Our news journalists obtained a quote from the research from William Harvey Research Institute, "Improved biologic prodrugs specifically targeted to the site of inflammation have the potential to alleviate current concerns surrounding biologic anticytokine therapies. The purpose of this study was to design, construct, and evaluate in vitro and ex vivo the targeting and antiinflammatory capacity of activatable bispecific antibodies. Activatable dual variable domain (aDVD) antibodies were designed and constructed to target intercellular adhesion molecule 1 (ICAM-1), which is up-regulated at sites of inflammation, and anti-TNF antibodies (adalimumab and infliximab). These bispecific molecules included an external arm that targets ICAM-1 and an internal arm that comprises the therapeutic domain of an anti-TNF antibody. Both arms were linked to matrix metalloproteinase (MMP)-cleavable linkers. The constructs were tested for their ability to bind and neutralize both in vitro and ex vivo targets. Intact aDVD constructs demonstrated significantly reduced binding and anti-TNF activity in the prodrug formulation as compared to the parent antibodies. Human synovial fluid and physiologic concentrations of MMP enzyme were capable of cleaving the external domain of the antibody, revealing a fully active molecule. Activated antibodies retained the same binding and anti-TNF inhibitory capacities as the parent molecules. The design of a biologic prodrug with enhanced specificity for sites of inflammation (synovium) and reduced specificity for off-target TNF is described."

According to the news editors, the research concluded: "This construct has the potential to form a platform technology that is capable of enhancing the therapeutic index of drugs for the treatment of RA and other inflammatory diseases."

For more information on this research see: Rational design of antirheumatic prodrugs specific for sites of inflammation. Arthritis & Rheumatology, 2015;67(10):2661-72.

Reports Outline Aquatic Toxicology Study Findings from University of Insubria (Evaluation of tissue morphology and gene expression as biomarkers of pollution in mussel Mytilus galloprovincialis caging experiment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Aquatic Toxicology. According to news reporting from Milan, Italy, by NewsRx journalists, research stated, "The ecosystem is being anthropogenically disturbed, which has serious consequences for the environment and human health, having strong social and economic impacts on the community. One of the most common methods to evaluate the effects of toxic contaminants is based on biomonitoring, e.g., placing Mytilus galloprovincialis in the polluted areas investigated."

Funders for this research include PRIN, FAR.

The news correspondents obtained a quote from the research from the University of Insubria, "In this study, we have combined two different methods, transcriptomic and morphological analysis, with the purpose of determining whether cell morphology and the ultrastructural organization of our animal model are related to gene expression in outdoor experiments. The most pronounced changes were observed in mussel gills and digestive gland for mRNA involved in protein machinery (18S, 28S and EF1), while HSP70, MT10, CYP4Y1, SOD1, and CAT mRNAs showed scattered modifications not related to the studied area. In agreement with 18S, 28S, and EF1 mRNA evaluation, optical and electron microscopy demonstrated an initial inflammatory response of the cells that can lead to apoptosis in the caged mussels in all the polluted areas."

According to the news reporters, the research concluded: "The application of a multidisciplinary approach proved to be effective for assessing the biological effects of contaminations on the health of aquatic organisms, and thus suitable to be applied in ecotoxicological studies. Although affected by several uncontrolled environmental variables, the assessment of mRNA can represent a useful endpoint for an integrated estimation of the overall threats to the sea environment within a field research approach."

For more information on this research see: Evaluation of tissue morphology and gene expression as biomarkers of pollution in mussel Mytilus galloprovincialis caging experiment. Aquatic Toxicology, 2016;181():57-66. Aquatic Toxicology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Aquatic Toxicology - www.journals.elsevier.com/aquatic-toxicology/)

Heart Disorders and Diseases - Atrial Fibrillation

Reports Outline Atrial Fibrillation Findings from V. Velagic and Colleagues (Repeat Procedures After Hybrid Thoracoscopic Ablation in the Setting of Longstanding Persistent Atrial Fibrillation: Electrophysiological Findings and 2-Year Clinical ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting from Brussels, Belgium, by NewsRx journalists, research stated, "In order to increase success rates of invasive treatment of persistent atrial fibrillation, the hybrid approach was developed, combining video-assisted thoracoscopic epicardial procedure with conventional endocardial catheter ablation. Currently, there are no reports of electrophysiological findings and clinical outcomes of repeat procedures after the hybrid approach."

The news correspondents obtained a quote from the research, "Out of 64 patients who were treated by hybrid ablation for persistent atrial fibrillation (AF), 14 underwent the repeat catheter ablation and were selected for this study. All 14 patients initially presented with longstanding persistent atrial fibrillation and markedly dilated atria. The hybrid procedure was performed in a single act and the mean time to redo procedure was 346 ± 227 days. In 57% of patients indication for redo procedure was regular atrial tachycardia, and the rest presented with recurrent atrial fibrillation. In 36% of patients, recovered conduction was found along the previous ablation lesions. Only 9% of pulmonary veins were reconnected (0.36 veins per patient) and 7% of box lesions were not complete. The overall success rate at 2 years follow-up after the repeat procedure, including second repeat procedure and patients taking antiarrhythmic drugs, was 64% (57% without drugs and further ablation). One case of moderate pulmonary vein stenosis was detected as a consequence of hybrid procedure. Hybrid atrial fibrillation ablation results in durable lesions and high rates of chronic pulmonary vein isolation even after long-term follow-up."

According to the news reporters, the research concluded: "Most of the repeat procedures after the hybrid approach are related to left atrial flutters that could be successfully treated by catheter ablation."

**Reports Outline Atrial Fibrillation Study Results from Heart Center**

(Cryoballoon ablation for persistent atrial fibrillation - Large single-center experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Atrial Fibrillation is now available. According to news reporting from Munich, Germany, by NewsRx journalists, research stated, "Different catheter ablation (CA) strategies have been established in the treatment of persistent atrial fibrillation (persAF). Pulmonary vein isolation (PVI) only might be an option for the initial ablation procedure."

The news correspondents obtained a quote from the research from Heart Center, "There is a paucity of outcome data on second-generation cryoballoon (CBG2) PVI in persAF. Patients with symptomatic drug-refractory persAF who underwent initial CA of AF were prospectively enrolled and PVI was performed with CBG2. The primary composite endpoint was freedom from AF, atrial tachycardia, or related symptoms after a 3-month blanking period. The secondary endpoint referred to periprocedural complications. One hundred seventy-three consecutive patients (64 +/- 10 years, 29% female) with symptomatic drug-refractory persAF were identified. Acute PVI was achieved in 100% of pulmonary veins with the CB technique. The left atrial procedure time was 112 +/- 30 min. Major complications occurred in 1.7% (3 of 173 patients) including two phrenic nerve palsies (1%), which resolved until discharge, and one pericardial effusion (0.6%). Follow-up >= 12 months was completed for 157 of 173 patients (91%). Median follow-up was 14 months. At 12 months, the primary composite endpoint was achieved in 129 of 157 patients (82%). However, 22 of 129 patients at risk (17%) were still on antiarrhythmic drugs. A relapse during the blanking period was identified as the only independent predictor for AF recurrence."

According to the news reporters, the research concluded: "PVI using the second-generation cryoballoon is a reasonable treatment option for patients with symptomatic drug-refractory persAF with a favorable rate of freedom from AF and a low complication rate."

For more information on this research see: Cryoballoon ablation for persistent atrial fibrillation - Large single-center experience. *Journal of Cardiology*, 2016;68(5-6):492-497. *Journal of Cardiology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Cardiology - www.journals.elsevier.com/journal-of-cardiology/)

Our news journalists report that additional information may be obtained by contacting F. Straube, Munich Municipal Hosp Grp, Dept. of Cardiol & Internal Intens Care
Reports Outline Autografts Study Findings from Department of Surgery (Outcomes of Reintervention on the Autograft After Ross Procedure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Autografts have been presented. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "After a Ross procedure, a small subset of patients requires reintervention for autograft dilatation or valve insufficiency. We sought to determine the indications, nature, and outcomes of autograft reinterventions in the left ventricular outflow tract after a Ross procedure."

Our news journalists obtained a quote from the research from the Department of Surgery, "We retrospectively reviewed the charts of 316 consecutive patients, age 4 days to 70 years, who underwent a Ross procedure at our institution. Of these, 47 patients (15%) required autograft reintervention during a median follow-up of 8.2 years. Forty-seven patients, median age 26 years (interquartile range [IQR], 14.4 to 44.8 years), 32 (68%) men, required autograft reintervention a median 5.5 years (IQR, 1.8 to 9.4 years) after a Ross procedure. In 47% (22 of 47 patients), the autograft valve could be salvaged (15 valve-sparing aortic replacements, 7 valve repairs). The remaining 53% underwent replacement of the root (10 mechanical, 5 homograft) or valve alone (7 mechanical, 3 bioprosthetic). Twenty patients presented without autograft root dilatation 1 year (IQR, 0.5 to 2.9 years) after Ross. Fifteen of them (75%) required valve replacement. The 27 patients who demonstrated root dilatation presented 6.9 years (IQR, 4.5 to 9.7 years; p< 0.01 compared with the nondilated group) after Ross, and 17 (63%) of these valves could be spared (p = 0.01). There was no surgical mortality and 5 (11%) major morbidity events. Patients were followed up for 4.9 years (IQR, 2.1 to 7 years) after left ventricular outflow tract reintervention. For patients whose autograft valve could be spared, 3-, 5-, and 8-year freedom from valve replacement was 92%, 86%, and 86%, respectively. At last follow-up, only 1 patient had greater than mild aortic insufficiency, and all but 1 had normal ejection fraction. Autograft reintervention after a Ross appears to follow a bimodal distribution. Patients with primary autograft leaflet problems tend to present early without root dilatation and frequently require valve replacement. The autograft valve can be salvaged in the majority of patients who present later with root dilatation."

According to the news editors, the research concluded: "Valve-sparing procedures are durable in the intermediate term and can be accomplished with low morbidity."

Chemistry - Biochemistry

Reports Outline Biochemistry Study Results from University of Manchester (Cytoskeletal Filamin A Differentially Modulates RNA Polymerase III Gene Transcription in Transformed Cell Lines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Chemistry - Biochemistry. According to news originating from Manchester, United Kingdom, by NewsRx correspondents, research stated, "Cytoskeletal filamin A (FLNA) is an important protein involved in multiple cellular processes. Previous studies have shown that FLNA can promote or inhibit cancer growth and development; however, the mechanisms underlying these events are not fully understood."

Funders for this research include National Natural Science Foundation of China, Worldwide Cancer Research.

Our news journalists obtained a quote from the research from the University of Manchester, "Here we show that, in both 293T and SaOS2 cells, knockdown of FLNA significantly enhanced transcription of RNA polymerase (pol) III-transcribed genes except for a subset of tRNA genes. In contrast, re-expression of FLNA in an FLNA-deficient melanoma cell line (A7) repressed transcription of all pol III-transcribed genes, suggesting that FLNA inhibits pol III transcription in a cell type-specific manner. Chromatin immunoprecipitation assays revealed that the repression of pol III gene transcription by FLNA correlates with the decreased occupancy of the RNA pol III transcription machinery at promoters. Immunofluorescence microscopy and coimmunoprecipitation assays revealed that FLNA can associate with the RNA pol III transcription machinery through its actin-binding domain within nuclei. Mechanistic analysis revealed that FLNA suppresses pol III gene transcription by confining the recruitment of the RNA pol III transcription machinery at the promoters of the genes that are sensitive to the alteration of FLNA expression."

According to the news editors, the research concluded: "These findings not only extend the understanding of FLNA function in cells but also provide novel insights into the mechanism by which FLNA represses cell proliferation."

Reports Outline Biophysical Chemistry Study Results from Indian Institute of Technology [Binding of the alkaloid coralyne to parallel G-quadruplex DNA [d(TTGGGGT)][4] studied by multi-spectroscopic techniques]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Chemistry - Biophysical Chemistry. According to news reporting from Uttar Pradesh, India, by NewsRx journalists, research stated, "Binding of coralyne to tetra-molecular parallel G-quadruplex DNA [d(TTGGGGT)][4] was evaluated for the first time using biophysical techniques. Absorbance titration show hypo/hyper-chromism accompanied by 12 nm red shift with binding constant K-b = 02-4.0 x 10(6) M-1."

The news correspondents obtained a quote from the research from the Indian Institute of Technology, "Binding induces a negative circular dichroism band of coralyne at 315 nm. Quenching of fluorescence (similar to 64%) along with 10 nm blue shift in emission maxima indicates proximity of coralyne to guanine bases. Job plot indicates existence of multiple complexes. The observed two fluorescence life times, 6 and 12 ns, with relative abundance 33% and 63%, respectively suggest two binding sites/conformations in complex. ID H-1 NMR spectra reveal significant broadening and upfield shift of G3NH, G6NH and G3H8 proton signals upon binding."

According to the news reporters, the research concluded: "The NOESY spectra reveal sequence specific non-intercalative interaction of coralyne in monomeric form at two sites close to A3/G3 and G6 bases of [d(TTGGGGT)][4] and [d(TTAGGGT)][4] and [d(TTAGGGT)][4], which has implications in anti-cancer drug action."

For more information on this research see: Binding of the alkaloid coralyne to parallel G-quadruplex DNA [d(TTGGGGT)][4] studied by multi-spectroscopic techniques, *Biophysical Chemistry*, 2016;219():49-58. *Biophysical Chemistry* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Biophysical Chemistry - www.journals.elsevier.com/biophysical-chemistry/)

Reports Outline Blood Coagulation Factors Study Findings from Research Center (The contribution of von Willebrand factor-GPIba interactions to persistent aggregate formation in apheresis platelet concentrates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematology - Blood Coagulation Factors are discussed in a new report. According to news reporting out of Ghent, Belgium, by NewsRx editors, research stated, "Apheresis platelet concentrates sometimes contain persistent aggregates (PA). Because apheresis involves extracorporeal circulation, we hypothesized that interactions between GPIba and von Willebrand factor (VWF) underlie their origin."

Our news journalists obtained a quote from the research from Research Center, "Platelets in donations with PA were compared to aggregate-free (AF) controls. Flow cytometry was used to determine platelet bound VWF. Degranulation was measured using P-selectin expression in flow cytometry and cytokine release using immunosorbent assays. Platelet adhesion to VWF was assessed in hydrodynamic flow and real-time video microscopy. Platelets in PA concentrates had significantly more (p=0.009, n (>=) 8) bound VWF compared to AF platelets, but differences in VWF concentration, VWF collagen binding, activated VWF or GPIba expression were not found. Degranulation was higher (p=0.030, n=7) in PA than AF concentrates on day 1 of storage, but adhesion to immobilized VWF under hydrodynamic flow conditions was normal at that moment. On day 6, however, significantly less VWF adhesion (p=0.009, n (>=) 6) was found for PA platelets compared to AF, indicating accelerated storage lesion in PA products. In a model that mimicks PA formation by chemically induced binding of VWF to platelets, we found that degranulation, phosphatidyserine expression and metabolism did not differ with paired controls at any time during subsequent storage. Accelerated storage lesion is found in concentrates with PA, but this cannot be explained solely by increased platelet bound VWF following apheresis."

According to the news editors, the research concluded: "Therefore, additional stressors are probably responsible for the increases observed in platelet degranulation and storage lesion in products with PA."

Our news journalists report that additional information may be obtained by contacting H.B. Feys, Transfusion Research Center, Belgian Red Cross-Flanders, Ghent, Belgium. Additional authors for this research include B. Van Aelst, R. Devloo, P. Vandekerckhove and V. Compernolle.

The direct object identifier (DOI) for that additional information is:
Reports Outline Blood Pressure Findings from State University of Campinas [New 2-Aminothiazoline derivatives lower blood pressure of spontaneously hypertensive rats (SHR) via I-1-imidazoline and alpha-2 adrenergic receptors activation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Pressure have been published. According to news reporting originating in Campinas, Brazil, by NewsRx journalists, research stated, "2-Aminothiazolines share an isosteric relationship with imidazolines and oxazolines with antihypertensive activity mainly mediated by the imidazole I-1-receptor. In the present work, we have prepared five aminothiazolines, following a previously described synthetic pathway."

The news reporters obtained a quote from the research from the State University of Campinas, "Aminothiazolines derived from dicyclo-propylmethylamine (ATZ1) and cyclohexylamine (3) are unprecedented in the literature. Competitive radioligand assay was carried out with all synthetic compounds, and the I-1 receptor affinity in comparison to rilmenidine in PC12 cells was determined. Surprisingly, the rilmenidine isoster (ATZ1) showed no I-1-receptor interaction. Diethyl (ATZ4) and 2-ethyl-hexylamine (ATZ5) derivatives bind to the receptor with 11.98 and 10.94 nmol/l, respectively. These compounds were selected for in vivo experiments. Both compounds reduced the blood pressure of spontaneously hypertensive rats (SHR). The hypotensive effect of these compounds was abrogated in the presence of a(2) adrenergic (yohimbine) and I-1 (efaroxan) receptor antagonists suggesting that both aminothiazolines bind to the adrenergic and imidazoline receptors."

According to the news reporters, the research concluded: "Lipinski's descriptors of the synthesized aminothiazolines were calculated and are similar to the known imidazoline I-1 receptor ligands. 3D-Similarity between ATZ5 and agmatine, the natural imidazoline receptor ligand, was also observed."

Our news correspondents report that additional information may be obtained by contacting W.P. Almeida, Campinas State University, Fac Pharmaceut Sci, BR-13083859 Campinas, SP, Brazil. Additional authors for this research include M.G. De Oliveira, E. Antunes, W.P. Almeida, B.M. Ibrahim and A.A. Abdel-Rahman.

Reports Outline Blood Proteins Study Results from Uppsala University
[The lectin complement pathway serine proteases (MASPs) represent a possible crossroad between the coagulation and complement systems in thromboinflammation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Blood Proteins. According to news originating from Uppsala, Sweden, by NewsRx correspondents, research stated, "ESSENTIALS: The lectin pathway's MASP-1/2 activates coagulation factors but the trigger of the activation is unknown. MASP-1/2 activation was assessed by quantifying complexes between MASPs and antithrombin/C1-inhibitor."

Funders for this research include Vetenskapsradet, Seventh Framework Programme.

Our news journalists obtained a quote from the research from Uppsala University, "Activated platelets and fibrin were demonstrated to activate MASP-1 and MASP-2 both in vitro and in vivo. These findings may represent a crossroad between the complement and the coagulation systems. The activated forms of the complement lectin pathway (LP) proteases MASP-1 and MASP-2 are able to cleave the coagulation factors prothrombin, fibrinogen, factor XIII and thrombin-activatable fibrinolysis inhibitor in vitro. In vivo studies also show that MASP-1 is involved in thrombogenesis. To clarify the not yet identified mechanisms involved in triggering activation of the LP during thrombotic reactions. Novel sandwich-ELISAs for detection of complexes between MASP-1 or MASP-2 and the serpins C1 inhibitor (C1-INH) or antithrombin (AT), were used to specifically detect and quantify the activated forms of MASP-1 and MASP-2. Activated platelets were shown by flow cytometry to bind Ficolin-1, -2 and -3 but not MBL, which was associated with activation of MASP-1 and MASP-2. We also demonstrated that fibrin and the plasmin-generated fibrin fragment DD in plasma, bind and activate MASP-1 and MASP-2. As demonstrated by the ELISA and SDS-PAGE/Western blotting, the fibrin-associated activation was reflected in a specific inactivation by AT during clotting without the assistance of heparin. In all other cases the MASPs were, as previously reported, inactivated by C1-INH. In systemic lupus erythematosus patients with thrombotic disease and in polytrauma patients, the levels of activated MASP-1 and MASP-2 in complex with both AT and C1-INH were associated with markers of thrombotic disease and contact/coagulation system activation. MASP-1 and MASP-2 are activated during blood clotting."

According to the news editors, the research concluded: "This activation is triggered by activated platelets and by the generation of fibrin during thrombotic reactions in vitro and in vivo, and may represent a novel activation/amplification mechanism in thromboinflammation."

The news correspondents report that additional information may be obtained from H. Kozarcanin, Dept. of Immunology, Genetics and Pathology, Rudbeck Laboratory C5:3, Uppsala University, Uppsala, Sweden. Additional authors for this research include C. Lood, L. Munthe-Fog, K. Sandholm, O.A. Hamad, A.A. Bengtsson, M.O. Skjoedt, M. Huber-Lang, P. Garred, K.N. Ekdahl and B. Nilsson.

**Transfusion Medicine - Blood Transfusion**

**Reports Outline Blood Transfusion Study Findings from University of Texas Health Science Center (Recurrent event frailty models reduced time-varying and other biases in evaluating transfusion protocols for traumatic hemorrhage)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Transfusion Medicine - Blood Transfusion. According to news reporting out of Houston, Texas, by NewsRx editors, research stated, "Transfusion research seeks to improve survival for severely injured and hemorrhaging patients using optimal plasma and platelet ratios over red blood cells (RBCs). However, most published studies comparing different ratios are plagued with serious bias and ignore time-varying effects."

Our news journalists obtained a quote from the research from the University of Texas Health Science Center, "We applied joint recurrent event frailty models to increase validity and clinical utility. Using the PRospective Observational Multicenter Major Trauma Transfusion study data, our joint random effects models estimated the association of (1) clinical covariates with transfusion rate intensities and (2) varying plasma:RBC and platelet:RBC ratios with survival over the 24 hours after hospital admission. Along with survival time, baseline patient vital signs, laboratory values, and longitudinal data on types and volumes of transfusions were included. Baseline systolic blood pressure, heart rate, pH, and hemoglobin were significantly associated with RBC transfusion rates. Increased transfusion rates (per hour) of plasma (P = 0.05), platelets (P < 0.001), or RBCs were associated with increased 24-hour mortality. Higher ratios of plasma:RBC (P = 0.107) and platelet:RBC (P < 0.001) were associated with reduced mortality in a time-varying pattern (P < 0.001)."

According to the news editors, the research concluded: "The proposed joint analysis of transfusion rates and ratios offers a more valid statistical approach to evaluate survival effects in the presence of informative censoring by early death."

For more information on this research see: Recurrent event frailty models reduced time-varying and other biases in evaluating transfusion protocols for traumatic hemorrhage. *Journal of Clinical Epidemiology*, 2016;77():52-59. *Journal of Clinical Epidemiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.
Reports Outline Blue Rubber Bleb Nevus Syndrome Study Findings from Catholic University of Louvain [Blue Rubber Bleb Nevus (BRBN) Syndrome Is Caused by Somatic TEK (TIE2) Mutations]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Diseases and Conditions - Blue Rubber Bleb Nevus Syndrome. According to news reporting from Brussels, Belgium, by NewsRx journalists, research stated, "Blue rubber bleb nevus syndrome (Bean syndrome) is a rare, severe disorder of unknown cause, characterized by numerous cutaneous and internal venous malformations; gastrointestinal lesions are pathognomonic. We discovered somatic mutations in TEK, the gene encoding TIE2, in 15 of 17 individuals with blue rubber bleb nevus syndrome."

The news correspondents obtained a quote from the research from the Catholic University of Louvain, "Somatic mutations were also identified in five of six individuals with sporadically occurring multifocal venous malformations. In contrast to common unifocal venous malformation, which is most often caused by the somatic L914F TIE2 mutation, multifocal forms are predominantly caused by double (cis) mutations, that is, two somatic mutations on the same allele of the gene. Mutations are identical in all lesions from a given individual."

According to the news reporters, the research concluded: "T1105N-T1106P is recurrent in blue rubber bleb nevus, whereas Y897C-R915C is recurrent in sporadically occurring multifocal venous malformation: both cause ligand-independent activation of TIE2, and increase survival, invasion, and colony formation when expressed in human umbilical vein endothelial cells."

Our news journalists report that additional information may be obtained by contacting M. Vikkula, Catholic University of Louvain, de Duve Inst, Human Mol Genet, Brussels, Belgium. Brachytherapy

Reports Outline Brachytherapy Findings from W.T. Hrinivich and Colleagues (Three-dimensional transrectal ultrasound guided high-dose-rate prostate brachytherapy: A comparison of needle segmentation accuracy with two-dimensional image guidance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Brachytherapy. According to news reporting originating in London, Canada, by NewsRx journalists, research stated, "Conventional transrectal ultrasound guided high-dose-rate prostate brachytherapy (HDR-BT) uses an axially acquired image set for organ segmentation and 2D sagittal images for needle segmentation. Sagittally reconstructed 3D (SR3D) transrectal ultrasound enables both organ and needle segmentation and has the potential to reduce organ-needle alignment uncertainty."

The news reporters obtained a quote from the research, "This study compares the accuracy of needle tip localization between the conventional 2D sagittally assisted axially reconstructed (SAAR) and SR3D approaches. Twelve patients underwent SAAR-guided HDR-BT, during which SR3D images were acquired for subsequent segmentation and analysis. A total of 183 needles were investigated. Needle end-length measurements were taken, providing a gold standard for insertion depths. Dosimetric impact of insertion depth errors (IDEs) on clinical treatment plans was assessed. SR3D guidance provided statistically significantly smaller IDEs than SAAR guidance with a mean +/- SD of -0.6 +/- 3.2 mm and 2.8 +/- 3.2 mm, respectively (p < 0.001). Shadow artifacts were found to obstruct the view of some needle tips in SR3D images either partially (12%) or fully (10%); however, SR3D IDEs had a statistically significantly smaller impact on prostate V-100% than SAAR IDEs with mean +/- SD decreases of -1.2 +/- 1.3% and-6.5 +/- 6.7%, respectively (p < 0.05). SR3D-guided HDR-BT eliminates a source of systematic uncertainty from the SAAR-guided approach, providing decreased IDEs for most needles, leading to a significant decrease in dosimetric uncertainty."

According to the news reporters, the research concluded: "Although imaging artifacts can limit the accuracy of tip localization in a subset of needles, we identified a method to mitigate these artifacts for clinical implementation."

Oncology - Breast Cancer

Reports Outline Breast Cancer Findings from University Hospital (EpCAM-Independent Enrichment of Circulating Tumor Cells in Metastatic Breast Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting originating in Duesseldorf, Germany, by NewsRx journalists, research stated, "Circulating tumor cells (CTCs) are the potential precursors of metastatic disease. Most assays established for the enumeration of CTCs so far-including the gold standard CellSearch-rely on the expression of the cell surface marker epithelial cell adhesion molecule (EpCAM)."

The news reporters obtained a quote from the research from University Hospital, "But, these approaches may not detect CTCs that express no/low levels of EpCAM, e.g. by undergoing epithelial-to-mesenchymal transition (EMT). Here we present an enrichment strategy combining different antibodies specific for surface proteins and extracellular matrix (ECM) components to capture an EpCAMlow/neg cell line and EpCAMneg CTCs from blood samples of breast cancer patients depleted for EpCAM-positive cells. The expression of respective proteins (Trop2, CD49f, c-Met, CK8, CD44, ADAM8, CD146, TEM8, CD47) was verified by immunofluorescence on EpCAMpos (e.g. MCF7, SKBR3) and EpCAMlow/neg (MDA-MB-231) breast cancer cell lines. To test antibodies and ECM proteins (e.g. hyaluronic acid (HA), collagen I, laminin) for capturing EpCAMneg cells, the capture molecules were first spotted in a single-and multi-array format onto aldehyde-coated glass slides. Tumor cell adhesion of EpCAMpos/neg cell lines was then determined and visualized by Coomassie/MitoTracker staining. In consequence, marginal binding of EpCAMlow/neg MDA-MB-231 cells to EpCAM-antibodies could be observed. However, efficient adhesion/capturing of EpCAMlow/neg cells could be achieved via HA and immobilized antibodies against CD49f and Trop2. Optimal capture conditions were then applied to immunomagnetic beads to detect EpCAMneg CTCs from clinical samples. Captured CTCs were verified/quantified by immunofluorescence staining for anti-pan-Cytokeratin (CK)-FITC/anti-CD45 AF647/DAPI. In total, in 20 out of 29 EpCAM-depleted fractions (69%) from 25 metastatic breast cancer patients additional EpCAMneg CTCs could be identified [range of 1-24 CTCs per sample] applying Trop2, CD49f, c-Met, CK8 and/or HA magnetic enrichment. EpCAMneg dual-positive (CKpos/CD45pos) cells could be traced in 28 out of 29 samples [range 1-480]. By single-cell array-based comparative genomic hybridization we were able to demonstrate the malignant nature of one EpCAMneg subpopulation."

According to the news reporters, the research concluded: "We established a novel
enhanced CTC enrichment strategy to capture EpCAMneg CTCs from clinical blood samples by targeting various cell surface antigens with antibody mixtures and ECM components."

Our news correspondents report that additional information may be obtained by contacting H. Schneck, Dept. of Obstetrics and Gynecology, University Hospital and Medical Faculty of the Heinrich-Heine University Duesseldorf, Duesseldorf, Germany. Oncology - Breast Cancer

Reports Outline Breast Cancer Study Results from King Saud University (Development of Liposomal Formulation for Delivering Anticancer Drug to Breast Cancer Stem-Cell-Like Cells and its Pharmacokinetics in an Animal Model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting from Riyadh, Saudi Arabia, by NewsRx journalists, research stated, "The objective of the present study is to develop a liposomal formulation for delivering anticancer drug to breast cancer stem-cell-like cells, ANV-1, and evaluate its pharmacokinetics in an animal model. The anticancer drug ESC8 was used in dexamethasone (Dex)-associated liposome (DX) to form ESC8-entrapped liposome named DXE."

Funders for this research include Council of Scientific and Industrial Research, Mayo Clinic, National Plan for Science, Technology and Innovation.

The news correspondents obtained a quote from the research from King Saud University, "ANV-1 cells showed high-level expression of NRP-1. To enhance tumor regression, we additionally adapted to codeliver the NRP-1 shRNA-encoded plasmid using the established DXE liposome. In vivo efficacy of DXE-NRP-1 was carried out in mice bearing ANV-1 cells as xenograft tumors and the extent of tumor growth inhibition was evaluated by tumor-size measurement. A significant difference in tumor volume started to reveal between DXE-NRP-1 group and DXE-Control group. DXE-NRP-1 group showed ∼4 folds and ∼2.5 folds smaller tumor volume than exhibited by untreated and DXE-Control-treated groups, respectively. DXE disposition was evaluated in Sprague-Dawley rats following an intraperitoneal dose (3.67 mg/kg of ESC8 in DXE). The plasma concentrations of ESC8 in the DXE formulation were measured by liquid chromatography mass spectrometry and pharmacokinetic parameters were determined using a noncompartmental analysis. ESC8 had a
half-life of 11.01 ± 0.29 h, clearance of 2.10 ± 3.63 L/kg/h, and volume of distribution of 33.42 ± 0.83 L/kg. This suggests that the DXE liposome formulation could be administered once or twice daily for therapeutic efficacy."

According to the news reporters, the research concluded: "In overall, we developed a potent liposomal formulation with favorable pharmacokinetic and tumor regression profile that could sensitize and kill highly aggressive and drug-resistive cancer stem-cell-like cells."

Our news journalists report that additional information may be obtained by contacting A. Ahmad, Dept. of Clinical Pharmacy, College of Pharmacy, King Saud University, Riyadh 11451, Saudi Arabia. Additional authors for this research include S.K. Mondal, D. Mukhopadhyay, R. Banerjee and K.M Alkharfy.

Oncology - Breast Cancer

Reports Outline Breast Cancer Study Results from Veneto Institute of Oncology (Predictive markers in elderly patients with estrogen receptor-positive breast cancer treated with aromatase inhibitors: an array-based pharmacogenetic study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting originating in Padua, Italy, by NewsRx journalists, research stated, "So far, no reliable predictive clinicopathological markers of response to aromatase inhibitors (AIs) have been identified, and little is known regarding the role played by host genetics. To identify constitutive predictive markers, an array- based association study was performed in a cohort of 55 elderly hormone-dependent breast cancer (BC) patients treated with third-generation AIs."

The news reporters obtained a quote from the research from the Veneto Institute of Oncology, "The array used in this study interrogates variants in 225 drug metabolism and disposition genes with documented functional significance. Six variants emerged as associated with response to AIs: three located in ABCG1, UGT2A1, SLCO3A1 with a good response, two in SLCO3A1 and one in ABCC4 with a poor response. Variants in the AI target CYP19A1 resulted associated with a favourable response only as haplotype; haplotypes with increased response association were also detected for ABCG1 and SLCO3A1."

According to the news reporters, the research concluded: "These results highlight the relevance of host genetics in the response to AIs and represent a first step toward precision
medicine for elderly BC patients."

Our news correspondents report that additional information may be obtained by contacting E. Rumiato, Veneto Inst Oncol IOV IRCCS, Immunol & Mol Oncol Unit, I-35128 Padua, Italy. Additional authors for this research include A. Brunello, S. A. Djaballah, L. Borgato, M. Gusella, D. Menon, F. Pasini, A. Amadori, D. Saggioro and V. Zagonel.

**Lung Diseases and Conditions - Bronchopulmonary…**

**Reports Outline Bronchopulmonary Dysplasia Study Results from University of Colorado (Endothelin-1-Rho kinase interactions impair lung structure and cause pulmonary hypertension after bleomycin exposure in neonatal rat pups)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Bronchopulmonary Dysplasia is now available. According to news reporting originating in Aurora, Colorado, by NewsRx journalists, research stated, "Bronchopulmonary dysplasia (BPD) is the chronic lung disease associated with premature birth, characterized by impaired vascular and alveolar growth. In neonatal rats bleomycin decreases lung growth and causes pulmonary hypertension (PH), which is poorly responsive to nitric oxide."

The news reporters obtained a quote from the research from the University of Colorado, "In the developing lung, through Rho kinase (ROCK) activation, ET-1 impairs endothelial cell function; however, whether ET-1-ROCK interactions contribute to impaired vascular and alveolar growth in experimental BPD is unknown. Neonatal rats were treated daily with intraperitoneal bleomycin with and without selective ETA (BQ123/ BQ610) and ETB (BQ788) receptor blockers, nonselective ET receptor blocker (ETRB) (bosentan), or fasudil (ROCK inhibitor). At day 14, lungs were harvested for morphometrics, and measurements of Fulton's index (RV/ LV + S), medial wall thickness (MWT), and vessel density. Lung ET-1 protein and ROCK activity (phosphoMYPT-1: total MYPT-1 ratio) were also measured by Western blot analysis. Bleomycin increased lung ET-1 protein expression by 65%, RV/ LV + S by 60%, mean linear intercept (MLI) by 212%, and MWT by 140% and decreased radial
alveolar count (RAC) and vessel density by 40 and 44%, respectively (P < 0.01 for each comparison). After bleomycin treatment, fasudil and bosentan partially restored RAC and vessel density and decreased MLI, RV/LV + S, and MWT to normal values. Bleomycin increased ROCK activity by 120%, which was restored to normal values by bosentan but not selective ETRB.

According to the news reporters, the research concluded: "ET-1-ROCK interactions contribute to decreased alveolar and vascular growth and PH in experimental BPD. We speculate that nonselective ETRB and ROCK inhibitors may be effective in the treatment of infants with BPD and PH."

Our news correspondents report that additional information may be obtained by contacting J. Gien, University of Colorado, Dept. of Pediat, Pediat Heart Lung Center, Sch Med, Aurora, CO, United States. Additional authors for this research include N. Tseng, G. Seedorf, K. Kuhn and S.H. Abman.

Oncology - Cancer Epidemiology

Reports Outline Cancer Epidemiology Study Results from University of Toronto (Cancer screening barriers and facilitators for under and never screened populations: A mixed methods study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Cancer Epidemiology is now available. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "Cancer screening is below targets in Ontario, Canada. Our objective was to identify and quantify the barriers and facilitators for breast, cervical and colorectal cancer screening for under and never screened (UNS) residents living in Ontario between 2011 and 2013."

Financial support for this research came from Integrated Cancer Screening Program at Cancer Care Ontario.

Our news editors obtained a quote from the research from the University of Toronto, "We used a multi-phased mixed methods study design. Results from thematic analysis of focus group discussions with health care providers and UNS community members were used to develop an online, province-wide, cross-sectional survey to estimate the prevalence of barriers and facilitators for the provincial population. Adjusted prevalence odds ratios and 95% confidence intervals were estimated for UNS compared to regularly screened participants using
logistic regression. Four focus groups were held with health service providers and sixteen with UNS community members. Top barriers and facilitators themed around provider-patient communication, fear and embarrassment, history of physical or sexual abuse, social determinants of health (including low literacy, lack of awareness, and health insurance), symptoms appearing, and family and friends. 3075 participants completed the online survey. Compared to regularly screened participants, UNS had significantly higher odds of reporting: no regular health care provider; not feeling comfortable talking about screening; or the Doctor or Nurse Practitioner not suggesting screening. UNS also had significantly higher odds of reporting the facilitators: the test being less scary/painful or uncomfortable; friend/family insisting on getting screened; starting to have symptoms; or an easier test that could be done at home.

According to the news editors, the research concluded: "Interventions addressing fear through individual, interpersonal and structural facilitators may increase cancer screening."

For more information on this research see: Cancer screening barriers and facilitators for under and never screened populations: A mixed methods study. Cancer Epidemiology, 2016;45():126-134. Drugs and Therapies - Cancer Therapy

Reports Outline Cancer Therapy Study Results from Safarik University
[Total synthesis and the anticancer activity of (+)-spisulosine]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cancer Therapy have been published. According to news originating from Kosice, Slovakia, by NewsRx correspondents, research stated, "The total synthesis of the anticancer agent (+)-spisulosine has been accomplished."

Funders for this research include Ministry of Education, Slovak Republic, Slovak Research and Development Agency, Operational Programme Research and Development.

Our news journalists obtained a quote from the research from Safarik University, "The strategy involved a substrate-controlled aza-Claisen rearrangement to establish the erythro-configured amino-alcohol motif followed by deoxygenation to create a methyl side-chain. Subsequent Wittig olefination then permitted the construction of the carbon backbone of the target molecule."
According to the news editors, the research concluded: "To investigate the anti proliferative effect of 1, its biological profile was examined on a panel of 6 human malignant cell lines and demonstrated the significant anticancer activity of 1 on at least five of the evaluated lines with IC50 < 1 μM (MCF-7, HTC-116, Caco-2, Jurkat and HeLa)."

The news correspondents report that additional information may be obtained from M. Martinkova, Safarik Univ, Inst Chem Sci, Dept. of Organ Chem, Kosice 04001, Slovakia. Additional authors for this research include M. Martinkova, S. Hirkova, J. Gonda, M.B. Pilatova and G. Gonciova.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.carres.2016.09.010. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Carbamazepine Therapy

Reports Outline Carbamazepine Therapy Study Findings from Medical University (Isobolographic Analysis of Interaction for Three-Drug Combination of Carbamazepine, Phenobarbital and Topiramate in the Mouse Maximal Electroshock-Induced Seizure ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Carbamazepine Therapy have been published. According to news reporting out of Lublin, Poland, by NewsRx editors, the research stated, "To characterize the anticonvulsant effects of a combination of 3 antiepileptic drugs (AEDs; i.e. carbamazepine (CBZ), phenobarbital (PB) and topiramate (TPM)) at the fixed-ratio of 1:1:1 in the mouse maximal electroshock (MES)-induced seizure model. Tonic hind limb extension (seizure activity) was evoked in adult male albino Swiss mice by a current (sine-wave, 25 mA, 500 V, 50 Hz, 0.2 s stimulus duration) delivered via auricular electrodes."

Our news journalists obtained a quote from the research from Medical University, "Type I isobolographic analysis for parallel dose-response relationship curves (DRRCs) was used to analyze the 3-drug combination. In the mouse MES model, all the studied AEDs (i.e., CBZ, PB and TPM) administered singly had their DRRCs parallel to each other. With type I isobolography for parallel DRRCs, a combination of CBZ, PB and TPM at the fixed-ratio of 1:1:1 exerted supra-additive (synergistic) interaction in the mouse MES model. Synergistic interaction among CBZ, PB and TPM at the fixed-ratio of 1:1:1 against MES-induced seizures is worthy of consideration in further clinical settings."

According to the news editors, the research concluded: "All detailed calculations required to perform type I isobolographic analysis for the 3-drug combination were presented."

Our news journalists report that additional information may be obtained by contacting J.J. Luszczki, Dept. of Pathophysiology, Medical University of Lublin, Lublin, Poland.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000444452. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Carcinomas**

**Reports Outline Carcinomas Findings from Adolfo Lutz Institute (Breast Carcinoma-associated Fibroblasts Share Similar Biomarker Profiles in Matched Lymph Node Metastasis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Carcinomas. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "This study sought to understand the role of breast carcinoma-associated fibroblasts in the progression of cancer cells into lymph nodes. We compared fibroblasts of primary tumors and matched the involved lymph nodes to select fibroblast activation markers, namely -smooth muscle actin (-SMA), S100A4, and vimentin, as well as to determine the frequency of transforming growth factor 1, a pleiotropic cytokine that induces the differentiation of fibroblasts to myofibroblasts, and its downstream effectors: CXCR4 and p-AKT."

Our news journalists obtained a quote from the research from Adolfo Lutz Institute, "We disposed samples of 80 primary invasive ductal carcinomas and matched the involved lymph nodes from 43 cases into 3 tissue microarrays, and analyzed stromal and tumor epithelial cells separately by immunohistochemistry. Control uninvolved lymph nodes were analyzed by whole-tissue sections. Cancer-associated fibroblast in lymph nodes with macrometastasis expressed similar profiles of vimentin, -SMA, and S100A4 as those found in primary tumors. Cancer-associated fibroblast were uniformly estrogen receptor, progesterone receptor, HER-2, Ki-67, and p53 negative, but expressions of transforming growth factor 1 (TGF1), CXCR4, and p-AKT staining (62.3%, 52.4%, 65%, respectively) were equivalent between primary and lymph node metastasis (LNM) fibroblasts. A significant coexpression of TGF1 with p-AKT and CXCR4 in LNMs suggested the involvement of these proteins with TGF1 signaling. These biomarkers, including -SMA and S100A4, were negative in fibroblasts of cancer-free lymph nodes, with the exception of vimentin."

According to the news editors, the research concluded: "Our finding that expressions
of biological markers were similar in fibroblasts of the primary tumors and in matched LNMs, but were absent in cancer-free lymph nodes, supports the assumption that the lymph node stroma mimics the microenvironment observed in primary tumors."

For more information on this research see: Breast Carcinoma-associated Fibroblasts Share Similar Biomarker Profiles in Matched Lymph Node Metastasis. *Applied Immunohistochemistry & Molecular Morphology*, 2016;24(10):712-720. *Applied Immunohistochemistry & Molecular Morphology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. ### Oncology - Carcinomas

**Reports Outline Carcinomas Study Results from Kyoto University**

**Population Pharmacokinetics of Everolimus in Relation to Clinical Outcomes in Patients With Advanced Renal Cell Carcinoma**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Carcinomas have been published. According to news reporting originating from Kyoto, Japan, by NewsRx correspondents, research stated, "Everolimus has been used for the treatment of unresectable or metastatic renal cell carcinoma (RCC). Here, we measured blood concentrations of everolimus to obtain the population pharmacokinetic parameters and to examine the relationship between blood concentration and clinical outcomes."

Our news editors obtained a quote from the research from Kyoto University, "Twenty-two Japanese patients were enrolled. Blood samples were collected before and 2, 4, 8, and 24 hours after drug administration on days 1 and 8 of everolimus therapy (5 or 10 mg) from inpatients; occasional samples were collected from outpatients. Blood concentrations of everolimus were measured by high-performance liquid chromatography with tandem mass spectrometry. Population pharmacokinetic analysis was conducted using the NONMEM software. Everolimus pharmacokinetics was best described by a 2-compartment model with population mean estimates of apparent oral clearance of 10.0 L/h and an interindividual variability of 42.4%. There was no relationship between overall best responses and the predicted trough concentrations at day 8. The predicted trough concentration in patients who terminated everolimus treatment owing to adverse drug reactions (ADRs) was significantly higher than in patients who stopped the treatment owing to disease progression or other reasons (27.6 +/- 3.1 versus 15.7 +/- 2.3 ng/mL; mean +/- SEM). Patients who terminated the treatment owing to ADRs had significantly shorter time-to-treatment failure than other patients (112 versus 187
days, median). This study reports the first population pharmacokinetic parameters of everolimus in patients with RCC.

According to the news editors, the research concluded: "Individual dose adjustment based on everolimus blood concentrations helps to avoid early drug cessation due to ADRs."

For more information on this research see: Population Pharmacokinetics of Everolimus in Relation to Clinical Outcomes in Patients With Advanced Renal Cell Carcinoma. Therapeutic Drug Monitoring, 2016;38(6):663-669. Therapeutic Drug Monitoring can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Therapeutic Drug Monitoring - journals.lww.com/drug-monitoring/pages/default.aspx)

Cardiology

Reports Outline Cardiology Findings from University of Hong Kong (Transcatheter Leadless Cardiac Pacing in Renal Failure with Limited Venous Access)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiology is the subject of a report. According to news reporting out of Hong Kong, People's Republic of China, by NewsRx editors, research stated, "Entirely leadless cardiac pacemakers that are delivered transvenously required the use of large-diameter delivery sheath and femoral venous approach."

Our news journalists obtained a quote from the research from the University of Hong Kong, "The complexity of external femoral and iliac venous anatomy may limit their implantation. We describe a hemodialysis patient without subclavian venous access and a conventional pacemaker with a failed right ventricular lead, who had difficult iliac venous anatomy that was also compressed by an external endovascular abdominal aortic stent."

According to the news editors, the research concluded: "Successful leadless pacing using a Micra™ (Medtronic Inc., Minneapolis, MN, USA) was accomplished with a strong support wire, hydrophilic delivery sheath, and guided by venography."

For more information on this research see: Transcatheter Leadless Cardiac Pacing in Renal Failure with Limited Venous Access. PACE-Pacing and Clinical Electrophysiology, 2016;39(11):1281-1284. PACE-Pacing and Clinical Electrophysiology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by contacting C.P. Lau, University of Hong Kong, Li Ka Shing Fac Med, Res Center Heart Brain Hormone & Hlth Ageing, Hong Kong, Hong Kong, People's Republic of China.
Reports Outline Cardiology Study Findings from Heart Center
(Performance of allogeneic bioengineered replacement pulmonary valves in rapidly growing young lambs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting from Kansas City, Missouri, by NewsRx journalists, research stated, "Cardiac allometric organ growth after pediatric valve replacement can lead to patient-prosthesis size mismatch and valve re-replacement, which could be mitigated with allogeneic decellularized pulmonary valves treated with collagen conditioning solutions to enhance biological and mechanical performance, termed 'bioengineered valves.' In this study, we evaluated functional, dimensional, and biological responses of these bioengineered valves compared with traditional cryopreserved valves implanted in lambs during rapid somatic growth. From a consanguineous flock of 13 lambs, the pulmonary valves of 10 lambs (mean weight, 19.6 +/- 1.4 kg) were replaced with 7 bioengineered valves or 3 classically cryopreserved valves."

The news correspondents obtained a quote from the research from Heart Center, "After 6 months, the 10 lambs with implanted valves and 3 untreated flock mates were compared by echocardiography, cardiac catheterization, and explant pathology. Increases in body mass, valve geometric dimensions, and effective orifice areas were similar in the 2 groups of lambs. The bioengineered valves had higher median cusp-to-cusp coaptation areas (34.6%; interquartile range, 21.00%-35.13%) and were more similar to native valves (43.4%; interquartile range, 42.59%-44.01%) compared with cryopreserved valves (13.2%; interquartile range, 7.07%-13.91%) (P = .043). Cryopreserved valves cusps, but not bioengineered valve cusps, were thicker than native valve cusps (P = .01). Histologically, cryopreserved valves demonstrated less than native cellularity, whereas bioengineered valves that were acellular at the time of surgery gained surface endothelium and subsurface myofibroblast interstitial cells in pulmonary artery, sinus wall, and cusp base regions. Biological valve conduits can enlarge via passive dilatation without matrix synthesis, but this would result in decreased cusp coaptation areas. Bioengineered valves demonstrated similar annulus enlargement as cryopreserved valves but usually retained larger areas of cuspal coaptation."

According to the news reporters, the research concluded: "Heat-shock protein 47-positive (collagen-synthesizing) cells were present in previously acellular bioengineered sinus walls and cusp bases, but rarely in more distal cusp matrices."

Cardiology

Reports Outline Cardiology Study Findings from University of Picardie
(Role of echocardiography before cardiac resynchronization therapy: new advances and current developments)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiology are presented in a new report. According to news reporting from Amiens, France, by NewsRx journalists, research stated, "The role of echocardiography in improving the selection of patients who will benefit from cardiac resynchronization therapy (CRT) remains a source of debate. Although previous landmark reports have demonstrated a link between mechanical dyssynchrony, assessed by delays between left ventricle (LV) walls and response to CRT, the predictive value of these findings has not yet been confirmed in multicenter trials."

The news correspondents obtained a quote from the research from the University of Picardie, "Indeed, recent studies demonstrated that the classical assessment of LV mechanical dyssynchrony using delay between walls by echocardiography depends not only on LV electrical activation delay (electrical dyssynchrony), but also on abnormalities in regional contractility of the LV and/or loading conditions, which do not represent an appropriate target for CRT. Recent reports highlighted the value of new indices of electromechanical dyssynchrony obtained by echocardiography, to predict LV response and outcome after CRT including septal flash, left bundle branch blocktypical pattern by longitudinal strain, apical rocking, septal strain patterns, and systolic stretch index. This was achieved using a mechanistic approach, based on the contractile consequences of electrical dyssynchrony. These indices are rarely found in patients with narrow QRS (<120ms), whereas their frequency rises in patients with an increase in QRS duration (>120ms)."

According to the news reporters, the research concluded: "Theses indices should improve candidate selection for CRT in clinical practice, especially for patients in whom the benefit of CRT remains uncertain, for example, patients with intermediate QRS width (120-150ms)."

Our news journalists report that additional information may be obtained by contacting S. Marechaux, Univ Picardie, INSERM, U1088, Amiens, France. Additional authors for this research include A. Menet, Y. Guyomar, P.V. Ennezat, R.A. Guerbaai, P. Graux and C. Tribouilloy.

### Cardiology

**Reports Outline Cardiology Study Results from University of California (High Efficiency Coronary MR Angiography with Nonrigid Cardiac Motion Correction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "To improve the coronary visualization quality of four-dimensional (4D) coronary MR angiography (MRA) through cardiac motion correction and iterative reconstruction. A contrast-enhanced, spoiled gradient echo sequence with 3D radial trajectory and self-gating was used for 4D coronary MRA data acquisition at 3 Tesla."

Our news journalists obtained a quote from the research from the University of California, "A whole-heart 16-phase cine series was reconstructed with respiratory motion correction. Nonrigid registration was performed between the identified quiescent phases and a reference. The motion information of all included phases was then used along with the corresponding k-space data to iteratively reconstruct the final image. Healthy volunteer studies (N = 13) were conducted to compare the proposed method with the conventional strategy, which accepts data from a single, contiguous window out of the original 16-phase data. Apparent signal-to-noise ratio (aSNR) and coronary sharpness were used as the image quality metrics. The proposed method significantly improved aSNR (11.89+/−3.76 to 13.97+/−5.21; P = 0.005) and scan efficiency (18.8%+/−6.0% to 40.9%+/−9.7%; P<0.001), compared with the conventional strategy. Sharpness of left main (P = 0.002), proximal (P = 0.04), and middle (P = 0.02) right coronary artery, and proximal left anterior descending (P = 0.04) was also significantly improved."

According to the news editors, the research concluded: "The proposed cardiac motion-corrected reconstruction significantly improved the achievable quality of coronary visualization from 4D coronary MRA."

Our news journalists report that additional information may be obtained by contacting D.B. Li, University of California, Bioengineering, Los Angeles, CA, United States. Additional authors for this research include Y.H. Chen, Z.Y. Fan, C. Nguyen, Q. Yang, Y.B. Xie and D.B. Li.

Cardiovascular Diseases

Reports Outline Cardiovascular Diseases Study Findings from George Institute for Global Health (Inaccurate risk perceptions contribute to treatment gaps in secondary prevention of cardiovascular disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases have been presented. According to news reporting from Sydney, Australia, by NewsRx journalists, research stated, "All patients with cardiovascular disease (CVD) are at high risk of recurrent events. Despite strong evidence, large treatment gaps exist in CVD secondary prevention."

The news correspondents obtained a quote from the research from George Institute for Global Health, "We hypothesise that patients' self-perception and general practitioner's (GP) assessment of future cardiovascular (CV) risk may influence secondary prevention behaviours. To examine in patients with known CVD the perceived risk of future CV events and its relationship with use of secondary prevention medications and risk factor control. We examined patient and practitioner's perceived risk and its relationship with the uptake of secondary prevention recommendations in adults with CVD participating in the Australian Hypertension and Absolute Risk Study. Among the 1453 participants, only 11% reported having a high absolute risk and 29% reported high relative risk of recurrent events. The GP categorised only 30% as having a 5-year risk (>=)15%. After adjusting for covariates, hospitalisation within the preceding 12 months was the only significant predictor of patients' accurate risk perception. Conventional CV risk factors were predictive of the GP's risk estimates. Patients who accurately understood their risk reported higher smoking cessation rates (7 vs 3%, p=0.003) and greater use of antiplatelet, blood pressure lowering therapy and statins (P (<=) 0.01). However, there was no relationship between GP's risk perception and secondary prevention treatments. Both patients and GP have optimistic bias and underestimate the risk of future CV events. Patients’ accurate self-perception, but not GP risk perception, was associated with improved secondary preventative behaviours. This suggests that helping patients to understand their risk may influence their motivation towards secondary prevention."

According to the news reporters, the research concluded: "Providing support to GP or programmes to help patients better understand their risks could have potential benefit on secondary prevention behaviours."

Our news journalists report that additional information may be obtained by contacting J. Thakkar, The George Institute for Global Health, Sydney, New South Wales, Australia. Additional authors for this research include E.L. Heeley, J. Chalmers and C.K Chow.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/imj.12982. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Research

Reports Outline Cardiovascular Research Study Results from Sahlgrenska University Hospital (Contemporary cardiovascular risk and secondary preventive drug treatment patterns in peripheral artery disease patients undergoing revascularization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Research. According to news reporting out of Gothenburg, Sweden, by NewsRx editors, research stated, "Peripheral artery disease (PAD) is common worldwide, and PAD patients are increasingly offered lower limb revascularization procedures. The aim of this population-based study was to describe the current risk for cardiovascular (CV) events and mortality and also to elucidate the current pharmacologic treatment patterns in revascularized lower limb PAD patients."

Our news journalists obtained a quote from the research from Sahlgrenska University Hospital, "This observational, retrospective cohort study analyzed prospectively collected linked data retrieved from mandatory Swedish national health care registries. The Swedish National Registry for Vascular Surgery database was used to identify revascularized PAD patients. Current risk for CV events and death was analyzed, as were prescribed drugs aimed for secondary prevention. A Cox proportional hazard regression model was used to explore risk factors for suffering a CV event. Between May 2008 and December 2013, there were 18,742 revascularized PAD patients identified. Mean age was 70.0 years among patients with intermittent claudication (IC; n = 6959) and 76.8 years among patients with critical limb ischemia (CLI; n = 11,783). Antiplatelet therapy, statins, angiotensin-converting enzyme inhibitors/angiotensin receptor blockers, and beta-blockers were used by 73%, 60%, 57%, and 49% at admission for revascularization. CV event rate (a composite of myocardial infarction, ischemic stroke, or CV death) at 12, 24, and 36 months was 5.1% (95% confidence interval [CI], 4.5-5.6), 9.5% (95% CI, 8.7-10.3), and 13.8% (95% CI, 12.8-14.8) in patients with IC and 16.8% (95% CI, 16.1-17.6), 25.9% (95% CI, 25.0-26.8), and 34.3% (95% CI, 33.2-35.4) in patients with CLI. Best medical treatment, defined as any antiplatelet or anticoagulant therapy along with statin treatment, was offered to 65% of IC patients and 45% of CLI patients with little change during the study period. Statin therapy was associated with reduced CV events (hazard ratio, 0.76; 95% CI, 0.71-0.81; P< .001), whereas treatment with low-dose aspirin was not. Revascularized PAD patients are still at a high risk for CV events without a declining time trend. A large proportion of both IC and CLI patients were not offered best medical treatment. The most commonly used agent was aspirin, which was not associated with CV event
According to the news editors, the research concluded: "This study calls for improved medical management and highlights an important and partly unmet medical need among revascularized PAD patients."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jvs.2016.03.429. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Research**

**Reports Outline Cardiovascular Research Study Results from Yonsei University (Prognostic value of urine dipstick proteinuria on mortality after acute ischemic stroke)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Research. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Proteinuria is a marker of kidney disease and a strong risk factor for cardiovascular diseases including stroke. This study was aimed at investigating the prognostic value of proteinuria measured by urine dipstick in patients with acute ischemic stroke."

Our news editors obtained a quote from the research from Yonsei University, "This post-hoc analysis of a prospective cohort study included 3404 consecutive patients who had been admitted for acute ischemic stroke between November 2005 and June 2013. Proteinuria was defined as a trace or more of protein on a urine dipstick test routinely performed at admission. Date and cause of death until December 31, 2013 were collected. We investigated the association of proteinuria with all-cause mortality, cardiovascular mortality (defined as ICD-10 codes 100-199), and noncardiovascular mortality. Proteinuria was present in 12.8% of the 3404 patients. During the mean follow-up period of 3.56 +/- 2.22 years, there were 681 cases of all-cause mortality (460 cardiovascular deaths and 221 noncardiovascular deaths). Multivariate Cox regression analysis showed that the presence of proteinuria was an independent risk factor for all-cause mortality (adjusted hazard ratio [HR] 1.69, 95% confidence interval [CI] 1.40-
2.04), cardiovascular mortality (adjusted HR 1.65, 95% CI 1.31-2.08), and noncardiovascular mortality (adjusted HR 1.59, 95% CI 1.13-2.23). Adding proteinuria to the multivariate Cox models moderately improved the model performance for all-cause mortality (integrated area under curve [95% CI]: from 0.800 [0.784-0.816] to 0.803 [0.788-0.818], p = 0.026).

According to the news editors, the research concluded: "Proteinuria, which was detected on a urine dipstick test, was a significant predictor of mortality after acute ischemic stroke."

For more information on this research see: Prognostic value of urine dipstick proteinuria on mortality after acute ischemic stroke. *Atherosclerosis*, 2016;253():118-123.

**Cell Proliferation**

**Reports Outline Cell Proliferation Study Results from Genomics Research Center (The nucleolar protein NIFK promotes cancer progression via CK1a/b-catenin in metastasis and Ki-67-dependent cell proliferation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cell Proliferation have been published. According to news reporting out of Taipei, Taiwan, by NewsRx editors, research stated, "Nucleolar protein interacting with the FHA domain of pKi-67 (NIFK) is a Ki-67-interacting protein. However, its precise function in cancer remains largely uninvestigated."

Financial support for this research came from Academia Sinica.

Our news journalists obtained a quote from the research from Genomics Research Center, "Here we show the clinical significance and metastatic mechanism of NIFK in lung cancer. NIFK expression is clinically associated with poor prognosis and metastasis. Furthermore, NIFK enhances Ki-67-dependent proliferation, and promotes migration, invasion in vitro and metastasis in vivo via downregulation of casein kinase 1a (CK1a), a suppressor of pro-metastatic TCF4/b-catenin signaling. Inversely, CK1a is upregulated upon NIFK knockdown. The silencing of CK1a expression in NIFK-silenced cells restores TCF4/b-catenin transcriptional activity, cell migration, and metastasis. Furthermore, RUNX1 is identified as a transcription factor of CSNK1A1 (CK1a) that is negatively regulated by NIFK."
According to the news editors, the research concluded: "Our results demonstrate the prognostic value of NIFK, and suggest that NIFK is required for lung cancer progression via the RUNX1-dependent CK1a repression, which activates TCF4/b-catenin signaling in metastasis and the Ki-67-dependent regulation in cell proliferation."

For more information on this research see: The nucleolar protein NIFK promotes cancer progression via CK1a/b-catenin in metastasis and Ki-67-dependent cell proliferation. *Elife*, 2016;5():.

Cell Surface Extensions

Reports Outline Cell Surface Extensions Findings from New University of Lisbon (Arl13b and the exocyst interact synergistically in ciliogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cell Surface Extensions is now available. According to news reporting from Lisbon, Portugal, by NewsRx journalists, research stated, "Arl13b belongs to the ADP-ribosylation factor family within the Ras superfamily of regulatory GTPases. Mutations in Arl13b cause Joubert syndrome, which is characterized by congenital cerebellar ataxia, hypotonia, oculomotor apraxia, and mental retardation."

The news correspondents obtained a quote from the research from the New University of Lisbon, "Arl13b is highly enriched in cilia and is required for ciliogenesis in multiple organs. Nevertheless, the precise role of Arl13b remains elusive. Here we report that the exocyst subunits Sec8, Exo70, and Sec5 bind preferentially to the GTP-bound form of Arl13b, consistent with the exocyst being an effector of Arl13b. Moreover, we show that Arl13b binds directly to Sec8 and Sec5. In zebrafish, depletion of arl13b or the exocyst subunit sec10 causes phenotypes characteristic of defective cilia, such as curly tail up, edema, and abnormal pronephric kidney development. We explored this further and found a synergistic genetic interaction between arl13b and sec10 morphants in cilia-dependent phenotypes. Through conditional deletion of Arl13b or Sec10 in mice, we found kidney cysts and decreased ciliogenesis in cells surrounding the cysts. Moreover, we observed a decrease in Arl13b expression in the kidneys from Sec10 conditional knockout mice."

According to the news reporters, the research concluded: "Taken together, our results indicate that Arl13b and the exocyst function together in the same pathway leading to functional cilia."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1091/mbc.E15-02-0061. This DOI is a link to an online electronic document that is either free or for purchase.

Kidney Diseases and Conditions - Chronic Kidney…

**Reports Outline Chronic Kidney Disease Study Findings from University of Belgrade (Oxidized Low-Density Lipoprotein Predicts the Development of Renal Dysfunction in Atrial Fibrillation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Kidney Diseases and Conditions - Chronic Kidney Disease. According to news reporting out of Belgrade, Serbia, by NewsRx editors, research stated, "To investigate the role of oxidative stress (OS) in the development of chronic kidney disease (CKD) in atrial fibrillation (AF). We compared OS burden, determined at study inclusion as plasma concentrations of oxidized low-density lipoprotein (oxLDL), between stable AF patients (n = 256, mean age: 62.8 +/- 9.3 years; 60.9% males) with preserved renal function, defined as an estimated glomerular filtration rate (eGFR) >= 60 ml/min/1.73 m2, and a matched control group in sinus rhythm (n = 138, mean age: 61.5 +/- 11.2 years; 60.9% males)."

Our news journalists obtained a quote from the research from the University of Belgrade, "During the prospective follow-up of AF patients, we investigated the association and prognostic validity of oxLDL for CKD development, diagnosed as a sustained decline in eGFR to <60 ml/min/1.73 m2. AF patients had a higher mean oxLDL (76.2 +/- 21.7 U/l) compared to sinus rhythm controls (61.6 +/- 13.1 U/l; p< 0.001). AF presence independently predicted increased oxLDL levels in the study cohort [beta = 14.7; 95% confidence interval (CI), 10.7-18.7; p< 0.001]. Over a median 4-year follow-up, 19.9% of AF patients developed CKD. Adjusting for all clinical covariates, oxLDL (per tertile) was associated with a hazard ratio of 2.17 for CKD occurrence (95% CI, 1.40-3.35; p< 0.001). AF patients in the upper oxLDL tertile ( >= 88.7 U/l) had a 3.70-fold (95% CI, 1.55-8.81) higher risk for CKD compared to the lower oxLDL tertile (<67.0 U/l) patients (p < 0.001). oxLDL improved discriminative validity (c-statistic increment: 0.041, 95% CI, 0.007-0.075, p = 0.017), and increased the net reclassification and integrated discrimination for CKD risk by 12.4 and 6.0%, respectively (both p< 0.001)."

According to the news editors, the research concluded: "OxLDL is increased in AF patients compared to sinus rhythm controls. oxLDL has an independent association and an
incremental predictive value that might complement clinical CKD risk assessment in AF patients following further research.”

For more information on this research see: Oxidized Low-Density Lipoprotein Predicts the Development of Renal Dysfunction in Atrial Fibrillation. Cardiorenal Medicine, 2017;7(1):31-41. Kidney Diseases and Conditions - Chronic Kidney Disease Study Results from Karolinska Institute (Lipophilic index, kidney function, and kidney function decline)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Kidney Diseases and Conditions - Chronic Kidney Disease is now available. According to news reporting from Stockholm, Sweden, by NewsRx journalists, research stated, "Unhealthy dietary fats are associated with faster kidney function decline. The cell membrane composition of phospholipid fatty acids (FAs) is a determinant of membrane fluidity and rheological properties."

Funders for this research include Stockholm County Council, Heart and Lung Foundation, Karolinska Institutet, Baxter Healthcare.

The news correspondents obtained a quote from the research from Karolinska Institute, "These properties, which have been linked to kidney damage, are thought to be reflected by the lipophilic index (LI). We prospectively investigated the associations of LI with kidney function and its decline. Observational study from the Prospective Investigation of Vasculature in Uppsala Seniors including 975 men and women with plasma phospholipid FAs composition and cystatin-C estimate glomerular filtration rate (eGFR). Of these, 780 attended reexamination after 5 years, and eGFR changes were assessed. Participants with a 5-year eGFR reduction >= 30% were considered chronic kidney disease (CKD) progressors (n = 198). LI was calculated as the sum of the products of the FA proportions with the respective FAs melting points. Blood rheology/viscosity measurements were performed in a random subsample of 559 subjects at baseline. Increased LI showed a statistically significant but overall weak association with blood, plasma viscosity (both Spearman rho = 0.16, p < 0.01), and erythrocyte deformability (rho = -0.09, p < 0.05). In cross-sectional analyses, LI associated with lower eGFR (regression coefficient 3.00 ml/min/1.73 m(2) 1-standard deviation (SD) increment in LI, 95% CI: -4.31, -1.69, p < 0.001). In longitudinal analyses, LI associated with a faster eGFR decline (-2.13 [95%
CI -3.58, -0.69] ml/min/1.73 m(2), p< 0.01) and with 32% increased odds of CKD progression (adjusted OR 1.32 [95%, CI 1.05-1.65])."

According to the news reporters, the research concluded: "A high LI was associated with lower kidney function, kidney function decline, and CKD progression."

For more information on this research see: Lipophilic index, kidney function, and kidney function decline. Nutrition Metabolism and Cardiovascular Diseases, 2016;26 (12):1096-1103. Nutrition Metabolism and Cardiovascular Diseases can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England.

Our news journalists report that additional information may be obtained by contacting J.J. Carrero, Karolinska Inst, Center Mol Med, Stockholm, Sweden. Additional authors for this research include J. Arnlov, B. Sandhagen, U. Riserus, B. Lindholm, L. Lind and J.J. Carrero.

Health and Medicine - Clinical Dysmorphology

Reports Outline Clinical Dysmorphology Study Findings from University Hospital (A rare example of germ-line chromothripsis resulting in large genomic imbalance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Clinical Dysmorphology. According to news reporting from Cardiff, United Kingdom, by NewsRx journalists, research stated, "Chromothripsis is a recently described 'chromosome catastrophe' phenomenon in which multiple genomic rearrangements are generated in a single catastrophic event. Chromothripsis has most frequently been associated with cancer, but there have also been rare reports of chromothripsis in patients with developmental disorders and congenital anomalies."

The news correspondents obtained a quote from the research from University Hospital, "In contrast to the massive DNA loss that often accompanies chromothripsis in cancer, only minimal DNA loss has been reported in the majority of cases of chromothripsis that have occurred in the germ line. Presumably, this is because in most instances, large genomic losses would be lethal in utero. We report on a female patient with developmental delay and dysmorphism. G-banded chromosome analysis detected a subtle, interstitial deletion of chromosome 13 and a complex rearrangement of one X chromosome. Subsequent array comparative genomic hybridisation studies indicated nine deletions on the X chromosome ranging from 327 kb to 8 Mb in size. A 4.4 Mb deletion on chromosome 13 was also confirmed, compatible with the patient's clinical phenotype."

According to the news reporters, the research concluded: "We propose that this is a rare example of constitutional chromothripsis in association with relatively large genomic imbalances and that these have been tolerated in this case as they have occurred in a female on
the X chromosome, which has undergone preferential X inactivation."

Our news journalists report that additional information may be obtained by contacting S.E. Anderson, Laboratory Genetics, Institute of Medical Genetics, University Hospital of Wales, Cardiff, UK. Additional authors for this research include A. Kamath, D.T. Pilz and S.M Morgan.

Clinical Research - Clinical Trials and Studies

Reports Outline Clinical Trials and Studies Findings from Dicle University (Efficiency of therapeutic ultrasound on pain, disability, anxiety, depression, sleep and quality of life in patients with subacromial impingement syndrome: A randomized ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Research - Clinical Trials and Studies. According to news reporting from Diyarbakir, Turkey, by NewsRx journalists, research stated, "Subacromial impingement syndrome (SIS) is characterized by pain and disability of shoulder. Various treatment methods have been used for SIS."

The news correspondents obtained a quote from the research from Dicle University, "The aim of our study was to evaluate efficacy of therapeutic ultrasound (US) on pain, disability, anxiety, depression, sleep quality and quality of life in patients with SIS. Patients with SIS were randomly divided into two groups, including the group 1 (continuous US group; 3 MHz, 1.5 W/cm2, n=26) and group 2 (sham US group, n=24). Additionally, transcutaneous electrical nerve stimulation (TENS) + exercise program were added in both groups. Pain and disability of the shoulder were assessed by the Shoulder Pain and Disability Index (SPADI), while anxiety and depression were evaluated using the Hospital Anxiety and Depression Scale. The Pittsburgh Sleep Quality Index (PSQI) was used to evaluate sleep quality. Quality of life was evaluated by the Nottingham Health Profile (NHP). Patients were evaluated at baseline and after end of three weeks. Both groups had significantly improvements in terms of SPADI-pain, SPADI-disability, SPADI-total, NHP-pain and NHP-sleep scores after the three weeks interventions. There were significantly improvements in the Group 1 in terms of PSQI-total, and NHP-physical activity. Group 2 had significantly improvements in terms of anxiety-HADS, depression-HADS and NHP-emotional reaction scores. In the inter-group comparison, there were no significantly differences in the change scores were observed in any domains of SPADI scores, anxiety, depression and sleep scores, or any NHP scores. Our study showed that US does not have any benefits on SIS."

According to the news reporters, the research concluded: "TENS + exercise program are not effective on anxiety, depression and fatigue, however TENS +$ exercise program are effective on pain, disability and sleep disturbance in patients with SIS."

Our news editors obtained a quote from the research from Health Science Center, "Secondary analysis of a randomised controlled parallel-group pilot trial. Canada, 2012-2013. 28 patients with stage 3 chronic kidney disease randomised (2:1) to a hydration (n=17) or control group (n=11). The hydration group was coached to increase water intake by up to 1.5 L/day for 6 weeks. The control group was asked to maintain regular water intake. Participants provided blood and 24 h urine samples at baseline and 6 weeks. Change in plasma copeptin was compared within and between study groups. Participants were 64% male with a mean age of 62 years and an estimated glomerular filtration rate of 40 mL/min/1.73 m(2). Between baseline and 6 weeks, 24 h urine volume increased by 0.7 L/day in the hydration group, rising from 2.3 to 3.0 L/day (p=0.01), while decreasing by 0.3 L/day among controls, from 2.0 to 1.7 L/day (p=0.07); between-group difference: 0.9 L/day (95% CI 0.37 to 1.46; p=0.002). In the hydration group, median copeptin decreased by 3.6 pmol/L, from 15.0 to 10.8 pmol/L (p=0.005), while remaining stable among controls at 19 pmol/L (p=0.76; p=0.19 for the between-group difference in median change); the between-group difference in mean change was 5.4 pmol/L (95% CI -1.2 to 12.0; p=0.11). Adults with stage 3 chronic kidney disease can be successfully randomised to drink approximately 1 L more per day than controls. This increased water intake caused a significant decrease in plasma copeptin concentration."

According to the news editors, the research concluded: "Our larger 12-month trial
will examine whether increased water intake can slow renal decline in patients with chronic kidney disease."

For more information on this research see: Effect of increased water intake on plasma copeptin in patients with chronic kidney disease: results from a pilot randomised controlled trial. *Bmj Open*, 2015;5(11):e008634. (BMJ Publishing Group - group.bmj.com/; Bmj Open - bmjopen.bmj.com/)

**Gram-Positive Bacteria - Clostridium difficile**

**Reports Outline Clostridium difficile Study Results from L.K. Kociolek et al (Breakthroughs in the treatment and prevention of Clostridium difficile infection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Positive Bacteria - Clostridium difficile have been published. According to news reporting from Chicago, Illinois, by NewsRx journalists, research stated, "This Review summarizes the latest advances in the treatment and prevention of *Clostridium difficile* infection (CDI), which is now the most common health-care-associated infection in the USA. As traditional, standard CDI antibiotic therapies (metronidazole and vancomycin) are limited by their broad spectrum and further perturbation of the intestinal microbiota, which result in unacceptably high recurrence rates, novel therapeutic strategies for CDI are needed."

The news correspondents obtained a quote from the research, "Emerging CDI therapies are focused on limiting further perturbation of the intestinal microbiota and/or restoring the microbiota to its pre-morbid state, reducing colonization of the intestinal tract by toxigenic strains of *C. difficile* and bolstering the host immune response against *C. difficile* toxins. Fidaxomicin is associated with reduced CDI recurrences, and other emerging narrow-spectrum CDI antibiotic therapies might eventually demonstrate a similar benefit. Prevention of intestinal colonization of toxigenic strains of *C. difficile* can be achieved through restoration of the intestinal microbiota with faecal microbiota transplantation, as well as by colonizing the gut with nontoxigenic *C. difficile* strains. Finally, emerging immunological therapies, including monoclonal antibodies and vaccines against *C. difficile* toxins, might protect against CDI and subsequent CDI recurrences."

According to the news reporters, the research concluded: "The available clinical data
for these emerging therapies, and their relative advantages and disadvantages, are described.

Our news journalists report that additional information may be obtained by contacting L.K. Kociolek, Ann & Robert H Lurie Children's Hospital of Chicago, 225 East Chicago Avenue, Chicago, Illinois 60611, United States.

**Digestive System Diseases and Conditions - Colitis**

**Reports Outline Colitis Study Results from University of Leeds (The relationship between different information sources and disease-related patient knowledge and anxiety in patients with inflammatory bowel disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Colitis have been published. According to news reporting originating in Leeds, United Kingdom, by NewsRx journalists, research stated, "Patient education forms a cornerstone of management of inflammatory bowel disease (IBD). The Internet has opened new avenues for information gathering."

Financial support for this research came from Warner Chilcott.

The news reporters obtained a quote from the research from the University of Leeds, "To determine the relationship between different information sources and patient knowledge and anxiety in patients with IBD. The use of information sources in patients with IBD was examined via questionnaire. Anxiety was assessed with the hospital anxiety and depression scale and disease-related patient knowledge with the Crohn's and colitis knowledge score questionnaires. Associations between these outcomes and demographics, disease-related factors, and use of different information sources were analysed using linear regression analysis. Of 307 patients (165 Crohn's disease, 142 ulcerative colitis) 60.6% were female. Participants used the hospital IBD team (82.3%), official leaflets (59.5%), and official websites (53.5%) most frequently in contrast to alternative health websites (9%). University education (P < 0.001), use of immunosuppressants (P = 0.025), Crohn's and Colitis UK membership (P = 0.001), frequent use of the hospital IBD team (P = 0.032), and frequent use of official information websites (P = 0.005) were associated with higher disease-related patient knowledge. Female sex (P = 0.004), clinically active disease (P < 0.001), frequent use of general practitioners (P = 0.014), alternative health websites (homoeopathy, nutritionists, etc.) (P = 0.004) and random links (P = 0.016) were
independently associated with higher anxiety. Different patient information sources are associated with better knowledge or worse anxiety levels. Face-to-face education and written information materials remain the first line of patient education."

According to the news reporters, the research concluded: "Patients should be guided towards official information websites and warned about the association between the use of alternative health websites or random links and anxiety."

The news correspondents report that additional information may be obtained by contacting C.P. Selinger, University of Leeds, Leeds Inst Biomed & Clin Sci, Leeds, W Yorkshire, United Kingdom. Additional authors for this research include I. Carbery, V. Warren, A.F. Rehman, C.J. Williams, S. Mumtaz, H. Bholah, R. Sood, D.J. Gracie, P.J. Hamlin and A.C. Ford.

Oncology - Colon Cancer

Reports Outline Colon Cancer Findings from Radboud University (The genetic heterogeneity of colorectal cancer predisposition - guidelines for gene discovery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting from Nijmegen, Netherlands, by NewsRx journalists, research stated, "Colorectal cancer (CRC) is a cumulative term applied to a clinically and genetically heterogeneous group of neoplasms that occur in the bowel. Based on twin studies, up to 45 % of the CRC cases may involve a heritable component."

Financial supporters for this research include ZonMw, KWF Kankerbestrijding (NL), KWF Kankerbestrijding.

The news correspondents obtained a quote from the research from Radboud University, "Yet, only in 5-10 % of these cases high-penetrant germline mutations are found (e.g. mutations in APC and DNA mismatch repair genes) that result in a familial aggregation and/or an early onset of the disease. Genome-wide association studies have revealed that another similar to 5 % of the CRC cases may be explained by a cumulative effect of low-penetrant risk factors. Recent attempts to identify novel genetic factors using whole exome and whole genome
sequencing has proven to be difficult since the remaining, yet to be discovered, high penetrant CRC predisposing genes appear to be rare. In addition, most of the moderately penetrant candidate genes identified so far have not been confirmed in independent cohorts. Based on literature examples, we here discuss how careful patient and cohort selection, candidate gene and variant selection, and corroborative evidence may be employed to facilitate the discovery of novel CRC predisposing genes. The picture emerges that the genetic predisposition to CRC is heterogeneous, involving complex interplays between common and rare (inter)genic variants with different penetrances."

According to the news reporters, the research concluded: "It is anticipated, however, that the use of large clinically well-defined patient and control datasets, together with improved functional and technical possibilities, will yield enough power to unravel this complex interplay and to generate accurate individualized estimates for the risk to develop CRC."

Our news journalists report that additional information may be obtained by contacting R.P. Kuiper, Radboud University, Radboud Inst Mol Life Sci, Dept. of Human Genet, Medical Center, NL-6500 HB Nijmegen, Netherlands. Additional authors for this research include R.M. de Voer, N. Hoogerbrugge, M.J.L. Ligtenberg, R.P. Kuiper and A.G. van Kessel.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13402-016-0284-6. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Colon Cancer**

Reports Outline Colon Cancer Findings from University of California (Differential Radiographic Appearance of BRAF V600E-Mutant Metastatic Colorectal Cancer in Patients Matched by Primary Tumor Location)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news originating from San Francisco, California, by NewsRx correspondents, research stated, "BRAF-mutant metastatic colorectal cancers (mCRCs) share many clinicopathologic features with right-sided colon tumors, including frequent peritoneal involvement. Because of the poorer outcomes associated with BRAF mutations, early enrollment in clinical trials has been encouraged."

