chromatography steps.
U.S. Pat. No. 5,164,487 concerns the use of caprylic acid for the manufacture of an intravenously tolerable IgG preparation free from aggregates, vasoactive substances and proteolytic enzymes. The method includes contacting the starting material containing IgG with 0.4% to 1.5% caprylic acid before chromatographic purification with an ion exchange or hydrophobic matrix.

"Due to the continuous improvements in purification processes, there has been an evolution in IgG products over the years. As mentioned above, the first IgG products were only suitable for intramuscular use, as they caused too many adverse events when administered intravenously. The first generation of an IgG product suitable for intravenous use (IVIG) was prepared by pepsin cleavage of the starting material (Cohn fraction II), the purpose of the cleavage being removal of immunoglobulin aggregates which caused serious adverse events such as complement activation and made it impossible to administer the early products intravenously. No column chromatography steps were included in the process. The product had to be freeze-dried in order to remain stable for a reasonable period of time and was dissolved immediately prior to use.

"A second generation of IVIG based on uncleaved and unmodified immunoglobulin molecules with low anticomplement activity and higher stability was introduced in the mid-eighties, but still in the form of a freeze-dried product. This IVIG was purified by processes including several chromatography steps. Pepsin cleavage was avoided, aggregates and particles were removed by precipitation, and further purification was achieved by column chromatographic ion exchange methods.

"For the third generation of IVIG, dedicated virus inactivation steps were included in the processes. While particularly the precipitation steps in the purification processes removed a lot of viruses, some patients treated with blood products nevertheless were infected with HIV, necessitating further, dedicated steps to be taken to inactivate and remove viruses from these products.

"The processes were continued to be refined further to achieve better purity and quality of the protein, in order to enable stable liquid products to be made available, and to improve the safety and tolerability of these products for patients. In addition, subcutaneous formulations were developed.

"IgG products are now used in a number of clinical applications. In addition to the traditional use for the treatment of primary or acquired immunodeficiencies, and infectious diseases, it has been shown that these products are also effective in the treatment of autoimmune diseases and certain neurological disorders such as CIDP. There has also been a marked increase in the number of studies focusing on further therapeutic uses of IgG products. Thus the demand for IgG products has been increasing. IgG products are now the plasma products in greatest demand on the world market; in 2008 the market reached approximately 82 metric tons (including 37 tons in the USA, 21 tons in Europe and 17 tons in Asia) with a tendency to grow at a rate of approximately 7% a year (the predicted demand in 2013 is 110 metric tons) (The Worldwide Plasma Fractions Market 2008. The Marketing Research Bureau, Inc. April 2010 Edition). As human plasma is a valuable, limited resource, the processes for purification of IgG from plasma need to be further improved to achieve higher yields than currently possible while not compromising the quality of the product. Current processes have an average yield of 3.7 to 4.2 g of IgG per liter of plasma, which represents only up to 55% of the IgG present in plasma."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "The invention relates to a modified process for the purification of IgG from plasma or other solutions comprising IgG and other proteins, improving the yield of IgG per litre of starting solution.
A first aspect of the invention is a method for increasing the yield of IgG in a purification process from a solution comprising IgG, other immunoglobulins and/or other protein contaminants, comprising (a) providing an acidic solution comprising IgG, other immunoglobulins and/or other protein contaminants with a pH of between 3.5 to 5.2 and a total protein concentration of at least 10 g/l; (b) adjusting the solution to a pH of 5.2 to 6.2 while maintaining a conductivity of below 1.5 mS/cm; (c) incubating the solution for at least 15 minutes; and (d) removing any precipitate.

Preferably, the solution comprising IgG comprises plasma-derived antibodies, more preferably, the solution comprising IgG is obtained by ethanol fractionation of human plasma or human cryo-poor plasma. In another preferred embodiment of the invention, the solution comprising IgG is a supernatant from an octanoic acid precipitation.

Typically, the solution in step (a) has been clarified by ultradialfiltration. Preferably, the pH of the solution in step (a) is 3.9 to 5.0, more preferably 3.9 to 4.6, even more preferably from 3.9 to 4.3. Preferably, the protein concentration in step (a) is between 10 and 50 g/l, more preferably between 20 and 25 g/l.

In step (b), the pH is adjusted to a pH of 5.2 to 6.2, preferably to a pH of 5.6 to 6.0, more preferably to a pH of 5.8 to 6.0. Preferably, the pH adjustment in step (b) is done by addition of at least one multi-hydroxylated amine compound. Preferably, the pH adjustment is done with Tris at a concentration above 250 mM, more preferably above 500 mM, even more preferably above 750 mM, most preferably around 1M. Preferably, the pH adjustment is done over a time period of at least 15 minutes. The conductivity in step (b) is below 1.5 mS/cm, preferably below 1.2 mS/cm, more preferably below 1.0 mS/cm, even more preferably below 0.8 mS/cm, most preferably between 0.2 and 0.5 mS/cm. Most preferably, the pH in step (b) is adjusted to pH 5.6 to 6.0, and the conductivity is between 0.2 and 0.5 mS/cm.

The incubation time in step (c) is up to 72 hours, up to 48 hours, up to 24 hours, preferably up to 12 hours, more preferably up to 6 hours, most preferably between 15 minutes and 90 minutes. Preferably, the incubation in step (c) is carried out at ambient temperature.

The precipitate in step (d) is preferably removed by depth filtration. Other methods for removing the precipitate are also possible, e.g. other filtration methods or centrifugation.

After step (d), further purification steps such as chromatographic methods, e.g. ion exchange chromatography, can be carried out. Preferably, an ion exchange chromatography step is carried out under conditions that allow contaminants but not IgG to bind to the resin. Preferably, the ion exchange chromatography is an anion exchange chromatography. Preferably, the ion exchange chromatography is carried out without further adjustment to the conductivity of the solution.

The method will further comprise a virus inactivation step. Preferably, the virus inactivation step is a low pH treatment. Preferably, the low pH treatment for virus inactivation is carried out prior to step (a)."

Patents

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors Korsower, Joshua Daniel (Sterling, VA); Fleury, III, Albert Fenwick (Chevy Chase, MD), filed on June 22, 2016, was made available online on December 29, 2016.

No assignee for this patent application has been made.

Reporters obtained the following quote from the background information supplied by the inventors: "Elderly individuals face an increasing likelihood of a traumatic event which could render the individual incapable of calling for help, for example a fall which renders them unconscious or immobile. Clearly, those individuals living alone are at an even higher risk of being unable to communicate with someone in the event of such an event.

"Physically impaired and/or mentally impaired individuals may be at an increased risk of injury, and may be at an increased risk of being unable to communicate or operate an active alert upon such an injury. This group includes individuals who may be permanently impaired, or temporarily impaired, for example those recovering from an injury or surgery.

"Individuals who enjoy adventurous or 'risky' activities on their own, such as biking, running or rock climbing, face a larger risk of being injured.

"For many injuries, it is imperative to get appropriate care and medical attention as soon as possible. Early intervention often is the difference between life and death. With the baby boomer generation entering into the older years, the need for a passive alert system for non-geriatric populations is extremely high.

"What is needed is a new way to identify the occurrence of an event that may have caused traumatic injury to the user, while minimizing false-positive event detections. What is needed is technology that fosters peace of mind among at-risk individuals and their loved ones. What is needed is a passive event detection system that would output an event notification when a user suffers a traumatic injury."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "Embodiments described herein overcome the disadvantages described above. These, and other advantages, are provided by, for example, a method performed by one or more processors associated with one or more computing devices. The method accesses, by one or more of the processors, one or more data streams from a plurality of sensors, the sensors comprising an accelerometer and heart-rate monitor worn by an individual, in which the data streams include accelerometer data of the individual from the accelerometer and heart-rate data of the individual from the heart rate monitor, and self-reported demographic data of the individual collected by manual input by the individual, a first data set from the sensor data streams collected upon initial usage by the individual, the person being engaged in activity monitoring for the first time,
and data received from continuous monitoring of the sensor data streams collected subsequent to baseline. The method detects if certain thresholds are met indicating the person is likely to have suffered a traumatic event where they need assistance, detects and monitors, by one or more of the processors, a set of trigger conditions comprising baseline accelerometer data and baseline heart-rate data, compared with current real time accelerometer data and heart-rate data, in which the baseline data measures normal activity, and in which the real time data is monitored for thresholds noting traumatic event likelihood. The method determines, by one or more of the processors, a current 'Event Detection' profile of the person based on the analysis of the first data set (initial baseline data) and second data set (indicating a traumatic event) with respect to each other.

"These and other advantages are also provided by, for example, a passive event detection system for traumatic events. The system includes an input configured to receive data collected by a plurality of sensors, a computer-readable storage medium configured to store computer-executable instructions, and a computer processor configured to execute the computer-executable instructions. The computer-executable instructions may include instructions for accessing, by one or more of the processors, one or more data streams from a plurality of sensors, the sensors comprising an accelerometer and heart-rate monitor worn by an individual, in which the data streams comprise accelerometer data of the individual from the accelerometer and heart-rate data of the individual from the heart-rate monitor, and self-reported demographic data of the individual collected by manual input by the individual from a first data set from the sensor data streams collected upon initial usage by the individual, the person being engaged in activity monitoring for the first time, and data received from continuous monitoring of the sensor data streams collected subsequent to baseline, detecting if certain thresholds are met indicating the person is likely to have suffered a traumatic event where they need assistance, detecting and monitoring, by one or more of the processors, a set of trigger conditions comprising baseline accelerometer data and baseline heart-rate data, compared with current real time accelerometer data and heart-rate data, wherein the baseline data measures normal activity, and in which the real time data is monitored for thresholds noting traumatic event likelihood, and determining, by one or more of the processors, a current 'Event Detection' profile of the person based on the analysis of the first data set (initial baseline data) and second data set (indicating a traumatic event) with respect to each other.

BRIEF DESCRIPTION OF THE FIGURES

"FIG. 1 shows a block diagram of the passive event detection system for individuals to detect traumatic events using physiological and environmental factors, according to one aspect of this disclosure.

"FIG. 2 shows a plurality of sensors that may provide data to the system, according to one aspect of this disclosure.

"FIG. 3 is a flowchart showing a method for detecting a potentially incapacitating traumatic event, according to one aspect of this disclosure."

**Patent Application Titled "Systems and Methods for Reporting and Displaying Blood Flow Characteristics" Published Online (USPTO 20160371456)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors TAYLOR, Charles A. (Menlo Park, CA); HART, Gregory R. (Palo Alto, CA), filed on September 1, 2016, was made available online on December 29, 2016.

The assignee for this patent application is HeartFlow, Inc.

Reporters obtained the following quote from the background information supplied by the inventors: "Coronary artery disease may produce coronary lesions in the blood vessels providing blood to the heart, such as a stenosis (abnormal narrowing of a blood vessel). As a result, blood flow to the heart may be restricted. A patient suffering from coronary artery disease may experience chest pain, referred to as chronic stable angina during physical exertion or unstable angina when the patient is at rest. A more severe manifestation of disease may lead to myocardial infarction, or heart attack.

"A need exists to provide more accurate data relating to coronary lesions, e.g., size, shape, location, functional significance (e.g., whether the lesion impacts blood flow), etc. Patients suffering from chest pain and/or exhibiting symptoms of coronary artery disease may be subjected to one or more tests that may provide some indirect evidence relating to coronary lesions. For example, noninvasive tests may include electrocardiograms, biomarker evaluation from blood tests, treadmill tests, echocardiography, single positron emission computed tomography (SPECT), and positron emission tomography (PET). These noninvasive tests, however, typically do not provide a direct assessment of coronary lesions or assess blood flow rates. The noninvasive tests may provide indirect evidence of coronary lesions by looking for changes in electrical activity of the heart (e.g., using electrocardiography (ECG)), motion of the myocardium (e.g., using stress echocardiography), perfusion of the myocardium (e.g., using PET or SPECT), or metabolic changes (e.g., using biomarkers).

"For example, anatomic data may be obtained noninvasively using coronary computed tomographic angiography (CCTA). CCTA may be used for imaging of patients with chest pain and involves using computed tomography (CT) technology to image the heart and the coronary arteries following an intravenous infusion of a contrast agent. However, CCTA also cannot provide direct information on the functional significance of coronary lesions, e.g., whether the lesions affect blood flow. In addition, since CCTA is purely a diagnostic test, it cannot be used to predict changes in coronary blood flow, pressure, or myocardial perfusion under other physiologic states, e.g., exercise, nor can it be used to predict outcomes of interventions.

"Thus, patients may also require an invasive test, such as diagnostic cardiac catheterization, to visualize coronary lesions. Diagnostic cardiac catheterization may include performing conventional coronary angiography (CCA) to gather anatomic data on coronary lesions by providing a doctor with an image of the size and shape of the arteries. CCA, however, does not provide data for assessing the functional significance of coronary lesions. For example,
a doctor may not be able to diagnose whether a coronary lesion is harmful without determining whether the lesion is functionally significant. Thus, CCA has led to what has been referred to as an 'oculostenotic reflex' of some interventional cardiologists to insert a stent for every lesion found with CCA regardless of whether the lesion is functionally significant. As a result, CCA may lead to unnecessary operations on the patient, which may pose added risks to patients and may result in unnecessary health care costs for patients.

"During diagnostic cardiac catheterization, the functional significance of a coronary lesion may be assessed invasively by measuring the fractional flow reserve (FFR) of an observed lesion. FFR is defined as the ratio of the mean blood pressure downstream of a lesion divided by the mean blood pressure upstream from the lesion, e.g., the aortic pressure, under conditions of increased coronary blood flow, e.g., induced by intravenous administration of adenosine. The blood pressures may be measured by inserting a pressure wire into the patient. Thus, the decision to treat a lesion based on the determined FFR may be made after the initial cost and risk of diagnostic cardiac catheterization has already been incurred.

"Thus, a need exists for a method for assessing coronary anatomy, myocardial perfusion, and coronary artery flow noninvasively. Such a method and system may benefit cardiologists who diagnose and plan treatments for patients with suspected coronary artery disease. In addition, a need exists for a method to predict coronary artery flow and myocardial perfusion under conditions that cannot be directly measured, e.g., exercise, and to predict outcomes of medical, interventional, and surgical treatments on coronary artery blood flow and myocardial perfusion. In addition, a need exists to generate and display reports relating to patient-specific blood flow characteristics.

"The foregoing general description and the following detailed description are exemplary and explanatory only and are not restrictive of the disclosure."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "In accordance with an embodiment, a system displays cardiovascular information for a patient. The system may include at least one computer system configured to receive patient-specific data regarding a geometry of the patient's heart and create a model representing at least a portion of the patient's heart based on the patient-specific data. The computer system may determine at least one value of the blood flow characteristic within the patient's heart based on the model. The computer system may also display a report comprising a representation of at least one artery corresponding to at least a portion the model, and display one or more indicators of the value of the blood flow characteristic on a corresponding portion of the at least one artery.

"In accordance with another embodiment, a method displays cardiovascular information for a patient. The method may include receiving patient-specific data regarding a geometry of the patient's heart, and creating a model representing at least a portion of the patient's heart based on the patient-specific data. The method may also include determining at least one value of the blood flow characteristic within the patient's heart based on the model. The method may further include displaying a report comprising a representation of at least one artery corresponding to at least a portion the model, and displaying one or more indicators of the value of the blood flow characteristic on a corresponding portion of the at least one artery.

"In accordance with another embodiment, a non-transitory computer-readable medium may store instructions that, when executed by a processor, cause the processor to perform a method for displaying cardiovascular information of a patient. The method may include receiving patient-specific data regarding a geometry of the patient's heart, and creating a model representing at least a portion of the patient's heart based on the patient-specific data. The method may also include determining at least one value of the blood flow characteristic within
the patient's heart based on the model. The method may further include displaying a report comprising a representation of at least one artery corresponding to at least a portion the model, and displaying one or more indicators of the value of the blood flow characteristic on a corresponding portion of the at least one artery.

"Additional embodiments and advantages will be set forth in part in the description that follows, including the attached appendix, and in part will be obvious from the description, or may be learned by practice of the disclosure. The embodiments and advantages will be realized and attained by means of the elements and combinations particularly pointed out below.

BRIEF DESCRIPTION OF THE DRAWINGS

"The accompanying drawings, which are incorporated in and constitute a part of this specification, illustrate several embodiments and together with the description, serve to explain the principles of the disclosure.

"FIG. 1 is a schematic diagram of a system for providing various information relating to coronary blood flow in a specific patient, according to an exemplary embodiment;

"FIG. 2 is a flow chart of a method for providing various information relating to blood flow in a specific patient, according to an exemplary embodiment;

"FIG. 3 shows an example report summary of a medical imaging report which may be generated by a software tool;

"FIG. 4 shows an example artery detail that may be included in a medical imaging report;

"FIG. 5 shows additional example of artery details that may be included in a medical imaging report;

"FIG. 6 depicts an example report conclusion of a medical imaging report;

"FIG. 7 depicts an example portion of a medical imaging report which may display indicators of one or more arterial occlusions;

"FIG. 8 depicts an example artery detail of a medical imaging report;

"FIGS. 9A-9N depict summary views and summary boxes that may be used when one or more arteries are occluded;

"FIG. 10 shows an example report summary of a medical imaging report;

"FIGS. 11A-11B show an example report summary of a medical imaging report which displays a stent;

"FIGS. 12A-12HH illustrate example graphs and other interface elements that may be displayed in a summary box or other portion of a medical imaging report; and

"FIGS. 13A-13K illustrate example representations of arteries and/or graphs associated with patient-specific blood flow characteristics."

Patents

**Patent Application Titled "Treprostinil Derivative Compounds and Methods of Using Same" Published Online (USPTO 20160368889)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors BECKER, Cyrus K. (Fremont, CA); VENKATRAMAN, Meenakshi s. (Fremont, CA); ZHANG, Xiaoming (Sunnyvale, CA), filed on May 18, 2016, was made available online on December 29, 2016.

No assignee for this patent application has been made.

Reporters obtained the following quote from the background information supplied by the inventors: "Pulmonary hypertension (PH) or pulmonary arterial hypertension (PAH) is a disease which can result in death and is characterized by increased pulmonary artery pressure and pulmonary vascular resistance. A need exists for better compounds and methods for treating PH and PAH. See, for example, US Patent Publication No. 2013/0274261. Many valuable pharmacologically active compounds, including some of interest with respect to PH and PAH, cannot be effectively administered orally for various reasons and are generally administered via intravenous or intramuscular routes. These routes of administration generally require intervention by a physician or other health care professional, and can entail considerable discomfort as well as potential local trauma to the patient. One example of such a compound is treprostinil and derivatives thereof, which has been used in the treatment of PH and PAH. See, for example, WO 2005/007081. The core chemical formula is (herein also labeled, Compound A):

"##STR00001##

including pharmaceutically acceptable salts such as the sodium salt.

"Accordingly, there is a clinical need in providing treprostinil by improved formulations and methods, e.g., either orally or transdermally. More particularly, there is a need for a safe and effective method for increasing the systemic availability of treprostinil via administration of treprostinil or treprostinil analogs.