Our news journalists obtained a quote from the research from the University of California, "However, the use of standard eligibility and assessment criteria, such as measurable
disease, has anecdotally impeded patient accrual and restricted appraisal of treatment response. We investigated whether the presence of a BRAF V600E mutation is differentially associated with sites and appearance of metastatic disease in patients matched by primary tumor location. A total of 40 patients with BRAF-mutant mCRC were matched to 80 patients with BRAF wild-type mCRC by location of primary tumor (right or left colon; rectum), sex, and age. Associations between BRAF mutation status and clinicopathologic characteristics and metastatic sites were analyzed using proportion tests. Survival was summarized with Kaplan-Meier and Cox regression methods. The distribution of primary tumor locations was: 60% right colon, 30% left colon, and 10% rectum. Compared with BRAF wild-type tumors, BRAF-mutant tumors more commonly associated with peritoneal metastases (50% vs 31%; P=.045) and ascites (50% vs 24%; P=.0038). In patients with left colon primaries, BRAF mutations were associated with more frequent ascites (58% vs 12%; P=.0038) and less frequent liver metastases (42% vs 79%; P=.024). Among patients with right colon primaries, no significant difference in sites of disease by BRAF mutation status was observed. Disease was not measurable by RECIST 1.1 in 24% of patients with right-sided primary tumors, irrespective of BRAF mutation status. In the BRAF-mutated cohort, ascites correlated unfavorably with survival (hazard ratio, 2.35; 95% CI, 1.14, 4.83; P=.02)."

According to the news editors, the research concluded: "Greater frequency of ascites and peritoneal metastases, which pose challenges for RECIST 1.1 interpretation of therapeutic outcomes, are seen with BRAF-mutant mCRC, even when patients are matched for primary tumor location."

For more information on this research see: Differential Radiographic Appearance of BRAF V600E-Mutant Metastatic Colorectal Cancer in Patients Matched by Primary Tumor Location. *Journal of the National Comprehensive Cancer Network*, 2016;14(12):1536-1543. *Journal of the National Comprehensive Cancer Network* can be contacted at: Harborside Press, 37 Main St, Cold Spring Harbor, NY 11724, USA.

The news correspondents report that additional information may be obtained from C.E. Atreya, University of California, Helen Diller Family Comprehens Canc Center, San Francisco, CA 94143, United States. Additional authors for this research include C. Greene, R.M. McWhirter, N.S. Ikram, I.E. Allen, K. Van Loon, A.P. Venook, B.M. Yeh and S.C. Behr.

**Oncology - Colon Cancer**

**Reports Outline Colon Cancer Study Results from Shiraz University of Medical Sciences [Determination of a CD4(+)CD25(-)FoxP3(+) T cells subset in tumor-draining lymph nodes of colorectal cancer secreting IL-2 and IFN-gamma]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating from Shiraz, Iran, by NewsRx correspondents, research stated, "CD4(+)CD25(-)FoxP3(+) cells are a newly recognized subset of T cells which was first
reported in autoimmune diseases. In our previous study, this subset was detected in tumor-draining lymph nodes (TDLNs) of patients with breast cancer."

Our news editors obtained a quote from the research from the Shiraz University of Medical Sciences, "As little is known about their function in TDLNs of cancer patients, in this study, their frequency as well as their ability to produce interleukin (IL)-2, IL-10, or interferon (IFN)-gamma were investigated in TDLNs of colorectal cancer (CRC) patients. Mononuclear cells were isolated from lymph nodes of 13 patients with CRC using Ficoll-Hypaque gradient centrifugation. Cells were stimulated in vitro and stained with CD25, CD4, FoxP3, IFN-gamma, IL-10, and IL-2 or isotype matched antibodies and subjected to flow cytometry. The frequency of CD4(+)CD25(-)FoxP3(+)CD127(dim/-) cells was significantly lower than CD4(+)CD25(+) FoxP3(+)CD127(dim/-) population in TDLNs of CRC patients. The percentage of CD127 (dim/-) cells and also the MFI of FoxP3 expression was significantly lower in CD4(+CD25(-) FoxP3(+) in comparison with CD4(+)CD25(+)FoxP3(+) population. Moreover, CD4(+)CD25(-) FoxP3(+) cells contained higher percentages of IL-2- and IFN-gamma-producing cells than CD4 (+)CD25(+FoxP3(+) subpopulation. But, no difference was seen between two subsets in terms of IL-10 production."

According to the news editors, the research concluded: "CD4(+)CD25(-)FoxP3(+) cells in TDLNs of CRC patients had lower suppressive and higher effector properties in comparison with CD4(+)CD25(+)FoxP3(+) conventional regulatory T cells."

For more information on this research see: Determination of a CD4(+)CD25(-) FoxP3(+) T cells subset in tumor-draining lymph nodes of colorectal cancer secreting IL-2 and IFN-gamma. *Tumor Biology*, 2016;37(11):14659-14666. *Tumor Biology* can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. **Oncology - Colon Cancer**

**Reports Outline Colon Cancer Study Results from Soochow University**

**(Total laparoscopic right hemicolecction with 3-step stapled intracorporeal isoperistaltic ileocolic anastomosis for colon cancer An evaluation of short-term outcomes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Laparoscopic right hemicolecction with extracorporeal anastomosis is a widely used procedure; several authors have published their approach to intracorporeal anastomosis. In this paper, we present an approach developed by us and compare..."
short-term outcomes with those of extracorporeal anastomosis in colon cancer patients."

Our news journalists obtained a quote from the research from Soochow University, "Retrospective review of colon cancer patients treated with laparoscopic right hemicolectomy either with intracorporeal anastomosis (TLG group) or extracorporeal anastomosis (LG group) at the Zhangjiagang Hospital Affiliated to Soochow University between January 2011 and October 2015. Operative and postoperative data are compared. Around 85 patients underwent laparoscopic hemicolecotomy (56 TLG and 29 LG) during the reference period for this study. Age, gender, body mass index (BMI), stage of cancer, operation time, number of lymph nodes harvested, and length of hospital stay were comparable between the two groups. In the TLG group, the ileocolic anastomosis time was significantly shorter (9.9-11.5 minutes vs 13.5-18.2 minutes in LG; P<0.001), the mean intraoperative blood loss was lower (83.2 mL [range, 56.5-100.5 mL] vs 93.3 mL [range, 75.8 - 110.3 mL]; P<0.001), the recovery of bowel function was faster (P<0.001), and the postoperative pain score was lower (P<0.001) as compared to that in the LG group. Complications in the LG group included wound infection (4 patients), obstruction (1), and postoperative bleeding complications (1); however, only 1 patient developed complication (wound infection) in the TLG group. Total laparoscopic right hemicolecotomy with 3-step stapled intracorporeal anastomosis for colon cancer is a safe and reliable procedure."

According to the news editors, the research concluded: "Its advantages include short anastomosis time, less intraoperative blood loss, less postoperative pain, and early bowel function recovery."

For more information on this research see: Total laparoscopic right hemicolecotomy with 3-step stapled intracorporeal isoperistaltic ileocolic anastomosis for colon cancer An evaluation of short-term outcomes. Medicine, 2016;95(48):239-243. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

The news correspondents report that additional information may be obtained from B. Zhang, Soochow Univ, Zhangjiagang Hosp, Dept. of Gen Surg, Zhangjiagang, Jiangsu, People's Republic of China. Additional authors for this research include S.S. Wang, B. Zhang, J. Fang and L. Zhou.

Oncology - Colon Cancer

Reports Outline Colon Cancer Study Results from University of South Carolina (IL-33 promotes growth and liver metastasis of colorectal cancer in mice by remodeling the tumor microenvironment and inducing angiogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting out of Columbia, South Carolina, by NewsRx editors, research stated, "Liver metastasis is the major cause of death from colorectal cancer (CRC). Understanding its mechanisms is necessary for timely diagnosis and development of effective therapies."
Our news journalists obtained a quote from the research from the University of South Carolina, "Interleukin-33 (IL-33) is an IL-1 cytokine family member that uniquely functions as a cytokine and nuclear factor. It is released by necrotic epithelial cells and activated innate immune cells, functioning as an alarmin or an early danger signal. Its role in invoking type 2 immune response has been established; however, it has contrasting roles in tumor development and metastasis. We identified IL-33 as a potently upregulated cytokine in a highly metastatic murine CRC cell line and examined its role in tumor growth and metastasis to the liver. IL-33 was transgenically expressed in murine and human adenocarcinoma and carcinoma cell lines and their growth and spontaneous metastasis to the liver were assessed in orthotopic models of CRC in wild-type C57Bl/6 and Il33 knockout mice. The results showed that increased expression of IL-33 in CRC cells enhanced their tumor take, growth, and liver metastasis. Tumor- rather than host-derived IL-33 induced the enhanced recruitment of CD11b(+) GR1(+) and CD11b(+)F4/80(+) myeloid cells to remodel the tumor microenvironment by increased expression of mobilizing cytokines, and tumor angiogenesis by activating endothelial cells. IL-33 expression was elevated in patient tumor tissues, induced early in adenoma development, and activated by pro-inflammatory cytokines derived from the tumor microenvironment."

According to the news editors, the research concluded: "The data suggest that tumor-derived IL-33 modulates the tumor microenvironment to potently promote colon carcinogenesis and liver metastasis, underscoring its potential as a therapeutic target."

Our news journalists report that additional information may be obtained by contacting M.M.O. Pena, University of South Carolina, Center Colon Canc Res, Columbia, SC, United States. Additional authors for this research include C. Davis, S. Shah, D. Hughes, J.C. Ryan, D. Altomare and M.M.O. Pena.

**Oncology - Colorectal Cancer**

**Reports Outline Colorectal Cancer Study Findings from General Hospital (Increased risk of colorectal neoplasia in patients with primary sclerosing cholangitis and inflammatory bowel disease: a meta-analysis of 16 observational studies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Colorectal Cancer is the subject of a report. According to news reporting originating in Shandong, People's Republic of China, by NewsRx journalists, research stated, "Ulcerative colitis (UC) patients with concomitant primary
sclerosing cholangitis (PSC) carry an increased risk of colorectal neoplasia (dysplasia and cancer), whereas the association between PSC and the development of colorectal neoplasia in Crohn's disease (CD) is controversial. A meta-analysis was carried out to compare the risk of this neoplasia in patients with inflammatory bowel disease (IBD) with and without PSC."

The news reporters obtained a quote from the research from General Hospital, "A systematic research of MEDLINE, EMBASE and the Cochrane Central Register of Controlled Trials was performed to identify studies that compared the risk of colorectal neoplasia (dysplasia and cancer) in patients with IBD with and without PSC. Quality assessment was performed using the Newcastle-Ottawa Scale. Pooled odds ratio (OR) was calculated using the random-effects model by STATA 12.0. A total of 16 studies (four cohort studies, 12 case-control studies; nine prospective studies and seven retrospective studies) were selected for further study. These studies included 13 379 IBD patients, of whom 1022 also had PSC. Patients with IBD and PSC were at an increased risk of colorectal dysplasia and cancer compared with patients with IBD alone [OR 3.24; 95% confidence interval (CI): 2.14-4.90]. This increased risk was present even when the risk of colorectal cancer alone was analysed (OR 3.41; 95% CI: 2.13-5.48). Data only from patients with UC showed that PSC was associated with an increased risk for the development of colorectal neoplasia and cancer in patients with UC (OR 2.98; 95% CI: 1.54-5.76) (OR 3.01; 95% CI: 1.44-6.29), but there were high heterogeneity among studies (I²= 76.9 and 62.8%, respectively). Heterogeneity of the studies was affected by the study design (prospective or retrospective). The OR of colorectal neoplasia was 2.32 (95% CI: 0.70-7.70, p= 0.133) and that of cancer was 2.91 (95% CI: 0.84-10.16, p=0.388) for patients with CD and concurrent PSC. Patients with IBD and PSC have a markedly higher risk for the development of colorectal neoplasia than patients with IBD, but not PSC. Stratification by IBD type show that the presence of PSC is associated with an increased risk for the development of colorectal neoplasia in patients with UC; however, there is a nonsignificant association in CD patients."

According to the news reporters, the research concluded: "When the risk of colorectal cancer alone is analysed, the conclusion does not change."

Our news correspondents report that additional information may be obtained by contacting H.H. Zheng, a Postgraduate Training Base of the General Hospital of Jinan Military Command, Liaoning Medical University, Dept. of Gastroenterology, The General Hospital of Jinan Military Command, Jinan, Shandong, People's Republic of China.

Reports Outline Cor Triatriatum Study Results from University of Toronto (Catheter-Based Palliation in an Infant With Obstructed Cor Triatriatum)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Cor Triatriatum have been published. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "A 33-day-old infant with obstructed cor triatriatum sinister and partial anomalous pulmonary venous drainage presented with respiratory distress and fever."

Our news editors obtained a quote from the research from the University of Toronto, "Her suprasystemic pulmonary hypertension was relieved by opening the connection to the right atrium using balloon atrial septoplasty and septostomy, and to the inferior chamber using balloon dilation of a fenestration in the dividing membrane. This enabled extubation and discharge, with elective surgical repair at 2 months."

According to the news editors, the research concluded: "To our knowledge, this is the youngest patient to receive a catheter intervention for obstructed cor triatriatum sinister, providing relief of pulmonary hypertension and postponement of surgical repair."

The news editors report that additional information may be obtained by contacting R.R. Chaturvedi, University of Toronto, Hospital for Sick Children, Div Cardiol, Dept. of Paediat, Toronto, ON, Canada. Additional authors for this research include J.P. Sandoval, L. Grosse-Wortmann, E. Jaeggi and R.R. Chaturvedi.

Keywords for this news article include: Toronto, Ontario, Canada, North and Central America, Cardiovascular Diseases and Conditions, Lung Diseases and Conditions, Heart Disorders and Diseases, Cardiovascular Abnormalities, Congenital Heart Defects, Congenital Abnormalities, Pulmonary Hypertension, Cor Triatriatum, Heart Disease, University of Toronto.

Cystic Fibrosis

Reports Outline Cystic Fibrosis Findings from Catholic University of Louvain (High-level resistance to meropenem in clinical isolates of Pseudomonas aeruginosa in the absence of carbapenemases: role of active efflux and porin alterations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cystic Fibrosis. According to news
reporting originating in Brussels, Belgium, by NewsRx journalists, research stated, "High-level carbapenem resistance is worryingly increasing in clinical isolates and is often attributed to carbapenemase expression. This study aimed to determine the mechanisms leading to high-level meropenem resistance in six carbapenemase-negative Pseudomonas aeruginosa isolated from cystic fibrosis (CF) patients and seven carbapenemase-positive isolates from patients suffering from hospital-acquired pneumonia (HAP)."

The news reporters obtained a quote from the research from the Catholic University of Louvain, "MICs were determined in the absence or presence of L-arginine or glycine-glutamate as competitive substrates for OprD (OccD1) or OpdP (OccD3), respectively, or the efflux pump inhibitor Phe-Arg beta-naphthylamide (PA beta N). beta-Lactamases were screened by phenotypic tests and/or PCR. The oprD gene and its promoter were sequenced; protein expression was evidenced by SDS-PAGE. mexA, mexX, mexC and mexE transcripts were evaluated by real-time and semiquantitative PCR. Meropenem/ imipenem MICs were 64-128/16-32 mg/L and 128/128-256 mg/L in CF and HAP isolates, respectively; PA beta N reduced meropenem MICs to 4-16 mg/L only and specifically in CF isolates; porin competitors had no effect on MICs. All isolates showed an increase in transcription levels of mexA, mexX and/or mexC and mutations in oprD leading to production of truncated proteins. AmpC-type cephalosporinases were overexpressed in CF isolates and VIM-2 was expressed in HAP isolates. Antibiotic exclusion from bacteria by concomitant efflux and reduced uptake is sufficient to confer high-level resistance to meropenem in isolates overexpressing AmpC-type cephalosporinases. As efflux is preponderant in these isolates, it confers a paradoxical phenotype where meropenem is less active than imipenem."

According to the news reporters, the research concluded: "Concomitant susceptibility testing of both carbapenems and rapid elucidation of the most probable resistance mechanisms is thus warranted."

Our news correspondents report that additional information may be obtained by contacting F. Van Bambeke, Catholic University of Louvain, Louvain Drug Res Inst, Pharmacol Cellulaire & Mol, B-1200 Brussels, Belgium. Additional authors for this research include Y. Saenz, H. Rodriguez-Villalobos, O. Denis, B.C. Kahl, P.M. Tulkens and F. Van Bambeke.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijantimicag.2016.09.012. This DOI is a link to an online electronic document that is either free or for purchase.

Reports Outline Cystic Fibrosis Study Findings from Erasmus University Medical Center (Correction of lung inflammation in a F508del CFTR murine cystic fibrosis model by the sphingosine-1-phosphate lyase inhibitor LX2931)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Cystic Fibrosis is the subject of a report. According to news reporting out of Rotterdam, Netherlands, by NewsRx editors, research stated, "Progressive lung disease with early onset is the main cause of mortality and morbidity in cystic fibrosis patients. Here we report a reduction of sphingosine-1-phosphate (S1P) in the lung of unchallenged Cftr(tm1EUR) F508del CFTR mutant mice."

Financial supporters for this research include Dutch Lung Foundation, Dutch Cf Foundation (NCFS).

Our news journalists obtained a quote from the research from Erasmus University Medical Center, "This correlates with enhanced infiltration by inducible nitric oxide synthase (iNOS)expressing granulocytes, B cells, and T cells. Furthermore, the ratio of macrophage-derived dendritic cells (MoDC) to conventional dendritic cells (cDC) is higher in mutant mouse lung, consistent with unprovoked inflammation. Oral application of a S1P lyase inhibitor (LX2931) increases S1P levels in mutant mouse tissues. This normalizes the lung MoDC/cDC ratio and reduces B and T cell counts. Lung granulocytes are enhanced, but iNOS expression is reduced in this population. Although lung LyC6+ monocytes are enhanced by LX2931, they apparently do not differentiate to MoDC and macrophages. After challenge with bacterial toxins (LPS-fMLP) we observe enhanced levels of proinflammatory cytokines TNF-alpha, KC, IFN gamma, and IL-12 and the inducible mucin MUC5AC in mutant mouse lung, evidence of deficient resolution of inflammation. LX2931 does not prevent transient inflammation or goblet cell hyperplasia after challenge, but it reduces MUC5AC and proinflammatory cytokine levels toward normal values. We conclude that lung pathology in homozygous mice expressing murine F508del CFTR, which represents the most frequent mutation in CF patients, is characterized by abnormal behavior of infiltrating myeloid cells and delayed resolution of induced inflammation."

According to the news editors, the research concluded: "This phenotype can be partially corrected by a S1P lyase inhibitor, providing a rationale for therapeutic targeting of the S1P signaling pathway in CF patients."

Our news journalists report that additional information may be obtained by contacting B.J. Scholte, Erasmus MC, Cell Biol, Rotterdam, Netherlands. Additional authors for this research include M. Stolarczyk, D. Radzioch, G. Wojewodka, J.B. De Sanctis, W.A. Dik, O. Dzyubachyk, T. Oravec, I. de Kleer and B.J. Scholte.

Lung Diseases and Conditions - Cystic Fibrosis

Reports Outline Cystic Fibrosis Study Results from D. Fraser-Pitt et al (Activity of Cysteamine against the Cystic Fibrosis Pathogen Burkholderia cepacia Complex)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lung Diseases and Conditions - Cystic Fibrosis. According to news originating from Aberdeen, United Kingdom, by NewsRx correspondents, research stated, "There are no wholly successful chemotherapeutic strategies against Burkholderia cepacia complex (BCC) colonization in cystic fibrosis (CF). We assessed the impact of cysteamine (Lynovex) in combination with standard-of-care CF antibiotics in vitro against BCC CF isolates by the concentration at which 100% of bacteria were killed (MIC100) and checkerboard assays under CLSI standard conditions."

Our news journalists obtained a quote from the research, "Cysteamine facilitated the aminoglycoside-, fluoroquinolone- and folate pathway inhibitor-mediated killing of BCC organisms that were otherwise resistant or intermittently sensitive to these antibiotic classes. Slow-growing BCC strains are often recalcitrant to treatment and form biofilms."

According to the news editors, the research concluded: "In assessing the impact of cysteamine on biofilms, we demonstrated inhibition of BCC biofilm formation at sub-MIC(100)s of cysteamine."

For more information on this research see: Activity of Cysteamine against the Cystic Fibrosis Pathogen Burkholderia cepacia Complex. Antimicrobial Agents and Chemotherapy, 2016;60(10):6200-6206. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news correspondents report that additional information may be obtained from D. Fraser-Pitt, NovaBiot Ltd, Craibstone, Bucksburn, Aberdeen, United Kingdom. Additional authors for this research include D. Mercer, E. Lovie, J. Robertson and D. O'Neil.

Reports Outline Dementia Study Findings from Asia University
(Diverticular disease and additional comorbidities associated with increased risk of dementia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neurodegenerative Diseases and Conditions - Dementia. According to news reporting from Taichung, Taiwan, by NewsRx journalists, research stated, "Colonic diverticular disease may cause a chronic systemic effect, but its role in the development of dementia remains unclear. The purpose of this study was to investigate the potential increased risk for dementia in colonic diverticular disease."

The news correspondents obtained a quote from the research from Asia University, "We conducted a population-based cohort study using data from Taiwan's National Health Insurance Research Database. A total of 66,377 sex-matched, age-matched, and index year-matched (1:4) pairs of patients with colonic diverticular disease and 265,508 patients without colonic diverticular disease, who served as controls, were selected from all potential participants aged 20 years or older in the database. Each subject was individually tracked from 2000 to 2011 to identify incident cases of dementia. Cox proportional hazards regression was employed to calculate the hazard ratios and 95% confidence intervals for the association between colonic diverticular disease and dementia. There were 1057 dementia cases in the diverticular disease cohort during the follow-up period of 315,171 person-years; the overall incidence rate of dementia differed from that of the control group (3.35 vs 2.43 per 1000 person-years, P< 0.001). The adjusted hazard ratio for dementia was 1.24 (95% confidence interval 1.15-1.33) for diverticular disease patients after adjusting for age, sex, and comorbidities."

According to the news reporters, the research concluded: "Colonic diverticular disease may be associated with increased risk for dementia."

Our news journalists report that additional information may be obtained by contacting C.H. Kao, Asia Univ, Dept. of Bioinform & Med Engn, Taichung, Taiwan. Additional authors for this research include C.L. Lin, H.Z. Yeh, C.F. Tung, C.S. Chang and C.H. Kao.

**Mental Health Diseases and Conditions - Depression**

**Reports Outline Depression Findings from University of Montpellier**

(Patterns of selective serotonin reuptake inhibitor use and risk of falls and fractures in community-dwelling elderly people: the Three-City cohort)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mental Health Diseases and Conditions - Depression have been published. According to news reporting originating from Montpellier, France, by NewsRx correspondents, research stated, "In this population-based elderly cohort, participants using selective serotonin reuptake inhibitor (SSRI) antidepressants have an increased risk of falls and fractures notably when the treatment was continued over 4 years. Among the various SSRI types, citalopram only was at significant risk for falls and fluoxetine for fractures."

Financial support for this research came from Fondation pour la Recherche Medicale.

Our news editors obtained a quote from the research from the University of Montpellier, "Increased risk of falls and fractures has been reported in elderly users of SSRIs. However, biases were insufficiently addressed notably temporality between exposure and outcome and confounding by residual depression. Our objective was to examine the associations between SSRIs and fall or fracture incidence focusing on their chronic use and different types of SSRIs. The population-based cohort included participants aged 65 years and above, who had not fallen before inclusion (n = 6599) or were free of recent fracture (n = 6823) and were followed up twice over 4 years. New fall and fracture events were self-reported and defined as at least two falls and one fracture, respectively, during the previous 2 years. SSRI users were compared with those taking no antidepressants. Hazard ratios (HRs) were estimated using Cox models with delayed entry and adjusted for many confounders including residual depressive symptoms. Incidence of falls was 19.3 % over 4 years and that of fractures 9.5 %. After multi-adjustment, SSRI intake was significantly associated with a higher risk of falls (HR, 95 % CI = 1.58, 1.23-2.03) and fractures (HR, 95 % CI = 1.61, 1.16-2.24). The risks were significantly increased by 80 % in those continuing the treatment over 4 years. Citalopram intake only was at significant risk for falls and fluoxetine for fractures. In this large community-dwelling elderly sample, SSRI users were at higher risk of falls and fractures. This association was not due to reverse causality or residual depressive symptoms."

According to the news editors, the research concluded: "Different SSRI drugs may have specific adverse effects on falls and fractures."

For more information on this research see: Patterns of selective serotonin reuptake inhibitor use and risk of falls and fractures in community-dwelling elderly people: the Three-City cohort. *Osteoporosis International*, 2016;27(11):3187-3195. *Osteoporosis International* can be contacted at: Springer London Ltd, 236 Grays Inn Rd, 6TH Floor, London WC1X 8HL, England. Nutritional and Metabolic Diseases and Conditions - ...

Reports Outline Diabetic Angiopathies Study Findings from Yang Ming
National University (Regulatory SNPs Alter the Gene Expression of
Diabetic Retinopathy Associated Secretary Factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions -
Diabetic Angiopathies is now available. According to news reporting originating in Taipei,
Taiwan, by NewsRx journalists, research stated, "Diabetic retinopathy (DR) is a common
microvascular complication in both type I and type II diabetes. Several previous reports
indicated the serum centration of some secretary factors were highly associated with DR."

The news reporters obtained a quote from the research from Yang Ming National
University, "Therefore, we hypothesis regulatory SNPs (rSNPs) genotype in secretary factors
may alter these gene expression and lead to DR. At first, pyrosequencing were applying to
screen the SNPs which present allele frequency different in DR and DNR. Then individual
genotyping was processed by Taqman assays in Taiwanese DR and DNR patients. To evaluate
the effect of SNP allele on transcriptional activity, we measured promoter activity using
luciferase reporter constructs. We found the frequencies of the CC, CG, and GG genotype of the
rs2010963 polymorphism were 15.09%, 47.14%, and 37.74% in DR and 12.90%, 19.35%, and
67.74% in DNR, respectively (p = 0.0205). The prevalence of DR was higher (p = 0.00793) in
patients with the CC or CG genotype (62.26% and 32.26% for DR and DNR, respectively)
compared with the patients with the GG genotype. To evaluate the effect of rs2010963-C allele
on transcriptional activity, we measured promoter activity using luciferase reporter constructs.
The rs2010963-C reporter showed 1.6 to 2-fold higher luciferase activity than rs2010963-G in 3
cell lines. Our data proposed rs2010963-C altered the expression level of VEGFA in different
tissues."

According to the news reporters, the research concluded: "We suggested small
increase but long term exposure to VEGFA may lead to DR finally."

For more information on this research see: Regulatory SNPs Alter the Gene
Expression of Diabetic Retinopathy Associated Secretary Factors. *International Journal of
Medical Sciences*, 2016;13(9):717-723. *International Journal of Medical Sciences* can be

**Diabetic Neuropathy**

**Reports Outline Diabetic Neuropathy Study Findings from Roma Tor Vergata University (Recent advances in exploring the genetic susceptibility to diabetic neuropathy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Diabetic Neuropathy have been presented. According to news reporting out of Rome, Italy, by NewsRx editors, research stated, "Diabetic polyneuropathy and cardiovascular autonomic neuropathy are common and disabling complications of diabetes. Although glycaemic control and cardiovascular risk factors are major contributory elements in its development, diabetic neuropathy recognizes a multifactorial influence and a multiplicity of pathogenetic mechanisms."

Our news journalists obtained a quote from the research from Roma Tor Vergata University, "Thus genetic and environmental factors may contribute to its susceptibility, each with a modest contribution, by targeting various metabolic and microvascular pathways whose alterations intervene in diabetic neuropathy pathogenesis. This review is aimed at describing major data from the available literature regarding genetic susceptibility to diabetic neuropathies. It provides an overview of the genes reported as associated with the development or progression of these complications, i.e. ACE, MTHFR, GST, GLO1, APOE, TCF7L2, VEGF, IL-4, GPX1, eNOS, ADRA2B, GFRA2, MIR146A, MIR128A."

According to the news editors, the research concluded: "The identification of genetic susceptibility can help in both expanding the comprehension of the pathogenetic mechanisms of diabetic nerve damage and identifying biomarkers of risk prediction and response to therapeutic intervention."

For more information on this research see: Recent advances in exploring the genetic susceptibility to diabetic neuropathy. *Diabetes Research and Clinical Practice*, 2016;120():198-208. *Diabetes Research and Clinical Practice* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Our news journalists report that additional information may be obtained by contacting P. Borgiani, Roma Tor Vergata University, Genet Sect, Dept. of Biomed & Prevent, I-00133 Rome, Italy. Additional authors for this research include C. Ciccacci, C. D'Amato, G. Novelli, P. Borgiani and V. Spallone.
Diarylheptanoids

Reports Outline Diarylheptanoids Findings from Nanjing University (Nrf2 Knockdown Disrupts the Protective Effect of Curcumin on Alcohol-Induced Hepatocyte Necroptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Diarylheptanoids. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "It has emerged that hepatocyte necroptosis plays a critical role in chronic alcoholic liver disease (ALD). Our previous study has identified that the beneficial therapeutic effect of curcumin on alcohol-caused liver injury might be attributed to activation of nuclear factor (erythroid-derived 2)-like 2 (Nrf2), whereas the role of curcumin in regulating necroptosis and the underlying mechanism remain to be determined."

Financial supporters for this research include Natural Science Foundation of Jiangsu Province, National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from Nanjing University, "We first found that chronic alcohol consumption triggered obvious hepatocyte necroptosis, leading to increased expression of receptor-interacting protein 1, receptor-interacting protein 3, high-mobility group box 1, and phosphorylated mixed lineage kinase domain-like in murine livers. Curcumin dose-dependently ameliorated hepatocyte necroptosis and alleviated alcohol-caused decrease in hepatic Nrf2 expression in alcoholic mice. Then Nrf2 shRNA lentivirus was introduced to generate Nrf2-knockdown mice. Our results indicated that Nrf2 knockdown aggravated the effects of alcohol on liver injury and necroptosis and even abrogated the inhibitory effect of curcumin on necroptosis. Further, activated Nrf2 by curcumin inhibited p53 expression in both livers and cultured hepatocytes under alcohol stimulation. The next in vitro experiments, similar to in vivo ones, revealed that although Nrf2 knockdown abolished the suppression of curcumin on necroptosis of hepatocytes exposed to ethanol, p53 siRNA could clearly rescued the relative effect of curcumin. In summary, for the first time, we concluded that curcumin attenuated alcohol-induced hepatocyte necroptosis in a Nrf2/p53-dependent mechanism."

According to the news reporters, the research concluded: "These findings make curcumin an excellent candidate for ALD treatment and advance the understanding of ALD mechanisms associated with hepatocyte necroptosis."

For more information on this research see: Nrf2 Knockdown Disrupts the Protective Effect of Curcumin on Alcohol-Induced Hepatocyte Necroptosis. Molecular Pharmaceutics.
2016;13(12):4043-4053. *Molecular Pharmaceutics* can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

Our news journalists report that additional information may be obtained by contacting S.Z. Zheng, Nanjing Univ Chinese Med, Jiangsu Key Lab Pharmacol & Safety Evaluat Chines, Nanjing, Jiangsu, People's Republic of China. Additional authors for this research include W.X. Xu, F. Zhang, J.J. Shao and S.Z. Zheng.

### Drugs and Therapies - Drug Delivery Systems

#### Reports Outline Drug Delivery Systems Study Findings from Chinese Academy of Sciences (Multitriggered Tumor-Responsive Drug Delivery Vehicles Based on Protein and Polypeptide Coassembly for Enhanced Photodynamic Tumor Ablation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Drug Delivery Systems. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Tumor-responsive nanocarriers are highly valuable and demanded for smart drug delivery particularly in the field of photodynamic therapy (PDT), where a quick release of photosensitizers in tumors is preferred. Herein, it is demonstrated that protein-based nanospheres, prepared by the electrostatic assembly of proteins and polypeptides with intermolecular disulfide cross-linking and surface polyethylene glycol coupling, can be used as versatile tumor-responsive drug delivery vehicles for effective PDT."

Financial supporters for this research include National Natural Science Foundation of China, Talent Fund of the Recruitment Program of Global Youth Experts, Chinese Academy of Sciences.

Our news editors obtained a quote from the research from the Chinese Academy of Sciences, "These nanospheres are capable of encapsulation of various photosensitizers including Chlorin e6 (Ce6), protoporphyrin IX, and verteporfin. The Chlorin e6-encapsulated nanospheres (Ce6-Ns) are responsive to changes in pH, redox potential, and proteinase concentration, resulting in multitriggered rapid release of Ce6 in an environment mimicking tumor tissues. In vivo fluorescence imaging results indicate that Ce6-Ns selectively accumulate near tumors and the quick release of Ce6 from Ce6-Ns can be triggered by tumors. In tumors the fluorescence of released Ce6 from Ce6-Ns is observed at 0.5 h postinjection, while in normal tissues the fluorescence appeared at 12 h postinjection."

According to the news editors, the research concluded: "Tumor ablation is demonstrated by in vivo PDT using Ce6-Ns and the biocompatibility of Ce6-Ns is evident from
the histopathology imaging, confirming the enhanced in vivo PDT efficacy and the biocompatibility of the assembled drug delivery vehicles.

The news editors report that additional information may be obtained by contacting X.H. Yan, Chinese Academy Sci, Inst Proc Engn, Center Mesosci, Beijing 100190, People's Republic of China. Additional authors for this research include F.F. Zhao, Q.L. Zou, Y.X. Li, G.H. Ma and X.H. Yan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/smll.201602339. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Drug Resistance

Reports Outline Drug Resistance Findings from Singapore National University [Thermoresponsive Delivery of Paclitaxel by beta-Cyclodextrin-Based Poly(N-isopropylacrylamide) Star Polymer via Inclusion Complexation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Drug Resistance. According to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Paclitaxel (PTX), a hydrophobic anticancer drug, is facing several clinical limitations such as low bioavailability and drug resistance. To solve the problems, a well-defined beta-cyclodextrin-poly(N-isopropylacrylamide) star polymer was synthesized and used as a nanocarrier to improve the water solubility and aim to thermoresponsive delivery of PTX to cancer cells."

Our news editors obtained a quote from the research from Singapore National University, "The star polymer was able to form supramolecular self-assembled inclusion complex with PTX via host guest interaction at room temperature, which is below the low critical solution temperature (LCST) of the star polymer, significantly improving the solubilization of PTX. At body temperature (above LCST), the phase transition of poly(N-isopropylacrylamide) segments induced the formation of nanoparticles, which greatly enhanced the cellular uptake of the polymer-drug complex, resulting in efficient thermoresponsive delivery of PTX."

According to the news editors, the research concluded: "In particular, the polymer drug complex exhibited better antitumor effects than the commercial formulation of PTX in overcoming the multi-drug resistance in AT3B-1 cells."

For more information on this research see: Thermoresponsive Delivery of Paclitaxel
Drugs and Therapies - Drugs Used In Alcohol

Reports Outline Drugs Used In Alcohol Dependence Study Results from Changchun Institute of Applied Chemistry [Pharmacological characterization of the opioid inactive isomers (+)-naltrexone and (+)-naloxone as antagonists of toll-like receptor 4]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drugs Used In Alcohol Dependence have been published. According to news reporting originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "The toll-like receptor TLR4 is involved in neuropathic pain and in drug reward and reinforcement. The opioid inactive isomers (+)-naltrexone and (+)-naloxone act as TLR4 antagonists, reversing neuropathic pain and reducing opioid and cocaine reward and reinforcement."

Funders for this research include National Institutes of Health, Australian Research Council Research Fellowship, National Natural Science Foundation of China, Natural Medicines, China Pharmaceutical University.

Our news editors obtained a quote from the research from the Changchun Institute of Applied Chemistry, "However, how these agents modulate TLR4 signalling is not clear. Here, we have elucidated the molecular mechanism of (+)-naltrexone and (+)-naloxone on TLR4 signalling. BV-2 mouse microglial cell line, primary rat microglia and primary rat peritoneal macrophages were treated with LPS and TLR4 signalling inhibitors. Effects were measured using Western blotting, luciferase reporter assays, fluorescence microscopy and ELISA KEY (+)-Naltrexone and (+)-naloxone were equi-potent inhibitors of the LPS-induced TLR4 downstream signalling and induction of the pro-inflammatory factors NO and TNF-a. Similarly, (+)-naltrexone or (+)-naloxone inhibited production of reactive oxygen species and increased microglial phagocytosis, induced by LPS. However, (+)-naltrexone and (+)-naloxone did not directly inhibit the increased production of IL-1β, induced by LPS. The drug interaction of (+)-naloxone and (+)-naltrexone was additive. (+)-Naltrexone or (+)-naloxone inhibited LPS-induced activation of IFN regulatory factor 3 and production of IFN-β. However, they did not inhibit TLR4 signalling via the activation of either NF-kβ, p38 or JNK in these cellular models.
(+)-Naltrexone and (+)-naloxone were TRIF-IFN regulatory factor 3 axis-biased TLR4 antagonists. They blocked TLR4 downstream signalling leading to NO, TNF-a and reactive oxygen species."

According to the news editors, the research concluded: "This pattern may explain, at least in part, the in vivo therapeutic effects of (+)-naltrexone and (+)-naloxone."

The news editors report that additional information may be obtained by contacting X. Wang, Chemical Biology Laboratory, Changchun Institute of Applied Chemistry, Chinese Academy of Sciences, Changchun, Jilin, 130022, People's Republic of China. Additional authors for this research include Y. Zhang, Y. Peng, M.R. Hutchinson, K.C. Rice, H. Yin and L.R Watkins.

Oncology - Duodenal Cancer

Reports Outline Duodenal Cancer Study Findings from University of Pennsylvania (Lymph node evaluation and survival after curative-intent resection of duodenal adenocarcinoma: A matched cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Duodenal Cancer. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Lymph node (LN) metastasis in patients with duodenal adenocarcinoma is associated with poor prognosis; however, the optimal extent of LN assessment and the interaction between LN assessment and adjuvant systemic therapy is poorly understood. Resected non-metastatic duodenal adenocarcinoma patients (n = 1743) were identified in the National Cancer Database (1998-2011)."

The news correspondents obtained a quote from the research from the University of Pennsylvania, "Logistic regression analysis identified covariates associated with LN metastasis. The influence of increasing LN cut-off points on overall survival (OS) was analysed using the log-rank test and Cox proportional hazards modelling. Adjuvant chemotherapy (AC) and
surgery alone cohorts were matched (1:1) by propensity scores based on the likelihood of nodal metastasis or survival hazard on Cox modelling. OS in the matched cohort was compared by Kaplan-Meier estimates. LN metastases were present in 865 (49.6%) patients. Increasing LN assessment was associated with an increased likelihood of nodal involvement (P = 0.008). In node-negative patients, increasing LN assessment was associated with a decreased risk of death, with the largest actuarial survival differences observed for >= 15 LN (hazard ratio [HR] 0.63, 95% confidence interval [CI] 0.48-0.82, P = 0.001). In the propensity score-matched cohort of node-negative patients, AC was associated with non-significant improvements in 5-year actuarial (66.1% versus 58.7%, HR 0.79, 95% CI 0.53-1.18, P = 0.249), and did not vary by adequacy of LN counts (< 15 LNs: HR 0.79, 95% CI 0.51-1.24, P = 0.305; >= 15 LNs: HR 0.90, 95% CI 0.35-2.30, P = 0.900).

According to the news reporters, the research concluded: "The extent of LN identification has prognostic significance in resected node-negative duodenal adenocarcinoma, but cannot be implicated in the selection of non-dendegenative patients for AC."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejca.2016.09.027. This DOI is a link to an online electronic document that is either free or for purchase.

End Stage Renal Disease

Reports Outline End Stage Renal Disease Study Findings from People's Hospital (Resveratrol Ameliorated Vascular Calcification by Regulating Sirt-1 and Nrf2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on End Stage Renal Disease have been presented. According to news reporting originating in Chengdu, People's Republic of China, by NewsRx journalists, research stated, "Pathologic vascular calcification is a significant reason for mortality and morbidity in patients who suffer from end-stage renal disease (ESRD). Resveratrol, a scavenger for many free radicals, is a crucial compound for biomedicine."
The news reporters obtained a quote from the research from People's Hospital, "However, the role and mechanism of resveratrol in vascular calcification is still unknown. In this study, to mimic vascular calcification in ESRD, we used beta-glycophosphate to stimulate the rat vascular smooth muscle cells (RASMCs). We investigate the therapeutic role of resveratrol pretreatment in vascular calcification. In the current in vitro study, we observe the effects of resveratrol on improving intracellular calcium deposition and protecting against mitochondria dysfunction in calcific RASMCs. Resveratrol decreased the mRNA level of fibroblast growth factor-23, then increased the mRNA level of klotho and the nuclear transcription factor NF-E2-related factor 2 (nuclear factor-erythroid 2 related factor 2 [Nrf2]) in RASMCs after calcification. Further, resveratrol activated the expression of sirtuin-1 and Nrf2, and inhibited the expression of osteopontin, runt-related transcription factor 2, and heme oxygenase-1. Our study shows that resveratrol could ameliorate oxidative injury of RASMCs by preventing vascular calcification induced calcium deposition and mitochondria dysfunction through involving sirtuin-1 and Nrf2."

According to the news reporters, the research concluded: "These results might indicate a novel role for resveratrol in resistance to oxidative stress for ESRD patients suffering from vascular calcification."

Our news correspondents report that additional information may be obtained by contacting L. Wang, Sichuan Prov Peoples Hosp, Chengdu 610072, People's Republic of China. Additional authors for this research include Y. Li, Y. Du, G. Li, L. Wang and F. Zhou.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.transproceed.2016.10.023. This DOI is a link to an online electronic document that is either free or for purchase.

Environmental Health - Environmental Research and...
"By the use of unmanned aerial vehicle (UAV) photography and video processing techniques, the conflict type and severity was judged. Time to collision (TTC) was determined with the traffic conflict evaluation index. Then, the TTC severity threshold was determined. Quantizing the weight of the conflict by direct losses of different severities of freeway traffic accidents, the calculated weight of the HCRI can be obtained. Calibration of the relevant parameters of the micro-simulation simulator VISSIM is conducted by the travel time according to the field data. Variables are placed into orthogonal tables at different levels. On the basis of this table, the trajectory file of every traffic condition is simulated, and then submitted into a surrogate safety assessment model (SSAM), identifying the number of hourly traffic conflicts in the merging area, a statistic of HCRI. Moreover, the multivariate linear regression model was presented and validated to study the relationship between HCRI and the influencing variables. A comparison between the HCRI model and the hourly conflicts ratio (HCR), without weight, shows that the HCRI model fitting degree was obviously higher than the HCR."

According to the news editors, the research concluded: "This will be a reference to design and implement operational planners."

For more information on this research see: Crash Risk Prediction Modeling Based on the Traffic Conflict Technique and a Microscopic Simulation for Freeway Interchange Merging Areas. *International Journal of Environmental Research and Public Health*, 2016;13 (11):1623-1636. *International Journal of Environmental Research and Public Health* can be contacted at: MdpI Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Our news journalists report that additional information may be obtained by contacting S. Li, Southeast Univ, Sch Transportat, Nanjing 210096, Jiangsu, People's Republic of China. Additional authors for this research include Q.J. Xiang, Y.F. Ma, X. Gu and H. Li.

Enzymes and Coenzymes

Reports Outline Enzymes and Coenzymes Findings from National Reference Laboratory of Veterinary Drug Residues SCAU (Comparative Characterization of CTX-M-64 and CTX-M-14 Provides Insights into the Structure and Catalytic Activity of the CTX-M ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Enzymes and Coenzymes are discussed in a new report. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Clinical isolates producing hybrid CTX-M beta-lactamases, presumably due to recombination between the bla(CTX-M-15) and bla(CTX-M-14) elements, have emerged in recent years. Among the hybrid enzymes, CTX-M-64 and CTX-M-14 display the most significant difference in catalytic activity."

Financial support for this research came from Chinese National Key Basic Research and Development (973) Program.

Our news journalists obtained a quote from the research from the National Reference Laboratory of Veterinary Drug Residues SCAU, "This study aims to investigate the mechanisms underlying such differential enzymatic activities in order to provide insight into the
structure/function relationship of this class of enzymes. Sequence alignment analysis showed that the major differences between the amino acid composition of CTX-M-64 and CTX-M-14 lie at both the N and C termini of the enzymes. Single or multiple amino acid substitutions introduced into CTX-M-64 and CTX-M-14 were found to produce only minor effects on hydrolytic functions; such a finding is consistent with the notion that the discrepancy between the functional activities of the two enzymes is not the result of only a few amino acid changes but is attributable to interactions between a unique set of amino acid residues in each enzyme. This theory is supported by the results of the thermal stability assay, which confirmed that CTX-M-64 is significantly more stable than CTX-M-14."

According to the news editors, the research concluded: "Our data confirmed that, in addition to the important residues located in the active site, residues distal to the active site also contribute to the catalytic activity of the enzyme through stabilizing its structural integrity."

For more information on this research see: Comparative Characterization of CTX-M-64 and CTX-M-14 Provides Insights into the Structure and Catalytic Activity of the CTX-M Class of Enzymes. Antimicrobial Agents and Chemotherapy, 2016;60(10):6084-6090. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Central Nervous System Diseases and Conditions -…

Reports Outline Epilepsy Study Findings from LUMC (Mortality in Dravet syndrome: A review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting originating from Leiden, Netherlands, by NewsRx correspondents, research stated, "Premature mortality is a major issue in Dravet syndrome (DS). To improve understanding of DS premature mortality, we conducted a comprehensive literature search with a particular emphasis on SUDEP."

Financial supporters for this research include Dutch National Epilepsy Fund, NIHR.

Our news editors obtained a quote from the research from LUMC, "We searched PubMed, Embase, Web of Science, Cochrane, CENTRAL, CINAHL, PsycINFO, Academic Search Premier, and ScienceDirect on the following terms: 'Dravet syndrome', 'severe myoclonic
epilepsy', 'SMEI', 'mortality', 'survivors', 'prognosis', and 'death'. DS cases or cohorts studies reporting mortality were included. The search yielded 676 articles and 86 meeting abstracts. After removing duplicates and screening titles and abstracts, full text of 73 articles was reviewed. Only 28 articles and six meeting abstracts met inclusion criteria. Five articles and four meeting abstracts were excluded, as the case(s) were also described elsewhere. After checking the references, five additional studies were included. The 30 items reported 177 unique cases. Sudden unexpected death in epilepsy was the likely cause in nearly half of the cases (n = 87, 49%), followed by status epilepticus (n = 56, 32%). Drowning or accidental death was reported in 14 cases (8%), infections in 9 (5%), other causes in six (3%), and unknown in five (3%). Age at death was reported for 142 of the 177 cases (80%), with a mean age of 8.7 +/- 9.8 years (SD); 73% died before the age of 10 years. Dravet syndrome is characterized by high epilepsy-related premature mortality and a marked young age at death. Sudden unexpected death in epilepsy is the leading reported cause of death in DS, accounting for nearly half of all deaths."

According to the news editors, the research concluded: "The cause of this excess mortality remains elusive but may be explained by epilepsy severity, as well as genetic susceptibility to SUDEP."

For more information on this research see: Mortality in Dravet syndrome: A review. *Epilepsy & Behavior*, 2016;64():69-74. *Epilepsy & Behavior* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Epilepsy & Behavior - www.journals.elsevier.com/epilepsy-and-behavior/)

The news editors report that additional information may be obtained by contacting R.D. Thijs, LUMC Leiden Univ, Medical Center, Dept. of Neurol, Leiden, Netherlands. Additional authors for this research include S.M. Sisodiya, W.B. Gunning, J.W. Sander and R.D. Thijs.

**Gram-Negative Bacteria - Escherichia coli**

**Reports Outline Escherichia coli Study Findings from Third Military Medical University (Design of New Antibacterial Enhancers Based on AcrB's Structure and the Evaluation of Their Antibacterial Enhancement Activity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Negative Bacteria - Escherichia coli. According to news reporting originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "Previously, artesunate (AS) and dihydroartemisinine 7 (DHA7) were found to have antibacterial enhancement activity against Escherichia coli via inhibition of the efflux pump AcrB. However, they were only effective against E. coli standard strains."
Our news editors obtained a quote from the research from Third Military Medical University. "This study aimed to develop effective antibacterial enhancers based on the previous work. Our results demonstrate that 86 new antibacterial enhancers were designed via 3D-SAR and molecular docking. Among them, DHA27 had the best antibacterial enhancement activity. It could potentiate the antibacterial effects of ampicillin against not only E. coli standard strain but also clinical strains, and of beta-lactam antibiotics, not non-beta-lactam antibiotics. DHA27 could increase the accumulation of daunomycin and nile red within E. coli ATCC 35218, but did not increase the bacterial membrane permeability. DHA27 reduced acrB's mRNA expression of E. coli ATCC 35218 in a dose-dependent manner, and its antibacterial enhancement activity is related to the degree of acrB mRNA expression in E. coli clinical strains. The polypeptides from AcrB were obtained via molecular docking assay; the pre-incubated polypeptides could inhibit the activity of DHA27. Importantly, DHA27 had no cytotoxicity on cell proliferation."

According to the news editors, the research concluded: "Among newly designed antibacterial enhancers, DHA27 had favorable physical and pharmacological properties with no significant cytotoxicity at effective concentrations, and might serve as a potential efflux pump inhibitor in the future."

For more information on this research see: Design of New Antibacterial Enhancers Based on AcrB's Structure and the Evaluation of Their Antibacterial Enhancement Activity. *International Journal of Molecular Sciences*, 2016;17(11):2405-2424. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news editors report that additional information may be obtained by contacting Y. Song, Third Military Medical University, Dept. of Pharmacol, Coll Pharm, Chongqing 400038, People's Republic of China. Additional authors for this research include R.X. Qin, X.C. Pan, Q.Y. **Drugs and Therapies - Ethnopharmacology**

**Reports Outline Ethnopharmacology Study Results from Research Institute (Standardization of the manufacturing procedure for Pinelliae Rhizoma Praeparatum cum Zingibere et Alumine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Ethnopharmacology is now available. According to news reporting originating in Shenzhen, People's Republic of China, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Pinelliae Rhizoma (PR), the dried tuber of Pinellia ternata (Thunb.) Breit., is a traditional Chinese medicinal herb. It is commonly used for treating cancer, cough and phlegm."

Funders for this research include Research Grants Council of Hong Kong, National Natural Science Foundation of China, Science, Technology and Innovation Commission of Shenzhen, Guangdong Natural Science Foundation, Hong Kong Baptist University, Chinese
Pharmacopoeia Commission.

The news reporters obtained a quote from the research from Research Institute, "To treat cancer, Chinese medicine practitioners often use raw PR; while to treat cough and phlegm, they usually use Pinelliae Rhizoma Praeparatum cum Zingibere et Alumine (PRZA, raw PR processed with ginger juice and alum as adjuvant materials). Currently, the producing protocol of PRZA varies greatly among different places in China. This study aims to standardize the manufacturing procedure for PRZA. We also evaluated the impact of processing on the bioactivities and chemical profile of raw PR. We used the orthogonal design to optimize the manufacturing procedure of PRZA at bench scale, and validated the optimized procedure in pilot-scale production. The MTT assay was used to compare the cytotoxicities of raw PR and PRZA in hepatocellular carcinoma HepG2 cells. Animal models (ammonia liquor-induced cough model and phenol red secretion model) were used to compare the antitussive and expectorant effects of raw PR and PRZA, respectively. The chemical profiles of raw PR and PRZA samples were compared using a newly developed ultra-performance liquid chromatography/quadrupole-time-of-flight mass spectrometry (UPLC/Q-TOF-MS) method. The standardized manufacturing procedure for PRZA is as follows: soak raw PR in water until the center of the cut surface is devoid of a dry core, after that, boil the herb in water (for each 100 kg raw PR, 12.5 kg alum and 25 L freshly squeezed ginger juice are added) for 6 h, and then take out and dry them. The cytotoxicity of PRZA was less potent than that of raw PR. Intragastric administration of raw PR or PRZA demonstrated antitussive and expectorant effects in mice. These effects of PRZA were more potent than that of raw PR at the dose of 3 g/kg. By comparing the chemical profiles, we found that six peaks were lower, while nine other peaks were higher in PRZA than in raw PR. Six compounds corresponding to six individual changed peaks were tentatively identified by matching with empirical molecular formulae and mass fragments. The manufacturing procedure for PRZA was standardized. This protocol can be used for PRZA industrial production. The bioactivity assay results of raw PR and PRZA (produced using the standardized protocol) support the common practice for the clinical applications of these two decoction pieces. Moreover, raw PR and PRZA showed different chemical profiles."

According to the news reporters, the research concluded: "Further studies are warranted to establish the relationship between the alteration of chemical profiles and the changes of medicinal properties caused by processing."

Reports Outline Fatty Acid Desaturases Findings from Southwestern Medical Center (Discovery of tumor-specific irreversible inhibitors of stearoyl CoA desaturase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Fatty Acid Desaturases have been published. According to news reporting originating from Dallas, Texas, by NewsRx correspondents, research stated, "A hallmark of targeted cancer therapies is selective toxicity among cancer cell lines. We evaluated results from a viability screen of over 200,000 small molecules to identify two chemical series, oxalamides and benzothiazoles, that were selectively toxic at low nanomolar concentrations to the same 4 of 12 human lung cancer cell lines."

Our news editors obtained a quote from the research from Southwestern Medical Center, "Sensitive cell lines expressed cytochrome P450 (CYP) 4F11, which metabolized the compounds into irreversible inhibitors of stearoyl CoA desaturase (SCD). SCD is recognized as a promising biological target in cancer and metabolic disease. However, SCD is essential to sebocytes, and accordingly SCD inhibitors cause skin toxicity. Mouse sebocytes did not activate the benzothiazoles or oxalamides into SCD inhibitors, providing a therapeutic window for inhibiting SCD in vivo."

According to the news editors, the research concluded: "We thus offer a strategy to target SCD in cancer by taking advantage of high CYP expression in a subset of tumors."

The news editors report that additional information may be obtained by contacting P.C. Theodoropoulos, Dept. of Biochemistry, UT Southwestern Medical Center, Dallas, Texas, United States. Additional authors for this research include S.S. Gonzales, S.E. Winterton, C. Rodriguez-Navas, J.S. McKnight, L.K. Morlock, J.M. Hanson, B. Cross, A.E. Owen, Y. Duan, J.R. Moreno, A. Lemoff, H. Mirzaei, B.A. Posner, N.S. Williams, J.M. Ready and D. Nijhawan.

Reports Outline Gallbladder Cancer Findings from International Agency for Research on Cancer (Burden of gallbladder cancer in Central and South America)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gallbladder Cancer. According to news reporting out of Lyon, France, by NewsRx editors, research stated, "Rationale and objective: Gallbladder carcinoma (GBC) is a rare neoplasm yet it is the most common malignancy of the biliary tract and its prognosis is poor. Incidence of GBC is high in some areas of Central and South America and the Caribbean."

Our news journalists obtained a quote from the research from International Agency for Research on Cancer, "We described the current burden of GBC in Central and South America (CSA). We obtained GBC incidence data from 48 population-based cancer registries in 13 countries in CSA, and national level cancer death data from the WHO mortality data base for 18 countries. We estimated World population age-standardized incidence and mortality rates per 100,000 persons-years, including distribution and incidence rates by anatomic subsite. GBC rates were the highest in countries located in the Andean region. In 2003-2007, Chile had the highest incidence and mortality rates in CSA (17.1 and 12.9 in females and 7.3 and 6.0 in males, respectively). Females had higher GBC rates than males. The most frequently diagnosed anatomic subsite was gallbladder (60%). Unspecified subsite represented 21% of all cases. Trends in incidence and mortality of GBC remained unchanged in Argentina, Brazil, Chile and Costa Rica in 1998-2008. GBC rates varied extensively across the CSA region reflecting, in part, differences in data quality, coverage and healthcare access. Chile had the highest GBC rates in CSA and the world."

According to the news editors, the research concluded: "The large proportion of unspecified cases indicates low precision in diagnosis/registration and highlights the need to promote and improve cancer registration in the region to better understand the burden of GBC in CSA."

For more information on this research see: Burden of gallbladder cancer in Central and South America. Cancer Epidemiology, 2016;44():S82-S89. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Oncology - Gastric Cancer

Reports Outline Gastric Cancer Study Results from China Medical University and Hospital (Establishment of a gastric cancer subsline with high metastatic potential using a novel microfluidic system)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gastric Cancer is the subject of a report. According to news reporting originating in Shenyang, People's Republic of China, by NewsRx journalists, research stated, "Metastasis is an important hallmark of malignant tumors. In this study, we developed a microfluidic system to screen highly metastatic sublines via differential resolution of cell invasiveness."

The news reporters obtained a quote from the research from China Medical University and Hospital, "The system was composed of a PDMS-glass device connected with a syringe pump and a Petri dish. To facilitate the selection process, a long-term cell invasion driving force based on a chemotactic factor gradient was created using the Petri dish-based liquid supply pattern, and the invasive cells were collected for round-by-round selection via an open region in the chip. Using the system, we established an SGC-7901/B2 subsline from the human gastric cancer SGC-7901 cell line by only two rounds of selection. In vitro assays showed that the SGC-7901/B2 cells were superior to the parental cells in proliferation and invasiveness. Furthermore, an in vivo tumorigenicity assay demonstrated that compared with the parental cells, the subsline had stronger spontaneous metastatic and proliferative capability, which led to a shorter survival duration. Additionally, the protein expression differences including E-cadherin and Smad3 between the subsline and parental cells were revealed."

According to the news reporters, the research concluded: "This microfluidic system is a highly effective tool for selecting highly metastatic subslines, and SGC-7901/B2 cells could serve as a potential model for tumor metastasis research."

For more information on this research see: Establishment of a gastric cancer subsline with high metastatic potential using a novel microfluidic system. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hormones - Gastrointestinal Hormones. According to news reporting originating from Dalian, People's Republic of China, by NewsRx correspondents, research stated, "A class of novel quinazoline derivatives bearing various C-4 aniline moieties was synthesized and biologically evaluated as potent epidermal growth factor receptor (EGFR) inhibitors for intervention of non-small-cell lung cancer (NSCLC). Most of these inhibitors are comparable to gefitinib in inhibiting these cancer cell lines, and several of them even displayed superior inhibitory activity."

Funders for this research include National Natural Science Foundation of China, Natural Science Foundation of Liaoning Province.

Our news editors obtained a quote from the research from Dalian Medical University, "In particular, analogue 5b with an IC[50] of 0.10 mm against the EGFR wild-type A431 cells and 5c with an IC[50] of 0.001 mm against the gefitinib-sensitive HCC827 cells (EGFR del E746-A750) was identified as highly active EGFR inhibitors. It was also significant that the discovered analogue 2f, not only has high potency against the gefitinib-sensitive cells (IC[50]=0.031 mm), but also possesses remarkably improved activity against the gefitinib-resistant cells."

According to the news editors, the research concluded: "In addition, the enzymatic assays and the Western blot analysis for evaluating the effects of the typical inhibitors indicated that these molecules strongly interfere with the EGFR target."

The news editors report that additional information may be obtained by contacting C. Wang, College of Pharmacy, Dalian Medical University, Dalian, 116044, People's Republic of China. Additional authors for this research include Y. Sun, X. Zhu, B. Wu, Q. Wang, Y. Zhen, X. Shu, K. Liu, Y. Zhou and X. Ma.

Reports Outline Gastrointestinal Hormones Study Findings from University of Miami [Fluorescent Kinase Probes Enabling Identification and Dynamic Imaging of HER2(+) Cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hormones - Gastrointestinal Hormones. According to news reporting originating in Miami, Florida, by NewsRx journalists, research stated, "The human epidermal growth factor receptor, EGFR/ERBB/HER, family of receptor tyrosine kinases is central to many signaling pathways and a validated chemotherapy target in multiple cancers. While EGFR/ERBB-targeted therapies, including monoclonal antibodies, e.g., trastuzumab, and small molecule kinase inhibitors, such as lapatinib, have been developed, rapid identification and classification of cancer cells is key to identifying the best treatment regime."

Funders for this research include U.S. Department of Health and Human Services, American Cancer Society.

The news reporters obtained a quote from the research from the University of Miami, "We report ERBB2 (also HER2) targeting kinase probes that exhibit a 'turn-on' emission response upon binding. These live cell compatible probes differentiate ERBB2(+) cells from low-level, ERBB2(-) cells by targeting the intracellular ATP-binding pocket of ERBB2 with therapeutic inhibitor-like specificity. Beyond kinase expression levels, probe signal is linked to the phosphotyrosine-correlated activation state of the ERBB2 population."

According to the news reporters, the research concluded: "Additionally, the rapid signaling capability of the probes can report changes in activation state in live cells providing a unique type of complementary information to immunohistochemical assays of receptor kinase populations."

Our news correspondents report that additional information may be obtained by contacting R. Landgraf, University of Miami, Dept. of Biochem & Mol Biol, Miami, FL 33101, United States. Additional authors for this research include W.J. Liu, A.S. Brown, R. Landgraf and J.N. Wilson.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.analchem.6b03836. This DOI is a link to an online electronic document that is either free or for purchase.

Reports Outline Gene Therapy Study Findings from State University of New Jersey (Practical Issues with the Use of Stem Cells for Cancer Gene Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biotechnology - Gene Therapy. According to news reporting originating in Piscataway, New Jersey, by NewsRx journalists, research stated, "Stem cell-based drug delivery for cancer therapy has steadily gained momentum in the past decade as several studies have reported stem cells' inherent tropism towards tumors. Since this science is still in its early stages and there are many factors that could significantly impact tumor tropism of stem cells, some contradictory results have been observed."

The news reporters obtained a quote from the research from the State University of New Jersey, "This review starts by examining a number of proof-of-concept studies that demonstrate the potential application of stem cells in cancer therapy. Studies that illustrate stem cells' tumor tropism and discuss the technical difficulties that could impact the therapeutic outcome are also highlighted. The discussion also emphasizes stem cell imaging/tracking, as it plays a crucial role in performing reliable dose-response studies and evaluating the therapeutic outcome of treatment protocols. In each section, the pros and cons associated with each method are highlighted, limitations are underlined, and potential solutions are discussed."

According to the news reporters, the research concluded: "The overall intention is to familiarize the reader with important practical issues related to stem cell cancer tropism and in vivo tracking, underline the shortcomings, and emphasize critical factors that need to be considered for effective translation of this science into the clinic."

For more information on this research see: Practical Issues with the Use of Stem Cells for Cancer Gene Therapy. Stem Cell Reviews, 2015;11(5):688-98. Stem Cell Reviews can be contacted at: Springer, 233 Spring Street, New York, NY 10013, USA. (Springer - www.springer.com; Stem Cell Reviews - www.springerlink.com/content/1550-8943/)

Our news correspondents report that additional information may be obtained by contacting F.S. Nouri, Dept. of Pharmaceutics, Rutgers, The State University of New Jersey, William Levine Hall, Room 222, 160 Frelinghuysen Road, Piscataway, NJ, 08854, United States. Life Science Research - Genetics

Reports Outline Genetics Study Findings from University of California School of Medicine (TGFb and BMP Dependent Cell Fate Changes Due to Loss of Filamin B Produces Disc Degeneration and Progressive Vertebrae Fusions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Genetics have been published. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "Spondylocarpotarsal synostosis (SCT) is an autosomal recessive disorder characterized by progressive vertebrae fusions and caused by loss of function mutations in Filamin B (FLNB). FLNB acts as a signaling scaffold by linking the actin cytoskeleton to signal transduction systems, yet the disease mechanisms for SCT remain unclear."

Our news journalists obtained a quote from the research from the University of California School of Medicine, "Employing a Filb knockout mouse, we found morphologic and molecular evidence that the intervertebral discs (IVDs) of Flnb/-mice undergo rapid and progressive degeneration during postnatal development as a result of abnormal cell fate changes in the IVD, particularly the annulus fibrosus (AF). In Flnb/-mice, the AF cells lose their typical fibroblast-like characteristics and acquire the molecular and phenotypic signature of hypertrophic chondrocytes. This change is characterized by hallmarks of endochondral-like ossification including alterations in collagen matrix, expression of Collagen X, increased apoptosis, and inappropriate ossification of the disc tissue. We show that conversion of the AF cells into chondrocytes is coincident with upregulated TGFb signaling via Smad2/3 and BMP induced p38 signaling as well as sustained activation of canonical and noncanonical target genes p21 and Ctgf. These findings indicate that FLNB is involved in attenuation of TGFb/BMP signaling and influences AF cell fate."

According to the news editors, the research concluded: "Furthermore, we demonstrate that the IVD disruptions in Flnb/-mice resemble aging degenerative discs and reveal new insights into the molecular causes of vertebrae fusions and disc degeneration."

For more information on this research see: TGFb and BMP Dependent Cell Fate Changes Due to Loss of Filamin B Produces Disc Degeneration and Progressive Vertebrae Fusions. Plos Genetics, 2016;12(3):e1005936. (Public Library of Science - www.plosgenetics.org; Plos Genetics - www.plosgenetics.org)

Our news journalists report that additional information may be obtained by contacting J. Reports Outline Genetics Study Findings from University of Montreal
(Loss of Bmi1 causes anomalies in retinal development and
degeneration of cone photoreceptors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Genetics. According to news reporting originating from Montreal, Canada, by NewsRx correspondents, research stated, "Retinal development occurs through the sequential but overlapping generation of six types of neuronal cells and one glial cell type. Of these, rod and cone photoreceptors represent the functional unit of light detection and phototransduction and are frequently affected in retinal degenerative diseases."

Our news editors obtained a quote from the research from the University of Montreal, "During mouse development, the Polycomb group protein Bmi1 is expressed in immature retinal progenitors and differentiated retinal neurons, including cones. We show here that Bmi1 is required to prevent postnatal degeneration of cone photoreceptors and bipolar neurons and that inactivation of Chk2 or p53 could improve but not overcome cone degeneration in Bmi1(-/-) mice. The retinal phenotype of Bmi1(-/-) mice was also characterized by loss of heterochromatin, activation of tandem repeats, oxidative stress and Rip3-associated necroptosis. In the human retina, BMI1 was preferentially expressed in cones at heterochromatic foci. BMI1 inactivation in human embryonic stem cells was compatible with retinal induction but impaired cone terminal differentiation."

According to the news editors, the research concluded: "Despite this developmental arrest, BMI1-deficient cones recapitulated several anomalies observed in Bmi1(-/-) photoreceptors, such as loss of heterochromatin, activation of tandem repeats and induction of p53, revealing partly conserved biological functions between mouse and man."

The news editors report that additional information may be obtained by contacting G. Bernier, University of Montreal, Dept. of Ophthalmol, Montreal, PQ H3T 1J4, Canada. Additional authors for this research include V. Plamondon, M. Abdouh, W. Chatoo, A. Flamier, R. Hanna, S.F. Zhou, N. Motoyama, M. Hebert, J. Lavoie and G. Bernier.

Reports Outline Genetics Study Results from PEBC (Epigenetic inactivation of the p53-induced long noncoding RNA TP53 target 1 in human cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Genetics have been presented. According to news reporting originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Long noncoding RNAs (lncRNAs) are important regulators of cellular homeostasis. However, their contribution to the cancer phenotype still needs to be established."

Financial support for this research came from EC | European Research Council (ERC).

Our news editors obtained a quote from the research from PEBC, "Herein, we have identified a p53-induced lncRNA, TP53TG1, that undergoes cancer-specific promoter hypermethylation-associated silencing. In vitro and in vivo assays identify a tumor-suppressor activity for TP53TG1 and a role in the p53 response to DNA damage. Importantly, we show that TP53TG1 binds to the multifaceted DNA/RNA binding protein YBX1 to prevent its nuclear localization and thus the YBX1-mediated activation of oncogenes. TP53TG1 epigenetic inactivation in cancer cells releases the transcriptional repression of YBX1-targeted growth-promoting genes and creates a chemoresistant tumor. TP53TG1 hypermethylation in primary tumors is shown to be associated with poor outcome."

According to the news editors, the research concluded: "The epigenetic loss of TP53TG1 therefore represents an altered event in an lncRNA that is linked to classical tumoral pathways, such as p53 signaling, but is also connected to regulatory networks of the cancer cell."

For more information on this research see: Epigenetic inactivation of the p53-induced long noncoding RNA TP53 target 1 in human cancer. Proceedings of the National Academy of Sciences of the United States of America, 2016;113(47):E7535-E7544.

Reports Outline Genetics and Development Study Findings from University of Manchester [Transcriptional regulation of the proto-oncogene Zfp521 by SPI1 (PU.1) and HOXC13]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Genetics and Development. According to news reporting out of Manchester, United Kingdom, by NewsRx editors, research stated, "The mouse zinc-finger gene Zfp521 (also known as ecotropic viral insertion site 3; Evi3; and ZNF521 in humans) has been identified as a B-cell proto-oncogene, causing leukemia in mice following retroviral insertions in its promoter region that drive Zfp521 over-expression. Furthermore, ZNF521 is expressed in human hematopoietic cells, and translocations between ZNF521 and PAX5 are associated with pediatric acute lymphoblastic leukemia."

Our news journalists obtained a quote from the research from the University of Manchester, "However, the regulatory factors that control Zfp521 expression directly have not been characterized. Here we demonstrate that the transcription factors SPI1 (PU.1) and HOXC13 synergistically regulate Zfp521 expression, and identify the regions of the Zfp521 promoter required for this transcriptional activity. We also show that SPI1 and HOXC13 activate Zfp521 in a dose-dependent manner. Our data support a role for this regulatory mechanism in vivo, as transgenic mice over-expressing Hoxc13 in the fetal liver show a strong correlation between Hoxc13 expression levels and Zfp521 expression. Overall these experiments provide insights into the regulation of Zfp521 expression in a nononcogenic context."

According to the news editors, the research concluded: "The identification of transcription factors capable of activating Zfp521 provides a foundation for further investigation of the regulatory mechanisms involved in ZFP521-driven cell differentiation processes and diseases linked to Zfp521 mis-expression."

Our news journalists report that additional information may be obtained by contacting K.E. Hentges, University of Manchester, Fac Life Sci, Manchester M13 9PT, Lancs, United Kingdom. Additional authors for this research include S. Al-Dallal, L. Al-Haj, S. Panjwani, A.S. McCartney, S.M. Edwards, P. Manjunath, C. Walker, A. Awgulewitsch and K.E. Hentges.

Oncology - Glioblastomas

Reports Outline Glioblastomas Study Results from University of Kebangsaan (Silencing of PROS1 induces apoptosis and inhibits migration and invasion of glioblastoma multiforme cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Glioblastomas is the subject of a report. According to news originating from Kuala Lumpur, Malaysia, by NewsRx correspondents, research stated, "Glioblastoma multiforme (GBM) is an aggressive brain tumor and most patients have poor prognosis. Despite many advances in research, there has been no significant improvement in the patient survival rate."

Our news journalists obtained a quote from the research from the University of Kebangsaan, "New molecular therapies are being studied and RNA interference (RNAi) therapy is one of the promising approaches to improve prognosis and increase survival in patients with GBM. We performed a meta-analysis of five different microarray datasets and identified 460 significantly upregulated genes in GBM. Loss-of-function screening of these upregulated genes using LN18 cells was performed to identify the significant target genes for glioma. Further investigations were performed using siRNA in LN18 cells and various functional assays were carried out on the selected candidate gene to understand further its role in GBM. We identified PROSI as a candidate gene for GBM from the meta-analysis and RNAi screening. Knockdown of PROS1 in LN18 cells significantly induced apoptosis compared to siPROS1-untreated cells (p <0.05). Migration in cells treated with siPROS1 was reduced significantly (p <0.05) and this was confirmed with wound-healing assay. PROS1 knockdown showed substantial reduction in cell invasion up to 82% (p <0.01). In addition, inhibition of PROS1 leads to decrease in cellular proliferation by 18%. Knockdown of PROS1 in LN18 cells caused activation of both of the extrinsic and intrinsic apoptotic pathways. It caused major upregulation of FasL which is important for death receptor signaling activation and also downregulation of GAS6 and other members of TAM family of receptors. PROS1 may play an important role in the development of GBM through cellular proliferation, migration and invasion as well as apoptosis."

According to the news editors, the research concluded: "Targeting PROS1 in GBM could be a novel therapeutic strategy in GBM treatment."

For more information on this research see: Silencing of PROS1 induces apoptosis and inhibits migration and invasion of glioblastoma multiforme cells. *International Journal of Oncology*, 2016;49(6):2359-2366. *International Journal of Oncology* can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

Oncology - Gliomas

Reports Outline Gliomas Findings from First Affiliated Hospital (Tumor-suppressive function of long noncoding RNA MALAT1 in glioma cells by downregulation of MMP2 and inactivation of ERK/MAPK signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gliomas have been published. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Metastasis-associated lung adenocarcinoma transcript 1 (MALAT1) is a type of long noncoding RNA. It is associated with metastasis and is a favorable prognostic factor for lung cancer."

Our news editors obtained a quote from the research from First Affiliated Hospital, "Recent studies have shown that MALAT1 plays an important role in other malignancies. But, little is known about the role of MALAT1 in glioma. In this study, quantitative reverse transcription PCR (qRT-PCR) was used to demonstrate that the expression of MALAT1 was lower than that in normal brain tissues. Stable RNA interference-mediated knockdown of MALAT1 in human glioma cell lines (U87 and U251) significantly promoted the invasion and proliferation of the glioma cells by in vitro assays. Conversely, overexpression of MALAT1 caused significant reduction in cell proliferation and invasion in vitro, and tumorigenicity in both subcutaneous and intracranial human glioma xenograft models. Furthermore, MALAT1-mediated tumor suppression in glioma cells may be via reduction of extracellular signal-regulated kinase/mitogen-activated protein kinase (ERK/MAPK) signaling activity and expression of matrix metalloproteinase 2 (MMP2)."

According to the news editors, the research concluded: "Overall data demonstrated the tumor-suppressive role of MALAT1 in glioma by attenuating ERK/MAPK-mediated growth and MMP2-mediated invasiveness."

For more information on this research see: Tumor-suppressive function of long noncoding RNA MALAT1 in glioma cells by downregulation of MMP2 and inactivation of ERK/MAPK signaling. Cell Death & Disease, 2016;7():e2123. (Nature Publishing Group - www.nature.com/cddis/)

Oncology - Gliomas

Reports Outline Gliomas Study Results from Medical University of South Carolina (Delivery of a drug cache to glioma cells overexpressing platelet-derived growth factor receptor using lipid nanocarriers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gliomas. According to news reporting originating from Charleston, South Carolina, by NewsRx correspondents, research stated, "Glioblastoma multiforme is a devastating disease with no curative options due to the difficulty in achieving sufficient quantities of effective chemotherapies into the tumor past the blood-brain barrier. Micelles loaded with temozolomide (TMZ) were designed to increase the delivery of this drug into the brain. pH-responsive micelles composed of distearoyl phosphoethanolamine-PEG-2000-amine and N-palmitoyl homocysteine were surface-functionalized with PDGF peptide and Dylight 680 fluorophore."

Our news editors obtained a quote from the research from the Medical University of South Carolina, "PDGF-micelles containing TMZ have specific uptake and increased killing in glial cells compared with untargeted micelles. In vivo studies demonstrated selective accumulation of PDGF-micelles containing TMZ in orthotopic gliomas implanted in mice."

According to the news editors, the research concluded: "Targeted micelle-based drug carrier systems hold potential for delivery of a wide variety of hydrophobic drugs thereby reducing its systemic toxicity."

The news editors report that additional information may be obtained by contacting K. Miller, Dept. of Radiology & Radiological Sciences, Medical University of South Carolina, 68 President Street, MSC 120, BEB 213, Charleston, SC 29425, United States. Reports Outline Gliomas Study Results from University of Jinan (Tailoring Particle Size of Mesoporous Silica Nanosystem To Antagonize Glioblastoma and Overcome Blood-Brain Barrier)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Gliomas are presented in a new report. According to news originating from Guangzhou, People's Republic of China, by NewsRx correspondents, research stated, "The blood-brain barrier (BBB) is the main bottleneck to prevent some macromolecular substance entering the cerebral circulation, resulting the failure of chemotherapy in the treatment of glioma. Cancer nanotechnology displays potent applications in glioma therapy owing to their penetration across BBB and accumulation into the tumor core."

Funders for this research include National Natural Science Foundation of China, Foundation for High-level Talents in Higher Education of Guangdong, Guangdong Province, Guangdong Frontier and Key Technological Innovation Special Funds, Science Foundation for Distinguished Young Scholars of Guangdong Province.

Our news journalists obtained a quote from the research from the University of Jinan, "In this study, we have tailored the particle size of mesoporous silica nanoparticles (MSNs) through controlling the hydrolysis rate and polycondensation degree of reactants, and optimized the nanosystem that could effectively penetrate BBB and target the tumor tissue to achieve enhanced antiglioma efficacy. The nanoparticle was conjugated with cRGD peptide to enhance its cancer targeting effect, and then used to load antineoplastic doxorubicin. Therefore, the functionalized nanosystem (DOX@MSNs) selectively recognizes and binds to the U87 cells with higher expression level of anb3 integrin, sequentially enhancing the cellular uptake and inhibition to glioma cells, especially the particle size at 40 nm. This particle could rapidly enter cancer cells and was difficult to excrete outside the cells, thus leading to high drug accumulation. Furthermore, DOX@MSNs exhibited much higher selectivity and anticancer activity than free DOX and induced the glioma cells apoptosis through triggering ROS overproduction. Interestingly, DOX@MSNs at about 40 nm exhibited stronger permeability across the BBB, and could disrupt the VM-capability of glioma cells by regulating the expression of E-cadherin, FAK, and MMP-2, thus achieving satisfactory antiglioblastoma efficacy and avoiding the unwanted toxic side effects to normal brain tissue."

According to the news editors, the research concluded: "Taken together, these results suggest that tailoring the particle size of MSNs nanosystem could be an effective strategy to antagonize glioblastoma and overcome BBB."

The news correspondents report that additional information may be obtained from J. Mo, Dept. of Chemistry, Jinan University, Guangzhou 510632, People's Republic of China. Additional authors for this research include L. He, B. Ma and T. Chen.

Reports Outline HIV/AIDS Findings from Loyola University (Dynamic conformational changes in the rhesus TRIM5 alpha dimer dictate the potency of HIV-1 restriction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news reporting originating in Chicago, Illinois, by NewsRx journalists, research stated, "The TRIM5 alpha protein from rhesus macaques (rhTRIM5 alpha) mediates a potent inhibition of HIV-1 infection via a mechanism that involves the abortive disassembly of the viral core. We have demonstrated that alpha-helical elements within the Linker 2 (L2) region, which lies between the SPRY domain and the Coiled-Coil domain, influence the potency of restriction."

The news reporters obtained a quote from the research from Loyola University, "Here, we utilize single-molecule FRET analysis to reveal that the L2 region of the TRIM5 alpha dimer undergoes dynamic conformational changes, which results in the displacement of L2 regions by 25 angstroms relative to each other. Analysis of restriction enhancing or abrogating mutations in the L2 region reveal that restriction defective mutants are unable to undergo dynamic conformational changes and do not assume compact, alpha-helical conformations in the L2 region."

According to the news reporters, the research concluded: "These data suggest a model in which conformational changes in the L2 region mediate displacement of CA bound SPRY domains to induce the destabilization of assembled capsid during restriction."

For more information on this research see: Dynamic conformational changes in the rhesus TRIM5 alpha dimer dictate the potency of HIV-1 restriction. Virology, 2017;500():161-168. Virology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Virology - www.journals.elsevier.com/virology/)

Our news correspondents report that additional information may be obtained by contacting E.M. Campbell, Loyola University, Stritch Sch Med, Dept. of Microbiol & Immunol, Chicago, IL 60611, United States. Additional authors for this research include S. Mukherjee, N. Small, R.F. Pauszek, M. Bradley, J. Sastri, S.L. Robia, D. Millar and E.M. Campbell.

Reports Outline HIV/AIDS Study Findings from University of Antioquia
(Precursor Forms of Vitamin D Reduce HIV-1 Infection In Vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immune System Diseases and Conditions - HIV/AIDS are presented in a new report. According to news reporting from Medellin, Colombia, by NewsRx journalists, research stated, "Although the anti-HIV-1 effects of vitamin D (VitD) have been reported, mechanisms behind such protection remain largely unexplored. The effects of two precursor forms (cholecalciferol/calciole at 0.01, 1 and 100 nM and calcidiol at 100 and 250 nM) on HIV-1 infection, immune activation, and gene expression were analyzed in vitro in cells of Colombian and Italian healthy donors."

The news correspondents obtained a quote from the research from the University of Antioquia, "We quantified levels of released p24 by enzyme-linked immunosorbent assay, of intracellular p24 and cell-surface expression of CD38 and HLA-DR by flow cytometry, and mRNA expression of antiviral and immunoregulatory genes by real-time reverse transcription-polymerase chain reaction. Cholecalciferol decreased the frequency of HIV-1-infected p24(+) CD4(+) T cells and levels of p24 in supernatants in a dose-dependent manner. Moreover, the CD4(+)CD38(+)HLA-DR+ and CD4(+)/CD38(-)/HLA-DR+ subpopulations were more susceptible to infection but displayed the greatest cholecalciferol-induced decreases in infection rate by an X4-tropic strain. Likewise, cholecalciferol at its highest concentration decreased the frequency of CD38(-)/HLA-DR+ but not of CD38(+)HLA-DR+ T-cell subsets. Analyzing the effects of calcidiol, the main VitD source for immune cells and an R5-tropic strain as the most frequently transmitted virus, a reduction in HIV-1 productive infection was also observed. In addition, an increase in mRNA expression of APOBEC3G and PI3 and a reduction of TRIM22 and CCR5 expression, this latter positively correlated with p24 levels, was noted."

According to the news reporters, the research concluded: "VitD reduces HIV-1 infection in T cells possibly by inducing antiviral gene expression, reducing the viral co-receptor CCR5 and, at least at the highest cholecalciferol concentration, by promoting an HIV-1-restrictive CD38(+)HLA-DR2 immunophenotype."

For more information on this research see: Precursor Forms of Vitamin D Reduce HIV-1 Infection In Vitro. Jaids-Journal of Acquired Immune Deficiency Syndromes, 2016;73 (5):497-506. Jaids-Journal of Acquired Immune Deficiency Syndromes can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Our news journalists report that additional information may be obtained by contacting M.T. Rugeles, Univ Antioquia UdeA, Fac Med, Grp Inmunovirol, Medellin 050010, Colombia. Immune System Diseases and Conditions - HIV/AIDS

Reports Outline HIV/AIDS Study Findings from University of KwaZulu-Natal (Binding Free Energy Calculations of Nine FDA-approved Protease Inhibitors Against HIV-1 Subtype C I36T↑T Containing 100 Amino Acids Per Monomer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news originating from Durban, South Africa, by NewsRx correspondents, research stated, "In this work, we have investigated the binding affinities of nine FDA-approved protease inhibitor drugs against a new HIV-1 subtype C mutated protease, I36T↑T. Without an X-ray crystal structure, homology modelling was used to generate a three-dimensional model of the protease."

Financial supporters for this research include Neurosciences Research Foundation, Inyuvesi Yakwazulu-Natali, University of the Witwatersrand, Johannesburg.

Our news journalists obtained a quote from the research from the University of KwaZulu-Natal, "This and the inhibitor models were employed to generate the inhibitor/I36T↑T complexes, with the relative positions of the inhibitors being superimposed and aligned using the X-ray crystal structures of the inhibitors/HIV-1 subtype B complexes as a reference. Molecular dynamics simulations were carried out on the complexes to calculate the average binding free energies for each inhibitor using the molecular mechanics generalized Born surface area (MM-GBSA) method. When compared to the binding free energies of the HIV-1 subtype B and subtype C proteases (calculated previously by our group using the same method), it was clear that the I36T↑T proteases mutations and insertion had a significant negative effect on the binding energies of the non-pepditic inhibitors nelfinavir, darunavir and tipranavir. On the other hand, ritonavir, amprenavir and indinavir show improved calculated binding energies in comparison with the corresponding data for wild-type C-SA protease."

According to the news editors, the research concluded: "The computational model used in this study can be used to investigate new mutations of the HIV protease and help in establishing effective HIV drug regimes and may also aid in future protease drug design."

The news correspondents report that additional information may be obtained from H.A. Lockhat, Catalysis and Peptide Research Unit, School of Health Sciences, University of KwaZulu-Natal, Durban, 4001, South Africa. Additional authors for this research include J.R. Silva, C.N. Alves, T. Govender, J. Lameira, G.E. Maguire, Y. Sayed and H.G Kruger.

**Reports Outline HIV/AIDS Study Findings from University of Michigan**

(Transcriptional start site heterogeneity modulates the structure and function of the HIV-1 genome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - HIV/AIDS have been published. According to news originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "The promoter in HIV type 1 (HIV-1) proviral DNA contains three sequential guanosines at the U3-R boundary that have been proposed to function as sites for transcription initiation. Here we show that all three sites are used in cells infected with HIV-1 and that viral RNAs containing a single 5' capped guanosine ((Cap)1G) are specifically selected for packaging in virions, consistent with a recent report [Masuda et al. (2015) Sci Rep 5: 17680]."

Financial support for this research came from HHS | NIH | National Institute of General Medical Sciences (NIGMS).

Our news journalists obtained a quote from the research from the University of Michigan, "In addition, we now show that transcripts that begin with two or three capped guanosines ((Cap)2G or (Cap)3G) are enriched on polysomes, indicating that RNAs synthesized from different transcription start sites have different functions in viral replication. Because genomes are selected for packaging as dimers, we examined the in vitro monomer-dimer equilibrium properties of (Cap)1G, (Cap)2G, and (Cap)3G 5'-leader RNAs in the NL4-3 strain of HIV-1. Strikingly, under physiological-like ionic conditions in which the (Cap)1G 5'-leader RNA adopts a dimeric structure, the (Cap)2G and (Cap)3G 5'-leader RNAs exist predominantly as monomers. Mutagenesis studies designed to probe for base-pairing interactions suggest that the additional guanosines of the 2G and 3G RNAs remodel the base of the PolyA hairpin, resulting in enhanced sequestration of dimer-promoting residues and stabilization of the monomer."

According to the news editors, the research concluded: "Our studies suggest a mechanism through which the structure, function, and fate of the viral genome can be modulated by the transcriptionally controlled presence or absence of a single 5' guanosine."

The news correspondents report that additional information may be obtained from A. Telesnitsky, University of Michigan, Sch Med, Dept. of Microbiol & Immunol, Ann Arbor, MI 48109, United States. Additional authors for this research include S. Monti, P.J. Smaldino, V. Van, N.C. Bolden, J.D. Brown, E. Russo, C. Swanson, A. Shuey, A. Telesnitsky and M.F. Summers.

The direct object identifier (DOI) for that additional information is:

Heart Disorders and Diseases - Heart Attack

Reports Outline Heart Attack Findings from University of British Columbia (Sudden cardiac death: A reappraisal)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news originating from Vancouver, Canada, by NewsRx correspondents, research stated, "Sudden cardiac death (SCD) is still among the leading causes of death in women and men, accounting for over 50% of all fatal cardiovascular events in the United States. Two arrhythmia mechanisms of SCD can be distinguished as follows: shockable rhythms (ventricular fibrillation and pulseless ventricular tachycardia) and non-shockable rhythms including asystole or pulseless electrical activity."

Our news journalists obtained a quote from the research from the University of British Columbia, "The overall prognosis of cardiac arrest due to shockable rhythms is significantly better. While the majority of SCDs is attributed to coronary artery disease or other structural heart disease, no obvious cause can be identified in 5% of all events, and those events are labeled as sudden unexplained deaths (SUD). Those unexplained events are typically caused by rare hereditary electrical disorders or arrhythmogenic cardiomyopathies. A systematic approach to the diagnosis of cardiac arrest followed by tailored therapy based on etiology has emerged in the last 10-15 years, with significant changes of medical practice and risk management of cardiac arrest victims. The aim of this review is to summarize our contemporary understanding of SCD/SUD in adults and to discuss current concepts of management and secondary prevention in cardiac arrest victims."

According to the news editors, the research concluded: "A full discussion of the topic of primary prevention of SCD is beyond the scope of this article."

The news correspondents report that additional information may be obtained from A.D. Krahn, University of British Columbia, Heart Rhythm Serv, Vancouver, BC, Canada.
Additional authors for this research include Z.W.M. Laksrnan and A.D. Krahn.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.tcm.2016.05.006. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Heart Disease

Reports Outline Heart Disease Findings from Erasmus University (Genetic Research and Women's Heart Disease: a Primer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Disease. According to news reporting originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "Purpose of Review This review provides a brief synopsis of sexual dimorphism in atherosclerosis with an emphasis on genetic studies aimed to better understand the atherosclerotic process and clinical outcomes in women. Such studies are warranted because development of atherosclerosis, impact of several traditional risk factors, and burden of coronary heart disease (CHD) differ between women and men."

Our news editors obtained a quote from the research from Erasmus University, "While most candidate gene studies pool women and men and adjust for sex, some sex-specific studies provide evidence of association between candidate genes and prevalent and incident CHD in women. So far, most genome-wide association studies (GWAS) also failed to consider sex-specific associations. The few GWAS focused on women tended to have small sample sizes and insufficient power to reject the null hypothesis of no association even if associations exist. Few studies consider that sex can modify the effect of gene variants on CHD. Sufficiently large-scale genetic studies in women of different race/ethnic groups, taking into account possible gene-gene and gene-environment interactions as well as hormone-mediated epigenetic mechanisms, are needed. Using the same disease definition for women and men might not be appropriate. Accurate phenotyping and inclusion of relevant outcomes in women, together with targeting the entire spectrum of atherosclerosis, could help address the contribution of genes to sexual dimorphism in atherosclerosis. Discovered genetic loci should be taken forward for replication and functional studies to elucidate the plausible underlying biological mechanisms."

According to the news editors, the research concluded: "A better understanding of the etiology of atherosclerosis in women would facilitate future prevention efforts and interventions."

For more information on this research see: Genetic Research and Women's Heart Disease: a Primer. Current Atherosclerosis Reports, 2016;18(11):38-47. Heart Disorders and Diseases - Heart Failure

Reports Outline Heart Failure Study Results from University of Groningen (Worsening renal function and outcome in heart failure patients with reduced and preserved ejection fraction and the impact of angiotensin receptor blocker treatment: data ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Failure is the subject of a report. According to news reporting originating from Groningen, Netherlands, by NewsRx correspondents, research stated, "We investigated the association between worsening renal function (WRF) that occurs during renin-angiotensin-aldosterone system inhibition initiation and outcome in heart failure (HF) patients with preserved ejection fraction (HFPEF) and compared this with HF patients with reduced ejection fraction (HFREF). We examined changes in estimated glomerular filtration rate (GFR) and the relationship between WRF (defined as >= 26.5 mu mol/L and >= 25% increase in serum creatinine from baseline to 6 weeks) and outcome, according to randomized treatment, in patients with HFREF (EF < 45%; n = 1569) and HFPEF (EF = 45%; n = 836) in the CHARM programme."

Our news editors obtained a quote from the research from the University of Groningen, "The primary outcome was cardiovascular death or HF hospitalization. Estimated GFR decreased 9.0+/-21 vs. 4.0+/-21 mL/min/1.73m(2) with candesartan and placebo, respectively, and this was similar in HFREF and HFPEF. WRF developed more frequently with candesartan, 16% vs. 7%, P < 0.001, with similar findings in patients with HFREF and HFPEF. WRF was associated with a higher risk of the primary outcome: multivariable hazard ratio (HR) 1.26, 95% confidence interval 1.03-1.54, P = 0.022, in both treatment groups, and in both HFREF and HFPEF (P for interaction 0.98). In HFREF, WRF was mostly related to HF hospitalization, while in HFPEF, WRF seemed more associated with mortality. GFR decreased more and WRF was more common with candesartan compared with placebo, and this was similar in HFREF and HFPEF. WRF was associated with worse outcomes in HFREF and HFPEF."

According to the news editors, the research concluded: "Although no formal interaction was present, the association between candesartan treatment, WRF, and type of clinical outcome was slightly different between HFREF and HFPEF."

The news editors report that additional information may be obtained by contacting K. Damman, University of Groningen, Groningen University Medical Center, Dept. of Cardiol, NL-9700 RB Groningen, Netherlands. Additional authors for this research include S.D. Solomon, M.A. Pfeffer, K. Swedberg, S. Yusuf, J.B. Young, J.L. Rouleau, C.B. Granger and J.J.V. McMurray.

Transplant Medicine - Heart Transplants
Reports Outline Heart Transplants Study Findings from Baylor University College of Medicine (Durable Mechanical Circulatory Support versus Organ Transplantation: Past, Present, and Future)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Transplant Medicine - Heart Transplants are presented in a new report. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "For more than 30 years, heart transplantation has been a successful therapy for patients with terminal heart failure. Mechanical circulatory support (MCS) was developed as a therapy for end-stage heart failure at a time when cardiac transplantation was not yet a useful treatment modality."

Our news editors obtained a quote from the research from the Baylor University College of Medicine, "With the more successful outcomes of cardiac transplantation in the 1980s, MCS was applied as a bridge to transplantation. Because of donor scarcity and limited long-term survival, heart transplantation has had a trivial impact on the epidemiology of heart failure. Surgical implementation of MCS, both for short-and long-term treatment, affords physicians an opportunity for dramatic expansion of a meaningful therapy for these otherwise mortally ill patients."

According to the news editors, the research concluded: "This review explores the evolution of mechanical circulatory support and its potential for providing long-term therapy, which may address the limitations of cardiac transplantation."

The news editors report that additional information may be obtained by contacting J. Anand, Dept. of Surgery, Baylor College of Medicine and Center for Cardiac Support, Texas Heart Institute, Houston, TX 77030, United States. Additional authors for this research include S.K. Singh, D.G. Antoun, W.E. Cohn, O.H. Frazier and H.R Mallidi.

Reports Outline Helper-Inducer T-Lymphocytes Findings from Seoul National University (Targeting IL-17 in autoimmunity and inflammation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Helper-Inducer T-Lymphocytes have been presented. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The discovery of two distinct subsets of helper T cells, IFN-gamma-producing Th1 cells and IL-4-producing Th2 cells, about three decades ago enabled us to understand the immunopathology of cell-mediated and allergic inflammatory diseases in humans. The observation that T cell-mediated experimental autoimmune diseases can be induced in mice lacking Th1 and Th2 cell responses prompted many immunologists to hypothesize that there might be additional subsets in helper T cell population which mediate autoimmunity in the absence of Th1 and Th2 cells."

Financial support for this research came from National Research Foundation of Korea.

Our news editors obtained a quote from the research from Seoul National University, "Consequently, multiple independent research groups identified IL-17-expressing ROR gamma t (+)CD4(+) T cell population as a distinct subset of helper T cells which promotes autoimmune tissue inflammation. Subsequent studies have revealed that innate immune cells, including gamma delta T cells, NKT cells and innate lymphoid cells, also produce type 17 cytokines and contribute to tissue inflammation."

According to the news editors, the research concluded: "In this review, we discuss our current understanding on the biology of IL-17 and the therapeutic potential of targeting IL-17 for the treatment of immune disorders in humans."

For more information on this research see: Targeting IL-17 in autoimmunity and inflammation. Archives of Pharmacal Research, 2016;39(11):1537-1547. Archives of Pharmacal Research can be contacted at: Pharmaceutical Soc Korea, 1489-3 Suhcho-Dong, Suhcho-Ku, Seoul 137-071, South Korea. (Springer - www.springer.com; Archives of Pharmacal Research - www.springerlink.com/content/0253-6269/)

Stem Cell Research - Hematopoietic Stem Cells

Reports Outline Hematopoietic Stem Cells Findings from New York University (Hematopoietic Stem Cells Are the Major Source of Multilineage Hematopoiesis in Adult Animals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Stem Cell Research - Hematopoietic Stem Cells have been presented. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Hematopoietic stem cells (HSCs) sustain long-term reconstitution of hematopoiesis in transplantation recipients, yet their role in the endogenous steady-state hematopoiesis remains unclear. In particular, recent studies suggested that HSCs provide a relatively minor contribution to immune cell development in adults."

The news correspondents obtained a quote from the research from New York University, "We directed transgene expression in a fraction of HSCs that maintained reconstituting activity during serial transplantations. Inducible genetic labeling showed that transgene-expressing HSCs gave rise to other phenotypic HSCs, confirming their top position in the differentiation hierarchy. The labeled HSCs rapidly contributed to committed progenitors of all lineages and to mature myeloid cells and lymphocytes, but not to B-1a cells or tissue macrophages. Importantly, labeled HSCs gave rise to more than two-thirds of all myeloid cells and platelets in adult mice, and this contribution could be accelerated by an induced interferon response."

According to the news reporters, the research concluded: "Thus, classically defined HSCs maintain immune cell development in the steady state and during systemic cytokine responses."

For more information on this research see: Hematopoietic Stem Cells Are the Major Source of Multilineage Hematopoiesis in Adult Animals. Immunity, 2016;45(3):597-609. Immunity can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Immunity - www.journals.elsevier.com/immunity/)

Reports Outline Heparin Therapy Study Findings from Texas Health Presbyterian Hospital Dallas (Managing transitions from oral factor Xa inhibitors to unfractionated heparin infusions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Heparin Therapy have been presented. According to news reporting from Dallas, Texas, by NewsRx journalists, research stated, "Published evidence regarding the effects of oral factor Xa inhibitors on anticoagulation monitoring tests is reviewed with a focus on monitoring concerns that can arise during transitions to i.v. heparin therapy. Assays that measure inhibition of factor Xa activity (i.e., anti-Xa assays) are widely used in U.S. institutions to monitor i.v. heparin therapy and, in some cases, for monitoring other types of anticoagulation therapy."

The news correspondents obtained a quote from the research from Texas Health Presbyterian Hospital Dallas, "Clinicians have raised concerns that the use of anti-Xa assays to monitor heparin levels in hospitalized patients who must be transitioned from oral factor Xa inhibitor therapy to i.v. unfractionated heparin (UFH) infusions could yield unquantifiable or inaccurate results, leading to unnecessary UFH dose reductions and potential treatment failures; the manufacturer labeling of oral factor Xa inhibitors (apixaban, edoxaban, and rivaroxaban) does not provide specific guidance on this issue. Results of a literature review indicated that residual effects of oral factor Xa inhibitor use can result in substantial interference with the currently available chromogenic anti-Xa assays but negligible to moderate effects on global coagulation assays, which measure activated partial thromboplastin time (aPTT) or prothrombin time. Therefore, during the transition from an oral factor Xa inhibitor to i.v. UFH therapy, it may be prudent to consider an aPTT assay for anticoagulation monitoring."

According to the news reporters, the research concluded: "The use of oral factor Xa inhibitors appears to affect the accuracy of anti-Xa assay results, with results of global coagulation assays affected to a lesser degree."

For more information on this research see: Managing transitions from oral factor Xa inhibitors to unfractionated heparin infusions. American Journal of Health-System Pharmacy, 2016;73(24):2037-2041. American Journal of Health-System Pharmacy can be contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD 20814, USA.

Our news reporters report that additional information may be obtained by contacting A.C. Faust, Texas Hlth Presbyterian Hosp Dallas, Dept. of Pharm, Dallas, TX 75231, United States. Additional authors for this research include D. Kanyer and A.K. Wittkowsky.

Reports Outline Human Immunology Study Findings from University of Strasbourg (Innate immune receptors in solid organ transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immunology - Human Immunology. According to news reporting originating in Strasbourg, France, by NewsRx editors, the research stated, "The discovery of Pattern Recognition Receptors (PRRs) followed by that of their role in the early detection of pathogens and the ignition of the innate immune response has been a formidable progress for immunological research in the past 15 years. This has massively fueled investigations aiming at developing better strategies to fight off infectious diseases and/or to prevent their occurrence."

Funders for this research include French government, French National Research Agency.

The news reporters obtained a quote from the research from the University of Strasbourg, "However, infected individuals are for most part outliers in a given population and therefore, the primary function of these receptors should be considered in pathogen-free conditions. Our current understanding indicates that an important physiological function of PRRs resides in their capacity to maintain epithelial homeostasis in response to colonizing commensals. In addition, endogenous host-derived ligands, expressed under stressed, albeit sterile, conditions (called DAMPs for Danger-Associated Molecular Patterns) are also able to trigger PRR signaling. Solid organ transplantation represents a unique situation where both contributions of PRRs signaling can be studied. Indeed, dysbiosis (either caused by antibiotherapy preceding organ transplantation or simply due to the microbiota differences between the transplanted organ and the recipient host) is a characteristic feature of this situation, which is also marked by a massive synthesis and liberation of DAMPs as a result of hypoxia/reperfusion injury."

According to the news reporters, the research concluded: "Therefore, in the transplanted organ, at least two compartments (epithelial and that composed of immune cells) participate in graft rejection/acceptance depending on the activation status of expressed PRRs."

For more information on this research see: Innate immune receptors in solid organ transplantation. Human Immunology, 2016;77(11):1071-1075. Human Immunology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Hyperlipidemia

Reports Outline Hyperlipidemia Findings from Seoul National University
(Parks and Green Areas Are Associated with Decreased Risk for Hyperlipidemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hyperlipidemia are presented in a new report. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "This study aimed to investigate the association between parks and green areas and hyperlipidemia in adults with groups stratified by moderate physical activity as a behavioral modification using the 2009 Korean Community Health Survey data and 212,584 participants enrolled in this study. The geographical codes of study participants were all matched on the basis of the amount of parks and green areas in each administrative district."

Our news journalists obtained a quote from the research from Seoul National University, "Compared with participants living in the highest quartile of parks and green areas (Quartile 4), those living in the lowest quartile of green and park area (Quartile 1) were at an increased risk of physician-diagnosed hyperlipidemia and hyperlipidemia currently under treatment. Participants in the lowest quartile of parks and green areas were likely not to engage in any moderate physical activity. After classifying hyperlipidemia risk depending on the presence of moderate physical activity, those participating in moderate physical activity were less likely to have hyperlipidemia in all quartiles of parks and green areas than those not engaging in moderate physical activity. We found that parks and green areas were associated with decreased hyperlipidemia risk."

According to the news editors, the research concluded: "Physical activity, which may benefit from the presence of parks and green areas, may reduce hyperlipidemia risk."

Our news journalists report that additional information may be obtained by contacting H.J. Kim, Seoul National University, Sch Public Hlth, Seoul 08826, South Korea. Additional authors for this research include J.Y. Min, H.J. Kim and K.B. Min.

Keywords for this news article include: Seoul, South Korea, Asia, Risk and Prevention. Hyperlipidemias, Seoul National University.

Cardiovascular Diseases and Conditions

Reports Outline Hypertension Findings from University of California
(The Use of Qualitative Methods in Developing Implementation Strategies in Prevention Research for Stroke Survivors in Nigeria)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Hypertension. According to news originating from San Diego, California, by NewsRx correspondents, research stated, "Implementing complex clinical interventions is a key challenge in many global regions. Local communities play a necessary role in enhancing feasibility and strengthening adaptive issues in the design and implementation of stroke interventions in developing countries."

Financial support for this research came from National Institute of Neurological Disorders and Stroke.

Our news journalists obtained a quote from the research from the University of California, "Drawing on the knowledge of physicians, patients, and caregivers, the authors employed qualitative methods as a phase 1 strategy to explore the challenges of stroke management and improve the adaptability and efficient delivery of a multimodal preventive intervention for secondary stroke disease in Nigeria. A total of 22 individual interviews were conducted with healthcare professionals, as well as 12 focus groups with patients and caregivers."

According to the news editors, the research concluded: "Findings revealed four operational domains to improve strategies for phase 2 implementation and intervention: (1) barriers influencing optimal adherence in stroke survivors, (2) patient health beliefs and perceptions of patient health beliefs by others, (3) adoption of the patient report card, and (4) medical action plan and family management strategies."

The news correspondents report that additional information may be obtained from S. Hurst, University of California, Dept. of Family Med & Public Hlth, San Diego, CA 92103, United States. Additional authors for this research include O. Arulogun, M.O. Owolabi, R.O. Akinyemi, E. Uvere, S. Warth, G. Fakunle and B. Oviagele.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jch.12817. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions -

Reports Outline Hypertension Study Results from University of Notre Dame (A cross-sectional study of preoperative medication adherence and early postoperative recovery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions -
Hypertension have been published. According to news reporting originating from Sydney, Australia, by NewsRx correspondents, research stated, "To quantify the impact of preoperative medication adherence on recovery length of stays and complication rates. Cross-sectional analytical study."

Our news editors obtained a quote from the research from the University of Notre Dame, "Postanesthetic care unit (PACU) of a single-center tertiary hospital. Surgical patients admitted for surgery at our institution over a 4-month period. A data collection tool was used to collect demographic data, length of stay in recovery, prespecified conditions likely to impact on PACU recovery (chronic pain, insulin-dependent diabetes, epilepsy, hypertension, on a methadone program, and Parkinson disease), medication compliance, and complications in PACU. Differences among categorical variables were assessed for significance using the chi(2) test; continuous parametric data were compared using a time to survival analysis via Kaplan-Meier estimates and Cox proportional hazard regressions to account for possible confounders. Preoperative medication compliance for the prespecified conditions was 65.1%. Patients with a preoperative condition spent more time in the PACU compared to patients without a preoperative condition. Time in PACU was not significantly longer for patients who took their medications compared to those who failed to take their medications. Patients with multiple prespecified conditions were more likely to incur a postoperative complication compared to patients without a prespecified condition. Patients with preoperative hypertension and insulin-dependent diabetes incurred higher complication rates in PACU for medication nonadherence compared to medication adherence. This study taken together with accruing evidence suggests that preoperative medication omission remains an ongoing issue that can influence complication rates in the PACU. Patients with preoperative conditions stay longer in PACU, and medication omission was associated with higher rates of certain postoperative complications in PACU. This identifies patients likely to require more interventions and greater recovery resources."

According to the news editors, the research concluded: "Further research into the impact of medication omission on recovery parameters after discharge from the PACU is warranted."

The news editors report that additional information may be obtained by contacting E. Ben-Menachem, Notre Dame Univ, Sydney, NSW, Australia. Additional authors for this research include E. Demetriou, J. Galvin and E. Ben-Menachem.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jclinane.2016.07.007. This DOI is a link to an online electronic document that is either free or for purchase.

Nutritional and Metabolic Diseases and Conditions ---

Reports Outline Hypoglycemia Study Findings from Veterans Affairs Medical Center (A case of extragastrointestinal stromal tumor complicated by severe hypoglycemia: a unique presentation of a rare tumor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Hypoglycemia. According to news reporting from Indianapolis, Indiana, by NewsRx journalists, research stated, "Non-Islet Cell Tumor Hypoglycemia (NICTH) is a rare paraneoplastic cause of hypoglycemia arising from excess tumor production of insulin-like growth factor. The objective of this report is to describe an unusual case of Extragastrointestinal Stromal Tumor (EGIST) associated NICTH."

The news correspondents obtained a quote from the research from Veterans Affairs Medical Center, "Case presentation: A 64 year-old African female was brought to the emergency room with a 1-month history of recurrent syncope, weight loss, and abdominal bloating. Serum blood glucose was discovered to 39 mg/dL, when insulin, proinsulin, and C-peptide were suppressed. Computed tomography scan revealed a diffuse extraintestinal metastatic disease process, and a biopsy confirmed the diagnosis of an Extragastrointestinal Stromal Tumor (EGIST). IGF-I and II levels were 27 ng/ml and 262 ng/ml respectively, and the ratio of IGF-II to IGF-I was calculated as 9.7:1, suggestive of IGF-II-mediated NICTH. Acutely, the patient's hypoglycemia resolved with dextrose and glucagon infusion. Long-term euglycemia was achieved with prednisone and imatinib therapy. NICTH should be considered when hypoglycemia occurs in the setting of low serum insulin levels."

According to the news reporters, the research concluded: "Whereas definitive treatment of EGIST involves surgical resection, immunotherapy with tyrosine kinase inhibitors and corticosteroids have been shown to alleviate hypoglycemia in cases where surgery is delayed or not feasible."

Our news journalists report that additional information may be obtained by contacting C. Evans-Molina, Roudebush VA Med Center, Indianapolis, IN 46202, United States. Additional authors for this research include S. Taleb and C. Evans-Molina.

Keywords for this news article include: Indianapolis, Indiana, United States, North and Central America, Nutritional and Metabolic Diseases and Conditions, Glucose Metabolism Disorders, Peptide Proteins, Peptide Hormones, Hypoglycemia, Proinsulin, Veterans Affairs Medical Center.

Reports Outline Immunotherapy Study Findings from Tel Aviv University (A Harmonization Study for the Use of 22C3 PD-L1 Immunohistochemical Staining on Ventana's Platform)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Immunotherapy is the subject of a report. According to news reporting from Tel Aviv, Israel, by NewsRx journalists, research stated, "Immunotherapy is a novel treatment for lung cancer. Pembrolizumab (Merck Sharp and Dohme, Kenilworth, NJ) is a monoclonal antibody against programmed cell death 1 that has been approved for use with NSCLC together with a companion diagnostic by Dako (Carpinteria, CA)."

The news correspondents obtained a quote from the research from Tel Aviv University, "Ventana's BenchMark XT (Ventana Medical Systems, Tucson, AZ) is a widely used immunohistochemical (IHC) platform. However, data on its reliability and reproducibility with the 22C3 antibody are scant. We performed a comprehensive calibration of 22C3 programmed cell death ligand 1 (PD-L1) staining on the BenchMark XT platform using Dako's prediluted 22C3 anti-PD-L1 primary antibody with two of Ventana's detection systems. Forty-one random cases of NSCLC were then independently evaluated by two pathologists. Each case was scored using Dako- or Ventana-stained slides. The scores obtained with the two 22C3 Ventana assays were compared with those obtained using the Dako 22C3 IHC platform. The Dako IHC platform stratified eight, seven, and 26 cases as being strongly positive, weakly positive, and negative for PD-L1, respectively, whereas 36 of 41 cases (87.8%) had the same results with Ventana's UltraView 22C3 protocol (Pearson's correlation score 0.91, p<0.0001). Moreover, 35 of 41 cases (85.3%) had the same results with Ventana's OptiView 22C3 protocol (Pearson's correlation score 0.89, p<0.0001). The results of this study demonstrate that the same PD-L1 IHC algorithm can be reliably applied to Ventana's BenchMark XT platform.

Furthermore, we were able to detect all of the strongly positive cases with high interobserver and intraobserver agreement by using the Ventana platform."

According to the news reporters, the research concluded: "These findings suggest that the Ventana platform can be used to stratify patients for pembrolizumab-based immunotherapy."

Our news journalists report that additional information may be obtained by contacting G.W. Vainer, Tel Aviv University, Sackler Sch Med, Tel Aviv, Israel. Additional authors for this research include M. London, J. Kania-Almog, A. Litvin, Y. Zohar, L. Fridel, J. Sandbank, I. Barshak and G.W. Vainer.

Influenza A Virus Subtype H1N1

Reports Outline Influenza A Virus Subtype H1N1 Study Findings from Manipal University [Genetic analysis of neuraminidase gene of influenza A(H1N1)pdm09 virus circulating in Southwest India from 2009 to 2012]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Influenza A Virus Subtype H1N1 is now available. According to news reporting from Karnataka, India, by NewsRx journalists, research stated, "Genetic analysis of neuraminidase gene sequences in 23 archived isolates of influenza A (H1N1)pdm09 virus, isolated during the 2009-2012 influenza seasons, was carried out to determine the genetic variability. Amino acid substitutions were observed at the rates of 0.3-0.7% per year."

The news correspondents obtained a quote from the research from Manipal University, "The catalytic site consisting of 8 functional and 11 framework residues were found conserved in 20 isolates and mutated in three (E228G, E278G, and N295T) isolates. To the best of our knowledge the three catalytic site mutants observed in our study have not been reported elsewhere to date. Similarly, mutations in the antigenic sites (K217E, K254E, V267A, and D451E except I263V) are discussed for the first time through this article. The effect of these mutations on drug and antibody binding were analyzed using biochemical and structural studies."

According to the news reporters, the research concluded: "Detailed studies on the neuraminidase gene are sparse and our study may serve as an appropriate platform to gain insights about the evolution of influenza virus, thereby facilitating drugs/vaccines design and development. J. Med. Virol. 89:202-212, 2017."

Our news journalists report that additional information may be obtained by contacting G. Arunkumar, Manipal Univ, ICMR Virol Netowrk Lab Grade 1, Manipal, Karnataka, India. Additional authors for this research include A.A.A. Salam, V.R. Zadeh and G. Arunkumar.

Keywords for this news article include: Karnataka, India, Asia, Enzymes and Coenzymes, Genetics, Influenza A Virus Subtype H1N1, Glycoside Hydrolases, Vertebrate Viruses, Infectious Disease, Orthomyxoviridae, Swine Influenza, Neuraminidase, RNA Viruses, Swine Flu, Manipal University.

Central Nervous System Diseases and Conditions - …
Reports Outline Intracranial Aneurysm Study Findings from Second Military Medical University [The safety and efficacy of low profile visualized intraluminal support (LVIS) stents in assisting coil embolization of intracranial saccular aneurysms: ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions - Intracranial Aneurysm have been presented. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The low profile visualized intraluminal support (LVIS) device is a new generation of self expanding braided stents recently introduced into China for stent assisted coiling of intracranial aneurysms. This study assessed the clinical safety and efficacy of the LVIS stent for embolization of intracranial saccular aneurysms."

Our news editors obtained a quote from the research from Second Military Medical University, "Patients with intracranial saccular aneurysms treated using the LVIS device in our center between April 2014 and December 2014 were reviewed. The primary outcomes were procedural safety, target aneurysm recurrence, and mid-term follow-up of clinical and angiographic outcomes. Results 97 patients with intracranial saccular aneurysms were treated using the LVIS stent, with 100% technical success rate. No mortality was observed. One patient had transient deficit (1/97, 1.0%). Immediate angiographic outcome evaluation showed complete occlusion in 28 (28.8%) and neck remnant in 39 (40.2%) of the 97 patients, respectively. Of the 76 (78.35%) patients who underwent angiographic follow-up at a mean of 8.1 months, complete occlusion was achieved in 64 (84.2%) patients. In the remaining patients, neck remnant in nine (11.8%) and residual sac in three (4%) patients were observed. None of the patients had any target aneurysm recurrence, and the mortality rate was 0."

According to the news editors, the research concluded: "The LVIS stent is safe and effective in the treatment of intracranial saccular aneurysms."

The news editors report that additional information may be obtained by contacting Q.H. Huang, Second Military Med Univ, Shanghai Hosp, Dept. of Neurosurg, Shanghai 200433, People's Republic of China. Additional authors for this research include Y.B. Fang, Y. Xu, B. Hong, W.Y. Zhao, J.M. Liu and Q.H. Huang.

Central Nervous System Diseases and Conditions -

Reports Outline Intracranial Aneurysm Study Results from University of Toronto (Computational fluid dynamics analysis of flow reduction induced by flow-diverting stents in intracranial aneurysms: a patient-unspecific hemodynamics change ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Intracranial Aneurysm are discussed in a new report. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "Flow-diverter stents (FDSs) have been used effectively to treat large neck and complex saccular aneurysms on the anterior carotid circulation. Intra-aneurysmal flow reduction induces progressive aneurysm thrombosis in most patients."

Our news editors obtained a quote from the research from the University of Toronto, "Understanding the degree of flow modification necessary to induce complete aneurysm occlusion among patients with considerable hemodynamics variability may be important for treatment planning. Patients with incidental intracranial saccular aneurysms who underwent FDS endovascular procedures were included and studied for a 12 months' follow-up period. We used computational fluid dynamics on patient-specific geometries from 3D rotational angiography without and with virtual stent placement and thus compared intra-aneurysmal hemodynamic problems. Receiver operating characteristic analysis was used to estimate the stent: no-stent minimum hemodynamic ratio thresholds that significantly (p=0.05) determined the condition necessary for long-term (12 months) aneurysm occlusion. We included 12 consecutive patients with sidewall aneurysms located in the internal carotid or vertebral artery. The measured porosity of the 12 deployed virtual FDSs was 83 +/- 3% (mean +/- SD). Nine aneurysms were occluded during the 12 months' follow-up, whereas three were not. A significant (p=0.05) area under the curve (AUC) was found for spatiotemporal mean velocity reduction in the aneurysms: AUC=0.889 +/- 0.113 (mean +/- SD) corresponding to a minimum velocity reduction threshold of 0.353 for occlusion to occur. The 95% CI of the AUC was 0.66 to 1.00. The sensitivity and specificity of the method were similar to 99% and similar to 67%, respectively. For both wall shear stress and pressure reductions in aneurysms no thresholds could be determined: AUC=0.63 +/- 0.16 (p=0.518) and 0.67 +/- 0.165 (p=0.405), respectively."

According to the news editors, the research concluded: "For successful FDS treatment the post-stent average velocity in sidewall intracranial aneurysms must be reduced by at least one-third from the initial pre-stent conditions."

The news editors report that additional information may be obtained by contacting V.M. Pereira, University of Toronto, Univ Hlth Network, Dept. of Surg, Div Neurosurg, Toronto, ON, Canada. Additional authors for this research include I. Larrabide, O. Brina, P. Bouillot, G. Erceg, H. Yilmaz, K.O. Lovblad and V.M. Pereira.

Transplant Medicine - Kidney Transplants

Reports Outline Kidney Transplants Findings from Hospital Clinic (Presence of T-275A and C-2152T Polymorphisms of the Promoter Region of Uridine Diphosphate-Glucuronosyltransferase 1A9 Increases Mortality From Digestive Tumors: Results After 10 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Kidney Transplants have been published. According to news reporting out of Madrid, Spain, by NewsRx editors, research stated, "The aim of this study was to determine the distribution of uridine diphosphate-glucuronosyltransferase 1A9 (UGT1A9) promoter region T-275A and C-2152T single-nucleotide polymorphisms (SNPs) in stable transplant patients and to investigate the impact of these SNPs on the evolution of this population after 10 years of follow-up. White renal transplant recipients (n = 873) were studied."

Our news journalists obtained a quote from the research from Hospital Clinic, "The median time of follow-up was 91.8 months (P25-75 46-146). Amplification with specific 'primers' to delimit the study area was performed for each polymorphism. Amplification was performed with the use of real-time polymerase chain reaction. T-275A promoter mutation was detected in 13% of patients and C-2152T in 12% of patients. Survival analysis was performed on 873 renal transplants, carried out between 2004 and 2013. We found a higher frequency of death from cancer among polymorphism carriers (P = .001)."

According to the news editors, the research concluded: "It appears that carriers of T-275A and C-2152T SNPs of the UGT1A9 gene promoter region show a greater incidence of death from cancer, with a significantly higher cumulative incidence of death from gastrointestinal tumors."

For more information on this research see: Presence of T-275A and C-2152T Polymorphisms of the Promoter Region of Uridine Diphosphate-Glucuronosyltransferase 1A9 Increases Mortality From Digestive Tumors: Results After 10 Years of Follow-up in a Renal Transplant Population. Transplantation Proceedings, 2016;48(9):2947-2949. Transplantation Proceedings can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Heart Disorders and Diseases - Left Ventricular…

Reports Outline Left Ventricular Hypertrophy Findings from National Center for Scientific Research (CNRS) (Increased mean aliphatic lipid chain length in left ventricular hypertrophy secondary to arterial hypertension A cross-sectional study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Left Ventricular Hypertrophy have been published. According to news reporting from Toulouse, France, by NewsRx journalists, research stated, "About 77.9 million (1 in 4) American adults have high blood pressure. High blood pressure is the primary cause of left ventricular hypertrophy (LVH), which represents a strong predictor of future heart failure and cardiovascular mortality."

The news correspondents obtained a quote from the research from National Center for Scientific Research (CNRS), "Previous studies have shown an altered metabolic profile in hypertensive patients with LVH. The goal of this study was to identify blood metabolomic LVH biomarkers by 1H NMR to provide novel diagnostic tools for rapid LVH detection in populations of hypertensive individuals. This cross-sectional study included 48 hypertensive patients with LVH matched with 48 hypertensive patients with normal LV size, and 24 healthy controls. Two-dimensional targeted M-mode echocardiography was performed to measure left ventricular mass index. Partial least squares discriminant analysis was used for the multivariate analysis of the H-1 NMR spectral data. From the H-1 NMR-based metabolomic profiling, signals coming from methylene (-CH2-) and methyl (-CH3) moieties of aliphatic chains from plasma lipids were identified as discriminant variables. The -CH2/-CH3 ratio, an indicator of the mean length of the aliphatic lipid chains, was significantly higher (P <0.001) in the LVH group than in the hypertensive group without LVH and controls. Receiver operating characteristic curve showed that a cutoff of 2.34 provided a 52.08% sensitivity and 85.42% specificity for discriminating LVH (AUC= 0.703, P-value <0.001)."

According to the news reporters, the research concluded: "We propose the -CH2/-CH3 ratio from plasma aliphatic lipid chains as a biomarker for the diagnosis of left ventricular remodeling in hypertension."

For more information on this research see: Increased mean aliphatic lipid chain length in left ventricular hypertrophy secondary to arterial hypertension A cross-sectional study. Medicine, 2016;95(46):13-21. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier -

Life Science Research

Reports Outline Life Science Research Findings from University of British Columbia (The Effect of Statins on Blood Gene Expression in COPD)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research. According to news reporting out of Vancouver, Canada, by NewsRx editors, research stated, "COPD is currently the fourth leading cause of death worldwide. Statins are lipid lowering agents with documented cardiovascular benefits."

Our news journalists obtained a quote from the research from the University of British Columbia, "Observational studies have shown that statins may have a beneficial role in COPD. The impact of statins on blood gene expression from COPD patients is largely unknown. Identify blood gene signature associated with statin use in COPD patients, and the pathways underpinning this signature that could explain any potential benefits in COPD. Whole blood gene expression was measured on 168 statin users and 451 non-users from the ECLIPSE study using the Affymetrix Human Gene 1.1 ST microarray chips. Factor Analysis for Robust Microarray Summarization (FARMS) was used to process the expression data. Differential gene expression analysis was undertaken using the Linear Models for Microarray data (Limma) package adjusting for propensity score and surrogate variables. Similarity of the expression signal with published gene expression profiles was performed in ProfileChaser. 25 genes were differentially expressed between statin users and non-users at an FDR of 10%, including LDLR, CXCR2, SC4MOL, FAM108A1, IFI35, FRYL, ABCG1, MYLIP, and DHCR24. The 25 genes were significantly enriched in cholesterol homeostasis and metabolism pathways. The resulting gene signature showed correlation with Huntington's disease, Parkinson's disease and acute myeloid leukemia gene signatures. The blood gene signature of statins' use in COPD patients was enriched in cholesterol homeostasis pathways."

According to the news editors, the research concluded: "Further studies are needed to delineate the role of these pathways in lung biology."

For more information on this research see: The Effect of Statins on Blood Gene Expression in COPD. Plos One, 2015;10(10):e0140022. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)
Our news journalists report that additional information may be obtained by contacting M. Biotechnology - Liposomes

Reports Outline Liposomes Study Findings from Russian Academy of Science (Biopolymer nanovehicles for essential polyunsaturated fatty acids: Structure-functionality relationships)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biotechnology - Liposomes have been published. According to news reporting from Moscow, Russia, by NewsRx journalists, research stated, "Design of stimuli-sensitive (i.e., smart) nano-sized delivery systems for nutraceuticals, having both a nutritional and pharmaceutical value, is very important for the formulation of novel functional food. Omega-3 and omega-6 polyunsaturated fatty acids' (PUFAs) are among the most needed nutraceuticals for the maintenance of good health."

The news correspondents obtained a quote from the research from the Russian Academy of Science, "It is medically proven that in order to get the best effect on the human health the weight ratio of omega-6/omega-3 PUFAs should be within the range between 1/1 and 5/1. Thus, our work was focused on the molecular design of the delivery systems based on the nano-sized complexes formed between covalent conjugate (sodium caseinate + maltodextrin (a dextrose equivalent = 2)) and the combinations of polyunsaturated lipids, which are mutually complementary in the omega-6 and omega-3 PUFAs content: a-linolenic (ALA) + linoleic (LA) acids; liposomes of soy phosphatidylcholine (PC) + ALA; and micelles, of soy lysophosphatidylcholine (LPC) + ALA. For such complex particles the high extent (>95%) of encapsulation of these all combinations of lipids by the conjugate was found along with both the high protection of the lipids against oxidation and their high solubility in an aqueous medium."

According to the news reporters, the research concluded: "To gain a better insight into such functionality of the complex particles a number of their structural (the weight-averaged molar weight, M-w; the radius of gyration, R-G; the hydrodynamic radius, R-h; the architecture; the volume; the density; the zeta-potential; the microviscosity of both the bilayers of PC liposomes and LPC micelles), and thermodynamic (the osmotic second virial coefficient, A(2), reflecting the nature and intensity of both the complex-complex and complex-solvent pair interactions) parameters were measured by a combination of such basic physico-chemical methods as static and dynamic multiangle laser light scattering, particle electrophoresis, atomic-force microscopy and electron spin resonance spectroscopy."

**Oncology - Liver Cancer**

**Reports Outline Liver Cancer Findings from Chang Gung Memorial Hospital (Thyroid hormone suppresses expression of stathmin and associated tumor growth in hepatocellular carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting originating in Taoyuan, Taiwan, by NewsRx journalists, research stated, "Stathmin (STMN1), a recognized oncoprotein upregulated in various solid tumors, promotes microtubule disassembly and modulates tumor growth and migration activity. However, the mechanisms underlying the genetic regulation of STMN1 have yet to be elucidated."

The news reporters obtained a quote from the research from Chang Gung Memorial Hospital, "In the current study, we report that thyroid hormone receptor (THR) expression is negatively correlated with STMN1 expression in a subset of clinical hepatocellular carcinoma (HCC) specimens. We further identified the STMN1 gene as a target of thyroid hormone (T-3) in the HepG2 hepatoma cell line. An analysis of STMN1 expression profile and mechanism of transcriptional regulation revealed that T-3 significantly suppressed STMN1 mRNA and protein expression, and further showed that THR directly targeted the STMN1 upstream element to regulate STMN1 transcriptional activity. Specific knockdown of STMN1 suppressed cell proliferation and xenograft tumor growth in mice. In addition, T-3 regulation of cell growth arrest and cell cycle distribution were attenuated by overexpression of STMN1. Our results suggest that the oncogene STMN1 is transcriptionally downregulated by T-3 in the liver."

According to the news reporters, the research concluded: "This T-3-mediated suppression of STMN1 supports the theory that T-3 plays an inhibitory role in HCC tumor growth, and suggests that the lack of normal THR function leads to elevated STMN1 expression and malignant growth."

Our news correspondents report that additional information may be obtained by

Oncology - Liver Cancer

Reports Outline Liver Cancer Study Results from Chinese University of Hong Kong (Alternative splicing of estrogen receptor alpha in hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news originating from Shenzhen, People's Republic of China, by NewsRx correspondents, research stated, "The role of estrogen receptor alpha (ERa), estrogen receptor beta (ERb) and ERa36 signaling in hepatocellular carcinoma (HCC) is not fully addressed. In this study, three cohorts were included: (i) primary HCC patients (N = 76, cohort P), (ii) colorectal liver metastasis (mCRC) (N = 32, cohort S), and (iii) HCC from The Cancer Genome Atlas (TCGA) (N = 121)."

Our news journalists obtained a quote from the research from the Chinese University of Hong Kong, "The levels of ERa36 and wtER36 were measured and their correlation with clinicopathologic features was determined. WtERa was downregulated and that ERa36 was upregulated in tumor tissues in both cohort P and TCGA data set. ERa36 was downregulated in tumor tissues in cohort S. In cohort P, wtERa was differentially expressed in gender (P < 0.000), age (P = 0.004), tumor number (P = 0.043), tumor size (P = 0.002), intrahepatic recurrence (P = 0.054). ERa36 was unequally expressed in different non-tumor liver status (P = 0.040). WtERa was negatively associated with overall survival (OS) and disease free survival (DFS) in cohort P. Compared with non-tumor tissues, the expression of ERa36 was increased in primary HCC but decreased in secondary HCC, showing opposite expression patterns of ERa36 between primary HCC and secondary HCC. Primary HCC is associated with the decreased WtERa but increased ERa36. The expression pattern of ERa36 is different between primary HCC and secondary HCC, as the former with the increased ERa36 but the latter with the decreased ERa36."

According to the news editors, the research concluded: "Therefore, the expression of ERa36 may be used to differentiate the primary HCC and the secondary one."

The news correspondents report that additional information may be obtained from G.G. Chen, Chinese University of Hong Kong, Shenzhen Res Inst, Shenzhen, People's Republic
Reports Outline Liver Cancer Study Results from University of Rennes (Regulation of Transdifferentiation and Retrodifferentiation by Inflammatory Cytokines in Hepatocellular Carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Liver Cancer are presented in a new report. According to news reporting from Rennes, France, by NewsRx journalists, research stated, "Liver cancers are typically inflammation-associated cancers characterized by close communication between the tumor cells and the tumor environment. This supportive inflammatory environment contributes to the establishment of a pathologic niche consisting of transformed epithelial cells, tumor-educated fibroblasts, endothelial cells, and immunosuppressive immature myeloid cells."

The news correspondents obtained a quote from the research from the University of Rennes, "Stromal and infiltrated immune cells help determine tumor fate, but the tumor cells themselves, including cancer stem cells, also influence the surrounding cells. This bidirectional communication generates an intricate network of signals that promotes tumor growth. Cell plasticity, which includes transdifferentiation and retrodifferentiation of differentiated cells, increases tumor heterogeneity. Plasticity allows non-cancer stem cells to replenish the cancer stem cell pool, initiate tumorigenesis, and escape the effects of therapeutic agents; it also promotes tumor aggressiveness. There is increasing evidence that an inflammatory environment promotes the retrodifferentiation of tumor cells into stem or progenitor cells; this could account for the low efficacies of some chemotherapies and the high rates of cancer recurrence."

According to the news reporters, the research concluded: "Increasing our understanding of the signaling network that connects inflammation with retrodifferentiation could identify new therapeutic targets, and lead to combined therapies that are effective against highly heterogeneous tumors."

For more information on this research see: Regulation of Transdifferentiation and Retrodifferentiation by Inflammatory Cytokines in Hepatocellular Carcinoma. Gastroenterology, 2016;151(4):607-615. Gastroenterology can be contacted at: W B Saunders Co-Elsevier Inc, 1600 John F Kennedy Boulevard, Ste 1800, Philadelphia, PA 19103-2899, USA. (Elsevier - www.elsevier.com; Gastroenterology - www.journals.elsevier.com/gastroenterology/)

Reports Outline Liver Transplants Study Results from University of Alberta (Hepatitis C in non-hepatic solid organ transplant candidates and recipients: A new horizon)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Liver Transplants. According to news originating from Edmonton, Canada, by NewsRx correspondents, research stated, "Hepatitis C virus (HCV) infection is estimated to affect 130-150 million people globally which corresponds to 2%-3% of the total world population. It remains the leading indication for liver transplant worldwide and has been demonstrated to negatively impact both patient and graft survival following non-hepatic organ transplantation."

Our news journalists obtained a quote from the research from the University of Alberta, "In the era of interferon-based therapy, although treatment and cure of HCV prior to non-hepatic transplant improved survival, tolerability and low cure rates substantially limited therapy. Interferon (IFN)-based therapy following non-hepatic solid organ transplant, due to the risk of allograft rejection, is generally contraindicated. Rapid advances in IFN-free therapy with direct acting antivirals (DAAs) in the last few years have completely changed the paradigm of hepatitis C therapy. Compared to IFN-based regimens, DAAs have less frequent and less severe adverse effects, shorter durations of therapy, and higher cure rates that are minimally impacted by historically negative predictors of response such as cirrhosis, ethnicity, and post-transplant state. Recent studies have shown that liver transplant (LT) recipients can be safely and effectively treated with DAA combination therapies; although data are limited, many of the principles of therapy in LT may be extrapolated to non-hepatic solid organ transplant recipients."

According to the news editors, the research concluded: "Here we review the data on DAA combination therapies in transplantation, discuss the advantages and disadvantages of pre-vs post-transplant HCV therapy and future directions."

The news correspondents report that additional information may be obtained from S. Belga, Sara Belga, Karen Elizabeth Doucette, Division of Infectious Diseases, Dept. of Medicine, University of Alberta, Edmonton, Alberta T6G 2G3, Canada.

Reports Outline Lung Cancer Findings from Harbin Medical University (Gene expression profiling analysis of lung adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news originating from Heilongjiang, People's Republic of China, by NewsRx correspondents, research stated, "The present study screened potential genes related to lung adenocarcinoma, with the aim of further understanding disease pathogenesis. The GSE2514 dataset including 20 lung adenocarcinoma and 19 adjacent normal tissue samples from 10 patients with lung adenocarcinoma aged 45-73 years was downloaded from Gene Expression Omnibus."

Our news journalists obtained a quote from the research from Harbin Medical University, "Differentially expressed genes (DEGs) between the two groups were screened using the t-test. Potential gene functions were predicted using functional and pathway enrichment analysis, and protein-protein interaction (PPI) networks obtained from the STRING database were constructed with Cytoscape. Module analysis of PPI networks was performed through MCODE in Cytoscape. In total, 535 upregulated and 465 downregulated DEGs were identified. These included ATP5D, UQCRC2, UQCR11 and genes encoding nicotinamide adenine dinucleotide (NADH), which are mainly associated with mitochondrial ATP synthesis coupled electron transport, and which were enriched in the oxidative phosphorylation pathway. Other DEGs were associated with DNA replication (PRIM1, MCM3, and RNASEH2A), cell surface receptor-linked signal transduction and the enzyme-linked receptor protein signaling pathway (MAPK1, STAT3, RAF1, and JAK1), and regulation of the cytoskeleton and phosphatidylinositol signaling system (PIP5K1B, PIP5K1C, and PIP4K2B)."

According to the news editors, the research concluded: "Our findings suggest that DEGs encoding subunits of NADH, PRIM1, MCM3, MAPK1, STAT3, RAF1, and JAK1 might be associated with the development of lung adenocarcinoma."

For more information on this research see: Gene expression profiling analysis of lung adenocarcinoma. *Brazilian Journal of Medical and Biological Research*, 2016;49(3):.

Reports Outline Lung Cancer Findings from Zhengzhou University

[MicroRNA-490 regulates lung cancer metastasis by targeting poly r(C)-binding protein 1]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Lung Cancer is the subject of a report. According to news reporting originating in Zhengzhou, People's Republic of China, by NewsRx journalists, research stated, "Lung cancer remains a leading cause of cancer-related mortality, with metastatic progression remaining the single largest cause of lung cancer mortality. Hence, it is imperative to determine reliable biomarkers of lung cancer prognosis."

The news reporters obtained a quote from the research from Zhengzhou University, "MicroRNA-490-3p has been previously reported to be a positive prognostic biomarker for hepatocellular cancer. However, its role in human lung cancer has not yet been elucidated. Here, we report that hsa-miR-490-3p expression is significantly higher in human lung cancer tissue specimens and cell line."

According to the news reporters, the research concluded: "Gain-and loss-of-function studies of hsa-miR-490-3p showed that it regulates cell proliferation and is required for induction of in vitro migration and invasion-the latter being a hallmark of epithelial to mesenchymal transition."

For more information on this research see: MicroRNA-490 regulates lung cancer metastasis by targeting poly r(C)-binding protein 1. Tumor Biology, 2016;37(11):15221-15228. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

& Wellness Week -- A new study on Oncology - Lung Cancer is now available. According to news reporting originating from Moscow, Russia, by NewsRx correspondents, research stated, "The regulation of vascular endothelial growth factors C (VEGF-C) and D (VEGF-D), and their receptor VEGFR3 gene and protein expression by all-trans-retinoic acid (atRA) in A549 lung cancer cells, was investigated."

Our news editors obtained a quote from the research from the Institute of Carcinogenesis, "We showed that atRA treatment increased VEGF-C, VEGF-D, and VEGFR3 protein and mRNA contents in dose-dependent manner. atRA-mediated increase of both ligands and receptor expression correlated with the elevated level of retinoic acid receptor a (RARa) expression, while the level of another atRA receptor, peroxisome proliferator-activated receptor b/d (PPARb/d), was decreased. We demonstrated that the classical counterpart of RARa, retinoid X receptor a (RXRa), was down-regulated in both cytoplasm and nucleus of A549 cells upon atRA addition."

According to the news editors, the research concluded: "On the contrary, the nuclear quantity of another possible RARa counterpart, transcription factor Sp1, was increased after atRA treatment."

The news editors report that additional information may be obtained by contacting N.N. Kalitin, Laboratory of Tumor Cell Genetics, Institute of Carcinogenesis, NN Blokhin Russian Cancer Research Center, Moscow, 115478, Russia.

Oncology - Lung Cancer

Reports Outline Lung Cancer Study Results from German Center Lung Research (Treatment-related experiences and preferences of patients with lung cancer: a qualitative analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lung Cancer. According to news reporting out of Hannover, Germany, by NewsRx editors, research stated, "Lung cancer is one of the most common types of cancer worldwide, and it causes significant challenges for patients due to the poor survival rate and treatment-related side-effects. Because of lung cancer's great burden, identification and use of the patients' preferences can help to improve patients' quality of life."

Financial support for this research came from Bundesministerium fur Bildung und
Our news journalists obtained a quote from the research from German Center Lung Research, "Interviews with patients who have lung cancer were used to ascertain a range of experiences and to make recommendations regarding the improvement of treatment based on these patients' preferences. Because chemotherapy is the common treatment option for lung cancer, we focused on this treatment. The interviews were audio-taped, verbally transcribed and evaluated via content analysis. A total of 18 participants (11 men and 7 women) with small or non-small-cell lung cancer who were receiving chemotherapy in one clinic were interviewed between June and July 2013. Two main aspects with different subthemes were identified during the interviews. One main aspect focused on organizational context, such as the treatment day process, or experiences with different stakeholders, such as with the health insurance company or physicians. The other category referred to experiences that influenced psychosocial factors, including physical and mental experiences. Patients reported different experiences concerning physical, psychological and organizational areas during chemotherapy. Nevertheless, some potential areas for improving care, and therefore the quality of life of patients with lung cancer, could be identified."

According to the news editors, the research concluded: "These improvement measures highlighted that with small, non-time-consuming and inexpensive changes, the treatment for patients with lung cancer can be improved."

Our news journalists report that additional information may be obtained by contacting I. Aumann, German Center Lung Res DZL, Hannover, Germany. Additional authors for this research include K. Kreis, K. Damm, H. Golpon, T. Welte and J.M.G. von der Schulenburg.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/hex.12417. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Hannover, Germany, Europe, Drugs and Therapies, Lung Neoplasms, Chemotherapy, Lung Cancer, Oncology, German Center Lung Research.

Oncology - Lung Cancer
Reports Outline Lung Cancer Study Results from National Chiayi University (Astaxanthin enhances pemetrexed-induced cytotoxicity by downregulation of thymidylate synthase expression in human lung cancer cells)
multitargeted antifolate agent, has demonstrated clinical activity in non-small cell lung cancer (NSCLC) cells. Increased expression of thymidylate synthase (TS) is thought to be associated with resistance to pemetrexed.

Financial supporters for this research include Ministry of Science and Technology, Taiwan, Ditmanson Medical Foundation Chia-Yi Christian Hospital Research Program.

Our news journalists obtained a quote from the research from National Chiayi University, "Astaxanthin exhibits a wide range of beneficial effects including anti-cancer and anti-inflammatory properties. In this study, we showed that down-regulating of TS expression in two NSCLC cell lines, human lung adenocarcinoma H1650 and squamous cell carcinoma H1703 cells, with astaxanthin were associated with decreased MKK1/2-ERK1/2 activity. Enforced expression of constitutively active MKK1 (MKK1-CA) vector significantly rescued the decreased TS mRNA and protein levels in astaxanthin-treated NSCLC cells. Combined treatment with a MKK1/2 inhibitor (U0126 or PD98059) further decreased the TS expression in astaxanthin-exposed NSCLC cells. Knockdown of TS using small interfering RNA (siRNA) or inhibiting ERK1/2 activity enhanced the cytotoxicity and cell growth inhibition of astaxanthin. Combination of pemetrexed and astaxanthin resulted in synergistic enhancing cytotoxicity and cell growth inhibition in NSCLC cells, accompanied with reduced activation of phospho-MKK1/2, phospho-ERK1/2, and TS expression. Overexpression of MKK1/2-CA reversed the astaxanthin and pemetrexed-induced synergistic cytotoxicity."

According to the news editors, the research concluded: "Our findings suggested that the down regulation of MKK1/2-ERK1/2-mediated TS expression by astaxanthin is an important regulator of enhancing the pemetrexed-induced cytotoxicity in NSCLC cells."

Our news journalists report that additional information may be obtained by contacting Y.W. Lin, Natl Chiayi Univ, Dept. of Biochem Sci & Technol, Chiayi 600, Taiwan. Additional authors for this research include C.L. Wei, J.C. Chen, H.Y. Zheng, W.C. Chen, C.H. Wu, T.J. Wang, Y.S. Peng, P.Y. Chang and Y.W. Lin.

Reports Outline Lupus Study Results from Pontifical Catholic University (Contribution of dendritic cells to the autoimmune pathology of systemic lupus erythematosus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Autoimmune Diseases and Conditions - Lupus have been published. According to news originating from Santiago, Chile, by NewsRx correspondents, research stated, "Systemic lupus erythematosus (SLE) is a heterogeneous disease in which excessive inflammation, autoantibodies and complement activation lead to multisystem tissue damage. The contribution of the individual genetic composition has been extensively studied, and several susceptibility genes related to immune pathways that participate in SLE pathogenesis have been identified."

Financial supporters for this research include Fondo Nacional de Desarrollo Cientifico y Tecnologico, Comision Nacional de Investagacion Cientifica y Tecnologica, Vicerrectoria de Investigacion de la Pontificia Universidad Catolica de Chile, Millennium Institute on Immunology and Immunotherapy.

Our news journalists obtained a quote from the research from Pontifical Catholic University, "It has been proposed that SLE takes place when susceptibility factors interact with environmental stimuli leading to a deregulated immune response. Experimental evidence suggests that such events are related to the failure of T-cell and B-cell suppression mediated by defects in cell signalling, immune tolerance and apoptotic mechanism promoting autoimmunity. In addition, it has been reported that dendritic cells (DCs) from SLE patients, which are crucial in the modulation of peripheral tolerance to self-antigens, show an increased ratio of activating/inhibitory receptors on their surfaces. This phenotype and an augmented expression of co-stimulatory molecules is thought to be critical for disease pathogenesis. Accordingly, tolerogenic DCs can be a potential strategy for developing antigen-specific therapies to reduce detrimental inflammation without causing systemic immunosuppression."

According to the news editors, the research concluded: "In this review article we discuss the most relevant data relative to the contribution of DCs to the triggering of SLE."

The news correspondents report that additional information may be obtained from J.P. Mackern-Oberti, Millennium Institute on Immunology and Immunotherapy, Departamento de Genetica Molecular y Microbiologia, Facultad de Ciencias Biologicas, Pontificia Universidad Catolica de Chile, Santiago, Chile. Additional authors for this research include C. Llanos, C.A. Riedel, S.M. Bueno and A.M Kalergis.

Oncology - Lymphoma

Reports Outline Lymphoma Findings from Dana-Farber Cancer Institute (Next-generation sequencing-based detection of circulating tumour DNA After allogeneic stem cell transplantation for lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Lymphoma. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Next-generation sequencing (NGS)-based circulating tumour DNA (ctDNA) detection is a promising monitoring tool for lymphoid malignancies. We evaluated whether the presence of ctDNA was associated with outcome after allogeneic haematopoietic stem cell transplantation (HSCT) in lymphoma patients."

Financial supporters for this research include Ted and Eileen Pasquarello Research Fund, Jock and Bunny Adams Education and Research Fund, Conquer Cancer Foundation, National Cancer Institute of the National Institutes of Health.

The news correspondents obtained a quote from the research from Dana-Farber Cancer Institute, "We studied 88 patients drawn from a phase 3 clinical trial of reduced-intensity conditioning HSCT in lymphoma. Conventional restaging and collection of peripheral blood samples occurred at pre-specified time points before and after HSCT and were assayed for ctDNA by sequencing of the immunoglobulin or T-cell receptor genes. Tumour clonotypes were identified in 87% of patients with adequate tumour samples. Sixteen of 19 (84%) patients with disease progression after HSCT had detectable ctDNA prior to progression at a median of 3 <bold>7</bold> months prior to relapse/progression. Patients with detectable ctDNA 3months after HSCT had inferior progression-free survival (PFS) (2-year PFS 58% vs. 84% in ctDNA-negative patients, <bold>P=0</bold>). In multivariate models, detectable ctDNA was associated with increased risk of progression/death (Hazard ratio <bold>3.9</bold>, <bold>P=0</bold>) and increased risk of relapse/progression (Hazard ratio <bold>10.8</bold>, <bold>P=0</bold>)."

According to the news reporters, the research concluded: "Detectable ctDNA is associated with an increased risk of relapse/progression, but further validation studies are necessary to confirm these findings and determine the clinical utility of NGS-based minimal residual disease monitoring in lymphoma patients after HSCT."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bjh.14311. This DOI is a link to an online electronic document that is either free or for purchase.

Eye Diseases and Conditions - Macular Degeneration

Reports Outline Macular Degeneration Study Findings from University of Ljubljana (Clinical and genetic heterogeneity in Slovenian patients with BEST disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Eye Diseases and Conditions - Macular Degeneration is the subject of a report. According to news reporting originating in Ljubljana, Slovenia, by NewsRx journalists, research stated, "PurposeTo determine the spectrum of BEST1 mutations and to study the phenotype in Slovenian families with Best vitelliform macular dystrophy (BVMD) to identify genotype-phenotype correlations. MethodsTwenty patients from five families underwent the ophthalmological examination including electrooculogram (EOG; N=17), fundus autofluorescence imaging (N=16) and optical coherence tomography (N=14)."

Financial support for this research came from Javna Agencija za Raziskovalno Dejavnost RS.

The news reporters obtained a quote from the research from the University of Ljubljana, "Mutational screening was performed by direct DNA sequencing of the BEST1 gene. ResultsMutation c.43G >C (p.Gly15Arg) was detected in three patients from family M presenting with different clinical stages of Best disease. Mutation c.313G >C (p.Arg105Gly) was found in families K, ST, S, B and was associated with incomplete clinical penetrance and variable retinal changes, including extramacular and multifocal lesions. In three patients from family K, an atypical form of BVMD was observed; there were additional peripheral lesions outside of the vascular arcades in addition to the typical macular lesions. Multiple alterations between the vitelliruptive and pseudohypopyon stages over a period of 11 years were seen in one patient. ConclusionTwo previously unreported disease-associated variants in the BEST1 gene (p.Gly15Arg and p.Arg105Gly) were found in Slovenian patients with Best disease."

According to the news reporters, the research concluded: "Our data expand the mutation spectrum of the BEST1 gene and further support the broad phenotypic variability observed clinically and with optical coherence tomography (OCT) and AF imaging."

Our news correspondents report that additional information may be obtained by
contacting D. Glavac, Univ Ljubljana, Fac Med, Dept. of Mol Genet, Ljubljana, Slovenia.

Eye Diseases and Conditions - Macular Edema

Reports Outline Macular Edema Study Findings from Kyoto University
(Restoration of foveal photoreceptors after intravitreal ranibizumab injections for diabetic macular edema)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Eye Diseases and Conditions - Macular Edema have been presented. According to news reporting originating from Kyoto, Japan, by NewsRx correspondents, research stated, "Anti-vascular endothelial growth factor drugs are the first-line treatment for diabetic macular edema (DME), although the mechanism of the visual acuity (VA) improvement remains largely unknown. The association between photoreceptor damage and visual impairment encouraged us to retrospectively investigate the changes in the foveal photoreceptors in the external limiting membrane (ELM) and ellipsoid zone (EZ) on spectral-domain optical coherence tomography (SD-OCT) images in 62 eyes with DME treated with intravitreal ranibizumab (IVR) injections."

Our news editors obtained a quote from the research from Kyoto University, "The transverse lengths of the disrupted EZ and ELM were shortened significantly ($P < 0.001$ and $P = 0.044$, respectively) at 12 months. The qualitative investigation also showed restoration of the EZ and ELM lines on SD-OCT images. The EZ at 12 months lengthened in 34 of 38 eyes with discontinuous EZ and was preserved in 16 of 21 eyes with complete EZ at baseline. VA improvement was positively correlated with shortening of the disrupted EZ at 12 months ($rho = 0.463$, $P < 0.001$), whereas the decrease in central subfield thickness was associated with neither VA improvement nor changes in EZ status ($rho = 0.215$, $P = 0.093$ and ($rho = 0.209$, $P = 0.103$, respectively)."

According to the news editors, the research concluded: "These data suggested that photoreceptor restoration contributes to VA improvement after pro re nata treatment with IVR injections for DME independent of resolved retinal thickening."

For more information on this research see: Restoration of foveal photoreceptors after intravitreal ranibizumab injections for diabetic macular edema. Scientific Reports, 2016;6 ():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Magnetic Resonance

Reports Outline Magnetic Resonance Study Findings from Molecular Imaging Program at Stanford (Molecular Magnetic Resonance Imaging of Tumor Response to Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Magnetic Resonance are discussed in a new report. According to news reporting originating from Stanford, California, by NewsRx correspondents, research stated, "Personalized cancer medicine requires measurement of therapeutic efficacy as early as possible, which is optimally achieved by three-dimensional imaging given the heterogeneity of cancer. Magnetic resonance imaging (MRI) can obtain images of both anatomy and cellular responses, if acquired with a molecular imaging contrast agent."

Our news editors obtained a quote from the research from Molecular Imaging Program at Stanford, "The poor sensitivity of MRI has limited the development of activatable molecular MR contrast agents. To overcome this limitation of molecular MRI, a novel implementation of our caspase-3-sensitive nanoaggregation MRI (C-SNAM) contrast agent is reported. C-SNAM is triggered to self-assemble into nanoparticles in apoptotic tumor cells, and effectively amplifies molecular level changes through nanoaggregation, enhancing tissue retention and spin-lattice relaxivity. At one-tenth the current clinical dose of contrast agent, and following a single imaging session, C-SNAM MRI accurately measured the response of tumors to either metronomic chemotherapy or radiation therapy, where the degree of signal enhancement is prognostic of long-term therapeutic efficacy."

According to the news editors, the research concluded: "Importantly, C-SNAM is inert to immune activation, permitting radiation therapy monitoring."

For more information on this research see: Molecular Magnetic Resonance Imaging of Tumor Response to Therapy. *Scientific Reports*, 2015;5():14759. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting A.J. Shuhendler, Molecular Imaging Program at Stanford, Stanford, California 94305, United States. Oncology - Melanoma

Reports Outline Melanoma Study Findings from University Hospital (Novel Drugs and Combination Therapies for the Treatment of Metastatic Melanoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Melanoma are discussed in a new report. According to news reporting from Staten Island, New York, by NewsRx journalists, research stated, "Metastatic melanoma (MM) still remains as one of the most worrisome cancer known to mankind. In last two decades, treatment of melanoma took a dramatic turn with the discovery of targeted therapy which targets the mutations in mitogen-activated protein kinase (MAPK) pathway and immune checkpoint inhibitors."

The news correspondents obtained a quote from the research from University Hospital, "These new findings have led to emergence of many novel drugs that have been approved by FDA. Targeted therapy drugs such as vemurafenib, trametinib and dabrafenib target the MAPK pathway whereas immunotherapies such as ipilimumab, nivolumab and pembrolizumab block immune checkpoint receptors on T lymphocytes. All these drugs have shown to improve the overall survival in MM. Despite these recent discoveries, treatment of MM remains challenging because of rapid development of resistance to targeted therapy."

According to the news reporters, the research concluded: "This review will discuss recently approved drugs and their adverse effects and also shed light on combination therapy in treatment of melanoma."

For more information on this research see: Novel Drugs and Combination Therapies for the Treatment of Metastatic Melanoma. Journal of Clinical Medicine Research, 2015;8 (2):63-75.

Our news journalists report that additional information may be obtained by contacting A. Vennepureddy, Dept. of Medicine, Staten Island University Hospital, Staten Island, NY 10305, United States. Additional authors for this research include N. Thumallapally, V. Motilal Nehru, J.P. Atallah and T. Terjanian.

Merkel Cells

Reports Outline Merkel Cells Findings from University of California (Genomic portfolio of Merkel cell carcinoma as determined by comprehensive genomic profiling: implications for targeted therapeutics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Merkel Cells is the subject of a report. According to news reporting out of San Diego, California, by NewsRx editors, research stated, "Merkel cell carcinoma is an ultra-rare cutaneous neuroendocrine cancer for which approved treatment options are lacking. To better understand potential actionability, the genomic landscape of Merkel cell cancers was assessed."

Our news journalists obtained a quote from the research from the University of California, "The molecular aberrations in 17 patients with Merkel cell carcinoma were, on physician request, tested in a Clinical Laboratory Improvement Amendments (CLIA) laboratory (Foundation Medicine, Cambridge, MA) using next-generation sequencing (182 or 236 genes) and analyzed by N-of-One, Inc. (Lexington, MA). There were 30 genes harboring aberrations and 60 distinct molecular alterations identified in this patient population. The most common abnormalities involved the TP53 gene (12/17 [71% of patients]) and the cell cycle pathway (CDKN2A/B, CDKN2C or RB1)(12/17 [71%]). Abnormalities also were observed in the PI3K/AKT/mTOR pathway (AKT2, FBXW7, NF1, PIK3CA, PIK3R1, PTEN or RICTOR) (9/17 [53%]) and DNA repair genes (ATM, BAP1, BRCA1/2, CHEK2, FANCA or MLH1) (5/17 [29%]). Possible cognate targeted therapies, including FDA-approved drugs, could be identified in most of the patients (16/17 [94%]). In summary, Merkel cell carcinomas were characterized by multiple distinct aberrations that were unique in the majority of analyzed cases. Most patients had theoretically actionable alterations."

According to the news editors, the research concluded: "These results provide a framework for investigating tailored combinations of matched therapies in Merkel cell carcinoma patients."

For more information on this research see: Genomic portfolio of Merkel cell carcinoma as determined by comprehensive genomic profiling: implications for targeted therapeutics. Oncotarget, 2016;7(17):23454-67.

Our news journalists report that additional information may be obtained by contacting P.R. Cohen, Dept. of Dermatology, University of California San Diego, San Diego, CA, United States. Additional authors for this research include B.N. Tomson, S.K. Elkin, E. Marchlik, J.L. Carter and R. Kurzrock.

Mesylates

Reports Outline Mesylates Findings from Bharathiar University (Gas Chromatographic Method for the Quantitative Determination of a Hydrolytic Degradation Impurity in Busulfan Injectable Products)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mesylates. According to news reporting from Coimbatore, India, by NewsRx journalists, research stated, "An efficient and stability-indicating method has been developed and validated for the quantitative determination of tetrahydrofuran (THF), a hydrolytic degradation impurity, in Busulfan injectable pharmaceutical products by using gas chromatograph equipped with a liquid autosampler and a flame ionization detector. The chromatographic separation was performed on a fused silica capillary (Stabilwax; 60 mlenght x 0.32 mm i.d., 0.5 mu m film thickness) column."

The news correspondents obtained a quote from the research from Bharathiar University, "The methodology was validated in accordance with regulatory guidelines. The proposed method was found to be specific, stable, precise, linear, accurate, robust, and rugged in the concentration range from 4 to 1,080 ppm for THF."

According to the news reporters, the research concluded: "The developed method was successfully applied to determine the THF content in Busulfan injectable pharmaceutical products."

Our news journalists report that additional information may be obtained by contacting H.R. Reddy, Bharathiar Univ, Res & Dev Center, Coimbatore 641046, Tamil Nadu, India. Additional authors for this research include N. Chandrasekhar and C.S. Karigar. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/chromsci/bmw117. Neoplasms

Reports Outline Neoplasms Study Findings from University of Algarve (Salivary gland hybrid tumour revisited: could they represent high-grade transformation in a low-grade neoplasm?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators discuss new findings in Neoplasms. According to news reporting originating from Faro, Portugal, by NewsRx correspondents, research stated, "Salivary gland hybrid tumour, first described in 1996, is a very rare neoplasm for which exact morphological criteria have not been universally agreed upon. In contrast, the concept of high-grade transformation (HGT) in salivary neoplasms has been widely accepted during the last decade, and the number of reported cases is rapidly increasing."

Financial support for this research came from No funding was involved.

Our news editors obtained a quote from the research from the University of Algarve, "A review of the literature revealed 38 cases of hybrid tumour reported in 22 publications. During approximately the same time period, well over 100 cases of HGT in salivary neoplasms have been reported. There are important histological similarities between hybrid tumours and salivary tumours with HGT. In the latter, containing one tumour component of low-grade malignancy and the other of high grade, the two tumour components are not entirely separated and appear to originate in the same area. Virtually, all cases reported as hybrid tumour had no clear lines of demarcation between the two tumour types. We are inclined to suggest that most of the 38 cases of hybrid tumours described in the literature would today better be called tumour with HGT rather than hybrid tumour. The relative proportion of the two components may vary, and the high-grade component is sometimes very small, which emphasises the importance of very generous sampling of the surgical specimen. The molecular genetic mechanisms responsible for HGT, including what used to be called hybrid tumour, remain largely unknown. Abnormalities of a few genes (including p53, C-MYC, cyclin D1, HER-2/neu) have been documented. As insufficient data exist on gene abnormalities in these lesions, conclusions as to whether or not they have a common origin and which mechanisms are involved in transformation cannot be drawn. Due to the small number of cases reported, many of which lack follow-up details; indicators of prognosis of hybrid tumours are not available, but their behaviour seems to be similar to that of tumours with HGT, i.e. an accelerated aggressive course."

According to the news editors, the research concluded: "HGT of salivary gland neoplasms greatly influences macroscopic and microscopic evaluation of the specimen but also, given the high incidence of metastases and morbidity, carries significant treatment implications."