"The application of transdermal drug delivery technology to the administration of a wide variety of drugs has been proposed and various systems for accomplishing this are disclosed in numerous technical journals and patents. U.S. Pat. Nos. 3,598,122, 4,144,317, 4,201,211, 4,262,003, and 4,379,454, all of which are incorporated herein by reference, are representative of various transdermal drug delivery systems of the prior art, which systems have the ability of delivering controlled amounts of drugs to patients for extended periods of time ranging in duration from several hours to several days. None of the above patents nor any other prior art of which the inventors are aware describes a transdermal delivery system which is intended to deliver treprostinil or its derivatives nor are they aware of data on skin permeability or therapeutic transdermal delivery rates adequate to design such a system."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors’ summary information for this patent application: "Embodiments described herein including compounds, compositions, and devices, as well as methods of making and methods of using the same."
"One embodiment provides a compound represented by Formula (I)

##STR00002##

"wherein, R.sub.20, R.sub.21, R.sub.22, R.sub.23, R.sub.24, R.sub.25, R.sub.26, R.sub.27, R.sub.28, R.sub.29, R.sub.30, R.sub.31, R.sub.32, R.sub.33, R.sub.34, R.sub.35, and R.sub.36 are independently H or deuterium; Z is --OH, --OR.sub.11, --N(R.sub.11)R.sub.12, or P.sub.1; R.sub.11 is alkyl, substituted alkyl, cycloalkyl, substituted cycloalkyl, haloalkyl, heteroalkyl, substituted heteroalkyl, cycloheteroalkyl, substituted cycloheteroalkyl, alkylcycloalkyl, substituted alkylcycloalkyl, alkylcycloheteroalkyl, substituted alkylcycloheteroalkyl, aryl, substituted aryl, alkylaryl, substituted alkylaryl, heteroaryl, substituted heteroaryl, alkylheteroaryl, or substituted alkylheteroaryl; R.sub.12 is H, haloalkyl, heteroalkyl, cycloheteroalkyl, alkylcycloalkyl, alkylcycloheteroalkyl, aryl, or heteroaryl; P.sub.1 is selected from the group consisting of:

##STR00003##

"##STR00004##

"wherein, m is 1, 2, 3, or 4; R.sub.14 and R.sub.15 are independently in each occurrence selected from the group consisting of H, alkyl, cycloalkyl, alkylcycloalkyl, haloalkyl, heteroalkyl, substituted alkyl, aryl, substituted aryl, alkylaryl, substituted alkylaryl, heteroaryl, substituted heteroaryl, alkylheteroaryl, or substituted alkylheteroaryl; R.sub.14 and R.sub.15 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring optionally incorporating one or two ring heteroatoms chosen from N, O, or S, which is unsubstituted or substituted with 1, 2, or 3 substituents independently selected from the group consisting of halo, methyl, and methoxy; R.sub.18 and R.sub.19 are independently in each occurrence selected from the group consisting of hydrogen and alkyl, wherein the alkyl is unsubstituted or substituted with 1 substituent selected from the list consisting of halo, hydroxy, alkoxy, amino, thio, methylthio, --C(O)OH, --C(O)O-(alkyl), --CONH.sub.2, aryl, and heteroaryl, wherein the aryl or heteroaryl are unsubstituted or substituted from the list consisting of alkyl, haloalkyl, hydroxy, and alkoxy, haloalkoxy; R.sub.14 and R.sub.15 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; R.sub.14 and R.sub.15 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; R.sub.15 and R.sub.18 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; R.sub.15 and R.sub.19 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; and, R.sub.1 and R.sub.2 are independently H or P.sub.2, wherein at least one of R.sub.1 and R.sub.2 is P.sub.2, wherein P.sub.2 is selected from the group consisting of:

##STR00005##

"wherein, m is 1, 2, 3, or 4; R.sub.14 and R.sub.15 are as defined above; R.sub.14 and R.sub.15 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring optionally incorporating one or two ring heteroatoms chosen from N, O, or S, which is unsubstituted or substituted with 1, 2, or 3 substituents independently selected from the list consisting of halo, methyl and methoxy; R.sub.16 and R.sub.17 are independently in each occurrence H or alkyl; R.sub.16 and R.sub.17 taken together with the atoms to which they attach optionally form a 3- to 6-membered ring; R.sub.18 and R.sub.19 are as defined above; R.sub.14 and R.sub.18 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; R.sub.14 and R.sub.19 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; wherein Formula I includes enantiomers, pharmaceutically acceptable salts, and polymorphs of the compounds of Formula I.

"In another embodiment, the parameters of Formula I are defined as follows:

'R.sub.20, R.sub.21, R.sub.22, R.sub.23, R.sub.24, R.sub.25, R.sub.26, R.sub.27, R.sub.28, R.sub.29, R.sub.30, R.sub.31, R.sub.32, R.sub.33, R.sub.34, R.sub.35, and R.sub.36
are independently H or deuterium; Z is --OR.sub.11, --N(R.sub.11)R.sub.12, --SR.sub.11, or P.sub.1; R.sub.11 is branched alkyl, haloalkyl, halocycloalkyl, heteroalkyl, substituted heteroalkyl, cycloheteroalkyl, substituted cycloheteroalkyl, bicycloalkyl, alkylcycloalkyl, substituted alkylcycloalkyl, alkylcycloheteroalkyl, substituted alkylcycloheteroalkyl, alkylaryl, substituted alkylaryl, heteroaryl, substituted heteroaryl, alkylheteroaryl, substituted alkylheteroaryl; R.sub.12 is H, branched alkyl, haloalkyl, heteroalkyl, cycloheteroalkyl, alkylcycloalkyl, alkylcycloheteroalkyl, aryl, or heteroaryl; P.sub.1 is selected from the group consisting of:

"##STR00006##

"wherein, m is 1, 2, 3, or 4; R.sub.14 and R.sub.15 are independently in each occurrence selected from the group consisting of H, alkyl, cycloalkyl, alkylcycloalkyl, haloalkyl, heteroalkyl, substituted alkyl, aryl, heteroaryl, arylalkyl, heteroarylalkyl, substituted aryl, substituted heteroaryl, substituted arylalkyl, and substituted heteroarylalkyl; R.sub.14 and R.sub.15 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring optionally incorporating one or two ring heteroatoms chosen from N, O, or S, which is unsubstituted or substituted with 1, 2, or 3 substituents independently selected from the group consisting of halo, methyl, and methoxy; R.sub.18 and R.sub.19 are independently in each occurrence selected from the group consisting of hydrogen and alkyl, wherein the alkyl is unsubstituted or substituted with 1 substituent selected from the list consisting of halo, hydroxy, alkoxy, amino, thio, methylthio, --C(O)OH, --C(O)O-(alkyl), --CONH.sub.2, aryl, and heteroaryl, wherein the aryl or heteroaryl are unsubstituted or substituted from the list consisting of alkyl, haloalkyl, haloalkoxy; R.sub.14 and R.sub.18 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; R.sub.14 and R.sub.19 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; R.sub.15 and R.sub.18 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; R.sub.15 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; and, R.sub.1 and R.sub.2 are independently H or P.sub.2, wherein P.sub.2 is selected from the group consisting of:

"##STR00007##  ##STR00008##

"wherein, m is 1, 2, 3, or 4; R.sub.14 and R.sub.15 are as defined above; R.sub.14 and R.sub.15 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring optionally incorporating one or two ring heteroatoms chosen from N, O, or S, which is unsubstituted or substituted with 1, 2, or 3 substituents independently selected from the list consisting of halo, methyl and methoxy; R.sub.16 and R.sub.17 are independently in each occurrence H or alkyl; R.sub.16 and R.sub.17 taken together with the atoms to which they attach optionally form a 5- to 6-membered ring; R.sub.18 and R.sub.19 are as defined above; R.sub.14 and R.sub.18 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; R.sub.14 and R.sub.19 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; wherein Formula I includes enantiomers, pharmaceutically acceptable salts, and polymorphs of the compounds of Formula I.

"In another embodiment, provided is a compound represented by Formula II:

"##STR00009##  ##STR00009##

"wherein, R.sub.2 is selected from the group consisting of H and P.sub.2; R.sub.20, R.sub.21, R.sub.22, R.sub.23, R.sub.24, R.sub.25, R.sub.26, R.sub.27, R.sub.28, R.sub.29, R.sub.30, R.sub.31, R.sub.32, R.sub.33, R.sub.34, R.sub.35, and R.sub.36 are independently selected from the group consisting of H and deuterium; L.sub.1 is a selected from the group consisting of --O-alkylene-C(O)--, --O-alkylene-O(O)--, or a bond; wherein P.sub.2 is selected from the group consisting of:

"##STR00010##  ##STR00011##
"wherein, m is 1, 2, 3, or 4; R.sub.14 and R.sub.15 are as defined above; R.sub.14 and R.sub.15 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring optionally incorporating one or two ring heteroatoms chosen from N, O, or S, which is unsubstituted or substituted with 1, 2, or 3 substituents independently selected from the list consisting of halo, methyl and methoxy; R.sub.16 and R.sub.17 are independently in each occurrence H or alkyl; R.sub.16 and R.sub.17 taken together with the atoms to which they attach optionally form a 3- to 6-membered ring; R.sub.18 and R.sub.19 are as defined above; R.sub.14 and R.sub.18 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; R.sub.14 and R.sub.19 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; wherein Formula II includes enantiomers, pharmaceutically acceptable salts, and polymorphs of the compounds of Formula II.

"In another embodiment, a compound is represented by Formula III:

"##STR00012##

"L.sub.2 is selected from the group consisting of:

"##STR00013##

"wherein, m is 1, 2, 3, or 4;

"X is NR.sub.14, or O;

"R.sub.14 is selected from the group consisting of H, alkyl, cycloalkyl, alkylicycloalkyl, haloalkyl, heteroalkyl, substituted alkyl, aryl, heteroaryl, aryalkyl, heteroarylcycloalkyl, substituted aryl, substituted heteroarylcycloalkyl, substituted heteroaryl, substituted heteroarylcycloalkyl; R.sub.16 and R.sub.17 are independently in each occurrence H or alkyl; R.sub.16 and R.sub.17 taken together with the atoms to which they attach optionally form a 3- to 6-membered ring; and R.sub.20, R.sub.21, R.sub.22, R.sub.23, R.sub.24, R.sub.25, R.sub.26, R.sub.27, R.sub.28, R.sub.29, R.sub.30, R.sub.31, R.sub.32, R.sub.33, R.sub.34, R.sub.35, and R.sub.36 are independently selected from the group consisting of H and deuterium; wherein Z is --OH, --OR.sub.11, --N(R.sub.11)R.sub.12, --SR.sub.11, or P.sub.1; R.sub.11 is alkyl, substituted alkyl, cycloalkyl, substituted cycloalkyl, haloalkyl, heteroalkyl, substituted heteroalkyl, cycloheteroalkyl, substituted cycloheteroalkyl, alkylicycloalkyl, substituted alkylicycloalkyl, alkylcycloheteroalkyl, substituted alkylicycloheteroalkyl, aryl, substituted aryl, alkylaryl, substituted alkylaryl, heteroaryl, substituted heteroaryl, alkylheteroaryl, or substituted alkylheteroaryl; R.sub.12 is H, haloalkyl, cycloalkyl, cycloheteroalkyl, alkylicycloalkyl, alkylcycloheteroalkyl, aryl, or heteroaryl; P.sub.1 is selected from the group consisting of:

"##STR00014##

"wherein, m is 1, 2, 3, or 4; R.sub.14 and R.sub.15 are independently in each occurrence selected from the group consisting of H, alkyl, cycloalkyl, alkylicycloalkyl, haloalkyl, heteroalkyl, substituted alkyl, aryl, heteroaryl, aryalkyl, heteroarylcycloalkyl, substituted heteroarylcycloalkyl, substituted heteroaryl, substituted heteroarylcycloalkyl; R.sub.14 and R.sub.15 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring optionally incorporating one or two ring heteroatoms chosen from N, O, or S, which is unsubstituted or substituted with 1, 2, or 3 substituents independently selected from the group consisting of halo, methyl, and methoxy; R.sub.18 and R.sub.19 are independently in each occurrence selected from the group consisting of hydrogen and alkyl, wherein the alkyl is unsubstituted or substituted with 1 substituent selected from the list consisting of halo, hydroxy, alkoxy, amino, thio, methylthio, --C(O)OH, --C(O)O-(alkyl), --CONH.sub.2, aryland heteroaryl, wherein the aryl or heteroaryl are unsubstituted or substituted from the list consisting of alkyl, haloalkyl, hydroxy, and alkoxy, haloalkoxy; R.sub.14 and R.sub.18 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; R.sub.14 and R.sub.19 taken together with the atoms to which they attach optionally form a 5- to 7-membered ring.
ring; $R_{15}$ and $R_{18}$ taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; $R_{15}$ and $R_{19}$ taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; wherein Formula III includes enantiomers, pharmaceutically acceptable salts, and polymorphs of the compounds of Formula III.

"Another embodiment provides a compound represented by Formula IV:

"\[
R_{1} \text{ is selected from the group consisting of H and P}_{2}; R_{20}, R_{21}, R_{22}, R_{23}, R_{24}, R_{25}, R_{26}, R_{27}, R_{28}, R_{29}, R_{30}, R_{31}, R_{32}, R_{33}, R_{34}, R_{35}, \text{ and } R_{36} \text{ are independently selected from the group consisting of H and deuterium; } L_{1} \text{ is selected from the group consisting of } --O-\text{alkylene-C(O)--, } --O-\text{alkylene-OC(O)--, or a bond; wherein } P_{2} \text{ is selected from the group consisting of: }
\]

"\[##STR00015## ##STR00016## ##STR00017##\]

"wherein, $m$ is 1, 2, 3, or 4; $R_{14}$ and $R_{15}$ are independently in each occurrence selected from the group consisting of H, alkyl, cycloalkyl, alkylcycloalkyl, haloalkyl, heteroalkyl, substituted alkyl, aryl, heteroaryl, arylalkyl, heteroaryalkyl, substituted aryl, substituted heteroaryl, substituted arylalkyl, and substituted heteroarylalkyl; $R_{14}$ and $R_{15}$ taken together with the atoms to which they attach optionally form a 5- to 7-membered ring optionally incorporating one or two ring heteroatoms chosen from N, O, or S, which is unsubstituted or substituted with 1, 2, or 3 substituents independently selected from the group consisting of halo, methyl, and methoxy; $R_{16}$ and $R_{17}$ are independently in each occurrence $H$ or alkyl; $R_{16}$ and $R_{17}$ taken together with the atoms to which they attach optionally form a 3- to 6-membered ring; $R_{18}$ and $R_{19}$ are independently in each occurrence selected from the group consisting of hydrogen and alkyl, wherein the alkyl is unsubstituted or substituted with 1 substituent selected from the list consisting of halo, hydroxy, alkoxy, amino, thio, methylthio, --C(O)OH, --C(O)O-(alkyl), --CONH$_{2}$, aryl, and heteroaryl, wherein the aryl or heteroaryl are unsubstituted or substituted from the list consisting of alkyl, haloalkyl, hydroxy, and alkoxy, haloalkoxy; $R_{14}$ and $R_{18}$ taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; $R_{14}$ and $R_{19}$ taken together with the atoms to which they attach optionally form a 5- to 7-membered ring; wherein Formula IV includes enantiomers, pharmaceutically acceptable salts, and polymorphs of the compounds of Formula IV.

"Compositions are also provided including a composition comprising at least one compound according to Formula I, II, III, and IV and at least one other component. In one embodiment, the composition is formulated for transdermal delivery. In another embodiment, the composition is formulated for transdermal delivery with a patch. In one embodiment, the composition can further comprise at least one solvent. In one embodiment, the amount of the compound according to Formula I, II, III, or IV is adapted to provide a useful delivery profile for treatment of a human. In one embodiment, the treatment is carried out on a subject, such as a mammal, but the subject is not a human.

"At least one advantage for at least one embodiment includes ability to tailor the chemical structure of a pharmaceutically useful motif for a particular use including treatment and prophylactic use against, for example, PH and PAH. For example, the drug delivery profile can be adapted for a particular application.

"At least one additional advantage for at least one embodiment includes ability to use the compounds to provide better bioavailability including use in transdermal drug delivery applications.
DETAILED DESCRIPTION

"Introduction

"Priority U.S. provisional application 61/751,608 filed Jan. 11, 2013 is incorporated herein by reference in its entirety for all purposes including the chemical formulae and claims, including Formula I, Formula II, and Formula III, as well as Schemes 1-4, examples, and the tables of structures on pages 14-16.

"Various prostacyclin analogs, including treprostinil, and methods for their use are known. For example, they can be used in promoting vasodilation, inhibiting platelet aggregation and thrombus formation, stimulating thrombolysis, inhibiting cell proliferation (including vascular remodeling), providing cytoprotection, and preventing atherogenesis and inducing angiogenesis. Through these prostacyclin-mimetic mechanisms, these compounds may be used in the treatment of/for: pulmonary hypertension, ischemic diseases (e.g., peripheral vascular disease, Raynaud's phenomenon, Scleroderma, myocardial ischemia, ischemic stroke, renal insufficiency), heart failure (including congestive heart failure), conditions requiring anticoagulation (e.g., post MI, post cardiac surgery), thrombotic microangiopathy, extracorporeal circulation, central retinal vein occlusion, atherosclerosis, inflammatory diseases (e.g., COPD, psoriasis), hypertension (e.g., preeclampsia), reproduction and parturition, cancer or other conditions of unregulated cell growth, cell/tissue preservation, and other emerging therapeutic areas where prostacyclin treatment appears to have a beneficial role. These compounds may also demonstrate additive or synergistic benefit in combination with other cardiovascular agents (e.g., calcium channel blockers, phosphodiesterase inhibitors, endothelial antagonists, and antiplatelet agents).

"Treprostinil is a chemically stable analog of prostacyclin. Although treprostinil sodium (Remodulin.RTM.) is approved by the Food and Drug Administration (FDA) for subcutaneous administration, treprostinil as the free acid has an absolute oral bioavailability of less than 10% and a very short systemic half life due to significant metabolism."

Keywords for this news article include: Antithrombotic, Biotechnology, Gases, Patents, Elements, Hydrogen, Isotopes, Deuterium, Cardiology, Heart Disease, Heart Failure, Drugs and Therapies, Inorganic Chemicals, Transdermal Delivery, Treprostinil Therapy, Vitamin K Antagonist, Cardiovascular Agents, Drug Delivery Systems, Heart Disorders and Diseases.

Patent

Patent Application Titled "Unitary Endoscopic Vessel Harvesting Devices" Published Online (USPTO 20160367279)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors Orphanos, Mark J. (Foxboro, MA);
Glennon, Michael (Norwell, MA), filed on June 16, 2016, was made available online on December 29, 2016.

No assignee for this patent application has been made.

Reporters obtained the following quote from the background information supplied by the inventors: "Vessel harvesting is a surgical technique that is commonly used in conjunction with coronary artery bypass surgery. During a bypass surgery, blood is rerouted to bypass blocked arteries to restore and improve blood flow and oxygen to the heart. The blood may be rerouted using a bypass graft, where one end of the by-pass graft is attached to a blood source upstream of the blocked area and the other end is attached downstream of the blocked area, creating a 'conduit' channel or new blood flow connection bypassing the blocked area. Commonly, a surgeon will remove or 'harvest' healthy blood vessels from another part of the body to create the bypass graft. The success of coronary artery bypass graft surgery may be influenced by the quality of the conduit and how it is handled or treated during the vessel harvest and preparation steps prior to grafting.

"Vessel harvesting methods involve selecting a vessel, traditionally, the great saphenous vein in the leg or the radial artery in the arm to be used as a bypass conduit sealing off and cutting smaller blood vessels that branch off the main vessel conduit and harvesting the main conduit from the body. This practice does not harm the remaining blood vessel network, which heals and maintains sufficient blood flow to the extremities, allowing the patient to return to normal function without noticeable effects.

"Minimally invasive technique for vessel harvesting is known as endoscopic vessel harvesting, a procedure that requires only small incisions. While the endoscopic vessel harvesting procedure is an improvement over a traditional 'open' procedure that required a single, long incision from groin to ankle, the endoscopic procedure is still cumbersome and difficult. In particular, current endoscopic harvesting systems require multiple tools, which increases the potential for injury to the bypass conduit as well as increases the duration of the procedure. Accordingly, improvements in systems and methods for endoscopic vessel harvesting are still needed."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "Unitary endoscopic vessel harvesting devices are disclosed. In an embodiment of the present disclosure, such devices comprise an elongated body having a proximal end and a distal end, an inflatable tip disposed at the distal end of the elongated body; and a cutting unit having a first cutting portion and a second cutting portion, the first cutting portion and the second cutting portion being moveable in a longitudinal direction relative to the elongated body to capture a blood vessel between the first cutting portion and the second cutting portion, and being rotatable relative to one another circumferentially about the tip to cut the captured blood vessel.

"In some embodiments, the inflatable tip has an inner cavity in communication with one or more lumens and into which an endoscope is advanced for endoscopic viewing of a harvesting procedure performed by the device. The inflatable tip has a rigid, conical shape when the inflatable tip is fully inflated. The inflatable tip is optically clear so as not to interfere with the endoscopic viewing, and the inflatable tip is comprised of a material sufficient to maintain the conical shape through a vessel dissection. In some embodiments, a wall of the inflatable tip drapes tautly over the endoscope without distorting the endoscopic viewing when the inflatable tip is uninflated.

"In some embodiments, such devices comprise an elongated body having a proximal end and a distal end, a conditioned tip disposed at the distal end of the elongated body; and a cutting unit having a first cutting portion and a second cutting portion, the first cutting portion
and the second cutting portion being moveable in a longitudinal direction relative to the elongated body to capture a blood vessel between the first cutting portion and the second cutting portion, and being rotatable relative to one another circumferentially about the tip to cut the captured blood vessel. In some embodiments the conditioned tip further comprises a conditioned surface which is conditioned through mechanical polishing techniques or through chemical polishing techniques. In some embodiments the mechanical polishing techniques comprise buffing and the chemical polishing techniques comprise vapor polishing.