For more information on this research see: Salivary gland hybrid tumour revisited: could they represent high-grade transformation in a low-grade neoplasm? Virchows Archiv, 2016;469(6):643-650. Virchows Archiv can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Virchows Archiv - www.springerlink.com/content/0945-6317/)

Nephropathy

Reports Outline Nephropathy Study Findings from RWTH Aachen University (The mucosa-kidney axis in IgA nephropathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nephropathy is the subject of a report. According to news originating from Aachen, Germany, by NewsRx correspondents, research stated, "Links between IgA nephropathy (IgAN) and the mucosa have been recognized since the 1970s. In particular, the observation of visible haematuria induced by respiratory infections in patients with IgAN and the association of IgAN with diseases in which the mucosa plays a part, especially coeliac disease, have been taken as evidence of a mucosa-kidney axis."

Our news journalists obtained a quote from the research from RWTH Aachen University, "Here, we review current evidence that links the mucosa, in particular the gastrointestinal mucosa, and IgA produced by the bone marrow with IgAN. Genome-wide association studies in patients with IgAN have identified risk loci in genes involved in the intestinal mucosal integrity and immune network. Furthermore, the systemic immune response to mucosal antigens in IgAN is increased. Moreover, patients with IgAN have an increased reactivity to dietary proteins associated with subclinical intestinal mucosal inflammation. Associations between IgAN and gastrointestinal diseases have also been reported in a small number of patients, but whether these diseases share a common pathogenesis or whether gastrointestinal inflammation exacerbates IgAN is uncertain. Indeed, mucosal alterations such as infections could activate the innate immune system, aggravate a pre-existing IgAN and promote disease manifestations such as macrohaematuria."

According to the news editors, the research concluded: "Various clinical interventions and trials targeting the mucosa or presumed mucosa-associated mechanisms have so far not yielded consistent findings and the results of ongoing trials are eagerly awaited."

The news correspondents report that additional information may be obtained from J. Floege, Divisions of Nephrology and Immunology, RWTH University of Aachen, Pauwelstrasse 30, D 52057 Aachen, Germany.

**Health and Medicine - Neurooncology**

**Reports Outline Neurooncology Findings from NHS Foundation Trust (Surgical management of posterior fossa metastases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Health and Medicine - Neurooncology. According to news reporting originating from Liverpool, United Kingdom, by NewsRx correspondents, research stated, "The diagnosis of brain metastases is associated with a poor prognosis reflecting uncontrolled primary disease that has spread to the relative sanctuary of the central nervous system. 20% of brain metastases occur in the posterior fossa and are associated with significant morbidity. The risk of acute hydrocephalus and potential for sudden death means these metastases are often dealt with as emergency cases."

Our news editors obtained a quote from the research from NHS Foundation Trust, "This approach means a full pre-operative assessment and staging of underlying disease may be neglected and a proportion of patients undergo comparatively high risk surgery with little or no survival benefit. This study aimed to assess outcomes in patients to identify factors that may assist in case selection. We report a retrospective case series of 92 consecutive patients operated for posterior fossa metastases between 2007 and 2012. Routine demographic data was collected plus data on performance status, primary cancer site, details of surgery, adjuvant treatment and survival. The only independent positive prognostic factors identified on multivariate analysis were good performance status (if Karnofsky performance score > 70, hazard ratio (HR) for death 0.36, 95% confidence interval (CI) 0.18-0.69), adjuvant whole brain radiotherapy (HR 0.37, 95% CI 0.21-0.65) and adjuvant chemotherapy where there was extracranial disease and non-synchronous presentation (HR 0.51, 95% CI 0.31-0.82). Patients presenting with posterior fossa metastases may not be investigated as thoroughly as those with supratentorial tumours."

According to the news editors, the research concluded: "Staging and assessment is essential however, and in the meantime emergencies related to tumour mass effect should be managed with steroids and cerebrospinal fluid diversion as required."

For more information on this research see: Surgical management of posterior fossa metastases. *Journal of Neuro-Oncology, 2016;130(3):535-542.* Journal of Neuro-Oncology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Journal of Neuro-Oncology - www.springerlink.com/content/0167-594x/)

Neutral Amino Acids

Reports Outline Neutral Amino Acids Findings from University of Glasgow (A Highly Conserved Bacterial D-Serine Uptake System Links Host Metabolism and Virulence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neutral Amino Acids. According to news reporting from Glasgow, United Kingdom, by NewsRx journalists, research stated, "The ability of any organism to sense and respond to challenges presented in the environment is critically important for promoting or restricting colonization of specific sites. Recent work has demonstrated that the host metabolite D-serine has the ability to markedly influence the outcome of infection by repressing the type III secretion system of enterohaemorrhagic Escherichia coli (EHEC) in a concentration-dependent manner."

The news correspondents obtained a quote from the research from the University of Glasgow, "However, exactly how EHEC monitors environmental D-serine is not understood. In this work, we have identified two highly conserved members of the E. coli core genome, encoding an inner membrane transporter and a transcriptional regulator, which collectively help to 'sense' levels of D-serine by regulating its uptake from the environment and in turn influencing global gene expression. Both proteins are required for full expression of the type III secretion system and diversely regulated prophage-encoded effector proteins demonstrating an important infection-relevant adaptation of the core genome."

According to the news reporters, the research concluded: "We propose that this system acts as a key safety net, sampling the environment for this metabolite, thereby promoting colonization of EHEC to favorable sites within the host."

For more information on this research see: A Highly Conserved Bacterial D-Serine Uptake System Links Host Metabolism and Virulence. Plos Pathogens, 2016;12(1):e1005359. (Public Library of Science - www.plos.org; Plos Pathogens - www.plospathogens.org)

Our news journalists report that additional information may be obtained by contacting J.P. Connolly, Institute of Infection, Immunity and Inflammation, College of Med, Veterinary and Life Sciences, University of Glasgow, Glasgow, UK. Additional authors for this research include M. Oncology - Non-Small Cell Lung Cancer

Reports Outline Non-Small Cell Lung Cancer Study Results from University of Chicago (Systemic therapies in the treatment of non-small-cell lung cancer brain metastases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Non-Small Cell Lung Cancer is the subject of a report. According to news reporting originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Non-small-cell lung cancer (NSCLC) brain metastases are common. Even though there are various subsets of NSCLC with molecular alterations, there is a common theme of brain metastases."

Our news editors obtained a quote from the research from the University of Chicago, "Current treatment modalities are suboptimal. Systemic therapies for the treatment of NSCLC brain metastases have been explored and recent advances may pave the way for their successful employment in this patient population. While no specific agents have been associated with a marked benefit, stability of disease as well as radiographic responses have been noted in some patients."

According to the news editors, the research concluded: "Biological activity of systemic therapies in some patients with NSCLC brain metastases raises hope for future advances and supports further investigation for this patient population with limited treatment options."

The news editors report that additional information may be obtained by contacting R.V. Lukas, Dept. of Neurology, University of Chicago, Chicago, IL, United States. Additional authors for this research include P. Kumthekar, S. Rizvi and R. Salgia.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2217/fon.16.17. This DOI is a link to an online electronic document that is either free or for purchase.

Life Science Research - Nucleic Acids Research

Reports Outline Nucleic Acids Research Study Findings from University of North Carolina (Selective single cell isolation for genomics using microraft arrays)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Nucleic Acids Research have been published. According to news reporting originating from Chapel Hill, North Carolina, by NewsRx correspondents, research stated, "Genomic methods are used increasingly to
interrogate the individual cells that compose specific tissues. However, current methods for
single cell isolation struggle to phenotypically differentiate specific cells in a heterogeneous
population and rely primarily on the use of fluorescent markers."

Our news editors obtained a quote from the research from the University of North
Carolina, "Many cellular phenotypes of interest are too complex to be measured by this
approach, making it difficult to connect genotype and phenotype at the level of individual cells.
Here we demonstrate that microraft arrays, which are arrays containing thousands of individual
cell culture sites, can be used to select single cells based on a variety of phenotypes, such as cell
surface markers, cell proliferation and drug response. We then show that a common genomic
procedure, RNA-seq, can be readily adapted to the single cells isolated from these rafts. We
show that data generated using micrafts and our modified RNA-seq protocol compared
favorably with the Fluidigm C1. We then used microraft arrays to select pancreatic cancer cells
that proliferate in spite of cytotoxic drug treatment."

According to the news editors, the research concluded: "Our single cell RNA-seq
data identified several expected and novel gene expression changes associated with early drug
resistance."

For more information on this research see: Selective single cell isolation for

**Proteins - Nucleoproteins**

**Reports Outline Nucleoproteins Study Results from Tokyo Women's Medical University (Action mechanisms of histone deacetylase inhibitors in the treatment of hematological malignancies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- New research on Proteins - Nucleoproteins is the subject of a report.
According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Histone
deacetylases (HDACs) critically regulate gene expression by determining the acetylation status
of histones. Studies have increasingly focused on the activities of HDACs, especially involving
non-histone proteins, and their various biological effects."

Our news journalists obtained a quote from the research from Tokyo Women's
Medical University, "Aberrant HDAC expression observed in several kinds of human tumors makes HDACs potential targets for cancer treatment. Several preclinical studies have suggested that HDAC inhibitors show some efficacy in the treatment of acute myelogenous leukemia with AML1-ETO, which mediates transcriptional repression through its interaction with a complex including HDAC1. Recurrent mutations in epigenetic regulators are found in T-cell lymphomas (TCLs), and HDAC inhibitors and hypomethylating agents were shown to act cooperatively in the treatment of TCLs. Preclinical modeling has suggested that persistent activation of the signal transducer and activator of transcription signaling pathway could serve as a useful biomarker of resistance to HDAC inhibitor in patients with cutaneous TCL. Panobinostat, a pan-HDAC inhibitor, in combination with bortezomib and dexamethasone, has achieved longer progression-free survival in patients with relapsed/refractory multiple myeloma (MM) than the placebo in combination with bortezomib and dexamethasone. Panobinostat inhibited MM cell growth by degrading protein phosphatase 3 catalytic subunit (PPP3CA), a catalytic subunit of calcineurin. This degradation was suggested to be mediated by the blockade of the chaperone function of heat shock protein 90 due to HDAC6 inhibition. Aberrant PPP3CA expression in advanced MM indicated a possible correlation between high PPP3CA expression and the pathogenesis of MM."

According to the news editors, the research concluded: "Furthermore, PPP3CA was suggested as a common target of panobinostat and bortezomib."

Our news journalists report that additional information may be obtained by contacting Y. Imai, Tokyo Women's Medical University, Dept. of Hematol, Tokyo, Japan. Additional authors for this research include Y. Maru and J. Tanaka.

representative sample of adolescents in grades 7 to 12 (n = 18,200), cross-classified multilevel modeling was used to examine the fixed and random effects of individuals, schools, and neighborhoods on adolescent BMI."

The news reporters obtained a quote from the research from Children's Hospital, "Additionally, the ability of school and neighborhood demographics to explain racial/ethnic disparities in BMI was assessed. There were 18,200 students nested in 128 schools and 2,259 neighborhoods, with 2,757 unique combinations of schools and neighborhoods. In girls, schools (v(ojk) = 0.18, CI: 0.06-0.33) contributed twice that of neighborhoods (u(ojk) = 0.08, CI: 0.01-0.20) to the variance in BMI, while in males, schools (u(ojk) = 0.15, CI: 0.05-0.30) and neighborhoods (v(ojk) = 0.16, CI: 0.05-0.31) had similar contributions. The interaction of the neighborhood and school random effects contributed significantly to the variance of male and female BMI. Characteristics of neighborhoods and schools explained a large portion of the racial/ethnic disparity in female BMI. In an analysis of a nationally representative sample including multiple racial and ethnic groups, the BMI variance of adolescent females was associated with schools more than neighborhoods."

According to the news reporters, the research concluded: "In males, there was no difference in school or neighborhood association with BMI."

For more information on this research see: Disentangling Overlapping Influences of Neighborhoods and Schools on Adolescent Body Mass Index. *Obesity*, 2016;24(12):2570-2577. *Obesity* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. **Respiratory Tract Diseases and Conditions** - ...

**Reports Outline Obstructive Sleep Apnea Study Results from Fudan University (A Novel Method for Sensitive Determination of Subclinical Left-Ventricular Systolic Dysfunction in Subjects With Obstructive Sleep Apnea)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea is the subject of a report. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "This study was to evaluate the subclinical left-ventricular (LV) systolic dysfunction with 2-dimensional speckle-tracking echocardiography in subjects with obstructive sleep apnea (OSA) with normal left ventricular ejection fraction and without any confounding disease that can cause myocardial dysfunction. Nineteen healthy individuals and 60 subjects with OSA were included in this study."

The news reporters obtained a quote from the research from Fudan University,
According to the severity of disease, OSA subjects were examined in 3 groups: mild, moderate, and severe OSA. LV apical views (for longitudinal strain) and short-axis views (for circumferential strain) were acquired for evaluation. Three-layer longitudinal strain values and circumferential strain values were determined for each view, and averages of these were used in comparison with other groups. Three-layer longitudinal strain values of the subjects with OSA were lower than those of the healthy individuals, and these values were decreased along with the OSA severity. The difference was significant between severe OSA and all other groups. Three-layer circumferential strain values of the OSA subjects were lower than those of the healthy individuals, and the difference was significant between the control group and all other groups. The apnea hypopnea index was found to be correlated with the 3-layer longitudinal strain \((r=-0.74, p<.001; r=-0.72, p<.001; r=-0.69, p=.001)\). Three-layer longitudinal and circumferential LV systolic functions in OSA subjects with normal left ventricular ejection fraction are deteriorated in the subclinical stage.

According to the news reporters, the research concluded: "Two-dimensional speckle-tracking echocardiography can be used as an effective method in the determination of subclinical myocardial dysfunction in subjects with OSA."

For more information on this research see: A Novel Method for Sensitive Determination of Subclinical Left-Ventricular Systolic Dysfunction in Subjects With Obstructive Sleep Apnea. Respiratory Care, 2015;61(3):366-75.

Respiratory Tract Diseases and Conditions -...

Reports Outline Obstructive Sleep Apnea Study Results from State University of Campinas (Morbidity and Mortality Rates After Maxillomandibular Advancement for Treatment of Obstructive Sleep Apnea)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea have been published. According to news reporting out of Campinas, Brazil, by NewsRx editors, research stated, "To compare morbidity and mortality rates in obstructive sleep apnea (OSA) versus dentofacial deformity (DFD) patients undergoing equivalent maxillofacial surgical procedures. Patients with OSA who underwent
maxillomandibular advancement with genial tubercle advancement in the Massachusetts General Hospital Department of Oral and Maxillofacial Surgery from December 2002 to June 2011 were matched to patients with DFD undergoing similar maxillofacial procedures during the same period."

Our news journalists obtained a quote from the research from the State University of Campinas, "They were compared regarding demographic variables, medical comorbidities, perioperative management, intraoperative complications, early and late postoperative complications, and mortality rate. A study group of 28 patients with OSA and a control group of 26 patients with DFD were compared. The patients with OSA were older (41.9 +/- 12.5 years vs 21.7 +/- 8.6 years), had a higher American Society of Anesthesiologists classification (2.0 +/- 0.5 vs 1.3 +/- 0.6), and had a higher body mass index (29.6 +/- 4.7 kg/m(2) vs 23.0 +/- 3.1 kg/m (2)). They also had a greater number of medical comorbidities (2.4 +/- 2.3 vs 0.7 +/- 1.0). More OSA patients than DFD patients had complications (28 [100%] vs 19 [73%], P = .003), and the total number of complications in the OSA group was higher (108 vs 33, P< .001). Of the complications, 13.9% in the OSA group and 3.0% in the DFD group were classified as major. The absolute risk of a complication was 3.9 for the OSA group versus 1.3 for the DFD group. The relative risk of complications in OSA patients compared with DFD patients was 3.0. No difference in mortality rate was found. The patients in the OSA group were older, had more comorbidities, and ultimately had a greater number of early, late, minor, and major complications than those in the DFD group. The incidence of death in both groups was zero."

According to the news editors, the research concluded: "Maxillomandibular advancement appears to be a safe procedure regarding mortality rate, but OSA patients should be counseled preoperatively regarding the relative increased risk of complications."

Our news journalists report that additional information may be obtained by contacting L.A. Passeri, Campinas State University, Sch Med Sci, Dept. of Surg, Oral & Maxillofacial Surg, Campinas, SP, Brazil. Additional authors for this research include J.G. Choi, L.B. Kaban and E.T. Lahey.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.joms.2016.04.005. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology

Reports Outline Oncology Study Findings from University of Insubria (RNASET2 silencing affects miRNAs and target gene expression pattern in a human ovarian cancer cell model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology. According to news reporting from Varese, Italy, by NewsRx journalists, research stated, "Ribonucleases (RNases) are hydrolytic enzymes endowed with the ability to either process or degrade ribonucleic acids. Among the many biological functions assigned to RNases, a growing attention has been recently devoted to the control of cancer growth, in the attempt to bring novel therapeutic approaches to clinical oncology."

The news correspondents obtained a quote from the research from the University of Insubria, "Indeed, several enzymes belonging to different ribonuclease families have been reported in the last decade to display a marked oncosuppressive activity in a wide range of experimental models. The human RNASET2 gene, the only member of the highly conserved T2/Rh/S family of endoribonucleolytic enzymes described in our species, has been shown to display oncosuppressive roles in both in vitro and in vivo models representing several human malignancies. In the present study, we extend previous findings obtained in ovarian cancer models to shed further light on the cell-autonomous roles played by this gene in the context of its oncosuppressive role and to show that RNASET2 silencing can significantly affect the transcriptional output in one of the most thoroughly investigated human ovarian cancer cell lines."

According to the news reporters, the research concluded: "Moreover, we report for the first time that RNASET2-mediated changes in the cell transcriptome are in part mediated by its apparent ability to affect the cell's microRNA expression pattern."

Our news journalists report that additional information may be obtained by contacting F. Acquati, University of Insubria, Dept. of Biotechnol & Life Sci, Varese, Italy. Additional authors for this research include D. Scaldaferri, M. Fabbri, L. Monti, M. Lualdi, E. Pedrini, L. Gribaldo, R. Taramelli and F. Acquati.

Keywords for this news article include: Varese, Italy, Europe, Cancer, Genetics, Oncology, University of Insubria.

Oncology - Osteosarcomas

Reports Outline Osteosarcomas Study Findings from Hebei Medical University (The tumor suppressor miR-124 inhibits cell proliferation and invasion by targeting B7-H3 in osteosarcoma)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Osteosarcomas is now available. According to news originating from Shijiazhuang, People's Republic of China, by NewsRx correspondents, research stated, "Our previous studies have shown that the expression level of B7 homolog 3 (B7-H3) was correlated with clinical staging and prognosis of osteosarcoma (OS) patients, and its silencing inhibited the proliferation and invasion of OS cells in vitro. However, its overexpression mechanism behind was far from elucidated."

Our news journalists obtained a quote from the research from Hebei Medical University, "On the basis of bioinformatics and the preliminary screening data, we hypothesized that miR-124 might play an important role in OS development and as a lead candidate for modulating B7-H3 expression. In this study, we found that miR-124 was downregulated significantly in OS tumor tissue, compared to normal adjacent tissues (NATs). Lower miR-124 expression levels were associated with advanced Enneking stage, lower tumor differentiation, and common pulmonary metastasis. The 5-year overall survival rate in the miR-124 upregulated group was 61.5 %, while with low miR-124 expression, only 11.8 % survived. Further studies in vitro showed that B7-H3 was a direct target of miR-124. Overexpression of miR-124 decreased B7-H3 mRNA and protein level and inhibited B7-H3 3'-UTR reporter activity. Treatment of OS cells with miR-124 mimics induced the inhibition of cell growth and invasion in vitro, which could be abrogated by transfected by B7-H3 expression vector."

According to the news editors, the research concluded: "Our findings highlight the potential application of miR-124 as a novel onco-miRNA in OS, and its oncogenic effects are mediated chiefly through downregulation of B7-H3, thus suggesting a model for identifying miR-124 that can be exploited to improve the therapeutic potential efficacy of mAb targeting to B7-H3."

The news correspondents report that additional information may be obtained from B.E. Shan, Hebei Medical University, Hosp 4, Canc Res Inst, Shijiazhuang, Hebei, People's Republic of China. Additional authors for this research include F.B. Kang, N. Sun, J. Wang, W. Chen, D. Li and B.E. Shan.

Membrane Proteins - Pattern Recognition Receptors

Reports Outline Pattern Recognition Receptors Study Findings from Oregon Health and Science University (Mesenchymal Stromal Cell-derived Extracellular Vesicles Promote Myeloid-biased Multipotent Hematopoietic Progenitor Expansion via Toll-Like ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Membrane Proteins - Pattern Recognition Receptors have been published. According to news originating from Portland, Oregon, by NewsRx correspondents, research stated, "Mesenchymal stromal cells (MSCs) present in the bone marrow microenvironment secrete cytokines and angiogenic factors that support the maintenance and regenerative expansion of hematopoietic stem and progenitor cells (HSPCs). Here, we tested the hypothesis that extracellular vesicles (EVs) released by MSCs contribute to the paracrine crosstalk that shapes hematopoietic function."

Our news journalists obtained a quote from the research from Oregon Health and Science University, "We systematically characterized EV release by murine stromal cells and demonstrate that MSC-derived EVs prompt a loss of HSPC quiescence with concomitant expansion of murine myeloid progenitors. Our studies reveal that HSPC expansion by MSC EVs is mediated via the MyD88 adapter protein and is partially blocked by treatment with a TLR4 inhibitor. Imaging of fluorescence protein-tagged MSC EVs corroborated their cellular co-localization with TLR4 and endosomal Rab5 compartments in HSPCs. The dissection of downstream responses to TLR4 activation reveals that the mechanism by which MSC EVs impact HSPCs involves canonical NF-kappa B signaling and downstream activation of Htf-1a and CCL2 target genes."

According to the news editors, the research concluded: "Our aggregate data identity a previously unknown role for MSC-derived EVs in the regulation of hematopoiesis through innate immune mechanisms and illustrate the expansive cell-cell crosstalk in the bone marrow microenvironment."

The news correspondents report that additional information may be obtained from P. Kurre, Oregon Health Sciences University, Pediat Canc Biol Program, Portland, OR 97239, United States. Additional authors for this research include S.C. Verghese, Y.M. Yoon, O. Taratula, D.L. Marks and P. Kurre.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.745653. This DOI is a link to an online electronic document that is either free or for purchase.

Reports Outline Penicillins Study Findings from University of Notre Dame (In Vitro and In Vivo Synergy of the Oxadiazole Class of Antibacterials with beta-Lactams)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Penicillins are presented in a new report. According to news reporting originating in Notre Dame, Indiana, by NewsRx journalists, research stated, "The oxadiazole antibacterials target the bacterial cell wall and are bactericidal. We investigated the synergism of ND-421 with the commonly used beta-lactams and non-beta-lactam antibiotics by the checkerboard method and by time-kill assays."

The news reporters obtained a quote from the research from the University of Notre Dame, "ND-421 synergizes well with beta-lactam antibiotics, and it also exhibits a long postantibiotic effect (4.7 h). We also evaluated the in vivo efficacy of ND-421 in a murine neutropenic thigh infection model alone and in combination with oxacillin. ND-421 has in vivo efficacy by itself in a clinically relevant infection model (1.49 log(10) bacterial reduction for ND-321 versus 0.36 log(10) for linezolid with NRS119) and acts synergistically with beta-lactam antibiotics in vitro and in vivo, and the combination of ND-421 with oxacillin is efficacious in a mouse neutropenic thigh methicillin-resistant Staphylococcus aureus (MRSA) infection model (1.60 log(10) bacterial reduction)."

According to the news reporters, the research concluded: "The activity of oxacillin was potentiated in the presence of ND-421, as the strain would have been resistant to oxacillin otherwise."

For more information on this research see: In Vitro and In Vivo Synergy of the Oxadiazole Class of Antibacterials with beta-Lactams. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5581-5588. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting M.L. Chang, University of Notre Dame, Dept. of Chem & Biochem, Notre Dame, IN 46556, United States. Peptides and Proteins

Reports Outline Peptides and Proteins Study Findings from National Heart Lung and Blood Institute (Peptide affinity analysis of proteins that bind to an unstructured region containing the transactivating domain of the osmoprotective ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Peptides and Proteins. According to news originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "NFAT5 is a transcription factor originally identified because it is activated by hypertonicity and that activation increases expression of genes that protect against the adverse effects of the hypertonicity. However, its targets also include genes not obviously related to tonicity."

Our news journalists obtained a quote from the research from National Heart Lung and Blood Institute, "The transactivating domain of NFAT5 is contained in its COOH-terminal region, which is predicted to be unstructured. Unstructured regions are common in transcription factors particularly in transactivating domains where they can bind co-regulatory proteins essential to their function. To identify potential binding partners of NFAT5 from either cytoplasmic or nuclear HEK293 cell extracts, we used peptide affinity chromatography followed by mass spectrometry. Peptide aptamerbaits consisted of overlapping 20 amino acid peptides within the predicted COOH-terminal unstructured region of NFAT5. We identify a total of 351 unique protein preys that associate with at least one COOH-terminal peptide bait from NFAT5 in either cytoplasmic or nuclear extracts from cells incubated at various tonicities (NaCl varied). In addition to finding many proteins already known to associate with NFAT5, we found many new ones whose function suggest novel aspects of NFAT5 regulation, interaction, and function. Relatively few of the proteins pulled down by peptide baits from NFAT5 are generally involved in transcription, and most, therefore, are likely to be specifically related to the regulation of NFAT5 or its function."

According to the news editors, the research concluded: "The novel associated proteins are involved with cancer, effects of hypertonicity on chromatin, development, splicing of mRNA, transcription, and vesicle trafficking."

For more information on this research see: Peptide affinity analysis of proteins that bind to an unstructured region containing the transactivating domain of the osmoprotective transcription factor NFAT5. *Physiological Genomics*, 2016;48(11):835-849. *Physiological Genomics* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

The news correspondents report that additional information may be obtained from M.B. Reports Outline Pharmaceutical Research Study Results from Ben-Gurion University of the Negev (Segmental-dependent permeability throughout the small intestine following oral drug administration: Single-pass vs. Doluisio approach to in-situ rat ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Pharmaceutical Research. According to news reporting originating from Beer Sheva, Israel, by NewsRx correspondents, research stated, "Intestinal drug permeability is position dependent and pertains to a specific point along the intestinal membrane, and the resulted segmental-dependent permeability phenomenon has been recognized as a critical factor in the overall absorption of drug following oral administration. The aim of this research was to compare segmental-dependent permeability data obtained from two different rat intestinal perfusion approaches: the single-pass intestinal perfusion (SPIP) model and the closed-loop (Doluisio) rat perfusion method."

Our news editors obtained a quote from the research from the Ben-Gurion University of the Negev, "The rat intestinal permeability of 12 model drugs with different permeability characteristics (low, moderate, and high, as well as passively and actively absorbed) was assessed in three small intestinal regions: the upper jejunum, mid-small intestine, and the terminal ileum, using both the SPIP and the Doluisio experimental methods. Excellent correlation was evident between the two approaches, especially in the upper jejunum (R-2 = 0.95). Significant regional-dependent permeability was found in half of drugs studied, illustrating the importance and relevance of segmental-dependent intestinal permeability. Despite the differences between the two methods, highly comparable results were obtained by both methods, especially in the medium-high P-eff range."

According to the news editors, the research concluded: "The SPIP and the Doluisio method are both equally useful in obtaining crucial segmental-dependent intestinal permeability data."

The news editors report that additional information may be obtained by contacting A. Dahan, Ben Gurion University of the Negev, Fac Hlth Sci, Sch Pharm, Dept. of Clín Pharmacol, Beer Sheva, Israel. Additional authors for this research include M. Zur, A. Beig, N. Fine, Y. Cohen, M. Gonzalez-Alvarez, M. Merino-Sanjuan, I. Gonzalez-Alvarez, M. Bermejo and A. Dahan.

Reports Outline Pharmacogenetics Study Findings from University of Auckland (CYP2C19 and CYP2D6 genotypes in Pacific peoples)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Pharmacogenetics are presented in a new report. According to news reporting from Auckland, New Zealand, by NewsRx editors, the research stated, "The study of pharmacogenetic variants in populations which reside in Oceania has been focused mainly on CYP2C19 and CYP2D6. Statements about the high prevalence of CYP2C19 no function genotype in Pacific Islanders' can be found in the literature."

The news correspondents obtained a quote from the research from the University of Auckland, "This review article summarizes the published information about these pharmacogenes in this geographical region and highlights the differences observed between Melanesian and Polynesian populations. It is not appropriate to combine the prevalence data of pharmacogenetic variants, particularly CYP2C19, across this region."

According to the news reporters, the research concluded: "Indeed, apocryphal assumptions about CYP2C19 no function alleles and possible effect on the therapeutic activity of clopidogrel are unhelpful and reiterate the importance of assessing the individual patient rather than relying on inappropriate ethnicity-based assumptions for drug dosing decisions."

Our news journalists report that additional information may be obtained by contacting N.A. Helsby, University of Auckland, Sch Med Sci, Auckland, New Zealand.

Keywords for this news article include: Auckland, New Zealand, Australia and New Zealand, Pharmaceuticals, Article Review, Pharmacogenetics, University of Auckland.

Reports Outline Pharmacokinetics Study Results from Chengdu University (y Effect of Chemical Profiling Change of Processed Magnolia officinalis on the Pharmacokinetic Profiling of Honokiol and Magnolol in Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacokinetics. According to news reporting originating from Chengdu, People's Republic of China, by NewsRx correspondents,
research stated, "The stem of Magnoliae officinalis (MO) cortex is always preliminarily processed before being applied in traditional Chinese medicine. The definite bioavailability of honokiol (HO) and magnolol (MA) in processed MO (PMO) and the effect of chemical profiling change on the pharmacokinetics of HO and MA are always a greater challenge compared with those of MO."

Our news editors obtained a quote from the research from Chengdu University, "Compared with that of MO, the pharmacokinetic profiling of HO and MA in the PMO was significantly changed and the mean T-max of HO and MA was increased by 31 and 50% (P < 0.05), respectively; the mean AUC(0-t) and C-max of HO were increased by 36 and 24% (P < 0.05), respectively. Subsequently, the chemical profiling of MO and PMO was investigated by a simple and rapid LC-Q/TOF-MS coupled with multivariate analysis method. Principal component analysis and hierarchical cluster analysis of the chromatographic data demonstrated that the chemical profiling of PMO was significantly different from that of MO. Eight marker components including six alkaloids (magnocurarine, magnoflorine, roemerine and three unidentified peaks) and two lignans (obovatol and MA) were screened out by partial least-squares discriminant analysis."

According to the news editors, the research concluded: "The results indicated that the changes of eight marker components of PMO may have an effect on the pharmacokinetic profiles of HO and MA."

The news editors report that additional information may be obtained by contacting Z.G. Wang, Chengdu Univ, Sch Med & Nursing, Metabon Synergy Innovat Lab, Chengdu 610106, People's Republic of China. Additional authors for this research include Z.G. Wang, W. Hua, Y. You and L. Zou.

**Pharmacology**

**Reports Outline Pharmacology Findings from University of York (Are Non-Pharmacological Interventions Effective in Reducing Drug Use and Criminality? A Systematic and Meta-Analytical Review with an Economic Appraisal of These Interventions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pharmacology have been published. According to news reporting from York, United Kingdom, by NewsRx journalists, research stated, "The numbers of incarcerated people suffering from drug dependence has steadily risen since the 1980s and only a small proportion of these receive appropriate treatment. A systematic review to evaluate the effectiveness and economic evidence of non-pharmacological interventions for drug
using offenders was conducted."

The news correspondents obtained a quote from the research from the University of York, "Cochrane Collaboration criteria were used to identify trials across 14 databases between 2004 and 2014. A series of meta-analyses and an economic appraisal were conducted. 43 trials were identified showing to have limited effect in reducing re-arrests RR 0.97 (95% CI 0.89-1.07) and drug use RR 0.90 (95% CI 0.80-1.00) but were found to significantly reduce re-incarceration RR 0.70 (95% CI 0.57-0.85). Therapeutic community programs were found to significantly reduce the number of re-arrests RR 0.70 (95% CI 0.56-0.87). 10 papers contained economic information. One paper presented a cost-benefit analysis and two reported on the cost and cost effectiveness of the intervention. We suggest that therapeutic community interventions have some benefit in reducing subsequent re-arrest."

According to the news reporters, the research concluded: "We recommend that economic evaluations should form part of standard trial protocols."

Our news journalists report that additional information may be obtained by contacting A.E. Perry, University of York, Dept. of Hlth Sci, Mental Hlth & Addict Res Grp, York YO10 5DD, N Yorkshire, United Kingdom. Additional authors for this research include R. Woodhouse, M. Neilson, M.M. St James, J. Glanville, C. Hewitt and D. Trepel.

Drugs and Therapies - Pharmacy Practice

Reports Outline Pharmacy Practice Findings from University of Mississippi (Understanding pharmacist success in practice: A scoping review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmacy Practice. According to news originating from Jackson, Mississippi, by NewsRx correspondents, research stated, "The objective was to identify literature providing a description of characteristics contributing to pharmacists' individual level success in providing advanced patient care. An interpretive scoping review was conducted to synthesize knowledge and address the study objective."

Our news journalists obtained a quote from the research from the University of Mississippi, "Searches were undertaken in Ovid MEDLINE (1946-2015), EMBASE (1974-2015), and International Pharmaceutical Abstracts (1970-2015). Not applicable. Specific keywords used in the search included: motivation, attitude, career, clinical competence, certification, pursuit of an expanded scope of practice, pharmacist, and success. This was not intended to be an exhaustive list, and every effort was made to be inclusive as the search
revealed additional words and phrases of interest. A total of 93 articles were initially identified, 10 articles met inclusion criteria and were retained for full-text analysis. Most of the included articles were published in the United States (70%). One-third of the articles conducted semi-structured interviews, one-third of the articles were editorials or commentaries, and the remaining articles collected data using surveys, knowledge assessments, and observation. Content analysis of the extracted definitions of success yielded 2 themes; 'what successful pharmacists do' and 'what successful pharmacists should be.' Conclusion: Professional organizations representing pharmacy have made significant strides in advocating for pharmacists’ provision of advanced patient care.

According to the news editors, the research concluded: "If pharmacists are to successfully provide advanced patient care a more specific and practically-oriented understanding that accounts for individual and environmental factors of how to achieve individual level success is needed.

The news correspondents report that additional information may be obtained from M.M. Rosenthal, University of Mississippi, Sch Pharm, Dept. of Pharm Adm, Jackson, MS 38677, United States. **Phenothiazines**

**Reports Outline Phenothiazines Findings from Department of Psychology (Methylene Blue Facilitates Memory Retention in Zebrafish in a Dose-Dependent Manner)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Phenothiazines is now available. According to news reporting from Hattiesburg, Mississippi, by NewsRx journalists, research stated, "Methylene blue (MB) is an FDA-grandfathered drug with memory-enhancing effects at low doses, but opposite effects at high doses. We investigated the effects of four MB doses (0.1, 0.5, 5.0, or 10.0M) on zebrafish memory retention in the T-maze task."

The news correspondents obtained a quote from the research from the Department of Psychology, "After training fish to swim into a certain arm of the T-maze, the fish were placed into a tank containing one of the four MB doses or a control tank containing blue food dye. Subsequently, fish were placed into the T-maze for memory retention testing. Results indicated that MB produced hormetic dose-response effects on memory. Fish that received the 0.5M dose performed significantly better at the T-maze than those that received higher doses. Fish who received 5.0M did not exhibit a significant difference in performance from control fish, and the fish that received the 10.0M dose performed significantly worse than lower doses."
According to the news reporters, the research concluded: "These findings support the utility of zebrafish in comparative research and their potential value for testing of MB and other neuropsychopharmacological treatments in animal models of memory disorders."

For more information on this research see: Methylene Blue Facilitates Memory Retention in Zebrafish in a Dose-Dependent Manner. Zebrafish, 2016;13(6):489-494. Life Science Research - Physiology

Reports Outline Physiology Study Results from Lund University (Emerging roles of the myocardin family of proteins in lipid and glucose metabolism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Life Science Research - Physiology. According to news reporting from Lund, Sweden, by NewsRx journalists, research stated, "Members of the myocardin family bind to the transcription factor serum response factor (SRF) and act as coactivators controlling genes of relevance for myogenic differentiation and motile function. Binding of SRF to DNA is mediated by genetic elements called CArG boxes, found often but not exclusively in muscle and growth controlling genes."

The news correspondents obtained a quote from the research from Lund University, "Studies aimed at defining the full spectrum of these CArG elements in the genome (i.e. the CArGome) have in recent years, unveiled unexpected roles of the myocardin family proteins in lipid and glucose homeostasis. This coactivator family includes the protein myocardin (MYOCD), the myocardin-related transcription factors A and B (MRTF-A/MKL1 and MRTF-B/MKL2) and MASTR (MAMSTR). Here we discuss growing evidence that SRF-driven transcription is controlled by extracellular glucose through activation of the Rho-kinase pathway and actin polymerization. We also describe data showing that adipogenesis is influenced by MLK activity through actions upstream of peroxisome proliferator-activated receptor, with consequences for whole body fat mass and insulin sensitivity. The recently demonstrated involvement of myocardin coactivators in the biogenesis of caveolae, Omega-shaped membrane invaginations of importance for lipid and glucose metabolism, is finally discussed. These novel roles of myocardin proteins may open the way for new unexplored strategies to combat
metabolic diseases such as diabetes, which, at the current incidence, is expected to reach 333 million people worldwide by 2025. This review highlights newly discovered roles of myocardin-related transcription factors in lipid and glucose metabolism as well as novel insights into their well-established role as mediators of stretch-dependent effects in smooth muscle. As co-factors for serum response factor (SRF), MKLs regulates transcription of genes involved in the contractile function of smooth muscle cells. In addition to mechanical stimuli, this regulation has now been found to be promoted by extracellular glucose levels in smooth muscle. Recent reports also suggest that MKLs can regulate a subset of genes involved in the formation of lipid-rich invaginations in the cell membrane called caveolae."

According to the news reporters, the research concluded: "Finally, a potential role of MKLs in non-muscle cells has been discovered as they negatively influence adipocyte differentiation."

Our news journalists report that additional information may be obtained by contacting S. Albinsson, Lund University, Dept. of Expt Med Sci, Lund, Sweden. Additional authors for this research include K.G. Stenkula, C. Rippe, A. Alajbegovic, M.F. Gomez and S. Albinsson.

Lung Diseases and Conditions - Pneumonia

**Reports Outline Pneumonia Findings from Army General Hospital**

**Healthcare-associated Pneumonia: Clinical Features and Retrospective Analysis Over 10 Years**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Pneumonia have been published. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Healthcare-associated pneumonia (HCAP) is associated with drug-resistant pathogens and high mortality, and there is no clear evidence that this is due to inappropriate antibiotic therapy. This study was to elucidate the clinical features, pathogens, therapy, and outcomes of HCAP, and to clarify the risk factors for drug-resistant pathogens and prognosis."

Our news journalists obtained a quote from the research from Army General Hospital, "Retrospective observational study among hospitalized patients with HCAP over 10 years. The primary outcome was 30-day all-cause hospital mortality after admission. Demographics (age, gender, clinical features, and comorbidities), dates of admission, discharge and/or death, hospitalization costs, microbiological results, chest imaging studies, and CURB-65 were analyzed. Antibiotics, admission to Intensive Care Unit (ICU), mechanical ventilation, and pneumonia prognosis were recorded. Patients were dichotomized based on CURB-65 (low-vs. high-risk). Among 612 patients (mean age of 70.7 years), 88.4% had at least one comorbidity."
Commonly detected pathogens were *Acinetobacter baumannii*, *Pseudomonas aeruginosa*, and coagulase-negative staphylococci. Initial monotherapy with β-lactam antibiotics was the most common initial therapy (50%). Mean age, length of stay, hospitalization expenses, ICU admission, mechanical ventilation use, malignancies, and detection rate for *P. aeruginosa*, and *Staphylococcus aureus* were higher in the high-risk group compared with the low-risk group. CURB-65 (≥3), malignancies, and mechanical ventilation were associated with an increased mortality. Logistic regression analysis showed that cerebrovascular diseases and being bedridden were independent risk factors for HCAP. Initial treatment of HCAP with broad-spectrum antibiotics could be an appropriate approach.

According to the news editors, the research concluded: "CURB-65 (≥)3, malignancies, and mechanical ventilation may result in an increased mortality."

Our news journalists report that additional information may be obtained by contacting L.A. Chen, Dept. of Respiratory Medicine, Chinese People's Liberation Army General Hospital, Beijing 100853, People's Republic of China. Additional authors for this research include G.X. Zhang, D.Y. She, Z.X. Liang, R.T. Wang, Z. Yang, L.A. Chen and J.C Cui.

macrolones, a novel class of macrolide antibiotics, against key respiratory pathogens was evaluated in vitro and in vivo."

Our news journalists obtained a quote from the research from the University of Zagreb, "MIC values against Streptococcus pneumoniae, Streptococcus pyogenes, Staphylococcus aureus, and Haemophilus influenzae strains sensitive to macrolide antibiotics and with defined macrolide resistance mechanisms were determined. The propensity of macrolones to induce the expression of inducible erm genes was tested by the triple-disk method and incubation in the presence of subinhibitory concentrations of compounds. In vivo efficacy was assessed in a murine model of S. pneumoniae-induced pneumonia, and pharmacokinetic (PK) profiles in mice were determined. The in vitro antibacterial profiles of macrolones were superior to those of marketed macrolide antibiotics, including the ketolide telithromycin, and the compounds did not induce the expression of inducible erm genes. They acted as typical protein synthesis inhibitors in an Escherichia coli transcription/translation assay. Macrolones were characterized by low to moderate systemic clearance, a large volume of distribution, a long half-life, and low oral bioavailability. They were highly efficacious in a murine model of pneumonia after intraperitoneal application even against an S. pneumoniae strain with constitutive resistance to macrolide-lincosamide-streptogramin B antibiotics."

According to the news editors, the research concluded: "Macrolones are the class of macrolide antibiotics with an outstanding antibacterial profile and reasonable PK parameters resulting in good in vivo efficacy."

For more information on this research see: Macrolones Are a Novel Class of Macrolide Antibiotics Active against Key Resistant Respiratory Pathogens In Vitro and In Vivo. Antimicrobial Agents and Chemotherapy, 2016;60(9):5337-5348. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Liver Diseases and Conditions - Portal Hypertension are discussed in a new report. According to news reporting out of Nottingham, United Kingdom, by NewsRx editors, research stated, "Hepatic venous pressure gradient (HVPG) measurement is currently the only validated technique to accurately evaluate changes in portal pressure. In this study, we evaluate the use of non-contrast quantitative magnetic resonance imaging (MRI) as a surrogate measure of portal pressure."

Our news journalists obtained a quote from the research from the University of Nottingham, "Thirty patients undergoing HVPG measurement were prospectively recruited. MR parameters of longitudinal relaxation time (T-1), perfusion of the liver and spleen (by arterial spin labelling), and blood flow in the portal, splanchnic and collateral circulation (by phase contrast MRI) were assessed. We estimated the liver stiffness measurement (LSM) and enhanced liver fibrosis (ELF) score. The correlation of all non-invasive parameters with HVPG was evaluated. The mean (range) HVPG of the patients was 9.8 (1-22) mmHg, and 14 patients (48%) had clinically significant portal hypertension (CSPH, HVPG 10 mmHg). Liver T1 relaxation time, splenic artery and superior mesenteric artery velocity correlated significantly with HVPG. Using multiple linear regression, liver T1 and splenic artery velocity remained as the two parameters in the multivariate model significantly associated with HVPG (R = 0.90, p <0.001). This correlation was maintained in patients with CSPH (R = 0.85, p<0.001). A validation cohort (n = 10) showed this linear model provided a good prediction of HVPG. LSM and ELF score correlated significantly with HVPG in the whole population but the correlation was absent in CSPH. MR parameters related to both hepatic architecture and splanchnic haemodynamics correlate significantly with HVPG. This proposed model, confirmed in a validation cohort, could replace the invasive HVPG measurement. Lay summary: In patients with cirrhosis, the development and progression of portal hypertension is related to worse outcomes. However, the standard technique of assessing portal pressure is invasive and not widely used in clinical practice. Here, we have studied the use of non-invasive MRI in evaluating portal pressure. The MRI measures of liver architecture and blood flow in the splenic artery correlated well with portal pressure."

According to the news editors, the research concluded: "Therefore, this non-invasive method can potentially be used to assess portal pressure in clinical trials and monitoring treatment in practice."

Our news journalists report that additional information may be obtained by contacting G.P. Aithal, University of Nottingham, Nottingham NG7 2UH, United Kingdom. Peptide Proteins - Posterior Pituitary Hormones

Reports Outline Posterior Pituitary Hormones Study Findings from Tamagawa University (Relationship between Salivary Oxytocin Levels and Generosity in Preschoolers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Peptide Proteins - Posterior Pituitary Hormones are discussed in a new report. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "This study examined the association between salivary oxytocin (sOT) levels and generosity in preschoolers."

The news reporters obtained a quote from the research from Tamagawa University, "Fifty preschoolers played two dictator games (DG) by deciding how to allocate 10 chocolates between themselves and another child, who was either from the same class as the participant (ingroup member), or an unknown child from another class (outgroup member). sOT levels were assessed in saliva collected from the children immediately prior to the DG tasks. While sOT levels were negatively associated with allocations made to both ingroup and outgroup members by boys, among girls sOT levels were positively related to allocations made to ingroup members, and unrelated to allocations made to outgroup members."

According to the news reporters, the research concluded: "These results suggest sex differences in the association between salivary oxytocin and generosity."

For more information on this research see: Relationship between Salivary Oxytocin Levels and Generosity in Preschoolers. Scientific Reports, 2016:6():1-7. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Oncology - Prostate Cancer

Reports Outline Prostate Cancer Findings from Thomas Jefferson University (c-Src, Insulin-Like Growth Factor I Receptor, G-Protein-Coupled Receptor Kinases and Focal Adhesion Kinase are Enriched Into Prostate Cancer Cell Exosomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Prostate Cancer have been presented.
According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "It is well known that Src tyrosine kinase, insulin-like growth factor 1 receptor (IGF-IR), and focal adhesion kinase (FAK) play important roles in prostate cancer (PrCa) development and progression. Src, which signals through FAK in response to integrin activation, has been implicated in many aspects of tumor biology, such as cell proliferation, metastasis, and angiogenesis."

Our news editors obtained a quote from the research from Thomas Jefferson University, "Furthermore, Src signaling is known to crosstalk with IGF-IR, which also promotes angiogenesis. In this study, we demonstrate that c-Src, IGF-IR, and FAK are packaged into exosomes (Exo), c-Src in particular being highly enriched in Exo from the androgen receptor (AR)-positive cell line C4-2B and AR-negative cell lines PC3 and DU145. Furthermore, we show that the active phosphorylated form of Src (Src(pY416)) is co-expressed in Exo with phosphorylated FAK (FAK(pY861)), a known target site of Src, which enhances proliferation and migration. We further demonstrate for the first time exosomal enrichment of G-protein-coupled receptor kinase (GRK) 5 and GRK6, both of which regulate Src and IGF-IR signaling and have been implicated in cancer. Finally, Src(pY416) and c-Src are both expressed in Exo isolated from the plasma of prostate tumor-bearing TRAMP mice, and those same mice have higher levels of exosomal c-Src than their wild-type counterparts."

According to the news editors, the research concluded: "In summary, we provide new evidence that active signaling molecules relevant to PrCa are enriched in Exo, and this suggests that the Src signaling network may provide useful biomarkers detectable by liquid biopsy, and may contribute to PrCa progression via Exo. J. Cell. Biochem. 118: 66-73, 2017."

The news editors report that additional information may be obtained by contacting L.R. Languino, Thomas Jefferson University, Sidney Kimmel Canc Center, Dept. of Canc Biol, Philadelphia, PA 19107, United States. Additional authors for this research include B. Zerlanko, A. Singh, H.M. Lu, R.V. Iozzo, J.L. Benovic and L.R. Languino.

Oncology - Prostate Cancer

Reports Outline Prostate Cancer Study Findings from Rosalind Franklin University of Medicine and Science (Racial Disparities in Prostate Cancer Mortality in the 50 Largest US Cities)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Prostate Cancer is the subject of a report. According to news reporting originating from North Chicago, Illinois, by NewsRx correspondents, research stated, "This paper presents race-specific prostate cancer mortality rates and the corresponding disparities for the largest cities in the US over two decades. The 50 largest cities in the US were the units of analysis."

Our news editors obtained a quote from the research from the Rosalind Franklin University of Medicine and Science, "Data from two 5-year periods were analyzed: 1990-1994 and 2005-2009. Numerator data were abstracted from national death files where the cause was malignant neoplasm of prostate (prostate cancer) (ICD9 = 185 and ICD10 = C61). based denominators were obtained from US Census data. To measure the racial disparity, we calculated non-Hispanic Black: non-Hispanic White rate ratios (RRs), rate differences (RDs), and corresponding confidence intervals for each 5-year period. We also calculated correlation and unadjusted regression coefficients for 11 city-level variables, such as segregation and median income, and the RDs. At the final time point (2005-2009), the US and all 41 cities included in the analyses had a RR greater than 1 (indicating that the Black rate was higher than the White rate) (range = 1.13 in Minneapolis to 3.24 in Los Angeles), 37 of them statistically significantly so. The US and 26 of the 41 cities saw an increase in the Black: White RR between the time points. The level of disparity within a city was associated with the degree of Black segregation. This analysis revealed large disparities in Black: White prostate cancer mortality in the US and many of its largest cities over the past two decades. The data show considerable variation in the degree of disparity across cities, even among cities within the same state."

According to the news editors, the research concluded: "This type of specific city-level data can be used to motivate public health professionals, government officials, cancer control agencies, and community-based organizations in cities with large or increasing disparities to demand more resources, focus research efforts, and implement effective policy and programmatic changes in order to combat this highly prevalent condition."

The news editors report that additional information may be obtained by contacting M.R. Benjamins, Rosalind Franklin Univ Med & Sci, Chicago Med Sch, North Chicago, IL 60064, United States. Additional authors for this research include B.R. Hunt, S.M. Raleigh, J.L. Hirschtick and M.M. Hughes.

Reports Outline Prostate Cancer Study Results from Shandong University (LncRNA PVT1 regulates prostate cancer cell growth by inducing the methylation of miR-146a)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting originating from Shandong, People's Republic of China, by NewsRx correspondents, research stated, "Prostate cancer is the third most common causes of death from cancer in men. Our previous study demonstrated that lncRNA PVT1 was overexpressed and played an oncogenic role in the progression of prostate cancer."

Financial supporters for this research include National Natural Science Foundation of China, National Science Foundation of Shandong.

Our news editors obtained a quote from the research from Shandong University, "However, the molecular mechanism of modulating the prostate cancer tumorigenesis was still unknown. In this study, we aim to investigate the interaction between PVT1 and miR-146a in prostate cancer and reveal the potential mechanism in prostate cancer carcinogenesis. The expression level of miR-146a was assessed by quantitative RT-PCR. The correlation analysis and methylation status analysis was made to confirm the interaction between PVT1 and miR-146a. Biological function analysis was performed through gain-of-function and loss-of-function strategies. Our results showed that miR-146a was downregulated and negatively correlated with PVT1 level in prostate cancer. PVT1 mediated miR-146a expression by inducing the methylation of CpG Island in its promoter. miR-146a overexpression eliminated the effects of PVT1 knockdown on prostate cancer cells. PVT1 regulated prostate cancer cell viability and apoptosis depending on miR-146a. Our study suggested a regulatory relationship between lncRNA PVT1 and miR-146a during the process of the prostate cancer tumorigenesis. PVT1 regulated prostate cancer cell viability and apoptosis depending on miR-146a."

According to the news editors, the research concluded: "It would contribute to the diagnosis, treatment and prognosis of prostate cancer."

The news editors report that additional information may be obtained by contacting Q. Sun, Shandong University, Dept. of Pathol, Qian Fo Shan Hosp, Jinan 250014, Shandong, People's Republic of China. Additional authors for this research include L. Fang, Y.X. Cheng and Q. Sun.

Reports Outline Prostate Cancer Study Results from University of California (Rectourethral Fistulas Secondary to Prostate Cancer Treatment: Management and Outcomes from a Multi-Institutional Combined Experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Prostate Cancer is the subject of a report. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated, "Rectourethral fistula is a known complication of prostate cancer treatment. Reports in the literature on rectourethral fistula repair technique and outcomes are limited to single institution series."

The news reporters obtained a quote from the research from the University of California, "We examined the variations in technique and outcomes of rectourethral fistula repair in a multi-institutional setting. We retrospectively identified patients who underwent rectourethral fistula repair after prostate cancer treatment at 1 of 4 large volume reconstructive urology centers, including University of California-San Francisco, University College London Hospitals, Lahey Clinic and Devine-Jordan Center for Reconstructive Surgery, in a 15-year period. We examined the types of prostate cancer treatment, technical aspects of rectourethral fistula repair and outcomes. After prostate cancer treatment 201 patients underwent rectourethral fistula repair. The fistula developed in 97 men (48.2%) after radical prostatectomy alone and in 104 (51.8%) who received a form of energy ablation. In the ablation group 84% of patients underwent bowel diversion before rectourethral fistula repair compared to 65% in the prostatectomy group. An interposition flap or graft was placed in 91% and 92% of the 2 groups, respectively. Concomitant bladder neck contracture or urethral stricture developed in 26% of patients in the ablation group and in 14% in the prostatectomy group. Postoperatively the rates of urinary incontinence and complications were higher in the energy ablation group at 35% and 25% vs 16% and 11%, respectively. The ultimate success rate of fistula repair in the energy ablation and radical prostatectomy groups was 87% and 99% with 92% overall success. Rectourethral fistulas due to prostate cancer therapy can be reconstructed successfully in a high percent of patients."

According to the news reporters, the research concluded: "This avoids permanent urinary diversion in these complex cases."

Our news correspondents report that additional information may be obtained by contacting C.R. Harris, University of California, San Francisco General Hospital, Dept. of Urol, San Francisco, CA 94110, United States. Additional authors for this research include J.W. McAninch, A.R. Mundy, L.N. Zinman, G.H. Jordan, D. Andrich, A.J. Vanni, R. Virasoro and

Psychiatric Disorders

Reports Outline Psychiatric Disorders Study Findings from M. Andrews and Colleagues (Early Therapeutic Alliance, Treatment Retention, and 12-Month Outcomes in a Healthy Lifestyles Intervention for People with Psychotic Disorders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Psychiatric Disorders. According to news originating from Newcastle, Australia, by NewsRx correspondents, research stated, "Engaging and retaining individuals with psychotic disorders in psychosocial treatments is difficult. Early therapeutic alliance, treatment retention, and 12-month outcomes were examined in a subsample of smokers with a psychotic disorder (N = 178) participating in a healthy lifestyles study comparing a telephone versus face-to-face delivered intervention."

Our news journalists obtained a quote from the research, "Therapeutic alliance was assessed using the Agnew Relationship Measure; primary outcomes were treatment retention and changes in symptoms and health behaviors. Contrary to expectations, early alliance did not predict treatment retention. However, elements of both client-and therapist-rated alliance predicted some clinical outcomes (e.g., higher confidence in the therapeutic alliance at session 1 predicted improvements in 12-month depression)."

According to the news editors, the research concluded: "Some modest interactions between early alliance and intervention condition were also identified (e.g., clients initially with lower self-perceived initiative, or higher therapist-perceived bonding benefited preferentially from the telephone-delivered intervention), highlighting the need to further examine the interplay between therapeutic alliance and treatment modality."

For more information on this research see: Early Therapeutic Alliance, Treatment Retention, and 12-Month Outcomes in a Healthy Lifestyles Intervention for People with Psychotic Disorders. 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Rectal Cancer. According to news reporting originating from Hong Kong, People's Republic of China, by NewsRx correspondents, research stated, "To review the clinical outcome of locally advanced rectal cancer treated with neoadjuvant chemoradiation followed by definitive surgery with or without adjuvant chemotherapy and to elucidate the prognostic factors for treatment outcome. This historical cohort study was conducted at a tertiary public hospital in Hong Kong."

Our news editors obtained a quote from the research from the Chinese University of Hong Kong, "All patients who had undergone neoadjuvant chemoradiation for locally advanced rectal cancer in our department from November 2005 to October 2014 were recruited. Local recurrence-free survival, distant metastasis free survival, disease free survival, and overall survival of patients were documented. A total of 135 patients who had received neoadjuvant chemoradiation during the study period were reviewed. There were 130 patients who had completed neoadjuvant chemoradiation and surgery. The median follow-up time was 35.1 months. The 3- and 5-year local recurrence free survival, distant metastasis free survival, disease free survival, as well as overall survival rates were 91.8% and 86.7%, 73.9% and 72.1%, 70.1% and 64.6%, as well as 86.5% and 68.4%, respectively. The rate of pathological complete response was 13.8%. The T and N downstaging rate was 49.2% and 63.1%, respectively. The rate of conversion from threatened circumferential resection margin to clearance of margin was 90.6%. Of the 42 cases that were initially deemed to require abdominal perineal resection, 15 (35.7%) were converted to sphincter-sparing surgery. The treatment outcome of neoadjuvant chemoradiation for locally advanced rectal cancer was comparable with overseas data in terms of local control rate and overall survival."

According to the news editors, the research concluded: "This strategy may increase the chance of achieving a clear surgical margin by downstaging the tumour, especially in patients who presented with threatened circumferential margin."

For more information on this research see: Clinical outcome of neoadjuvant chemoradiation in locally advanced rectal cancer at a tertiary hospital. *Hong Kong Medical Journal*, 2016;22(6):546-555. *Hong Kong Medical Journal* can be contacted at: Hong Kong Acad Medicine Press, 9, F, Room 901, 99 Wong Chuk Hang Rd, Aberdeen, Hong Kong, 00000, Peoples R China.

Reports Outline Retinal Vein Occlusion Findings from Eye Research Institute (Ambulatory Blood Pressure Patterns In Patients With Retinal Vein Occlusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Eye Diseases and Conditions - Retinal Vein Occlusion. According to news originating from Fort Worth, Texas, by NewsRx correspondents, research stated, "Failure of blood pressure (BP) to dip during sleep (nondipper pattern) is associated with cardiovascular disease and stroke. The prevalence and degree of nondipping and masked hypertension in patients with retinal vein occlusion (RVO), which is associated with stroke, has not been previously examined."

Our news journalists obtained a quote from the research from Eye Research Institute, "We measured clinic and 24-hour ambulatory BPs in 22 patients with RVO and 20 control participants without known eye disease matched by age and sex. Mean BP dipping, defined as the ratio of difference in mean awake and sleep systolic BPs to mean awake systolic BP, and masked and nocturnal hypertension were compared between groups. Mean 24-hour ambulatory BP was 144/79 mmHg among those with RVO and 136/77 mmHg among controls. Patients with RVO had an almost 2-fold higher prevalence of nondipping pattern (80.8% [95% confidence interval, 52.8-94.1] vs. 50.4% [95% confidence interval, 26.1-74.5]; P = 0.008). Average sleep systolic BP dip in patients with RVO was 6.1% versus 11.9% in controls (P = 0.004). More patients with RVO had masked hypertension by ambulatory BPs than controls (71% vs. 50%), but this difference was not statistically significant. Our data suggest an association between RVO and nondipper BP pattern."

According to the news editors, the research concluded: "Ambulatory BP monitoring may be useful in the evaluation of patients with RVO by identifying those who may benefit from more aggressive BP control."

For more information on this research see: Ambulatory Blood Pressure Patterns In Patients With Retinal Vein Occlusion. Retina-The Journal of Retinal and Vitreous Diseases, 2016;36(12):2304-2310. Retina-The Journal of Retinal and Vitreous Diseases can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Salicylic Acids

Reports Outline Salicylic Acids Study Results from Boston University
(Spectral biomarkers for chemoprevention of colonic neoplasia: a placebo-controlled double-blinded trial with aspirin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Salicylic Acids. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "A major impediment to translating chemoprevention to clinical practice has been lack of intermediate biomarkers. We previously reported that rectal interrogation with low-coherence enhanced backscattering spectroscopy (LEBS) detected microarchitectural manifestations of field carcinogenesis."

The news correspondents obtained a quote from the research from Boston University, "We now wanted to ascertain if reversion of two LEBS markers spectral slope (SPEC) and fractal dimension (FRAC) could serve as a marker for chemopreventive efficacy. We conducted a multicentre, prospective, randomised, double-blind placebo-controlled, clinical trial in subjects with a history of colonic neoplasia who manifested altered SPEC/FRAC in histologically normal colonic mucosa. Subjects (n=79) were randomised to 325 mg aspirin or placebo. The primary endpoint changed in FRAC and SPEC spectral markers after 3 months. Mucosal levels of prostaglandin E2 (PGE2) and UDP-glucuronosyltransferase (UGT)1A6 genotypes were planned secondary endpoints. At 3 months, the aspirin group manifested alterations in SPEC (48.9%, p=0.055) and FRAC (55.4%, p=0.200) with the direction towards non-neoplastic status. As a measure of aspirin's pharmacological efficacy, we assessed changes in rectal PGE2 levels and noted that it correlated with SPEC and FRAC alterations (R=-0.55, p=0.01 and R=0.57, p=0.009, respectively) whereas there was no significant correlation in placebo specimens. While UGT1A6 subgroup analysis did not achieve statistical significance, the changes in SPEC and FRAC to a less neoplastic direction occurred only in the variant consonant with epidemiological evidence of chemoprevention."

According to the news reporters, the research concluded: "We provide the first proof of concept, albeit somewhat underpowered, that spectral markers reversion mirrors antineoplastic efficacy providing a potential modality for titration of agent type/dose to optimise chemopreventive strategies in clinical practice."

For more information on this research see: Spectral biomarkers for chemoprevention of colonic neoplasia: a placebo-controlled double-blinded trial with aspirin. Gut, 2015();. (BMJ Publishing Group - group.bmj.com/; Gut - gut.bmj.com/)

**Mental Health Diseases and Conditions - Schizophrenia**

**Reports Outline Schizophrenia Findings from Mustafa Kemal University (DNA Methylation of BDNF Gene in Schizophrenia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mental Health Diseases and Conditions - Schizophrenia is now available. According to news reporting originating in Hatay, Turkey, by NewsRx journalists, research stated, "Although genetic factors are risk factors for schizophrenia, some environmental factors are thought to be required for the manifestation of disease. Epigenetic mechanisms regulate gene functions without causing a change in the nucleotide sequence of DNA."

The news reporters obtained a quote from the research from Mustafa Kemal University, "Brain-derived neurotrophic factor (BDNF) is a neurotrophin that regulates synaptic transmission and plasticity. It has been suggested that BDNF may play a role in the pathophysiology of schizophrenia. It is established that methylation status of the BDNF gene is associated with fear learning, memory, and stressful social interactions. In this study, we aimed to investigate the DNA methylation status of BDNF gene in patients with schizophrenia. The study included 49 patients (33 male and 16 female) with schizophrenia and 65 unrelated healthy controls (46 male and 19 female). Determination of methylation pattern of CpG islands was based on the principle that bisulfite treatment of DNA results in conversion of unmethylated cytosine residues into uracil, whereas methylated cytosine residues remain unmodified. Methylation-specific PCR was performed with primers specific for either methylated or unmethylated DNA. There was no significant difference in methylated or un-methylated status for BDNF promoters between schizophrenia patients and controls. The mean duration of illness was significantly lower in the hemi-methylated group compared to the non-methylated group for BDNF gene CpG island-1 in schizophrenia patients."

According to the news reporters, the research concluded: "Although there were no differences in BDNF gene methylation status between schizophrenia patients and healthy controls, there was an association between duration of illness and DNA methylation."

For more information on this research see: DNA Methylation of BDNF Gene in Schizophrenia. *Medical Science Monitor*, 2016;22():397-402.

Science

Reports Outline Science Findings from Fudan University (LEGO: a novel method for gene set over-representation analysis by incorporating network-based gene weights)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Pathway or gene set over-representation analysis (ORA) has become a routine task in functional genomics studies. However, currently widely used ORA tools employ statistical methods such as Fisher's exact test that reduce a pathway into a list of genes, ignoring the constitutive functional non-equivalent roles of genes and the complex gene-gene interactions."

Our news journalists obtained a quote from the research from Fudan University, "Here, we develop a novel method named LEGO (functional Link Enrichment of Gene Ontology or gene sets) that takes into consideration these two types of information by incorporating network-based gene weights in ORA analysis. In three benchmarks, LEGO achieves better performance than Fisher and three other network-based methods. To further evaluate LEGO's usefulness, we compare LEGO with five gene expression-based and three pathway topology-based methods using a benchmark of 34 disease gene expression datasets compiled by a recent publication, and show that LEGO is among the top-ranked methods in terms of both sensitivity and prioritization for detecting target KEGG pathways. In addition, we develop a cluster-and-filter approach to reduce the redundancy among the enriched gene sets, making the results more interpretable to biologists."

According to the news editors, the research concluded: "Finally, we apply LEGO to two lists of autism genes, and identify relevant gene sets to autism that could not be found by Fisher."

For more information on this research see: LEGO: a novel method for gene set over-representation analysis by incorporating network-based gene weights. Scientific Reports, 2016;6 ():18871. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Reports Outline Science Findings from Yale University (Adolescents growing up amidst intractable conflict attenuate brain response to pain of outgroup)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Science are discussed in a new report. According to news reporting originating in New Haven, Connecticut, by NewsRx journalists, research stated, "Adolescents’ participation in intergroup conflicts comprises an imminent global risk, and understanding its neural underpinnings may open new perspectives. We assessed Jewish-Israeli and Arab-Palestinian adolescents for brain response to the pain of ingroup/outgroup protagonists using magnetoencephalography (MEG), one-on-one positive and conflictual interactions with an outgroup member, attitudes toward the regional conflict, and oxytocin levels."

Financial supporters for this research include Fetzer foundation, German-Israel Foundation.

The news reporters obtained a quote from the research from Yale University, "A neural marker of ingroup bias emerged, expressed via alpha modulations in the somatosensory cortex (S1) that characterized an automatic response to the pain of all protagonists followed by rebound/enhancement to ingroup pain only. Adolescents’ hostile social interactions with outgroup members and uncompromising attitudes toward the conflict influenced this neural marker. Furthermore, higher oxytocin levels in the Jewish-Israeli majority and tighter brain-to-brain synchrony among group members in the Arab-Palestinian minority enhanced the neural ingroup bias."

According to the news reporters, the research concluded: "Findings suggest that in cases of intractable intergroup conflict, top-down control mechanisms may block the brain’s evolutionary-ancient resonance to outgroup pain, pinpointing adolescents’ interpersonal and sociocognitive processes as potential targets for intervention."

Our news correspondents report that additional information may be obtained by contacting R. Feldman, Yale University, Child Study Center, New Haven, CT 06520, United States. Additional authors for this research include A. Goldstein, M. Influs, S. Masalha, O. Zagoory-Sharon and R. Feldman.

Reports Outline Science Study Results from Swiss Federal Institute of Technology (Foa1 is essential for development and functional integrity of the subthalamic nucleus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Science are presented in a new report. According to news originating from Zurich, Switzerland, by NewsRx correspondents, research stated, "Inactivation of transcription factor Foxa1 in mice results in neonatal mortality of unknown cause. Here, we report that ablation of Foxa1 causes impaired development and loss of the subthalamic nucleus (STN)."

Our news journalists obtained a quote from the research from the Swiss Federal Institute of Technology, "Functional deficits in the STN have been implicated in the etiology of Huntington's and Parkinson's disease. We show that neuronal ablation by Synapsin1-Cre-mediated Foxa1 deletion is sufficient to induce hyperlocomotion in mice. Transcriptome profiling of STN neurons in conditional Foxa1 knockout mice revealed changes in gene expression reminiscent of those in neurodegenerative diseases. We identified Ppargc1a, a transcriptional co-activator that is implicated in neurodegeneration, as a Foxa1 target. These findings were substantiated by the observation of Foxa1-dependent demise of STN neurons in conditional models of Foxa1 mutant mice. Finally, we show that the spontaneous firing activity of Foxa1-deficient STN neurons is profoundly impaired."

According to the news editors, the research concluded: "Our data reveal so far elusive roles of Foxa1 in the development and maintenance of STN function."

For more information on this research see: Foxa1 is essential for development and functional integrity of the subthalamic nucleus. Scientific Reports, 2016;6():1-15. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Blood Diseases and Conditions - Sepsis

Reports Outline Sepsis Study Findings from Wayne State University (Daptomycin Improves Outcomes Regardless of Vancomycin MIC in a Propensity-Matched Analysis of Methicillin-Resistant Staphylococcus aureus Bloodstream Infections)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Diseases and Conditions - Sepsis have been published. According to news reporting originating from Detroit, Michigan, by NewsRx correspondents, research stated, "Vancomycin remains the mainstay treatment for methicillin-resistant Staphylococcus aureus (MRSA) bloodstream infections (BSIs) despite increased treatment failures. Daptomycin has been shown to improve clinical outcomes in patients with BSIs caused by MRSA isolates with vancomycin MICs of > 1 mg/liter, but these studies relied on automated testing systems."

Financial support for this research came from Merck & Co., Inc.

Our news editors obtained a quote from the research from Wayne State University, "We evaluated the outcomes of BSIs caused by MRSA isolates for which vancomycin MICs were determined by standard broth microdilution (BMD). A retrospective, matched cohort of patients with MRSA BSIs treated with vancomycin or daptomycin from January 2010 to March 2015 was completed. Patients were matched using propensity-adjusted logistic regression, which included age, Pitt bacteremia score, primary BSI source, and hospital of care. The primary endpoint was clinical failure, which was a composite endpoint of the following metrics: 30-day mortality, bacteremia with a duration of > 7 days, or a change in anti-MRSA therapy due to persistent or worsening signs or symptoms. Secondary endpoints included MRSA-attributable mortality and the number of days of MRSA bacteremia. Independent predictors of failure were determined through conditional backwards-stepwise logistic regression with vancomycin BMD MIC forced into the model. A total of 262 patients were matched. Clinical failure was significantly higher in the vancomycin cohort than in the daptomycin cohort (45.0% versus 29.0%; P = 0.007). All-cause 30-day mortality was significantly higher in the vancomycin cohort (15.3% versus 6.1%; P = 0.024). These outcomes remained significant when stratified by vancomycin BMD MIC. There was no significant difference in the length of MRSA bacteremia. Variables independently associated with treatment failure included vancomycin therapy (adjusted odds ratio [aOR] = 2.16, 95% confidence interval [CI] = 1.24 to 3.76), intensive care unit admission (aOR = 2.46, 95% CI = 1.34 to 4.54), and infective endocarditis as the primary source (aOR = 2.33, 95% CI = 1.16 to 4.68)."

According to the news editors, the research concluded: "Treatment of MRSA BSIs with daptomycin was associated with reduced clinical failure and 30-day mortality; these findings were independent of vancomycin BMD MIC."

The news editors report that additional information may be obtained by contacting M.J. Rybak, Wayne State University, Sch Med, Dept. of Internal Med, Div Infect Dis, Detroit, MI 48201, United States. Additional authors for this research include E.J. Zasowski, A.M. Casapao, A.M. Lagnf, J.L. Nagel, C.T. Nguyen, J.A. Hallesy, M.T. Compton, K.S. Kaye, D.P. Levine, S.L. Davis and M.J. Rybak.

Intracellular Signaling Peptides and Proteins - Sirtuins

Reports Outline Sirtuins Study Findings from Karolinska Institute (Sirtuins are Unaffected by PARP Inhibitors Containing Planar Nicotinamide Bioisosteres)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Intracellular Signaling Peptides and Proteins - Sirtuins is now available. According to news reporting originating in Stockholm, Sweden, by NewsRx journalists, research stated, "PARP-family ADP-ribosyltransferases (PARPs) and sirtuin deacetylases all use NAD(+) as cosubstrate for ADP-ribosyl transfer. PARP inhibitors are important research tools and several are being evaluated in cancer treatment."

Financial supporters for this research include Stiftelsen for Strategisk Forskning, IngaBritt och Arne Lundbergs Forskningsstiftelse, Arne Lundbergs Research Foundation, Karolinska Institutet.

The news reporters obtained a quote from the research from Karolinska Institute, "With the exception of a few tankyrase inhibitors, all current PARP inhibitors mimic the nicotinamide moiety in NAD(+) and block the nicotinamide binding pocket. We report here that while the activities of the four human sirtuin isoforms SIRT1, SIRT2, SIRT3 and SIRT6 are blocked by sirtuin inhibitor Ex527 in vitro, they are unaffected by the seven clinical and commonly used PARP inhibitors niraparib, olaparib, rucaparib, talazoparib, veliparib, PJ34, and XAV939. These findings indicate that PARP inhibitors containing planar nicotinamide mimetics do not bind to sirtuin cofactor sites."

According to the news reporters, the research concluded: "A simple commercially available assay can be used to rule out interference of novel PARP inhibitors with sirtuin NAD (+) binding."

For more information on this research see: Sirtuins are Unaffected by PARP Inhibitors Containing Planar Nicotinamide Bioisosteres. Chemical Biology & Drug Design, 2015;87(3):478-82. Chemical Biology & Drug Design can be contacted at: Blackwell Publishing Inc, 350 Main St, Malden, MA 02148, USA. (Wiley-Blackwell - www.wiley.com; Chemical Biology & Drug Design - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1747-0285)

Reports Outline Smith-Magenis Syndrome Study Findings from National Institutes of Health (Delayed Diagnosis in a House of Correction: Smith-Magenis Syndrome Due to a De Novo Nonsense RAI1 Variant)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Diseases and Conditions - Smith-Magenis Syndrome are presented in a new report. According to news originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "We report a 25-year-old female confirmed to have Smith-Magenis syndrome (SMS) due to a de novo RAI1 variant. Her past history is significant for developmental and intellectual delay, early and escalating maladaptive behaviors, and features consistent with significant sleep disturbance, the etiology of which was not confirmed for over two decades."

Financial supporters for this research include Intramural Research Program of the National Human Genome Research Institute, National Institutes of Health, Intramural Research Program of the National Institute of Mental Health, National Institutes of Health, Jerome Lejeune Foundation.

Our news journalists obtained a quote from the research from the National Institutes of Health, "The diagnosis of SMS was initially suspected in 1998 (at age 12 years), but that was 5 years before the initial report of RAI1 variants as causative of the SMS phenotype; cytogenetic fluorescence in situ hybridization studies failed to confirm an interstitial deletion of 17p11.2. Re-evaluation for suspected SMS was pursued with RAI1 sequencing analysis in response to urgent parental concerns of escalating behaviors and aggression with subsequent incarceration of the subject for assault of a health professional. Genetic analysis revealed a de novo RAI1 (NM_030665.3) nonsense variant, c.5536C>T; p.Q1846X. This case illustrates the importance of confirming the SMS diagnosis, which is associated with cognitive and functional impairment, as well as significant psychiatric comorbidities and behavioral problems. The diagnosis was particularly relevant to the legal discussion and determination of her competence to stand trial."

According to the news editors, the research concluded: "As other similar cases may exist, this report will help to increase awareness of the possibility of a very late diagnosis of SMS, with the need for re-evaluation of individuals suspected to have SMS who were initially evaluated prior to the identification of the RAI1 gene."

The news correspondents report that additional information may be obtained from A.C.M. Smith, NHGRI, Off Clin Director, National Institutes of Health, Bethesda, MD 20895, United States. Additional authors for this research include T. Vilboux, C. Ciccone, K. Boulier, R.E. Schnur, W.A. Gahl, M. Huizing, G. Laje and A.C.M. Smith.

**Stem Cell Research**

**Reports Outline Stem Cell Research Findings from ShanghaiTech University (SUMO regulates somatic cyst stem cell maintenance and directly targets the Hedgehog pathway in adult Drosophila testis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Stem Cell Research are presented in a new report. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "SUMO (Small ubiquitin-related modifier) modification (SUMOylation) is a highly dynamic post-translational modification (PTM) that plays important roles in tissue development and disease progression. However, its function in adult stem cell maintenance is largely unknown."

The news reporters obtained a quote from the research from ShanghaiTech University, "Here, we report the function of SUMOylation in somatic cyst stem cell (CySC) self-renewal in adult Drosophila testis. The SUMO pathway cell-autonomously regulates CySC maintenance. Reduction of SUMOylation promotes premature differentiation of CySCs and impedes the proliferation of CySCs, which leads to a reduction in the number of CySCs. Consistent with this, CySC clones carrying a mutation of the SUMO-conjugating enzyme are rapidly lost. Furthermore, inhibition of the SUMO pathway phenocopies disruption of the Hedgehog (Hh) pathway, and can block the proliferation of CySCs induced by Hh activation. Importantly, the SUMO pathway directly regulates the SUMOylation of Hh pathway transcription factor Cubitus interruptus (Ci), which is required for promoting CySC proliferation."

According to the news reporters, the research concluded: "Thus, we conclude that SUMO directly targets the Hh pathway and regulates CySC maintenance in adult Drosophila testis."

Stilbenes

Reports Outline Stilbenes Findings from Central University (Chitosan-modified PLGA polymeric nanocarriers with better delivery potential for tamoxifen)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stilbenes. According to news reporting originating from Rajasthan, India, by NewsRx correspondents, research stated, "Breast cancer is believed as the second most common cause of cancer-related deaths in women for which tamoxifen is frequently prescribed. Despite many promises, tamoxifen is associated with various challenges like low hydrophilicity, poor bioavailability and dose-dependent toxicity."

Our news editors obtained a quote from the research from Central University, "Therefore, it was envisioned to develop tamoxifen-loaded chitosan-PLGA micelles for potential safe and better delivery of this promising agent. The chitosan-PLGA copolymer was synthesised and characterised by Fourier Transform-Infrared, Ultraviolet-visible and Nuclear Magnetic Resonance spectroscopic techniques. The drug-loaded nanocarrier was characterised for drug-pay load, micrometrics, surface charge and morphological attributes. The developed system was evaluated for in-vitro drug release, haemolytic profile, cellular-uptake, anticancer activity by cytotoxicity assay and dermatokinetic studies. The developed nano-system was able to substantially load the drug and control the drug release. The in-vitro cytotoxicity offered by the system was significantly enhanced vis-a-vis plain drug, and there was no substantial haemolysis. The IC50 values were significantly decreased and the nanocarriers were uptaken by MCF-7 cells, noticeably. The carrier was able to locate the drug in the interiors of rat skin in considerable amounts to that of the conventional product."

According to the news editors, the research concluded: "This approach is promising as it provides a biocompatible and effective option for better delivery of tamoxifen."

The news editors report that additional information may be obtained by contacting K. Raza, Cent Univ Rajasthan, Sch Chem Sci & Pharm, Dept. of Pharm, Bandar Sindri 305817, Rajasthan, India. Additional authors for this research include N. Thotakura, R. Kumar, P.
Kumar, B. Singh, D. Chitkara and K. Raza.

Subcellular Fractions

Reports Outline Subcellular Fractions Study Results from Wistar Institute (A neuronal network of mitochondrial dynamics regulates metastasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Subcellular Fractions are presented in a new report. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "The role of mitochondria in cancer is controversial. Using a genome-wide shRNA screen, we now show that tumours reprogram a network of mitochondrial dynamics operative in neurons, including syntaphilin (SNPH), kinesin KIF5B and GTPase Miro1/2 to localize mitochondria to the cortical cytoskeleton and power the membrane machinery of cell movements."

Our news journalists obtained a quote from the research from Wistar Institute, "When expressed in tumours, SNPH inhibits the speed and distance travelled by individual mitochondria, suppresses organelle dynamics, and blocks chemotaxis and metastasis, in vivo. Tumour progression in humans is associated with downregulation or loss of SNPH, which correlates with shortened patient survival, increased mitochondrial trafficking to the cortical cytoskeleton, greater membrane dynamics and heightened cell invasion."

According to the news editors, the research concluded: "Therefore, a SNPH network regulates metastatic competence and may provide a therapeutic target in cancer."

Our news journalists report that additional information may be obtained by contacting D.C. Altieri, Wistar Inst Anat & Biol, Tumor Microenvironm & Metastasis Program, Philadelphia, PA 19104, United States. Additional authors for this research include J.H. Seo, A. Aguinaldo, E. Wait, K.G. Bryant, A.V. Kossenkov, J.E. Hayden, V. Vaira, A. Morotti, S. Ferrero, S. Bosari, D.I. Gabrilovich, L.R. Languino, A.R. Cohen and D.C. Altieri.

Central Nervous System Diseases and Conditions - …

Reports Outline Subdural Hematoma Study Results from Department of Neurosurgery (Spontaneously rapid and complete resolution of acute subdural hemorrhage in a 1-year-old patient)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Subdural Hematoma are discussed in a new report. According to news reporting originating in Agri, Turkey, by NewsRx journalists, research stated, "Acute subdural hematoma is one of the neurosurgical emergencies that could lead to mortality, thus needing urgent surgical intervention in most of the cases. A 1-year-old female patient was admitted to the emergency department after she fell from a 2-m height."

The news reporters obtained a quote from the research from the Department of Neurosurgery, "She had 5 x 2-cm acute traumatic subdural hematoma diagnosed with computed tomographic (CT) scan of the head. She was rushed to the operating room for a need of possible surgical intervention. Her vital signs improved before she was operated on. A new CT scan was obtained. The CT scan revealed complete resolution of the subdural hematoma. Spontaneous resolution is rarely seen in acute traumatic subdural hematoma patients, and complete resolution could take several weeks."

According to the news reporters, the research concluded: "In the presented case report, complete resolution occurred in approximately an hour."

Our news correspondents report that additional information may be obtained by contacting S. Cevik, Agri State Hosp, Dept. of Neurosurg, Agri, Turkey. Additional authors for this research include S. Cevik, C. Soyalp, H. Hanimoglu and A.F. Bektas.

Keywords for this news article include: Agri, Turkey, Eurasia, Central Nervous System Diseases and Conditions, Subdural Hematoma, Department of Neurosurgery.

Biological Factors - Synthetic Prostaglandins E

Reports Outline Synthetic Prostaglandins E Study Results from Liverpool Women’s Hospital (Short versus Standard Mifepristone and Misoprostol Regimen for Second- and Third-Trimester Termination of Pregnancy for Fetal Anomaly)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biological Factors - Synthetic Prostaglandins E have been presented. According to news reporting out of Liverpool, United Kingdom, by NewsRx editors, research stated, "Termination of pregnancy requires a 48-hour ‘window’ between mifepristone and misoprostol. Shorter durations have been used in first-trimester termination, but there are few data available in later termination for fetal anomaly."

Our news journalists obtained a quote from the research from Liverpool Women's Hospital, "We reviewed all terminations for fetal anomaly at (>)=13 weeks from May 2013 to May 2014. Cases were managed using a short ( (<)=12 h) or standard ( (>)=36 h) mifepristone-to-misoprostol interval. Two hundred and twenty women underwent a termination of pregnancy for fetal anomaly during the study period, of which 119 were included for analysis. Sixty-six (55%) women were managed according to the short regimen and 53 (45%) women with the standard regimen. The short regimen resulted in a shorter mifepristone-to-delivery interval but was less likely to result in delivery within 12 h of misoprostol. Delivery rates at 24 h were equivocal. There was no difference in blood loss, vaginal delivery rates, complications or bed nights. The short regimen did require more doses of misoprostol. Feticide or previous uterine scar had no effect on outcomes."

According to the news editors, the research concluded: "There was no significant difference in clinical outcome for women managed with a short ( (<)=12 h) or a standard ( (>)=36 h) regimen for medical termination of pregnancy for fetal anomaly, suggesting that either regimen could be offered."

Our news journalists report that additional information may be obtained by contacting A. Sharp, Dept. of Women and Children's Health Research, University Department, Liverpool Women's Hospital, Liverpool, UK. Additional authors for this research include K. Navaratnam, P. Abreu and Z. Alfirevic.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000436963. This DOI is a link to an online electronic document that is either free or for purchase.

Reports Outline Thoracic Surgical Procedures Findings from St. Anne's University Hospital (Resting End-Tidal Carbon Dioxide Predicts Respiratory Complications in Patients Undergoing Thoracic Surgical Procedures)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Surgery - Thoracic Surgical Procedures have been
published. According to news reporting originating in Brno, Czech Republic, by NewsRx journalists, research stated, "Ventilatory efficiency (\(\dot{V}/\dot{V}\text{CO}_2\) slope [minute ventilation to carbon dioxide output slope]) has been shown to predict morbidity and mortality in lung resection candidates. Patients with increased \(\dot{V}/\dot{V}\text{CO}_2\) during exercise also exhibit an increased \(\dot{V}/\dot{V}\text{CO}_2\) ratio and a decreased endtidal CO2 at rest."

The news reporters obtained a quote from the research from St. Anne's University Hospital, "This study hypothesized that ventilatory values at rest predict respiratory complications and death in patients undergoing thoracic surgical procedures. Inclusion criteria for this retrospective, multicenter study were thoracotomy and cardiopulmonary exercise testing as part of routine preoperative assessment. Respiratory complications were assessed from the medical records (from the hospital stay or from the first 30 postoperative days). For comparisons, Student's t test or the Mann-Whitney U test was used. Logistic regression and receiver operating characteristic analyses were performed for evaluation of measurements associated with respiratory complications. Data are summarized as mean +/- SD; p< 0.05 is considered significant. Seventy-six subjects were studied. Post-operatively, respiratory complications developed in 56 (74%) patients. Patients with postoperative respiratory complications had significantly lower resting tidal volume (0.8 +/- 0.3 vs 0.9 +/- 0.3L; p = 0.03), lower rest end-tidal CO2 (28.1 +/- 4.3vs 31.5 +/- 4.2 mm Hg; p< 0.01), higher resting \(\dot{V}/\dot{V}\text{CO}_2\) over dot(E)/(V) over dot(CO2) ratio (45.1 +/- 7.1 vs 41.0 +/- 6.4; p = 0.02), and higher \(\dot{V}/\dot{V}\text{CO}_2\) slope (34.9 +/- 6.4 vs 31.2 +/- 4.3; p = 0.01). Logistic regression (age and sex adjusted) showed resting end-tidal CO2 to be the best predictor of respiratory complications (odds ratio: 1.21; 95% confidence interval: 1.06 to 1.39; area under the curve: 0.77; p = 0.01)."

According to the news reporters, the research concluded: "Resting end-tidal CO2 may identify patients at increased risk for postoperative respiratory complications of thoracic surgical procedures."

Our news correspondents report that additional information may be obtained by contacting I. Cundrle, St Annes Univ Hosp, Dept. of Anesthesiol & Intens Care, Brno 65691, Czech Republic. Additional authors for this research include Z. Tothova, Z. Merta, A. Taskova, P. Homolka, M. Vasakova, J. Skrickova, V. Sramek, L.J. Olson and I. Cundrle.

Reports Outline Tissue Engineering Findings from University of Tampere (Human Adipose Stem Cells Differentiated on Braided Polylactide Scaffolds Is a Potential Approach for Tendon Tissue Engineering)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Biomedical Engineering - Tissue Engineering are discussed in a new report. According to news reporting originating from Tampere, Finland, by NewsRx correspondents, research stated, "Growing number of musculoskeletal defects increases the demand for engineered tendon. Our aim was to find an efficient strategy to produce tendon-like matrix in vitro."

Our news editors obtained a quote from the research from the University of Tampere, "To allow efficient differentiation of human adipose stem cells (hASCs) toward tendon tissue, we tested different medium compositions, biomaterials, and scaffold structures in preliminary tests. This is the first study to report that medium supplementation with 50 ng/mL of growth and differentiation factor-5 (GDF-5) and 280 mM l-ascorbic acid are essential for tenogenic differentiation of hASCs. Tenogenic medium™ was shown to significantly enhance tendon-like matrix production of hASCs compared to other tested media groups. Cell adhesion, proliferation, and tenogenic differentiation of hASCs were supported on braided poly(l/d)lactide (PLA) 96l/4d copolymer filament scaffolds in TM condition compared to foamed poly(l-lactide-co-e-caprolactone) (PLCL) 70L/30CL scaffolds. A uniform cell layer formed on braided PLA 96/4 scaffolds when hASCs were cultured in TM compared to maintenance medium (MM) condition after 14 days of culture. Furthermore, total collagen content and gene expression of tenogenic marker genes were significantly higher in TM condition after 2 weeks of culture. The elastic modulus of PLA 96/4 scaffold was more similar to the elastic modulus reported for native Achilles tendon. Our study showed that the optimized TM is needed for efficient and rapid in vitro tenogenic extracellular matrix production of hASCs."

According to the news editors, the research concluded: "PLA 96/4 scaffolds together with TM significantly stimulated hASCs, thus demonstrating the potential clinical relevance of this novel and emerging approach to tendon injury treatments in the future."

For more information on this research see: Human Adipose Stem Cells Differentiated on Braided Polylactide Scaffolds Is a Potential Approach for Tendon Tissue Engineering. Tissue Engineering Part a, 2016;22(5-6):513-23.

The news editors report that additional information may be obtained by contacting K. Vuornos, 1 Adult Stem Cells, BioMediTech, University of Tampere, Tampere, Finland. Reports Outline Tissue Engineering Study Findings from Duke University [Tissue-engineered 3-dimensional (3D) microenvironment enhances the direct reprogramming of fibroblasts into cardiomyocytes by microRNAs]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Biomedical Engineering - Tissue Engineering is now available. According to news reporting originating from Durham, North Carolina, by NewsRx correspondents, research stated, "We have recently shown that a combination of microRNAs, miR combo, can directly reprogram cardiac fibroblasts into functional cardiomyocytes in vitro and in vivo. Reprogramming of cardiac fibroblasts by miR combo in vivo is associated with improved cardiac function following myocardial infarction."

Our news editors obtained a quote from the research from Duke University, "However, the efficiency of direct reprogramming in vitro is relatively modest and new strategies beyond the traditional two-dimensional (2D) culture should be identified to improve reprogramming process. Here, we report that a tissue-engineered three-dimensional (3D) hydrogel environment enhanced miR combo reprogramming of neonatal cardiac and tail-tip fibroblasts. This was associated with significantly increased MMPs expression in 3D vs. 2D cultured cells, while pharmacological inhibition of MMPs blocked the effect of the 3D culture on enhanced miR combo mediated reprogramming."

According to the news editors, the research concluded: "We conclude that 3D tissue-engineered environment can enhance the direct reprogramming of fibroblasts to cardiomyocytes via a MMP-dependent mechanism."

For more information on this research see: Tissue-engineered 3-dimensional (3D) microenvironment enhances the direct reprogramming of fibroblasts into cardiomyocytes by microRNAs. Scientific Reports, 2016;6():1-11. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. **Proteins - Transcription Factors**

**Reports Outline Transcription Factors Study Findings from University of Toulouse (Foxo3 Transcription Factor Drives Pathogenic T Helper 1 Differentiation by Inducing the Expression of Eomes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Proteins - Transcription Factors are discussed in a new report. According to news reporting out of Toulouse, France, by NewsRx editors, research stated, "The transcription factor Foxo3 plays a crucial role in myeloid cell function but its role in lymphoid cells remains poorly defined. Here, we have shown that Foxo3 expression was increased after T cell receptor engagement and played a specific role in the polarization of CD4(+) T cells toward pathogenic T helper 1 (Th1) cells producing interferon-gamma (IFN-gamma) and granulocyte monocyte colony stimulating factor (GM-CSF)."

Our news journalists obtained a quote from the research from the University of Toulouse, "Consequently, Foxo3-deficient mice exhibited reduced susceptibility to experimental autoimmune encephalomyelitis. At the molecular level, we identified Eomes as a direct target gene for Foxo3 in CD4(+) T cells and we have shown that lentiviral-based overexpression of Eomes in Foxo3-deficient CD4(+) T cells restored both IFN-gamma and GM-CSF production."

According to the news editors, the research concluded: "Thus, the Foxo3-Eomes pathway is central to achieve the complete specialized gene program required for pathogenic Th1 cell differentiation and development of neuroinflammation."

For more information on this research see: Foxo3 Transcription Factor Drives Pathogenic T Helper 1 Differentiation by Inducing the Expression of Eomes. *Immunity*, 2016;45(4):774-787. *Immunity* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Immunity - www.journals.elsevier.com/immunity/)

**Enzymes and Coenzymes - Transferases**

**Reports Outline Transferases Study Findings from Takeda Pharmaceutical (Pharmacological characterization of a series of aryl-sulfonamide derivatives that potently and selectively inhibit monoacylglycerol acyltransferase 2)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - Transferases. According to news reporting from Fujisawa, Japan, by NewsRx journalists,
research stated, "Monoacylglycerol acyltransferase (MGAT) 2 is an endoplasmic reticulum membrane enzyme that catalyzes the synthesis of diacylglycerol (DAG) from fatty acyl-CoA and monoacylglycerol as substrates. It is important for the resynthesis of triacylglycerol in the intestine."

The news correspondents obtained a quote from the research from Takeda Pharmaceutical, "We have identified a series of ary1-sulfonamide MGAT2 inhibitors and demonstrated pharmacological inhibition of MGAT2 improved hyperlipidemia, obesity, and diabetes in animal models. However, its mechanism of action has not been elucidated in molecular and cellular levels. In the present study, we have characterized a series of ary1 sulfonamide derivatives that potently and selectively inhibit human MGAT2 and determined their pharmacological profiles. Analyses on the molecular mechanism of a representative ary1-sulfonamide MGAT2 inhibitor revealed a reversible inhibitory activity and a binding activity to MGAT2. The ary1 sulfonamide derivatives exhibited potenti inhibitory activities against both human and mouse intestinal MGAT activities, which were correlated to those determined using recombinant human and mouse MGAT enzymes. We have developed a cellular assay using Liquid Chromatography-Mass Spectrometry and confirmed that the ary1-sulfonamide derivatives suppressed DAG synthesis in the cellular context."

According to the news reporters, the research concluded: "We have thus elucidated their pharmacological profiles and provided the fundamental clues for understanding the molecular and cellular actions of the ary1-sulfonamide MGAT2 inhibitors."

For more information on this research see: Pharmacological characterization of a series of ary1-sulfonamide derivatives that potently and selectively inhibit monoacylglycerol acyltransferase 2. European Journal of Pharmacology, 2016;791():569-577. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Nutritional and Metabolic Diseases and Conditions --

Reports Outline Type 2 Diabetes Findings from Florida Hospital
(Adipose tissue natriuretic peptide receptor expression is related to insulin sensitivity in obesity and diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases
and Conditions - Type 2 Diabetes. According to news reporting from Orlando, Florida, by NewsRx journalists, research stated, "Cardiac natriuretic peptides (NPs) bind to two receptors (NPRA—mediator of signaling; NPRC—clearance receptor) whose ratio, NPRR (NPRA/NPRC), determines the NP bioactivity. This study investigated the relationship of NP receptor gene expression in adipose tissue and muscle with obesity and glucose intolerance."

Financial supporters for this research include Florida Hospital Translational Research Institute for Metabolism and Diabetes, Research Institute for Dental Sciences, Shahid Beheshti University of Medical Sciences, Takeda Pharmaceuticals USA, Inc.

The news correspondents obtained a quote from the research from Florida Hospital, "Prospectively, the study also assessed whether changes in NP receptor expression and thermogenic gene markers accompanied improvements of insulin sensitivity. A cross-sectional study of subjects with a wide range of BMI and glucose tolerance (n = 50) was conducted, as well as a randomized 12-week trial of subjects with type 2 diabetes mellitus (T2DM) treated with pioglitazone (n = 9) or placebo (n = 10). NPRR mRNA was significantly lower in adipose tissue of subjects with obesity when compared with lean subjects (P (<=) 0.001). NPRR decreased with progression from normal glucose tolerance to T2DM (p < 0.01) independently of obesity. Treatment of subjects with T2DM with pioglitazone increased NPRR in adipose tissue (P (<=) 0.01) in conjunction with improvements in insulin sensitivity and increases of the thermogenic markers PPARg coactivator-1a and uncoupling protein 1 (P (<=) 0.01). Decreased adipose tissue NPRR was associated with obesity, glucose intolerance, and insulin resistance. This relationship was not observed for skeletal muscle NPRR."

According to the news reporters, the research concluded: "Pharmacological improvement of insulin sensitivity in subjects with T2DM was tied to improvement in NPRR and increased expression of genes involved in thermogenic processes."

For more information on this research see: Adipose tissue natriuretic peptide receptor expression is related to insulin sensitivity in obesity and diabetes. *Obesity*, 2016;24(4):820-8. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

Our news journalists report that additional information may be obtained by contacting Z. Kovacova, Translational Research Institute for Metabolism and Diabetes, Florida Hospital, Orlando, Florida, United States. Additional authors for this research include W.G. Tharp, D. Liu, W. Wei, H. Xie, S. Collins and R.E Pratley.

Reports Outline Type 2 Diabetes Study Results from Zhongshan Ophthalmic Center (Association of monocyte chemoattractant protein-1 gene 2518A/G polymorphism with diabetic retinopathy in type 2 diabetes mellitus: A meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "The relationship between monocyte chemoattractant protein-1 (MCP-1) 2518 A/G polymorphism and diabetic retinopathy (DR) attracted intense interest recently, but the reported results are controversial. A meta-analysis was performed to assess the MCP-1 polymorphism associated with DR susceptibility in type 2 diabetes mellitus."

Our news journalists obtained a quote from the research from Zhongshan Ophthalmic Center, "Eligible studies were identified from PubMed, Embase, Web of science, Chinese Biomedical database, and references of retrieved articles. Pooled odds ratios (ORs) with their 95% confidence intervals (95% CI) were calculated by fixed or random-effects models. Six studies involving 3415 patients without DR and 3468 with any DR were included in the final meta-analysis. Each 5 studies evaluated the associations of MCP-1 polymorphism and any DR and proliferative DR (PDR), respectively. Meta-analysis in fixed model demonstrated a significant association between MCP-1 polymorphism and any DR under the homozygous model (OR = 1.36; 95% CI: 1.15-1.62, P< 0.001), heterozygous model (OR = 1.20; 95% CI: 1.02-1.42, P = 0.031), dominant model (OR = 1.28; 95% CI: 1.10-1.50, P = 0.002), recessive model (OR = 1.17; 95% CI: 1.05-1.31, P = 0.004), and allelic model (OR = 1.16; 95% CI: 1.07-1.25, P< 0.001). Furthermore, a significant association of MCP-1 polymorphism and DR progression from non-proliferative DR to proliferative DR was identified under heterozygous model (OR = 1.45; 95% CI: 1.04-2.02, P = 0.030). Sensitivity analyses did not draw different findings."

According to the news editors, the research concluded: "Meta-analysis of existing data suggested that MCP-1 2518 A/G polymorphism affected the risk of presence and progression of DR in type 2 diabetes mellitus."

Our news journalists report that additional information may be obtained by contacting W.Y. Huang, Sun Yat Sen University State Key Lab Ophthalmol, Zhongshan Ophthalm Center, Guangzhou 510060, Guangdong, People's Republic of China. Additional authors for this research include M. He and W.Y. Huang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.diabres.2016.07.016. This DOI is a link to an online electronic document that is either free or for purchase.
Reports Outline Ulcerative Colitis Study Findings from Institute of Digestive Diseases (Expression of Transcription Factor FOXO3a is Decreased in Patients with Ulcerative Colitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Inflammatory Bowel Diseases and Conditions - Ulcerative Colitis have been published. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Ulcerative colitis (UC) is associated with differential expression of genes involved in inflammation and tissue remodeling, including FOXO3a, which encodes a transcription factor known to promote inflammation in several tissues. However, FOXO3a expression in tissues affected by UC has not been examined."

The news correspondents obtained a quote from the research from the Institute of Digestive Diseases, "This study investigated the effects of FOXO3a on UC pathogenesis. FOXO3a expression, in 23 patients with UC and in HT29 cells treated with tumor necrosis factor-a (TNF-a) for various durations, was detected by quantitative real-time polymerase chain reaction and Western blotting analysis. Enzyme-linked immunosorbent assay was used to quantify interleukin (IL)-8 expression in FOXO3a-silenced HT29 cells treated with TNF-a for various durations. The messenger RNA and protein expression of FOXO3a were significantly lower in UC tissues than those in normal subjects (p <0.01). TNF-a treatment for 0, 0.5, 1, 6, and 24 h induced FOXO3 degradation in HT29 cells. FOXO3a silencing increased IL-8 levels in HT29 cells treated with TNF-a for 6 h (p <0.05)."

According to the news reporters, the research concluded: "FOXO3a may play an important role in the intestinal inflammation of patients with UC."

Our news journalists report that additional information may be obtained by contacting Y.S. Yang, Dept. of Gastroenterology and Hepatology, Institute of Digestive Diseases, Chinese People's Liberation Army General Hospital, Beijing 100853, People's Republic of China. Urinary Tract

Reports Outline Urinary Tract Study Results from Zhejiang University
(Performance of the Sysmex UF-1000i urine analyser in the rapid diagnosis of urinary tract infections in hospitalized patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Urinary Tract is the subject of a report. According to news reporting originating from Hangzhou, People's Republic of China, by NewsRx correspondents, research stated, "Urinary tract infections (UTIs) are the second most frequently encountered nosocomial infectious diseases, and they greatly increase the cost of medical care and prolong the duration of hospital stays. We aimed to evaluate the performance of the Sysmex UF-1000i analyser for the rapid prediction of UTIs in hospitalized patients with or without indwelling catheters at a comprehensive teaching hospital that encounters complex disease types."

Financial support for this research came from Medical Science and Technology Planning Project of Zhejiang Province in China.

Our news editors obtained a quote from the research from Zhejiang University, "Urine specimens (n = 1016) were cultured and examined for WBC, RBC, bacteria (BACT) and yeast-like cell (YLC) count using the Sysmex UF-1000i. The results were compared with the urine culture results. Receiver operating characteristic curve analysis was applied to determine BACT and YLC cutoff values for bacterial and fungal UTIs independently. The diagnostic ability of the UF-1000i was also compared for patients with and without indwelling catheters. A cutoff value of 38.7/mu L was acceptable for ruling out bacterial UTIs. In this setting, we achieved a sensitivity of 90%, a negative predictive value of 94.5%, a false negative rate of 2.85% (29 cases), and avoided culturing in 52% of the samples. The BACT count presented a larger area under the curve for patients with indwelling catheters than for those without (0.939 vs. 0.861); however, no significant difference in the diagnostic ability of the two curves was found."

According to the news editors, the research concluded: "The Sysmex UF-1000i analyser could be a reliable method for excluding bacterial UTIs in hospitalized patients with or without urinary catheters and could help clinicians determine whether antibiotic therapy is necessary."

For more information on this research see: Performance of the Sysmex UF-1000i urine analyser in the rapid diagnosis of urinary tract infections in hospitalized patients. Journal
Immunization - Vaccines
Reports Outline Vaccines Study Results from National Institute for Communicable Diseases (Variability at the FCGR locus: characterization in Black South Africans and evidence for ethnic variation in and out of Africa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immunization - Vaccines are presented in a new report. According to news reporting from Johannesburg, South Africa, by NewsRx journalists, research stated, "This study set out to comprehensively investigate all known functional FcgR variants in South African Black and Caucasian individuals. Population diversity was further assessed using data from the 1000 Genomes Project."

The news correspondents obtained a quote from the research from National Institute for Communicable Diseases, "In our cohort, Black South Africans neither possessed the haplotypes previously associated with increased surface densities of FcgRIIb and FcgRIIIa nor the FCGR2C haplotype recently associated with increased vaccine efficacy in the RV144 HIV-1 vaccine trial (despite 48.7% bearing the c.134-96T tag allele). Moreover, Africans (South Africans, Luhya Kenyans and Yoruba Nigerians) lack the FCGR2C c.798+1G splice-site allele required for the expression of functional FcgRIIc. Although the presence or absence of surface FcgRIIc did not affect natural killer cell-mediated antibody-dependent cellular cytotoxicity capability, this may be significant for other FcgRIIc-mediated functions. Overall, allele distribution and linkage disequilibrium in Africans and Caucasians differed in a manner that would suggest a differentially maintained balance of FcgR-mediated cell activation in these populations. Finally, significant variation observed among different African populations precludes the use of any one African population as a proxy for FcgR diversity in Africans."

According to the news reporters, the research concluded: "The findings of this study highlight further ethnic variation at the FCGR gene locus, in particular for FCGR2C, a gene with increasingly recognized clinical significance."

For more information on this research see: Variability at the FCGR locus:

Our news journalists report that additional information may be obtained by contacting R. Lassaunier, Centre for HIV and STIs, National Institute for Communicable Diseases, National Health Laboratory Service, Johannesburg, South Africa.

**Varicose Veins**

**Reports Outline Varicose Veins Findings from Erzincan University (Effects of Fentanyl and Morphine on Shivering During Spinal Anesthesia in Patients Undergoing Endovenous Ablation of Varicose Veins)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Varicose Veins. According to news reporting originating in Erzincan, Turkey, by NewsRx journalists, research stated, "We sought to investigate the effect of morphine and fentanyl on shivering when used adjunctively with bupivacaine during spinal anesthesia in patients undergoing varicose vein surgery on an outpatient basis. The study included a total of 90 patients, aged 25-45 years, ASA I-II, scheduled to undergo endovenous laser ablation under spinal anesthesia for lower extremity venous insufficiency/varicose vein disease."

The news reporters obtained a quote from the research from Erzincan University, "Patients were randomly allocated into 3 groups: Group M (morphine group) received 5 mg 0.5% hyperbaric bupivacaine + 0.1 mg morphine, Group F (fentanyl group) received 5 mg 0.5% hyperbaric bupivacaine + 25 ?g fentanyl, and Group C (control group) received 5 mg 0.5% hyperbaric bupivacaine + physiologic saline. The level of sensory blockade was assessed with pin-prick test and the level of motor blockade was assessed with Bromage scale at 5-min intervals. Shivering grade and time to first postoperative analgesic requirement was recorded. Level and time of sensory block showed a slight but insignificant increase in the Morphine Group and Fentanyl Group. Time of postoperative analgesic requirement was significantly longer in patients who received morphine (p <0.05). Shivering was significantly less common in patients who received morphine and fentanyl than in patients who are in the Control Group (p <0.02)."

According to the news reporters, the research concluded: "Morphine or fentanyl may be used as adjunctives to spinal anesthesia to prevent shivering in patients undergoing venous surgery."

For more information on this research see: Effects of Fentanyl and Morphine on Shivering During Spinal Anesthesia in Patients Undergoing Endovenous Ablation of Varicose Veins. *Medical Science Monitor*, 2016;22():469-73.

Cardiovascular Diseases and Conditions - Venous...

Reports Outline Venous Thromboembolism Findings from Institute of Epidemiology (Testosterone treatment and risk of venous thromboembolism: population based case-control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Venous Thromboembolism are presented in a new report. According to news reporting out of Frankfurt, Germany, by NewsRx editors, research stated, "To determine the risk of venous thromboembolism associated with use of testosterone treatment in men, focusing particularly on the timing of the risk. Population based case-control study."

Our news journalists obtained a quote from the research from the Institute of Epidemiology, "Setting 370 general practices in UK primary care with linked hospital discharge diagnoses and in-hospital procedures and information on all cause mortality. Participants 19215 patients with confirmed venous thromboembolism (comprising deep venous thrombosis and pulmonary embolism) and 909 530 age matched controls from source population including more than 2.22 million men between January 2001 and May 2013. Exposure of interest Three mutually exclusive testosterone exposure groups were identified: current treatment, recent (but not current) treatment, and no treatment in the previous two years. Current treatment was subdivided into duration of more or less than six months. Rate ratios of venous thromboembolism in association with current testosterone treatment compared with no treatment were estimated using conditional logistic regression and adjusted for comorbidities and all matching factors. The adjusted rate ratio of venous thromboembolism was 1.25 (95% confidence interval 0.94 to 1.66) for current versus no testosterone treatment. In the first six months of testosterone treatment, the rate ratio of venous thromboembolism was 1.63 (1.12 to 2.37), corresponding to 10.0 (1.9 to 21.6) additional venous thromboembolisms above the base rate of 15.8 per 10 000 person years. The rate ratio after more than six months' treatment was 1.00 (0.68 to 1.47), and after treatment cessation it was 0.68 (0.43 to 1.07). Increased rate ratios within the first six months of treatment were observed in all strata: the rate ratio was 1.52 (0.94 to 2.46) for patients with pathological hypogonadism and 1.88 (1.02 to 3.45) for those without it, and 1.41 (0.82 to 2.41) for those with a known risk factor for venous thromboembolism and 1.91 (1.13 to 3.23) for those without one."

According to the news editors, the research concluded: "Starting testosterone treatment was associated with an increased risk of venous thromboembolism, which peaked..."
within six months and declined thereafter."

Our news journalists report that additional information may be obtained by contacting C. Martinez, Inst Epidemiol Stat & Informat GmbH, D-60388 Frankfurt, Germany. Additional authors for this research include S. Suissa, S. Rietbrock, A. Katholing, B. Freedman, A.T. Cohen and D.J. Handelsman.

Keywords for this news article include: Frankfurt, Germany, Europe, Cardiovascular Diseases and Conditions, Vascular Diseases and Conditions, Embolism and Thrombosis, Venous Thromboembolism, Risk and Prevention, Hematology, Hospital, Institute of Epidemiology.

Heart Disorders and Diseases - Ventricular Tachycardia

Reports Outline Ventricular Tachycardia Findings from Brigham and Women's Hospital (Substrate-Based Ablation Versus Ablation Guided by Activation and Entrainment Mapping for Ventricular Tachycardia: A Systematic Review and Meta-Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Ventricular Tachycardia. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Substrate vs. Activation/Entrainment Guided VT Ablation. Substrate-based ablation for scar-related ventricular tachycardia (VT) has gained prominence: however, there is limited data comparing it to ablation guided predominantly by activation and entrainment mapping of inducible and hemodynamically tolerated VTs."

Our news journalists obtained a quote from the research from Brigham and Women's Hospital, "We compared the acute procedural efficacy and outcomes of predominantly substrate-based ablation versus ablation guided predominantly by activation and entrainment mapping. Database searches through April 2016 identified 6 eligible studies (enrolling 403 patients, with 1 randomized study) comparing the 2 strategies. The relative risk of VT recurrence at follow-up was assessed as the primary outcome using a random-effects meta-analysis. Secondary endpoints of acute success (based on noninducibility of VT), procedural complications, and mortality were assessed using weighted mean difference with the random effects model. At a median follow-up of 18 months, the relative risk (RR) of VT recurrence was not significantly different with substrate-based versus activation/entrainment guided VT ablation (0.72, 95% confidence interval [CI] 0.44-1.18, P = 0.2). Acute success (RR 1.02, 95% CI 0.95-1.1, P = 0.6), procedural complications (RR 0.8, 95% CI 0.35-1.82, P = 0.5) cardiovascular mortality and total mortality did not differ significantly (RR 0.83, 95% CI 0.38-1.79, P = 0.6 and RR 0.76, 95% CI 0.36-1.59, P = 0.5, respectively)."

According to the news editors, the research concluded: "This meta-analysis demonstrates similar acute procedural efficacy, and complications, VT recurrence and mortality rates when comparing a predominantly substrate-based ablation strategy to a strategy guided
predominantly by activation and entrainment mapping of inducible and hemodynamically tolerated VTs."

Our news journalists report that additional information may be obtained by contacting W.G. Stevenson, Brigham & Women's Hospital, Div Cardiovasc, Boston, MA 02115, United States. Gram-Negative Bacteria - Vibrionaceae

Reports Outline Vibrionaceae Study Results from University of Pittsburgh (Vibrio cholerae LeuO Links the ToxR Regulon to Expression of Lipid A Remodeling Genes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Vibrionaceae have been presented. According to news reporting originating in Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "Vibrio cholerae is an intestinal pathogen that causes the diarrheal disease cholera. Colonization of the intestine depends upon the expression of genes that allow V. cholerae to overcome host barriers, including low pH, bile acids, and the innate immune system."

Financial support for this research came from HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID).

The news reporters obtained a quote from the research from the University of Pittsburgh, "ToxR is a major contributor to this process. ToxR is a membrane-spanning transcription factor that coordinates gene expression in response to environmental cues. In previous work we showed that ToxR upregulated leuO expression in response to bile salts. LeuO is a LysR family transcription factor that contributes to acid tolerance, bile resistance, and biofilm formation in V. cholerae. Here, we investigated the function of ToxR and LeuO in cationic antimicrobial peptide (CAMP) resistance. We report that ToxR and LeuO contribute to CAMP resistance by regulating carRS transcription. CarRS is a two-component regulatory system that positively regulates almEFG expression. AlmEFG confers CAMP resistance by glycinylation of lipid A. We found that the expression of carRS and almEFG and the polymyxin B MIC increased in mutants lacking toxRS or leuO. Conversely, leuO overexpression decreased..."
the polymyxin B MIC. Furthermore, we found that LeuO directly bound to the carRS promoter and that ToxR-dependent activation of leuO transcription regulated carRS transcription in response to bile salts. Our results suggest that LeuO functions downstream of ToxR to modulate carRS expression in response to environmental cues."

According to the news reporters, the research concluded: "This study extends the functional role of ToxR and LeuO in environmental adaptation to include cell surface remodeling and CAMP resistance."

For more information on this research see: Vibrio cholerae LeuO Links the ToxR Regulon to Expression of Lipid A Remodeling Genes. *Infection and Immunity*, 2016;84 (11):3161-3171. *Infection and Immunity* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Infection and Immunity - iai.asm.org)

Our news correspondents report that additional information may be obtained by contacting J.E. Bina, University of Pittsburgh, Sch Med, Dept. of Microbiol & Mol Genet, Pittsburgh, PA 15260, United States. Additional authors for this research include M.F. Howard, V.M. Ante and J.E. Bina.

Skin Diseases and Conditions - Vitiligo

**Reports Outline Vitiligo Study Results from University of Massachusetts**

(Understanding mechanisms of autoimmunity through translational research in vitiligo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Skin Diseases and Conditions - Vitiligo have been published. According to news reporting originating in Worcester, Massachusetts, by NewsRx journalists, research stated, "Vitiligo is an autoimmune disease of the skin that leads to life altering depigmentation and remains difficult to treat. However, clinical observations and translational studies over 30-40 years have led to the development of an insightful working model of disease pathogenesis: Genetic risk spanning both immune and melanocyte functions is pushed over a threshold by known and suspected environmental factors to initiate autoimmune T cell mediated killing of melanocytes."

Financial support for this research came from NIH.

The news reporters obtained a quote from the research from the University of Massachusetts, "While under cellular stress, melanocytes appear to signal innate immunity to activate T cells. Once the autoimmune T cell response is established, the IFN--y-STAT1-CXCL10 signaling axis becomes the primary inflammatory pathway driving both progression
and maintenance of vitiligo. This pathway is a tempting target for both existing and developing pharmaceuticals, but further detailing how melanocytes signal their own demise may also lead to new therapeutic targets. Research in vitiligo may be the future key to understand the pathogenesis of organ-specific autoimmunity, as vitiligo is common, reversible, progresses over the life of the individual, has been relatively well-defined, and is quite easy to study using translational and clinical approaches.

According to the news reporters, the research concluded: "What is revealed in these studies can lead to innovative treatments and also help elucidate the principles that underlie similar organ-specific autoimmune diseases, especially in cases where the target organ is less accessible."

For more information on this research see: Understanding mechanisms of autoimmunity through translational research in vitiligo. Current Opinion in Immunology, 2016;43():81-88. Current Opinion in Immunology can be contacted at: Current Biology Ltd, 84 Theobalds Rd, London WC1X 8RR, England. (Elsevier - www.elsevier.com; Current Opinion in Immunology - www.journals.elsevier.com/current-opinion-in-immunology/)

Gram-negative Bacteria - Acinetobacter

Reports Summarize Acinetobacter Study Results from University of Maryland (Structural Diversity in the Type IV Pili of Multidrug-resistant Acinetobacter)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Acinetobacter have been published. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Acinetobacter baumannii is a Gram-negative coccobacillus found primarily in hospital settings that has recently emerged as a source of hospital-acquired infections. A. baumannii expresses a variety of virulence factors, including type IV pili, bacterial extracellular appendages often essential for attachment to host cells."

According to the news editors, the research concluded: "Comparisons of genomic
and structural data with pilin proteins from other species of soil gammaproteobacteria suggest that these structural differences stem from evolutionary pressure that has resulted in three distinct classes of type IVa pilins, each found in multiple species."

The news correspondents report that additional information may be obtained from E.J. Sundberg, University of Maryland, Sch Med, Dept. of Microbiol & Immunol, Baltimore, MD 21201. United States. Additional authors for this research include E. Lillehoj, C.M. Harding, J.W. Labonte, X.T. Zuo, C.A. Rapp, R.S. Munson, S.E. Goldblum, M.F. Feldman, J.J. Gray and E.J. Sundberg.

**Gram-Negative Bacteria - Acinetobacter baumannii**

**Reports Summarize Acinetobacter baumannii Findings from School of Pharmacy and Pharmaceutical Science (Comparative pharmacodynamics of four different carbapenems in combination with polymyxin B against carbapenem-resistant Acinetobacter ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Acinetobacter baumannii are presented in a new report. According to news originating from Buffalo, New York, by NewsRx correspondents, research stated, "The objective of this study was to determine the comparative pharmacodynamics of four different carbapenems in combination with polymyxin B (PMB) against carbapenem-resistant Acinetobacter baumannii isolates using time-kill experiments at two different inocula. Two A. baumannii strains (03-149-1 and N16870) with carbapenem minimum inhibitory concentrations (MICs) ranging from 8 to 64 mg/L were investigated in 48-h time-kill experiments using starting inocula of 10^6 CFU/mL and 10^8 CFU/mL. Concentration arrays of ertapenem, doripenem, meropenem and imipenem at 0.25x, 0.5x, 1x, 1.5x and 2x published maximum serum concentration (C-max) values (C-max concentrations of 12, 21, 48 and 60 mg/L, respectively) were investigated in the presence of 1.5 mg/L PMB."

Our news journalists obtained a quote from the research from the School of Pharmacy and Pharmaceutical Science, "Use of carbapenems without PMB resulted in drastic re-growth. All carbapenem combinations were able to achieve a>= 3 log(10) CFU/mL reduction by 4 h against both strains at 10^6 CFU/mL, whereas maximum reductions against strain 03-149-1 at 10^8 CFU/mL were 1.0, 3.2, 2.2 and 3.3 log(10) CFU/mL for ertapenem, doripenem, meropenem and imipenem, respectively. None of the combinations were capable of reducing 10^8 CFU/mL of N16870 by >= 2 log(10) CFU/mL. Ertapenem combinations consistently
displayed the least activity, whereas doripenem, meropenem and imipenem combinations had similar activities that were poorly predicted by carbapenem MICs."

According to the news editors, the research concluded: "As doripenem, meropenem, or imipenem displayed similar pharmacodynamics in combination, the decision of which carbapenem to use in combination with PMB may be based on toxicodynamic profiles if drastic discordance in MICs is not present."

The news correspondents report that additional information may be obtained from B.T. Tsuji, SUNY Buffalo, Sch Pharm & Pharmaceut Sci, Buffalo, NY 14215, United States. Additional authors for this research include J.S. Gall, J.B. Bulitta, V. Thamlikitkul, C.B. Landersdorfer, A. Forrest, R.L. Nation, J. Li and B.T. Tsuji.

Heart Disorders and Diseases - Acute Coronary...

**Reports Summarize Acute Coronary Syndrome Findings from Third Military Medical University (Higher Plasma Concentrations of Platelet Microparticles in Patients With Acute Coronary Syndrome: A Systematic Review and Meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Acute Coronary Syndrome have been published. According to news reporting originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "Platelet microparticles (PMP), shedding on platelet activation, have been proposed as key components in the procoagulant and proinflammatory process. The aim of this study was to clarify the correlation between plasma PMP concentration and the presence of acute coronary syndrome (ACS)."

Our news editors obtained a quote from the research from Third Military Medical University, "We searched for potential relevant studies in PubMed, EMBASE, the Cochrane..."
Library, and Web of Science databases before December 2015. After screening for eligibility, 11 observational studies that tested the plasma concentration of PMP in patients with ACS were retrieved for comprehensive review, quality assessment, and data extraction. Seven studies (64%) provided explicit information between healthy controls and patients with ACS. Five studies (45%) addressed the plasma levels of PMP between patients with ACS and patients with stable angina. Moreover, 5 studies (45%) compared changes in PMP concentration before and after percutaneous coronary intervention (PCI) in patients with ACS. The results showed a significant difference in plasma PMP levels between the patients with ACS and healthy controls, with the pooled standardized mean difference of 1.95 (95% confidence intervals, 0.87-3.02; \( P < 0.0001 \)). And the plasma concentration of PMP in patients with ACS was higher before PCI than after PCI (standardized mean difference, -0.97; 95% confidence interval, -1.91 to -0.03; \( P = 0.043 \)). Four of the five studies described that patients with ACS had higher plasma PMP concentration than patients with stable angina, but there was no significant difference between these 2 patient cohorts. PMP is a promising biomarker for the development of ACS."

According to the news editors, the research concluded: "Moreover, PCI, the most common treatment for ACS, could effectively decrease the plasma concentration of PMP, indicating PMP as a prognostic factor."

The news editors report that additional information may be obtained by contacting H.Y. Hu, Third Military Medical University, Southwest Hosp, Dept. of Cardiol, Chongqing 400038, People's Republic of China. Additional authors for this research include W.B. Zhao, Y. Chen and H.Y. Hu.

Keywords for this news article include: Chongqing, People's Republic of China, Asia, Percutaneous Coronary Intervention, Vascular Diseases and Conditions, Heart Disorders and Diseases, Surgery, Article Review, Acute Coronary Syndrome, Myocardial Ischemia, Heart Disease, Cardiology, Third Military Medical University.

Acute Kidney Injury

Reports Summarize Acute Kidney Injury Findings from Nanjing Medical University (Meta-analysis for outcomes of acute kidney injury after cardiac surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Acute Kidney Injury are discussed in a new report. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "This study aimed to investigate the outcomes of acute kidney injury (AKI) after cardiac surgery by the meta-analysis. Electronic databases PubMed and Embase were searched for relative studies from December 2008 to June 2015."

The news correspondents obtained a quote from the research from Nanjing Medical
University, "For eligible studies, the R software was conducted to meta-analyze outcomes of AKI patients (AKI group) and none-AKI patients after cardiac surgery (NO AKI group). The chi-square-based Q test and I-2 statistic were used for heterogeneity analysis. P<0.1 or I-2 >50% revealed significant heterogeneity among studies, and then a random effects model was used; otherwise a fixed effect model was performed. Egger's test was performed for publication bias assessment. Subgroup analysis was performed by stratifying AKI definitions and study type. Totally 17 studies with 9656 subjects (2331 in the AKI group and 7325 in the NO AKI group) were enrolled. Significantly higher renal replacement therapy (RRT) (OR=23.67, 95% CI: 12.58-44.55), mortality (OR=6.27, 95% CI: 3.58-11.00), serum creatinine (SMD=1.42, 95% CI: 1.01-1.83), and hospital length of stay (LOS) (SMD=0.45, 95% CI: 0.02-0.88) were shown in the AKI group compared with patients in the NO AKI group. Subgroup analysis showed that results of only 3 subgroups were reversed indicating that the definition of AKI did not affect its outcomes. Publication bias was only found among studies involving mortality and serum creatinine, but the 2 outcomes were not reversed after correction."

According to the news reporters, the research concluded: "This meta-analysis confirmed the worse outcomes of AKI in patients after cardiac surgery, including higher RRT rates, mortality, and longer hospital LOS than those of NO AKI patients."

Oncology - Acute Myeloid Leukemia

Reports Summarize Acute Myeloid Leukemia Findings from Haukeland University Hospital (Targeting of cell metabolism in human acute myeloid leukemia--more than targeting of isocitrate dehydrogenase mutations and PI3K/AKT/mTOR signaling?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Myeloid Leukemia. According to news reporting from Bergen, Norway, by NewsRx journalists, research stated, "Targeting of cellular metabolism has emerged as a possible strategy in the treatment of human malignancies, and several experimental studies suggest that this therapeutic approach should also be considered in acute myeloid leukemia (AML). Clinical studies of metabolic intervention in AML patients with isocitrate dehydrogenase mutations have shown promising results."

Funders for this research include Helse Vest, Solveig and Ove Lundes Foundation, Bergens Forskningsstiftelse, Kreftforeningen.

The news correspondents obtained a quote from the research from Haukeland
University Hospital, "Moreover, metabolic targeting of the PI3K/AKT/mTOR signaling pathway as an anticancer strategy has been extensively studied. In this review, we focus on other emerging therapeutic alternatives for metabolic inhibition in human AML, in particular targeting of glycolysis and the AMP kinase signaling pathway. Pharmacological drugs for these metabolic interventions are already available and they seem to have an acceptable toxicity, even when used in combination with conventional chemotherapy."

According to the news reporters, the research concluded: "Future clinical studies of these therapeutic strategies should focus on the following: (i) heterogeneity of patients and the possibility that this treatment is most effective only for certain subsets of patients, (ii) toxic effects in AML patients with an existing disease-induced bone marrow failure prior to treatment, and (iii) whether this strategy should be used as part of a potentially curative treatment and/or as disease-stabilizing treatment to prolong survival in elderly or unfit patients."

Our news journalists report that additional information may be obtained by contacting M. Hauge, Dept. of Medicine, Haukeland University Hospital, Bergen, Norway. Additional authors for this research include 0. Bruserud and K.J Hatfield.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ejh.12690. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Acute Myeloid Leukemia**

**Reports Summarize Acute Myeloid Leukemia Study Results from Ohio State University (Inherited variation in OATP1B1 is associated with treatment outcome in acute myeloid leukemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Acute Myeloid Leukemia is the subject of a report. According to news originating from Columbus, Ohio, by NewsRx correspondents, research stated, "Using broad interrogation of clinically relevant drug absorption, distribution, metabolism, and excretion (ADME) genes on the DMET platform, we identified a genetic variant in SLCO1B1 (rs2291075; c.597C >T), encoding the transporter OATP1B1, associated with event-free (p=0.006, hazard ratio=1.74) and overall survival (p=0.012, hazard ratio=1.85) in children with de novo acute myeloid leukemia (AML). Lack of SLCO1B1 expression in leukemic blasts suggested the association might be due to an inherited rather than a somatic effect. rs2291075 was in strong linkage with known functional variants rs2306283 (c.388A >G) and rs4149056 (c.521T >C)."
Financial supporters for this research include National Institutes of Health Cancer Center, American Lebanese Syrian Associated Charities (ALSAC).

Our news journalists obtained a quote from the research from Ohio State University, "Functional studies in vitro determined that four AML-directed chemotherapeutics (cytarabine, daunorubicin, etoposide, and mitoxantrone) are substrates for OATP1B1 and the mouse ortholog Oatp1b2. In vivo pharmacokinetic studies using Oatp1b2-deficient mice further confirmed our results."

According to the news editors, the research concluded: "Collectively, these findings demonstrate an important role for OATP1B1 in the systemic pharmacokinetics of multiple drugs used in the treatment of AML and suggest that inherited variability in host transporter function influences the effectiveness of therapy."

For more information on this research see: Inherited variation in OATP1B1 is associated with treatment outcome in acute myeloid leukemia. Clinical Pharmacology and Therapeutics, 2016;99(6):651-60. (Nature Publishing Group - www.nature.com/; Clinical Pharmacology and Therapeutics - www.nature.com/clpt/)

Oncology - Acute Myeloid Leukemia

Reports Summarize Acute Myeloid Leukemia Study Results from University of Texas [Whole-arm translocation of der(5;17)(p10;q10) with concurrent TP53 mutations in acute myeloid leukemia (AML) and myelodysplastic syndrome (MDS): A unique ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Acute Myeloid Leukemia is the subject of a report. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Der(5;17)(p10;q10) is a recurrent but rare aberration reported in myeloid neoplasms (MNs). We report 48 such patients including 19 acute myeloid leukemia (AML) and 29 myelodysplastic syndrome (MDS), to characterize their clinicopathological features."

Financial support for this research came from Jiangsu Health International Exchange Program (China).

Our news editors obtained a quote from the research from the University of Texas, "There were 29 men and 19 women, with a median age of 61 years (range, 18-80). 62.5%
patients had therapy-related diseases (t-MNs), 70.8% had multilineage dysplasia and 83.3% showed complex karyotypes. In 39 patients tested, FLT3, NPM1, CEBPA, KIT were all wild type and NRAS, KRAS, IDH1, APC, TET2 mutations were detected in single case(s) respectively. TP53 mutations were identified in 8 of 10 cases (80%) tested. Median disease-free survival (DFS) and overall survival (OS) were 3 and 10 months, respectively and did not differ between AML or MDS cases, or between de novo versus therapy related cases, or between the groups with or without complex karyotypes. In 19 patients who achieved complete remission after chemotherapy, and in 9 patients who underwent stem cell transplantation, the OS was better (14 and 17.5 months, P= 0.0128 and P= 0.0086, respectively). The der(5;17)(p10;q10) represents a unique molecular-cytogenetic subgroup in t-MNs and, associated with complex karyotypes.

According to the news editors, the research concluded: "TP53 inactivation, resulting from 17p deletion coupled with TP53 mutation, likely contributes to the poor clinical outcome of these patients."

The news editors report that additional information may be obtained by contacting X.Y. Lu, Univ Texas MD Anderson Canc Center, Dept. of Hematopathol, Houston, TX 77030, United States. Additional authors for this research include S.Y. Hao, K.P. Patel, H.M. Kantarjian, G. Garcia-Manero, C.C. Yin, L.J. Medeiros, P. Lin and X.Y. Lu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cancergen.2016.04.001. This DOI is a link to an online electronic document that is either free or for purchase.

Proteins - Albumins

Reports Summarize Albumins Findings from Mashhad University of Medical Sciences (Induction of a balanced Th1/Th2 immune responses by co-delivery of PLGA/ovalbumin nanospheres and CpG ODNs/PEI-SWCNT nanoparticles as TLR9 agonist in BALB/c mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Proteins - Albumins are discussed in a new report. According to news reporting originating in Mashhad, Iran, by NewsRx journalists, research stated. "To develop effective and safe vaccines with reduced dose of antigen and adjuvant, intelligent delivery systems are required. Many delivery systems have been developed to enhance the biological activity of cytosine-phosphorothioate-guanine oligodeoxynucleotides..."
(CpG ODN) as both immunotherapeutic agents and vaccine adjuvants."

Funders for this research include Ferdowsi University of Mashhad, Mashhad University of Medical Sciences, Mashhad, Iran, Iranian Nanotechnology Initiative Council.

The news reporters obtained a quote from the research from the Mashhad University of Medical Sciences, "In this study we designed a novel CpG ODN delivery system based on single-walled carbon nanotube (SWCNT) functionalized with polyethylenimine (PEI) and alkylcarboxylated PEI (AL-PEI). The physicochemical characteristics, cytotoxicity and cellular uptake studies of these carriers were performed. All carriers were conjugated with CpG ODN followed by co-delivery with ovalbumin (OVA) encapsulated into poly (lactic-co-glycolic acid) nanospheres (PLGA NSs) to enhance the induction of immune responses. The effect of these formulations on antibody (IgG1, IgG2a) and cytokine (IL-1 beta, IFN-gamma, IL-4) production was evaluated in an in vivo experiment. The results showed that all nano-adjuvant formulations had a strong influence in up-regulation of IFN-g and IL-4 in parallel with high IgG1-IgG2a isotype antibody titers in mice. In particular, SWCNT-AL-PEI nano-adjuvant formulation generated a balanced Th1 and Th2 immune response with more biased toward Th1 response without exhibiting any inflammatory and toxic effects."

According to the news reporters, the research concluded: "Therefore this nano-adjuvant formulation could be used as an efficient prophylactic immune responses agent."

Our news correspondents report that additional information may be obtained by contacting M. Ramezani, Mashhad Univ Med Sci, Sch Pharm, Pharmaceut Res Center, Mashhad, Iran. Additional authors for this research include M. Hashemi, M. Maleki, K. Abnous, G. Hashemitabar, M. Ramezani and A. Haghparast.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.065. This DOI is a link to an online electronic document that is either free or for purchase.

Lung Diseases and Conditions - Allergic...

Reports Summarize Allergic Bronchopulmonary Aspergillosis Findings from Sheffield Children's Hospital (Antifungal therapies for allergic bronchopulmonary aspergillosis in people with cystic fibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Allergic Bronchopulmonary Aspergillosis. According to news reporting out of Sheffield, United
Kingdom, by NewsRx editors, research stated, "Allergic bronchopulmonary aspergillosis (ABPA) is an allergic reaction to colonisation of the lungs with the fungus Aspergillus fumigatus and affects around 10% of people with cystic fibrosis. ABPA is associated with an accelerated decline in lung function."

Our news journalists obtained a quote from the research from Sheffield Children's Hospital, "High doses of corticosteroids are the main treatment for ABPA; although the long-term benefits are not clear, their many side effects are well-documented. A group of compounds, the azoles, have activity against Aspergillus fumigatus and have been proposed as an alternative treatment for ABPA. Of this group, itraconazole is the most active. A separate antifungal compound, amphotericin B, has been employed in aerosolised form to treat invasive infection with Aspergillus fumigatus, and may have potential for the treatment of ABPA. Antifungal therapy for ABPA in cystic fibrosis needs to be evaluated. This is an update of a previously published review. The review aimed to test the hypotheses that antifungal interventions for the treatment of ABPA in cystic fibrosis: 1. improve clinical status compared to placebo or standard therapy (no placebo); 2. do not have unacceptable adverse effects. If benefit was demonstrated, we aimed to assess the optimal type, duration and dose of antifungal therapy. Search methods We searched the Cochrane Cystic Fibrosis and Genetic Disorders Group Trials Register which comprises references identified from comprehensive electronic database searches, handsearches of relevant journals and abstract books of conference proceedings. In addition, pharmaceutical companies were approached. Date of the most recent search of the Group's Trials Register: 29 September 2016. Selection criteria Published or unpublished randomised controlled trials, where antifungal treatments have been compared to either placebo or no treatment, or where different doses of the same treatment have been used in the treatment of ABPA in people with cystic fibrosis. Data collection and analysis Four trials were identified by the searches; none of which was judged eligible for inclusion in the review. No completed randomised controlled trials were included. Authors’ conclusions At present, there are no randomised controlled trials to evaluate the use of antifungal therapies for the treatment of ABPA in people with cystic fibrosis, although trials in people who do not have cystic fibrosis have shown clinical and serological evidence of improvement and a reduction in the use of corticosteroids with no increase in adverse effects."

According to the news editors, the research concluded: "Trials with clear outcome measures are needed to properly evaluate this potentially useful treatment for cystic fibrosis."

For more information on this research see: Antifungal therapies for allergic bronchopulmonary aspergillosis in people with cystic fibrosis. Cochrane Database of Systematic Reviews, 2016;(11):483-494. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Reports Summarize Alzheimer Disease Findings from Aarhus University
(Stereological investigation of the CA1 pyramidal cell layer in untreated and lithium-treated 3xTg-AD and wild-type mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting originating in Aarhus, Denmark, by NewsRx journalists, research stated, "Pyramidal neuron loss in the hippocampal CM region is a very early hallmark of Alzheimer disease (AD). Lithium might be a therapeutic strategy for AD due to its neuroprotective and neurotrophic properties."

Financial supporters for this research include Eliza H, State of Sao Paulo Research Support Foundation, University of Sao Paulo, Alzira Denise Hertzog Silva Benevolent Association, Stereology Laboratory.

The news reporters obtained a quote from the research from Aarhus University, "This study used modern stereological techniques to investigate possible CM pyramidal neuron loss in 11-month-old triple transgenic AD (3xTg-AD) mice, and also the effects of therapeutic and subtherapeutic lithium doses on the number and density of CA1 pyramidal neurons and volume of CA1 pyramidal layer in 3xTg-AD and wild-type mice treated from 3 toil months of age. 3xTg-AD mice displayed CM pyramidal layer atrophy that is likely due to reduced neuronal volume because of the absence of neuronal loss. Both lithium treatments of 3xTg-AD mice, which already expressed AD-like pathology, had no effect on CM atrophy. However, lithium treatment of wild-type mice, at low (subtherapeutic) doses, induced a significant increase in total CM pyramidal neuron number that led to a significant increase in total CA1 pyramidal layer volume. The lithium-induced increase in CM neuron number is highly consistent with previous evidence that adult neurogenesis can be exogenously induced in the CM pyramidal layer with impact on total CA1 neuron number, thus raising the possibility of the chronic use of low-dose lithium as a strategy to help compensate for neuronal loss in CM and perhaps other typically non-neurogenic brain regions in various neurological diseases."

According to the news reporters, the research concluded: "With regard to AD, low-dose lithium intervention must be initiated as early as possible in the course of neuropathology for beneficial effects to occur."

For more information on this research see: Stereological investigation of the CA1 pyramidal cell layer in untreated and lithium-treated 3xTg-AD and wild-type mice. Annals of Anatomy-Anatomischer Anzeiger, 2017;209():51-60. Reports Summarize Alzheimer Disease Findings from P.R. Manzine and Co-Authors (BACE1 levels are increased in plasma of Alzheimer's disease patients compared with matched cognitively healthy controls)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting from Sao Carlos, Brazil, by NewsRx journalists, research stated, "BACE1 is the secretase that acts in A beta production in Alzheimer's disease (AD). We investigated mRNA expression in total blood and the levels of plasma protein BACE1 in AD patients compared with cognitively healthy subjects."

The news correspondents obtained a quote from the research, "Probable AD (n = 47) and non-AD control group (n = 32) were evaluated for mRNA expression for BACE1 using reverse transcription-qPCR. A subsample of n = 21 AD and n = 20 non-AD had plasma BACE1 levels analyzed, using ELISA. No differences were found on BACE1 mRNA between groups. However, higher levels of BACE1 were detected in plasma of AD patients. Blood-based diagnostic tools are desired to improve AD diagnosis."

According to the news reporters, the research concluded: "BACE1 plasma levels could provide an additional diagnostic tool for AD in association with neuropsychological tests."

For more information on this research see: BACE1 levels are increased in plasma of Alzheimer's disease patients compared with matched cognitively healthy controls. Personalized Medicine, 2016;13(6):531-540. Personalized Medicine can be contacted at: Future Medicine Ltd, Unitec House, 3RD Floor, 2 Albert Place, Finchley Central, London, N3 1QB, England.

Reports Summarize Alzheimer Disease Findings from Russian Academy of Science [AChE and the amyloid precursor protein (APP) - Cross-talk in Alzheimer's disease]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting from St. Petersburg, Russia, by NewsRx journalists, research stated, "The amyloid precursor protein (APP) and acetylcholinesterase (AChE) are multi-faceted proteins with a wide range of vital functions, both crucially linked with the pathogenesis of Alzheimer's disease (AD). APP is the precursor of the Ab peptide, the pathological agent in AD, while AChE is linked to its pathogenesis either by increasing cholinergic deficit or exacerbating Ab fibril formation and toxicity."

The news correspondents obtained a quote from the research from the Russian Academy of Science, "As such, both proteins are the main targets in AD therapeutics with AChE inhibitors being currently the only clinically available AD drugs. In our studies we have demonstrated an important inter-relation in functioning of these proteins. Both can be released from the cell membrane and we have shown that AChE shedding involves a metalloproteinase-mediated mechanism which, like the a-secretase dependent cleavage of APP, is stimulated by cholinergic agonists. Overexpression of the neuronal specific isoform APP695 in neuronal cells substantially decreased levels of the AChE mRNA, protein and catalytic activity accompanied by a similar decrease in mRNA levels of the AChE membrane anchor, PRiMA (proline rich membrane anchor). We further established that this regulation does not involve APP processing and its intracellular domain (AICD) but requires the E1 region of APP, specifically its copper-binding domain. On the contrary, siRNA knock-down of APP in cholinergic SN56 cells resulted in a significant upregulation of AChE mRNA levels."

According to the news reporters, the research concluded: "Hence APP may influence AChE physiology while released AChE may regulate amyloidogenesis through multiple mechanisms suggesting novel therapeutic targets."

Our news journalists report that additional information may be obtained by contacting N.N. Nalivaeva, Russian Academy Sci, Sechenov Inst Evolutionary Physiol & Biochem, St Petersburg 194223, Russia.

Reports Summarize Aneurysm Findings from Georg-August-University
(Unenhanced Time-of-Flight MR Angiography versus Gadolinium-
Enhanced Time-of-Flight MR Angiography in the Follow-Up of Coil-
Embolized Aneurysms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurism. According to news reporting out of Gottingen, Germany, by NewsRx editors, research stated, "Coil embolization of ruptured and unruptured aneurysms has emerged as a widely accepted alternative to clipping. Unfortunately, coil-embolized aneurysms need a long-term imaging follow-up to confirm the stability of the occlusion status."

Our news journalists obtained a quote from the research from Georg-August-University, "We investigated whether contrast-enhanced time-of-flight (ToF) magnetic resonance angiography (MRA) ( gadolinium [Gd-ToF]) provides any diagnostic benefit over conventional ToF MRA (nonenhanced [NE]-ToF) in this context. From October 2013 to January 2015, all patients who were regularly scheduled for their follow-up after coil embolization were examined with Gd-ToF and NE-ToF angiography. The general visibility of the occlusion result was compared between the two MRAs as well as with the last digital subtraction angiography (DSA) available. Subgroups of interest (follow-up after stent-assisted coil embolization, cases with already known aneurysm remnants) were also analyzed. A total of 70 patients (44 female) harboring 74 treated aneurysms were examined. The reproducibility of the DSA result in terms of therapeutic relevance was 100%. In 10 of 74 cases (14%), the aneurysm status was more difficult to judge in the NE-ToF images (p = 0.02), and the visualization of small vessels was significantly better in the Gd-ToF (p = 0.003). NE-ToF did not fail to show any aneurysm remnants but were more difficult to depict in 35% of the cases (p = 0.09). Regarding the aneurysms that were coiled with stent assistance, there was no significant difference in terms of the visualization (p = 0.1)."

According to the news editors, the research concluded: "Gd-ToF angiography is in general not superior to NE-ToF for the follow-up of coil-embolized aneurysms."

Our news journalists report that additional information may be obtained by contacting A. Mohr, Georg August Univ Gottingen, University Medical Center, Dept. of Neuroradiol, D-37075 Gottingen, Germany. Additional authors for this research include V. Malinova, K. Kallenberg, M. Knauth and A. Mohr.

Reports Summarize Angiotensin II Inhibitors Study Results from Federal University (Olmesartan Prevented Intra-articular Inflammation Induced by Zymosan in Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Angiotensin II Inhibitors have been published. According to news reporting from Natal, Brazil, by NewsRx journalists, research stated, "The objective of this study was to study the effect of olmesartan medoxomil (OLM), an antihypertensive drug, on intra-articular inflammation induced by zymosan (Zy) in Wistar rats. Intra-articular inflammation was induced in the right knees of rats by 1 mg Zy dissolved in saline."

The news correspondents obtained a quote from the research from Federal University, "The animals were divided into the following groups: saline only (oral saline and intra-articular saline); Zy only (intra-articular Zy and oral saline), and intra-articular Zy and oral OLM (5, 15, or 30 mg/kg) or diclofenac sodium (SD; 100mg/kg). Twenty-four hours after Zy injection, synovial fluid was collected for total leukocyte counts, blood was collected for biochemical measurements, and synovial tissue was collected for histopathology, immunohistochemistry, immunofluorescence and myeloperoxidase (MPO), malonaldehyde (MDA), and non-protein sulphhydryl (NPSH) assays. OLM doses of 15 and 30 mg/kg had protective effects, as evidenced by improved histopathological parameters of synovium, reduced total leukocyte counts, reduced MPO and MDA levels, and increased NPSH group levels compared with the Zy group. OLM reduced immunostaining for cyclooxygenase 2, tumour necrosis factor and interleukin 17 and increased immunostaining for superoxide dismutase and glutathione peroxidase. SD produced similar results. The drugs studied caused no change in biochemical parameters of the animals."

According to the news reporters, the research concluded: "OLM showed protective effects in this model of Zy-induced intra-articular inflammation."

Our news journalists report that additional information may be obtained by contacting C. de Medeiros, Univ Fed Rio Grande do Norte, Dept. of Biophys & Pharmacol, Post Grad Program Biotechnol RENORBIOState Univ, Post Grad Program Biol SciPost Grad Program HLth, BR-59072970 Natal, RN, Brazil. **Drugs and Therapies - Antineoplastics**

**Reports Summarize Antineoplastics Study Results from Martin-Luther-University (2016 Updated MASCC/ESMO consensus recommendations: Emetic risk classification and evaluation of the emetogenicity of antineoplastic agents)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antineoplastics have been published. According to news reporting originating in Halle, Germany, by NewsRx journalists, research stated, "Employing the same framework as in previous guideline updates, antineoplastic agents were classified into four emetic risk categories. The classification of the emetogenic level of new antineoplastic agents, especially for the oral drugs, represents an increasing challenge."

The news reporters obtained a quote from the research from Martin-Luther-University, "Accurate reporting of emetogenicity of new antineoplastic agents in the absence of preventive antiemetic treatment is rarely available. A systematic search was conducted for drugs approved after 2009 until June 2015 using EMBASE and PubMed. The search term was 'drug name.' The restrictions were language (English records only), date (2009 to 2015), and level of evidence ('clinical trial'). From January 2009 to June 2015, 42 new antineoplastic agents were identified and a systematic search was conducted to identify relevant studies to help define emetic risk levels. The reported incidence of vomiting varied across studies for many agents, but there was adequate evidence to allow 41 of the 42 new antineoplastic agents to be classified according to emetogenic risk. No highly emetogenic agents were identified. Seven moderately emetogenic agents, 26 low emetogenic, agents and eight minimal emetogenic agents were identified and classified accordingly. The MASCC/ESMO update committee also recommended reclassification of the combination of an anthracycline and cyclophosphamide (AC) as highly emetogenic. Despite several limitations, we have attempted to provide a reasonable approximation of the emetic risk associated with new antineoplastic agents through a comprehensive search of the available literature."

According to the news reporters, the research concluded: "Hopefully by the next update, more precise information on emetic risk will have been collected during new agent development process."

For more information on this research see: 2016 Updated MASCC/ESMO consensus recommendations: Emetic risk classification and evaluation of the emetogenicity of antineoplastic agents. *Supportive Care in Cancer*, 2017;25(1):271-275. *Supportive Care in Cancer* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Reports Summarize Antiretrovirals Findings from Novartis Institutes for Biomedical Research (Assessment of pharmacokinetic drug-drug interaction between pradigastat and atazanavir or probenecid)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antiretrovirals is the subject of a report. According to news reporting out of Cambridge, Massachusetts, by NewsRx editors, research stated, "Pradigastat, a novel diacylglycerol acyltransferase-1 inhibitor, has activity in common metabolic diseases associated with abnormal accumulation of triglycerides. In vitro studies suggest that glucuronidation is the predominant metabolism pathway for elimination of pradigastat in humans and confirmed the role of uridine 5'-diphosphoglucuronosyltransferase (UGT) enzymes, UGT1A1, -1A3, and -2B7."

Financial support for this research came from Novartis Healthcare Pvt Ltd.

Our news journalists obtained a quote from the research from Novartis Institutes for Biomedical Research, "The in vitro studies using atazanavir as a selective inhibitor of UGT1A1 and -1A3 indicated that these enzymes contribute &sim;55% toward the overall glucuronidation pathway. Therefore, a clinical study was conducted to assess the potential for drug interaction between pradigastat and probenecid (purported general UGT inhibitor) or atazanavir (selective UGT1A1, -1A3 inhibitor). The study included 2 parallel cohorts, each with 3 sequential treatment periods and 22 healthy subjects per cohort. The 90%CI of the geometric mean ratios for Cmax,ss and AUCt,ss of pradigastat were within 0.80-1.25 when administered in combination with probenecid. However, the Cmax,ss and AUCt,ss of pradigastat decreased by 31% (90%CI: 0.62-0.78) and 26% (0.67-0.82), respectively, when administered in combination with atazanavir. This magnitude of decrease in pradigastat steady-state exposure is not considered clinically relevant."

According to the news editors, the research concluded: "Pradigastat was well tolerated by all subjects, either alone or in combination with atazanavir or probenecid."

For more information on this research see: Assessment of pharmacokinetic drug-drug interaction between pradigastat and atazanavir or probenecid. Journal of Clinical Pharmacology, 2015;56(3):355-64. Journal of Clinical Pharmacology can be contacted at: SAGE Publications, USA , 2455 Teller Road, Thousand Oaks, CA 91320, USA. (Sage Publications - www.sagepub.com; Journal of Clinical Pharmacology - jcp.sagepub.com)

Our news journalists report that additional information may be obtained by contacting A. Mendonza, Novartis Institutes for BioMedical Research, Cambridge, MA, United States. Additional authors for this research include I. Hanna, D. Meyers, P. Koo, S. Neelakantham, B. Zhu, T. Majumdar, S. Rebello, G. Sunkara and J. Chen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/jcph.595. This DOI is a link to an online electronic document that is either free or for purchase.
Reports Summarize Apoptosis Study Results from Peking Union Medical College (ISG12a inhibits HCV replication and potentiates the anti-HCV activity of IFN-alpha through activation of the Jak/STAT signaling pathway independent of autophagy and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Apoptosis. According to news reporting originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "Interferon stimulated (sensitive) genes (ISGs) are the effector molecules downstream of type interferon (IFN) signaling pathways in host innate immunity. ISG12a can be induced by IFN-alpha."

Our news editors obtained a quote from the research from Peking Union Medical College, "Although ISG12a has been reported to inhibit the replication of HCV, the exact mechanism remains to be determined. In this study, we investigated the possible mechanisms of ISG12a anti-HCV property by exploring the production of type I IFN and the activation of Janus kinase signal transducer and activator of transcription (Jak/STAT) signaling pathway, apoptosis and autophagy in Huh7.5.1 cells transiently transfected with ISG12a over-expression plasmid. Interestingly, we found that ISG12a inhibited HCV replication in both Con1b replicon and the HCV JFH1-based cell culture system and potentiated the anti-HCV activity of IFN-alpha. ISG12a promoted the production of IFN alpha/beta and activated the type I IFN signaling pathway as shown by increased p-STAT1 level, higher Interferon sensitive response element (ISRE) activity and up-regulated ISG levels. However, ISG12a over-expression did not affect cell autophagy and apoptosis."

According to the news editors, the research concluded: "Data from our current study collectively indicated that ISG12a inhibited HCV replication and potentiated the anti-HCV activity of IFN-alpha possibly through induced production of type I IFNs and activation of Jak/STAT signaling pathway independent of autophagy and cell apoptosis."

For more information on this research see: ISG12a inhibits HCV replication and potentiates the anti-HCV activity of IFN-alpha through activation of the Jak/STAT signaling pathway independent of autophagy and apoptosis. *Virus Research*, 2017;227():231-239. *Virus Research* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Science - Applied Sciences

Reports Summarize Applied Sciences Study Results from University of Technology (Numerical Study of Photoacoustic Pressure for Cancer Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Science - Applied Sciences is now available. According to news reporting out of Troyes, France, by NewsRx editors, research stated, "A commonly used therapy for cancer is based on the necrosis of cells induced by heating through the illumination of nanoparticles embedded in cells. Recently, the photoacoustic pressure shock induced by the illumination pulse was proved and this points to another means of cell destruction."

Our news journalists obtained a quote from the research from the University of Technology, "The purpose of this study is to propose a model of the photoacoustic pressure in cells. The numerical resolution of the problem requires the accurate computation of the electromagnetism, the temperature and the pressure around the nanostructures embedded in a cell. Here, the problem of the interaction between an electromagnetic excitation and a gold nanoparticle embedded in a cell domain is solved."

According to the news editors, the research concluded: "The variations of the thermal and photoacoustic pressures are studied in order to analyze the pressure shock wave inducing the collapse of the cell's membrane in cancer therapy."

For more information on this research see: Numerical Study of Photoacoustic Pressure for Cancer Therapy. Applied Sciences-Basel, 2016;6(11):668-676. Applied Sciences-Basel can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Life Science Research - Applied Toxicology

Reports Summarize Applied Toxicology Findings from VIT University (Natural remedies for non-steroidal anti-inflammatory drug-induced toxicity)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Applied Toxicology. According to news reporting from Tamil Nadu, India, by NewsRx journalists, research stated, "The liver is an important organ of the body, which has a vital role in metabolic functions. The non-steroidal anti-inflammatory drug (NSAID), diclofenac causes hepato-renal toxicity and gastric ulcers."

The news correspondents obtained a quote from the research from VIT University, "NSAIDs are noted to be an agent for the toxicity of body organs. This review has elaborated various scientific perspectives of the toxicity caused by diclofenac and its mechanistic action in affecting the vital organ. This review suggests natural products are better remedies than current clinical drugs against the toxicity caused by NSAIDs. Natural products are known for their minimal side effects, low cost and availability."

According to the news reporters, the research concluded: "On the other hand, synthetic drugs pose the danger of adverse effects if used frequently or over a long period."

Our news journalists report that additional information may be obtained by contacting S.E. Prince, VIT Univ, Sch Biosci & Technol, Vellore 632014, Tamil Nadu, India.

Cardiovascular Diseases and Conditions -...

Reports Summarize Atherosclerosis Study Results from Radboud University (Innate immune cell activation and epigenetic remodeling in symptomatic and asymptomatic atherosclerosis in humans in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting out of Nijmegen, Netherlands, by NewsRx editors, research stated, "We have recently reported that monocytes can undergo functional and transcriptional reprogramming towards a long-term pro-inflammatory phenotype after brief in vitro exposure to atherogenic stimuli such as oxidized LDL. This process is termed 'trained immunity', and is mediated by epigenetic remodeling and a metabolic switch towards increased aerobic glycolysis."

Our news journalists obtained a quote from the research from Radboud University, "We hypothesize that trained immunity contributes to atherogenesis. Therefore, we investigated the inflammatory phenotype and epigenetic remodeling of monocytes from patients with and without established atherosclerosis. Monocytes were isolated from 20 patients with severe symptomatic coronary atherosclerosis (total plaque score >4 on coronary computed tomography angiography) and 17 patients with asymptomatic carotid atherosclerosis and matched controls for both groups. Ex vivo stimulation, RNA analysis and chromatin immunoprecipitation were
performed. Monocytes from patients with symptomatic atherosclerosis have a higher production of pro-inflammatory cytokines upon LPS stimulation than healthy controls (TNF alpha 499 +/- 102 vs. 267 +/- 45 pg/ml, p = 0.01). This was associated with lower histone 3 lysine 4 trimethylation (H3K4me3) (19% vs. 33%, p = 0.002), and lower H3K27me3 (0.005% vs. 0.8%, p< 0.0001) on the TNF alpha promoter. Furthermore, relative mRNA expression of the glycolytic rate limiting enzymes hexokinase 2 and 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 3 was higher in patients (0.7 +/- 0.2 vs. 0.3 +/- 0.1 resp. 1.7 +/- 0.2 vs. 1.0 +/- 0.1, p = 0.007 resp. 0.003) compared to control individuals. Interestingly, this pro-inflammatory phenotype was only present in patients with symptomatic atherosclerosis, and not in patients with asymptomatic carotid atherosclerosis."

According to the news editors, the research concluded: "Circulating monocytes of patients with symptomatic, but not asymptomatic, atherosclerosis have a pro-inflammatory phenotype and increased expression of glycolytic enzymes, associated with epigenetic remodeling at the level of histone methylation."

For more information on this research see: Innate immune cell activation and epigenetic remodeling in symptomatic and asymptomatic atherosclerosis in humans in vivo. Atherosclerosis, 2016;254():228-236. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Our news journalists report that additional information may be obtained by contacting N.P. Riksen, Radboud University, Medical Center, Dept. of Internal Med, NL-6500 HB Nijmegen, Netherlands. Heart Disorders and Diseases - Atrial Fibrillation

Reports Summarize Atrial Fibrillation Study Results from Grigore T. Popa University of Medicine and Pharmacy (The Interplay between Cardiomyocytes and Non-cardiomyocytes in Postoperative Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting out of Iasi, Romania, by NewsRx editors, research stated, "Postoperative atrial fibrillation is a common complication after cardiac surgery, and changes in atrial structure may be the substrate for atrial fibrillation. In this study, including 10 coronary patients admitted at the Cardiovascular Disease Institute in 2012, we attempted to identify histopathological and immunohistological changes in right atrial tissue that might explain the development of postoperative atrial fibrillation."
Our news journalists obtained a quote from the research from the Grigore T. Popa University of Medicine and Pharmacy, "Atrial tissue samples from patients in the atrial fibrillation group were compared with samples from patients who remained in postoperative sinus rhythm. Lesions identification requires microscopic examination using special histological techniques and immunohistochemistry. Atrial tissue from 10 patients who underwent elective coronary artery bypass grafting was sampled. Histological and immunohistochemical methods were used for revealing atrial lesions. Five patients developed postoperative atrial fibrillation. Both groups of patients developed degenerative and adaptive lesions, but in different degrees, values recorded in postoperative atrial fibrillation being much higher than in postoperative sinus rhythm. Abnormalities in atrial biopsies can indicate the morphological substrate for postoperative atrial fibrillation development."

According to the news editors, the research concluded: "The same lesions, with various degrees of intensity, make the difference between the severely ischemic myocardium in postoperative atrial fibrillation hearts compared to mild ischemia in postoperative sinus rhythm hearts."

For more information on this research see: The Interplay between Cardiomyocytes and Non-cardiomyocytes in Postoperative Atrial Fibrillation. Revista De Chimie, 2016;67 (10):2012-2014. Revista De Chimie can be contacted at: Chiminform Data S A, Calea Plevnei Nr 139, Sector 6, Bucharest R-77131, Romania.

Heart Disorders and Diseases - Atrial Fibrillation

Reports Summarize Atrial Fibrillation Study Results from Wenzhou Medical University (Resolution of massive left atrial appendage thrombi with rivaroxaban before balloon mitral commissurotomy in severe mitral stenosis A case report and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting out of Zhejiang, People's Republic of China, by NewsRx editors, research stated, "Data on nonvitamin K antagonist oral anticoagulant being used for the treatment of LAA thrombi are limited only in nonvalvular atrial fibrillation. There are no data on the antithrombotic efficacy and safety of nonvitamin K antagonist oral anticoagulant in the resolution of left atrial appendage (LAA) thrombi in patients with rheumatic mitral stenosis."