"In some embodiments, such devices comprise an elongated body having a proximal end and a distal end, a coated tip disposed at the distal end of the elongated body; and a cutting unit having a first cutting portion and a second cutting portion, the first cutting portion and the second cutting portion being moveable in a longitudinal direction relative to the elongated body to capture a blood vessel between the first cutting portion and the second cutting portion, and being rotatable relative to one another circumferentially about the tip to cut the captured blood vessel. In some embodiments, the coated tip further comprises a coating on a surface of the coated tip, the coating providing increased surface tension and lubricity to the coated tip. The coating may be selected from one of paralene, polytetrafluoroethylene, fluorinated ethylene propylene, silicon or tethered liquid perfluorocarbon. In further embodiments, the coating may be applied to an inflatable tip or a conditioned tip.

"In some embodiments, the present devices comprise an elongated body having a proximal end and a distal end and an inflatable tip disposed at the distal end of the elongated body, wherein the inflatable tip has a conical shape when the inflatable tip is fully inflated. The device may further include a cutting unit having a first cutting portion and a second cutting portion, the first cutting portion and the second cutting portion being moveable in a longitudinal direction relative to the elongated body from a retracted position substantially proximally of the tip to an extended position over the tip to capture a blood vessel between the first cutting portion and the second cutting portion, and being rotatable relative to one another circumferentially about the tip to cut the captured blood vessel.

BRIEF DESCRIPTION OF DRAWINGS

"The presently disclosed embodiments will be further explained with reference to the attached drawings, wherein like structures are referred to by like numerals throughout the several views. The drawings shown are not necessarily to scale, with emphasis instead generally being placed upon illustrating the principles of the presently disclosed embodiments.

"FIG. 1A illustrates a side view of an embodiment of an endoscopic cannula of the present disclosure.

"FIG. 1B and FIG. 1C illustrate an embodiment of a dissection tip of the present disclosure having an indent at the distal tip.

"FIG. 1D and FIG. 1E illustrate an alternative embodiment of an endoscopic cannula having a dissection tip comprised of an inflatable balloon at the distal tip. FIG. 1D shows the inflatable balloon fully inflated, and FIG. 1E shows the inflatable balloon in an uninflated state.

"FIGS. 2A-2C illustrate a dissection procedure using an endoscopic cannula of the present disclosure.

"FIG. 3A, FIG. 3B and FIG. 3C illustrate an embodiment of a cutting unit of an endoscopic cannula of the present disclosure.

"FIGS. 4A-4D illustrate an embodiment of a cutting unit of an endoscopic cannula of the present disclosure.

"FIG. 5 illustrates an embodiment of a control handle suitable for use with an
endoscopic cannula of the present disclosure.

"FIGS. 6A-6F illustrate an embodiment of an endoscopic cannula of the present disclosure in operation being controlled by the control handle of FIG. 5.

"FIGS. 7A-7B illustrate an embodiment of a cutting unit of an endoscopic cannula of the present disclosure.

"FIG. 8 illustrates an embodiment of a cutting unit of an endoscopic cannula of the present disclosure.

"FIG. 9A, FIG. 9B and FIG. 9C illustrate an embodiment of a cutting unit of an endoscopic cannula of the present disclosure.

"FIG. 10A and FIG. 10B illustrate an embodiment of a cutting unit of an endoscopic cannula of the present disclosure.

"While the above-identified drawings set forth presently disclosed embodiments, other embodiments are also contemplated, as noted in the discussion. This disclosure presents illustrative embodiments by way of representation and not limitation. Numerous other modifications and embodiments can be devised by those skilled in the art which fall within the scope and spirit of the principles of the presently disclosed embodiments."

Patents

Patent Application Titled "Use of Chemical Compounds That Can Inhibit the Toxic Activity of Sphingomyelinase D from Venoms of Loxosceles Spiders and Pharmaceutical Composition Comprising Said Compounds" Published Online (USPTO 20160367533)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors TAMBOURGI, Denise Vilarinho (Sao Paulo, BR); LOPES, Priscila Hess (Sao Paulo, BR); MURAKAMI, Mario Tyago (Sao Paulo, BR); PORTARO, Fernanda Calheta Vieira (Sao Paulo, BR), filed on December 2, 2014, was made available online on December 29, 2016.

No assignee for this patent application has been made.

Reporters obtained the following quote from the background information supplied by the inventors: "Loxoscelism (accident involving brown recluse spider) has been described in several continents. It corresponds to the most severe form of araneism in Brazil. The majority of accidents notified occur in the South Region of the country, particularly in Parana and Santa Catarina. The accident occurs more commonly with adults, with a small predominance in women, occurring at home. A centripetal distribution of insect bites is observed, which affect
more the thigh, the upper body or arm.

"The most important component of Loxosceles venom is sphingomyelinase D, that acts on the extracellular matrix and through the activation of the complement system and action on endothelial cells, epithelial cells, leukocytes and platelets, which causes the release of inflammatory mediators, obstruction of small vessels at the site of venom inoculation and consequent tissue damage. Likewise, hemolysis has been attributed to the action of sphingomyelinase-D on endogenous metalloproteinases. Once activated, they act on the membrane proteins of red blood cells, making them susceptible to complement action.

"The Brazilian patent application PI 0514809-0 A, filed on Aug. 29, 2005, on behalf of National Autonomous University of Mexico) and Laboratorios Silanes S.A. of C.V. and entitled: 'Imunogeno e antiveneno contra o veneno da aranha marrom' describes the isolation, characterization and expression of coding DNA fragments of sphingomyelinas D of 3 species of spiders of the genus Loxosceles: L. boneti, L. reclusa and L. laeta and its use as an immunogen for the production of neutralizing antibodies of the corresponding venom and of respective F(ab')2 fragments. Said document PI 0514809-0 also reports the use of recombinant sphingomyelinas D as part of an antigenic array useful in immunopurifying antibodies and its fragments as part of a diagnostic device for venoming by spider of the genus Loxosceles.

"As can be observed, document PI 0514809-0 basically describes the production of recombinant sphingomyelinas for producing neutralizing antibodies against spider venom of the genus Loxosceles and its use in compositions for treating venoming by these spiders. In no time document PI 0514809-0 describes or suggests the use of inhibitor compounds belonging to the class of benzenesulfonamides and chloro-benzenesulfonates for treating symptoms associated with loxoscelism caused by the bite of spiders belonging to genus Loxosceles.

"The international patent application WO 01/74343, filed on Mar. 30, 2001, published on Oct. 11, 2001; on behalf of 3M INNOVATIVE PROPERTIES COMPANY and entitled: 'Method for the treatment of dermal lesions caused by envenomation' relates to a method of treating skin lesions caused by venoming, comprising the application, at the site of injury, of a therapeutically effective amount of a modifier compound of the immune response selected from the group consisting of imidazoquinoline amines, imidazopyridine amines, 6,7-fused cycloalkyl imidazopyridine amines, imidazonaphtiridine amines, tetra-hydro imidazonaphtiridine amines, oxazolopyridine amines, oxazoloquinoline amines, thiazolopyrimidine amines, thiazoloquinoline amines and 1,2-bridged imidazoquinoline amines.

"As noted, the international patent application WO 01/74343 only provides the use of known immune response modifier (IRMs) compounds mentioned above, which are able to stimulate the innate and acquired immune response for the treatment of skin lesions by venoming caused, for example, by bites of spiders of the genus Loxosceles, among others. Said international patent application WO 01/74343 neither mentions nor suggests the use of specific inhibitor compounds to sphingomyelinas (D) present in the venom of spiders of the genus Loxosceles for the treatment of skin lesions and/or to avoid developing loxoscelism.

"The international patent application WO 2007/149343, filed on Jun. 15, 2007, published on Dec. 27, 2007; on behalf of THE BOARD OF TRUSTEES OF THE LELAND STANFORD JUNIOR UNIVERSITY and entitled: 'Proteases for treatment of venemous bites' relates to materials and methods, including kits, for use in the treatment of venom bites, bee stings, spider bites and other forms of venoming or exposure to toxins. The materials and methods involve the use of proteases associated with the protective mechanism of mast cell degranulation, associated with a reduction in the toxic effects and increased survival rate in animal models. The proteases used are selected from the group containing chymases (specificity to a substrate similar to chymotrypsin), carboxypeptidase A, carboxypeptidase B, trypases
(specificity to a substrate similar to trypsin), chymotrypsin or papain.

"Although the international patent application WO 2007/149343 uses, in its embodiment examples, treatment for venoming caused by spider Loxosceles reclusa, said international patent application WO 2007/149343 does not provide for the use of a specific inhibitor compound for sphingomyelinase D of spiders of the genus Loxosceles.

"The international patent application WO 2008/022771, filed on Aug. 21, 2007, and published on Feb. 28, 2008; on behalf of NOVARTIS AG and entitled: 'Amides as sphingomyelinase inhibitors' describes a formulation that provides the use of acid sphingomyelinase for treating disorders mediated by the activity of acid sphingomyelinase present in the lysosome of mammalian cells, such as autoimmune diseases, diseases involving abnormal apoptosis and tumor growth. Therefore, said document does not describe any compounds that can specifically inhibit the toxicity of sphingomyelinases D from the venoms of spiders of the genus Loxosceles, controlling the development of cutaneous and systemic loxoscelism.

"The article published in Journal of Investigative Dermatology (2007), volume 127, pages 1410 to 1418, available online on Jan. 11, 2007, Authors: Danielle Paixao-Cavalcante, Carmem W. van der Berg, Rute M. Goncalves-de-Andrade, Matheus de F. Fernandes-Pedrosa, Cinthya Kimori Okamoto e Denise V. Tambourgi, entitled: 'Tetracycline protects against dermonecrosis induced by loxosceles spider venom', relates to the use of classic tetracycline antibiotics (tetracycline, doxycycline and minocycline) in the inhibition or reduction of dermonecrotic lesions and to the mechanisms involved in the development of cutaneous loxoscelism induced by the venom of Loxosceles spiders through in vitro and in vivo experiments. According to this document, the topical treatment is more effective in the prevention or reduction of dermonecrotic lesions than the oral (systemic) treatment, possibly by the concentration of tetracyclines used which, in high systemic concentrations, can lead to toxicity. According to said document, the binding of sphingomyelinase D from the venom of Loxosceles spiders to the cell surface induces the expression and activation of endogenous metalloproteinases (MMPs). Thus, the mechanism of action proposed in the document involves the tetracycline inhibitory action on metalloproteinases (MMPs), whose expression and activation are induced by the venom of Loxosceles spiders. In no time said document refers to the use of compounds belonging to the class of benzenesulfonamides and chloro-benzenesulfonates with similar purposes.

"As can be observed, there is no state of the art document that describes or suggests the use of inhibitor compounds belonging to the class of benzenesulfonamides and benzenesulfonates for treating symptoms associated with loxoscelism caused by the bite of spiders belonging to genus Loxosceles.

"Dictionary--See detailed dictionary"

In addition to obtaining background information on this patent application, NewsRx
Editors also obtained the inventors’ summary information for this patent application: “In order to solve the problems mentioned above, this invention provides significant advantages related to the use of inhibitor compounds belonging to the class of benzenesulfonamides and benzenesulphonate for treating symptoms associated with loxoscelism caused by the bite of spiders belonging to genus Loxosceles, enabling an increase in their performance and offering a more favorable cost/benefit ratio.

“This invention relates to the use of inhibitors compounds belonging to the class of benzenesulfonamides and benzenesulphonate with inhibitory activity on sphingomyelinases D of the venom of Loxosceles spiders for preparing a medicine to act on the lytic activity of recombinant sphingomyelinase D toxin (SMase D) and of the venom of brown recluse spider Loxosceles laeta.

“The present invention preferably relates to the use of 4-bromo-N-[(E)-(2-methyl-1H-indol-3-yl)methyleneamino]benzenosulfonamide and of 4-methyl-3-oxo-2-(3-pyridylmethylene)benzo[3,4-b]furan-6-yl-4-chlorobenzenesulfonate (compounds 5 and 6, respectively), which are compounds that can inhibit the toxicity action of sphingomyelinases D of the venom of Loxosceles, controlling the development of cutaneous and systemic loxoscelism; reduction of hemolysis, inhibition of cutaneous lesion, inhibition of dermonecrosis, inhibition of the intracellular signaling pathways and production of reactive oxygen species. Besides the therapeutic potential, such inhibitors can be used as tools in the study of the action of sphingomyelinases and phospholipases D.

“In a second aspect, this invention relates to a pharmaceutical composition for treating loxoscelism, hemolysis reduction, inhibition of cutaneous lesion, inhibition of dermonecrosis, inhibition of intracellular signaling pathways and production of reactive oxygen species, which comprises a benzenesulfonamide compound and a pharmaceutically acceptable vehicle. The benzenesulfonamide compound preferably being the compound 4-bromo-N-[(E)-(2-methyl-1H-indol-3-yl)methyleneamine]benzenosulfonamide.

“A third aspect of this invention relates to a pharmaceutical composition for treating loxoscelism, hemolysis reduction, inhibition of cutaneous lesion, inhibition of dermonecrosis, inhibition of intracellular signaling pathways and production of reactive oxygen species, which comprises a benzenesulphonate compound and a pharmaceutically acceptable vehicle. The benzenesulphonate compound preferably being compound 4-methyl-3-oxo-2-(3-pyridylmethylene)benzo[3,4-b]furan-6-yl-4-chlorobenzenesulfonate.

BRIEF DESCRIPTION OF THE DRAWINGS

“The structure and operation of the invention, along with the additional advantages thereof, can be better understood by reference to the attached drawings and the description that follows:

“FIG. 1 shows the structural formula of compound 5--4-bromo-N-[(E)-(2-methyl-1H-indol-3-yl)methyleneamino]benzenosulfonamide;

“FIG. 2 shows the structural formula of compound 6--4-methyl-3-oxo-2-(3-pyridylmethylene)benzo[3,4-b]furan-6-yl-4-chlorobenzenesulfonate;

“FIG. 3 shows a graphic indicating the inhibition ability of the hydrolytic activity of recombinant sphingomyelinases and present in the venom of Loxosceles laeta, on the substrate sphingomyelin (SM), by compounds 5 and 6;

“FIG. 4 shows a graphic indicating the inhibition ability of the hydrolytic activity of recombinant sphingomyelinases and present in the venom of Loxosceles laeta, on the substrate lysophosphatidylcholine (LPC), by compounds 5 and 6;
"FIGS. 5 (a) and 5 (b) show the dose-response curves of compounds 5 and 6 in the inhibition of the hydrolytic activity on SM, on which basis the IC_{50} values of compounds have been calculated;

"FIG. 6 presents the inhibition percentage of removal of glycoporphin C from the surface of red blood cells by compounds 5 and 6, a crucial event in the development of complement system-dependent hemolysis observed in venoming;

"FIG. 7 shows the inhibition percentage of the sphingomyelinases D binding to the surface of red blood cells, by compounds 5 and 6;

"FIGS. 8 and 9 represent the ability of compounds 5 and 6 to reduce the death of human keratinocytes induced by recombinant sphingomyelinases present in the venom of L. laeta;

"FIG. 10 shows the inhibition percentage of the binding of recombinant sphingomyelinases present in the venom to the cell membrane of human keratinocytes, by compounds 5 and 6;

"FIG. 11 describes the inhibition percentage of production/secretion of matrix metalloproteinases (MMP-2 and 9) by human keratinocytes treated with recombinant sphingomyelinases D promoted by compounds 5 and 6;

"FIG. 12 shows the inhibition percentage of the development of dermonecrotic lesions in rabbits, analyzed 24, 48 and 72 hours after inoculation of the venom, by compounds 5 and 6;

"FIG. 13 represents the inhibition percentage of MAPK ERK1/2 intracellular signaling pathway activation in human keratinocytes treated with recombinant sphingomyelinases D by compounds 5 and 6;

"FIG. 14 shows the inhibition percentage of superoxide ion production by human keratinocytes treated with sphingomyelinases D recombinant, by compounds 5 and 6;

"FIG. 15 shows the inhibition percentage of the production of cytokines TNF-.alpha. and TGF-.beta.1 by human keratinocytes treated with the recombinant sphingomyelinases D, by compounds 5 and 6;

"FIG. 16 shows the average inhibition of all activities tested for compounds 5 and 6;

"FIG. 17 shows the action of inhibitor compounds 5 and 6 on the substrate hydrolytic activity of PLD of Corynebacterium pseudotuberculosis;

"FIG. 18 shows the action of inhibitor compounds 5 and 6 on the hydrolytic activity on sphingomyelin substrate, of PLD of Bacillus cereus; and

"FIG. 19 shows the action of inhibitor compounds 5 and 6 on the hydrolytic activity on sphingomyelin substrate, of PLD of Staphylococcus aureus.

"Annex 1 shows microphotographs of histopathological analysis of the skin of rabbits inoculated with the venom of L. laeta or with the venom incubated with compounds 5 and 6."

Patent Application Titled "Vascular Stents and Related Methods"
Published Online (USPTO 20160367388)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Washington, D.C., by NewsRx journalists, a patent application by the inventors Skousen, Darrell J. (Lehi, UT); Jensen, Brian D. (Orem, UT); Bowden, Anton E. (Lindon, UT), filed on March 1, 2016, was made available online on December 29, 2016.

The assignee for this patent application is Brigham Young University.

Reporters obtained the following quote from the background information supplied by the inventors: "The leading cause of death in the United States is heart disease, claiming approximately 24% of all deaths. Coronary artery disease is a condition where coronary arteries narrow due to fatty plaque build up, reducing the blood flow to the heart which can lead to heart failure and death. A minimally invasive procedure called percutaneous coronary intervention (PCI) including balloon and stent angioplasty has been developed to treat coronary artery disease.

"There are two major complications associated with PCI: restenosis (renarrowing) and thrombosis (blood clots). Restenosis is caused by a combination of early elastic recoil, negative remodeling, and neoimtimal formation. Early elastic recoil occurs immediately, and is due to the elastic properties of the arteries. Late lumen loss in balloon angioplasty is caused by neoimtima formation (tissue in-growth) and negative remodeling (arterial shrinking). In stent angioplasty, a cylindrical scaffold wire mesh (stent) typically made of stainless steel is implanted in the artery to prevent restenosis. These stents prevent elastic recoil and negative remodeling, however, neoimtimal formation can still lead to restenosis.

"Stents have proven to reduce the rates of restenosis more than angioplasty alone. Drug-eluting stents have further reduced restenosis rates, but there is a concern for their ability to prevent late-term thrombosis. New stent materials that can improve these two complications associated with existing coronary stents will be advantageous in stent development."

In addition to obtaining background information on this patent application, NewsRx editors also obtained the inventors' summary information for this patent application: "In accordance with one embodiment, the invention provides a vascular stent assembly, including at least a first and a second strut, each including a thickness and a depth. A pair of end radii can also be provided, with each of the first and second struts extending from one of the pair of end radii. A thickness of at least one of the first and second struts can include a tapering profile extending from one of the end radii to another of the end radii. The tapering profile can follow a continuously increasing or decreasing function through at least half a length of the at least one strut.

"In accordance with another aspect of the invention, a vascular stent assembly is provided, including a series of struts, each including a length, a thickness and a depth. A series
of end radii can also be provided, each of the struts extending between one end radii on one end of the strut and another end radii on another end of the strut. A thickness of each of the struts includes a tapering profile extending from one end of the strut to another end of the strut, the thickness of the tapering profile continuously increasing or decreasing along the length of the strut through at least half a length of the strut. The depth of each of the struts can be substantially constant along the length of the strut.

BRIEF DESCRIPTION OF THE DRAWINGS

"Additional features and advantages of the invention will be apparent from the detailed description which follows, taken in conjunction with the accompanying drawings, which together illustrate, by way of example, features of the invention; and, wherein:

"FIG. 1 is a perspective view of selected segments of a stent in accordance with an embodiment of the invention;

"FIG. 2 is a side view of two struts and three end radii of a stent segment in accordance with an embodiment of the invention;

"FIG. 3 is a perspective view of end radii of a conventional stent and a stent in accordance with the present technology;

"FIG. 4 is a side, partial view of a stent strut in accordance with an embodiment of the invention;

"FIG. 5 is a side, partial view of another stent strut in accordance with an embodiment of the invention;

"FIG. 6 is a side, partial view of another stent strut in accordance with an embodiment of the invention;

"FIG. 7 is a side, partial view of another stent strut in accordance with an embodiment of the invention;

"FIG. 8 is a perspective, partial view of a cylindrical stent assembly in accordance with an embodiment of the invention; and

"FIG. 9 is a perspective, partially sectioned view of a stent assembly installed within an artery in accordance with an embodiment of the invention.

"Reference will now be made to the exemplary embodiments illustrated, and specific language will be used herein to describe the same. It will nevertheless be understood that no limitation of the scope of the invention is thereby intended."

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
Geneva, Switzerland --- By a News Reporte r-Staff News Editor at Obesity, Fitness & Wellness Week -- From Alexandria, Virginia, NewsRx journalists report that a patent by the inventors Zhang, Fuli (Shanghai, CN); Yang, Zhezhou (Shanghai, CN); Bao, Rusheng (Taizhou, CN); Qiu, Pengcheng (Shanghai, CN); Jin, Linyong (Shanghai, CN); Pan, Hu (Shanghai, CN); Pan, Linyu (Shanghai, CN); Jiang, Dongming (Taizhou, CN); Xu, Weiwei (Taizhou, CN), filed on June 23, 2014, was published online on December 27, 2016.

The patent’s assignee for patent number 9527804 is Zhejiang Hisun Pharmaceutical Co., Ltd. (CN).

News editors obtained the following quote from the background information supplied by the inventors: "Praziquantel is a broad spectrum insecticide, and is especially suitable for the treatment of acute and chronic schistosomiasis along with complications, which is a choice drug for treating schistosomiasis at present. The structural formula of praziquantel is formula V as below:

"##STR00002##

"Francisco Yuste et al. (Journal of Heterocyclic Chemistry, 1986, Vol. 23, p 189-190.) discloses a method for preparing praziquantel with the following reaction scheme, wherein the key intermediate compound of formula IV was subjected to many reaction steps to obtain the praziquantel compound of formula V.

"##STR00003##

"As to the key intermediate 4-benzyl-1-phenethyl-piperazine-2,6-dione (the compound of formula IV) in the above reaction, Francisco Yuste et al. (Journal of Heterocyclic Chemistry, 1986, Vol. 23, p 189-190.) and Malcolm D. Brewer et al. (Journal of Medicinal Chemistry, 1989, Vol. 32, No. 9, p 2058-2062.) disclose a method for preparing this compound.

"##STR00004##

"As disclosed in the method, the compound of formula I was directly mixed with \( \beta\)-phenethylamine and heated to 200.\degree\ C., to obtain the compound of formula IV at a yield of 65%. This method has a low yield and produces many impurities, thus the product is hard to purify. Meanwhile, the high-temperature reaction not only is energy-consuming, but also has a high requirement on the device, which is hard to achieve industrial production.

"In view of the importance of the compound of formula IV in synthesizing praziquantel compound of formula V, it is greatly meaningful to develop a preparation method having high yield, high purity and being easily applicable in industrial production."

As a supplement to the background information on this patent, NewsRx correspondents also obtained the inventors’ summary information for this patent: "The present invention provides a new key intermediate (a compound of formula III) for synthesizing the schistosomicide, or pharmaceutically acceptable salts thereof.

"##STR00005##

"wherein, the pharmaceutically acceptable salts of the compound of formula III may be sulfates, hydrochlorides, phosphates, acetates, oxalates, formates, nitrates or mesylates.

"The present invention further provides a method for preparing the compound of
formula III comprising the reaction steps of:

"Step 1. carrying out a dehydration reaction between a compound of formula I and acetic anhydride

"##STR00006##
"to obtain a compound of formula II
"##STR00007##

"Step 2. carrying out an acylation reaction between the compound of formula II and \( \beta \)-phenethylamine with the presence of an aprotic organic solvent or without a solvent, to obtain the compound of formula III.

"In the above reaction step 1, the compound of formula II can be prepared from a compound of formula I by the method according to the literature (US2009105269; Journal of Heterocyclic Chemistry; vol. 3; 1966; p. 503-511).

"The aprotic organic solvents in step 2 are selected from ether, aromatic hydrocarbon, hydrocarbon or halogenated hydrocarbon, ester and ketone solvents.

"Further, the above ether solvents are selected from tetrahydrofuran, ethyl ether, 1,2-dimethoxyethane, methyl tert-butyl ether and 2-methyl tetrahydrofuran; the aromatic hydrocarbon solvents are selected from benzene, toluene, ethylbenzene and dimethylbenzene; the hydrocarbon or halogenated hydrocarbon solvents are selected from n-hexane, cyclohexane, n-heptane, dichloromethane, trichloromethane and dichloroethane; the ester solvents are selected from methyl formate, ethyl formate, methyl acetate, ethyl acetate and isopropyl acetate; and the ketone solvents are selected from acetone, butanone and methyl isobutyl ketone.

"Further, the aprotic organic solvents are preferably methyl tert-butyl ether, acetone, toluene, ethyl acetate or isopropyl acetate.

"In step 2, the temperature of the acylation reaction is 0-100 degree. C., preferably 5-40 degree. C., more preferably room temperature.

"The present invention further relates to a method for preparing the key intermediate of praziquantel with the following formula IV, comprising carrying out a cyclization reaction of the compound of formula III in the presence of a dehydrating agent and an alkaline substance in an aprotic organic solvent or without a solvent, to obtain the compound of formula IV as follow:

"##STR00008##

"The dehydrating agents in the cyclization reaction are selected from one or more substances of acetic anhydride, propionic anhydride, trifluoroacetic anhydride, acetyl chloride, propionyl chloride, chloroacetyl chloride, oxalyl chloride, phosgene and triphosgene, preferably acetic anhydride.

"The alkaline substances in the cyclization reaction are selected from one or more substances of triethylamine, imidazole, pyridine, 2-methylpyridine, 2,6-dimethylpyridine, 4-dimethylaminopyridine, piperidine, 1-methylpiperidine, morpholine, 4-methylmorpholine, quinoline, 1-methylpyrroldine, diisopropylamine, dimethylisopropylamine, di(isopropyl) ethylamine and sodium acetate, preferably triethylamine.

"The aprotic organic solvents in the cyclization reaction are selected from ether, aromatic hydrocarbon, hydrocarbon or halogenated hydrocarbon, ester and ketone solvents.

"Further, the above ether solvents are selected from tetrahydrofuran, ethyl ether, 1,2-dimethoxyethane, methyl tert-butyl ether and 2-methyltetrahydrofuran; the aromatic hydrocarbon solvents are selected from benzene, toluene, ethylbenzene and dimethylbenzene; the hydrocarbon or halogenated hydrocarbon solvents are selected from n-hexane, cyclohexane, n-heptane, dichloromethane, trichloromethane and dichloroethane; the ester solvents are selected from methyl formate, ethyl formate, methyl acetate, ethyl acetate and isopropyl acetate;
and the ketone solvents are selected from acetone, butanone and methyl isobutyl ketone.

"Further, the aprotic organic solvents in the cyclization reaction are preferably methyl tert-butyl ether, acetone, toluene, ethyl acetate or isopropyl acetate."

"The temperature of the cyclization reaction is 0-100.degree. C., preferably 40-80.degree. C.

"Another object of the present invention is to provide pharmaceutical acceptable salts of the compound of formula III, which can be prepared by the method as below: the compound of formula III was subjected to salt forming reaction in the presence of acid aqueous solution to obtain the pharmaceutical acceptable salts of the compound of formula III.

"The acid aqueous solutions can be selected from sulfuric acid, hydrochloric acid, phosphoric acid, acetic acid, oxalic acid, formic acid, nitric acid and methanesulfonic acid aqueous solutions.

"The present invention further relates to a method for preparing the compound of formula IV from the pharmaceutical acceptable salt of the compound of formula III: carrying out a cyclization reaction of the pharmaceutical acceptable salt of the compound of formula III in the presence of an alkaline substance and a dehydrating agent, to obtain the compound of formula IV, wherein the alkaline substance and the dehydrating agent are as defined above.

"The present invention further relates to use of the compound of formula III and the pharmaceutical acceptable salts thereof and the compound of formula IV in the preparation of schistosocide praziquantel.

"The design of synthetic process for preparing 4-benzyl-1-phenethyl-piperazine-2,6-dione (the compound of formula IV) is reasonable, economic and environmental. Additionally, the source of the raw materials is convenient, and the product has a high total yield (\( \geq 91\% \)). Furthermore, the compound of formula IV has a high chemical purity (the HPLC purity is more than 98\%) and is easy to achieve industrial mass production.

"The methods of the present invention overcome the shortcomings of current methods for preparing the compounds of formula IV, such as low production volumes, low purity, high energy consumption, high costs, and inability to achieve industrialized production, and provides a method for preparing the compound of formula IV, which is economical, environmental and easy to achieve industrialized production. In the present invention, the reaction solvent of the method is easily recycled and the method can produce the compound of formula IV at a high yield and with a high purity."

**Patent Issued for Ablation Catheter Electrode Having Multiple Thermal Sensors and Method of Use (USPTO 9526574)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Alexandria, Virginia, by NewsRx journalists, a patent by the inventors Wang, Huisun (Maple Grove, MN); Cao, Hong (Maple Grove, MN); Dando, Jeremy D. (Plymouth, MN), filed on September 30, 2014, was published online on December 27, 2016.

The assignee for this patent, patent number 9526574, is St. Jude Medical, Atrial Fibrillation Division, Inc. (St. Paul, MN).

Reporters obtained the following quote from the background information supplied by the inventors:

"a. Field of the Invention

The instant invention relates generally to devices and methods for ablating tissue. The diagnosis and treatment of electrophysiological diseases of the heart are described in connection with the devices and methods of the present invention. In particular, the instant invention relates to devices and methods related to cardiac ablation for the treatment of atrial fibrillation, as well as the advantages of devices that employ more accurate temperature monitoring during ablation at selected cardiac sites.

"b. Background Art

It is well known that atrial fibrillation results from disorganized electrical activity in the heart muscle, or myocardium. The surgical 'Maze' procedure has been developed for treating atrial fibrillation and involves the creation of a series of surgical incisions through the atrial myocardium in a pre-selected pattern to create conductive corridors of viable tissue bounded by non-conductive scar tissue.

In performing the Maze procedure and its variants, whether using ablation or surgical incisions, it is generally considered most efficacious to include a transmural incision or lesion that isolates the pulmonary veins from the surrounding myocardium. The pulmonary veins connect the lungs to the left atrium of the heart. The Maze procedures have been found to offer 57-70% success without antiarrhythmic drugs. However, they are also associated with a 20-60% recurrence rate several possible factors, including incomplete lesions, lesion recovery, non-pulmonary vein foci of the arrhythmia, or the need for further tissue modifications.

As an alternative to the surgical incisions used in the Maze procedure, transmural ablations of the heart have also been used. The use of catheters for ablating specific locations within the heart has been disclosed, for example in U.S. Pat. Nos. 4,641,649, 5,263,493, 5,231,995, 5,228,442 and 5,281,217. Such ablations may be performed either from within the chambers of the heart (endocardial ablation) using endovascular devices (e.g., catheters) introduced through arteries or veins, or from outside of the heart (epicardial ablation) using devices introduced into the chest. Various ablation techniques have been used, including cryogenic, radiofrequency (RF), laser and microwave ablation. The ablation devices are used to create transmural lesions--that is, lesions extending throughout a sufficient thickness of the myocardium to block electrical conduction, which effectively forms boundaries around the conductive corridors in the atrial myocardium. Perhaps the most advantageous aspect of the use of transmural ablation rather than surgical incisions is the ability to perform the procedure on the beating heart without the use of cardiopulmonary bypass.

Producing precise transmural lesions during cardiac ablation presents significant
obstacles for the physician for several reasons. First, the elongated and flexible vascular ablation devices are difficult to manipulate into the complicated geometries required for forming the lesions. Additionally, maintaining the proper positioning against the wall of a beating heart can be difficult. Also, visualization of cardiac anatomy and vascular devices is often inadequate which makes identifying the precise position of such devices in the heart difficult, which can result in misplaced lesions.

"During an ablation procedure, precise temperature regulation of the tissue under ablation is another issue encountered by the physician. Tissue ablation generally begins to occur at 50° C., while over-heating occurs at around 100° C. It can be important to monitor the temperature of the tissue during ablation. Most ablation devices accomplish this by measuring the electrode temperature during the ablation. The most common way to monitor the electrode temperature is to install a thermal sensor (e.g., thermocouple or thermistor) inside the tip electrode to measure its temperature.

"One of the shortcomings of current methods of monitoring electrode temperature is that the cylindrical shape of a typical ablation catheter tip often means that only a portion of the catheter tip is in direct contact with the ablation surface. Generally, the catheter electrodes themselves do not retain a great deal of thermal energy because they are made of materials with extremely high thermal conductivity, for instance, metals. Thus, the highest temperatures on the electrode itself are generally seen on that portion of the electrode which is direct contact with the tissue surface. Conversely, portions of the electrode not in direct contact with target tissue are most likely contacting blood or interstitial fluids. Since these fluids can conduct a significant amount of heat away from the ablating tissue, temperatures measured in the blood or interstitial fluid may appear to be significantly cooler than the ablating tissue temperature.

"Temperature monitoring devices that rely on measuring a point temperature on an electrode with only a single sensor can skew tissue temperature readings by other mechanisms. Since an ablation electrode tip can be quite long in comparison with the diameter of a catheter, the contact angle between the catheter and the ablating tissue can also be a significant factor. For instance, consider the case of a catheter electrode that is positioned with only its distal end contacting the tissue. If the temperature sensor is located on the proximal end of the electrode (which is not in contact with the tissue) then a significantly different temperature reading from the one present at the tissue may be measured. Whether the result of tissue-contacting angle or conduction of heat away from the electrode, the monitoring of only a single point temperature can produce misleading readings of the temperature at an ablation surface.

"If presented with an inaccurate temperature reading, a physician may apply an inappropriate amount of ablation energy to the site. If a tissue being ablated does not reach a sufficiently high temperature for a sufficient period of time, the target tissue may receive an incomplete ablation, which can significantly affect the efficacy of the treatment. On the other hand, excessively high electrode temperatures can cause tissue steam-pop, tissue-charring, or other serious over-heat related tissue damage. Additionally, blood contacting an overheated electrode can lead to the formation of coagulum, which can present thrombo-embolic hazards to the patient.

"The limitations of single point temperature monitoring are well known and several attempts have been made to overcome their disadvantages. U.S. Pat. No. 6,312,425 (Simpson, et. al.) discusses a design using multiple thermal sensors to monitor the temperature in a tip electrode. Simpson describes an arrangement of thermal sensors where one sensor is positioned at the distal apex of the tip and a plurality of other thermal sensors are positioned around the circumference of the electrode in a more proximal location on the catheter. Since the highest temperatures are most likely to be found at the portion of the electrode making contact with target tissue, by monitoring and comparing the temperature reading at the distal end of the
electrode to that at the proximal end, a determination can be made of both the maximum temperature being experienced by the tissue and which end of the electrode is performing the ablation.

"Similarly, U.S. Pat. No. 6,616,657 (by the same inventors) discusses a method of using the multiple temperature sensors to determine the orientation of the catheter. Experience with that device has shown that the variation in temperature between the end in contact with tissue and the non-contacting end is approximately 10 degree. C. Therefore, an ablation which is showing a temperature at the distal apex of the electrode that is 10 degree. warmer than the proximal sensor is assumed to be in an 'end-firing' position--with the distal end of the catheter providing all of the ablation energy to the tissue. Similarly, an observation that the proximal ports are 10 degree. warmer than the distal sensor means that the electrode is in a 'side-firing' position--with only the side portion of the catheter contacting the tissue. Temperature differences falling somewhere between 1-10 degree. are assumed to indicate a contacting angle between these two extremes."

"The thermal sensors described in each of the above publications are positioned at different ends of a relatively long electrode. However, it is often desirable to use a short electrode during an ablation procedure in order to improve RF energy transfer efficiency. A typical short electrode of this type has an electrode length of approximately 2.0-2.5 mm. This length is roughly comparable to the diameter of most ablation catheters. As mentioned previously, most ablation electrodes are made from materials having excellent thermal conductivity. In these situations, placement of temperature sensors at the proximal and distal ends of a relatively short electrode may create an undesirable situation where the temperature differences between the sensors will not be significant enough to measure because of the rapid conduction of heat energy from one end of the electrode to the other.

"What are needed, therefore, are devices and methods which allow for precise temperature measurement at several points in relatively short ablation electrodes. The devices and methods would preferably allow the physician to accurately measure the maximum temperature experienced by a target tissue during a thermal ablation and provide information that would allow the physician to determine the extent and orientation of contact between the ablat ing electrode and the target tissue."

In addition to obtaining background information on this patent, NewsRx editors also obtained the inventors' summary information for this patent: "It is desirable to be able to detect and determine the maximum temperature experienced by a target tissue during an ablation procedure. Accurate determination of maximum temperature of an electrode at the target tissue provides increased safety to the patient and can provide the physician with information useful in the placement of ablation catheters, such as the orientation of the ablating surfaces.

"The present invention meets these and other objectives by providing devices and methods for accurately measuring the temperature of an ablation electrode when in contact with tissue, and monitoring temperature changes during an ablation procedure. In one aspect, the invention integrates an ablation catheter having an electrode assembly with at least two thermal sensors disposed near the external surface of the electrode ablating surfaces. The thermal sensors are separated by a thermal insulation member, which functions to thermally shield one thermal sensor from another to effectively produce two or more temperature measurements from two or more different points along the surface of the electrode. The results of the positioning of the thermal sensors combined with the separate temperature measurements at those positions can lead to a determination of the orientation of the ablating electrode and its external surfaces with respect to a target tissue. The invention is especially advantageous when a smaller ablating electrode is used, where the electrode length is approximately the same as its outer diameter in the case of a cylindrical electrode, or approximately the same as the cross-sectional length when
other shapes are employed. With the preferred size of electrodes of about 2.5 mm or about 2.0 mm in diameter and length, the thermal sensors cannot be effectively positioned at distal (or near the terminal end) and proximal (near the elongated catheter body end) areas of the electrode to generate temperature measurements at different ends of the electrode. By employing the electrodes described here, one of skill in the art can position thermal sensors at approximately the same distance from a distal end of the electrode and at different positions along the circumferential or external surface of cylindrical electrodes, for example. The measurement of temperatures from thermal sensors positioned in this manner can advantageously be used to determine which side or surface of the electrode is in contact with tissue and which is not. Furthermore, the use of thermal insulating members or materials to shield one thermal sensor from another, or create distinct isothermal zones of the electrode, provides more accurate temperature measurements.

"In preferred embodiments, the device of the invention comprises an electrode for an ablation catheter, where the tip has a distal end or tip, a partially hollowed core or body region, and a proximal region that is connected to the catheter with elongated end with control functions and a power source for activating an ablation procedure. The tip electrode is designed to incorporate at least two thermal sensors within the partially hollowed core or body region and preferably near the external surface of the electrode. The positioning of the thermal sensors with respect to thermal insulating material or members can effectively shield one thermal sensor from the temperature changes that might occur at the electrode surface near another thermal sensor. Thus, for example, one region of the electrode tip in contact with tissue may register a higher temperature than a region that is not in contact with tissue, and in small electrodes the proximity of these regions can cause both of the thermal sensors to register higher temperatures. Shielding a thermal sensor will substantially reduce the transfer of heat in a metallic electrode. Accordingly, more accurate temperature measurements from each positioned thermal sensor can be rendered into precise orientation information on the electrode tip and its placement on tissue or in the body.

"In another aspect, the invention comprises a method of manufacturing an electrode as described. Employing the partially hollowed region or cuts or slots from a side of the electrode, the manufacture or production of an electrode with multiple isothermal zones, each having a thermal sensor and separated by an insulation member or element, is relatively simple compared to other electrodes having thermal sensors at distal and proximal regions. For example, laser cutting or simple drilling of the metallic electrode from one end can be used to prepare holes or slots to accommodate a thermal sensor in appropriate positions and to accommodate the thermal insulation member or element. As describe here, the positioning of the thermal sensors and insulating members can vary. In preferred aspects where a 2.5 mm electrode is used, the thermal sensors can be positioned at about 0.25 mm from the external surface of the electrode through the use of the laser cutting or drilling process. Filling the hollow or partially hollowed region or holes or slots in the electrode with an appropriate polymer or adhesive can affix the thermal sensors and insulating members in place, and the polymer or adhesive selected can also provide some insulating properties to the electrode design. However, the shape, placement and material selected for the insulating members or elements are preferably employed in a manner where the insulating member is a separate and defined shape from the adhesive or affixing compound, as shown in some of the examples of the figures. Thus, in particular embodiments the methods of the invention encompass using a cylindrical or shaped metal or metal alloy electrode having a length approximately equal to its diameter, cutting three or more slots or holes in the base of the electrode opposite a distal end or tip to create a partially hollowed core region, filling or inserting a thermal insulation member into a slot or hole, and inserting two or more thermal sensors into different slots or holes such
that the thermal insulation member separates at least two thermal sensors, effectively creating an isothermal zone for each thermal sensor.

"In an advantageous aspect of the invention, the ablation catheter electrode is used to determine the orientation of the ablating surface by measuring the temperature at the thermal sensors or measuring the changes in temperature over time. These measurements can be used to determine the orientation of the electrode in contact with a target tissue."

"The foregoing and other aspects, features, details, utilities, and advantages of the present invention will be apparent from reading the following description and claims, and from reviewing the accompanying drawings."