Our news journalists obtained a quote from the research from Wenzhou Medical University, "Patient concerns: A 49-year-old woman with known rheumatic mitral stenosis and atrial fibrillation was referred for percutaneous transvenous mitral commissurotomy because of..."
progressive dyspnea on exertion over a period of 3 months. Diagnoses: Transesophageal echocardiography (TEE) demonstrated a large LAA thrombus protruding into left atria cavity before the procedure. Direct factor Xa (FXa) inhibitor rivaroxaban (20 mg/d) was started for the patient. After 3 weeks of rivaroxaban treatment TEE showed a relevantly decreased thrombus size, and a complete thrombus resolution was achieved after 5 weeks of anticoagulant therapy with the FXa inhibitor. To the best of our knowledge, this is the first documented case of large LAA thrombus resolution with nonvitamin K antagonist oral anticoagulant in severe mitral stenosis, and in which percutaneous transvenous mitral commissurotomy was performed subsequently. Lessons: The report indicated that rivaroxaban could be a therapeutic option for mitral stenosis patients with LAA thrombus."

According to the news editors, the research concluded: "Further study is required before the routine use of rivaroxaban in patients with rheumatic mitral stenosis and atrial fibrillation."

For more information on this research see: Resolution of massive left atrial appendage thrombi with rivaroxaban before balloon mitral commissurotomy in severe mitral stenosis A case report and literature review. Medicine, 2016;95(49):468-471. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

**Reports Summarize Basilar Aneurysm Study Results from Strasbourg University Hospital (Spontaneous thrombosis of a basilar tip aneurysm after ventriculoperitoneal shunting)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Diseases and Conditions - Basilar Aneurysm. According to news reporting originating in Strasbourg, France, by NewsRx journalists, research stated, "We present a case of a large unruptured basilar tip aneurysm with concomitant hydrocephalus."

The news reporters obtained a quote from the research from Strasbourg University Hospital, "Complete thrombosis of the aneurysm was observed after ventriculoperitoneal shunting. Analyzing preoperative and postoperative MRI and DSA images, we identified reduced intracranial pressure and widening of the aneurysm-artery inclination angle as possible factors influencing spontaneous thrombosis."
According to the news reporters, the research concluded: "To the best of our knowledge, this is the first report of aneurysm thrombosis occurring after CSF diversion."

Our news correspondents report that additional information may be obtained by contacting R. Pop, Strasbourg Univ Hosp, Dept. of Intervent Neuroradiol, Strasbourg, France. Additional authors for this research include S. Chibarro, M. Manisor, F. Proust and R. Beaujeux.

Keywords for this news article include: Strasbourg, France, Europe, Cardiovascular Diseases and Conditions, Vascular Diseases and Conditions, Embolism and Thrombosis, Basilar Tip Aneurysm, Basilar Aneurysm, Hematology, Neurology, Strasbourg University Hospital.

**Drugs and Therapies - Beta-Adrenergic Blocking…**

**Reports Summarize Beta-Adrenergic Blocking Agents Findings from Dalian University (Carvedilol suppresses cartilage matrix destruction)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Beta-Adrenergic Blocking Agents have been presented. According to news originating from Liaoning, People's Republic of China, by NewsRx correspondents, research stated, "Collagen type II (col II) and aggrecan, the main components of the extracellular matrix (ECM) in human joint cartilage, have been reported to be reduced by chronic production of inflammatory cytokine interleukin (IL)-beta in arthritic joints. Carvedilol, a licensed medicine, has been used for treatment of hypertension, congestive heart failure and coronary disease in clinics."

Our news journalists obtained a quote from the research from Dalian University, "In this study, we investigated the effects of Carvedilol on the expression of col II and aggrecan. Our results demonstrate that treatment with Carvedilol didn't change the expression of aggrecan or col II at mRNA levels in SW1353 chondrocytes. However, the expression of aggrecan and Col II at protein levels were significantly reduced by IL-beta treatment, which were reversed by Carvedilol in a dose dependent manner, suggesting the inhibitory effects of Carvedilol on the expression of aggrecan and Col II are at post-translational modification levels. In addition, it was shown that IL-beta treatment highly induced MMP-1 and MMP-13 expression in SW1353 chondrocytes at both gene and protein expression levels, which were restored by Carvedilol in a dose dependent manner. Mechanistically, exposure to IL-beta increased phosphorylation of IKK-alpha/beta and degradation of IKB-a in SW1353 chondrocytes, which were suppressed by pretreatment with Carvedilol. Administration of Carvedilol inhibited IL-beta-induced translocation of NF-KB p65 from cytosol to nucleus manner. Notably, a luciferase reporter assay showed that IL-beta severely increased NE KB luciferase activity, which was markedly suppressed by Carvedilol treatment."

According to the news editors, the research concluded: "Our results suggest that Carvedilol might be a potential therapeutic agent for chondro-protective therapy."
For more information on this research see: Carvedilol suppresses cartilage matrix destruction. *Biochemical and Biophysical Research Communications*, 2016;480(3):309-313. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Life Science Research - Biological Macromolecules**

**Reports Summarize Biological Macromolecules Findings from School of Chemistry and Chemical Engineering (Response surface methodology for the synthesis of an Auricularia auriculajudae polysaccharides-CDDP complex)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Biological Macromolecules have been published. According to news originating from Harbin, People's Republic of China, by NewsRx correspondents, research stated, "A self-assembly method was used to synthesize the Auricularia auriculajudae polysaccharides (AAPs)cisplatin (cis-dichlorodiammine platinum (II), CDDP) complexes. Response surface methodology (RSM) was used to optimize the synthesis conditions."

Our news journalists obtained a quote from the research from the School of Chemistry and Chemical Engineering, "The effects of four independent factors: pH (X-1: 1-9), time (X-2: 0.5-3 h), temperature (X-3: 20-70 degrees C), and amount of CDDP (X-4: 2-22 mg) on the platinum content in AAPs-CDDP complexes were evaluated. The RSM results showed that the optimal synthesis conditions were: X-1: 7.7, X-2: 1.83 h, X-3: 56.93 degrees C, and X-4: 6.02 mg. Verification tests showed no significant differences between the practical and the predictive values for each response. Under the optimal conditions, platinum content was 47.0 mg/g, without significant differences with the predicted value (47.1 mg/g). The FT-IR analysis and H-1 NMR spectra of AAPs-CDDP complexes showed that the AAPs combined with CDDP using the hydroxyl group on the polysaccharide's chains. In addition, the microphotograph of the AAPs and AAPs-CDDP complexes suggested that an AAPs-CDDP complex was formed."

According to the news editors, the research concluded: "The MTT assay in vitro
indicated that AAPs-CDDP complexes exhibited significant anti-tumor activity against Hela and LoVo cells."

The news correspondents report that additional information may be obtained from Z.Y. Wang, Harbin Inst Technol, Sch Chem & Chem Engn, Dept. of Food Sci, Harbin, People's Republic of China. Additional authors for this research include H. Zhang, Z.Y. Wang, S.M. Liu and J.M. Regenstein.

**Blood Pressure**

**Reports Summarize Blood Pressure Study Results from University College (Blood Pressure and the Capacity-Load Model in 8-Year-Old Children from Nepal: Testing the Contributions of Kidney Size and Intergenerational Effects)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Blood Pressure have been presented. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Growth patterns in early life are increasingly linked with subsequent cardio-metabolic risk, but the underlying mechanisms require elucidation. We have developed a theoretical model of blood pressure, treating it as a function of homeostatic metabolic capacity, and antagonistic metabolic load."

Our news editors obtained a quote from the research from University College, "We sought to differentiate prenatal and postnatal components of metabolic capacity, and to identify intergenerational contributions to offspring capacity and load. We followed up at 8 years a cohort of children originally recruited into a randomized trial of maternal micronutrient supplementation in pregnancy. Maternal anthropometry was measured at recruitment. Offspring anthropometry was measured at birth, 2 years and 8 years. Offspring blood pressure, kidney size, and body composition were measured at 8 years. Regression analysis was used to investigate potential associations of maternal phenotype, birth phenotype, and current body composition with kidney size and blood pressure. Blood pressure was positively associated with body fat, but negatively associated with birth weight and relative leg length. Kidney size was positively associated with birth weight but not with relative leg length. Adjusting for adiposity, blood
pressure was independently negatively associated with birth weight, relative leg length, and kidney length. Maternal height and BMI predicted offspring size at birth and at 8 years, but not blood pressure. Our data provide support for the capacity-load model of blood pressure in Nepalese children. Fetal and postnatal growth and kidney dimensions all contribute to metabolic capacity."

According to the news editors, the research concluded: "Maternal phenotype contributed to offspring capacity and load, but these associations did not propagate to blood pressure."

The news editors report that additional information may be obtained by contacting J.C.K. Wells, UCL Inst Child Hlth, Childhood Nutr Res Center, London, United Kingdom. Additional authors for this research include D. Devakumar, C.S. Grijalva-Eternod, D.S. Manandhar, A. Costello and D. Osrin.

**Musculoskeletal Diseases and Conditions - Bone…**

**Reports Summarize Bone Resorption Study Results from Nagasaki University (Glucocorticoid Signaling and Bone Biology)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Musculoskeletal Diseases and Conditions - Bone Resorption is the subject of a report. According to news reporting from Nagasaki, Japan, by NewsRx editors, the research stated, "Since glucocorticoids remain an effective therapeutic option for the treatment of many inflammatory and autoimmune diseases, glucocorticoid-induced osteoporosis is the most common form of secondary osteoporosis. Fractures may occur in as many as 30-50 % of patients receiving chronic glucocorticoid therapy."

The news correspondents obtained a quote from the research from Nagasaki University, "Under physiological conditions, glucocorticoids are required for normal bone development due to their regulation of osteoblast differentiation, possibly via the Wnt/beta-catenin pathway and TSC22D3. However, serum levels of endogenous corticosterone are elevated in aged mice and glucocorticoids exert negative effects on the survival of osteoblasts and osteocytes as well as angiogenesis. Glucocorticoid treatments impair bone formation and enhance bone resorption. Excess glucocorticoids induce osteoblast and osteocyte apoptosis by increasing pro-apoptotic molecules, reactive oxygen species, and endoplasmic reticulum stress and suppressing the Wnt/beta-catenin path-way. Autophagy protects osteocytes from glucocorticoid-induced apoptosis, but passed some threshold, the process of autophagy leads the cells to apoptosis. Excess glucocorticoids impair osteoblastogenesis by inducing Wnt antagonists, including Dkk1, Sost, and sFRP-1. However, the findings are controversial and the involvement of Wnt antagonists requires further study. Excess glucocorticoids reduce the
phosphorylation of Akt and GSK3 beta, which enhances the degradation of beta-catenin. Excess glucocorticoids have been shown to modulate the expression of miRNAs, including miR-29a, miR-34a-5p, and miR-199a-5p, which regulate the proliferation and differentiation of osteoblast lineage cells.

According to the news reporters, the research concluded: "Excess glucocorticoids also enhance bone resorption by reducing OPG expression, increasing Rankl expression and reactive oxygen species, and prolonging the life span of osteoclasts; however, they also suppress the bone-degrading capacity of osteoclasts by disturbing the organization of the cytoskeleton."

For more information on this research see: Glucocorticoid Signaling and Bone Biology. Hormone and Metabolic Research, 2016;48(11):755-763. Hormone and Metabolic Research can be contacted at: Georg Thieme Verlag Kg, Rudigerstr 14, D-70469 Stuttgart, Germany. (Thieme - www.thieme.com)

Brachytherapy

Reports Summarize Brachytherapy Study Results from Taussig Cancer Institute (Outcomes for prostate glands > 60 cc treated with low-dose-rate brachytherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Brachytherapy have been presented. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "We sought to analyze whether outcomes of biochemical relapse free survival (bRFS), late genitourinary (GU), and late gastrointestinal toxicity are different for prostate cancer patients with small (<= 60 cc) vs. large (>60 cc) prostates following low dose-rate brachytherapy. The bRFS outcomes for 2076 low- or intermediate-risk prostate cancer patients from 1996 to 2012 were determined from a review of a prospectively maintained database."

The news reporters obtained a quote from the research from Taussig Cancer Institute, "All patients were treated with I-125 monotherapy without androgen deprivation therapy. Biochemical failure was defined per the Phoenix definition. related factors and dosimetric values were examined in Cox regression analyses for bRFS and late toxicity. Late toxicity was scored according to a modified Common Terminology Criteria for Adverse Events version 4.0 scale. The median followup for all patients was 55 months. The 5-year bRFS rates for all
patients, prostates >60 cc, and prostates cc were 93.4% (95% confidence interval [CI]: 92.1%, 94.7%), 96.7% (95% CI: 94.4%, 98.9%), and 92.9% (95% CI: 91.4%, 94.3%), respectively. On multivariable analysis, prostate size >60 cc was significantly associated with improved bRFS (p = 0.01), as were initial prostate-specific antigen and biopsy Gleason score (p < 0.0001 and p = 0.0002, respectively). Patients with prostates >60 cc had significantly higher rates of Grade 3-4 late GU toxicity at 5 years than patients with smaller prostates; 7.2% (95% CI: 4.0%, 10.4%) and 3.2% (95% CI: 2.3%, 4.1%), respectively (p = 0.0007). The overall late gastrointestinal toxicity rate for all patients was 0.7% at 5 years with no significant difference between the two groups."

According to the news reporters, the research concluded: "Implantation of large prostates >60 cc results in favorable bRFS outcomes and is associated with increased but acceptable rates of Grade 3 and higher late GU toxicities."

Our news correspondents report that additional information may be obtained by contacting R.D. Tendulkar, Cleveland Clinic, Taussig Canc Inst, Dept. of Radiat Oncol, Cleveland, OH 44106, United States. Additional authors for this research include J.A. Kittel, C.A. Reddy, J.P. Ciezki, E.A. Klein, K.L. Stephans and R.D. Tendulkar.

**Oncology - Breast Cancer**

**Reports Summarize Breast Cancer Findings from Northwestern University (Cytologic atypia in the contralateral unaffected breast is related to parity and estrogen-related genes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "The contralateral unaffected breast (CUB) of women with unilateral breast cancer provides a model for the study of breast tissue-based risk factors. Using random fine needle aspiration (rFNA), we have investigated hormonal and gene expression patterns related to atypia in the CUBs of newly diagnosed breast cancer patients."

Financial support for this research came from Lynn Sage Cancer Research Foundation.

Our news journalists obtained a quote from the research from Northwestern University, "83 women underwent rFNA of the CUB. Cytologic analysis was performed using the Masood Score (MS), atypia was defined as MS > 14. RNA was extracted using 80% of the sample. The expression of 20 hormone related genes was quantified using Taqman Low Density Arrays. Statistical analysis was performed using 2-tailed t tests and linear regression."
Cytological atypia was more frequent in multiparous women (P = 0.0392), and was not associated with any tumor-related features in the affected breast. Masood Score was higher with shorter interval since last pregnancy (R = 0.204, P = 0.0417), higher number of births (R = 0.369, P = 0.0006), and estrogen receptor (ER) negativity of the index cancer (R = -0.203, P = 0.065). Individual cytologic features were associated with aspects of parity. Specifically, anisonucleosis was correlated with shorter interval since last pregnancy (R = 0.318, P = 0.0201), higher number of births (R = 0.382, P = 0.0004), and ER status (R = -0.314, P = 0.0038). Eight estrogen-regulated genes were increased in atypical samples (P < 0.005), including TFF1, AGT, PDZK1, PGR, GREB1, PRLR, CAMK2B, and CCND1. Cytologic atypia, and particularly anisonucleosis, is associated with recent and multiple births and ER negative status of the index tumor.

According to the news editors, the research concluded: "Atypical samples showed increased expression of estrogen-related genes, consistent with the role of estrogen exposure in breast cancer development."

Our news journalists report that additional information may be obtained by contacting S.A. Khan, Northwestern University, Feinberg Sch Med, Robert H Lurie Comprehens Canc Center, Chicago, IL 60611, United States. Additional authors for this research include J. Wang, O. Lee, E. Revesz, N. Taft, D. Ivancic, N.M. Hansen, K.P. Bethke, C. Zalles and S.A. Khan.

**Cachexia**

**Reports Summarize Cachexia Study Results from University of Ottawa (CCAAT/enhancer binding protein beta protects muscle satellite cells from apoptosis after injury and in cancer cachexia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cachexia. According to news reporting originating in Ottawa, Canada, by NewsRx journalists, research stated, "CCAAT/enhancer binding protein beta (C/EBPb), a transcription factor expressed in muscle satellite cells (SCs), inhibits the myogenic program and is downregulated early in differentiation. In a conditional null model in which C/EBPb expression is knocked down in paired box protein 7+ (Pax7+) SCs, cardiotoxin (CTX) injury is poorly repaired, although muscle regeneration is efficient in control littermates."

The news reporters obtained a quote from the research from the University of Ottawa, "While myoblasts lacking C/EBPb can differentiate efficiently in culture, after CTX injury poor regeneration was attributed to a smaller than normal Pax7+ population, which was not due to a failure of SCs to proliferate. Rather, the percentage of apoptotic SCs was increased in muscle lacking C/EBPb. Given that an injury induced by BaCl2 is repaired with greater efficiency than controls in the absence of C/EBPb, we investigated the inflammatory response following BaCl2 and CTX injury and found that the levels of interleukin-1b (IL-1b), a proinflammatory cytokine, were robustly elevated following CTX injury and could induce C/EBPb expression in myoblasts. High levels of C/EBPb expression in myoblasts correlated with resistance to apoptotic stimuli, while its loss increased sensitivity to thapsigargin-induced cell death. Using cancer cachexia as a model for chronic inflammation, we found that C/EBPb expression was increased in SCs and myoblasts of tumor-bearing cachectic animals. Further, in cachectic conditional knockout animals lacking C/EBPb in Pax7+ cells, the SC compartment was reduced because of increased apoptosis, and regeneration was impaired."
According to the news reporters, the research concluded: "Our findings indicate that the stimulation of C/EBPβ expression by IL-1β following muscle injury and in cancer cachexia acts to promote SC survival, and is therefore a protective mechanism for SCs and myoblasts in the face of inflammation."

For more information on this research see: CCAAT/enhancer binding protein beta protects muscle satellite cells from apoptosis after injury and in cancer cachexia. *Cell Death & Disease*, 2016;7():e2109. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

**Oncology - Cancer Epidemiology**

**Reports Summarize Cancer Epidemiology Findings from International Agency for Research on Cancer (Cancer patterns and trends in Central and South America)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Cancer Epidemiology are presented in a new report. According to news originating from Lyon, France, by NewsRx correspondents, research stated, "Rationale and objective: Cancer burden is increasing in Central and South America (CSA). We describe the current burden of cancer in CSA."

Our news journalists obtained a quote from the research from International Agency for Research on Cancer, "We obtained regional and national-level cancer incidence data from 48 population-based registries (13 countries) and nation-wide cancer mortality data from the WHO (18 countries). We estimated world population age-standardized incidence and mortality rates per 100,000 person-years. The leading cancers diagnosed were prostate, lung, breast, cervix, colorectal, and stomach, which were also the primary causes of cancer mortality. Countries of high/very high human development index (HDI) in the region experienced a high burden of prostate and breast cancer while medium HDI countries had a high burden of stomach and cervical cancers. Between countries, incidence and mortality from all cancers combined varied by 2-3-fold. French Guyana, Brazil, Uruguay, and Argentina had the highest incidence of all cancers while Uruguay, Cuba, Argentina, and Chile had the highest mortality. Incidence of colorectum, prostate and thyroid cancers increased in Argentina, Brazil, Chile and Costa Rica from 1997 to 2008, while lung, stomach and cervical cancers decreased. CSA carries a double-burden of cancer, with elevated rates of infection- and lifestyle-related cancers. Encountered
variation in cancer rates between countries may reflect differences in registration practices, healthcare access, and public awareness. Resource-dependent interventions to prevent, early diagnose, and treat cancer remain an urgent priority."

According to the news editors, the research concluded: "There is an overwhelming need to improve the quality and coverage of cancer registration to guide and evaluate future cancer control policies and programs."

For more information on this research see: Cancer patterns and trends in Central and South America. *Cancer Epidemiology*, 2016;44():S23-S42. *Cancer Epidemiology* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. **Cardiology**

**Reports Summarize Cardiology Study Results from Mayo Clinic**

(Synchronous ventricular pacing with direct capture of the atrioventricular conduction system: Functional anatomy, terminology, and challenges)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting originating in Rochester, Minnesota, by NewsRx journalists, research stated, "Right ventricular apical pacing is associated with an increased incidence of heart failure, atrial fibrillation, and overall mortality. As a result, pacing the ventricles in a manner that closely mimics normal AV conduction with an intact His-Purkinje system has been explored."

The news reporters obtained a quote from the research from Mayo Clinic, "Recently, the sustainable benefits of selective His-bundle stimulation have been demonstrated and proposed as the preferred method of ventricular stimulation for appropriate patients. Ideally, conduction system pacing should be selective without myocardial capture, overcome distal bundle branch block when present, and not compromise tricuspid valve function. Contemporary literature on conduction system pacing is confusing largely because of inconsistent terminology and, at times, anatomically inaccurate terms used interchangeably for nonsynonymous anatomic sites. In this review, we discuss the functional anatomy of AV conduction access with specific emphasis on terminology, relationship to the membranous septum, tricuspid valve tissue, and proximity to atrial or ventricular myocardium."
According to the news reporters, the research concluded: "The potential benefits of each specific site as well as associated unique difficulties with those sites are described."

Our news correspondents report that additional information may be obtained by contacting S.J. Asirvatham, Mayo Clinic, Dept. of Pediat & Adolescent Med, Rochester, MN, United States. Additional authors for this research include Y.M. Cha and S.J. Asirvatham.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.hrthm.2016.08.005. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Diseases and Conditions - Cavernous…**

**Reports Summarize Cavernous Hemangioma Findings from Istanbul University (Diffuse Cavernous Hemangioma of the Colon)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Cavernous Hemangioma is now available. According to news reporting originating in Istanbul, Turkey, by NewsRx journalists, research stated, "A 70-year-old man was admitted to our clinic with a history of rectal bleeding and constipation, his colonoscopy revealed varicosities and bluish nodular lesions of the rectum (Figure 1). Abdominal CT showed multiple nodular lesions beginning from the distal descending colon and extending to the rectum, calcifications suggesting phleboliths were also seen in these lesions."

The news reporters obtained a quote from the research from Istanbul University, "A contrast enhanced pelvic MRI demonstrated multiple tubular lesions showing hyperintensity on T2-weighted images and hypointensity on T1-weighted images, consistent with the affected areas on the CT scan (Figure 2). It was a diffuse cavernous hemangioma, which mostly affects the rectosigmoid colon in the gastrointestinal tract, and can clinically mimic internal hemorrhoids, ulcerative colitis or cancer (1). Gastrointestinal hemangioma is a rare benign vascular neoplasm, and might be associated with a congenital disorder like Osler-Weber-Rendu disease, Maffucci's syndrome, Klippel-Trenaunay syndrome, or the congenital blue rubber bleb nevus syndrome (2). Even though there are different medical treatment options targeting VEGF and FGF-mediated pathways such as bevacizumab and thalidomide, and endoscopic approaches like sclerotherapy and electrocautery; complete resection of the hemangioma is the only curative treatment method (1, 3)."

According to the news reporters, the research concluded: "Therefore, the patient was referred to department of surgery for a definitive treatment, and lost to follow-up."

Respiratory Tract Diseases and Conditions - Central...

Reports Summarize Central Sleep Apnea Study Results from University Health Network (Sleep Apnea and Left Atrial Phasic Function in Heart Failure With Reduced Ejection Fraction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Respiratory Tract Diseases and Conditions - Central Sleep Apnea. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "The study aim was to determine whether phasic left atrial (LA) function of patients with heart failure with reduced ejection fraction differs between those with obstructive sleep apnea (OSA) and central sleep apnea (CSA). Participation in the Adaptive Servo Ventilation for Therapy of Sleep Apnea in Heart Failure (ADVENT-HF) trial requires 2-dimensional echocardiographic documentation of left ventricular ejection fraction <= 45% and a polysomnographic apnea hypopnea index (AHI) >= 15 events per hour."

Our news journalists obtained a quote from the research from University Health Network, "Of initial enrollees, we identified 132 patients in sinus rhythm (82 with predominantly OSA and 50 with CSA). To determine LA reservoir (expansion index; EI), conduit (passive emptying index; PEI), and booster function (active emptying index), we blindly quantified maximum and minimum LA volume and LA volume before atrial contraction. Each of EI (P = 0.004), PEI (P < 0.001), and active emptying index (P = 0.045) was less in participants with CSA compared with those with OSA, whereas average left ventricular ejection fraction and LA and left ventricular volumes were similar. Multivariable analysis identified an independent relationship between central AHI and LA EI (P = 0.040) and PEI (P = 0.005). In contrast, the obstructive AHI was unrelated to any LA phasic index, and slopes relating central AHI to EI and PEI differed significantly from corresponding relationships with obstructive AHI (P = 0.018; P = 0.006). In these ADVENT-HF patients with heart failure with reduced ejection fraction, all 3 components of LA phasic function (reservoir, conduit, and contractile) were significantly reduced in those with CSA compared with participants with OSA. The severity of CSA, but not OSA associated inversely and independently with LA reservoir and conduit function."

According to the news editors, the research concluded: "Impaired LA phasic function might be consequential to or could exacerbate CSA."

For more information on this research see: Sleep Apnea and Left Atrial Phasic Function in Heart Failure With Reduced Ejection Fraction. Canadian Journal of Cardiology, 2016;32(12):1402-1410. Canadian Journal of Cardiology can be contacted at: Elsevier
Reports Summarize Chemometrics Findings from Norwegian University of Life Sciences (ROSA-a fast extension of partial least squares regression for multiblock data analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Chemometrics. According to news reporting from As, Norway, by NewsRx journalists, research stated, "We present the response-oriented sequential alternation (ROSA) method for multiblock data analysis. ROSA is a novel and transparent multiblock extension of the partial least squares regression (PLSR)."

The news correspondents obtained a quote from the research from the Norwegian University of Life Sciences, "According to a 'winner takes all' approach, each component of the model is calculated from the block of predictors that most reduces the current residual error. The suggested algorithm is computationally fast compared with other multiblock methods because orthogonal scores and loading weights are calculated without deflation of the predictor blocks. Therefore, it can work effectively even with a large number of blocks included. The ROSA method is invariant to block scaling and ordering."

According to the news reporters, the research concluded: "The ROSA model has the same attributes (vectors of scores, loadings, and loading weights) as PLSR and is identical to PLSR modeling for the case with only one block of predictors."

Our news journalists report that additional information may be obtained by contacting U.G. Indahl, Norwegian University of Life Science, Dept. of Math Sci & Technol, N-
Reports Summarize Chronic Disease Study Results from D. Hennessy and Co-Researchers (Out-of-pocket spending on drugs and pharmaceutical products and cost-related prescription non-adherence among Canadians with chronic disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Disease Attributes - Chronic Disease have been published. According to news reporting out of Ottawa, Canada, by NewsRx editors, research stated, "Approximately one-third of Canadians' prescription medication costs are paid directly out-of-pocket. This study attempts to determine if out-of-pocket expenditures of more than 5% of household income on drugs and pharmaceutical products are associated with cost-related prescription non-adherence among people with cardiovascular-related chronic conditions."

Our news journalists obtained a quote from the research, "The data are from the survey on Barriers to Care for People with Chronic Health Conditions. Three categories of out-of-pocket spending on drugs and pharmaceutical products as a percentage of household income were identified: 0%, more than 0% to less than 5%, and 5% or more. Log-binomial regression was used to examine associations between category of out-of-pocket spending and cost-related prescription non-adherence. In 2012, about 80% of people aged 40 or older who lived in British Columbia, Alberta, Saskatchewan or Manitoba and had cardiovascular-related chronic conditions reported out-of-pocket spending on drugs and pharmaceutical products; 4.8% reported out-of-pocket spending of at least 5% of their household income. These individuals were significantly older, more often lived in households with incomes less than $30,000, and more often reported multiple morbidities than did people whose out-of-pocket spending on drugs and pharmaceutical products was less than 5% of household income. When the results were adjusted for age and sex, people whose spending amounted to 5% or more of household income were almost three times as likely (prevalence ratio rate = 2.6) to report cost-related prescription non-adherence than were those spending less than 5%. Spending at least 5% of household income on drugs and pharmaceutical products was significantly associated with cost-related prescription non-adherence."

According to the news editors, the research concluded: "Additional data are required to determine if even lower levels of spending put individuals at risk of cost-related non-adherence."

For more information on this research see: Out-of-pocket spending on drugs and pharmaceutical products and cost-related prescription non-adherence among Canadians with chronic disease. Health Reports, 2016;27(6):3-8. Health Reports can be contacted at: Statistics Canada, 100 Tunneys Pasture Driveway, Ottawa, Ontario K1A 0T6, Canada.

Our news journalists report that additional information may be obtained by contacting D. Hennessy, STAT Canada, Hlth Anal Div, Ottawa, ON, Canada. Additional authors for this research include C. Sanmartin, P. Ronksley, R. Weaver, D. Campbell, B.

Reports Summarize Citalopram Therapy Findings from University of Copenhagen (Structure-activity relationship studies of citalopram derivatives: examining substituents conferring selectivity for the allosteric site in the 5-HT transporter)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Citalopram Therapy have been presented. According to news reporting originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "The 5-HT transporter (SERT) is a target for antidepressant drugs. SERT possesses two binding sites: the orthosteric (S1) binding site, which is the presumed target for current SERT inhibitors, and an allosteric (S2) site for which potential therapeutic effects are unknown."

Our news editors obtained a quote from the research from the University of Copenhagen, "The antidepressant drug citalopram displays high-affinity S1 binding and low-affinity S2 binding. To elucidate a possible therapeutic role of allosteric inhibition of SERT, a drug that specifically targets the allosteric site is required. The purpose of this study was to find a compound having higher selectivity towards the S2 site. We performed a systematic structure-activity relationship study based on the scaffold of citalopram and the structurally closely related congener, talopram, which shows low-affinity S1 binding in SERT. The role of the four chemical substituents, which distinguish citalopram from talopram in conferring selectivity towards the S1 and S2 site, respectively, was assessed by determining the binding of 14 citalopram/talopram analogous to the S1 and S2 binding sites in SERT using membranes of COS7 cells transiently expressing SERT. The structure-activity relationship study revealed that dimethyl citalopram possesses the highest affinity for the allosteric site relative to the S1 site in SERT and has approximately twofold selectivity for the allosteric site relative to the S1 site in SERT."

According to the news editors, the research concluded: "The compound could be a useful lead for future synthesis of drugs with high affinity and high selectivity towards the allosteric binding site."

The news editors report that additional information may be obtained by contacting M.A. Larsen, Dept. of Neuroscience and Pharmacology, Faculty of Health and Medical Sciences, University of Copenhagen, Copenhagen, Denmark. Additional authors for this
Clinical Research - Clinical Trials and Studies

Reports Summarize Clinical Trials and Studies Findings from University of Munster (Corneal Densitometry as a Novel Technique for Monitoring Amiodarone Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Clinical Research - Clinical Trials and Studies is the subject of a report. According to news reporting out of Munster, Germany, by NewsRx editors, research stated, "The clinical efficacy and toxicity of amiodarone may be determined more effectively by tissue deposition than by levels of the agent in serum. Therefore, corneal densitometry might be useful for therapeutic monitoring."

Our news journalists obtained a quote from the research from the University of Munster, "The aim of the study is to evaluate Scheimpflug corneal densitometry in patients with amiodarone keratopathy (AK). Comparative case series. Sixty-six patients receiving amiodarone therapy and 66 healthy controls were consecutively enrolled in this study. Patients were examined using the Oculus Pentacam (Wetzlar, Germany). Densitometry data from different corneal layers and different annuli were extracted, analyzed, and compared with densitometry values of healthy controls. Duration of treatment, cumulative dose, Orlando stage (slit-lamp biomicroscopy), and serum concentrations of amiodarone and N-desethylamiodarone also were determined, and the correlation to different densitometry data was evaluated. The total corneal light backscatter at total corneal thickness and at total diameter was significantly higher in the amiodarone group compared with the control group (AK group: 28.3 +/- 5.2; control group: 24.4 +/- 4.2; P< 0.001). Upon dividing the corneal surface into different layers at total thickness, the differences were significant in all layers (P < 0.001). The serum concentrations of the metabolite N-desethylamiodarone correlate with densitometry values, especially in the 0-to 2-mm annulus in the anterior layer (r = 0.419; P = 0.001), whereas the cumulative dose and duration of treatment correlate significantly with the densitometry values in the 0-to 2-mm annulus at total thickness (P = 0.014 and P = 0.022, respectively). Corneal densitometry is a useful, objective method for quantifying AK and can help in monitoring amiodarone therapy."

According to the news editors, the research concluded: "The serum concentration of the active metabolite N-desethylamiodarone correlates with the extent of keratopathy in the anterior layer, whereas chronic changes in the stroma correlate with the cumulative dose and duration of treatment."

Our news journalists report that additional information may be obtained by contacting M. Alnawaiseh, University of Munster, Medical Center, Dept. of Ophthalmol, D-48149 Munster, Germany. Clinical Research - Clinical Trials and Studies

Reports Summarize Clinical Trials and Studies Study Results from University Hospital (Nuclear Factor of Activated T Cells-Regulated Gene Expression as Predictive Biomarker of Personal Response to Calcineurin Inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting from Heidelberg, Germany, by NewsRx journalists, research stated, "Calcineurin inhibitors (CNIs) represent the most widely used immunosuppressive agents in kidney transplantation. Both CNIs show a narrow therapeutic window; thus, monitoring is necessary to balance efficacy and toxicity."

The news correspondents obtained a quote from the research from University Hospital, "Several approaches have been undertaken to measure the biological effects of CNI-based immunosuppression. A quantitative analysis of gene expression was established to calculate the functional effects of calcineurin inhibition, the assessment of nuclear factor of activated T cells (NFAT)-regulated gene expression. This assay is based on the quantitative analysis of interleukin-2, interferon-g, and granulocyte macrophage colony-stimulating factor gene expression in whole blood samples collected at the time cyclosporine A/tacrolimus troughs (C0) and 2 hours after oral uptake (C2). In this comprehensive review, analytical aspects of the assay and also clinical benefits and limitations are presented and discussed. Several observational studies underline the beneficial effect of NFAT-regulated gene expression as biomarker of personal response on CNI therapy, especially in infectious complications, malignancies, and acute rejection episodes. Data are more comprehensive in cyclosporine A compared with tacrolimus therapy. However, results on prospective interventional studies are sparse. A randomized controlled study evaluating the opportunity for NFAT-guided immunosuppression is ongoing. NFAT-regulated gene expression is a promising biomarker in CNI therapy concerning infectious complications, malignancies, and acute rejection."
According to the news reporters, the research concluded: "Prospective interventional studies and randomized controlled studies are ongoing to confirm the encouraging results."

For more information on this research see: Nuclear Factor of Activated T Cells-Regulated Gene Expression as Predictive Biomarker of Personal Response to Calcineurin Inhibitors. *Therapeutic Drug Monitoring*, 2016;38 Suppl 1():S50-6. (Lippincott Williams and Wilkins - www.lww.com; Therapeutic Drug Monitoring - journals.lww.com/drug-monitoring/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting C. Sommerer, Departments of *Nephrology and †Immunology, University Hospital Heidelberg, Im Neuenheimer Feld 305, Heidelberg, Germany.

**Drugs and Therapies - Clopidogrel Therapy**

**Reports Summarize Clopidogrel Therapy Study Results from Shenzhen University (Effect of Ginkgo Biloba Extract on the Pharmacokinetics and Metabolism of Clopidogrel in Rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Clopidogrel Therapy. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Ginkgo biloba extract (GBE), a traditional herbal product used worldwide as both medicine and supplement, is often supplied with clopidogrel for the treatment of cerebrovascular diseases. The aim of the current study was to explore the effect of GBE on the metabolism and pharmacokinetics of clopidogrel."

Our news journalists obtained a quote from the research from Shenzhen University, "The in vitro study using rat liver microsomes revealed that GBE significantly induced the conversion of clopidogrel into its active metabolite. The effect of GBE on the pharmacokinetics of clopidogrel was also investigated in vivo. Compared to rats without GBE pretreatment, administration of 4 mg/kg, 20 mg/kg, and 100 mg/kg of GBE significantly decreased the C-max and the AUC(0-infinity) of clopidogrel in a dose-dependent manner. As expected, pretreatment of high dose GBE significantly increased the C-max and AUC(0-infinity) of the clopidogrel active metabolite. However, no marked change was observed following medium and low dose of GBE, suggesting that the biotransformation of clopidogrel was altered differently by high dose of GBE."

According to the news editors, the research concluded: "Our study suggested that the awareness of the potential herb-drug interactions between GBE and clopidogrel should be increased in clinical practice."

For more information on this research see: Effect of Ginkgo Biloba Extract on the

Our news journalists report that additional information may be obtained by contacting C.S. Xu, Shenzhen Univ, Sch Med, Dept. of Pharm, Shenzhen 518060, Guangdong, People's Republic of China. **Oncology - Colon Cancer**

### Reports Summarize Colon Cancer Findings from Hospital del Mar (Acquired RAS or EGFR mutations and duration of response to EGFR blockade in colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Colon Cancer are presented in a new report. According to news reporting originating in Barcelona, Spain, by NewsRx journalists, research stated, "Blockade of the epidermal growth factor receptor (EGFR) with the monoclonal antibodies cetuximab or panitumumab is effective in a subset of colorectal cancers (CRCs), but the emergence of resistance limits the efficacy of these therapeutic agents. At relapse, the majority of patients develop RAS mutations, while a subset acquires EGFR extracellular domain (ECD) mutations."

The news reporters obtained a quote from the research from Hospital del Mar, "Here we find that patients who experience greater and longer responses to EGFR blockade preferentially develop EGFR ECD mutations, while RAS mutations emerge more frequently in patients with smaller tumour shrinkage and shorter progression-free survival. In circulating cell-free tumour DNA of patients treated with anti-EGFR antibodies, RAS mutations emerge earlier than EGFR ECD variants. Subclonal RAS but not EGFR ECD mutations are present in CRC samples obtained before exposure to EGFR blockade."

According to the news reporters, the research concluded: "These data indicate that clonal evolution of drug-resistant cells is associated with the clinical outcome of CRC patients treated with anti-EGFR antibodies."

Our news correspondents report that additional information may be obtained by contacting C. Montagut, Hosp del Mar, Canc Res Program, FIMIM, Medical Res Inst, Barcelona 08003, Spain. Additional authors for this research include S. Arena, G. Siravegna, L.
Oncology - Colon Cancer

Reports Summarize Colon Cancer Findings from Leiden University (Are disseminated tumor cells in bone marrow and tumor-stroma ratio clinically applicable for patients undergoing surgical resection of primary colorectal cancer? The Leiden MRD ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting out of Leiden, Netherlands, by NewsRx editors, research stated, "Current TNM staging does not appropriately identify high-risk colorectal cancer (CRC) patients. The aim of this study was to evaluate whether the presence of disseminated tumor cells (DTCs) in the bone marrow (BM) and the presence of stroma in the primary tumor, i.e., the tumor-stroma ratio (TSR), in patients undergoing surgical resection of primary CRC provides information relevant for disease outcome."

Financial supporters for this research include ZonMw, Sixth Framework Programme.

Our news journalists obtained a quote from the research from Leiden University, "Patients with primary CRC (n = 125), consecutively admitted for curative resection between 2001 and 2007, were included in the study. All patients underwent BM aspiration before surgery. Detection of tumor cells was performed using immunocytochemical staining for cytokeratin (CK-ICC). The TSR was determined on diagnostic H&E stained sections of primary tumors. DTCs were detected in the BM of 23/125 patients (18 %). No association was found between BM status and overall survival (HR 0.97 (95 % CI 0.45-2.09), p = 0.93). Also, no significant difference was found in their 5-year survival rate (resp. 72 % and 68 % for BM-positive versus BM-negative patients). The TSR was found to be associated with a worse overall survival (HR 2.16, 95 % CI 1.02-4.57, p = 0.04) with 5-year survival rates of 84 % versus 62 % for stroma-low and stroma-high patients, respectively. No relation was found between the presence of DTCs and TSR. Our data indicate that the presence of DTCs in the BM of CRC patients is not associated with disease outcome."

According to the news editors, the research concluded: "The TSR was, however, found to be associated with a worse overall survival, which indicates that for CRC the tumor microenvironment plays an important role in its behavior and prognosis."

For more information on this research see: Are disseminated tumor cells in bone marrow and tumor-stroma ratio clinically applicable for patients undergoing surgical resection of primary colorectal cancer? The Leiden MRD study. Cellular Oncology, 2016;39(6):537-544. Cellular Oncology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. Oncology - Colon Cancer

Reports Summarize Colon Cancer Study Results from Institute for Cancer Research and Treatment (IRCCS) (MM-151 overcomes acquired resistance to cetuximab and panitumumab in colorectal cancers harboring EGFR extracellular domain mutations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting from Candiolo, Italy, by NewsRx journalists, research stated, "The anti-epidermal growth factor receptor (EGFR) antibodies cetuximab and panitumumab are used to treat RAS wild-type colorectal cancers (CRCs), but their efficacy is limited by the emergence of acquired drug resistance. After EGFR blockade, about 20% of CRCs develop mutations in the EGFR extracellular domain (ECD) that impair antibody binding and are associated with clinical relapse."

The news correspondents obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "We hypothesized that EGFR ECD-resistant variants could be targeted by the recently developed oligoclonal antibody MM-151 that binds multiple regions of the EGFR ECD. MM-151 inhibits EGFR signaling and cell growth in preclinical models, including patient-derived cells carrying mutant EGFR. Upon MM-151 treatment, EGFR ECD mutations decline in circulating cell-free tumor DNA (ctDNA) of CRC patients who previously developed resistance to EGFR blockade."

According to the news reporters, the research concluded: "These data provide molecular rationale for the clinical use of MM-151 in patients who become resistant to cetuximab or panitumumab as a result of EGFR ECD mutations."

For more information on this research see: MM-151 overcomes acquired resistance to cetuximab and panitumumab in colorectal cancers harboring EGFR extracellular domain mutations. Science Translational Medicine, 2016;8(324):324ra14.

Reports Summarize Congenital Heart Disease Findings from Tokyo Women's Medical University (Vitamin D Kinetics and Parathyroid Gland Function in Patients with Congenital Heart Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Congenital Diseases and Conditions - Congenital Heart Disease. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "It has been recently reported that vitamin D deficiency may contribute to systemic illnesses that accompany chronic heart failure. These reports also suggest the serum levels of parathormone, which activates vitamin D in the liver, can be a useful marker of heart failure."

Our news editors obtained a quote from the research from Tokyo Women's Medical University, "This study was designed to evaluate the clinical implications of vitamin D and parathormone levels in patients with congenital heart diseases and chronic heart failure. We measured 25-hydroxyvitamin D and parathormone serum levels in 103 adult patients with congenital heart diseases (age range 20-89 years). Of 103 patients, 54 were in New York Heart Association functional classes II or III. Their clinical data regarding cardiothoracic ratio, fractional shortening of the systemic ventricle, brain natriuretic peptide plasma levels, and pulse oximetry were also evaluated. Of 54 patients with chronic heart failure, 50 (93%) exhibited vitamin D deficiency (25-hydroxyvitamin D serum levels <50 nmol/L) or elevation of parathormone (serum levels >65 pg/mL). These two parameters were inversely correlated. In multivariate analyses including age, gender, 25-hydroxyvitamin D, parathormone, pulse oximetry, cardiothoracic ratio, calcium, phosphorus, glomerular filtration rate, albumin, creatine kinase, end-diastolic diameter and fractional shortening of the systemic ventricle, and ratio of early diastolic transmitral flow velocity to mitral annular velocity, only the parathormone serum levels (P <.01) remained independently associated with brain natriuretic peptide plasma levels. Moreover, in multivariate analyses including the same variables minus parathormone serum levels, both pulse oximetry (P <.01) and glomerular filtration rate (P <.01) remained independently associated with parathormone levels. Vitamin D deficiency and secondary hyperparathyroidism are common in patients with congenital heart diseases and heart failure."

According to the news editors, the research concluded: "Serum parathormone and 25-hydroxyvitamin D levels correlated with several clinical heart failure markers, suggesting that vitamin D deficiency may deteriorate heart function in congenital heart disease patients."

For more information on this research see: Vitamin D Kinetics and Parathyroid Gland Function in Patients with Congenital Heart Disease. Congenital Heart Disease, 2016;11
Reports Summarize Coronavirus Findings from University of Tokyo (Identification of Nafamostat as a Potent Inhibitor of Middle East Respiratory Syndrome Coronavirus S Protein-Mediated Membrane Fusion Using the Split-Protein-Based Cell-Cell ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Coronavirus. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Middle East respiratory syndrome (MERS) is an emerging infectious disease associated with a relatively high mortality rate of approximately 40%. MERS is caused by MERS coronavirus (MERS-CoV) infection, and no specific drugs or vaccines are currently available to prevent MERS-CoV infection."

Financial support for this research came from Japan Agency for Medical Research and Development (AMED).

Our news editors obtained a quote from the research from the University of Tokyo, "MERS-CoV is an enveloped virus, and its envelope protein (S protein) mediates membrane fusion at the plasma membrane or endosomal membrane. Multiple proteolysis by host proteases, such as furin, transmembrane protease serine 2 (TMPRSS2), and cathepsins, causes the S protein to become fusion competent. TMPRSS2, which is localized to the plasma membrane, is a serine protease responsible for the proteolysis of S in the post-receptor-binding stage. Here, we developed a cell-based fusion assay for S in a TMPRSS2-dependent manner using cell lines expressing Renilla luciferase (RL)-based split reporter proteins. S was stably expressed in the effector cells, and the corresponding receptor for S, CD26, was stably coexpressed with TMPRSS2 in the target cells. Membrane fusion between these effector and target cells was quantitatively measured by determining the RL activity. The assay was optimized for a 384-well format, and nafamostat, a serine protease inhibitor, was identified as a potent inhibitor of S-mediated membrane fusion in a screening of about 1,000 drugs approved for use by the U.S. Food and Drug Administration. Nafamostat also blocked MERS-CoV infection in vitro."

According to the news editors, the research concluded: "Our assay has the potential
to facilitate the discovery of new inhibitors of membrane fusion of MERS-CoV as well as other viruses that rely on the activity of TMPRSS2."

For more information on this research see: Identification of Nafamostat as a Potent Inhibitor of Middle East Respiratory Syndrome Coronavirus S Protein-Mediated Membrane Fusion Using the Split-Protein-Based Cell-Cell Fusion Assay. *Antimicrobial Agents and Chemotherapy*, 2016;60(11):6532-6539. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **DNA Research**

**Reports Summarize DNA Research Findings from University of British Columbia (Dosage Mutator Genes in Saccharomyces cerevisiae: A Novel Mutator Mode-of-Action of the Mph1 DNA Helicase)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on DNA Research is the subject of a report. According to news originating from Vancouver, Canada, by NewsRx correspondents, research stated, "Mutations that cause genome instability are considered important predisposing events that contribute to initiation and progression of cancer. Genome instability arises either due to defects in genes that cause an increased mutation rate (mutator phenotype), or defects in genes that cause chromosome instability (CIN)."

Our news journalists obtained a quote from the research from the University of British Columbia, "To extend the catalog of genome instability genes, we systematically explored the effects of gene overexpression on mutation rate, using a forward-mutation screen in budding yeast. We screened similar to 5100 plasmids, each overexpressing a unique single gene, and characterized the five strongest mutators, MPH1 (mutator phenotype 1), RRM3, UBP12, PIF1, and DNA2. We show that, for MPH1, the yeast homolog of Fanconi Anemia complementation group M (FANCM), the overexpression mutator phenotype is distinct from that of mph1 Delta. Moreover, while four of our top hits encode DNA helicases, the overexpression of 48 other DNA helicases did not cause a mutator phenotype, suggesting this is not a general property of helicases. For Mph1 overexpression, helicase activity was not required for the mutator phenotype; in contrast Mph1 DEAH-box function was required for hypermutation. Mutagenesis by MPH1 overexpression was independent of translesion synthesis..."
(TLS), but was suppressed by overexpression of RAD27, a conserved flap endonuclease. We propose that binding of DNA flap structures by excess Mph1 may block Rad27 action, creating a mutator phenotype that phenocopies rad27 Delta.

According to the news editors, the research concluded: "We believe this represents a novel mutator mode-of-action and opens up new prospects to understand how upregulation of DNA repair proteins may contribute to mutagenesis."

For more information on this research see: Dosage Mutator Genes in Saccharomyces cerevisiae: A Novel Mutator Mode-of-Action of the Mph1 DNA Helicase. Genetics, 2016;204 (3):975-986,196-198. Genetics can be contacted at: Genetics Society America, 9650 Rockville Ave, Bethesda, MD 20814, USA. (Cell Press - www.cell.com; Genetics - www.cell.com/trends/genetics/home)

The news correspondents report that additional information may be obtained from P. Hieter, University of British Columbia, Michael Smith Labs, Vancouver, BC V6T 1Z4, Canada. Additional authors for this research include S. Duffy, R. Segovia, P.C. Stirling and P. Hieter.

**Nutritional and Metabolic Diseases and Conditions - ...**

**Reports Summarize Diabetic Foot Study Results from University of Manchester (Development of a Novel Collagen Wound Model To Simulate the Activity and Distribution of Antimicrobials in Soft Tissue during Diabetic Foot Infection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Diabetic Foot are presented in a new report. According to news originating from Manchester, United Kingdom, by NewsRx correspondents, research stated, "Diabetes has major implications for public health, with diabetic foot ulcers (DFUs) being responsible for significant morbidity and mortality. A key factor in the development of nonhealing ulcers is infection, which often leads to the development of biofilm, gangrene, and amputation."

Financial support for this research came from Biotechnology and Biological Sciences Research Council (BBSRC) (Sparking Impact).

Our news journalists obtained a quote from the research from the University of Manchester, "A novel approach to treating DFUs is the local release of antibiotics from calcium sulfate beads. We have developed a novel model system to study and compare the release and efficacy of antibiotics released locally, using collagen as a substrate for biofilm growth and incorporating serum to mimic the biochemical complexity of the wound environment. We found that our soft-tissue model supports the growth of a robust Pseudomonas aeruginosa biofilm, and that this was completely eradicated by the introduction of calcium sulfate beads loaded with
tobramycin or gentamicin. The model also enabled us to measure the concentration of these antibiotics at different distances from the beads and in simulated wound fluid bathing the collagen matrix. We additionally found that a multidrug-resistant Staphylococcus aureus biofilm, nonsusceptible to antibiotics, nonetheless showed an almost 1-log drop in viable counts when exposed to calcium sulfate beads combined with antibiotics. Together, these data suggest that locally applied antibiotics combined with calcium sulfate provide surprising efficacy in diabetic foot infections and offer an effective alternative approach to infection management."

According to the news editors, the research concluded: "Our study additionally establishes our new system as a biochemically and histologically relevant model that may be used to study the effectiveness of a range of therapies locally or systemically for infected DFUs."

For more information on this research see: Development of a Novel Collagen Wound Model To Simulate the Activity and Distribution of Antimicrobials in Soft Tissue during Diabetic Foot Infection. Antimicrobial Agents and Chemotherapy, 2016;60(11):6880-6889. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Our news editors obtained a quote from the research from the University of Missouri, "Chemical derivatization of hydrophilic agents with lipophilic pro-moieties can significantly elevate drug diffusion across absorptive membranes. Moreover, the desired linkage (ester vs. amide) may be selected to improve stability in vivo. Importantly, an appropriate selection of pro-moiet (targeting ligand) may promote drug specificity and selectivity. In this review article, an attempt has been made to summarize lipophilic prodrugs employed to improve delivery and efficacy of a wide range of poorly permeable but highly potent therapeutic agents."

According to the news editors, the research concluded: "In addition, a brief overview on recent application of lipophilic prodrugs to promote encapsulation of hydrophilic agents in nano-sized drug carriers has been provided."

The news editors report that additional information may be obtained by contacting A.K. Mitra, University of Missouri Curators' Professor of Pharmacy, Chair, Division of Pharmaceutical Sciences, Vice-Provost for Interdisciplinary Research, University of Missouri-Kansas City, 2464 Charlotte Street, Kansas City, MO 64108, United States. ### Drugs and Therapies - Drug Delivery Systems

**Reports Summarize Drug Delivery Systems Study Results from Free University (Tailored dendritic core-multishell nanocarriers for efficient dermal drug delivery: A systematic top-down approach from synthesis to preclinical testing)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Drug Delivery Systems have been presented. According to news reporting from Berlin, Germany, by NewsRx journalists, research stated, "Drug loaded dendritic core-multishell (CMS) nanocarriers are of especial interest for the treatment of skin diseases, owing to their striking dermal delivery efficiencies following topical applications. CMS nanocarriers are composed of a polyglycerol core, connected by amide-bonds to an inner alkyl shell and an outer methoxy poly(ethylene glycol) shell."

Financial support for this research came from SFB 1112.

The news correspondents obtained a quote from the research from Free University, "Since topically applied nanocarriers are subjected to biodegradation, the application of conventional amide-based CMS nanocarriers (10-A-18-350) has been limited by the potential production of toxic polyglycerol amines. To circumvent this issue, three tailored ester-based CMS nanocarriers (10-E-12-350, 10-E-15-350, 10-E-18-350) of varying inner alkyl chain length
were synthesized and comprehensively characterized in terms of particle size, drug loading, biodegradation and dermal drug delivery efficiency. Dexamethasone (DXM), a potent drug widely used for the treatment of inflammatory skin diseases, was chosen as a therapeutically relevant test compound for the present study. Ester- and amide-based CMS nanocarriers delivered DXM more efficiently into human skin than a commercially available DXM cream. Subsequent in vitro and in vivo toxicity studies identified CMS (10-E-15-350) as the most biocompatible carrier system. The anti-inflammatory potency of DXM-loaded CMS (10-E-15-350) nanocarriers was assessed in TNF alpha supplemented skin models, where a significant reduction of the pro-inflammatory cytokine IL-8 was seen, with markedly greater efficacy than commercial DXM cream."

According to the news reporters, the research concluded: "In summary, we report the rational design and characterization of tailored, biodegradable, ester-based CMS nanocarriers, and their subsequent stepwise screening for biocompatibility, dermal delivery efficiency and therapeutic efficacy in a top-down approach yielding the best carrier system for topical applications."

For more information on this research see: Tailored dendritic core-multishell nanocarriers for efficient dermal drug delivery: A systematic top-down approach from synthesis to preclinical testing. Journal of Controlled Release, 2016;242():50-63. Journal of Controlled Release can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. RNA Viruses - Encephalitis Virus

Reports Summarize Encephalitis Virus Study Results from University of Florida (Evaluation of the Honey-Card Technique for Detection of Transmission of Arboviruses in Florida and Comparison With Sentinel Chicken Seroconversion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on RNA Viruses - Encephalitis Virus have been published. According to news reporting from Vero Beach, Florida, by NewsRx journalists, research stated, "Zoonotic mosquito-borne viruses, such as the West Nile virus (WNV) and
eastern equine encephalitis virus (EEEV), are major public health threats in the United States. Early detection of virus transmission and targeted vector management are critical to protect humans against these pathogens."

The news correspondents obtained a quote from the research from the University of Florida, "Sentinel chickens and pool screening of mosquitoes, the most widely used methods of arbovirus early detection, have technical time-lags that compromise their early-detection value. The exploitation of sugar-feeding by trapped mosquitoes for arbovirus surveillance may represent a viable alternative to other methods. Here we compared effectiveness of sugar-impregnated nucleic-acid preserving substrates (SIPS) and sentinel chicken program for detecting WNV, EEEV, and St. Louis encephalitis virus in gravid traps, CO2-baited light traps, and resting traps at 10 locations in two Florida counties. In St. Johns County, comparable numbers of EEEV detections were made by SIPS traps (18) and sentinel chickens (22), but fewer WNV detections were made using SIPS (1) than sentinel chickens (13). In Volusia County, seven arbovirus detections were made via the sentinel chicken program (one EEEV and six WNV), whereas only one arbovirus detection (WNV) was made using SIPS. CO2-baited light traps captured > 90% of total mosquitoes, yet yielded < 30% of arbovirus detections. Resting traps and gravid traps captured a fraction of total mosquitoes, yet yielded roughly equivalent numbers of arbovirus detections, as did light traps."

According to the news reporters, the research concluded: "Challenges to successful deployment of SIPS include optimization of traps for collecting all vector species, increasing sugar-feeding rates of trapped vectors, and developing tractable methods for arbovirus detection."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/jme/tjw106. This DOI is a link to an online electronic document that is either free or for purchase.

Enterovirus

Reports Summarize Enterovirus Study Results from Chang Gung University (Enterovirus 71 induces dsRNA/PKR-dependent cytoplasmic redistribution of GRP78/BiP to promote viral replication)
"GRP78/BiP is an endoplasmic reticulum (ER) chaperone protein with the important function of maintaining ER homeostasis, and the overexpression of GRP78/BiP alleviates ER stress. Our previous studies showed that infection with enterovirus 71 (EV71), a (+)RNA picornavirus, induced GRP78/BiP upregulation; however, ectopic GRP78/BiP overexpression in ER downregulates virus replication and viral particle formation."

Our news journalists obtained a quote from the research from Chang Gung University, "The fact that a virus infection increases GRP78/BiP expression, which is unfavorable for virus replication, is counterintuitive. In this study, we found that the GRP78/BiP protein level was elevated in the cytoplasm instead of in the ER in EV71-infected cells. Cells transfected with polyinosinic-polycytidylic acid, a synthetic analog of replicative double-stranded RNA (dsRNA), but not with viral proteins, also exhibited upregulation and elevation of GRP78/BiP in the cytosol. Our results further demonstrate that EV71 infections induce the dsRNA/protein kinase R-dependent cytosolic accumulation of GRP78/BiP. The overexpression of a GRP78/BiP mutant lacking a KDEL retention signal failed to inhibit both dithiothreitol-induced eIF2a phosphorylation and viral replication in the context of viral protein synthesis and viral titers."

According to the news editors, the research concluded: "These data revealed that EV71 infection might cause upregulation and aberrant redistribution of GRP78/BiP to the cytosol, thereby facilitating virus replication."

For more information on this research see: Enterovirus 71 induces dsRNA/PKR-dependent cytoplasmic redistribution of GRP78/BiP to promote viral replication. **Environmental Research**

**Reports Summarize Environmental Research Study Results from Polytechnic University (Removal of pharmaceutical industry pollutants by coal-based activated carbons)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Environmental Research. According to news reporting originating in Manresa, Spain, by NewsRx journalists, research stated, "Several studies have demonstrated the presence of pollutants from the pharmaceutical industry in surface and groundwater. The main inputs of pollutants come from households, hospitals and the industry and many of these compounds are not completely removed by WWTPs."

The news reporters obtained a quote from the research from Polytechnic University, "The purpose of this research is to study the adsorption of paracetamol, phenol and salicylic acid using coal-based activated carbons. A lignite from Mequinenza (M) and an anthracite from Coto Minero Narcea (CN) from Spain were chemically activated with alkaline agents obtaining two activated carbons (MAC and CNAC). Two commercial activated carbons widely used in water treatment (F400 and NPK) were selected for comparison purposes. The activated carbons were characterized and the results showed a high surface BET (1839 m(2) g(-1)) and total pore volume (0.83 cm(3) g(-1)) on CNAC while MAC was characterized by high sulphur content (6%). Vapour isotherms indicated a chemical interaction between the surface functional groups of MAC and the water molecules. The highest uptake of the three pharmaceutical compounds was achieved by CNAC. MAC showed a high affinity for anion salicylates (at pH 4-8)."

According to the news reporters, the research concluded: "The maximum adsorption capacity of the pollutants onto the activated carbons followed the order salicylic acid > phenol > paracetamol which can be explained by hydrophobicity."

Our news correspondents report that additional information may be obtained by contacting J. Llado, Univ Politecn Cataluna, Dept. of Min Ind & TIC Engn EMIT, Manresa 08242, Spain. Additional authors for this research include M. Sole-Sardans, C. Lao-Luque, E. Fuente and B. Ruiz.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.psep.2016.09.009. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Epithelial Cancer

Reports Summarize Epithelial Cancer Study Results from Institute for Cancer Research and Treatment (IRCCS) (Mesenchymal Stem/Stromal Cells in Stromal Evolution and Cancer Progression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Epithelial Cancer. According to news reporting from Naples, Italy, by NewsRx journalists, research stated, "The study of cancer biology has mainly focused on malignant epithelial cancer cells, although tumors also contain a
stromal compartment, which is composed of stem cells, tumor-associated fibroblasts (TAFs), endothelial cells, immune cells, adipocytes, cytokines, and various types of macromolecules comprising the extracellular matrix (ECM). The tumor stroma develops gradually in response to the needs of epithelial cancer cells during malignant progression initiating from increased local vascular permeability and ending to remodeling of desmoplastic loosely vascularized stromal ECM."

The news correspondents obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "The constant bidirectional interaction of epithelial cancer cells with the surrounding microenvironment allows damaged stromal cell usage as a source of nutrients for cancer cells, maintains the stroma renewal thus resembling a wound that does not heal, and affects the characteristics of tumor mesenchymal stem/stromal cells (MSCs). Although MSCs have been shown to coordinate tumor cell growth, dormancy, migration, invasion, metastasis, and drug resistance, recently they have been successfully used in treatment of hematopoietic malignancies to enhance the effect of total body irradiation-hematopoietic stem cell transplantation therapy."

According to the news reporters, the research concluded: "Hence, targeting the stromal elements in combination with conventional chemotherapeutics and usage of MSCs to attenuate graft-versus-host disease may offer new strategies to overcome cancer treatment failure and relapse of the disease."

For more information on this research see: Mesenchymal Stem/Stromal Cells in Stromal Evolution and Cancer Progression. Stem Cells International, 2015;2016():4824573. (Hindawi Publishing - www.hindawi.com; Stem Cells International - www.hindawi.com/journals/sci/)

Drugs and Therapies - Ethnopharmacology

Reports Summarize Ethnopharmacology Study Results from Nanjing University (Antitumor activity of Annona squamosa seed oil)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Ethnopharmacology have been published. According to news reporting originating in Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Custard apple (Annona squamosa Linn.) is an edible tropical fruit, and its seeds have been used to treat 'malignant sore' (cancer) and other usage as insecticide. A comparison of extraction processes, chemical composition analysis and antitumor activity of A. squamosa seed oil (ASO) were investigated."

The news reporters obtained a quote from the research from Nanjing University,
"The optimal extraction parameters of ASO were established by comparing percolation, soxhlet, ultrasonic and SFE-CO2 extraction methods. The chemical composition of fatty acid and content of total annonaceous acetogenins (ACGs) of ASO was tested by GC-MS and colorimetric assay, and anti-tumor activity of ASO was tested using H-22 xenografts bearing mice. The optimal extraction parameters of ASO were obtained as follows: using soxhlet extraction method with extraction solvent of petroleum ether, temperature of 80 degrees C, and extraction time of 90 min. Under these conditions, the yield of ASO was 22.65%. GC-MS analysis results showed that the main chemical compositions of fatty acid of ASO were palmitic acid (9.92%), linoleic acid (20.49%), oleic acid (56.50%) and stearic acid (9.14%). The total ACGs content in ASO was 41.00 mg/g. ASO inhibited the growth of H-22 tumor cells in mice with a maximum inhibitory rate of 53.54% by oral administration. Furthermore, it was found that ASO exerted an antitumor effect via decreasing interleukin-6 (IL-6), janus kinase (JAK) and phosphorylated signal transducers and activators of transcription (p-Stat3) expression. The results demonstrated that ASO suppressed the H-22 solid tumor development may due to its main chemical constituents unsaturated fatty acid and ACGs via IL-6/Jak/Stat3 pathway."

According to the news reporters, the research concluded: "ASO may be a potential candidate for the treatment of cancer."

Our news correspondents report that additional information may be obtained by contacting Y. Chen, Nanjing Univ Chinese Med, Coll Pharm, Nanjing, Jiangsu, People's Republic of China. **Drugs and Therapies - Fexofenadine Therapy**

**Reports Summarize Fexofenadine Therapy Findings from University of Warmia & Mazury (Cytokine production by PBMC and serum from allergic and non-allergic subjects following in vitro histamine stimulation to test fexofenadine and osthole ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Fexofenadine Therapy are discussed in a new report. According to news reporting originating from Olsztyn, Poland, by NewsRx correspondents, research stated, "FXF is a third-generation antihistamine drug and osthole is assumed a natural antihistamine alternative. This paper compares peripheral blood mononuclear cell (PBMC) incubation with FXF and osthole, by studying FXF, osthole and
Our news editors obtained a quote from the research from the University of Warmia & Mazury, "Mabtech kits determined the interleukins IL-1 beta, IL-4, IL-10, IL-13 and TNF-alpha. The influence of the above active substances on cytokine secretion in PBMC's and serum was assessed: cytokines were IL-1 beta, IL-4, IL-10, IL-13 and TNF-alpha; and cytokine levels secreted by untreated PBMCs in pure culture medium formed the absolute control (ctrl). We determined that osthole affects PBMC cytokine secretion to almost precisely the same extent as FXF (IL-1 beta, IL-4, IL-10 and TNF). In addition osthole had greater IL-13 blocking ability than FXF. Moreover, we observed significantly decreased IL-4 level in histamine/osthole treatment compared to histamine alone. Meanwhile, FXF not significantly decrease the level of IL-4 increased by histamine. This data indicates osthole's strong role in allergic inflammation."

According to the news editors, the research concluded: "All results confirm our hypothesis that osthole is a natural histamine antagonist and therefore can be beneficially used in antihistamine treatment of conditions such as allergies."

For more information on this research see: Cytokine production by PBMC and serum from allergic and non-allergic subjects following in vitro histamine stimulation to test fexofenadine and osthole anti-allergic properties. Oncology - Gastric Cancer

Reports Summarize Gastric Cancer Findings from Tianjin Medical University (Direct targeting of HGF by miR-16 regulates proliferation and migration in gastric cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gastric Cancer. According to news reporting out of Tianjin, People's Republic of China, by NewsRx editors, research stated, "MicroRNAs (miRNAs) have been reported to be involved in each stage of tumor development in various types of cancers. We have previously showed that miR-16 is down-regulated in cancer and acts as a tumor suppressor."

Funders for this research include National Natural Science Foundation of China,

Our news journalists obtained a quote from the research from Tianjin Medical University, "Other studies indicated that hepatocyte growth factor (HGF)/c-Met is implicated in proliferation, migration, and other pathophysiological processes. However, little is known about the relationship between miR-16 and HGF/c-Met in gastric cancer (GC). In the present study, we used bioinformatics tools and related experiments to search for miRNAs targeting HGF. Here, we found that miR-16 suppressed HGF protein expression by directly targeting 3'-untranslated region (UTR) of HGF mRNA. Subsequently, it was illustrated the down-regulation of miR-16 promotes, while overexpressed of miR-16 significantly inhibits cell proliferation and migration by negatively regulating HGF/c-Met pathway. Moreover, the biological role of HGF in GC cells was determined by using HGF siRNA and HGF-overexpressing plasmid, respectively."

According to the news editors, the research concluded: "To conclude, our results provide a potential target by using miR-16 for the future clinical treatment of GC."

For more information on this research see: Direct targeting of HGF by miR-16 regulates proliferation and migration in gastric cancer. *Tumor Biology*, 2016;37(11):15175-15183. *Tumor Biology* can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. Financial supporters for this research include National Science Foundation (NSF), Fralin Life Science Institute, Virginia Polytechnic Institute and State University (VT).

The news correspondents obtained a quote from the research from the Korea Advanced Institute of Science and Technology (KAIST), "Per2 binding prevents Mdm2-mediated ubiquitination of p53 and, therefore, its degradation, and oscillations in the peaks of Per2 and p53 were expected to correspond. However, our findings showed that Per2 and p53 rhythms were significantly out-of-phase relative to each other in cell lysates and in purified cytoplasmic fractions. These seemingly conflicting experimental data motivated the use of a combined theoretical and experimental approach focusing on the role played by Per2 in dictating the phase of p53 oscillations. Systematic modeling of all possible regulatory scenarios predicted that the observed phase relationship between Per2 and p53 could be simulated if (i) p53 was more stable in the nucleus than in the cytoplasm, (ii) Per2 associates to various ubiquitinated forms of p53, and (iii) Per2 mediated p53 nuclear import. These predictions were supported by a sevenfold increase in p53's half-life in the nucleus and by in vitro binding of Per2 to the various ubiquitinated forms of p53. Last, p53's nuclear shuttling was significantly favored by ectopic expression of Per2 and reduced because of Per2 down-regulation."

According to the news reporters, the research concluded: "Our combined theoretical/mathematical approach reveals how clock regulatory nodes can be inferred from oscillating time course data."

**Oncology - Glioblastomas**

**Reports Summarize Glioblastomas Findings from Capital Medical University (IDH mutation and MGMT promoter methylation are associated with the pseudoprogression and improved prognosis of glioblastoma multiforme patients who have undergone ...)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Glioblastomas have been published. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "This study aimed to investigate the potential association between IDH mutation and O-6-methyl-guanine methyl transferase (MGMT) gene promoter methylation and pseudoprogression disease (psPD) in glioblastoma multiforme (GBM) patients after concurrent temozolomide (TMZ)-based chemoradio-therapy. A total of 157 GBM patients who received concurrent TMZ-based chemoradiotherapy were included in this retrospective study."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Capital Medical University. "The association between psPD and a number of demographic and genetic factors, including IDH mutation and MGMT promoter methylation, were analyzed based on logistic regression, Cox regression, and multivariate analysis. Of the 157 GBM patients, 145 (92.36%) patients, including 38 patients with psPD, 38 patients with early progression (ePD), and 69 patients with non-progression (non-PD), were followed up for six to 56 months. We identified a higher rate of MGMT promoter methylation and IDH1 mutation in psPD patients compared with ePD patients (P = 0.002). In addition, MGMT promoter methylation and IDH1 mutation predicted a high probability of psPD development in GBM patients (P = 0.001 and P< 0.001, respectively). MGMT promoter methylation, IDH1 mutation, Karnofsky performance score (KPS) >= 70, and psPD were associated with a significantly longer overall survival of GBM patients (P = 0.001, 0.001, 0.002, and P< 0.001, respectively). Both of MGMT promoter methylation and IDH mutation had a cumulative effect on the OS of GBM patients. GBM patients with psPD (39.2 +/- 2.1 months, P< 0.001) had a longer median survival (MS) than GBM patients with ePD (11.9 +/- 1.1 months) or with non-PD (24.4 +/- 2.4 months). MGMT promoter methylation and IDH1 mutation were associated with PsPD and predicted a longer median survival in GBM patients after TMZ-based chemoradiotherapy."

According to the news editors, the research concluded: "Genetic analyses of the MGMT promoter and IDH1 may allow us to effectively treat GBM patients."

For more information on this research see: IDH mutation and MGMT promoter methylation are associated with the pseudoprogression and improved prognosis of glioblastoma multiforme patients who have undergone concurrent and adjuvant temozolomide-based chemoradiotherapy. Clinical Neurology and Neurosurgery, 2016;151():31-36. Clinical Neurology and Neurosurgery can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Reports Summarize Gliomas Study Results from Fudan University (miR-491 regulates glioma cells proliferation by targeting TRIM28 in vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gliomas. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "MicroRNAs are significantly involved in tumorigenesis and progression of glioma. However, the critical part they play in glioma have not been fully elaborated. miR-491 and Tripartite motif containing 28 (TRIM28) are reported to aberrantly express in glioblastoma multiforme (GBM)."

Our news journalists obtained a quote from the research from Fudan University, "Here, we detected miR-491 and TRIM28 expression and function in glioma cells. We analyzed miR-491 expressions in 20 primary human GBM tissues and 6 control brain tissues by qRT-PCR assays and searched for The Cancer Genome Atlas (TCGA) database. Then we predicted possible mRNA target of miR-491 by TargetScan/MicroRNA and confirmed it via luciferase reporter assays. Knock-down of miR-491 and transfection of pLenti-TRIM28 were performed in U251 and U87 cells. Proliferation ability was examined by MTT and clone formation assays. miR-491 expression was obviously reduced in GBM cells and tissues. There was a positive correlation between the down-regulation of miR-491 and poor prognosis. Spearman's correlation analysis demonstrated that miR-491 expression was negatively correlated with TRIM28 protein level. Possible mRNA binding sites of miR-491 predicted by TargetScan/MicroRNA were proved by luciferase assays. Clone formation and MTT assays indicated that up-regulation of miR-491 inhibited the proliferation of glioma cells."

According to the news editors, the research concluded: "MiR-491 regulates glioma cells proliferation in vitro by targeting TRIM28."

Our news journalists report that additional information may be obtained by contacting L. Chen, Fudan University, Shanghai Med College, Dept. of Neurosurg, Shanghai, People's Republic of China. Additional authors for this research include S.Y. Cai, J.J. Cai, L.C. Chen, Y. Yao, L. Chen and Y. Mao.

Reports Summarize Granulocytes Findings from Huazhong Agricultural University [Acute Exposure to Tris(1,3-dichloro-2-propyl) Phosphate (TDCIPP) Causes Hepatic Inflammation and Leads to Hepatotoxicity in Zebrafish]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immunology - Granulocytes is the subject of a report. According to news reporting out of Wuhan, People's Republic of China, by NewsRx editors, research stated, "Tris(1,3-dichloro-2-propyl) phosphate (TDCIPP) has been frequently detected in environmental media and has adverse health effect on wildlife and humans. It has been implicated to have hepatotoxicity, but its molecular mechanisms remain unclear."

Our news journalists obtained a quote from the research from Huazhong Agricultural University, "In the present study, adult male zebrafish were exposed to TDCIPP and global hepatic gene expression was examined by RNA-Seq and RT-qPCR in order to understand the molecular mechanisms of TDCIPP-induced hepatotoxicity. Our results indicated that TDCIPP exposure significantly up-regulated the expression of genes involved in endoplasmic reticulum stress and Toll-like receptor (TLR) pathway, implying an inflammatory response, which was supported by up-regulation of inflammation-related biomaker genes. Hepatic inflammation was further confirmed by histological observation of increase of infiltrated neutrophils and direct observation of liver recruitment of neutrophils labeled with Ds-Red fluorescent protein of Tg (lysC:DsRed) zebrafish upon TDCIPP exposure. To further characterize the hepatotoxicity of TDCIPP, the expression of hepatotoxicity biomaker genes, liver histopathology and morphology were examined. The exposure to TDCIPP significantly up-regulated the expression of several biomarker genes for hepatotoxicity (gck, gsr and nqo1) and caused hepatic vacuolization and apoptosis as well as increase of the liver size."

According to the news editors, the research concluded: "Collectively, our results suggest that exposure to TDCIPP induces hepatic inflammation and leads to hepatotoxicity in zebrafish."

For more information on this research see: Acute Exposure to Tris(1,3-dichloro-2-propyl) Phosphate (TDCIPP) Causes Hepatic Inflammation and Leads to Hepatotoxicity in Zebrafish. Scientific Reports, 2016;6():19045. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Immunology - Granulocytes

Reports Summarize Granulocytes Study Results from University of Oxford (Blood eosinophils and inhaled corticosteroid/long-acting b-2 agonist efficacy in COPD)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immunology - Granulocytes are discussed in a new report. According to news reporting originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "We performed a review of studies of fluticasone propionate (FP)/salmeterol (SAL) (combination inhaled corticosteroid (ICS)/long-acting b2-agonist (LABA)) in patients with COPD, which measured baseline (pretreatment) blood eosinophil levels, to test whether blood eosinophil levels (>=2%) were associated with a greater reduction in exacerbation rates with ICS therapy. Three studies of (>=)1-year duration met the inclusion criteria."

Our news editors obtained a quote from the research from the University of Oxford, "Moderate and severe exacerbation rates were analysed according to baseline blood eosinophil levels (<2% vs (>=)2%). At baseline, 57-75% of patients had (>=)2% blood eosinophils. Changes in FEV1 and St George's Respiratory Questionnaire (SGRQ) scores were compared by eosinophil level. For patients with (>=)2% eosinophils, FP/SAL was associated with significant reductions in exacerbation rates versus tiotropium (INSPIRE: n=719, rate ratio (RR)=0.75, 95% CI 0.60 to 0.92, p=0.006) and versus placebo (TRISTAN: n=1049, RR=0.63, 95% CI 0.50 to 0.79, p<0.001). No significant difference was seen in the <2% eosinophil subgroup in either study (INSPIRE: n=550, RR=1.18, 95% CI 0.92 to 1.51, p=0.186; TRISTAN: n=354, RR=0.99, 95% CI 0.67 to 1.47, p=0.957, respectively). In SCO30002 (n=373), no significant effects were observed (FP or FP/SAL vs placebo). No relationship was observed in any study between eosinophil subgroup and treatment effect on FEV1 and SGRQ."

According to the news editors, the research concluded: "Baseline blood eosinophil levels may represent an informative marker for exacerbation reduction with ICS/LABA in patients with COPD and a history of moderate/severe exacerbations."

For more information on this research see: Blood eosinophils and inhaled corticosteroid/long-acting b-2 agonist efficacy in COPD. Thorax, 2015;71(2):118-25. (BMJ Publishing Group - group.bmj.com/; Thorax - thorax.bmj.com/)

The news editors report that additional information may be obtained by contacting I.D. Pavord, Respiratory Medicine Unit, Nuffield Dept. of Clinical Medicine, University of Oxford, Oxford, UK. Heart Disorders and Diseases - Heart Attack

Reports Summarize Heart Attack Study Results from K. Chaikriangkrai and Co-Researchers (Prognostic Value of Coronary Artery Calcium Score in Acute Chest Pain Patients Without Known Coronary Artery Disease: Systematic Review and Meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Coronary artery calcium score (CACS) is a well-established test for risk stratifying asymptomatic patients. Recent studies also indicate that CACS may accurately risk stratify stable patients presenting to the emergency department (ED) with acute chest pain; however, many were underpowered."

The news correspondents obtained a quote from the research, "The purpose of this systematic review and meta-analysis is to evaluate the prognostic value and accuracy of a zero (normal) CACS for identifying patients at acceptable low risk for future cardiovascular events who might be safely discharged home from the ED. We searched multiple databases for longitudinal studies of CACS in symptomatic patients without known coronary artery disease that reported major adverse cardiovascular events (MACEs), including death and myocardial infarction. Pooled risk ratios, sensitivity, specificity, and likelihood ratios were analyzed. Eight studies evaluated 3,556 patients, with a median follow-up of 10.5 months. Pooled prevalence of zero CACS was 60%. Patients with CACS=0 had a significantly lower risk of cardiovascular events compared with those with CACS greater than 0 (MACEs: relative risk 0.06, 95% confidence interval 0.04 to 0.11, I-2=0%; death/myocardial infarction: relative risk 0.19; 95% confidence interval 0.08 to 0.47, I-2=0%). The pooled event rates for CACS=0 (MACEs 0.8%/year; death/myocardial infarction 0.5%/year) were significantly lower than for CACS greater than 0 (MACEs 14.6%/year; death/myocardial infarction 3.5%/year). Analysis of summary testing parameters showed a sensitivity of 96%, specificity of 60%, positive likelihood ratio of 2.36, and negative likelihood ratio of 0.07. Acute chest pain patients without history of coronary artery disease, ischemic ECG changes, or increased cardiac enzyme levels commonly have a CACS of zero, with a very low subsequent risk of MACEs or death or myocardial infarction."

According to the news reporters, the research concluded: "This meta-analysis proffers the potential role of initial CACS testing for avoiding unnecessary hospitalization and further cardiac testing in acute chest pain patients with a CACS of zero."