SORIN CRM SAS

Patent Issued for Active Implantable Medical Device for Atrial Stimulation for the Treatment of Heart Failure with Preserved Ejection Fraction (USPTO 9526901)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A patent by the inventors Amblard, Amel (Sceaux, FR); Limousin, Marcel (Paris, FR), filed on March 11, 2016, was published online on December 27, 2016, according to news reporting originating from Alexandria, Virginia, by NewsRx correspondents.

Patent number 9526901 is assigned to SORIN CRM SAS (Clamart, FR).

The following quote was obtained by the news editors from the background information supplied by the inventors: "The invention relates to 'active implantable medical devices' as defined by Directive 90/385/EEC of 20 Jun. 1990 of the Council of the European Communities, specifically implants to continuously monitor heart rhythm and deliver if necessary electrical pulses to the heart for stimulation, resynchronization and/or defibrillation in case of rhythm disorder detected by the device. It more particularly relates to devices for treating heart failure (HF), as an alternative or in addition to the treatment of cardiac rhythm disorders.

"This therapy is designed to resynchronize the contraction of the heart chambers (atrium and ventricle) so as to improve the patient's condition by optimizing the phases of the hemodynamic cycle. The cycle includes pre-ejection, isovolumetric contraction, systolic ejection, isovolumetric relaxation and finally filling of the cavity.

"Most of these devices implement a technique called 'CRT' (Cardiac Resynchronization Therapy) or 'BVP' (Bi-Ventricular Pacing) for delivering, as necessary,
electrical pulses needed to ensure joint and continuous stimulation of the two (left and right) ventricles to resynchronize them. This biventricular resynchronization technique however addresses only one of the forms of heart failure, known as 'systolic failure'. In this form of the disease, the heart muscle is unable to provide the force necessary to ensure adequate cardiac output, and the patient shows signs of expansion resulting in a delay of left ventricular depolarization. CRT biventricular pacing is then used to resynchronize the ventricles and make more uniform cardiac contraction.

"In the other form of heart failure called 'diastolic failure' or 'preserved ejection fraction heart failure' (HFpEF, Heart Failure with preserved Ejection Fraction), there is no desynchronization of the ventricles; it comes from a failure in the left ventricular filling. Biventricular CRT stimulation will be ineffective in this case. This condition affects about 40% of heart failure patients, and there is no known effective treatment to remedy it.

"This form of disease in some patients may be the result of a disorder of conduction in the atria (inter-atrial block), which delays the depolarization, and therefore the contraction of the left atrium (OG) with respect to the right atrium (OD). However, as atrioventricular conduction pathways are not altered, depolarization and contraction of the right (VD) and left (VG) ventricles occur within a reasonable time, without synchronization VD-VG. It is between the contraction of the left atrium and that of the left ventricle that the inter-atrial block OD-OG generates a poor sequencing OG-VG. The delay of the contraction of the left atrium has for consequence that it contracts substantially at the same moment as the left ventricle, and therefore cannot properly fulfill its function and contribute to the left ventricular active filling.

"To treat this heart failure with preserved ejection fraction, a technique of atrial overdriving, pathology, has been proposed. This is described for example in the U.S. Pat. No. 7,494,921B1, which describes permanently stimulating the left atrium to a frequency slightly above the spontaneous sinus rhythm frequency (i.e. the rate of the right atrium), thereby systematically causing premature depolarization of the left atrium and restoring an almost normal OG-VG sequence.

"Specifically, in this technique, the device regularly measures the spontaneous rhythm of the patient and applies a sequence of pacing pulses at a slightly faster rate, arbitrarily programmed to cause a prematurity in the order of 50 to 100 ms compared to an atrial coupling interval corresponding to the spontaneous sinus rhythm. After several cycles at this accelerated pace, the frequency gradually slows until reappearance of spontaneous activity, then the overdriving method is repeated in the same way.

"In the description of this technique, the 'atrial coupling interval' or 'atrial coupling' is defined as the time interval separating two spontaneous (in sinus rhythm, also designated as 'PP interval') or stimulated consecutive atrial events. The applied stimulation frequency thus varies continuously between values wherein it is too fast (overdriving period) or too slow (period of reappearance of spontaneous rhythm, with OD-VD synchronization), without real monitoring of the effectiveness of a possible return to a proper synchronization of the left cavities.

"It should also be noted that this pacing mode may interfere with the filling of the right cavities. In fact, due to premature stimulation of the left atrium, the OD-VD synchronization is significantly altered in a manner which may be incompatible with satisfactory filling of the right ventricle (we will clarify these aspects in the detailed description).

Improvement therapy in left ventricular filling is thus likely to induce adverse effects on the filling of the right ventricle, so in the cavity that was not affected by the pathology to be treated.

"Moreover, this technique requires the presence of a right ventricular sensing lead, so as to ensure that overdriving is controlled on the basis of the actual atrial activity, and not on signals detected at the atrium but actually due to the depolarization of the ventricles (far-field
signals).

"Another technique is described in EP 2471575 A1 (Sorin CRM SAS) which implements a sensor for collecting an endocardial acceleration signal (EA). The EA signal is analyzed to detect the presence of a specific component reflecting atrial contraction (EA4 component) and to identify the instant of occurrence of this component. If the EA4 component is present, this means that the sequencing of atrial contractions is correct because otherwise (i.e., left atrial contractions too late), the EA4 component would be mixed in the component of the EA signal corresponding to the immediately following ventricular contraction (EA1 component). The atrial stimulation interval (AA interval) is then dynamically adjusted depending on the result of this analysis.

"However, this technique requires an implantable lead provided with an endocardial acceleration sensor, and a generator capable of processing the EA signals delivered by such a sensor."

In addition to the background information obtained for this patent, NewsRx journalists also obtained the inventors' summary information for this patent: "One object of the invention is to propose a new technique for treatment of heart failure with preserved ejection fraction in patients with mechanical inter-atrial delay, which overcomes the drawbacks of the methods proposed so far and which does not require the use of methods for collecting and analyzing an EA signal.

"Another object of the invention is to propose a technique that ensures recovery of diastolic function in a method that is relatively simple (in terms of resources used) and reactive (high efficiency obtained cycle to cycle).

"The invention operates by a unique atrial pacing to restore a satisfactory OG-VG sequencing (sequencing the contraction of the left atrium compared to that of the left ventricle), so that the atrium can properly fulfill its function of completion of the filling of the left ventricle.

"To implement the disclosed embodiments, there is no need for ventricular pacing and/or ventricular depolarization detection methods. The latter can of course exist, for example in the case of a multi-site pacemaker providing stimulation of the right ventricle or of the two ventricles in addition to the stimulation of the atria (triple or quadruple chamber pacemakers). But these ventricular methods are not involved in the treatment of heart failure with preserved ejection fraction, which aims to overcome pre-existing conduction condition between the atria, namely an inter-atrial block resulting in an excessive delay in conduction between the right atrium and the left atrium.

"Specifically, the invention provides a device including digital processor circuits configured for: sensing of right atrial depolarizations; sensing of left atrial depolarizations; delivering left atrial stimulation pulses; and delivering, selectively on the basis of adjustable controlling parameters, of premature the left atrial stimulation pulses, by applying a short inter-atrial coupling, shorter than the sinus rhythm coupling interval

"A feature of the invention is that the device has no means for collecting and analyzing the endocardial acceleration, and the digital processor is configured so as to:

"after a first cardiac cycle without left atrial stimulation, deliver a left atrial stimulation pulse during an immediately consecutive second cardiac cycle, with application of an inter-atrial coupling,

"the inter-atrial coupling applied during the second immediately consecutive cardiac cycle being a short coupling shorter than the sinus rhythm coupling interval, so that the left atrial stimulation pulse delivered during the second cardiac cycle is a premature pulse;

"deliver a not premature left-atrial stimulation pulse during a third cardiac cycle
immediately subsequent to the second cardiac cycle, with application of an inter-atrial coupling corresponding to the sinus rhythm coupling interval (D1), so as to: assess the right atrial coupling interval between the right atrial depolarizations during the second and third cardiac cycles; compare the right atrial coupling interval thus assessed to the sinus rhythm coupling interval; and

"modify or not, at least one of the adjustable controlling parameters according to the result of the comparison.

"According to various advantageous subsidiary characteristics:

"the modified or not controlling parameter depending on the result of the comparison is the short inter-atrial coupling;

"in that case, if the right atrial coupling interval is less than the sinus rhythm coupling interval (D1), the digital processor is further configured so as to change by one step the short inter-atrial coupling, then deliver a premature left atrial stimulation pulse during a subsequent cardiac cycle, with application of the short inter-atrial coupling changed by one step;

"on detection of a predetermined event, the digital processor is further configured so as to inhibit any delivery of left atrial stimulation pulse during at least one cardiac cycle; measure on at least one cardiac cycle the atrial escape interval and the inter-atrial delay; and store this escape interval as a coupling interval of the sinus rhythm for the determination of the short inter-atrial coupling and inter-atrial delay corresponding to the sinus rhythm coupling interval in the subsequent cycles;

"the predetermined event is the expiry of a predetermined fixed timing interval; and

"the predetermined event is the detection of the crossing of a predetermined threshold by the variation in the atrial coupling interval.

"According to one embodiment, there is an active implantable medical device, the device comprising digital processor circuits configured to sense right and left atrial depolarizations and deliver, selectively on the basis of adjustable controlling parameters, left atrial stimulation pulses according to a stimulation protocol. The stimulation protocol includes, after a first cardiac cycle without left atrial stimulation, delivering a left atrial stimulation pulse during an immediately consecutive second cardiac cycle at an inter-atrial coupling interval. The inter-atrial coupling interval applied during the second immediately consecutive cardiac cycle is a short coupling interval shorter than the sinus rhythm coupling interval, so that the left atrial stimulation pulse delivered during the second cardiac cycle is a premature pulse. The protocol further includes delivering a not premature left-atrial stimulation pulse during a third cardiac cycle immediately subsequent to the second cardiac cycle, at an inter-atrial coupling interval corresponding to the sinus rhythm coupling interval. The protocol also includes assessing the right atrial coupling interval between the right atrial depolarizations during the second and third cardiac cycles and comparing the right atrial coupling interval to the sinus rhythm coupling interval. And finally, modifying at least one of the adjustable controlling parameters if necessary according to the result of the comparison. The device has no means for collecting and analyzing the endocardial acceleration.

"According to another embodiment, there is a method for resynchronization of the contraction of the heart chambers. The method includes sensing right atrial depolarizations and sensing left atrial depolarizations. The method also includes delivering, selectively on the basis of adjustable controlling parameters, left atrial stimulation pulses according to a stimulation protocol. The stimulation protocol includes, after a first cardiac cycle without left atrial stimulation, delivering a left atrial stimulation pulse during an immediately consecutive second cardiac cycle at an inter-atrial coupling interval. The inter-atrial coupling interval applied during the second immediately consecutive cardiac cycle is a short coupling interval shorter than
the sinus rhythm coupling interval, so that the left atrial stimulation pulse delivered during the second cardiac cycle is a premature pulse. The protocol further includes delivering a not premature left-atrial stimulation pulse during a third cardiac cycle immediately subsequent to the second cardiac cycle, at an inter-atrial coupling interval corresponding to the sinus rhythm coupling interval; and assessing the right atrial coupling interval between the right atrial depolarizations during the second and third cardiac cycles. The protocol also includes comparing the right atrial coupling interval to the sinus rhythm coupling interval and modifying at least one of the adjustable controlling parameters if necessary according to the result of the comparison.

"According to yet another embodiment, there is a cardiac resynchronization system including a stimulation/detection electrode for positioning in the right atrium of a heart and a stimulation/detection electrode for positioning in the left atrium of the heart, wherein the electrodes are configured to be coupled to an implantable medical device. The implantable medical device includes a generator and digital processor circuits. The digital processor circuits are configured to sense right atrial depolarizations from the stimulation/detection electrode and sense left atrial depolarizations from the stimulation/detection electrode. The digital processor circuits are further configured to deliver a left atrial stimulation pulse during a cardiac cycle immediately following a preceding cardiac cycle with no left atrial stimulation, the left atrial stimulation pulse delivered at an inter-atrial coupling interval. The inter-atrial coupling interval is a short coupling interval shorter than the sinus rhythm coupling interval. The digital processor circuits are further configured to deliver a second left-atrial stimulation pulse during an immediately subsequent cardiac cycle at an inter-atrial coupling interval corresponding to the sinus rhythm coupling interval. The digital processor circuits are further configured to assess the right atrial coupling interval between the right atrial depolarizations during the consecutive cardiac cycles and compare the right atrial coupling interval to the sinus rhythm coupling interval. After comparing, the digital processor circuits are configured to determine whether to modify the inter-atrial coupling interval based on the result of the comparison."

**Patent Issued for Administration of Angiocidin for Arresting the Growth of a Tumor Cell (USPTO 9526758)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Alexandria, Virginia, by NewsRx journalists, a patent by the inventors Tuszyński, George P. (Pittsgrove, NJ); Wong, John F. (Los Angeles, CA); Williams, Taffy (Concord, NC), filed on October 24, 2014, was
published online on December 27, 2016.

The assignee for this patent, patent number 9526758, is Temple University-of the Commonwealth System of Higher Education (Philadelphia, PA).

Reporters obtained the following quote from the background information supplied by the inventors: "Various publications, including patents, published applications, technical articles and scholarly articles are cited throughout the specification. Each of these cited publications is incorporated by reference herein, in its entirety.

"Solid human tumors are often infiltrated by host immune cells, which can have a diverse effect on tumor progression. Among other cell types, macrophages are known to be a major component in the leukocyte infiltrate in tumors. These tumor-associated macrophages, (TAMs), have a complex dual function in their interactions with neoplastic cells (Mantovani, et al., Trends Immunol. 23: 549-555, 2002). First, TAMs stimulate cell destruction through antigen presentation to T-cells, which induces cytotoxic T-cells to kill tumor cells bearing the presented antigen. In contrast, TAMs also promote cell proliferation and angiogenesis, thus affecting tissue growth.

"These contradictory effects can be explained in terms of the 'macrophage balance hypothesis,' which asserts that the outcome of the interaction between macrophages and neoplastic cells depends on the number of macrophages recruited to the tumor microenvironment and their state of activation (Mantovani, et al., Immunol. Today 13: 265-270, 1992; Bingle, et al., J. Pathol. 196: 254-265, 2002; Nesbit, et al., J. Immunol. 166: 6483-6490). Nesbit, et al. have shown that, in a mouse model, high levels of monocyte chemoattractant protein-1 (MCP-1) secreted by melanoma cells is associated with massive monocyte/macrophage infiltration into the tumor mass, leading to destruction of the tumor within a few days. However, low levels of secreted MCP-1 stimulated angiogenesis and tumor growth. Furthermore, ex vivo-grown cytotoxic macrophages that recognize and destroy tumor cells, but not normal cells, are effective in murine models of metastasizing tumors. (Andreesen, et al., J. Leukocyte Biol. 64: 419-426, 1998). Accordingly, immunomodulation, in particular regulating macrophage activity, has potential as a therapeutic strategy for the treatment of tumors, secondary metastasis, and other disorders.

In addition to obtaining background information on this patent, NewsRx editors also obtained the inventors' summary information for this patent: "The invention features methods for treating tumors such as glioma, breast cancer, and leukemia. The methods generally comprise administering to a subject having a glioma, breast cancer, or leukemia an amount of angiocidin effective to treat the glioma, breast cancer, or leukemia. The angiocidin can be administered to the subject as a composition comprising a pharmaceutically acceptable carrier. The amount of angiocidin administered to the subject can vary according to the type of tumor, or other variables, but generally will be a dose of about 0.001 to 10 mg/kg body weight of the subject.

"In some aspects, the methods further comprise administering to the subject an effective amount of a growth factor such as fibroblast growth factor-2 (FGF-2), nerve growth
factor (NGF), brain-derived neural factor (BDNF), neurotropin-3 (NT-3), epidermal growth factor (EGF), or stem cell growth factor (SCF). The angiocidin can complex with the growth factor. In some aspects, the angiocidin-growth factor complex can induce growth arrest of the tumor cells, such as the glioma, breast cancer, or leukemia cells. In some aspects, the angiocidin-growth factor complex can promote healthy stem cell differentiation at or proximal to the site of the glioma or breast cancer, or in the blood or the bone marrow.

"The invention also features methods for arresting growth of tumor cells. The methods generally comprise contacting the tumor cell with an amount of angiocidin effective to arrest growth of the tumor cell. In some aspects, subsequent to or concomitant with the growth arrest, the tumor cell undergoes apoptosis. The methods are preferably used to arrest the growth of glioma cells, breast cancer cells, leukemia cells, and melanoma cells. In some aspects, the angiocidin can be complexed with a growth factor such as fibroblast growth factor-2 or nerve growth factor.

"The invention also features methods for inducing differentiation of leukemia cells. The methods generally comprise contacting the leukemia cell with an amount of angiocidin effective to induce differentiation of the leukemia cell. Leukemia cell differentiation preferably inhibits the tumorigenicity of the leukemia cell. In some aspects, induced leukemia cell differentiation confers a non-cancerous phenotype.

"The invention also features methods for treating tumors that express a growth factor receptor. The methods generally comprise administering to a subject having a tumor that expresses a receptor for fibroblast growth factor-2, nerve growth factor, brain-derived neural factor, neurotropin-3, epidermal growth factor, or stem cell growth factor an amount of angiocidin effective to treat the tumor expressing a receptor for fibroblast growth factor-2, nerve growth factor, brain-derived neural factor, neurotropin-3, epidermal growth factor, or stem cell growth factor. The angiocidin can be administered to the subject as a composition comprising a pharmaceutically acceptable carrier. The amount of angiocidin administered to the subject can vary according to the type of tumor, or other variables, but generally will be a dose of about 0.001 to 10 mg/kg body weight of the subject. The tumor expressing a receptor for such growth factors can be, for example, glioma, breast cancer, leukemia, or melanoma among others."

Patent Issued for Ang-2 Specific Antibodies and Uses (USPTO 9527910)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Alexandria, Virginia, by NewsRx journalists, a patent by the inventors Lee, Yoon Sook (Hwaseong-si, KR); Kim, Chung Ho (Yongin-si, KR); Kim, Kyung Eun (Yongin-si, KR); Kim, Hyung-Chan (Yongin-si, KR); Lee, Kwang Hoon (Osan-si, KR); Lee, Hyo Seon (Hwaseong-si, KR); Han, Sang Yeul (Yongin-si, KR), filed on July 2, 2014, was published online on December 27, 2016.

The assignee for this patent, patent number 9527910, is SAMSUNG ELECTRONICS CO., LTD. (Suwon-Si, KR).

Reporters obtained the following quote from the background information supplied by the inventors: "The present disclosure relates to an anti-Ang-2 antibody specifically binding to an angiogenesis-inducing factor Angiopoietin-2 (Ang-2), and related compositions and methods utilizing such antibodies.

"Angiopoietin-2 (Ang-2) is an antagonistic ligand of a receptor Tie2 present at vascular endothelial cells and it suppresses signal transduction by Tie2 by competing with Angiopoietin-1 (Ang1), which is an agonist of Tie2, in binding Tie2. Ang1-Tie2 binding maintains the stability of vascular endothelial cells. Thus, interruption of this binding by Ang-2 may trigger signal transduction through this interruption, ultimately accelerating angiogenesis via the dynamic rearrangement of blood vessels.

"As angiogenesis is an essential element for the growth of cancer, preventing the additional growth of cancer by inhibiting the function of Tie2-dependent Ang-2 to suppress angiogenesis has been known by the research of several preclinical models and in fact, various attempts to prevent the progress of cancer using antibodies specific to Ang-2 are ongoing.

"Although there are phenomena showing that Ang-2 not only causes the growth of cancer through Tie2-dependent angiogenesis but also accelerates the metastasis of cancer through Tie2-independent mechanism, research results about the detailed mechanisms of action are yet to be elucidated.

"As a method for effectively inhibiting the progress of cancer by Ang-2, it is believed to be important to suppress Tie2 signaling by Ang-2, and it is expected to be possible to secure cancer treatment agents with superior performance by blocking Tie2-independent mechanisms of Ang-2.

"Accordingly, it is needed to elucidate Tie2-independent mechanisms of Ang-2 and to develop a substance suppressing them."
need thereof.

"Further provided is a method of preventing and/or treating a disease related to angiogenesis and/or Ang-2-dependent cell adhesion, including administering the anti-Ang-2 antibody or an antigen-binding fragment thereof to a subject in need thereof.

"Also provided is a method for detecting Ang-2, including treating a specimen obtained (isolated) from a subject with the anti-Ang-2 antibody or antigen-binding fragment thereof; and identifying the presence of an antigen-antibody reaction."

Keywords for this news article include: Antibodies, Cancer, Oncology, Immunology, Angiogenesis, Angiopoietin-2, Blood Proteins, Immunoglobulins, Angiogenic Proteins, SAMSUNG ELECTRONICS CO. LTD, Intercellular Signaling Peptides and Proteins.