Our news journalists report that additional information may be obtained by contacting S.M. Chang, Houston Methodist DeBakey Heart & Vasc Center, Houston, TX 77030, United States. Additional authors for this research include G.P.S. Shantha, H.Y. Jhun, P. Ungprasert, G. Sigurdsson, F. Nabi, J.J. Mahmarian and S.M. Chang.

Liver Diseases and Conditions - Hepatitis B Virus

Reports Summarize Hepatitis B Virus Study Results from Bassett Medical Center (Hepatitis B virus infection and risk of gallstones: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Hepatitis B Virus. According to news reporting originating from Cooperstown, New York, by NewsRx correspondents, research stated, "Background/objectivesGallstone disease and its complications are common, particularly in Western populations. Recent studies have reported a significantly increased risk of gallstones among hepatitis C virus-infected patients."

Our news editors obtained a quote from the research from Bassett Medical Center, "However, the data on patients with hepatitis B virus (HBV) infection are still limited. This meta-analysis was carried out with the aim of summarizing all available evidence. Patients and methodsA literature search was performed using MEDLINE and the EMBASE database from inception to May 2016. Studies that reported relative risks, odd ratios, or hazard ratios comparing the risk of gallstones among HBV-infected patients versus patients without HBV infection were included. Pooled odds ratio (OR) and 95% confidence interval (CI) were calculated using a random-effect, generic inverse-variance method. ResultsNine studies fulfilled our eligibility criteria and were included in the analysis. We found no significant association between HBV infection and the risk of gallstones, with a pooled OR of 1.10 (95% CI, 0.91-1.33). The statistical heterogeneity was moderate, with an I-2 of 69%. Subgroup analysis was carried out."

According to the news editors, the research concluded: "The pooled OR of cross-sectional studies was 1.01 (95% CI, 0.91-1.12; I-2 0%), whereas the pooled OR of case-control studies was 1.53 (95% CI, 0.85-2.74; I-2 80%). ConclusionA significant association between HBV infection and the risk of gallstones was not observed in this study."

For more information on this research see: Hepatitis B virus infection and risk of gallstones: a systematic review and meta-analysis. Liver Diseases and Conditions - Hepatitis C Virus

Reports Summarize Hepatitis C Virus Study Results from University of Auckland (High Efficacy of ABT-493 and ABT-530 Treatment in Patients With HCV Genotype 1 or 3 Infection and Compensated Cirrhosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Liver Diseases and Conditions - Hepatitis C Virus is the subject of a report. According to news reporting from Auckland, New Zealand, by NewsRx journalists, research stated, "The combination of ABT-493 (NS3/4A protease inhibitor) plus ABT-530 (NS5A inhibitor) has shown high rates of sustained virologic response at post-treatment week 12 (SVR12) in noncirrhotic patients infected with hepatitis C virus (HCV) genotypes (GTs) 1-6. We describe 2 open-label phase 2 studies investigating the efficacy and safety of ABT-493 plus ABT-530 with or without ribavirin (RBV) in GT1-or GT3-infected patients with compensated cirrhosis."

The news correspondents obtained a quote from the research from the University of Auckland, "Patients with GT1 infection received 200 mg ABT-493 plus 120 mg ABT-530 for 12 weeks. Patients with GT3 infection were randomized 1:1 to receive 300 mg ABT-493 plus 120 mg ABT-530 with or without once-daily 800 mg RBV for 12 weeks; treatment-experienced patients who were not treated with RBV received 16 weeks of therapy. Efficacy was measured by SVR12, defined as an HCV-RNA level less than 25 IU/mL. Adverse events and laboratory parameters were evaluated throughout the study. Twenty-seven patients with GT1 infection and 55 patients with GT3 infection were enrolled. The majority were treatment-naive (84%) and male (65%). In patients with GT1 infection, SVR12 was achieved by 96% (26 of 27; 95% confidence interval [CI], 82-99) of patients, with 1 relapse. Among GT3-infected patients, SVR12 was achieved in 96% (27 of 28; 95% CI, 82-99) of patients in the RBV-free arm (1 relapse), and in 100% (27 of 27; 95% CI, 88-100) in the RBV-containing arm. The most common adverse events were headache, fatigue, and nausea. Laboratory abnormalities were rare; no patient discontinued treatment."

According to the news reporters, the research concluded: "In cirrhotic HCV GT1-or GT3-infected patients, ABT-493 plus ABT-530 with or without RBV achieved SVR12 rates of 96%-100% and was well tolerated."

For more information on this research see: High Efficacy of ABT-493 and ABT-530 Treatment in Patients With HCV Genotype 1 or 3 Infection and Compensated Cirrhosis. Reports Summarize Hypokalemia Findings from Chinese People's Liberation Army General Hospital (Preoperative Diagnosis of Juxtaglomerular Cell Tumors in Eight Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Hypokalemia are presented in a new report. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "The aim of this study was to improve the diagnostic efficiency for juxtaglomerular cell tumors (JCTs) and to determine whether clinical and magnetic resonance imaging features can help to differentiate JCTs from clear cell renal cell carcinoma (ccRCC). The clinical features of eight patients with JCTs and 27 patients with ccRCCs were analyzed."

The news reporters obtained a quote from the research from Chinese People's Liberation Army General Hospital, "A flow diagram for young people with hypertension was applied to facilitate the diagnosis. Clinical presentations were analyzed, including age, hypertension, and hypokalemia. The results of our study produced a flow diagram that narrowed the scope of diagnosis. The statistical results demonstrated that patients with a renal mass aged 14 to 30 years, had grade 3 hypertension, or had moderate hypokalemia had a greater possibility of having a JCT than a ccRCC (P < .0000, P < .01, P < .0005, respectively)."

According to the news reporters, the research concluded: "In addition, the flow diagram and magnetic resonance imaging features were useful to distinguish JCTs from other renal tumors."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jch.12810. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions - Hypotension

Reports Summarize Hypotension Study Results from Army Medical Center (Dialysate-induced hypocalcemia presenting as acute intradialytic hypotension: A case report, safety review, and recommendations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Hypotension are presented in a new report. According to news reporting originating from El Paso, Texas, by NewsRx correspondents, research stated, "Intradialytic hypotension is the most common complication associated with hemodialysis. We describe a case of severe intradialytic hypotension during routine chronic dialysis, the presenting symptom of hypocalcemia due to a procedural error involving a zero calcium liquid acid dialysate concentrate."

Our news editors obtained a quote from the research from Army Medical Center, "Although human factors were the root cause of this event, we discuss physical and procedural controls that may help to minimize the risk of human error. Citrate anticoagulation for renal replacement therapy is increasingly used, particularly in acute kidney injury. Thus, zero calcium liquid acid dialysate is more likely to be stocked by dialysis units that serve both inpatients and outpatients. Providers in such units must maintain the utmost vigilance for human error involving these concentrates, as it is likely that the reported literature does not accurately reflect the frequency of such adverse events occurring during dialysis."

According to the news editors, the research concluded: "Structured and universal reporting of errors to allow systematic analysis of hemodialysis device related hazards would allow identification of engineering controls that could prevent such potentially catastrophic clinical errors."

The news editors report that additional information may be obtained by contacting J.S. Thurlow, Nephrology Service, Dept. of Medicine, William Beaumont Army Medical Center, El Paso, Texas, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/hdi.12386. This DOI is a link to an online electronic document that is either free or for purchase.

Membrane Proteins - Ion Channels

Reports Summarize Ion Channels Study Results from University College (Nav1.7 and other voltage-gated sodium channels as drug targets for pain relief)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Membrane Proteins - Ion Channels. According to news reporting originating in London, United Kingdom, by NewsRx journalists, research stated, "Chronic pain is a massive clinical problem. We discuss the potential of subtype selective sodium channel blockers that may provide analgesia with limited side effects."

Financial supporters for this research include Medical Research Council, Wellcome Trust.

The news reporters obtained a quote from the research from University College, "Sodium channel subtypes have been linked to human pain syndromes through genetic studies. Gain of function mutations in Nav1.7, 1.8 and 1.9 can cause pain, whilst loss of function Nav1.7 mutations lead to loss of pain in otherwise normal people. Intriguingly, both human and mouse Nav1.7 null mutants have increased opioid drive, because naloxone, an opioid antagonist, can reverse the analgesia associated with the loss of Nav1.7 expression. We believe there is a great future for sodium channel antagonists, particularly Nav1.7 antagonists in treating most pain syndromes. This review deals with recent attempts to develop specific sodium channel blockers, the mechanisms that underpin the Nav1.7 null pain-free phenotype and new routes to analgesia using, for example, gene therapy or combination therapy with subtype specific sodium channel blockers and opioids."

According to the news reporters, the research concluded: "The use of selective Nav1.7 antagonists together with either enkephalinase inhibitors or low dose opioids has the potential for side effect-free analgesia, as well as an important opioid sparing function that may be clinically very significant."

For more information on this research see: Nav1.7 and other voltage-gated sodium channels as drug targets for pain relief. Expert Opinion On Therapeutic Targets, 2016;20 (8):975-83.

Our news correspondents report that additional information may be obtained by contacting E.C. Emery, a Molecular Nociception Group, Dept. of Medicine, WIBR, University College London, London WC1E 6BT, UK. Additional authors for this research include A.P. Luiz and J.N. Wood.

Reports Summarize Kidney Transplants Study Results from Tokyo Women's Medical University (Two cases of kidney transplantation-associated thrombotic microangiopathy successfully treated with eculizumab)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Kidney Transplants. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Transplantation-associated thrombotic microangiopathy (TA-TMA) is relatively rare and requires immediate intervention to avoid irreversible organ damage or death; however, consensus regarding the treatment approach is lacking. Atypical haemolytic uraemic syndrome (aHUS) is a rare disease caused by dysregulation of the alternative complement pathway resulting in TMA. aHUS is histologically similar to TA-TMA; approximately 60% of TA-TMA patients have complement dysregulation."

The news correspondents obtained a quote from the research from Tokyo Women's Medical University, "Eculizumab, a humanized anti-C5 monoclonal antibody, inhibits terminal membrane-attack complex formation and TMA progression. Eculizumab has been successfully used to treat aHUS post-transplant. We present two cases of kidney TA-TMA due to unknown causes, suspected antibody-mediated rejection, or calcineurin inhibitor (CNI)-related toxicity that developed on day 1 or 2 post-kidney transplantation. Low platelet count and haemoglobin level with red cell fragments were detected. Despite steroid pulse, plasma exchange (PE), and intravenous immunoglobulin therapy, TA-TMA did not improve; therefore, eculizumab was administered despite no genetic testing. Laboratory data, including renal function, improved immediately. TA-TMA treatment primarily involves PE initiation or CNI discontinuation; eculizumab can be used to safely treat TA-TMA and then be ceased in the short term."

According to the news reporters, the research concluded: "Therefore, eculizumab administration might be beneficial for kidney TA-TMA as early as the diagnosis of refractory to PE."

Our news journalists report that additional information may be obtained by contacting M. Okumi, Tokyo Women's Medical University, Dept. of Urol, Tokyo, Japan. Additional authors for this research include M. Okumi, K. Unagami, T. Kanzawa, A. Sawada, K. Kawanishi, K. Omoto, H. Ishida and K. Tanabe.

Keywords for this news article include: Tokyo, Japan, Asia, Antineoplastic Monoclonal Antibodies, Thrombotic Microangiopathy, Drugs and Therapies, Transplant Medicine, Immunologic Agents, Kidney Transplants, Organ Transplants, Medical Devices, Transplantation, Biotechnology, Biomedicine, Eculizumab, Genetics, Tokyo Women's Medical University.

Reports Summarize Kidney Transplants Study Results from University of Miami Miller School of Medicine (Lower tacrolimus trough levels are associated with subsequently higher acute rejection risk during the first 12 months after kidney ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Kidney Transplants is now available. According to news reporting originating in Miami, Florida, by NewsRx journalists, research stated, "The premise that lower TAC trough levels are associated with subsequently higher first BPAR risk during the first 12 mo post-transplant was recently questioned. Using our prospectively followed cohort of 528 adult, primary kidney transplant recipients (pooled across four randomized trials) who received reduced TAC dosing plus an IMPDH inhibitor, TAC trough levels measured at seven time points, 7, 14 days, 1, 2, 3, 6 and 9 months post-transplant, were utilized along with Cox's model to determine the multivariable significance of TAC level (t) (a continuous time-dependent covariate equaling the most recently measured TAC level prior to time t) on the hazard rate of developing first BPAR during the first 12 months post-transplant."

The news reporters obtained a quote from the research from the University of Miami Miller School of Medicine, "The percentage developing BPAR during the first 12 months post-transplant was 10.2% (54/528). In univariable analysis, lower TAC level(t) was associated with a significantly higher BPAR rate (p=0.00006), and its significance was maintained even after controlling for 2 significant baseline predictors (African-American/Hispanic Recipient and Developed DGF) in Cox's model (multivariable p=0.0003). Use of a cutpoint, TAC level(t) <4.0 vs. (>=)4.0 ng/ml, yielded an even greater association with BPAR rate (univariable and multivariable p<0.000001), with an estimated hazard ratio of 6.33."

According to the news reporters, the research concluded: "These results suggest that TAC levels <4.0 ng/ml should be avoided during the first 12 months post-transplant when TAC is used in combination with fixed-dose mycophenolate with or without corticosteroids and induction therapy."

For more information on this research see: Lower tacrolimus trough levels are associated with subsequently higher acute rejection risk during the first 12 months after kidney transplantation. Reports Summarize Levothyroxine Therapy Findings from Oregon Health and Science University (Effect of Thyroid Function Variations Within the Laboratory Reference Range on Health Status, Mood, and Cognition in Levothyroxine-Treated Subjects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Levothyroxine Therapy have been published. According to news reporting originating in Portland, Oregon, by NewsRx journalists, research stated, "There has been recent debate within the thyroid field regarding whether current upper limits of the thyrotropin (TSH) reference range should be lowered. This debate can be better informed by investigation of whether variations in thyroid function within the reference range have clinical effects."

The news reporters obtained a quote from the research from Oregon Health and Science University, "One important target organ for thyroid hormone is the brain, but little is known about variations in neurocognitive measures within the reference range for thyroid function. This was a cross-sectional study of 132 otherwise healthy hypothyroid subjects receiving chronic replacement therapy with levothyroxine (LT4) who had TSH levels across the full span of the laboratory reference range (0.34-5.6 mU/L). Subjects underwent detailed tests of health status, mood, and cognitive function, with an emphasis on memory and executive functions. Subjects with low-normal (<= 2.5 mU/L) and high-normal (>2.5 mU/L) TSH levels did not differ on most tests of health status, mood, or cognitive function, and there were no correlations between TSH, free T4, or free T3 levels and most outcomes. There was, however, a suggestion that thyroid function affected performance on the Iowa Gambling Task, which mimics real life decision-making. Subjects with low-normal TSH levels made more advantageous decisions than those with high-normal TSH levels. Variations in thyroid function within the laboratory reference range do not appear to have clinically relevant effects on health status, mood, or memory in LT4 treated subjects. However, decision making, which encompasses many executive functions, may be affected."

According to the news reporters, the research concluded: "Unless further studies strengthen this finding, these data do not support narrowing the TSH reference range."

For more information on this research see: Effect of Thyroid Function Variations Within the Laboratory Reference Range on Health Status, Mood, and Cognition in Levothyroxine-Treated Subjects, Thyroid, 2016;26(9):1173-1184. Biotechnology - Liposomes

Reports Summarize Liposomes Study Results from National Heart Lung and Blood Institute (Mammalian Nonmuscle Myosin II Binds to Anionic Phospholipids with Concomitant Dissociation of the Regulatory Light Chain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Biotechnology - Liposomes are presented in a new report. According to news originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "Mammalian cells express three Class II nonmuscle myosins (NM): NM2A, NM2B, and NM2C. The three NM2s have well established essential roles in cell motility, adhesion, and cytokinesis and less well defined roles in vesicle transport and other processes that would require association of NM2s with cell membranes."

Financial support for this research came from National Heart, Lung, and Blood Institute.

Our news journalists obtained a quote from the research from National Heart Lung and Blood Institute, "Previous evidence for the mechanism of NM2-membrane association includes direct interaction of NM2s with membrane lipids and indirect interaction by association of NM2s with membrane-bound F-actin or peripheral membrane proteins. Direct binding of NM2s to phosphatidylserine-liposomes, but not to phosphatidylcholine-liposomes, has been reported, but the molecular basis of the interaction between NM2s and acidic phospholipids has not been previously investigated. We now show that filamentous, full-length NM2A, NM2B, and NM2C and monomeric, non-filamentous heavy meromyosin bind to liposomes containing one or more acidic phospholipids (phosphatidylserine, phosphatidylinositol 4,5-diphosphate, and phosphatidylinositol 3,4,5-triphosphate) but do not bind to 100% phosphatidylcholine-liposomes. Binding of NM2s to acidic liposomes occurs predominantly through interaction of the liposomes with the regulatory light chain (RLC) binding site in the myosin heavy chain with concomitant dissociation of the RLC. Phosphorylation of myosin-bound RLC by myosin light chain kinase substantially inhibits binding to liposomes of both filamentous NM2 and non-filamentous heavy meromyosin; the addition of excess unbound RLC, but not excess unbound essential light chain, competes with liposome binding."

According to the news editors, the research concluded: "Consistent with the in vitro data, we show that endogenous and expressed NM2A associates with the plasma membrane of HeLa cells and fibrosarcoma cells independently of F-actin."

For more information on this research see: Mammalian Nonmuscle Myosin II Binds to Anionic Phospholipids with Concomitant Dissociation of the Regulatory Light Chain.
Reports Summarize Liver Cancer Findings from Itabashi Chuo Medical Center (Early Prediction of the Outcome Using Tumor Markers and mRECIST in Unresectable Hepatocellular Carcinoma Patients Who Underwent Transarterial chemoembolization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "We examined early predictors of the outcome in hepatocellular carcinoma (HCC) patients after transarterial chemoembolization (TACE). We analyzed 116 patients with unresectable HCC treated with initial TACE. alpha-Fetoprotein (AFP) or des-gamma-carboxy prothrombin (DCP) response was assessed in patients who had baseline AFP levels >= 200 ng/ml or DCP >= 60 mAU/ml; a positive response was defined as a reduction of >50% compared to baseline 1 month after TACE."

Our news journalists obtained a quote from the research from Itabashi Chuo Medical Center, "A baseline AFP level 200 ng/ml was associated with a poor overall survival (OS) (29.4 vs. 6.1 months; p<0.0001). AFP response had no significantly prognostic effects on the OS. Conversely, although the baseline DCP did not influence the OS, DCP responders showed a significantly better OS than nonresponders (67.0 vs. 19.8 months, p = 0.020). The baseline AFP (p = 0.004) and initial tumor response evaluated by the modified Response Evaluation Criteria in Solid Tumors (mRECIST) (p = 0.012) were found to be independent predictors of the OS. The combination of the baseline AFP and initial assessment by mRECIST allowed stratification of the OS."

According to the news editors, the research concluded: "The combination of the baseline AFP level and mRECIST is useful for the early prediction of the OS in HCC patients who underwent TACE."

For more information on this research see: Early Prediction of the Outcome Using Tumor Markers and mRECIST in Unresectable Hepatocellular Carcinoma Patients Who Underwent Transarterial chemoembolization. Oncology, 2016;91(6):317-330. Oncology can be

Oncology - Liver Cancer

Reports Summarize Liver Cancer Findings from Third Military Medical University (Effect of ST2825 on the proliferation and apoptosis of human hepatocellular carcinoma cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Liver Cancer is the subject of a report. According to news reporting out of Chongqing, People's Republic of China, by NewsRx editors, research stated, "The purpose of this study was to investigate the effect of ST2825, an inhibitor of myeloid differentiation factor 88 (MyD88), on the proliferation and apoptosis of human hepatocellular carcinoma (HCC) cells as well as the potential mechanism and clinical significance of ST2825 in the treatment of HCC. Immunohistochemical staining with an MyD88 antibody was performed on tissues from 80 human HCC patients and adjacent normal tissues."

Our news journalists obtained a quote from the research from Third Military Medical University. "In the in vitro experiment, human HCC HepG-2 cells cultured in vitro were divided into the following groups: blank, control (1% DMSO), low-dose (2 mM), medium-dose (10 mM), and high-dose ST2825 (20 mM). Cell apoptosis was detected by the Annexin V-FITC assay, and HepG-2 cell proliferation was detected by the MTT assay. The expression of IkB, p65, cyclin D1, caspase-3, and bcl-2 in the cells after a 48-h treatment was assayed by western blot analysis. MyD88 expression in the HCC tissue was significantly higher than that in the adjacent normal tissue (p <0.05). The proliferation and apoptosis rates of control HCC cells displayed no significant differences compared with those of the blank group (p >0.05). Compared with the control, ST2825 significantly inhibited the proliferation of and promoted the apoptosis of HCC cells. Moreover, ST2825 significantly decreased bcl-2 expression, increased cleaved caspase-3 expression (p <0.05), and reduced p65 nuclear expression (p <0.05) in a dose-dependent manner."

According to the news editors, the research concluded: "ST2825 inhibits the proliferation of and promotes the apoptosis of HCC cells, thereby suggesting that ST2825 may be a new drug for HCC treatment."

For more information on this research see: Effect of ST2825 on the proliferation and apoptosis of human hepatocellular carcinoma cells. Genetics and Molecular Research

Reviews Summarize Liver Transplants Findings from French National Institute of Health and Medical Research (INSERM) (Role of Sorafenib in Patients With Recurrent Hepatocellular Carcinoma After Liver Transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Transplant Medicine - Liver Transplants. According to news reporting from Creteil, France, by NewsRx journalists, research stated, "The management of hepatocellular carcinoma (HCC) recurrence after liver transplantation (LT) is challenging, especially if it is not treatable by surgery or embolization. The present study aims to compare the survival rates of liver transplanted patients receiving sorafenib or best supportive care (BSC) for HCC recurrence not amenable to curative intent treatments."

The news correspondents obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "This is a retrospective comparative study on a prospectively maintained database. Liver transplanted patients with untreated HCC recurrence receiving BSC (n = 18) until 2007 or sorafenib (n = 15) thereafter were compared. No group difference was observed for demographic characteristics at the time of transplantation and at the time of HCC recurrence. On the explant pathology of the native liver, 81.2% patients were classified within the Milan criteria, and 53.1% presented with microvascular invasion. Hepatocellular carcinoma recurrence was diagnosed 17.8 months (standard deviation: 14.5) after LT, with 17 (53.1%) patients presenting with early recurrence (≤ 12 months). The 1-year survival from untreated progression of HCC recurrence was 23.9% for the BSC and 60% for the sorafenib group (P = .002). The type of treatment (sorafenib vs BSC) was the sole independent predictor of survival (hazard ratio: 2.98; 95% confidence interval: 1.09-8.1; P = .033). In the sorafenib group, 8 (53.3%) patients required dose reduction, and 2 (13.3%) patients discontinued the treatment due to intolerable side effects."

According to the news reporters, the research concluded: "Sorafenib improves survival and is superior to the BSC in cases of untreatable posttransplant hepatocellular carcinoma recurrence."

For more information on this research see: Role of Sorafenib in Patients With Recurrent Hepatocellular Carcinoma After Liver Transplantation. Progress in Transplantation,

**Cardiovascular Diseases and Conditions - Malignant...**

**Reports Summarize Malignant Hypertension Findings from Institute for Clinical and Experimental Medicine (Intrarenal alterations of the angiotensin-converting enzyme type 2/angiotensin 1-7 complex of the renin-angiotensin system do not alter the ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Malignant Hypertension have been published. According to news reporting from Prague, Czech Republic, by NewsRx journalists, research stated, "The role of the intrarenal renin-angiotensin system (RAS) in the pathophysiology of malignant hypertension is not fully understood. Accumulating evidence indicates that the recently discovered vasodilator axis of the RAS, angiotensin-converting enzyme (ACE) type 2 (ACE2)/angiotensin 1-7 (ANG 1-7), constitutes an endogenous system counterbalancing the hypertensiogenic axis, ACE/angiotensin II (ANG II)/AT1 receptor."

Funders for this research include Internal Grant Agency of the Ministry of Health the Czech Republic, Ministerstvo Zdravotnictvi Ceske Republiky, European Commission.

The news correspondents obtained a quote from the research from Institute for Clinical and Experimental Medicine, "This study aimed to evaluate the role of the intrarenal vasodilator RAS axis in the pathophysiology of ANG II-dependent malignant hypertension in Cyp1a1-Ren-2 transgenic rats. ANG II-dependent malignant hypertension was induced by 13? days' dietary administration of indole-3-carbinol (I3C), a natural xenobiotic that activates the mouse renin gene in Cyp1a1-Ren-2 transgenic rats. It was hypothesized that pharmacologically-induced inhibition of the ACE2/ANG 1-7 complex should aggravate, and activation of this axis should attenuate, the course of ANG II-dependent malignant hypertension. Blood pressure (BP) was monitored by radiotelemetry. ACE2 inhibitor (DX 600, 0.2?mg/day) and ACE2 activator (DIZE, 1?mg/day) were administrated via osmotic minipumps. Even though ACE2 inhibitor significantly decreased and ACE2 activator increased intrarenal ANG 1-7 concentrations, the course of BP, as well as of albuminuria, cardiac hypertrophy and renal glomerular damage, were not altered. It was shown that intrarenal alterations in the ACE2/ANG 1-7 complex did not..."
significantly modify the course of malignant hypertension in I3C-induced Cyp1a1-Ren-2 transgenic rats."

According to the news reporters, the research concluded: "Thus, in our experimental setting alterations of this intrarenal vasodilator complex of the RAS do not significantly modify the form of malignant hypertension that clearly depends on the inappropriately increased activity of the ACE/ANG II/AT1 receptor axis."

Our news journalists report that additional information may be obtained by contacting Z. Huskova, Centre for Experimental Medicine, Institute for Clinical and Experimental Medicine, Prague, Czech Republic. Additional authors for this research include L. Kopkan, L. Cervenkova, Š. Doleželova, Z. Vanourkova, P. Škaroupkova, A. Nishiyama, E. Kompanowska-Jezierska, J. Sadowski, H.J. Kramer and L. Cervenka.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1440-1681.12553. This DOI is a link to an online electronic document that is either free or for purchase.

Mass Spectrometry

Reports Summarize Mass Spectrometry Study Results from Uppsala University (Identification of transformation products from b-blocking agents formed in wetland microcosms using LC-Q-ToF)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mass Spectrometry have been published. According to news originating from Uppsala, Sweden, by NewsRx correspondents, research stated, "Identification of degradation products from trace organic compounds, which may retain the biological activity of the parent compound, is an important step in understanding the long-term effects of these compounds on the environment. Constructed wetlands have been successfully utilized to remove contaminants from wastewater effluent, including pharmacologically active compounds."

Our news journalists obtained a quote from the research from Uppsala University, "However, relatively little is known about the transformation products formed during wetland treatment. In this study, three different wetland microcosm treatments were used to determine the biotransformation products of the β-adrenergic receptor antagonists atenolol, metoprolol and propranolol. LC/ESI-Q-ToF run in the MS(E) and MS/MS modes was used to identify and
characterize the degradation products through the accurate masses of precursor and product ions. The results were compared with those of a reference standard when available. Several compounds not previously described as biotransformation products produced in wetlands were identified, including propranolol-O-sulfate, 1-naphthol and the human metabolite N-deaminated metoprolol. Transformation pathways were significantly affected by microcosm conditions and differed between compounds, despite the compounds' structural similarities. Altogether, a diverse range of transformation products in wetland microcosms were identified and elucidated using high resolving MS."

According to the news editors, the research concluded: "This work shows that transformation products are not always easily predicted, nor formed via the same pathways even for structurally similar compounds."

The news correspondents report that additional information may be obtained from A. Svan, Division of Analytical Pharmaceutical Chemistry, Uppsala University, BMC Box 574, SE-751 23, Uppsala, Sweden. Additional authors for this research include M. Hedeland, T. Arvidsson, J.T. Jasper, D.L. Sedlak and C.E Pettersson.

Oncology - Melanoma
Reports Summarize Melanoma Findings from Sapienza University (A Case of Sinonasal Melanoma With Unusual Primary Exon 17 KIT D820G Mutation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Melanoma are presented in a new report. According to news originating from Rome, Italy, by NewsRx correspondents, research stated, "SINONASAL melanomas are rare neoplasms with poor prognosis that may harbor KIT and NRAS genes mutations. Molecular alterations represent possible targets of tailored therapeutic approaches."

Our news journalists obtained a quote from the research from Sapienza University, "We describe the case of a 74-year-old patient with primary melanoma of the nasal cavity. Mutational analysis of KIT demonstrated a point missense mutation D820G in exon 17. This represents, to our knowledge, the first case of sinonasal melanoma harboring this specific KIT mutation. Although KIT mutations confer sensibility to thyrosine-kinase inhibitor, it has been proved that this is strongly dependent on the region in which this alteration occurs."

According to the news editors, the research concluded: "Thus it seems very important to perform an accurate gene mutational analysis to provide a biological rationale to
the tailored therapy."

For more information on this research see: A Case of Sinonasal Melanoma With Unusual Primary Exon 17 KIT D820G Mutation. *Applied Immunohistochemistry & Molecular Morphology*, 2016;24(10):E94-E97. *Applied Immunohistochemistry & Molecular Morphology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Applied Immunohistochemistry & Molecular Morphology - journals.lww.com/appliedimmunohist/pages/default.aspx)

The news correspondents report that additional information may be obtained from E. Pilozzi, Roma La Sapienza University, Dept. of Clin & Mol Med, Rome, Italy. Additional authors for this research include A. Bartolazzi, F. Fochetti, E. Duranti, S. Scarpino, M. Valeriani, P. Moriconi and L. Ruco.

**Oncology - Melanoma**

**Reports Summarize Melanoma Findings from University of Saskatchewan (E valuation of beta-cyclodextrin-modified gemini surfactant-based delivery systems in melanoma models)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Melanoma. According to news reporting from Saskatoon, Canada, by NewsRx journalists, research stated, "Novel drug delivery systems are developed to improve the biological behavior of poorly soluble drugs and to improve therapeutic outcomes. In melanoma therapy, the goal is efficient drug delivery and mitigation of drug resistance."

The news correspondents obtained a quote from the research from the University of Saskatchewan, "Melphalan (Mel), a currently used therapeutic agent for melanoma, requires solvent system for solubilization, leading to poor chemical stability. Moreover, drug resistance often renders the drug inefficient in clinical setting. A novel beta-cyclodextrin-modified gemini surfactant (CDgemini) delivery system was developed to incorporate Mel in order to improve its physicochemical and biological behavior. Melphalan nanoparticles (Mel-NP) showed optimal particle size in the 200-250 nm range for endocytosis and induced significantly higher cell death compared with Mel (50% of inhibitory concentration [IC50] of 36 mu M for the complexes vs 82 mu M for Mel). The CDgemini delivery system did not alter the pathway of the cellular death triggered by Mel and caused no intrinsic toxicity to the cells. The Mel-NP complexes induced significant cell death in melanoma cells that were rendered resistant to Mel."

According to the news reporters, the research concluded: "These findings demonstrate in principle the applicability of the CDgemini delivery system as safe and efficient alternative to the current melanoma therapy, especially in chemoresistant cases."

Our news journalists report that additional information may be obtained by contacting I. Badea, University of Saskatchewan, Coll Pharm & Nutr, Drug Design & Discovery Res Grp, Saskatoon, SK, Canada. Additional authors for this research include W. Mohammed-Saeid, H. Getson, C. Roy, M. Poorghorban, J.M. Chitanda, R. Verrall and I. Badea.

Otorhinolaryngologic Diseases and Conditions -

Reports Summarize Meniere's Disease Findings from Imperial College
(Intratympanic methylprednisolone versus gentamicin in patients with unilateral Meniere's disease: a randomised, double-blind, comparative effectiveness trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Otorhinolaryngologic Diseases and Conditions - Meniere's Disease. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Meniere's disease is characterised by severe vertigo attacks and hearing loss. Intratympanic gentamicin, the standard treatment for refractory Meniere's disease, reduces vertigo, but damages vestibular function and can worsen hearing."

Financial support for this research came from Meniere's Society.

Our news journalists obtained a quote from the research from Imperial College, "We aimed to assess whether intratympanic administration of the corticosteroid methylprednisolone reduces vertigo compared with gentamicin. In this double-blind comparative effectiveness trial, patients aged 18-70 years with refractory unilateral Meniere's disease were enrolled at Charing Cross Hospital (London, UK) and Leicester Royal Infirmary (Leicester, UK). Patients were randomly assigned (1:1) by a block design to two intratympanic methylprednisolone (62.5 mg/mL) or gentamicin (40 mg/mL) injections given 2 weeks apart, and were followed up for 2 years. All investigators and patients were masked to treatment allocation. The primary outcome was vertigo frequency over the final 6 months (18-24 months after injection) compared with the 6 months before the first injection. Analyses were done in the intention-to-treat population, and then per protocol. This trial is registered with ClinicalTrials.gov, number NCT00802529. Between June 19, 2009, and April 15, 2013, 256 patients with Meniere's disease were screened, 60 of whom were enrolled and randomly assigned: 30 to gentamicin and 30 to methylprednisolone. In the intention-to-treat analysis (ie, all 60 patients), the mean number of vertigo attacks in the final 6 months compared with the 6 months before the first injection (primary outcome) decreased from 19.9 (SD 16.7) to 2.5 (5.8) in the gentamicin group (87% reduction) and from 16.4 (12.5) to 1.6 (3.4) in the methylprednisolone group (90% reduction; mean difference -0.9, 95% CI -3.4 to 1.6). Patients whose vertigo did not improve after injection (ie, non-responders) after being assessed by an unmasked clinician were eligible for additional injections given by a masked clinician (eight patients in the gentamicin group vs 15 in the methylprednisolone group). Two non-responders switched from methylprednisolone to gentamicin. Both drugs were well tolerated with no safety concerns. Six patients reported one adverse event each: three in the gentamicin group and three in the methylprednisolone group.
The most common adverse event was minor ear infections, which was experienced by one patient in the gentamicin group and two in the methylprednisolone group. Methylprednisolone injections are a non-ablative, effective treatment for refractory Meniere's disease."

According to the news editors, the research concluded: "The choice between methylprednisolone and gentamicin should be made based on clinical knowledge and patient circumstances."

Our news journalists report that additional information may be obtained by contacting A.M. Bronstein, Imperial Coll London, Div Brain Sci, Neurootol Unit, London W6 8RF, United Kingdom. Additional authors for this research include K. Agarwal, Q. Arshad, M. Hariri, P. Rea, B.M. Seemungal, J.F. Golding, J.P. Harcourt and A.M. Bronstein.

Life Science Research - Molecular Biology

Reports Summarize Molecular Biology Study Results from Emory University (Arl13b regulates Shh signaling from both inside and outside the cilium)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Molecular Biology have been published. According to news originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "The regulatory GTPase Arl13b localizes to primary cilia, where it regulates Sonic hedgehog (Shh) signaling. Missense mutations in ARL13B can cause the ciliopathy Joubert syndrome (JS), and the mouse null allele is embryonic lethal."

Our news journalists obtained a quote from the research from Emory University, "We used mouse embryonic fibroblasts as a system to determine the effects of Arl13b mutations on Shh signaling. We tested seven different mutants-three JS-causing variants, two point mutants predicted to alter guanine nucleotide handling, one that disrupts cilia localization, and one that prevents palmitoylation and thus membrane binding-in assays of transcriptional and nontranscriptional Shh signaling. We found that mutations disrupting Arl13b's palmitoylation site, cilia localization signal, or GTPase handling altered the Shh response in distinct assays of
transcriptional or nontranscriptional signaling. In contrast, JS-causing mutations in Arl13b did not affect Shh signaling in these same assays, suggesting that these mutations result in more subtle defects, likely affecting only a subset of signaling outputs. Finally, we show that restricting Arl13b from cilia interferes with its ability to regulate Shh-stimulated chemotaxis, despite previous evidence that cilia themselves are not required for this nontranscriptional Shh response."

According to the news editors, the research concluded: "This points to a more complex relationship between the ciliary and nonciliary roles of this regulatory GTPase than previously envisioned."

For more information on this research see: Arl13b regulates Shh signaling from both inside and outside the cilium. *Molecular Biology of the Cell*, 2016;27(23):3780-3790. *Molecular Biology of the Cell* can be contacted at: Amer Soc Cell Biology, 8120 Woodmont Ave, Ste 750, Bethesda, MD 20814-2755, USA.

The news correspondents report that additional information may be obtained from T. Caspary, Emory University, Dept. of Human Genet, Atlanta, GA 30322, United States. Additional authors for this research include M.F. Bijlsma, A.I. Ivanova, S.K. Suciu, R.A. Kahn and T. Caspary.

Myeloid Cells

**Reports Summarize Myeloid Cells Findings from Research Center**

(Depletion of CLL-associated patrolling monocytes and macrophages controls disease development and repairs immune dysfunction in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Myeloid Cells have been presented. According to news reporting originating from Heidelberg, Germany, by NewsRx correspondents, research stated, "Chronic lymphocytic leukemia (CLL) is characterized by apoptosis resistance and a dysfunctional immune system. Previous reports suggested a potential role of myeloid cells in mediating these defects."

Our news editors obtained a quote from the research from Research Center, "However, the composition and function of CLL-associated myeloid cells have not been thoroughly investigated in vivo. Using the Em-TCL1 mouse model, we observed severe skewing of myeloid cell populations with CLL development. Monocytes and M2-like macrophages infiltrated the peritoneal cavity of leukemic mice. Monocytes also accumulated in the spleen in a CCR2-dependent manner, and were severely skewed toward Ly6C(low) patrolling or nonclassical phenotype. In addition, the percentage of MHC-II(hi) dendritic cells and macrophages significantly dropped in the spleen. Gene expression profiling of CLL-associated monocytes revealed aberrantly high PD-L1 expression and secretion of multiple
inflammatory and immunosuppressive cytokines like interleukin-10, tumor necrosis factor-a and CXCL9. In vivo myeloid cell depletion using liposomal Clodronate resulted in a significant control of CLL development accompanied by a pronounced repair of innate immune cell phenotypes and a partial resolution of systemic inflammation. In addition, CLL-associated skewing of T cells toward antigen-experienced phenotypes was repaired."

According to the news editors, the research concluded: "The presented data suggest that targeting nonmalignant myeloid cells might serve as a novel immunotherapeutical strategy for CLL."

For more information on this research see: Depletion of CLL-associated patrolling monocytes and macrophages controls disease development and repairs immune dysfunction in vivo. Leukemia, 2015;30(3):570-9. (Nature Publishing Group - www.nature.com/; Leukemia - www.nature.com/leu/)

Gram-Negative Bacteria - Neisseria lactamica

Reports Summarize Neisseria lactamica Findings from Children's University Hospital (Resolution of a Protracted Serogroup B Meningococcal Outbreak with Whole-Genome Sequencing Shows Interspecies Genetic Transfer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gram-Negative Bacteria - Neisseria lactamica. According to news reporting originating in Dublin, Ireland, by NewsRx journalists, research stated, "A carriage study was undertaken (n = 112) to ascertain the prevalence of Neisseria spp. following the eighth case of invasive meningococcal disease in young children (5 to 46 months) and members of a large extended indigenous ethnic minority Traveller family (n = 123), typically associated with high-occupancy living conditions. Nested multilocus sequence typing (MLST) was employed for case specimen extracts."

Financial support for this research came from Wellcome.

The news reporters obtained a quote from the research from Children's University Hospital, "Isolates were genome sequenced and then were assembled de novo and deposited into the Bacterial Isolate Genome Sequencing Database (BIGSdb). This facilitated an expanded MLST approach utilizing large numbers of loci for isolate characterization and discrimination."
A rare sequence type, ST-6697, predominated in disease specimens and isolates that were carried (n = 8/14), persisting for at least 44 months, likely driven by the high population density of houses (n = 67/112) and trailers (n = 45/112). Carriage for Neisseria meningitidis (P < 0.05) and Neisseria lactamica (P < 0.002) (2-sided Fisher's exact test) was more likely in the smaller, more densely populated trailers. Meningococcal carriage was highest in 24-to 39-year-olds (45%, n = 9/20). Evidence of horizontal gene transfer (HGT) was observed in four individuals cocolonized by Neisseria lactamica and Neisseria meningitidis. One HGT event resulted in the acquisition of 26 consecutive N. lactamica alleles. This study demonstrates how housing density can drive meningococcal transmission and carriage, which likely facilitated the persistence of ST-6697 and prolonged the outbreak.

According to the news reporters, the research concluded: "Whole-genome MLST effectively distinguished between highly similar outbreak strain isolates, including those isolated from person-to-person transmission, and also highlighted how a few HGT events can distort the true phylogenetic relationship between highly similar clonal isolates."

For more information on this research see: Resolution of a Protracted Serogroup B Meningococcal Outbreak with Whole-Genome Sequencing Shows Interspecies Genetic Transfer. *Journal of Clinical Microbiology*, 2016;54(12):2891-2899. *Journal of Clinical Microbiology* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

Our news correspondents report that additional information may be obtained by contacting R.M. Mulhall, Temple St Childrens Univ Hosp, Irish Meningitis & Sepsis Reference Lab, Dublin, Ireland. **Surgery - Neurosurgery**

**Reports Summarize Neurosurgery Findings from University of Minnesota (Three-dimensional assessment of the effects of high-density embolization material on the absorbed dose in the target for Gamma Knife radiosurgery of arteriovenous ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Surgery - Neurosurgery is now available. According to news reporting originating in Minneapolis, Minnesota, by NewsRx journalists, research stated, "Arteriovenous malformation (AVM) is an intracranial vascular disorder. Gamma Knife radiosurgery (GKRS) is used in conjunction with intraarterial embolization to eradicate the nidus of AVMs."

The news reporters obtained a quote from the research from the University of
Minnesota, "Clinical results indicate that patients with prior embolization tend to gain less benefit from GKRS. The authors hypothesized that this was partly caused by dosimetric deficiency. The actual dose delivered to the target may be smaller than the intended dose because of increased photon attenuation by high-density embolic materials. The authors performed a phantom-based study to quantitatively evaluate the 3D dosimetric effect of embolic material on GKRS. A 16-cm-diameter and 12-cm-long cylindrical phantom with a 16-cm-diameter hemispherical dome was printed by a 3D printer. The phantom was filled with radiologically tissue-equivalent polymer gel. To simulate AVM treatment with embolization, phantoms contained Onyx 18. The material was injected into an AVM model, which was suspended in the polymer gel. The phantom was attached to a Leksell frame by standard GK fixation method, using aluminum screws, for imaging. The phantom was scanned by a Phillips CT scanner with the standard axial-scanning protocol (120 kV and 1.5-mm slice thickness). CT-based treatment planning was performed with the GammaPlan treatment planning system (version 10.1.1). The plan was created to cover a fictitious AVM target volume near the embolization areas with eleven 8-mm shots and a prescription dose of 20 Gy to 50% isodose level. Dose distributions were computed using both tissue maximum ratio (TMR) 10 and convolution dose-calculation algorithms. These two 3D dose distributions were compared using an in-house program. Additionally, the same analysis method was applied to evaluate the dosimetric effects for 2 patients previously treated by GKRS. The phantom-based analyses showed that the mean dose difference between TMR 10 and convolution doses of the AVM target was no larger than 6%. The difference for GKRS cases was 5%. There were small areas where a large dose difference was observed on the isodose line plots, and those differences were mostly at or in the vicinity of the embolization materials. The results of both the phantom and patient studies showed a dose reduction no larger than 5% due to the embolization material placed near the target."

According to the news reporters, the research concluded: "Although the comparison of 3D dose distributions indicated small local effects of the embolic material, the clinical impact on the obliteration rate is expected to be small."

For more information on this research see: Three-dimensional assessment of the effects of high-density embolization material on the absorbed dose in the target for Gamma Knife radiosurgery of arteriovenous malformations. *Journal of Neurosurgery*, 2016;125():123-128. *Journal of Neurosurgery* can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

Our news correspondents report that additional information may be obtained by contacting Y. Watanabe, University of Minnesota, Dept. of Radiat Oncol, Minneapolis, MN 55455, United States. Additional authors for this research include D. Sandhu, L. Warmington, S. Moen and R. Tummala.

Reports Summarize Non-Small Cell Lung Cancer Findings from I. Sullivan and Co-Authors (Treatment modalities for advanced ALK-rearranged non-small-cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Non-Small Cell Lung Cancer is the subject of a report. According to news reporting originating from Villejuif, France, by NewsRx correspondents, research stated, "The ALK gene plays a key role in the pathogenesis of non-small-cell lung cancer (NSCLC). Patients with NSCLC harboring an ALK-rearrangement represent the second oncogene addiction to be identified in this disease."

Our news editors obtained a quote from the research, "Crizotinib was the first ALK inhibitor showing pronounced clinical activity, and is now a reference treatment for ALK-positive NSCLC disease. However, despite initial impressive responses to crizotinib, acquired resistance almost invariably develops within 12 months. The pressing need for effective second-line agents has prompted the rapid development of next-generation ALK inhibitors."

According to the news editors, the research concluded: "These agents, notably ceritinib and alectinib as the most developed, have a higher potency against ALK than crizotinib, along with activity against tumors harboring crizotinib-resistant mutations and potentially improved CNS penetration."

For more information on this research see: Treatment modalities for advanced ALK-rearranged non-small-cell lung cancer. Future Oncology, 2016;12(7):945-61.

The news editors report that additional information may be obtained by contacting I. Sullivan, Medical Oncology Department, Gustave Roussy, 114 Rue Edouard Vaillant, 94805 Villejuif Cedex, France.

Reports Summarize Non-Small Cell Lung Cancer Findings from Institute for Cancer Research and Treatment (IRCCS) (KRAS mutations affect prognosis of non-small-cell lung cancer patients treated with first-line platinum containing chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Non-Small Cell Lung Cancer are presented in a new report. According to news reporting originating from Milan, Italy, by NewsRx correspondents, research stated, "KRAS mutations seem to indicate a poor outcome in Non-
Small-Cell Lung Cancer (NSCLC) but such evidence is still debated. The aim of this planned ancillary study within the TAILOR trial was to assess the prognostic value of KRAS mutations in advanced NSCLC patients treated with platinum-based first-line chemotherapy.

Our news editors obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Patients (N=540), enrolled in the study in 52 Italian hospitals, were centrally genotyped twice in two independent laboratories for EGFR and KRAS mutational status. Of these, 247 patients were eligible and included in the present study. The primary endpoint was overall survival (OS) according to KRAS mutational status in patients harboring EGFR wild-type. Sixty (24.3%) out of 247 patients harbored KRAS mutations. Median OS was 14.3 months and 10.6 months in wild-type and mutated KRAS patients, respectively (unadjusted Hazard Ratio [HR]=1.41, 95% Confidence Interval [CI]: 1.03-1.94 p=0.032; adjusted HR=1.39, 95% CI: 1.00-1.94 p=0.050).

According to the news editors, the research concluded: "This study, with all consecutive patients genotyped, indicates that the presence of KRAS mutations has a mild negative impact on OS in advanced NSCLC patient treated with a first-line platinum-containing regimen."

For more information on this research see: KRAS mutations affect prognosis of non-small-cell lung cancer patients treated with first-line platinum containing chemotherapy. *Oncotarget, 2015;6(32):34014-22.*

The news editors report that additional information may be obtained by contacting M. Marabese, Oncology Department, IRCCS - Istituto di Ricerche Farmacologiche Mario Negri, Milan, Italy. **Oncology - Non-Small Cell Lung Cancer**

**Reports Summarize Non-Small Cell Lung Cancer Study Results from M.S. Anker and Co-Researchers (Resting heart rate is an independent predictor of death in patients with colorectal, pancreatic, and non-small cell lung cancer: results of a ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news reporting originating in Gottingen, Germany, by NewsRx journalists, research stated, "Patients with advanced cancer have been shown to suffer from abnormal cardiac function and impaired exercise capacity that may contribute to their impaired quality of life. As tachycardia is considered as a sign of potential early cardiac damage, we sought to determine whether resting heart rate and other ECG-derived variables have prognostic
The news reporters obtained a quote from the research, "From 2005 to 2010, we enrolled 145 patients with histologically confirmed cancer (36 colorectal, 72 pancreatic, and 37 non-small cell lung cancer patients) and 59 healthy controls. During a mean follow-up of 27 months, 82 patients (57%) died from any cause. The mean resting heart rate of healthy subjects was 70+/-13 b.p.m., and that of cancer patients was 79+/-14 b.p.m. (P < 0.0001). As a sensitivity analysis, we excluded control subjects taking a beta-blocker, but resting heart rate remained increased in cancer patients vs. controls (P < 0.0001). Resting heart rate >= 75 b.p.m. [hazard ratio (HR) 1.84, 95% confidence interval (CI) 1.16-2.94; P = 0.01] significantly predicted survival in univariable analyses and remained an independent predictor of survival in a multivariate model (HR 1.67, 95% CI 1.01-2.78; P = 0.04). Furthermore, the heart rate stayed significant in a second model that included age and sex as well."

According to the news reporters, the research concluded: "The present study is the first to show that resting heart rate independently of haemoglobin and tumour stage predicts survival in patients with advanced colorectal, pancreatic, and non-small cell lung cancer, and may therefore represent a therapeutic target."

Our news correspondents report that additional information may be obtained by contacting S. von Haehling, Univ Med Gottingen UMG, Dept. of Cardiol & Pneumol, Innovat Clin Trials, Gottingen, Germany. Additional authors for this research include N. Ebner, B. Hildebrandt, J. Springer, M. Sinn, H. Riess, S.D. Anker, U. Landmesser, W. Haverkamp and S. von Haehling.

**Oncology - Non-Small Cell Lung Cancer**

**Reports Summarize Non-Small Cell Lung Cancer Study Results from Research Hospital (Retrospective analysis of third-line chemotherapy in advanced non-small cell lung cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news originating from Van, Turkey, by NewsRx correspondents, research stated, "First-and second-line chemotherapies have been demonstrated to be effective in treatment of patients with inoperable, advanced non-small cell lung cancer (NSCLC), although the role of third-line chemotherapy remains unclear. The present investigation assessed treatment outcomes in patients with advanced NSCLC who received third-line and higher chemotherapy."
Our news journalists obtained a quote from the research from Research Hospital, "This retrospective study included consecutive patients with advanced NSCLC who received at least three lines of systemic chemotherapy. A total of 72 patients who had received third-line or higher chemotherapy were included in the analysis. The median age of patients was 49 years (range 41-76), and there were 13 (18.1%) women and 59 (81.9%) men. Estimated median survival was 26 months. Moreover, overall survival was significantly longer in patients for whom disease control was achieved after second-line chemotherapy compared to those with disease progression (34 vs. 17 months, respectively). Survival after third-line treatment was significantly longer in the group with Eastern Cooperative Oncology Group (ECOG) performance status 0-1 at the beginning of third-line therapy compared to patients with a status of 2-3. In patients with advanced stage NSCLC, administration of third-line and higher systemic chemotherapy may be associated with increase in overall survival."

According to the news editors, the research concluded: "Furthermore, greater increases in overall survival were also observed in patients for whom disease control was achieved after second-line therapy and in those with ECOG performance status of 0-1 before third-line treatment."

The news correspondents report that additional information may be obtained from A.M. Tatli, Dept. of Medical Oncology, Van Training and Research Hospital, Van, Turkey. Additional authors for this research include D. Arslan, M. Uysal, S.S. Goksu, S.G. Gunduz, H.S. Coskun, M. Ozdogan, B. Savas and H.S Bozcuk.

Reports Summarize Obesity Hypoventilation Syndrome Findings from CIBERES (The Effect of Supplemental Oxygen in Obesity Hypoventilation Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Respiratory Tract Diseases and Conditions - Obesity Hypoventilation Syndrome have been published. According to news reporting originating from Madrid, Spain, by NewsRx correspondents, research stated, "Low flow supplemental oxygen is commonly prescribed to patients with obesity hypoventilation syndrome (OHS). However, there is a paucity of data regarding its efficacy and safety."

Our news editors obtained a quote from the research from CIBERES, "The objective of this study was to assess the medium-term treatment efficacy of adding supplemental oxygen therapy to commonly prescribed treatment modalities in OHS. In this post hoc analysis of a
previous randomized controlled trial, we studied 302 sequentially screened OHS patients who were randomly assigned to noninvasive ventilation, continuous positive airway pressure, or lifestyle modification. Outcomes at 2 mo included arterial blood gases, symptoms, quality of life, blood pressure, polysomnography, spirometry, 6-min walk distance, and hospital resource utilization. Statistical analysis comparing patients with and without oxygen therapy in the three treatment groups was performed using an intention-to-treat analysis. In the noninvasive ventilation group, supplemental oxygen reduced systolic blood pressure although this could be also explained by a reduction in body weight experienced in this group. In the continuous positive airway pressure group, supplemental oxygen increased the frequency of morning confusion. In the lifestyle modification group, supplemental oxygen increased compensatory metabolic alkalosis and decreased the apnea-hypopnea index during sleep. Oxygen therapy was not associated with an increase in hospital resource utilization in any of the groups. After 2 mo of follow-up, chronic oxygen therapy produced marginal changes that were insufficient to consider it, globally, as beneficial or deleterious. Because supplemental oxygen therapy did not increase hospital resource utilization, we recommend prescribing oxygen therapy to patients with OHS who meet criteria with close monitoring."

According to the news editors, the research concluded: "Long-term studies examining outcomes such as incident cardiovascular morbidity and mortality are necessary."

For more information on this research see: The Effect of Supplemental Oxygen in Obesity Hypoventilation Syndrome. *Journal of Clinical Sleep Medicine*, 2016;12(10):1379-1388. *Journal of Clinical Sleep Medicine* can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

**Reports Summarize Obesity Study Results from Deakin University (Can policy ameliorate socioeconomic inequities in obesity and obesity-related behaviours? A systematic review of the impact of universal policies on adults and children)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Obesity is the subject of a report. According to news reporting originating from Geelong, Australia, by NewsRx correspondents, research stated, "This systematic review examined the impact of universal policies on socioeconomic inequities in obesity, dietary and physical activity behaviours among adults and children. PRISMA-Equity guidelines were followed."

Our news editors obtained a quote from the research from Deakin University, "Database searches spanned from 2004 to August 2015. Eligible studies assessed the impact of universal policies on anthropometric, dietary or physical activity-related outcomes in adults or children according to socioeconomic position. Thirty-six studies were included. Policies were classified as agentic, agento-structural or structural, and their impact on inequities was rated as positive, neutral, negative or mixed according to the dominant associations observed. Most policies had neutral impacts on obesity-related inequities regardless of whether they were agentic (60% neutral), agento-structural (68% neutral) or structural (67% neutral). The proportion of positive impacts was similar across policy types (10% agentic, 18% agento-structural and 11% structural), with some differences for negative impacts (30% agentic, 14% agento-structural and 22% structural). The majority of associations remained neutral when stratified by participant population, implementation level and socioeconomic position measures and by anthropometric and behavioural outcomes. Fiscal measures had consistently neutral or positive impacts on inequities."

According to the news editors, the research concluded: "Findings suggest an important role for policy in addressing obesity in an equitable manner and strengthen the case for implementing a broad complement of policies spanning the agency-structure continuum."

The news editors report that additional information may be obtained by contacting D.L. Olstad, Deakin University, Sch Exercise & Nutr Sci, IPAN, Geelong, Vic, Australia. Additional authors for this research include M. Teychenne, L.M. Minaker, D.R. Taber, K.D. Raine, C.I.J. Nykiforuk and K. Ball.

Keywords for this news article include: Geelong, Australia, Australia and New Zealand, Nutritional and Metabolic Diseases and Conditions, Nutrition Disorders, Diet and Nutrition, Overnutrition, Bariatrics, Obesity, Deakin University.

Oncology - Oral Cancer

Reports Summarize Oral Cancer Study Results from Barretos Cancer Hospital (Tapirira guianensis Aubl. Extracts Inhibit Proliferation and Migration of Oral Cancer Cells Lines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Oral Cancer. According to
news reporting originating from Barretos, Brazil, by NewsRx correspondents, research stated, "Cancer of the head and neck is a group of upper aerodigestive tract neoplasms in which aggressive treatments may cause harmful side effects to the patient. In the last decade, investigations on natural compounds have been particularly successful in the field of anticancer drug research."

Our news editors obtained a quote from the research from Barretos Cancer Hospital, "Our aim is to evaluate the antitumor effect of Tapirira guianensis Aubl. extracts on a panel of head and neck squamous cell carcinoma (HNSCC) cell lines. Analysis of secondary metabolites classes in fractions of T. guianensis was performed using Nuclear Magnetic Resonance (NMR). Mutagenicity effect was evaluated by Ames mutagenicity assay. The cytotoxic effect, and migration and invasion inhibition were measured. Additionally, the expression level of apoptosis-related molecules (PARP, Caspases 3, and Fas) and MMP-2 was detected using Western blot. Heterogeneous cytotoxicity response was observed for all fractions, which showed migration inhibition, reduced matrix degradation, and decreased cell invasion ability. Expression levels of MMP-2 decreased in all fractions, and particularly in the hexane fraction. Furthermore, overexpression of FAS and caspase-3, and increase of cleaved PARP indicates possible apoptosis extrinsic pathway activation."

According to the news editors, the research concluded: "Antiproliferative activity of T. guianensis extract in HNSCC cells lines suggests the possibility of developing an anticancer agent or an additive with synergic activities associated with conventional anticancer therapy."

Keywords for this news article include: Barretos, Brazil, South America, Drugs and Therapies, Mouth Neoplasms, Cancer Therapy, Oral Cancers, Oncology, Barretos Cancer Hospital.

Musculoskeletal Diseases and Conditions - …

Reports Summarize Osteopetrosis Findings from Shandong University
(Characterization of a Relatively Malignant Form of Osteopetrosis Caused by a Novel Mutation in the PLEKHM1 Gene)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Musculoskeletal Diseases and Conditions - Osteopetrosis are presented in a new report. According to news reporting originating from Shandong, People's Republic of China, by NewsRx correspondents, research stated, "Osteopetrosis (OMIM: 611497), literally 'stone bone,' is a group of inherited bone disorders characterized by increased skeletal mass due to defective osteoclast function. A patient who reported a history of frequent
fractures, weakness and fatigue was admitted to our hospital in 2011.”

Our news editors obtained a quote from the research from Shandong University, "The patient presented with the typical features of osteopetrosis: fractures after minor trauma, early tooth loss, anemia, hepatosplenomegaly, and a generalized increase in bone mineral density (BMD). Aside from his father's complaint of excessive tooth loss, his mother, two sisters, son, and daughter were healthy. Blood samples of the family members were drawn for genetic analyses. The entire coding region and adjacent splice sites of the pleckstrin homology domain-containing family M (with RUN domain) member 1 (PLEKHM1) gene were sequenced. One mutation, a heterozygous deletion mutation in exon 11 (c.3051_3052delCA), was identified in the patient but not in his relatives. The mutation leads to a translation product with a highly impaired Rubicon homology domain. Co-immunoprecipitation and immunofluorescence analyses using HEK293 cells showed that overexpression of a PLEKHM1 CA-deletion mutant resulted in a dramatic decrease in the interaction between PLEKHM1 and the small GTPase Rab7 compared to wild-type PLEKHM1. The normal processes of endocytosis and autophagy were disturbed in cells expressing the mutant (transfected HEK293 and U937 cells), as indicated by epidermal growth factor receptor (EGFR) degradation and an altered LC3-I/II ratio, respectively, which may lead to a defect in osteoclast function."

According to the news editors, the research concluded: "A four-year follow-up study of the patient showed that the PLEKHM1-dependent osteopetrosis was relatively malignant, with significant symptoms of pancytopenia and hepatosplenomegaly."

The news editors report that additional information may be obtained by contacting C. Xu, Shandong University, Shandong Prov Hosp, Dept. of Endocrinol & Metab, Jinan, Shandong, People's Republic of China. Additional authors for this research include F. Yan, J. Guo, X.Y. Lin, H.Q. Zhang, Q.B. Guan, H. Wang, L. Fang, L. Gao, J.J. Zhao and C. Xu.

Pacemakers

Reports Summarize Pacemakers Findings from University of Washington (Concomitant Use of the Subcutaneous Implantable Cardioverter Defibrillator and a Permanent Pacemaker)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Pacemakers. According to news reporting
out of Seattle, Washington, by NewsRx editors, research stated, "The subcutaneous implantable cardioverter defibrillator (S-ICD) is a novel implanted defibrillator for the prevention of sudden cardiac death that avoids intravascular access. Use of this device is limited by its inability to provide backup pacing."

Our news journalists obtained a quote from the research from the University of Washington, "Combined use of the S-ICD with a permanent pacemaker may be the optimal choice in certain situations though experience with the use of both devices together remains limited. We reviewed our single-center experience with the S-ICD from March 2011 to November 2015. Four patients with concomitant use of the S-ICD and a permanent pacemaker were identified. Clinical indication for device therapy, operative details, and subsequent follow-up was reviewed. During implantation, S-ICD sensing of paced morphologies was evaluated at maximal voltage output. After S-ICD implant, if feasible, the upper rate was adjusted to <= 50% of the S-ICD tachycardia zone to minimize risk of inappropriate shocks. After a mean follow-up of over 1 year, no adverse events occurred, including no inappropriate shock, lead malfunction, or device infection. One patient had a total of eight appropriate shocks, while another individual had no inappropriate shocks despite having a unipolar pacing lead. In unique situations, combined use of the S-ICD and a permanent pacemaker may be preferable to alternative options."

According to the news editors, the research concluded: "In our experience, this approach was successful in varying conditions including complex congenital heart disease, recurrent device infection, and limited vascular access."

For more information on this research see: Concomitant Use of the Subcutaneous Implantable Cardioverter Defibrillator and a Permanent Pacemaker. PACE-Pacing and Clinical Electrophysiology, 2016;39(11):1240-1245. PACE-Pacing and Clinical Electrophysiology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by contacting J.M. Prutkin, University of Washington, Dept. of Med, Div Cardiol, Seattle, WA, United States. Additional authors for this research include K.K. Patton and J.M. Prutkin.

Keywords for this news article include: Seattle, Washington, United States, North and Central America, Medical Devices, Defibrillators, Cardio Device, Pacemakers, University of Washington.

**Oncology - Pancreatic Cancer**

**Reports Summarize Pancreatic Cancer Study Results from University of Glasgow (mTORC2 Signaling Drives the Development and Progression of Pancreatic Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news reporting from Glasgow, United Kingdom, by NewsRx journalists, research stated, "MTOR signaling controls several critical cellular functions and is deregulated in many cancers, including pancreatic cancer. To date, most efforts have focused on inhibiting the mTORC1 complex."
The news correspondents obtained a quote from the research from the University of Glasgow, "However, clinical trials of mTORC1 inhibitors in pancreatic cancer have failed, raising questions about this therapeutic approach. We employed a genetic approach to delete the obligate mTORC2 subunit Rictor and identified the critical times during which tumorigenesis requires mTORC2 signaling. Rictor deletion resulted in profoundly delayed tumorigenesis. Whereas previous studies showed most pancreatic tumors were insensitive to rapamycin, treatment with a dual mTORC1/2 inhibitor strongly suppressed tumorigenesis. In late-stage tumor-bearing mice, combined mTORC1/2 and PI3K inhibition significantly increased survival."

According to the news reporters, the research concluded: "Thus, targeting mTOR may be a potential therapeutic strategy in pancreatic cancer."

For more information on this research see: mTORC2 Signaling Drives the Development and Progression of Pancreatic Cancer. Cancer Research, 2016;76(23):6911-6923. Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Reports Summarize Pharmacokinetics Study Results from Wenzhou Medical University (Determination of Apremilast in Rat Plasma by UPLC-MS-MS and Its Application to a Pharmacokinetic Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Pharmacokinetics are presented in a new report. According to news reporting from Wenzhou, People's Republic of China, by NewsRx journalists, research stated, "A rapid, sensitive and selective ultra-performance liquid chromatography-tandem mass spectrometry (UPLC-MS-MS) was developed and validated for the determination and pharmacokinetic investigation of apremilast in rat plasma. Sample preparation was accomplished through a simple one-step deproteinization procedure with 0.2 mL of acetonitrile to a 0.1 mL plasma sample."

The news correspondents obtained a quote from the research from Wenzhou Medical University. "Plasma samples were separated by UPLC on an Acquity UPLC BEH C18 column using a mobile phase consisting of acetonitrile-0.1% formic acid in water with gradient elution.
The total run time was 3.0 min, and the elution of apremilast was at 1.27 min. The detection was performed on a triple quadrupole tandem mass spectrometer in the multiple reaction-monitoring mode using the respective transitions m/z 461.3 -> 257.1 for apremilast and m/z 237.2 -> 194.2 for carbamazepine (internal standard). The calibration curve was linear over the range of 0.1-100 ng/mL with a lower limit of quantitation of 0.1 ng/mL. The mean recovery of apremilast in plasma was in the range of 83.2-87.5%. Both intraday and interday precision were <9.6%.

According to the news reporters, the research concluded: "This method was successfully applied in the pharmacokinetic study after oral administration of 6.0 mg/kg apremilast in rats."

Our news journalists report that additional information may be obtained by contacting X.X. Lai, Wenzhou Med Univ, Affiliated Hosp 1, Wenzhou 325000, People's Republic of China. Additional authors for this research include Z. Wang, S.J. Wang, T. Li, Y.Y. Pan and X.X. Lai.

Keywords for this news article include: Wenzhou, People's Republic of China, Asia, Pharmacokinetics, Pharmaceuticals, Wenzhou Medical University.

Pharmacology

Reports Summarize Pharmacology Findings from A. Mayburd and Co-Author (Predicting High-Impact Pharmacological Targets by Integrating Transcriptome and Text-Mining Features)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pharmacology have been published. According to news reporting out of Moscow, Russia, by NewsRx editors, research stated, "Novel, 'outside of the box' approaches are needed for evaluating candidate molecules, especially in oncology. Throughout the years of 2000-2010, the efficiency of drug development fell to barely acceptable levels, and in the second decade of this century, levels have improved only marginally."

Our news journalists obtained a quote from the research, "This dismal condition continues despite unprecedented progress in the development of a variety of high-throughput tools, computational methods, aggregated databases, drug repurposing programs and innovative chemistries. Here we tested a hypothesis that the economic impact of targeting a particular gene product is predictable a priori by employing a combination of transcriptome profiles and quantitative metrics reflecting existing literature. To extract classification features, the gene expression patterns of a posteriori high-impact and low-impact anti-cancer target sets were compared. To minimize the possible bias of text-mining, the number of manuscripts published prior to the first clinical trial or relevant review paper, as well as its first derivative in this interval, were collected and used as quantitative metrics of public interest. By combining the gene expression and literature mining features, a 4-fold enrichment in high-impact targets was
produced, resulting in a favourable ROC curve analysis for the top impact targets. The dataset was enriched by the highest impact anticancer targets, while demonstrating drastic differences in economic value between high and low-impact targets. Known anti-cancer products of EGFR, ERBB2, CYP19A1/aromatase, MTOR, PTGS2, tubulin, VEGFA, BRAF, PGR, PDGFRA, SRC, REN, CSF1R, CTLA4 and HSP90AA1 genes received the highest scores for predicted impact, while microsomal steroid sulfatase, anticoagulant protein C, p53, CDKN2A, c-Jun, and TNSFS11 were highlighted as most promising research-stage targets. A significant cost reduction may be achieved by a priori impact assessment of targets and ligands before their development or repurposing.

According to the news editors, the research concluded: "Expanding a suite of combinational treatments could also decrease the costs, while achieving a higher impact per developed ligand."

Our news journalists report that additional information may be obtained by contacting A. Baranova, Atlas Biomed Grp, Moscow, Russia.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18433/J3SC8X. This DOI is a link to an online electronic document that is either free or for purchase.

Pharmacology

Reports Summarize Pharmacology Study Results from University of Florida (Systems pharmacology to predict drug safety in drug development)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Pharmacology. According to news originating from Orlando, Florida, by NewsRx correspondents, research stated, "Ensuring that drugs are safe and effective is a very high priority for drug development and the US Food and Drug Administration review process."

Our news journalists obtained a quote from the research from the University of Florida, "This is especially true today because of faster approval times and smaller clinical trials, especially in oncology and rare diseases. In light of these trends, systems pharmacology is seen as an essential strategy to understand and predict adverse drug events during drug development by analyzing interactions between drugs and multiple targets rather than the traditional 'one-drug-one-target' approach."

According to the news editors, the research concluded: "This commentary offers an overview of the current trends and challenges of using systems pharmacology to reduce the risks of unintended adverse events."

The news correspondents report that additional information may be obtained from M.N. Trame, University of Florida, Center Pharmacometr & Syst Pharmacol, Dept. of Pharmaceut, Orlando, FL, United States. Additional authors for this research include K. Biliouris, L.J. Lesko and J.T. Mettetal.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejps.2016.05.027. This DOI is a link to an online electronic document that is either free or for purchase.

**Photodynamics**

**Reports Summarize Photodynamics Study Results from Beihang University (Synthesis and conjugation of Sr2MgSi2O7:Eu2+, Dy3+ water soluble afterglow nanoparticles for photodynamic activation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Photodynamics are discussed in a new report. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "The applications of afterglow particles for photodynamic activation and biological imaging have become a topical research area. For these applications, it is critical to have water soluble nanoparticles."

Funders for this research include U.S. Army Medical Research Acquisition Activity (USAMRAA), NSF and DHS joint ARI program, National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Beihang University, "However, the synthesis of water soluble afterglow nanoparticles like Sr2MgSi2O7:Eu2+, Dy3+ is a challenging issue because most afterglow materials are very complicated in composition that cannot be synthesized by simple chemical routes. Here, for the first time, Sr2MgSi2O7:Eu2+, Dy3+ water soluble and stable nanoparticles are synthesize using a modified Sol-Gel method followed by the grinding and coating with APTES. The surface coating of the afterglow with APTES and the conjugation with PpIX and folic acid not only improve their water solubility but also enhance the PpIX luminescence by 10 times. More importantly, these strategies make it possible to produce singlet oxygen under X-ray irradiation, which is a very important result for deep cancer treatment. In addition, the surface coating and conjugation largely increase the cell uptake and greatly reduce their dark cytotoxicity."

According to the news reporters, the research concluded: "All these results indicate the methods reported here for afterglow nanoparticle synthesis, coating and conjugation are
successful, and consequently, the prepared Sr2MgSi2O7:Eu2+, Dy3+/PPIX/Folic acid nano-conjugates are promising for X-ray induced photodynamic therapy on cancer treatment."

For more information on this research see: Synthesis and conjugation of Sr2MgSi2O7:Eu2+, Dy3+ water soluble afterglow nanoparticles for photodynamic activation. *Photodiagnosis and Photodynamic Therapy*, 2016;16():90-99. *Photodiagnosis and Photodynamic Therapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Liver Diseases and Conditions - Portal Hypertension

Reports Summarize Portal Hypertension Study Results from Hacettepe University (Outcomes of partial splenic embolization in patients with massive splenomegaly due to idiopathic portal hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Liver Diseases and Conditions - Portal Hypertension are discussed in a new report. According to news reporting from Ankara, Turkey, by NewsRx journalists, research stated, "To determine the outcomes of partial splenic embolization (PSE) for massive splenomegaly due to idiopathic portal hypertension (IPH). In this prospective study, we evaluated the characteristics and prognosis of consecutive patients with IPH who underwent PSE for all indications at a single medical center between June 2009 and January 2015."

The news correspondents obtained a quote from the research from Hacettepe University, "The inclusion criteria were: presence of hypersplenism, massive splenomegaly, and resultant pancytopenia. The exclusion criteria were: presence of other diseases causing portal hypertension. During the post-PSE period, the patients were hospitalized. All patients underwent abdominal computed tomography imaging 4 wk post-PSE to determine total splenic and noninfarcted splenic volumes. A total of 11 patients, with median age of 33.27 +/- 4.8 years, were included in the study. Mean spleen size was 22.9 cm (21-28 cm), and severe hypersplenism was diagnosed in all patients before PSE. Post-PSE, leukocyte and platelet counts increased significantly, reaching peak levels in the second week with gradual decreases thereafter. Liver function tests did not exhibit significant changes during post-intervention follow-up. All patients developed post-embolization syndrome, and one patient experienced serious complications; all complications were successfully treated with conservative therapy and no death occurred."
According to the news reporters, the research concluded: "Our findings showed that PSE has a lower complication rate than previously-reported surgical complication rates, which supports this intervention as a viable alternative for high-risk operable patients with severe hypersplenism."

Our news journalists report that additional information may be obtained by contacting O. Ozturk, Hacettepe University, Dept. of Gastroenterol., Sch Med, TR-06100 Ankara, Turkey. Additional authors for this research include G. Eldem, B. Peynircioglu, T. Kav, A. Gormez, B.E. Cil, F. Balkanci, C. Sokmensuer and Y. Bayraktar.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i43.9623. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Prostate Cancer**

**Reports Summarize Prostate Cancer Findings from J.F. Zheng and Co-Authors (The up-regulation of long non-coding RNA CCAT2 indicates a poor prognosis for prostate cancer and promotes metastasis by affecting epithelial-mesenchymal transition)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Prostate Cancer have been presented. According to news originating from Xianyang, People's Republic of China, by NewsRx correspondents, research stated, "Recently, long noncoding RNAs (lncRNAs) have been shown to have critical regulatory roles in human cancer biology. LncRNA CCAT2 is a novel identified lncRNA that was previously reported to be up regulated in different cancers, however, its role in prostate cancer remains unclear."

Our news journalists obtained a quote from the research, "The aim of this study was to investigate the expression and role of lncRNA CCAT2 in prostate cancer. The expression levels of lncRNA CCAT2 in PCa tissues and cell lines (DU145 and 22RV1) were evaluated by quantitative real-time PCR (qRT-PCR), and its association with prognosis of patients was analyzed by statistical analysis. Furthermore, the effect of CCAT2 on proliferation, migration, and invasion was studied in PCa cells. We found that the expression level of CCAT2 was higher in PCa tissues and cells compared to adjacent non-tumor tissues and normal prostate stromal immortalized cells WPMY-1. Kaplan-Meier survival analysis revealed that patients with high CCAT2 expression level had poorer overall survival and progression-free survival than those
with low CCAT2 expression. Furthermore, multivariate analysis showed that the status of CCAT2 expression was an independent prognostic indicator for this disease. We also found that knockdown of CCAT2 could inhibit cell growth, migration, and invasion in vitro. In addition, knockdown of CCAT2 stimulated epithelial-mesenchymal transition (EMT) through abrogating N-cadherin, vimentin expression and intensifying the expression levels of E-cadherin.

According to the news editors, the research concluded: "Our data suggested that IncRNA CCAT2 was a novel molecule involved in PCa progression, which provided a potential prognostic biomarker and therapeutic target for new therapies in patients with prostate cancer."

For more information on this research see: The up-regulation of long non-coding RNA CCAT2 indicates a poor prognosis for prostate cancer and promotes metastasis by affecting epithelial-mesenchymal transition. *Biochemical and Biophysical Research Communications*, 2016;480(4):508-514. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Skin Diseases and Conditions - Psoriasis**

**Reports Summarize Psoriasis Findings from University of Sao Paulo [Biological therapies (immunomodulatory drugs), worsening of psoriasis and rebound effect: new evidence of similitude]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases and Conditions - Psoriasis are presented in a new report. According to news reporting out of Sao Paulo, Brazil, by NewsRx editors, the research stated, "Employing the secondary action or adaptative reaction of the organism as therapeutic response, homeopathy uses the treatment by similitude (similia similibus curentur) administering to sick individuals the medicines that caused similar symptoms in healthy individuals. Such homeostatic or paradoxical reaction of the organism is scientifically explained through the rebound effect of drugs, which cause worsening of symptoms after withdrawal of several palliative treatments."

Our news journalists obtained a quote from the research from the University of Sao Paulo, "Despite promoting an improvement in psoriasis at the beginning of the treatment, modern biological therapies provoke worsening of the psoriasis (rebound psoriasis) after discontinuation of drugs. Exploratory qualitative review of the literature on the occurrence of
the rebound effect with the use of immunomodulatory drugs [T-cell modulating agents and
tumor necrosis factor (TNF) inhibitors drugs] in the treatment of psoriasis. Several researches
indicate the rebound effect as the mechanism of worsening of psoriasis with the use of
efalizumab causing the suspension of its marketing authorization in 2009, in view of some
severe cases. Other studies also have demonstrated the occurrence of rebound psoriasis with the
use of alefacept, etanercept and infliximab."

According to the news editors, the research concluded: "As well as studied in other
classes of drugs, the rebound effect of biologic agents supports the principle of similitude
(primary action of the drugs followed by secondary action and opposite of the organism)."

For more information on this research see: Biological therapies (immunomodulatory
drugs), worsening of psoriasis and rebound effect: new evidence of similitude. Homeopathy,
2016;105(4):344-355. Homeopathy can be contacted at: Elsevier Sci Ltd, The Boulevard,
Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier - www.elsevier.com;

Oncology - Rectal Cancer

Reports Summarize Rectal Cancer Findings from Fourth Military Medical University (Comparison of non-Gaussian and Gaussian diffusion models of diffusion weighted imaging of rectal cancer at 3.0 T MRI)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Rectal Cancer have been published. According to news reporting originating from Shaanxi, People's Republic of China, by NewsRx correspondents, research stated, "Water molecular diffusion in vivo tissue is much more complicated. We aimed to compare non-Gaussian diffusion models of diffusion-weighted imaging (DWI) including intra-voxel incoherent motion (IVIM), stretched-exponential model (SEM) and Gaussian diffusion model at 3.0 T MRI in patients with rectal cancer, and to determine the optimal model for investigating the water diffusion properties and characterization of rectal carcinoma."

Our news editors obtained a quote from the research from Fourth Military Medical University. "Fifty-nine consecutive patients with pathologically confirmed rectal adenocarcinoma underwent DWI with 16 b-values at a 3.0 T MRI system. DWI signals were fitted to the mono-exponential and non-Gaussian diffusion models (IVIM-mono, IVIM-bi and SEM) on primary tumor and adjacent normal rectal tissue. Parameters of standard apparent
diffusion coefficient (ADC), slow- and fast-ADC, fraction of fast ADC (f), a value and distributed diffusion coefficient (DDC) were generated and compared between the tumor and normal tissues. The SEM exhibited the best fitting results of actual DWI signal in rectal cancer and the normal rectal wall (R-2 = 0.998, 0.999 respectively). The DDC achieved relatively high area under the curve (AUC = 0.980) in differentiating tumor from normal rectal wall. Non-Gaussian diffusion models could assess tissue properties more accurately than the ADC derived Gaussian diffusion model.

According to the news editors, the research concluded: "SEM may be used as a potential optimal model for characterization of rectal cancer."

For more information on this research see: Comparison of non-Gaussian and Gaussian diffusion models of diffusion weighted imaging of rectal cancer at 3.0 T MRI. Scientific Reports, 2016:6():1-9. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Eye Diseases and Conditions - Retinoblastoma

Reports Summarize Retinoblastoma Study Results from All India Institute of Medical Sciences [Multimodal Therapy for Stage III Retinoblastoma (International Retinoblastoma Staging System) A Prospective Comparative Study]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Eye Diseases and Conditions - Retinoblastoma are discussed in a new report. According to news originating from New Delhi, India, by NewsRx correspondents, research stated, "To compare the efficacy of 2 chemotherapeutic drug combinations as part of multimodal therapy for orbital retinoblastoma. Prospective, comparative, study."