COVIDIEN LP

Patent Issued for Apparatus, System and Method for Performing an Electrosurgical Procedure (USPTO 9526577)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- From Alexandria, Virginia, NewsRx journalists report that a patent by the inventor Brannan, Joseph D. (Lyons, CO), filed on September 1, 2015, was published online on December 27, 2016.

The patent's assignee for patent number 9526577 is COVIDIEN LP (Mansfield, MA).

News editors obtained the following quote from the background information supplied by the inventors: "Technical Field

"The present disclosure relates to an apparatus, system and method for performing an electrosurgical procedure. More particularly, the present disclosure relates to an apparatus, system and method including a directional microwave antenna probe and a catheter that are configured to perform a microwave ablation procedure.

"Description of Related Art

"Microwave ablation procedures, e.g., such as those performed for menorrhagia, are typically done to ablate the targeted tissue to denature or kill the tissue. Many procedures and types of devices utilizing electromagnetic radiation therapy are known in the art. Such microwave therapy is typically used in the treatment of tissue and organs such as the prostate, heart, and liver. One non-invasive procedure generally involves the treatment of tissue (e.g., a tumor) underlying the skin via the use of microwave energy. Typically, microwave energy is generated by a power source, e.g., microwave generator, and transmitted to tissue via a microwave antenna that is fed with a coaxial cable that operably couples to a radiating section of the microwave antenna.

"To treat the tissue, the radiating section of the microwave antenna may be
positioned inside the tissue of interest, e.g., the tumor, and microwave energy may be radiated thereabout. Typically, the microwave energy radiates with no specific directionality pattern, i.e., the direction of the microwave energy is not controlled. For example, under certain surgical environments, the microwave energy may radiate radially outward in a generally spherical pattern. While this spherical pattern of microwave energy may be suitable for treating certain shapes and/or types of tissue specimens, e.g., tissue specimens that exhibit a generally spherical shape, under certain circumstances, this spherical pattern of microwave energy may not be suitable for treating other shapes and/or types of tissue specimens, such as, for example, in the instance where the tumor is elongated or otherwise shaped."

As a supplement to the background information on this patent, NewsRx correspondents also obtained the inventor's summary information for this patent: "The present disclosure provides a system for performing a microwave ablation procedure. The system includes a catheter including an open proximal end and a closed distal end configured to percutaneously access tissue. A directional microwave antenna probe adapted to connect to a source of microwave energy selectively couples to the catheter. The directional microwave antenna is rotatable within the catheter for directing the emission of microwave energy therefrom to tissue.

"The present disclosure provides an apparatus for performing a microwave ablation procedure. The apparatus includes a catheter including an open proximal end and a closed distal end configured to percutaneously access tissue. A directional microwave antenna probe adapted to connect to a source of microwave energy selectively couples to the catheter. The directional microwave antenna is rotatable within the catheter for directing the emission of microwave energy therefrom to tissue.

"The present disclosure also provides method of performing a microwave procedure. The method includes percutaneously accessing tissue with a catheter including an open proximal end and a closed distal end configured to percutaneously access tissue for adjacent placement thereto. A step of the method includes positioning a directional microwave antenna probe adapted to connect to a source of microwave energy into the catheter. The directional microwave antenna is rotatable within the catheter for directing the emission of microwave energy therefrom to tissue. And, transmitting microwave energy to the microwave antenna such that a desired tissue effect may be achieved is another step of the method."

**ALKERMES PHARMA IRELAND LIMITED**

**Patent Issued for Aripiprazole Formulations Having Increased Injection Speeds (USPTO 9526726)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A patent by the inventors Hickey, Magali B. (Westwood, MA); Vandiver,
Jennifer (Arlington, MA), filed on May 25, 2016, was published online on December 27, 2016, according to news reporting originating from Alexandria, Virginia, by NewsRx correspondents. Patent number 9526726 is assigned to ALKERMES PHARMA IRELAND LIMITED (Dublin, IE).

The following quote was obtained by the news editors from the background information supplied by the inventors: "U.S. Pat. Nos. 4,734,416 and 5,006,528 disclose aripiprazole, 7-4-[4-(2,3-dichlorophenyl)-1-piperazinyl]butoxy-3,4-dihydro-2(1H)-quinolinone or 7-4-[4-(2,3-dichlorophenyl)-1-piperazinyl]butoxy-3,4-dihydro carbostyril, as an atypical antipsychotic agent useful in the treatment of schizophrenia, bipolar disease, depression, and other CNS disorders. Aripiprazole has the following chemical structure:

"##STR00001##

"Aripiprazole is sold under the trade name ABILIFY.RTM.. It acts as a dopamine D_{2} partial agonist, serotonin 5-HT_{1A} receptor agonist, and is an antagonist of the serotonin 5-HT_{2A} receptor. ABILIFY.RTM. is currently administered orally on a once-a-day dosing schedule as ABILIFY.RTM. (aripiprazole) Tablets, ABILIFY DISCMELT.RTM. (aripiprazole) Orally Disintegrating Tablets, and ABILIFY.RTM. (aripiprazole) Oral Solution. Poor and variable patient compliance with a once-a-day dosing schedule of psychiatric drugs has been reported. Efforts have been made to provide drug dosage forms that may increase the compliance of patients and thereby lower the rate of relapse in the treatment of schizophrenia.

"U.S. Pat. Nos. 7,807,680, 8,338,427, and 8,338,428 describe long-acting aripiprazole sterile injectable formulations. Studies on aripiprazole free base injections showed a prolonged pharmacokinetic profile, but there have been reports of moderate to severe tissue irritation following intramuscular (IM) injection and subcutaneous (SC) injection. As such, there exists a need for improved methods of delivering antipsychotics, such as aripiprazole, thereby improving patient compliance and maximizing the pharmacological profile of the active agent."

In addition to the background information obtained for this patent, NewsRx journalists also obtained the inventors' summary information for this patent: "In part, the invention provided herein relates to the intramuscular administration of pharmaceutical compositions comprising compounds of Formula (I) to a subject in need thereof using a rapid injection rate. It was discovered that the rapid injection rate resulted in fewer injection site failures, such as needle clogging. Surprisingly, the rapid injection rate did not cause a pain intensity above a normal threshold or any injection site reactions in the subject in need thereof. Thus, provided herein is an improved method of administering pharmaceutical compositions comprising compounds of Formula (I), wherein the method comprises intramuscular administration using a rapid or instantaneous injection speed.

"In one aspect, provided herein are methods of using pharmaceutical compositions comprising compounds of Formula (I) to treat disorders of the central nervous system, such as schizophrenia. In another aspect, provided herein is a method of intramuscular administration of a pharmaceutical composition to a subject in need thereof, comprising administering to said subject a therapeutically effective amount of the composition at an injection rate greater than or equal to 0.3 mL/s, wherein said pharmaceutical composition comprises:

"(a) 24-30 weight percent of a compound of Formula (I):
"##STR00002## wherein n is an integer between 4 and 14;
"(b) 0.3-0.4 weight percent sorbitan laurate;
"© 0.1-0.3 weight percent polysorbate 20; and
"(d) an aqueous vehicle
"wherein the percentages of (a), (b), and © are relative to the total weight of the composition.
"In another embodiment, the pharmaceutical composition comprises:
"(a) about 26.6 weight percent of a compound of Formula (I);
"(b) about 0.37 weight percent sorbitan laurate;
"© about 0.15 weight percent polysorbate 20; and
"(d) an aqueous vehicle
"wherein the percentages of (a), (b), and © are relative to the total weight of the composition.
"In another embodiment, component (a) of the pharmaceutical composition comprises a compound of Formula (I):
"##STR00003##
"wherein n is an integer between 9 and 11.
"In yet another embodiment, the pharmaceutical composition comprises:
"(a) 24-30 weight percent Compound 1:
"##STR00004##
"(b) 0.3-0.4 weight percent sorbitan laurate;
"© 0.1-0.3 weight percent polysorbate 20; and
"(d) an aqueous vehicle
"wherein the percentages of (a), (b), and © are relative to the total weight of the composition.
"In still another embodiment, the said pharmaceutical composition comprises:
"(a) about 26.6 weight percent Compound 1;
"(b) about 0.37 weight percent sorbitan laurate;
"© about 0.15 weight percent polysorbate 20; and
"(d) an aqueous vehicle
"wherein the percentages of (a), (b), and © are relative to the total weight of the composition.
"In some embodiments of the method, the injection is administered to the subject in the dorsal gluteal muscle. In other embodiments of the method, the injection is administered to the subject in the deltoid muscle.
"In some embodiments of the method, the needle does not experience injection failure due to needle clogging.
"In other embodiments, the method does not elicit a pain intensity above a normal threshold in the subject. In other embodiments, the method does not elicit any injection site reactions in the subject.
"In another aspect, provided herein is a method of treating a disorder of the central nervous system in a subject in need thereof, comprising administering to said subject a therapeutically effective amount of the composition at an intravenous injection rate greater than or equal to 0.3 mL/s. In one embodiment of the method, the disorder is schizophrenia.
"In certain embodiments of the methods described above, the intramuscular injection rate is greater than 0.3 mL/s.
"In another aspect, provided herein is a kit useful for the treatment of a disorder of the central nervous system, comprising a therapeutically effective amount of a pharmaceutical
composition and further comprising instructions for intramuscular injection, wherein the intramuscular injection rate is greater than or equal to 0.3 mL/s. In one embodiment, the kit is adapted to be associated with a treatment regimen. In another embodiment of the kit, the intramuscular injection rate is greater than 0.3 mL/s."

Keywords for this news article include: Pharmaceuticals, Alcohols, Autacoids, Serotonin, Psychiatry, Polysorbates, Schizophrenia, Abilify Therapy, Organic Chemicals, Biological Factors, Drugs and Therapies, Aripiprazole Therapy, Polyethylene Glycols, Atypical Antipsychotics, Intramuscular Injections, Psychotherapeutic Agents, ALKERMES PHARMA IRELAND LIMITED.

KOREA INSTITUTE OF SCIENCE AND...

Patent Issued for Aster Glehni Extracts, Fractions Or Compounds Isolated Therefrom for the Treatment Or Prevention of Hyperuricemia Or Gout (USPTO 9527879)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- From Alexandria, Virginia, NewsRx journalists report that a patent by the inventors Kim, Hyoung Ja (Seoul, KR); Jin, Chang Bae (Seoul, KR); Son, Min Jeoung (Seoul, KR); Lee, Yong Sup (Seoul, KR); Yook, Chang Soo (Seoul, KR); Lee, Jae Yeol (Seoul, KR), filed on May 20, 2015, was published online on December 27, 2016.

The patent's assignee for patent number 9527879 is KOREA INSTITUTE OF SCIENCE AND TECHNOLOGY (Seoul, KR).

News editors obtained the following quote from the background information supplied by the inventors: 

"(a) Technical Field

"The present invention relates to an Aster glehni extract, fractions thereof and the active compounds isolated therefrom, which are effective for the treatment, prevention and improvement of hyperuricemia or gout."

"(b) Background Art

"Hyperuricemia or gout is induced as the intake of uric acid increases due to westernized diet and the uric acid is not normally degraded in the body. The incidence of hyperuricemia or gout is increasing gradually as the intake of alcohols, animal viscera and seafood increases. It is reported that hyperuricemia or gout can increase the incidence of hypertension, hyperlipidemia, cancer, diabetes, obesity, etc.

"Gout occurs frequently in men in their 40s to 50s. However, due to the recent change in diet, the age of prevalence is gradually decreasing. It can occur easily in those who take immunosuppressants for a long time after organ transplantation, those who take diuretics for a long time and women of childbearing age. The currently used drugs for treating gout, allopurinol, benz bromarone, sulfinpyrazone and probenecid, were developed in 1950s and
Among these, allopurinol is the best known drug for gout treatment but there are concerns about hypersensitivity syndrome, which can be lethal, in addition to interstitial nephritis, renal disorder, hepatotoxicity, vasculitis and skin rash. Although benz bromarone is the most potent drug clinically used in the treatment of gout, its use is restricted because of severe hepatotoxicity. Although sulfinpyrazone and probenecid have been used until recently, they are known to cause renal failure.

"As described above, it is thought that the direct cause of gout is the increase in uric acid. Therefore, the inventors of the present invention have researched to develop a drug of natural origin for treating gout, which is substantially effective in decreasing uric acid.

"While searching for various natural products to develop a drug that exhibits potent effect of reducing uric acid, the inventors of the present invention have found out that Aster glehni has remarkable antiinflammatory, anticonvulsant, sedative or sleep-inducing effects. The excellent uric acid decreasing effect of Aster glehni has never been reported."

As a supplement to the background information on this patent, NewsRx correspondents also obtained the inventors' summary information for this patent: "The present invention is directed to providing a composition for treating, preventing and improving hyperuricemia or gout, which contains an Aster glehni extract, fractions thereof or specific active compounds isolated therefrom as an active ingredient.

"The present invention is also directed to providing a method for isolating the active compounds effective in decreasing the serum uric acid level from Aster glehni.

"The present invention is also directed to providing the active compound as novel compounds.

"In an aspect, the present invention provides a pharmaceutical composition or a health food composition for treating, preventing and improving hyperuricemia or gout, which contains an Aster glehni extract or fractions thereof.

"In another aspect, the present invention provides a pharmaceutical composition or a health food composition for treating, preventing and improving hyperuricemia or gout, which contains one or more compound selected from a group consisting of 6'-O-caffeoylampelopsisionoside, 6'-O-caffeoylroseoside, 6'-O-cafeoylsonchuinoside C, 6'-O-cafeooyldihydroxyrangin and glehnoside or a pharmaceutically acceptable salt, hydrate or solvate thereof.

"In another aspect, the present invention provides a pharmaceutical composition or a health food composition for treating, preventing and improving hyperuricemia or gout, which contains an Aster glehni extract or fractions thereof.

"In another aspect, the present invention provides a pharmaceutical composition or a health food composition for treating, preventing and improving hyperuricemia or gout, which contains one or more compound selected from a group consisting of 6'-O-caffeoylampelopsisionoside, 6'-O-cafeoylroseoside, 6'-O-cafeoylsonchuinoside C, 6'-O-cafeooyldihydroxyrangin and glehnoside or a pharmaceutically acceptable salt, hydrate or solvate thereof.

"In another aspect, the present invention provides a method for isolating the active compounds effective in decreasing the serum uric acid level from Aster glehni, which includes: 1) obtaining a solvent extract by extracting the aerial part or underground part of Aster glehni with one or more extraction solvent selected from dichloromethane, acetone, an aqueous solution of acetone, a C.sub.1-4 alcohol and an aqueous solution of a C.sub.1-4 alcohol; 2) obtaining an ethyl acetate fraction by extracting the solvent extract with water and ethyl acetate; and 3) obtaining 6'-O-caffeoylampelopsisionoside, 6'-O-cafeoylroseoside, 6'-O-cafeoylsonchuinoside C, 6'-O-cafeooyldihydroxyrangin and glehnoside by subjecting the ethyl acetate fraction to column chromatography.

"In another aspect, the present invention provides 6'-O-caffeoylampelopsisionoside, 6'-O-cafeoylroseoside, 6'-O-cafeoylsonchuinoside C, 6'-O-cafeooyldihydroxyrangin and glehnoside as novel compounds.

"The Aster glehni extract, the fraction thereof and the active compounds isolated therefrom according to the present invention are remarkably effective in reducing the serum uric acid level.

"Accordingly, the Aster glehni extract, the fraction thereof and the active compounds isolated therefrom according to the present invention can be effectively used as an active
ingredient to prepare a drug, health food, etc. for the treatment, prevention and improvement of hyperuricemia or gout.

"Specifically, the gout may include gouty arthritis, gouty renal disease and gouty nephrolithiasis."

For additional information on this patent, see: Kim, Hyoung Ja; Jin, Chang Bae; Son, Min Jeoung; Lee, Yong Sup; Yook, Chang Soo; Lee, Jae Yeol. Aster Glehni Extracts, Fractions Or Compounds Isolated Therefrom for the Treatment Or Prevention of Hyperuricemia Or Gout. H. Lee Moffitt Cancer Center and Research Institute...

**Patent Issued for Bad Phosphorylation Determines Ovarian Cancer Chemo-Sensitivity and Patient Survival (USPTO 9528982)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- According to news reporting originating from Alexandria, Virginia, by NewsRx journalists, a patent by the inventors Lancaster, Johnathan (Tampa, FL); Marchion, Douglas (Seminole, FL); Chen, Dung-Tsa (Tampa, FL), filed on August 26, 2013, was published online on December 27, 2016.

The assignee for this patent, patent number 9528982, is H. Lee Moffitt Cancer Center and Research Institute, Inc. (Tampa, FL).

Reporters obtained the following quote from the background information supplied by the inventors: "Ovarian cancer is the ninth most common cancer, and has the fifth highest mortality for cancers among women in the United States (American Cancer Society Statistics, 2012). As ovarian cancer symptoms tend to develop later in disease progression, most cases are advanced at diagnosis and have spread outside the ovary. Nearly all ovarian cancer patients receive a combination chemotherapy of cisplatin and/or carboplatin. Although the majority of patients with OVCA demonstrate remarkable sensitivity to platinum-based chemotherapy during primary therapy, the majority eventually develop platinum-resistant, recurrent disease (Baker, Salvage therapy for recurrent epithelial ovarian cancer. Hematol Oncol Clin North Am 2003; 17:977-988; Hansen, et al., New cytostatic drugs in ovarian cancer. Ann Oncol 1993; 4 Suppl 4:63-70).

"The development of chemoresistance dramatically affects survival for patients with cancer, and as such, targeted therapies that increase chemo-sensitivity offer the potential to significantly improve outcome. The clinical consequences of acquired chemoresistance are exemplified by the high mortality of patients with advanced-stage ovarian cancer (OVCA). Traditionally, resistance can only be determined retrospectively after patients have undergone therapy. Once platinum-resistance has developed, few active therapeutic options exist and patient survival is generally short-lived (Herrin and Thigpen, Chemotherapy for ovarian cancer: current concepts. Semin Surg Oncol 1999; 17:181-188). In this context, platinum resistance is frequently viewed as a surrogate clinical marker for more generic chemoresistance, and it is
likely that defining the molecular changes that drive the evolution of the platinum-resistant phenotype will contribute to a broader understanding of human cancer chemoresistance.

"Changes in cellular drug efflux, increased cellular glutathione levels, increased DNA repair, and drug tolerance have all been shown to contribute to platinum resistance (Godwin, et al., High resistance to cisplatin in human ovarian cancer cell lines is associated with marked increase of glutathione synthesis. Proc Natl Acad Sci USA 1992; 89:3070-3074; Johnson, et al., Increased platinum-DNA damage tolerance is associated with cisplatin resistance and cross-resistance to various chemotherapeutic agents in unrelated human ovarian cancer cell lines. Cancer Res 1997; 57:850-856; Johnson, et al., Relationship between platinum-DNA adduct formation and removal and cisplatin cytotoxicity in cisplatin-sensitive and -resistant human ovarian cancer cells. Cancer Res 1994; 54:5911-5916). More recently, genomic studies have defined gene expression signatures that may discriminate between cancers that are innately chemo-sensitive versus chemo-resistant (Benedetti, et al., Modulation of survival pathways in ovarian carcinoma cell lines resistant to platinum compounds. Mol Cancer Ther 2008; 7:679-687; Dressman, et al., An integrated genomic-based approach to individualized treatment of patients with advanced-stage ovarian cancer. J Clin Oncol 2007; 25:517-525; Jazaeri, et al., Gene expression profiles associated with response to chemotherapy in epithelial ovarian cancers. Clin Cancer Res 2005; 11:6300-6310). However, the genome-wide expression changes associated with the transition of a cancer cell from chemo-sensitive to chemo-resistant are less clear, and the discrete biologic pathways that drive the process are unknown.

"Outcomes for women with ovarian cancer could be improved by the identification of biomarkers capable of identifying resistant tumors and better therapies for treating them. Moreover, how these pathways influence clinical outcomes and their potential as therapeutic targets remain to be defined. As such, improved diagnostics are needed to identify likely chemotherapeutic-resistant cancers and novel targets for therapeutic approaches."

In addition to obtaining background information on this patent, NewsRx editors also obtained the inventors' summary information for this patent: "Few clinical or biologic events impact patient outcome more than response to chemotherapy. A novel in vitro strategy and OVCA model identified the BAD-apoptosis pathway to be influential in the response shown in a range of human cancers to a variety of chemotherapies. Without being bound to any specific theory, BAD appears to function via modulation of BAD phosphorylation. BAD is a member of the BCL2 family of proteins, which are characterized by the presence of up to 4 BCL2-homology domains (Danial and Korsmeyer, Cell death: critical control points. Cell 2004; 116:205-219). This family includes inhibitors and promoters of apoptosis, such that cell survival versus death is determined by the relative ratio of pro-apoptotic (e.g., BCL-Xs, BAD, Bax, Bak) and anti-apoptotic (e.g., Bcl-2, Bcl-xL, MCL-1, A1, BAG-1) family members (Danial and Korsmeyer, Cell death: critical control points. Cell 2004; 116:205-219; Dejean, et al., Oligomeric Bax is a component of the putative cytochrome c release channel MAC, mitochondrial apoptosis-induced channel. Mol Biol Cell 2005; 16:2424-2432; Desagher, et al., Bid-induced conformational change of Bax is responsible for mitochondrial cytochrome c release during apoptosis. J Cell Biol 1999; 144:891-901; Kuwana, et al., Bid, Bax, and lipids cooperate to form supramolecular openings in the outer mitochondrial membrane. Cell 2002; 111:331-342). BAD selectively hetero-dimerizes with Bcl-xL and Bcl-2 but not with Bax, Bcl-xs, Mcl-1, A1, or itself. When BAD dimerizes with Bcl-xL, Bax is displaced, mitochondrial membrane permeability increases, and apoptosis is induced (Yang, et al., Bad, a heterodimeric partner for Bcl-XL and Bcl-2, displaces Bax and promotes cell death. Cell 1995; 80:285-291). However, BAD function is regulated by phosphorylation (including serine-112, -136, and -155). When phosphorylated, BAD is unable to heterodimerize with Bcl-2 or Bcl-xL, freeing Bcl-xL to
dimerize and functionally sequestrate Bax, such that it is no longer free to induce apoptosis (Yang, et al., Bad, a heterodimeric partner for Bcl-XL and Bcl-2, displaces Bax and promotes cell death. Cell 1995; 80:285-291). Thus, the phosphorylation status of BAD determines whether Bax is displaced from Bcl-XL to drive cell death. BAD is thought to be phosphorylated at serine-136 by protein kinase B (PKB/Akt) (del Peso, et al., Interleukin-3-induced phosphorylation of BAD through the protein kinase Akt. Science 1997; 278:687-689). In contrast, serine-112 is phosphorylated by mitogen-activated protein kinase-activated protein kinase-1 (MAPKAP-K1, also called RSK) and PKA. Serine-155, at the center of the BAD BH3 domain, is phosphorylated preferentially by PKA, which also inhibits Bcl-XL binding (Lizcano, et al., Regulation of BAD by cAMP-dependent protein kinase is mediated via phosphorylation of a novel site, Ser155. Biochem J 2000; 349:547-557; Tan, et al., BAD Ser-155 phosphorylation regulates BAD/Bcl-XL interaction and cell survival. J Biol Chem 2000; 275:25865-25869; Zhou, et al., Growth factors inactivate the cell death promoter BAD by phosphorylation of its BH3 domain on Ser155. J Biol Chem 2000; 275:25046-25051). Conversely, the activity of a series of phosphatases, including PP1, PP2A, and PPM1 (PP2C/PPM1A), as well as calcineurin, has been shown to have pro-apoptotic effects via dephosphorylation of BAD (Klumpp, et al., Protein phosphatase type 2C dephosphorylates BAD. Neurochem Int 2003; 42:555-560; Yang, et al., Calcineurin-mediated BAD Ser155 dephosphorylation in ammonia-induced apoptosis of cultured rat hippocampal neurons. Neurosci Lett 2004; 357:73-75).

"The BAD pathway was also identified to be independently associated with clinical outcome for many human cancers. Extensive validation of these findings (and the importance of the BAD pathway) was provided, with in vitro functional studies in addition to in vivo and in silico analyses of >800 patient specimens and/or datasets. Further validation of these findings is provided by the fact that many BAD pathway signature genes, including RAF1, BAD, GNG5, PPM1B, PPM1F, GNAS, PRKAR1A, BAX, PIK3CD, and PTPN11, have previously been reported to be associated with OVCA chemoresponse (Klumpp, et al., Protein phosphatase type 2C dephosphorylates BAD. Neurochem Int 2003; 42:555-560; Yang, et al., Calcineurin-mediated BAD Ser155 dephosphorylation in ammonia-induced apoptosis of cultured rat hippocampal neurons. Neurosci Lett 2004; 357:73-75). Consistently, levels of pBAD were found increased with OVCA cisplatin-resistance in both the cell lines and primary patient samples that were analyzed, and that pBAD protein levels are associated with poor overall survival from ovarian cancer. Further validation of the in vitro and in vivo findings provided by in silico analysis of genomic and chemosensitivity data from 60 cancer cell lines representing 9 tumor types and 8 different chemotherapeutics showed a similar representation of BAD-pathway genes associated with chemosensitivity, suggesting that the pathway may not only influence OVCA cell sensitivity to platinum but also influences many other cancer cell types to a range of different chemotherapeutic agents.

"As such, a method of determining clinical outcome or predicting clinical outcome of platinum-based cancer treatment, taxane cancer treatment, gemcitabine, or oxazophorine treatment was developed using a sample of a suspected or known cancer. Non-limiting examples of treatments include the clinical outcome is chemotherapeutic effect, wherein the chemotherapeutic is cisplatin, carboplatin, paclitaxel, gemcitabine, and cyclophosphamide. Further, non-limiting examples of cancers include cancer is ovarian cancer, colon cancers, malignant glioma, breast cancer, leukemia, melanoma, non-small cell lung cancer, central nervous system cancer, renal cancer, and prostate cancer. The phosphorylation level of a BCL2 antagonist of cell death pathway protein was determined in the sample, wherein the BCL2 antagonist of cell death pathway protein is BAD, Bax, BcL-XL, PP2C/PPM1A, AKT, EGFR, IRS-1, Shc, H-Ras, CDK1, G-protein alpha-s, G-protein beta/gamma, PI3K cat class 1A, c-Raf-
1, p90Rsk, MEK2 (MAP2K2), PKA-cat, PKA-reg or a combination thereof. Phosphorylation levels may be determined by any means known in the art, including immunofluorescence, Western blot, chip assay, and immunochemistry. The phosphorylation level of a BCL2 antagonist of cell death pathway protein in the sample was then compared to a median level of the phosphorylation level of a BCL2 antagonist of cell death pathway protein, and the responsiveness to treatment determined based on the level of phosphorylation. It is noted that an elevated level of phosphorylation of the BCL2 antagonist of cell death pathway protein in the sample compared to median levels indicates poor clinical outcome to the platinum-based treatment and a reduced level of phosphorylation of the BCL2 antagonist of cell death pathway protein in the sample compared to median levels indicates positive clinical outcome to the platinum-based treatment.

"One protein noted for its effect is BCL2 antagonist of cell death phosphorylation, which is optionally compared to median phosphorylated BCL2 antagonist of cell death as a cutoff for high/low categorization. In some variations, the BCL2 antagonist of cell death phosphorylation is detected on serine-112, serine-136, serine-155, or combinations thereof. Low levels of the serine-112 or serine-155 phosphorylation are indicative of superior survival. Alternatively, the BCL2 antagonist of cell death pathway protein is determined in a gene signature, using BAD, Bax, Bcl-XL, PP2C/PPM1A, AKT, EGFR, IRS-1, Shc, H-Ras, CDK1, G-protein alpha-s, G-protein beta/gamma, PI3K cat class 1A, c-Raf-1, p90Rsk, MEK2 (MAP2K2), PKA-cat, PKA-reg or a combination thereof; wherein the gene signature is determined by $\sigma_i$, where $x_i$ represents gene $i$ expression level and $w_i$ is the corresponding weight (loading coefficient) with $\sigma_i^2 = 1$. A BCL2 antagonist of cell death pathway signature score above the median value in all analyses indicates positive clinical outcome to the platinum-based treatment whereas a score below the median indicates poor clinical outcome to the platinum-based treatment.

"To support and further explore the clinical relevance of these findings, a 47-gene BAD-pathway signature was developed and evaluated. A panel of OVCA cell lines was subject to serial cisplatin-treatments and the induced cisplatin-resistance was quantified. In parallel, genome-wide expression changes were measured and genes with expression correlated with increasing cisplatin-resistance were analyzed for representation of biologic pathways. In light of the association between cisplatin-resistance and expression of BAD-pathway kinases and phosphatases, levels of phosphorylated-BAD protein were measured in both treated cell lines and also chemo-sensitive and chemo-resistant OVCA patient samples. BAD phosphorylation status was modified in vitro using targeted siRNA and phosphorylation-site mutagenesis strategies, and the impact on cisplatin-sensitivity measured. Expression of the BAD pathway was studied in a range of cancer cell types and the influence on sensitivity to a variety of chemotherapeutics measured. Finally, a BAD-pathway expression signature was developed and evaluated in treated cell lines and also datasets from 848 patients with a range of different tumor types, which was used to develop a method of determining clinical outcome or predicting clinical outcome of platinum-based cancer treatment, taxane cancer treatment, gemcitabine, or oxazophorine treatment. Non-limiting examples of treatments include chemotherapeutic is cisplatin, carboplatin, paclitaxel, gemcitabine, or cyclophosphamide. A sample of a suspected or known cancer was collected, such as by a biopsy or other means known. Examples of cancers include, without being bound to specific examples, ovarian cancer, colon cancers, malignant glioma, breast cancer, leukemia, melanoma, non-small cell lung cancer, central nervous system cancer, renal cancer, or prostate cancer. The phosphorylation level of a BCL2 antagonist of cell death pathway signature score was determined in the sample using the genes or proteins represented in Table 3, FIG. 5, or FIG. 9, wherein the BCL2 antagonist of cell death
pathway signature score is determined by $\Sigma_w x_i$, where $x_i$ represents gene $i$ expression level and $w_i$ is the corresponding weight (loading coefficient) with $\Sigma w_i^2 = 1$; where a BCL2 antagonist of cell death pathway signature score above the median value in all analyses indicates positive clinical outcome to the platinum-based treatment and a score below the median indicates poor clinical outcome to the platinum-based treatment. As discussed above, the phosphorylation level of a BCL2 antagonist of cell death pathway protein level may be detected by means known in the art, such as immunofluorescence. The BCL2 antagonist of cell death pathway signature score is optionally evaluated using a log-rank test.

"Testing of the signature in a panel of OVCA cells in which cisplatin-resistance was induced by serial treatments, along with 5 discrete clinical-genomic datasets obtained from 848 patients worldwide; it was demonstrated that a high BAD-pathway signature score is associated with favorable disease-free and/or survival in all tumor types examined. Importantly, analysis of OVCA genomic data and phospho-BAD protein levels from patients with advanced-stage disease suggested that the influence of the BAD pathway on overall survival may be more important than the volume of residual disease at the completion of primary surgery, typically one of the most important clinical determinants of outcome for patients with OVCA. Such findings could have substantial implications for future clinical treatment of patients with this disease.

"In addition to characterizing a mechanism by which human cancers develop resistance to chemotherapy, a pathway was identified that has significant clinical relevance as a potential biomarker of therapeutic response, overall patient survival, and also as a promising therapeutic target. In vitro manipulation of BAD-phosphorylation levels (by siRNA depletion of a BAD kinase or BAD phosphatase or by targeted mutagenesis of key BAD-phosphorylation sites) resulted in a corresponding change in cisplatin sensitivity, validating the findings and the importance of the BAD pathway. Further validation of the in vitro and in vivo findings is provided by in silico analysis of genomic and chemosensitivity data from 60 cancer cell lines representing 9 tumor types and 8 different chemotherapeutics showed of BAD-pathway genes associated with chemosensitivity, suggesting that the pathway may not only influence OVCA cell sensitivity to platinum but also influences many other cancer cell types to a range of different chemotherapeutic agents. Accordingly, a method of inducing apoptosis in chemotherapeutic-resistant cells was developed. Non-limiting examples of the cancers includes cancer cell is ovarian cancer, colon cancer, malignant glioma, breast cancer, tamoxifen-treated breast cancer, and combinations thereof. A cancer having chemotherapeutic resistance was identified and assayed to determine if the BCL2 antagonist of cell death is phosphorylated. The cancer was then transfected with a plasmid adapted to over-express non-phosphorylated BCL2 antagonist of cell death into a cancer with phosphorylated BCL2 antagonist of cell death, where the non-phosphorylated BCL2 antagonist of cell death causes the chemotherapeutic-resistant cancer cell to undergo apoptosis. In some variations, the non-phosphorylated BCL2 antagonist of cell death is non-phosphorylated BCL2 antagonist of cell death [S136A], non-phosphorylated BCL2 antagonist of cell death [S155A], or combinations thereof. The method is useful for chemotherapeutic-resistant cells to chemotherapeutics, such as carboplatin, paclitaxel, gemcitabine, cyclophosphamide, or cisplatin. In some variations, a chemotherapeutic is administering after the transfection. Examples of the chemotherapeutics includes carboplatin, paclitaxel, gemcitabine, cyclophosphamide, or cisplatin."

**Patent Issued for Biosensor Chip Having Precise Count Function and Method of Sensing Amount of Cells (USPTO 9528954)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- From Alexandria, Virginia, NewsRx journalists report that a patent by the inventor Wu, Hung-Wei (Tainan, TW), filed on August 13, 2014, was published online on December 27, 2016.

The patent's assignee for patent number 9528954 is KUN SHAN UNIVERSITY (Tainan, TW).

News editors obtained the following quote from the background information supplied by the inventors: "The present invention generally relates to a biosensor chip and a method of sensing amount of cells, in particular with respect to a biosensor chip having precise count function and a sensing method."

"The purpose of cancer screening is aimed to detect cancer before the symptom is occurred. At present, the screening methods include medical imaging and indicator analysis of blood, urine . . . etc. Although medical imaging is of higher sensitivity towards cancer screening, it is still not suitable for detecting tumors of smaller than 0.1 cm (about 105 tumor cells). The conventional biomedical science indicators, such as prostate-specific antigen (PSA), cancer antigen 125 (CA-125), alpha-fetoprotein (AFP), human chorionic gonadotropin (HCG) and DR70, have been used as cancer marker on clinical detection; nonetheless, applying those detection methods to cancer screening still has various limitations, such as indirect determination on tumor cells counting, time-consuming blood sample separation or precision is interfered due to physical conditions (e.g. infection, inflammation or menstruation) and so on.

"Currently, many biologists focus on research into cancer cells, but numerous tumor cells (and/or cancer stem cells) are characterized of un-differentiated, resulting that is hard to distinguish from the differences. Therefore, as far as the biologists are concerned, the dielectric property of cell is regarded as one of significant tools which can be applied to count amount of cells. The known methods, however, are invasive and time-consuming, and cells necessitate to be separated from the growth surface, took out of cell culture vessel and stained before counted. As a result, how to reach purposes of low cost, high quality, low power-consumption and being able to detect less biological molecules becomes a problem of development of biosensor."

As a supplement to the background information on this patent, NewsRx correspondents also obtained the inventor's summary information for this patent: "In view of the aforementioned problems of the conventional art, one purpose of the present invention is to provide a biosensor chip having precise count function and a method of sensing amount of cells
to detect amount of cells precisely.

"According to goal of the present invention, it provides a biosensor chip having precise count function comprising: a substrate; a plurality of ground wire waveguide layers located on two sides of the substrate; a signal waveguide layer located on the substrate and between the plurality of ground wire waveguide layers, wherein the signal waveguide layer has a recess which forms a cell sensing region; and a protective layer covering a portion of the ground wire waveguide layers and a portion of the signal waveguide layer to expose the recess.

"The aforementioned plurality of ground wire waveguide layers and the signal waveguide layer may be formed by stacking a first metal layer and a second metal layer. Wherein, the first metal layer and the second metal layer may be formed of Ni, Cr, Ti or Au, respectively.

"The aforementioned substrate may be a glass substrate.

"The aforementioned protective layer may be formed of SU-8 photoresist.

"Operating frequency band of the aforementioned biosensor chip having precise count function may be between 1 GHz and 40 GHz.

"In addition, the present invention further provides a method of sensing cell using the aforementioned biosensor chip having precise count function, wherein the cell may be placed in a culture medium, and the method of sensing cell may comprise: measuring the biosensor chip to obtain a cell scattering parameter .

"##EQU00001## and amount of the cells is obtained from the cell scattering parameter 

"##EQU00002##

"wherein the cell scattering parameter may be satisfied with following relations in order to remove the microwave parasitic effect of the culture medium and the substrate effectively:

".times..times..times..times. ##EQU00003## is a loaded scattering parameter obtained by measuring the biosensor chip injecting the cell and the culture medium;

"##EQU00004## is a medium scattering parameter obtained by measuring the biosensor chip only injecting the culture medium; and

"##EQU00005## is an unloaded scattering parameter obtained by measuring the biosensor chip not injecting the cell and the culture medium.

"The aforementioned method of sensing cell may further obtain a propagation constant .gamma.(f)=.alpha.(f)+j.beta.(f) from the cell scattering parameter 

".times. ##EQU00006## .alpha..function..times..times..function..times..+.times..times. ##EQU00006.2## .beta..function..times..times..function..times..+.times..times..times..- .pi..times..function. ##EQU00006.3## and wherein L is a length of the signal waveguide layer; .di-elect cons..sub.eff(f) is an effective dielectric constant; f is a frequency.

"The aforementioned method of sensing cell may further obtain a characteristic impedance

".function..times..times..pi..function..times..function.'function. ##EQU00007## from the effective dielectric constant .di-elect cons..sub.eff(f), and wherein K(x) is an elliptical integral of a first kind;

".times..times..times..function..pi..times..times..times..times..times..times..pi..function..times..times..times..times..times..times..times. ##EQU00008## s is a width of the signal waveguide layer; G is an interval between the ground wire waveguide layer and the signal waveguide layer;
and h is a thickness of the substrate.

"The aforementioned method of sensing cell may further obtain an equivalent resistance \( R(f) \) and an equivalent capacitance \( C(f) \) from relations of 
\[
\gamma(f) \times Z_0(f) = R(f) + j \omega L(f) \quad \text{and} \quad \frac{\gamma(f)}{Z_0(f)} = G(f) + j \omega C(f),
\]
wherein \( R(f) \) is a resistance, \( L(f) \) is an inductance, \( G(f) \) is a conductance, \( C(f) \) is a capacitance and \( \omega \) is an angular frequency.

"In accordance with the preceding description, according to a biosensor chip having precise count function and a method of sensing amount of cells of the present invention, there may have one or more advantages as follows:

"(1) The biosensor chip having precise count function is capable of detecting amount of cells precisely by a cell sensing region formed of a recess of the signal waveguide layer.

"(2) The biosensor chip having precise count function is capable of covering frequency band between 1 GHz and 40 GHz, and comparing with specific resonant peak measured by the conventional sensing chip, the biosensor chip is not only of higher sensitivity, but also has a wider frequency band and a continuous frequency response.

"(3) The biosensor chip having precise count function is capable of removing the microwave parasitic effect of the culture medium and the substrate effectively by the preceding scattering parameter relations so as to obtain a more precise amount of cells.

"Hereinafter, embodiments of the present invention will be described in detail with reference to the accompanying drawings so that those skilled in the art to which the present invention pertains can realize the present invention."

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
cells, white blood cells, platelets and plasma. Although whole blood is useful, e.g., in blood replacement therapy during surgical procedures, individual blood components also have substantial utility in replacement therapies, coagulation therapy, wound healing and tissue regeneration, as described below.

"Red blood cells (RBCs) are flexible biconcave cells packed with hemoglobin which carry oxygen throughout the body. RBCs are the most dense whole blood component and thus can be readily separated from whole blood, e.g., by centrifugation or even by permitting settling under the force of gravity. Packed red cells can be transfused back into a donor patient (autologous transfusion) or transfused into a patient with a compatible blood type, e.g., having an appropriate A, B, AB, O and rh antigen type.

"White blood cells (WBCs) are a diverse array of cell types, e.g., lymphocytes, macrophages, and polymorphonuclear neutrophils (PMNs), which are primarily involved with immune responses and fighting infections. WBCs are generally somewhat less dense than RBCs and, together with platelets, form a white 'buffy coat' layer on top of RBCs during centrifugation of whole blood. Buffy coats can be a useful source of growth factors, blast cells and cytokines.

"Platelets are cell fragments shed into the blood stream by large megakaryocyte cells in the bone marrow. Platelets play an important role in coagulation of blood. When platelets contact damaged blood vessels, they aggregate and send chemical messages that can initiate the coagulation cascade. Patients with reduced peripheral blood platelet counts, e.g., patients with certain leukemias or sickle cell anemia, may require transfusions of platelets to help control bleeding episodes. Platelets settle through plasma more slowly than RBCs and WBCs due to their low density and small size. When whole blood is centrifuged, platelets can be found distributed in the plasma, in the buffy coat, and/or in the upper portion of the red cells, depending on the centrifugation time and centripetal forces involved.

"Plasma is a complex aqueous solution of proteins, lipids, small molecules and salts which acts as the transport medium for the other blood components. Plasma also contains elements necessary to the function of various biological systems, e.g., the coagulation cascade, the compliment cascade, hormones, buffers, nutrients, etc. Plasma can be stabilized with anticoagulants, e.g., citrate or heparin, for handling or storage. Plasma is the least dense of the blood components described here and presents as supernatant after centrifugation of whole blood.

"Plasma and/or platelets, in the absence of active anticoagulants, or in the presence of a catalyst, e.g. thrombin, can initiate coagulation or clotting to form a wound sealant or platelet gel useful to repair damaged tissues and to stop bleeding. Such wound sealants are generally more effective when they are concentrated and contain abundant platelets. Fibrin based wound sealants produced from pooled blood components have been available in Europe. Licensing of such products for use in the United States has been prolonged due to fear of disease transmission, though the first plasma-based fibrin sealant from pooled allogeneic sources was recently cleared. However, wound sealant preparations made from a patient's own (autologous) blood present minimal risk of disease transmission.

"Plasma can be harvested by filtration of blood directly from a patient. For example, in U.S. Pat. No. 4,498,983 to Bilsted, 'Pressure Cuff Draw Mode Enhancement System and Method for a Single Needle Blood Fractionation System', whole blood is drawn through a needle into an apparatus wherein the blood is treated with an anticoagulant and passed over a filter to remove some plasma. The plasma depleted blood is then reinfused into the patient along with some saline to make up the blood volume. Such filtered plasma will form a clot when exposed to thrombin. However, the concentration of fibrinogen in filtered plasma is too
low to act as an effective wound sealant.

"A plasma preparation can also be produced by centrifugation of whole blood (see, e.g., U.S. Pat. No. 3,145,713, 'Method and Apparatus for Processing Blood' and U.S. Pat. No. 4,151,844, 'Method and Apparatus for Separating Whole Blood into Its Components and for Automatically Collecting One Component'). Some platelets may remain in centrifuged plasma of these inventions to add some structure when it is clotted. However, without concentration, such plasma does not have the properties of an adequate fibrin glue.

"A fibrin glue wound sealant can be prepared by cryoprecipitation and centrifugation of plasma to concentrate fibrinogen. For example, a fibrin glue can be prepared by holding anticoagulated plasma in the cold to precipitate coagulation proteins, e.g., fibrinogen, followed by centrifugation to pellet and concentrate the cryoprecipitate. Just before application to a wound, thrombin is added to the cryoprecipitate to begin conversion of fibrinogen to fibrin whereby the fibrin glue clot is formed. The fibrin glue can stabilize surgical incisions and seal leaky blood vessels. Although such procedures can be helpful, they suffer from the time and effort required, the waste of disposed blood components, and the bulky equipment involved. Cryoprecipitated fibrin glues, particularly from autologous plasma, are not a practical solution to wound sealing on an emergency basis.

"In U.S. Pat. No. 5,585,007 to Antanavich, 'Plasma Concentrate and Tissue Sealant Methods and Apparatuses for Making Concentrated Plasma and/or Tissue Sealant', whole blood is separated by centripetal force and the plasma is concentrated by selective absorption of water. This device is an improvement over prior technology in that it both separates and concentrates plasma. Fifty (50) ml of whole blood is introduced into the top centrifugal chamber of the device, then the chamber is spun to sediment blood cells about the periphery of the chamber where they are captured, e.g., by a mat matrix. The rotation of the chamber is stopped, allowing liquid components of the blood to fall into a lower chamber where they are exposed to dehydrating beads which concentrate the liquid components to some extent.

"The Antanavich device lacks the flexibility required to accommodate different amounts of whole blood starting material, to adjust for variations in blood component proportions, or to control the character of concentrated products. For example, depending on the hematocrit of the whole blood, various amounts of liquid components remain trapped in the upper chamber and various proportions of water are removed by the dehydrating beads. Fine tuning the device to harvest special component mixtures, e.g., buffy coat, is not possible. In addition, many blood components, e.g. white blood cells, can not be collected or reinfused as they are lost in the device as waste material.

"There remains a need to provide an automated system to quickly and consistently separate and concentrate selected blood components in a single aseptically sealed instrument. Waste of blood components needs to be reduced by provision of technologies for high recovery and reconstitution of unselected blood components for reinfusion."

As a supplement to the background information on this patent, NewsRx correspondents also obtained the inventors' summary information for this patent: "The present invention provides an automated apparatus to consistently separate and/or concentrate blood components. The apparatus can include a separation disc, a concentrator and a control system to monitor and direct the flow of, e.g., blood and blood components, between containers. The apparatus can include a disposable component kit that is sterile, aseptically sealed and easily to load into the apparatus.

"In one aspect, the apparatus includes a whole blood container, a separation disc, a pump, a concentrator, a valve, a control system and detectors. Whole blood in the container can include blood components with differing densities and molecules with various molecular
weights. Blood, as used herein, can include, various suspensions of cells including, e.g., whole blood, other animal blood products, eukaryotic or prokaryotic cell culture fluids, and the like. The separation disc, mounted to rotate in the apparatus, has a first port in fluid communication with the whole blood container through a first conduit, and has a second port, e.g., near the disc axis of rotation. The pump can drive whole blood and blood components from the container through the first conduit to the separation disc and out the second port to the concentrator. The concentrator can have, e.g., an ultrafiltration membrane with a retentate side and permeate side and is in fluid communication with the second port of the separation disc through a second conduit. The valve can control, e.g., transfer of blood components through the second conduit. The control system can control, e.g., the pump, and the valve, to direct transfer of the blood between the container, the separation disc, and/or the concentrator. The detector can be connected to the control system and mounted on the apparatus in operative orientation to detect the fill level of the separation disc. In operation, for example:

"1) the control system directs the transfer of blood from the container to the separation disc,
"2) the separation disc rotates, creating a centripetal force which separates blood components in order of density,
"3) high density components accumulate at the periphery of the separation disc, and low density components, and/or intermediate density components, accumulate near the second port,
"4) the high density components accumulate to a level that triggers the detector which transmits a signal to the control system, and,
"5) the control system directs the valve to open allowing low density components and/or intermediate density components to flow from the separation disc outlet port into the concentrator and onto the retentate side of the membrane where the low molecular weight molecules pass through to the permeate side of the membrane, whereby the low density components and/or intermediate density components are concentrated into concentrated blood components.

"In a more basic form, the apparatus to produce concentrated blood components can comprises, e.g., a separation disc, a control system and a concentrator. The separation disc can receive blood through a first conduit and rotate, generating centripetal force, to separate the blood components according to density. The control system can direct operation of a first pump operably coupled to the first conduit to transfer blood and/or blood components to the separation disc. The separated blood components can include, e.g., plasma or buffy coat. The concentrator can receive separated blood components from the separation disc, through a second conduit, onto the retentate side of an ultrafiltration membrane. During operation of the apparatus, low molecular weight molecules in the blood components can be forced, by pressure, through the membrane to the permeate side of the membrane leaving the blood components concentrated on the retentate side. The concentrated blood components are a composition of the invention. The apparatus can automatically process, e.g., 100 to 500 ml of blood from a first container through the conduit and separation disc.

"The apparatus of the invention can have the separation disc, the centrifuge chamber, the concentrator, and the control system all within a bench top housing. The centrifuge chamber can be positioned within the apparatus on vibration isolation mounts. The separation disc can be rotatably mounted in the centrifuge chamber and locked into place with an iris-like chamber door. The iris door can be configured to center the separation disc, to comprise a port orienting keyway, to provide a mounting position for an RBC interface detector and/or to provide a force maintaining seal pressure on a rotary seal.
An RBC interface detector can be connected to the control system and mounted in operative orientation to the chamber in association with the separation disc to detect an RBC interface, buffy coat interface, or other interfaces. The control system can be connected to a junction valve which can direct separated components from the second conduit alternately to the concentrator or to a plasma container. The control system and RBC interface detector can be configured, e.g., to transfer low density components from the separation disc into the plasma container until the RBC interface is detected. The junction valve can then be switched to send selected blood components to a concentrator for concentration.

The control system can be in operatively connected (i.e., controlling power and/or receiving rotation rate information) with a drive motor that rotates the separation disc, and operatively connected (i.e., controlling actuation) to a valve operably coupled to the second conduit to direct the flow of separated components in the second conduit. The control system can set the separation speed to produce a force of about 2000.times.g during blood component separations. The control system can slow the rotation of the separation disc to produce a force between about 500.times.g and about 1000.times.g after detection of the RBC interface and direct opening of the valve to collect certain blood components. The composition of the blood components can be affected, e.g., by mounting the RBC level detector to trigger at a predetermined level of blood components in the separation disc. The control system can optionally pause separation and/or concentration operations to allow sampling of blood components before completion of processing. The control system can be operably connected to an air detector operatively coupled to the first conduit so that the pump will be stopped when air is detected in the first conduit.

The control system can be connected to an RBC detector on the second conduit to stop the first pump when RBCs are detected coming out of the separation disc. This mechanism can provide sharp resolution in the harvest of closely associated blood components, e.g., separated RBCs, WBCs and platelets. In addition, this mechanism can establish the end of a separation process pass and signal time to initiate transfer of depleted RBCs to a holding container. The control system can be connected to a junction valve operably coupled to the first conduit to direct transfer of residual blood components from the separation disc to an RBC holding container when the first pump is operated in reverse. Blood components, which were not sent to the concentrator, can be reconstituted by transferring separated components, to the RBC holding container, thereby reconstituting the residual blood component from the separation disc with separated components that were not received by the concentrator. Reconstituted components can be suitable for infusion into a patient or they can be further processed by the apparatus of the invention.

Concentrated blood components prepared by the apparatus of the invention are another aspect of the invention. The concentrated blood components can include growth factors present at levels 2-fold or more over peripheral blood levels. Concentrated growth factors of the invention can include, e.g., IGF, EGF at a concentration of about 100 pg/ml or more, FGF at a concentration of about 150 pg/ml or more, VEGF at a concentration of about 800 pg/ml or more, PDGF at a concentration of about 30 ng/ml or more, and/or TGF at a concentration of about 200 ng/ml or more.

The control system of the invention can be operably connected to detectors, e.g., pump turn counters, air detectors, optical array volume detectors and RBC detectors, to detect collection end points and to provide for calculation of component volumes. For example, the first pump can have a turn counter connected to the control system which can determine transferred blood volumes (V.sub.b) from the start of processing to the time air is detected in the first conduit. In another example, the volume of filtrate (V.sub.f) through the permeate side of the membrane can be detected by an optical array volume detector mounted to the holding
container and connected to the control system.

"The control system can receive an expected blood volume (V.sub.eb) from an operator interface and compare it to the determined blood volume (V.sub.b), then issue a notice to the operator if the expected and determined blood volumes do not match within about 30%, or more. The control system can calculate an expected separated blood component volume (V.sub.sce) by multiplying a separation factor, e.g., in the range of about 0.25 to about 0.4, times the lesser of the determined blood volume (V.sub.b) and the expected blood volume (V.sub.eb). A table or spreadsheet can be provided with an array of such calculations for ready reference by an operator. The control system can terminate separation processes by stopping the first pump when the volume of the separated components (V.sub.sc) equals the expected separated component volume (V.sub.esc). The control system can also terminate the concentration process when the volume of concentrated separated components (V.sub.csc) equals the volume of the separated components (V.sub.sc) multiplied by a concentration factor, e.g., about 0.2 to about 0.4.

"A disposable kit of the invention can include, e.g., the first conduit, the separation disc, the second conduit and/or the concentrator, which can all be loaded into the top of the apparatus. The first conduit and the second conduit can comprise peristaltic tubing. The disposable kit can be fabricated with one or more cassettes that guidedly mount, e.g., the conduit into valves, the conduit into detectors, and/or the conduit into pumps. Such cassettes can, e.g., firmly 'snap' conduit into functional association with valves, pumps and detectors in a fashion appreciated by those skilled in the art. The disposable kit components can be plastic and packaged in a sealed container, such as a plastic pouch or tray, and sterilized with gamma radiation.

"The separation disc can include a rotary seal, an inlet port, an outlet port, a keyway, a bowl, welded ribs and radial channels. The rotary seal can include a rubber seal spring which can be press-fitted into a graphite seal. The bowl can have an aspect ratio of 1 to 5, or less, to improve resolution of separated components. The inlet port and outlet port can be oriented in the same direction and a keyway can direct the pair of ports as the separation disc is loaded into the apparatus.

"The concentrator of the invention can be a tangential flow filter, e.g., a hollow fiber filter. The concentrator can have an ultrafiltration membrane with a molecular weight cut off of 2-150 kDa. A pressure gradient across the membrane can be provided by a fluid pump on the retentate side of the membrane or from a vacuum pump on the permeate side of the membrane. The concentrator can be part of a recirculating loop including the second conduit, a second pump operatively coupled to the conduit, and a second container. The control system can be connected to the pump to direct recirculation of separated components in the concentration loop.

"The present invention provides a method of producing concentrated blood components by processing blood with the apparatus of the invention. In one embodiment of the method, e.g., RBCs are detected in a separation disc at detection levels predetermined to provide a desired composition of separated blood components; separated components are collected from an outlet port proximate to the separation disc rotational axis until RBCs are detected in the collection stream; separated components are transferred to a concentrator; and, separated components are concentrated by ultrafiltration. Blood or blood components can be continuously loaded onto the separation disc while it is spinning. Separated components can be harvested in repeated milking cycles of collecting not more than about 10% of a separation disc volume and pausing collection for a time period before collecting again. In some embodiments, a pause in the cycle can allow the interface to stabilize between collections for improved resolution of blood components. The method of the invention can provide for the detection, collection, transfer, and concentration steps all in a single bench top instrument. The method provides a
control system for monitoring detection, directing collection, directing transfer, and/or directing concentration.

"The method of the invention additionally provides the steps of determining a total blood volume (V.sub.b) loaded onto the separation disc, monitoring a separated component volume (V.sub.sc), calculating an expected separated component volume (V.sub.sce), and ending collection of separated components when the separated component volume (V.sub.sc) equals the expected separated component volume (V.sub.sce). The expected separated component volume (V.sub.sce) can be calculated by multiplying the total blood volume (V.sub.b) by a separation factor. Collection of separated components volume (V.sub.sc) can be ended when an expected concentrated component volume (V.sub.cce) equals a monitored concentrated component volume (V.sub.cc). The expected concentrated component volume (V.sub.cce) can be calculated as the separated component volume (V.sub.sc) multiplied by a concentration factor. The concentrated component volume (V.sub.cc) can be calculated as the separated component volume (V.sub.sc) minus a concentrator filtrate volume (V.sub.f).

"Another aspect of the methods of the invention is manufacturing a disposable set by fabricating a separation disc coupled through a conduit to a concentrator. The manufacture of the disposable set can additionally include fabricating one or more cassettes configured to guidedly mount the disposable set to an apparatus. The method of the invention can further include the step of loading the disposable set into the apparatus.

"The present invention includes separated and concentrated blood components produced by the methods of the invention. Platelet poor plasma can be collected from the outlet port before the RBC interface is detected. Prothrombin in the platelet poor plasma can be converted into thrombin for use, e.g., in preparation of coagulated products of the invention. Concentrated blood components can be contacted with thrombin to prepare a fibrin gel, a wound sealant, and/or a bone graft substitute. The method can include isolating one or more growth factors, compliment cascade proteins and/or coagulation factors from the concentrated blood components."

TECHNION RESEARCH AND DEVELOPMENT...

Patent Issued for Breath Analysis of Pulmonary Nodules (USPTO 9528979)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A patent by the inventors Haick, Hossam (Haifa, IL); Peled, Nir (Hod...
Hasharon, IL), filed on November 15, 2012, was published online on December 27, 2016, according to news reporting originating from Alexandria, Virginia, by NewsRx correspondents.

Patent number 9528979 is assigned to TECHNION RESEARCH AND DEVELOPMENT FOUNDATION LTD. (Haifa, IL).

The following quote was obtained by the news editors from the background information supplied by the inventors: "Lung cancer (LC) is the leading cause of cancer mortality with more than 1 million deaths worldwide every year. The recent National Lung Cancer Screening Trial (NLST) has proven that screening for lung cancer by low dose CT scans reduces the related mortality rate by 20%. Unfortunately, the false-positive rate was extremely high, with 96% of the 24% positive CT findings being non-cancerous. Retrospectively, individuals with false-positive findings underwent unnecessary invasive procedures that are costly and are associated with significant risks and increased mortality (N. Engl. J. Med. 2011; 365:395-409). Since low dose CT screening programs for lung cancer are expected to be launched in many countries in the near future, it is reasonable to expect a dramatic increase in the detection of small solitary pulmonary nodules (SPNs) as well as a dramatic increase in the invasive procedures, morbidity, mortality and health care costs.

"Volatile Organic Compounds (VOCs) are organic molecules characterized by a high vapor pressure at ordinary, room temperature conditions. These molecules evaporate from the cell and/or from the surrounding microenvironment and enter the bloodstream. Some VOCs are then secreted in exhaled breath through exchange via the lungs. VOCs that evaporate from the membrane of cancer cells induce changes in the blood chemistry. These changes are then reflected in the composition of VOCs in exhaled breath which can be used to diagnose cancer (Expert Rev. Mol. Diagn. 2011; 11: 207-217; memo 2010; 3: 106-112; J. Chromatog. B 2010; 878: 2643-2651; Lung Cancer 2010; 67: 227-231; Br. J. Cancer 2010; 103: 542-551; Nature Nanotech. 2009; 4: 669-673; BMC Cancer 2009; 9: 348; Clin. Chem. 1985; 31: 1278-1282; and Clin. Chem. Lab Med. 2009; 47: 550-560).

"WO 2007/086986 discloses a method for detecting a target analyte/biomarker in exhaled breath comprising: a) exposing to the exhaled breath a molecular recognition agent capable of selectively binding to the target analyte/biomarker, wherein the molecular recognition agent is linked with a signaling agent; and b) detecting a signal generated by the signaling agent.

"WO 2009/066293 to one of the inventors of the present invention discloses an
apparatus comprising at least one chemically sensitive sensor for detecting volatile and non-volatile compounds, wherein the chemically sensitive sensor comprises cubic nanoparticle conductive cores capped with an organic coating.

"WO 2010/079490 to one of the inventors of the present invention discloses a breath analyzer comprising an array of sensors of conductive nanoparticles capped with an organic coating for detecting cancer.

"WO 2009/144725 to one of the inventors of the present invention discloses sensor apparatuses comprising single-walled carbon nanotubes for measuring volatile organic compounds and methods of use thereof for determining breath analytes indicative of various cancers and, in particular, lung cancer.

"WO 2010/064239 to one of the inventors of the present application discloses a system comprising an array of sensors for measuring volatile organic compounds as biomarkers for diagnosis, prognosis and monitoring of renal insufficiencies.

In addition to the many studies that were aimed at identifying VOCs indicative of lung cancer from breath samples, Filipiak et al. (Cancer Cell Inter. 2008; 8: 17) disclosed a list of 60 substances observed in the headspace of medium as well as in the headspace of lung cancer cell line CALU-1. A significant increase in the concentrations of 4 VOCs and a decrease in the concentrations of 11 VOCs as compared to medium controls were detected after 18 hours. In another study, Chen et al. (Cancer 2007; 110: 835-844) identified 4 VOCs that were found to exist in all culture mediums of lung cancer cells and can be used as markers of lung cancer. Recent in vitro experiments of the headspace of cell lines identified three substances (decanal, acetaldehyde and 1,3-bis(1,1-dimethylethyl)-benzene) as main contributors to the separation between small cell and non-small cell lung cancer. Nine VOCs (two aldehydes, one alkane, two ketones, one alcohol and three benzene derivatives) showed differences between subtypes of non-small cell lung cancer of which 2-ethyl-1-hexanol, 1,3-dimethyl-benzene and 1,3-bis (1,1-dimethylethyl)-benzene were found at higher concentrations in the headspace of adenocarcinoma cell lines as compared to the headspace of squamous cell carcinoma cell lines (Nanomedicine (NBM) 2012; 8: 580-589).

"WO 2012/023138 to the inventors of the present invention discloses methods of diagnosing, prognosing or monitoring the treatment of pre-cancerous conditions of the lung e.g. bronchial dysplasia or atypical alveolar hyperplasia (AAH), or identifying a genetic alteration which is associated with lung cancer as a means of prognosing or monitoring the treatment or the recurrence of lung cancer, or predicting a patient's response and/or resistance to various treatment regimens.

"There remains an unmet need for a reliable biomarker assay technique for differentiating between benign nodules and malignant nodules in a non-invasive and cost-effective manner while dramatically reducing false-positive rates."