Our news journalists obtained a quote from the research from the All India Institute of Medical Sciences, "Patients with stage III retinoblastoma (International Retinoblastoma Staging System). Demographic and clinical features were recorded at presentation. Treatment consisted of a multimodal protocol with neoadjuvant chemotherapy, enucleation, orbital external-beam radiotherapy, and adjuvant chemotherapy. For chemotherapy, patients were randomized into 2 groups: group A patients were treated with vincristine, etoposide, and carboplatin (VEC) and group B patients were treated with carboplatin and etoposide, alternating with cyclophosphamide, idarubicin, and vincristine. Treatment outcomes and adverse effects were recorded. Efficacy parameters were compared between the groups. Survival probability, cause of death, and chemotherapy-related toxicity. A total of 54 children were recruited (27 in each group). The mean +/- SD follow-up was 21.3 +/- 11.34 months. The overall Kaplan-Meier
survival probability was 80% (95% confidence interval [CI], 0.67-0.89) and 42% (95% CI, 0.24-0.59) at 1 year and 4 years, respectively. There were 9 deaths in group A and 15 deaths in group B. The Kaplan-Meier survival probability at 1 year was similar between the groups: 81% (95% CI, 0.60-0.91) and 79% (95% CI, 0.58-0.9) for groups A and B, respectively. At 4 years, the survival probability for group A was higher (63% [95% CI, 0.41-0.79] vs. 25% [95% CI, 0.08-0.46] for groups A and B, respectively), with a strong trend of better survival in group A over time (P = 0.05). The major cause of death was central nervous system relapse (8 patients in group A and 7 patients in group B). Two patients in group B died of sepsis after febrile neutropenia. Grade 3 and grade 4 hematologic toxicities were more common in group B, with a significant difference in grade 4 neutropenia (P = 0.002). This study compared the outcomes of VEC chemotherapy with a 5-drug combination of vincristine and carboplatin, alternating with cyclophosphamide, idarubicin, and vincristine, for stage III retinoblastoma."

According to the news editors, the research concluded: "The VEC combination was found to be more effective and may be recommended as neoadjuvant and adjuvant chemotherapy."

The news correspondents report that additional information may be obtained from B. Chawla, All India Inst Med Sci, Rajendra Prasad Center Ophthalm Sci, New Delhi, India. Additional authors for this research include F. Hasan, R. Seth, S. Pathy, R. Pattebahadur, S. Sharma, A. Upadhyaya and R. Azad.

Mental Health Diseases and Conditions - Schizophrenia

Reports Summarize Schizophrenia Findings from Shanxi Medical University (Altered expression of mRNA profiles in blood of early-onset schizophrenia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mental Health Diseases and Conditions - Schizophrenia is now available. According to news reporting originating in Taiyuan, People's Republic of China, by NewsRx journalists, research stated, "To identify gene expression abnormalities in schizophrenia (SZ), we generated whole-genome gene expression profiles using microarrays on peripheral blood mononuclear cells (PBMCs) from 18 early-onset SZ cases and 12 controls. We detected 84 transcripts differentially expressed by diagnostic status, with 82 genes being upregulated and 2 downregulated."
The news reporters obtained a quote from the research from Shanxi Medical University. "We identified two SZ associated gene coexpression modules (green and red), including 446 genes. The green module is positively correlated with SZ, encompassing predominantly up-regulated genes in SZ; while the red module was negatively correlated with disease status, involving mostly nominally down-regulated genes in SZ. The olfactory transduction pathway was the most enriched pathways for the genes within the two modules. The expression levels of several hub genes, including AKT1, BRCA1, CCDC134, UBD, and ZIC2 were validated using real-time quantitative PCR."

According to the news reporters, the research concluded: "Our findings indicate that mRNA coexpression abnormalities may serve as a promising mechanism underlying the development of SZ."

For more information on this research see: Altered expression of mRNA profiles in blood of early-onset schizophrenia. *Scientific Reports*, 2016;6():16767. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Science

**Reports Summarize Science Findings from University of Texas Southwestern (Multistep regulation of autophagy by WNK1)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news reporting originating in Dallas, Texas, by NewsRx journalists, research stated, "The with-no-lysine (K) (WNK) kinases are an atypical family of protein kinases that regulate ion transport across cell membranes. Mutations that result in their overexpression cause hypertension-related disorders in humans."

Financial supporters for this research include HHS | NIH | National Institute of General Medical Sciences (NIGMS), Welch Foundation, Cancer Prevention and Research Institute of Texas (CPRIT), HHS | NIH | National Cancer Institute (NCI).

The news reporters obtained a quote from the research from the University of Texas Southwestern, "Of the four mammalian WNKs, only WNK1 is expressed throughout the body. We report that WNK1 inhibits autophagy, an intracellular degradation pathway implicated in several human diseases. Using small-interfering RNA-mediated WNK1 knockdown, we show autophagosome formation and autophagic flux are accelerated. In cells with reduced WNK1, basal and starvation-induced autophagy is increased. We also show that depletion of WNK1
stimulates focal class III phosphatidylinositol 3-kinase complex (PI3KC3) activity, which is required to induce autophagy. Depletion of WNK1 increases the expression of the PI3KC3 upstream regulator unc-51-like kinase 1 (ULK1), its phosphorylation, and activation of the kinase upstream of ULK1, the AMP-activated protein kinase. In addition, we show that the N-terminal region of WNK1 binds to the UV radiation resistance-associated gene (UVRAG) in vitro and WNK1 partially colocalizes with UVRAG, a component of a PI3KC3 complex. This colocalization decreases upon starvation of cells. Depletion of the SPS/STE20-related proline-alanine-rich kinase, a WNK1-activated enzyme, also induces autophagy in nutrient-replete or -starved conditions, but depletion of the related kinase and WNK1 substrate, oxidative stress responsive 1, does not.

According to the news reporters, the research concluded: "These results indicate that WNK1 inhibits autophagy by multiple mechanisms."

Our news correspondents report that additional information may be obtained by contacting M.H. Cobb, Univ Texas Southwestern Med Center Dallas, Harold C Simmons Comprehens Canc Center, Dallas, TX 75390, United States. Additional authors for this research include A.Y. Lee, C. Wichaidit, A. Lorente-Rodriguez, A.M. Shah, S. Stippec, A.W. Whitehurst and M.H. Cobb.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1073/pnas.1617649113. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Dallas, Texas, United States, North and Central America, Science, Enzymes and Coenzymes, Genetics, Kinase, University of Texas Southwestern.

Science - Separation Science
Reports Summarize Separation Science Findings from Northwest Institute of Plateau Biology (Application of chromatography technology in the separation of active alkaloids from Hypecoum leptocarpum and their inhibitory effect on fatty acid ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science - Separation Science have been published. According to news reporting out of Xining, People's Republic of China, by NewsRx editors, research stated, "A method that involved the combination of pH-zone-refining counter-current chromatography and semipreparative reversed-phase liquid chromatography has been established for the preparative separation of alkaloids from Hypecoum leptocarpum. From 1.2 g of crude sample, 31 mg N-feruloyltyramine, 27 mg oxohydrastinine, 47 mg hydroprotopine, 25
mg leptopidine, and 18 mg hypecocarpine have been obtained.

Financial supporters for this research include Key Project of Chinese Ministry of Education, Bureau of Science and Technology, Qinghai Provincial Natural Science Foundation, State Key Laboratory Breeding Base.

Our news journalists obtained a quote from the research from the Northwest Institute of Plateau Biology, "The structure of the new compound, hypecocarpine, is confirmed based on the analysis of spectroscopic data, including NMR, UV, and IR spectroscopy and positive electrospray ionization mass spectrometry. The known chemical structures were characterized on the basis of (1) H and (13) C NMR spectroscopy. The purities of the five alkaloids are all over 92.7% as determined by high-performance liquid chromatography. The alkaloids' cytotoxicity in breast cancer cells is assessed by using a Cell Counting Kit assay and their inhibitory effect on fatty acid synthase expression is assessed by a Western blot assay."

According to the news editors, the research concluded: "These results suggest that leptopidine could suppress growth and induce cytotoxicity in breast cancer cells and that the cytotoxicity of leptopidine may be related to its inhibitory effect on fatty acid synthase expression."

Our news journalists report that additional information may be obtained by contacting Q. Zhang, Key Laboratory of Tibetan Medicine Research, Northwest Institute of Plateau Biology, Chinese Academy of Sciences, Xining, People's Republic of China. Additional authors for this research include G. Luan, T. Ma, N. Hu, Y. Suo, X. Wang, X. Ma and C. Ding.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/jssc.201500848. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Takotsubo...

Reports Summarize Takotsubo Cardiomyopathy Findings from School of Medicine (Severe respiratory depression and bradycardia before induction of anesthesia and onset of Takotsubo cardiomyopathy after cardiopulmonary resuscitation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Takotsubo Cardiomyopathy is the subject of a report. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "A 69-year-old woman undergoing treatment for hypertension and epilepsy was scheduled to undergo cataract surgery. All preoperative examination results were within normal limits."
Our news journalists obtained a quote from the research from the School of Medicine, "Despite being tense, she walked to the operating room. Approximately 2 minutes after an intravenous line was established by an anesthesia resident, severe hypoxia and bradycardia developed, and she lost consciousness. Cardiopulmonary resuscitation was initiated immediately, and after 1 minute, she regained consciousness, and her breathing and circulation recovered. After admission to the intensive care unit, emergency coronary angiography was performed. The blood flow in all the coronary arteries was normal. However, a decrease in the apical left ventricular wall motion and an increase in the basal wall motion were observed. Based on these findings, Takotsubo cardiomyopathy was diagnosed. The wall motion gradually improved and the patient was discharged from the hospital on postoperative day 15. The respiratory depression and bradycardia were thought to be due to an inadvertent bolus of remifentanil. We surmised that the patient had received a slight amount of retained medication when the anesthesia resident established the intravenous line, which caused severe respiratory depression."

According to the news editors, the research concluded: "It is important to note that adverse effects such as severe respiratory depression and bradycardia can be caused by even small doses of remifentanil."

The news correspondents report that additional information may be obtained from Y. Furuichi, Nippon Med Sch, Dept. of Anesthesiol, Bunkyo Ku, Tokyo 1138603, Japan. Additional authors for this research include A. Hamada, K. Nakazato, K. Kobayashi and A. Sakamoto.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jclinane.2016.08.007. This DOI is a link to an online electronic document that is either free or for purchase.

Terpenes

Reports Summarize Terpenes Study Results from School of Medicine (The Emerging Role of the Cannabinoid Receptor Family in Peripheral and Neuro-immune Interactions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Terpenes. According to news reporting originating in Dublin, Ireland, by NewsRx journalists, research stated, "The classical
endogenous cannabinoid (CB) system is composed of the endocannabinoid signalling molecules, 2-arachidonoyl glycerol (2-AG) and anandamide (AEA) and their G-protein coupled receptors (GPCR), CB1 and CB2 which together constitutes the endocannabinoid system (ECS). However, putative, novel lipid-sensing CB receptors have recently been identified, including the orphan GPR55 and GPR18 receptors that are regulated by cannabinoid-like molecules and interact with CB system."

The news reporters obtained a quote from the research from the School of Medicine, "CB receptors and associated orphan GPCRs are expressed at high levels in the immune and/or central nervous systems (CNS) and regulate a number of neurophysiological processes, including key events involved in neuroinflammation. As such, these receptors have been identified as emerging therapeutic targets for a number of brain disorders in which neuroinflammation is a key feature, including multiple sclerosis (MS) and Alzheimer's disease (AD)."

According to the news reporters, the research concluded: "This review will consider the role of the wider cannabinoid receptor superfamily in mediating immune function with a focus on the immune processes that contribute to neuroinflammatory conditions."

Our news correspondents report that additional information may be obtained by contacting V.A. Campbell, School of Medicine and Trinity College Institute of Neuroscience, Trinity College Dublin, The University of Dublin, Dublin, Ireland. Additional authors for this research include J. Penman, A.J. Irving and V.A Campbell.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2174/1389450117666160112113703. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Toxicology and Pharmacology**

**Reports Summarize Toxicology and Pharmacology Study Results from L.A. Cox and Co-Researchers (How accurately and consistently do laboratories measure workplace concentrations of respirable crystalline silica?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Toxicology and Pharmacology are presented in a new report. According to news reporting originating from Denver, Colorado, by NewsRx editors, the research stated, "Permissible exposure limits (PELs) for respirable crystalline silica (RCS) have recently been reduced from 0.10 to 0.05 mg/m(3). This raises an important question: do current laboratory practices and standards for assessing RCS concentrations permit reliable discrimination between workplaces that are in compliance and
workplaces that are not? To find out, this paper examines recent laboratory performance in quantifying RCS amounts on filters sent to them to assess their proficiency."

Financial support for this research came from The National Stone, Sand, and Gravel Association (NSSGA).

Our news editors obtained a quote from the research, "A key finding is that accredited laboratories do not reliably (e.g., with 95% confidence) estimate RCS quantities to within a factor of 2. Thus, laboratory findings indicating that RCS levels are above or below a PEL provide little confidence that this is true. The current accreditation standard only requires laboratories to achieve estimates within three standard deviations of the correct (reference) value at least two thirds of the time, rather than a more usual standard such as within 25% of the correct value at least 95% of the time."

According to the news editors, the research concluded: "Laboratory practices may improve as the new PEL is implemented, but they are presently essentially powerless to discriminate among RCS levels over most of the range of values that have been tested, leaving employers and regulators without a reliable means to ascertain when workplace RCS levels are above or below the PEL."

For more information on this research see: How accurately and consistently do laboratories measure workplace concentrations of respirable crystalline silica? Regulatory Toxicology and Pharmacology, 2016;81():268-274. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Regulatory Toxicology and Pharmacology - www.journals.elsevier.com/regulatory-toxicology-and-pharmacology/)

The news editors report that additional information may be obtained by contacting L.A. Cox, Cox Associates, Denver, CO 80218, United States.

**Mycobacterium Infections - Tuberculosis**

**Reports Summarize Tuberculosis Findings from Johns Hopkins University (Evolving strategies for dose optimization of linezolid for treatment of tuberculosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news reporting originating in Baltimore, Maryland, by NewsRx editors, the research stated, "The role of linezolid (LZD) in the management of drug resistant tuberculosis is evolving. Optimizing its usage to maximize efficacy while minimizing its toxicity requires greater understanding of the relationships between drug exposure and bacterial killing, resistance suppression and toxicity."

The news reporters obtained a quote from the research from Johns Hopkins University, "Recent non-clinical and clinical studies provide some useful insights and are
reviewed here. Because LZD toxicity is dose- and duration-dependent, and is driven by elevated trough concentrations and prolonged exposure to concentrations inhibiting mitochondrial protein synthesis, several innovative dosing strategies can be employed to optimize its usage. These strategies, which are not mutually exclusive, may include giving higher doses more intermittently, giving higher daily doses for shorter durations, and giving lower total durations. For example, one approach may involve daily doses of 900-1200 mg for the first 1-3 months of treatment, followed by intermittent (e.g., thrice-weekly) dosing of 1200 mg."

According to the news reporters, the research concluded: "Trials to evaluate regimens based on such strategies are required."

Our news correspondents report that additional information may be obtained by contacting E. Nuernberger, Johns Hopkins University, Sch Med, Dept. of Med, Center TB Res, Baltimore, MD 21287, United States.

Keywords for this news article include: Baltimore, Maryland, United States, North and Central America, Mycobacterium Tuberculosis, Actinomycetales Infections, Mycobacterium Infections, Gram-Positive Bacteria, Drugs and Therapies, Antiinfectives, Antibiotics, Linezolid, Johns Hopkins University.

**Nutritional and Metabolic Diseases and Conditions -…**

**Reports Summarize Type 2 Diabetes Study Results from University of California (The relationship of social support with treatment adherence and weight loss in Latinos with type 2 diabetes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting from La Jolla, California, by NewsRx journalists, research stated, "Little is known about the effects of social support on weight loss in Latinos. This study determined whether sex moderated and treatment adherence mediated the association between social support and weight loss."

Financial supporters for this research include Department of Health and Human Services, National Institutes of Health, National institute of Diabetes and Digestive and Kidney Diseases, National Heart, Lung, and Blood Institute, National Institute of Nursing Research, National Center on Minority Health and Health Disparities, Centers for Disease Control and Prevention, Intramural Research Program of the National Institute of Diabetes and Digestive and Kidney Diseases, The Johns Hopkins Medical Institutions Bayview General Clinical Research Center, Massachusetts General Hospital Mallinckrodt General Clinical Research Center, University of Colorado Health Sciences Center General Clinical Research Center, Clinical Nutrition Research Unit, University of Tennessee at Memphis General Clinical Research Center, University of Pittsburgh General Clinical Research Center, NIH, VA Puget Sound Health Care System Medical Research Service, Department of Veterans Affairs, Frederic C.
The news correspondents obtained a quote from the research from the University of California, "Data from 278 Latino males and females with type 2 diabetes in the Intensive Lifestyle Intervention of the Look AHEAD trial were analyzed. Multivariable modeling tested for moderation and parallel multiple mediator modeling simultaneously tested the mediating effects of adherence to physical activity, diet, and session attendance on the relationship between baseline social support and percent weight loss at 1 year. Social support for physical activity (having family and friends join in physical activity) was related to weight loss. Adherence to physical activity was related to both social support for physical activity and weight loss. Sex did not moderate these relationships. Adherence to physical activity completely mediated the relationship between social support for physical activity and weight loss."

According to the news reporters, the research concluded: "Increasing companionship for physical activity may be an effective intervention strategy to promote behaviors important for weight loss among Latinos."

For more information on this research see: The relationship of social support with treatment adherence and weight loss in Latinos with type 2 diabetes. *Obesity*, 2016;24(3):568-75. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

**Reports Summarize Type 2 Diabetes Study Results from Xiamen University (Changes in blood monocyte Toll-like receptor and serum surfactant protein A reveal a pathophysiological mechanism for community-acquired pneumonia in patients with type 2 ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is now available. According to news reporting originating in Xiamen, People's Republic of China, by NewsRx journalists, research stated, "The lung is one of the target organs of microangiopathy in diabetes mellitus (DM); patients with type 2 diabetes mellitus (T2DM) are vulnerable to pneumonia, and a variety of pathophysiological mechanisms has been described. This study aimed to determine the pathophysiological mechanism of community-
acquired pneumonia (CAP) in T2DM patients."

The news reporters obtained a quote from the research from Xiamen University, "A total of 90 individuals was included in this study comprised of three groups (n=30): healthy control, T2DM and T2DM+ CAP groups. Toll-like receptor (TLR)2 and 4 protein and messenger RNA expression in peripheral blood monocytes (PBMC) was assessed by western blot and reverse transcription-polymerase chain reaction, respectively, and surfactant protein A (SP-A) levels were examined in serum samples by enzyme-linked immunosorbent assay. In T2DM and T2DM+CAP groups, levels of both TLR2/4 protein and mRNA in PBMC were decreased compared with controls (p <0.05), with lower levels observed in the T2DM+CAP group in comparison with T2DM patients (p <0.05). The serum SP-A levels in T2DM+CAP individuals were significantly higher than the values obtained for T2DM patients (p <0.05). It also showed apparent increases when compared with that in controls although no statistical significance was detected."

According to the news reporters, the research concluded: "In T2DM patients with pneumonia, TLR2/4 levels in PBMC and serum SP-A were altered, maybe playing an important role in the susceptibility to pneumonia in T2DM patients."

Our news correspondents report that additional information may be obtained by contacting Y. Que, Dept. of Endocrinology and Metabolism, Zhongnanshan Hospital Xiamen University, Xiamen, People's Republic of China.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/imj.12978. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Hepatitis C Virus

Reports by M. Gambato and Co-Researchers Describe Recent Advances in Hepatitis C Virus (Hepatitis C Virus RNA Persists in Liver Explants of Most Patients Awaiting Liver Transplantation Treated With an Interferon-Free Regimen)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Hepatitis C Virus have been presented. According to news originating from Barcelona, Spain, by NewsRx correspondents, research stated, "We assessed the presence of hepatitis C virus (HCV) RNA in liver explants from 39 patients awaiting liver transplantation who were treated with an
interferon-free regimen and had undetectable serum HCV RNA at the time of liver transplantation."

Our news journalists obtained a quote from the research, "Interestingly, HCV RNA was detected in most liver explants (67%). Patients with HCV RNA-positive explants had received shorter courses of treatment, and HCV RNA was undetectable in serum for shorter periods before transplantation compared to patients with HCV RNA-negative explants (P =.014 and P =.013, respectively)."

According to the news editors, the research concluded: "Levels of HCV RNA in explants were significantly higher in patients with a relapse of HCV infection than patients who responded to treatment (P =.016), but most patients (85%) with residual HCV-RNA in the explant achieved a sustained virologic response after receiving their liver transplant."

The news correspondents report that additional information may be obtained from X. Forns, Univ Barcelona??Liver Unit, IDIBAPSCIBEREHD, Barcelona, Spain. Additional authors for this research include S. Perez-del-Pulgar, C. Hedskog, E.S. Svarovskaia, D. Brainard, J. Denning, M.P. Curry, M. Charlton, N. Caro-Perez, M.C. Londono, G. Koutsoudakis and X. Forns.

**Drugs and Therapies - Diclofenac Therapy**

**Reports by M. Rowcliffe and Co-Researchers Describe Recent Advances in Diclofenac Therapy (Topical diclofenac does not affect the antiplatelet properties of aspirin as compared to the intermediate effects of oral diclofenac: A prospective, ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Diclofenac Therapy have been published. According to news reporting out of Amherst, New York, by NewsRx editors, research stated, "Nonsteroidal anti-inflammatory drugs (NSAIDs) adversely interact with aspirin, diminishing its antiplatelet effect and potentially placing patients at an increased risk for recurrent thrombotic events. This crossover study aimed to determine whether the topical NSAID diclofenac epolamine 1.3% patch or oral diclofenac 50 mg interfered with the
Financial support for this research came from Dent Family Foundation.

Our news journalists obtained a quote from the research, "Twelve healthy men and women aged 18-50 were included. Participants were randomized into 5 treatment arms: aspirin, diclofenac potassium 50 mg, diclofenac patch, diclofenac potassium plus ASA 325 mg, and diclofenac patch plus aspirin. Platelet responsiveness was determined using whole-blood impedance aggregation (WBA) to collagen 1 mg/mL and arachidonic acid (AA) 0.5 mM and was sampled every 2 hours. No significant difference in platelet function was observed following the diclofenac patch and aspirin vs aspirin alone. Oral diclofenac produced a mixed effect with significant reduction in platelet inhibition at hour 2 and hour 8 following aspirin administration."

According to the news editors, the research concluded: "Topical diclofenac does not significantly interfere with the antiplatelet effects of aspirin and may be a safer alternative to the oral formulation."

For more information on this research see: Topical diclofenac does not affect the antiplatelet properties of aspirin as compared to the intermediate effects of oral diclofenac: A prospective, randomized, complete crossover study. Journal of Clinical Pharmacology, 2015;56 (4):422-8. Journal of Clinical Pharmacology can be contacted at: SAGE Publications, USA , 2455 Teller Road, Thousand Oaks, CA 91320, USA. (CIA) is highly variable between patients undergoing similar chemotherapy regimens. A decrease of the scalp skin temperature seems to be an important factor, but data on the optimum temperature reached by scalp cooling to prevent CIA are lacking."

Our news journalists obtained a quote from the research, "This study investigated the relation between scalp skin temperature and its efficacy to prevent CIA. In this explorative study, scalp skin temperature was measured during scalp cooling in 62 breast cancer patients undergoing up to six cycles of anthracycline containing chemotherapy. Scalp skin temperature was measured by using two thermocouples at both temporal sides of the head. The primary end-point was the need for a wig or other head covering. Maximal cooling was reached after 45 min and was continued for 90 min after chemotherapy infusion. The scalp skin temperature after 45 min cooling varied from 10 degrees C to 31 degrees C, resulting in a mean scalp skin temperature of 19 degrees C (SEM: 0.4). Intrapersonal scalp skin temperatures during cooling were consistent for each chemotherapy cycle (ANOVA: P = 0.855). Thirteen out of 62 patients (21%) did not require a wig or other head covering. They appeared to have a significantly lower mean scalp skin temperature (18 degrees C; SEM: 0.7) compared to patients with alopecia (20 degrees C; SEM: 0.5) (P = 0.01). The efficacy of scalp cooling during chemotherapy is temperature dependent."

According to the news editors, the research concluded: "A precise cutoff point could not be detected, but the best results seem to be obtained when the scalp temperature decreases below 18 degrees C."

For more information on this research see: Results of scalp cooling during anthracycline containing chemotherapy depend on scalp skin temperature. Breast, 2016;30 ():105-110. Breast can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Clinical Pharmacology and Toxicology are presented in a new report. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "In this survey, the correlation between adverse drug reactions (ADRs) in human and animal toxicities was investigated for 393 medicines which were approved in Japan from September 1999 to March 2013. ADRs were collected from each Japanese package insert."

The news correspondents obtained a quote from the research, "Comparable animal toxicities with ADRs were collected by thorough investigation of common technical documents. The results of this survey show that hypertension and/or hypotension were mainly observed in medicines affecting the central nervous system. Hypertension was also observed in antipyretics, analgesics, anti-inflammatory agents, vasoconstrictors and agents using antibody. Concordance between human ADRs and animal toxicities was analysed. True-positive rate for hypertension and hypotension is 0.29 and 0.52, respectively. Positive likelihood ratio and inverse negative likelihood ratio are 1.98 and 1.21, respectively, in hypertension and 1.67 and 1.44, respectively, in hypotension. Concordance between human ADRs and animal toxicities is not so high in hypertension and hypotension. Identified mechanisms as on-target for hypertension and hypotension are 29.8% and 30.5%, respectively. More than half of the causative factors of hypertension and hypotension were unable to be elucidated. Our results show that the intake of medicines is often linked to blood pressure variations that are not predicted in animal toxicity studies."

According to the news reporters, the research concluded: "Improvement of drug development processes may be necessary to provide safer medicines because current animal toxicity studies are insufficient to predict all ADRs in human beings."

Our news journalists report that additional information may be obtained by contacting T. Nagayama, Non-Clinical Evaluation Expert Committee, Drug Evaluation Committee, Japan Pharmaceutical Manufacturers Association, Tokyo, Japan. Additional authors for this research include M. 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Chronic Lymphocytic Leukemia. According to news reporting originating in Coimbra, Portugal, by NewsRx journalists, research stated, "The V delta 1(+) subset of gamma delta T lymphocytes is a promising candidate for cancer immunotherapy, but the lack of suitable expansion/differentiation methods has precluded therapeutic application. We set out to develop and test (preclinically) a V delta 1(+) T-cell-based protocol that is good manufacturing practice compatible and devoid of feeder cells for prompt clinical translation."

The news reporters obtained a quote from the research, "Experimental design: We tested multiple combinations of clinical-grade agonist antibodies and cytokines for their capacity to expand and differentiate (more than 2-3 weeks) V delta 1(+) T cells from the peripheral blood of healthy donors and patients with chronic lymphocytic leukemia (CLL). We characterized the phenotype and functional potential of the final cellular product, termed Delta One T (DOT) cells, in vitro and in vivo (xenograft models of CLL). We describe a very robust two-step protocol for the selective expansion (up to 2,000-fold in large clinical-grade cell culture bags) and differentiation of cytotoxic V delta 1(+) (DOT) cells. These expressed the natural cytotoxicity receptors, NKp30 and NKp44, which synergized with the T-cell receptor to mediate leukemia cell targeting in vitro. When transferred in vivo, DOT cells infiltrated tumors and peripheral organs, and persisted until the end of the analysis without showing signs of loss of function; indeed, DOT cells proliferated and produced abundant IFN gamma and TNF alpha, but importantly no IL17, in vivo. Critically, DOT cells were capable of inhibiting tumor growth and preventing dissemination in xenograft models of CLL."

According to the news reporters, the research concluded: "We provide a clinical-grade method and the preclinical proof of principle for application of a new cellular product, DOT cells, in adoptive immunotherapy of CLL."

For more information on this research see: Delta One T Cells for Immunotherapy of Chronic Lymphocytic Leukemia: Clinical-Grade Expansion/Differentiation and Preclinical Proof of Concept. Clinical Cancer Research, 2016;22(23):5795-5804. Clinical Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Reports from A.R. Boobis and Colleagues Advance Knowledge in Toxicology and Pharmacology (Classification schemes for carcinogenicity based on hazard - identification have become outmoded and serve neither science nor society)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Toxicology and Pharmacology. According to news originating from Cheshire, United Kingdom, by NewsRx correspondents, research stated, "Classification schemes for carcinogenicity based solely on hazard-identification such as the IARC monograph process and the UN system adopted in the EU have become outmoded. They are based on a concept developed in the 1970s that chemicals could be divided into two classes: carcinogens and non carcinogens."

Our news journalists obtained a quote from the research, "Categorization in this way places into the same category chemicals and agents with widely differing potencies and modes of action. This is how eating processed meat can fall into the same category as sulfur mustard gas. Approaches based on hazard and risk characterization present an integrated and balanced picture of hazard, dose response and exposure and allow informed risk management decisions to be taken. Because a risk-based decision framework fully considers hazard in the context of dose, potency, and exposure the unintended downsides of a hazard only approach are avoided, e.g., health scares, unnecessary economic costs, loss of beneficial products, adoption of strategies with greater health costs, and the diversion of public funds into unnecessary research. An initiative to agree upon a standardized, internationally acceptable methodology for carcinogen assessment is needed now."

According to the news editors, the research concluded: "The approach should incorporate principles and concepts of existing international consensus-based frameworks including the WHO IPCS mode of action framework."

For more information on this research see: Classification schemes for carcinogenicity based on hazard - identification have become outmoded and serve neither science nor society. Regulatory Toxicology and Pharmacology, 2016;82():158-166. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Reports from A.R. Molina and Co-Researchers Add New Data to Findings in Liver Transplts (Influence of Body Mass Index on Venous Thrombotic Complications of Liver Transplants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Transplant Medicine - Liver Transplants. According to news originating from Granada, Spain, by NewsRx correspondents, research stated, "To analyze venous thrombotic complications in transplanted patients as a function of their body mass index (BMI). This single-center, observational retrospective study of individuals undergoing liver transplantation between January 2008 and December 2014 analyzed the frequency of pretransplant portal thrombosis, post-transplant venous complications (early and late portal thrombosis), deep vein thrombosis, pulmonary thromboembolism and the survival outcomes as a function of World Health Organization BMI class."

Our news journalists obtained a quote from the research, "Liver transplantation was performed in 208 patients during the study period. No statistically significant differences in study variables were found as a function of BMI in bivariate analyses (P < .05), and Kaplan-Meier survival analysis results were also nonsignificant. No differences in the rate of venous thrombotic complications or survival were found as a function of the BMI class of these liver transplant recipients."

According to the news editors, the research concluded: "These findings are in line with previous reports that complication rates are not higher in obese patients and support the proposal that obesity should not be considered a contraindication for liver transplantation based on the risk of venous complications."

The news correspondents report that additional information may be obtained from A.R. Molina, Virgen Nieves Univ & Hosp Complex, Unit HepatobiliaryPancreat Surg & Liver Transplan, Granada, Spain. Additional authors for this research include A.R. Vilchez, M.B. Dominguez, A.N. Garcia, C.M. San Miguel, A.R.R. Gonzalez and Y.S. Fundora.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.transproceed.2016.10.001. This DOI is a link to an online electronic document that is either free or for purchase.

Environmental Water Research

Reports from Aalborg University Provide New Insights into Environmental Water Research (Evaluation of a membrane bioreactor system as post-treatment in waste water treatment for better removal of micropollutants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Environmental Water Research is the subject of a report. According to news reporting from Aalborg, Denmark, by NewsRx journalists, research stated, "Organic micropollutants (OMPs) such as pharmaceuticals are persistent pollutants that are only partially degraded in waste water treatment plants (WWTPs). In this study, a membrane bioreactor (MBR) system was used as a polishing step on a full-scale WWTP, and its ability to remove micropollutants was examined together with the development and stability of the microbial community."

Funders for this research include Danish Council for Strategic Research, CONACYT.

The news correspondents obtained a quote from the research from Aalborg University, "Two stages of operation were studied during a period of 9 months, one with (S1) and one without (S2) the addition of exogenous OMPs. Ibuprofen and naproxen had the highest degradation rates with values of 248 μg/g(VSS).h and 71 μg/g(VSS).h, whereas diclofenac was a more persistent OMP (7.28 μg/g(VSS).h). Mineralization of C-14-labeled OMPs in batch kinetic experiments indicates that higher removal rates (similar to 0.8 ng/mg(TSS).h) with a short lag phase can be obtained when artificial addition of organic micropollutants was performed. Similar microbial populations dominated S1 and S2, despite the independent operations. Hydrogenophaga, Nitrospira, p55-a5, the actinobacterial Tetrasphaera, Propionicimonas, Fodinicola, and Candidatus Microthrix were the most abundant groups in the polishing MBR."

According to the news reporters, the research concluded: "Finally, potential microbial candidates for ibuprofen and naproxen degradation are proposed."

Our news journalists report that additional information may be obtained by contacting J.L. Nielsen, Aalborg Univ, Dept. of Chem & Biosci, Center Microbial Communities, DK-9220 Aalborg, Denmark. Additional authors for this research include N. de Jonge, M.L. Nielsen, H.R. Andersen, V. Borregaard, K. Jewel, T.A. Ternes and J.L. Nielsen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.watres.2016.10.046. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from Aarhus University Add New Data to Findings in Cyclohexanes (Gene expression related to serotonergic and glutamatergic neurotransmission is altered in the flinders sensitive line rat model of depression: Effect of ketamine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cyclohexanes is now available. According to news originating from Risskov, Denmark, by NewsRx correspondents, research stated, "Major depressive disorder (MDD) is associated with dysfunctional serotonergic and glutamatergic neurotransmission, and the genetic animal model of depression Flinders Sensitive Line (FSL) rats display alterations in these systems relatively to their control strain Flinders Resistant Line (FRL). However, changes on transcript level related to serotonergic and glutamatergic signaling have only been sparsely studied in this model."

Our news journalists obtained a quote from the research from Aarhus University, "The non-competitive N-methyl-D-aspartate (NMDA) receptor antagonist ketamine has fast-onset antidepressant properties, and recent data implicate serotonergic neurotransmission in ketamine's antidepressant-like activities in rodents. Here, we investigated the transcript levels of 40 genes involved in serotonergic and glutamatergic neurotransmission in FSL and FRL rats in response to a single dose of ketamine (15 mg/kg; 90 min prior to euthanization). Using real-time quantitative polymerase chain reaction, we studied the effect of ketamine in the hippocampus, whereas strain differences were investigated in both hippocampus and frontal cortex. The expression of genes involved in serotonergic and glutamatergic neurotransmission were unaffected by a single dose of ketamine in the hippocampus. Relative to FRL rats, FSL rats displayed enhanced hippocampal transcript levels of 5-HT(2c), and P11, whereas the expression was reduced for 5-HT(2a), Nr2a, and Mglur2. In the frontal cortex, we found higher transcript levels of 5-HT(2c) and Mglur2, whereas the expression of 5-HT(2a) was reduced in FSL rats. Thus, ketamine is not associated with hippocampal alterations in serotonergic or glutamatergic genes at 90 min after an antidepressant dose."

According to the news editors, the research concluded: "Furthermore, FSL rats display serotonergic and glutamatergic abnormalities on gene expression level that partly may resemble findings in MDD patients."

The news correspondents report that additional information may be obtained from B. Elfving, Aarhus University, Dept. of Clin Med, Translat Neuropsychiat Unit, Risskov, Denmark. Additional authors for this research include H.K.M. Uller, C. Sanchez, G. Wegener and B. Elfving.

Keywords for this news article include: Risskov, Denmark, Europe, Glutamates, Genetics, Glutamic Acid, Hydrocarbons, Cyclohexanes, Ketamine, Aarhus University.

Reports from Aarhus University Add New Data to Findings in Pharmacoepidemiology and Drug Safety (Determining prescription durations based on the parametric waiting time distribution)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Pharmacoepidemiology and Drug Safety have been published. According to news reporting originating from Aarhus, Denmark, by NewsRx correspondents, research stated, "The purpose of the study is to develop a method to estimate the duration of single prescriptions in pharmacoepidemiological studies when the single prescription duration is not available. We developed an estimation algorithm based on maximum likelihood estimation of a parametric two-component mixture model for the waiting time distribution (WTD)."

Our news editors obtained a quote from the research from Aarhus University, "The distribution component for prevalent users estimates the forward recurrence density (FRD), which is related to the distribution of time between subsequent prescription redemptions, the inter-arrival density (IAD), for users in continued treatment. We exploited this to estimate percentiles of the IAD by inversion of the estimated FRD and defined the duration of a prescription as the time within which 80% of current users will have presented themselves again. Statistical properties were examined in simulation studies, and the method was applied to empirical data for four model drugs: non-steroidal anti-inflammatory drugs (NSAIDs), warfarin, bendroflumethiazide, and levothyroxine. Simulation studies found negligible bias when the data-generating model for the IAD coincided with the FRD used in the WTD estimation (Log-Normal). When the IAD consisted of a mixture of two Log-Normal distributions, but was analyzed with a single Log-Normal distribution, relative bias did not exceed 9%. Using a Log-Normal FRD, we estimated prescription durations of 117, 91, 137, and 118 days for NSAIDs, warfarin, bendroflumethiazide, and levothyroxine, respectively. Similar results were found with a Weibull FRD."

According to the news editors, the research concluded: "The algorithm allows valid estimation of single prescription durations, especially when the WTD reliably separates current users from incident users, and may replace ad-hoc decision rules in automated implementations."

The news editors report that additional information may be obtained by contacting H. Stovring, Aarhus University, Dept. of Public Hlth, Biostat, DK-8000 Aarhus C, Denmark. Additional authors for this research include A. Pottegard and J. Hallas.

Keywords for this news article include: Aarhus, Denmark, Europe, Pharmacoepidemiology and Drug Safety, Drugs and Therapies, Epidemiology, Aarhus University.

Reports from Aarhus University Advance Knowledge in Heart Attack (Clinical predictors of shockable versus non-shockable rhythms in patients with out-of-hospital cardiac arrest)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Attack. According to news reporting originating from Aarhus, Denmark, by NewsRx correspondents, research stated, "To identify factors associated with a non-shockable rhythm as first recorded heart rhythm. Patients >= 18 years old suffering out-of-hospital cardiac arrest between 2001 and 2012 were identified in the population-based Danish Cardiac Arrest Registry."

Our news editors obtained a quote from the research from Aarhus University, "Danish administrative registries were used to identify chronic diseases (within 10 years) and drug prescriptions (within 180 days). A multivariable logistic regression model, including patient related and cardiac arrest related characteristics, was used to estimate odds ratios (OR) for factors associated with non-shockable rhythm. A total of 29,863 patients were included: 6600 (22.1%) patients with a shockable rhythm and 23,263 (77.9%) patients with a non-shockable rhythm. A non-shockable rhythm was associated with female gender, arrest in private home, unwatched arrest, no bystander CPR, and longer time to first rhythm analysis compared to patients with shockable rhythm. In the adjusted multivariable regression model, pre-existing non-cardiovascular disease and drug prescription were associated with a non-shockable rhythm e.g. chronic obstructive lung disease (OR 1.44 [95% CI: 1.32-1.58]); and the prescription for antidepressants (OR 1.49 [95% CI: 1.35-1.65]), antipsychotics (OR 2.30 [95% CI: 1.96-2.69]) analgesics (OR 1.32 [95% CI: 1.23-1.41]), corticosteroids (OR 1.64 [95% CI: 1.44-1.85]), and antibiotics (OR 1.59 [95% CI: 1.40-1.81]). In contrast, the prescription of cardiovascular drugs and a history of cardiovascular disease e.g. ischemic heart disease was associated with a lower risk of non-shockable rhythm (OR 0.66 [95% CI: 0.60-0.71])."

According to the news editors, the research concluded: "This study demonstrate that non-cardiovascular disease and medication prescription are associated with a non-shockable rhythm while cardiovascular disease and medication prescription are associated with a shockable rhythm as first recorded rhythm in patients with OHCA."

The news editors report that additional information may be obtained by contacting A. Granfeldt, Aarhus University, Dept. of Anesthesiol & Intens Care, DK-8000 Aarhus C, Denmark. Additional authors for this research include M. Wissenberg, S.M. Hansen, F.K. Lippert, T. Lang-Jensen, O.M. Hendriksen, C. Torp-Pedersen, E.F. Christensen and C.F. Christiansen.

Parkinson's Disease

Reports from Aarhus University Hospital Describe Recent Advances in Parkinson's Disease (Adjustment disorder and risk of Parkinson's disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Parkinson's disease is now available. According to news reporting from Aarhus, Denmark, by NewsRx journalists, research stated, "It has been postulated that stress is part of the etiological process of Parkinson's disease (PD). The risk of PD was examined in a cohort of patients with adjustment disorders, a diagnosis made in the presence of a severe response to a stressful life event."

Funders for this research include National Institute of Mental Health, Lundbeck and Novo Nordisk Foundations, Aarhus Universitets Forskningsfond.

The news correspondents obtained a quote from the research from Aarhus University Hospital, "Using Danish medical registries, PD occurrence was examined in a nationwide population-based cohort of patients with adjustment disorder diagnosed between 1995 and 2011. The standardized incidence ratio of PD was calculated as the ratio of observed to expected cases, stratified by time and potential risk factors, including depression and anxiety. Our adjustment disorder cohort (67,786 patients) was followed for a median of 8 years (interquartile range 4, 12.6 years). During follow-up, 119 patients developed PD, versus 64 expected, corresponding to a standardized incidence ratio of 1.84 (95% confidence interval 1.53, 2.20). Consistent results were observed after stratification on potential risk factors, including depression and anxiety."

According to the news reporters, the research concluded: "Adjustment disorder, a diagnosis made in the presence of severe response to stressful life events, was associated with an increased risk of PD."

Our news journalists report that additional information may be obtained by contacting E. Svensson, Dept. of Clinical Epidemiology, Aarhus University Hospital, Aarhus, Denmark. Additional authors for this research include D.K. Farkas, J.L. Gradus, T.L. Lash and H.T Sorensen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ene.12933. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from Aix-Marseille University Advance Knowledge in Antibiotics (Molecular mechanisms of polymyxin resistance: knowns and unknowns)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antibiotics is now available. According to news reporting originating from Marseille, France, by NewsRx correspondents, research stated, "Colistin, also referred to as polymyxin E, is an effective antibiotic against most multidrug-resistant Gram-negative bacteria and is currently used as a last-line drug for treating severe bacterial infections. Colistin resistance has increased gradually for the last few years, and knowledge of its multifaceted mechanisms is expanding."

Financial supporters for this research include Centre National de la Recherche Scientifique, Institut hospitalo-universitaire.

Our news editors obtained a quote from the research from Aix-Marseille University, "This includes the newly discovered plasmid-mediated colistin resistance gene mcr-1, which has been detected in over 20 countries within 3 months of its first report. We previously reported all of the known mechanisms of polymyxin resistance in our first review in 2014, but an update seems necessary in 2016, considering the significant recent discoveries that have been made in this domain."

According to the news editors, the research concluded: "This review provides an update about what is already known, what is new, and some unresolved questions with respect to colistin resistance."

The news editors report that additional information may be obtained by contacting J.M. Rolain, Aix Marseille Univ, URMITE, CNRS IRD UMR 6236, Mediterrane InfectFac Med & Pharm, Marseille, France. Additional authors for this research include L. Hadjadj, J.M. Rolain and A.O. Olaitan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijantimicag.2016.06.023. This DOI is a link to an online electronic document that is either free or for purchase.

**Reports from Aix-Marseille University Describe Recent Advances in Acinetobacter baumannii [Acquisition of a High Diversity of Bacteria during the Hajj Pilgrimage, Including Acinetobacter baumannii with bla(OXA-72) and Escherichia coli with ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Acinetobacter baumannii have been presented. According to news reporting originating from Marseille, France, by NewsRx correspondents, research stated, "Pilgrims returning from the Hajj (pilgrimage to Mecca) can be carriers of multidrug-resistant bacteria (MDR). Pharyngeal and rectal swab samples were collected from 98 pilgrims before and after they traveled to the Hajj in 2014 to investigate the acquisition of MDR bacteria."

Our news editors obtained a quote from the research from Aix-Marseille University, "The bacterial diversity in pharyngeal swab samples was assessed by culture with selective media. There was a significantly higher diversity of bacteria in samples collected after the return from the Hajj than in those collected before (P = 0.0008). Surprisingly, Acinetobacter baumannii strains were isolated from 16 pharyngeal swab samples (1 sample taken during the Hajj and 15 samples taken upon return) and 26 post-Hajj rectal swab samples, while none were isolated from samples taken before the Hajj. Testing of all samples by real-time PCR targeting bla(OXA-51) gave positive results for only 1% of samples taken during the Hajj, 21/90 (23.3%) pharyngeal swab samples taken post-Hajj, and 35/90 (38.9%) rectal swab samples taken post-Hajj. One strain of A. baumannii isolated from the pharynx was resistant to imipenem and harbored a bla(OXA-72) carbapenemase gene. Multilocus sequence typing analysis of 43 A. baumannii isolates revealed a huge diversity of 35 sequence types (STs), among which 18 were novel STs reported for the first time in this study. Moreover, we also found one Escherichia coli isolate, collected from a rectal swab sample from a pilgrim taken after the Hajj, which harbored bla(NDM-5), bla(CTX-M-15), bla(TEM-1), and aadA2 (ST2659 and ST181)."

According to the news editors, the research concluded: "Pilgrims are at a potential risk of acquiring and transmitting MDR Acinetobacter spp. and carbapenemase-producing Gram-negative bacteria during the Hajj season."

For more information on this research see: Acquisition of a High Diversity of Bacteria during the Hajj Pilgrimage, Including Acinetobacter baumannii with bla(OXA-72) and Escherichia coli with bla(NDM-5) Carbapenemase Genes. *Antimicrobial Agents and Chemotherapy*, 2016;60(10):5942-5948. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news editors report that additional information may be obtained by contacting J.M. Rolain, Aix Marseille Univ, Fac Med & Pharm, CNRS IRD, URMITEUMR 6236Mediterranee Infect, Marseille, France. Cardiovascular Research

Reports from Aix-Marseille University Describe Recent Advances in Cardiovascular Research (WES/WGS Reporting of Mutations from Cardiovascular "Actionable" Genes in Clinical Practice: A Key Role for UMD Knowledgebases in the Era of Big Databases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Research have been published. According to news reporting originating in Marseille, France, by NewsRx journalists, research stated, "High-throughput next-generation sequencing such as whole-exome and whole-genome sequencing are being rapidly integrated into clinical practice. The use of these techniques leads to the identification of secondary variants for which decisions about the reporting or not to the patient need to be made."

The news reporters obtained a quote from the research from Aix-Marseille University, "The American College of Medical Genetics and Genomics recently published recommendations for the reporting of these variants in clinical practice for 56 'actionable' genes. Among these, seven are involved in Marfan Syndrome And Related Disorders (MSARD) resulting from mutations of the FBN1, TGFBR1 and 2, ACTA2, SMAD3, MYH11 and MYLK genes. Here, we show that mutations collected in UMD databases for MSARD genes (UMD-MSARD) are rarely reported, including the most frequent ones, in global scale initiatives for variant annotation such as the NHLBI GO Exome Sequencing Project (ESP), the Exome Aggregation Consortium (ExAC), and ClinVar. The predicted pathogenic mutations reported in global scale initiatives but absent in locus-specific databases (LSDBs) mainly correspond to rare events. UMD-MSARD databases are therefore the only resources providing access to the full spectrum of known pathogenic mutations."

According to the news reporters, the research concluded: "They are the most comprehensive resources for clinicians and geneticists to interpret MSARD-related variations not only primary variants but also secondary variants."

Our news correspondents report that additional information may be obtained by contacting G. Collod-Beroud, Aix Marseille Univ, INSERM, GMGF, Marseille, France. Additional authors for this research include D. Salgado, J.P. Desvignes, G. Rai, N. Hanna, P. Arnaud, C. Guien, M. Martinez, L. Faivre, G. Jondeau, C. Boileau, S. Zaffran, C. Beroud and G. Collod-Beroud.

Our reports deliver fact-based news of research and discoveries from around the
Heart Disorders and Diseases - Bradycardia

Reports from Akdeniz University Provide New Insights into Bradycardia (The efficacy of transcutaneous cardiac pacing in ED)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Bradycardia. According to news reporting from Antalya, Turkey, by NewsRx journalists, research stated, "Transcutaneous cardiac pacing (TCP) is a rapid, time-saving, and noninvasive ventricular stimulation that is tolerated by conscious patients despite the painful intervention for treatment of symptomatic brady-cardias. The goal of this study was to determine the efficacy of TCP in unstable bradycardia patients in emergency department (ED)."

The news correspondents obtained a quote from the research from Akdeniz University, "This single-central, observational clinical study was conducted on patients older than 18 years who presented with acute unstable bradycardia to the tertiary care university ED. Primary outcome measure was to determine the efficacy of TCP in unstable bradycardia patients in the emergency settings. Efficacy of TCP was to determine changes of clinically significant vital signs and electrocardiography. Of 349 patients who visited the ED presenting with bradycardia, 89 patients who met the criteria were included in the study. There was a statistically significant difference between before and after the first administration TCP in mean systolic (71.2 [64.8-77.6] and 105.3 [97.6-112.9 mm Hg]) and diastolic blood pressure (42.9 [38.8-47.0] and 61.0 [56.4-65.5] mm Hg) and median heart rate (40 [39-42] and 74 [71-78] beats/min, P<.0001)."

According to the news reporters, the research concluded: "Transcutaneous cardiac pacing is a clinically effective treatment modality in patients with atropine-resistant unstable bradycardia."

Our news journalists report that additional information may be obtained by contacting F. Bektas, Akdeniz University, Fac Med, Dept. of Emergency Med, TR-07059 Antalya, Turkey.

Reports from Akita University Provide New Insights into Vasculitis (Different Expression Patterns of Toll-Like Receptor mRNAs in Blood Mononuclear Cells of IgA Nephropathy and IgA Vasculitis with Nephritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current research results on Cardiovascular Diseases and Conditions - Vasculitis have been published. According to news originating from Akita, Japan, by NewsRx correspondents, research stated, "Mucosal immunity may play a key role in IgA nephropathy (IgAN) and IgA vasculitis with nephritis (IgAVN). IgAVN is characterized by the presence of non-thrombocytopenic palpable purpura, associated with glomerulonephritis with IgA-dominant immune deposits."

Our news journalists obtained a quote from the research from Akita University, "Recent studies have shown the up-regulation of Toll-like receptors (TLRs) in patients with IgAN or IgAVN. Among TLRs that mediate innate immune reactions, TLR2, TLR4, and TRL5 recognize bacterial components, while TLR3, TLR7, and TLR9 recognize viral components. Here we compared the expression levels of TLR mRNAs in peripheral blood mononuclear cells (PBMCs) from 49 IgAN patients, 20 IgAVN patients, and 20 patients with thin basement membrane nephropathy (TBMN), unrelated to immune-mediated pathogenesis, as a control. The real-time RT-PCR analysis revealed the significantly higher expression levels of TLR2, TLR3, TLR5, TLR7, and TLR9 mRNAs in PBMCs of IgAN and IgAVN patients, compared to TBMN patients. Importantly, TLR4 mRNA levels were significantly higher in IgAN patients than in IgAVN patients, while its expression levels were comparable in IgAVN patients and TBMN patients. In contrast, TLR5 and TLR9 mRNA levels were significantly higher in IgAVN patients than in IgAN patients. In IgAN patients, expression levels of TLR2, TLR3, TLR5, or TLR9 mRNA were correlated with proteinuria levels, and TLR4 mRNA levels were correlated with serum IgA levels. In IgAVN patients, however, there was no such correlation. The up-regulated expression of TLR mRNAs in PBMCs may be related to the development of IgAN and IgAVN."

According to the news editors, the research concluded: "The distinct expression patterns between these two diseases may reflect their different pathogenetic mechanisms."

The news correspondents report that additional information may be obtained from A. Komatsuda, Akita University, Grad Sch Med, Dept. of Hematol Nephrol & Rheumatol, Akita, Akita 0108543, Japan. Additional authors for this research include A. Komatsuda, H. Kaga, R. Sato, M. Togashi, S. Okuyama, H. Wakui and N. Takahashi.

Oncology - Acute Myeloid Leukemia

Reports from Albert Einstein College of Medicine Advance Knowledge in Acute Myeloid Leukemia (New IDH1 mutant inhibitors for treatment of acute myeloid leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Myeloid Leukemia. According to news reporting out of Bronx, New York, by NewsRx editors, research stated, "Neomorphic mutations in isocitrate dehydrogenase 1 (IDH1) are driver mutations in acute myeloid leukemia (AML) and other cancers. We report the development of new allosteric inhibitors of mutant IDH1."

Our news journalists obtained a quote from the research from the Albert Einstein College of Medicine, "Crystallographic and biochemical results demonstrated that compounds of this chemical series bind to an allosteric site and lock the enzyme in a catalytically inactive conformation, thereby enabling inhibition of different clinically relevant IDH1 mutants. Treatment of IDH1 mutant primary AML cells uniformly led to a decrease in intracellular 2-HG, abrogation of the myeloid differentiation block and induction of granulocytic differentiation at the level of leukemic blasts and more immature stem-like cells, in vitro and in vivo. Molecularly, treatment with the inhibitors led to a reversal of the DNA cytosine hypermethylation patterns caused by mutant IDH1 in the cells of individuals with AML."

According to the news editors, the research concluded: "Our study provides proof of concept for the molecular and biological activity of novel allosteric inhibitors for targeting different mutant forms of IDH1 in leukemia."

Our news journalists report that additional information may be obtained by contacting U.C. Okoye-Okafor, Dept. of Cell Biology, Albert Einstein College of Medicine, Bronx, New York, United States. Additional authors for this research include B. Bartholdy, J. Cartier, E.N. Gao, B. Pietrak, A.R. Rendina, C. Rominger, C. Quinn, A. Smallwood, K.J. Wiggall, A.J. Reif, S.J. Schmidt, H. Qi, H. Zhao, G. Joberty, M. Faeth-Savitski, M. Bantscheff and Drewes.

Liver Diseases and Conditions - Hepatitis B Virus

Reports from American Red Cross Describe Recent Advances in Hepatitis B Virus (Development of a multisystem surveillance database for transfusion-transmitted infections among blood donors in the United States)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Liver Diseases and Conditions - Hepatitis B Virus. According to news reporting from Rockville, Maryland, by NewsRx journalists, research stated, "The frequency of positive test results for transfusion-transmitted infections (TTIs) among blood donors is an important index of safety; thus, appropriate monitoring is critical, particularly when there are changes in policies affecting donor suitability. Testing algorithms from three large blood systems were reviewed and consensus definitions for a surveillance-positive result for hepatitis B virus (HBV), hepatitis C virus (HCV), human immunodeficiency virus (HIV), and human T-cell lymphotropic virus (HTLV) established."

The news correspondents obtained a quote from the research from American Red Cross, "In addition, information on each donation, including donor demographics and location, was collected. Combined data were analyzed to characterize the epidemiology of TTIs by person, place, and time. Data from 14.8 million donations were collected for 2011 to 2012, representing more than 50% of the US blood supply. Surveillance-positive rates per 10,000 donations were as follows: HBV, 0.76; HCV, 2.0; HIV, 0.28; and HTLV 0.34. Rates did not vary between the 2 years, although there was variation within a year. With the exception of HTLV, rates were higher among males, and all rates were higher among first-time donations. Window-period donations (those positive only in nucleic acid tests) were infrequent (HBV, 13; HCV, 60; HIV, 14) during the 2-year period. Frequencies of surveillance-positive results varied by donor age and residence location. We demonstrated that standardized data from multiple major US blood systems can be combined and analyzed for change. However, TTI frequencies are low, impacting their sensitivity to change."

According to the news reporters, the research concluded: "Furthermore, observed fluctuations in TTI frequencies may be secondary to changes in blood donor demographics rather than necessarily reflecting the immediate impact of policy modification."

Reports from American University Add New Data to Findings in Brain Injuries (A Quantification of the Injury-Induced Changes in Central Aromatase, Oestrogenic Milieu and Steroid Receptor Expression in the Zebra Finch)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Brain Injuries. According to news reporting originating in Washington, District of Columbia, by NewsRx journalists, research stated, "In songbirds and mammals, brain injury results in the up-regulation of aromatase (oestrogen synthase) expression in astroglia. The resulting presumed synthesis of neural oestradiol (E2) has neuroprotective effects including a decrease in neurodegeneration, neuroinflammation and apoptosis."

Financial support for this research came from National Institutes of Health.

The news reporters obtained a quote from the research from American University, "The development of therapeutic tools that exploit oestrogenic neuroprotection in the treatment of neurotrauma requires a precise quantification of the endogenous changes in neural aromatase and E2 following brain injury. Surprisingly, the expected increase in neural oestrogens following brain injury has not been demonstrated. Furthermore, we are just beginning to unravel the mechanisms behind the protective effects of centrally synthesised E2. In the present study, levels of aromatase immunoprotein, neural E2 and steroid receptor mRNA were quantified in adult male and female zebra finches 48?h following a unilateral penetrating brain injury. Both aromatase and E2 were up-regulated in the injured hemisphere of the brain compared to the uninjured hemisphere, demonstrating for the first time a robust increase in neural E2 levels following injury. We did not detect an effect of injury on mRNA expression of the oestrogen receptors (ER)-a, ER-b or GPER-1, but observed a significant decrease in androgen receptor transcription in the injured lobe relative to the contralateral uninjured hemisphere. We conclude that mechanical damage causes a dramatic increase in local aromatisation, and the resultant high levels of central E2 are available to modulate steroid sensitive targets."

According to the news reporters, the research concluded: "Studies using alternate methods of receptor detection and/or time points may be necessary to understand the complete suite of mechanisms underlying the neuroprotective effects of induced oestrogen synthesis in this animal model."

Our news correspondents report that additional information may be obtained by
contacting C.J. Mehos, Dept. of Biology and Center for Behavioral Neuroscience, American University, Washington, DC, United States. Additional authors for this research include L.H. Nelson and C.J Saldanha.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jne.12348. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Lymphoma

Reports from Asahi General Hospital Highlight Recent Findings in Lymphoma (Residual FDG uptake of primary thyroid lymphoma after treatment may overestimate residual lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lymphoma have been published. According to news reporting originating in Chiba, Japan, by NewsRx journalists, research stated, "To assess F-18-fluorodeoxyglucose positron emission tomography/computed tomography (F-18-FDG PET/CT) images in primary thyroid lymphoma (PTL) patients before and after treatment. We conducted a retrospective review of data for ten patients (four men, six women) of mean age 65 (range 48-88) years, with histopathologically confirmed malignant thyroid lymphoma who underwent pre-treatment and post-treatment F-18-FDG PET between January 2005 and December 2014."

The news reporters obtained a quote from the research from Asahi General Hospital, "Thyroid uptake was assessed by the 5-point scale score based on maximum intensity projection images. Four of the ten patients were judged to have a complete metabolic response (scores 1-3) and four to have a partial metabolic response (PMR; scores 4-5). Three of the four PMR patients had a good outcome with a treatment-free interval and overall survival of at least 53.0 months, although two of these three patients showed residual FDG uptake in the thyroid for more than 2 years after completion of treatment. Two of the ten patients were considered to have progressive metabolic disease."

According to the news reporters, the research concluded: "In patients with PTL, residual FDG uptake in the thyroid after treatment that corresponds to a PMR may not always indicate a poor outcome."

For more information on this research see: Residual FDG uptake of primary thyroid lymphoma after treatment may overestimate residual lymphoma. Annals of Nuclear Medicine, 2016;30(10):756-759. Annals of Nuclear Medicine can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Annals of Nuclear Medicine - www.springerlink.com/content/0914-7187/)

Our news correspondents report that additional information may be obtained by contacting H. Fujii, Asahi Gen Hosp, Dept. of Radiol, Asahi, Chiba 2892511, Japan. Additional authors for this research include M. Nakadate, H. Tanaka, N. Harata, S. Oota, J. Isogai and K.
Reports from Asia University Provide New Insights into Cancer Therapy
(Hericium erinaceus Inhibits TNF-a-Induced Angiogenesis and ROS Generation through Suppression of MMP-9/NF-kB Signaling and Activation of Nrf2-Mediated Antioxidant Genes in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Cancer Therapy. According to news reporting originating in Taichung, Taiwan, by NewsRx journalists, research stated, "Hericium erinaceus (HE) is an edible mushroom that has been shown to exhibit anticancer and anti-inflammatory activities. We investigated the antiangiogenic and antioxidant potentials of ethanol extracts of HE in human endothelial (EA.hy926) cells upon tumor necrosis factor-a-(TNF-a-) stimulation (10 ng/mL)."

Funders for this research include Ministry of Science and Technology, Taiwan, National Science Council, China Medical University, Taiwan.

The news reporters obtained a quote from the research from Asia University, "The underlying molecular mechanisms behind the pharmacological efficacies were elucidated. We found that noncytotoxic concentrations of HE (50-200 mg/mL) significantly inhibited TNF-a-induced migration/invasion and capillary-like tube formation of endothelial cells. HE treatment suppressed TNF-a-induced activity and/or overexpression of matrix metalloproteinase-9 (MMP-9) and intercellular adhesion molecule-1 (ICAM-1). Furthermore, HE downregulated TNF-a-induced nuclear translocation and transcriptional activation of nuclear factor-kB (NF-kB) followed by suppression of I-kB (inhibitor-kB) degradation. Data from fluorescence microscopy illustrated that increased intracellular ROS production upon TNF-a-stimulation was remarkably inhibited by HE pretreatment in a dose-dependent manner. Notably, HE triggered antioxidant gene expressions of heme oxygenase-1 (HO-1), g-glutamylcysteine synthetase (g-GCLC), and glutathione levels, which may contribute to inhibition of ROS. Increased antioxidant status was associated with upregulated nuclear translocation and transcriptional activation of NF-E2 related factor-2 (Nrf2) in HE treated cells."

According to the news reporters, the research concluded: "Our findings conclude that antiangiogenic and anti-inflammatory activities of H. erinaceus may contribute to its anticancer property through modulation of MMP-9/NF-kB and Nrf2-antioxidant signaling pathways."

For more information on this research see: Hericium erinaceus Inhibits TNF-a-Induced Angiogenesis and ROS Generation through Suppression of MMP-9/NF-kB Signaling and Activation of Nrf2-Mediated Antioxidant Genes in Human EA.hy926 Endothelial Cells. Urinary Tract

**Reports from Baqiyatallah University of Medical Sciences Advance Knowledge in Urinary Tract [Distribution of virulence genes and genotyping of CTX-M-15-producing Klebsiella pneumoniae isolated from patients with community-acquired urinary tract ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Urinary Tract. According to news reporting originating from Tehran, Iran, by NewsRx correspondents, research stated, "Klebsiella pneumoniae is one of the most important agents of community-acquired urinary tract infection (CA-UTI). In addition to extended-spectrum beta-lactamases (ESBLs), a number of virulence factors have been shown to play an important role in the pathogenesis of K. pneumoniae, including capsule, siderophores, and adhesins."

Our news editors obtained a quote from the research from the Baqiyatallah University of Medical Sciences, "Little is known about the genetic diversity and virulence content of the CTX-M-15-producing K. pneumoniae isolated from CA-UTI in Iran. A total of 152 K. pneumoniae isolates were collected from CA-UTI patients in Tehran from September 2015 through April 2016. Out of 152 isolates, 40 (26.3%) carried bla(CTX-m-15). PCR was performed for detection of virulence genes in CTX-M-15-producing isolates. Furthermore, all of these isolates were subjected to multiple-locus variable-number of tandem repeat (VNTR) analysis (MLVA). Using MLVA method, 36 types were identified. CIX-M-15-producing K. pneumoniae isolates were grouped into 5 clonal complexes (CCs). Of these isolates, mrkD was the most prevalent virulence gene (95%), followed by kpn (60%), rmpA (37.5%), irp (35%), and magA (2.5%). No correlation between MLVA types or CCs and virulence genes or antibiotic resistance patterns was observed."

According to the news editors, the research concluded: "Overall, it is thought that CTX-M-15-producing K. pneumoniae strains isolated from CA-UTI have arisen from different clones."

For more information on this research see: Distribution of virulence genes and genotyping of CTX-M-15-producing Klebsiella pneumoniae isolated from patients with community-acquired urinary tract infection (CA-UTI). *Microbial Pathogenesis*, 2016;100 ():244-249. *Microbial Pathogenesis* can be contacted at: Academic Press Ltd- Elsevier Science

Chemistry - Biochemistry

Reports from Baylor University College of Medicine Highlight Recent Findings in Biochemistry (Conditional knockout of retinal determination genes in differentiating cells in Drosophila)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Chemistry - Biochemistry. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "Conditional gene knockout in postmitotic cells is a valuable technique which allows the study of gene function with spatiotemporal control. Surprisingly, in contrast to its long-term and extensive use in mouse studies, this technology is lacking in Drosophila."

Funders for this research include National Eye Institute, Retina Research Foundation.

The news reporters obtained a quote from the research from the Baylor University College of Medicine, "Here, we use a novel method for generating complete loss of eyes absent (eya) or sine oculis (so) function in postmitotic cells posterior to the morphogenetic furrow (MF). Specifically, genomic rescue constructs with flippase recognition target (FRT) sequences flanking essential exons are used to generate conditional null alleles. By removing gene function in differentiating cells, we show that eya and so are dispensable for larval photoreceptor differentiation, but are required for differentiation during pupal development. Both eya and so are necessary for photoreceptor survival and the apoptosis caused by loss of eya or so function is likely a secondary consequence of inappropriate differentiation. We also confirm their requirement for cone cell development and reveal a novel role in interommatidial bristle (IOB) formation. In addition, so is required for normal eye disc morphology. This is the first report of a knockout method to study eya and so function in postmitotic cells."

According to the news reporters, the research concluded: "This technology will open the door to a large array of new functional studies in virtually any tissue and at any stage of development or in adults."

Our news correspondents report that additional information may be obtained by contacting G. Mardon, Baylor College of Medicine, Program Cell & Mol Biol, Houston, TX 77030, United States. Additional authors for this research include A. Eblimit, M. Pulikkathara, S. Corr, R. Chen and G. Mardon.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/febs.13772. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Toxicology and Pharmacology**

**Reports from Beijing Academy of Agriculture and Forestry Science Add New Data to Findings in Toxicology and Pharmacology [Residue behavior and dietary intake risk assessment of three fungicides in tomatoes (Lycopersicon esculentum Mill.) under ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Toxicology and Pharmacology are discussed in a new report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The residue behavior and dietary intake risk of three fungicides (pyrimethanil, iprodione, kresoxim-methyl) in tomatoes (Lycopersicon esculentum Mill.) grown in greenhouse were investigated. A simple, rapid analytical method for the quantification of fungicide residues in tomatoes was developed using gas chromatography coupled with mass spectrum detection (GC-MSD)."

Financial supporters for this research include National Natural Science Foundation of China, Platform Project of Beijing Academy of Agricultural and Forestry Sciences, Innovation Team in BAAFS.

Our news journalists obtained a quote from the research from the Beijing Academy of Agriculture and Forestry Science, "The fortified recoveries were ranged from 87% to 103% with relative standard deviations (RSDs) varied from 4.7% to 12.1%. The results indicated that the dissipation rate of the studied fungicides in tomatoes followed first order kinetics with half lives in the range of 8.6-11.5 days. The final residues of all the fungicides in tomatoes were varied from 0.241 to 0.944 mg/kg. The results of dietary intake assessment indicated that the dietary intake of the three fungicides from tomatoes consumption for Chinese consumers were acceptable."

According to the news editors, the research concluded: "This study would provide more understanding of residue behavior and dietary intake risk by these fungicides used under greenhouse conditions."

For more information on this research see: Residue behavior and dietary intake risk assessment of three fungicides in tomatoes (Lycopersicon esculentum Mill.) under greenhouse conditions. Regulatory Toxicology and Pharmacology, 2016;81():284-287. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525
Reports from Beijing Institute of Transfusion Medicine Highlight Recent Findings in Cardiology (Energy metabolism regulated by HDAC inhibitor attenuates cardiac injury in hemorrhagic rat model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "A disturbance of energy metabolism reduces cardiac function in acute severe hemorrhagic patients. Alternatively, adequate energy supply reduces heart failure and increases survival."

Our news journalists obtained a quote from the research from the Beijing Institute of Transfusion Medicine, "However, the approach to regulating energy metabolism conductive to vital organs is limited, and the underlying molecular mechanism remains unknown. This study assesses the ability of histone deacetylase inhibitors (HDACIs) to preserve cardiac energy metabolism during lethal hemorrhagic injury. In the lethally hemorrhagic rat and hypoxic myocardial cells, energy metabolism and heart function were well maintained following HDACI treatment, as evident by continuous ATP production with normal cardiac contraction. Valproic acid (VPA) regulated the energy metabolism of hemorrhagic heart by reducing lactate synthesis and protecting the mitochondrial ultrastructure and respiration, which were attributable to the inhibition of lactate dehydrogenase A activity and the increased myeloid cell leukemia-1 (mcl-1) gene expression, ultimately facilitating ATP production and consumption. MCL-1, the key target of VPA, mediated this cardioprotective effect under acute severe hemorrhage conditions."

According to the news editors, the research concluded: "Our results suggest that HDACIs promote cardioprotection by improving energy metabolism during hemorrhagic injury and could therefore be an effective strategy to counteract this process in the clinical setting."

For more information on this research see: Energy metabolism regulated by HDAC inhibitor attenuates cardiac injury in hemorrhagic rat model. Scientific Reports, 2016;6():1-10. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Proteins - Eye Proteins

Reports from Biomedical Research Foundation Add New Data to Findings in Eye Proteins (Desmin and alpha B-crystallin interplay in the maintenance of mitochondrial homeostasis and cardiomyocyte survival)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Proteins - Eye Proteins are presented in a new report. According to news reporting originating from Athens, Greece, by NewsRx correspondents, research stated, "The association of desmin with the alpha-crystallin.-chain (alpha B-crystallin; encoded by CRYAB), and the fact that mutations in either one of them leads to heart failure in humans and mice, suggests a potential compensatory interplay between the two in cardioprotection. To address this hypothesis, we investigated the consequences of alpha B-crystallin overexpression in the desmin-deficient (Des(-/-)) mouse model, which possesses a combination of the pathologies found in most cardiomyopathies, with mitochondrial defects as a hallmark."

Our news editors obtained a quote from the research from Biomedical Research Foundation, "We demonstrated that cardiac-specific alpha B-crystallin overexpression ameliorates all these defects and improves cardiac function to almost wild-type levels. Protection by alpha B-crystallin overexpression is linked to maintenance of proper mitochondrial protein levels, inhibition of abnormal mitochondrial permeability transition pore activation and maintenance of mitochondrial membrane potential (Delta psi(m))."

According to the news editors, the research concluded: "Furthermore, we found that both desmin and alpha B-crystallin are localized at sarcoplasmic reticulum (SR)-mitochondria-associated membranes (MAMs), where they interact with VDAC, Mic60 - the core component of mitochondrial contact site and cristae organizing system (MICOS) complex - and ATP synthase, suggesting that these associations could be crucial in mitoprotection at different levels."

The news editors report that additional information may be obtained by contacting Y. Capetanaki, Biomed Res Fdn, Academy Athens, Center Basic Res, Athens 11527, Greece. Additional authors for this research include E. Soumaka, I. Kloukina, M. Tsikitis, M.

Keywords for this news article include: Athens, Greece, Europe, Intermediate Filament Proteins, Cardiomyocyte, Eye Proteins, Crystallins, Cardiology, Genetics, Desmin, Biomedical Research Foundation.

Heart Disorders and Diseases - Heart Failure

Reports from Brooks College of Health Describe Recent Advances in Heart Failure (Associations between heart failure and physical function in US adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Failure. According to news originating from Jacksonville, Florida, by NewsRx correspondents, research stated, "There is a paucity of nationally representative data in the area of heart failure (HF) and physical function (PF). Examine the relationship(s) between HF and PF in a nationally representative sample of United States (US) adults."

Our news journalists obtained a quote from the research from the Brooks College of Health, "Cross-section analysis of US adults. Sample (n = 6623) included adult (>= 40 years of age) participants from the 1999-2006 National Health and Nutrition Examination Survey. Participants reporting HF answered questions related to their abilities to accomplish specific upper extremity and lower extremity tasks, and household chores. Prevalence estimates of reporting much difficulty or the inability to stand from an armless chair was 9.9% and 4.3% (P = 0.002) in those with and without HF, respectively. Similar estimates were revealed for much difficulty or inability to lift or carry 10 pounds (16.8% and 8.6%, P = 0.0004) and much difficulty or inability to do household chores (13.3% and 6.1%, P = 0.0008). Following adjustments participants reporting HF had significantly greater odds of reporting much difficulty or the inability to stand from an armless chair [odds ratio (OR) 1.93; 95% confidence intervals (CI) 1.25, 2.96], much difficulty or the inability to lift or carry 10 lbs (OR 1.90; 95% CI 1.36, 2.65) and much difficulty or inability to do household chores (OR 2.06; 95% CI 1.41, 3.02) compared with participants not reporting HF."

According to the news editors, the research concluded: "Findings suggest US adults reporting HF are more likely to report poorer PF."

The news correspondents report that additional information may be obtained from J.R. Churilla, Univ North Florida, Dept. of Clin & Appl Movement Sci Exercise Sci, Brooks Coll Hlth, Jacksonville, FL 32224, United States. Additional authors for this research include M.R. Reports from Brown University Provide New Insights into Enterococcus faecium (Homologous Recombination within Large Chromosomal Regions Facilitates Acquisition of beta-Lactam and Vancomycin Resistance in Enterococcus faecium)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - Enterococcus faecium. According to news reporting from Providence, Rhode Island, by NewsRx journalists, research stated, "The transfer of DNA between Enterococcus faecium strains has been characterized both by the movement of well-defined genetic elements and by the large-scale transfer of genomic DNA fragments. In this work, we report on the whole-genome analysis of transconjugants resulting from mating events between the vancomycin-resistant E. faecium C68 strain and the vancomycin-susceptible D344RRF strain to discern the mechanism by which the transferred regions enter the recipient chromosome."

The news correspondents obtained a quote from the research from Brown University, "Vancomycin-resistant transconjugants from five independent matings were analyzed by whole-genome sequencing. In all cases but one, the penicillin binding protein 5 (pbp5) gene and the Tn5382 vancomycin resistance transposon were transferred together and replaced the corresponding pbp5 region of D344RRF. In one instance, Tn5382 inserted independently downstream of the D344RRF pbp5 gene. Single nucleotide variant (SNV) analysis suggested that entry of donor DNA into the recipient chromosome occurred by recombination across regions of homology between donor and recipient chromosomes, rather than through insertion sequence-mediated transposition. The transfer of genomic DNA was also associated with the transfer of C68 plasmid pLRM23 and another putative plasmid. Our data are consistent with the initiation of transfer by cointegration of a transferable plasmid with the donor chromosome, with subsequent circularization of the plasmid-chromosome cointegrant in the donor prior to transfer."

According to the news reporters, the research concluded: "Entry into the recipient chromosome most commonly occurred across regions of homology between donor and recipient chromosomes."

For more information on this research see: Homologous Recombination within Large Chromosomal Regions Facilitates Acquisition of beta-Lactam and Vancomycin Resistance in Enterococcus faecium. Garcia-Solache, Brown University, Rhode Island Hospital, Dept. of Med, Warren Alpert Med Sch, Providence, RI 02903, United States. Additional authors for this research include F. Lebreton, R.E. McLaughlin, J.D. Whiteaker, M.S. Gilmore and L.B. Rice.
Reports from Brussels Free University Describe Recent Advances in Antibiotics (Evaluation of total body weight and body mass index cut-offs for increased cefazolin dose for surgical prophylaxis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antibiotics are presented in a new report. According to news reporting out of Brussels, Belgium, by NewsRx editors, research stated, "French and American guidelines recommend increased dosage regimens of cefazolin (CFZ) for surgical prophylaxis in patients with a body mass index (BMI) >= 35 kg/m(2) or with a total bodyweight (TBW) >= 120 kg. The objective of this study was to evaluate the accuracy of these cut-offs in identifying patients who require CFZ dose adjustment."

Our news journalists obtained a quote from the research from Brussels Free University, "A pharmacokinetic study was conducted in patients of varying TBW and BMI who received 2 g of CFZ intravenously for prophylaxis prior to digestive surgery. Adequacy of therapy, defined as a serum concentration of unbound CFZ (fCFZ) >= 4 mg/L, was evaluated 180 min (T-180) and 240 min (T-240) after the start of CFZ infusion. Possible factors associated with insufficient fCFZ levels were also assessed. A P-value of < 0.05 was considered statistically significant. A total of 63 patients were included in the study, categorised according to BMI (< 35 kg/m(2), 20 patients; and >= 35 kg/m(2), 43 patients) and TBW (< 120 kg, 41 patients; and >= 120 kg, 22 patients). All patients had adequate drug levels at T-180 but only 40/63 patients (63%) had adequate levels at T-240. At T-240, therapy was adequate in 15/20 patients (75%) and 25/43 patients (58%) with BMI < 35 kg/m(2) and >= 35 kg/m(2), respectively (P = 0.20), and in 28/41 patients (68%) and 12/22 patients (55%) with TBW < 120 kg and = 120 kg, respectively (P = 0.28). No factor associated with insufficient fCFZ was identified."

According to the news editors, the research concluded: "Current BMI and TBW cut-offs are poor indicators of which patients could benefit from increased CFZ dosage regimens."

Our news journalists report that additional information may be obtained by contacting M. Hites, Brussels Free University, CUB Erasme Hosp, Dept. of Infect Dis, B-1070 Brussels, Belgium. Additional authors for this research include G. Deprez, F. Wolff, B. Ickx, A. Verleije, J. Closset, P. Loi, J. Prevost, F.S. Taccone, J. Racape, F. Cotton and F. Jacobs.

Drugs and Therapies - Health-System Pharmacy

Reports from C. Walko et al Highlight Recent Findings in Health-System
Pharmacy (Precision medicine in oncology: New practice models and
roles for oncology pharmacists)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- New research on Drugs and Therapies - Health-System Pharmacy is the
subject of a report. According to news originating from Lexington, Kentucky, by NewsRx
correspondents, research stated, "Three different precision medicine practice models developed
by oncology pharmacists are described, including strategies for implementation and
recommendations for educating the next generation of oncology pharmacy practitioners.
Oncology is unique in that somatic mutations can both drive the development of a tumor and
serve as a therapeutic target for treating the cancer."

Our news journalists obtained a quote from the research, "Precision medicine
practice models are a forum through which interprofessional teams, including pharmacists,
discuss tumor somatic mutations to guide patient-specific treatment. The University of
Wisconsin, Indiana University, and Moffit Cancer Center have implemented precision medicine
practice models developed and led by oncology pharmacists. Different practice models,
including a clinic, a clinical consultation service, and a molecular tumor board (MTB), were
adopted to enhance integration into health systems and payment structures. Although the
practice models vary, commonalities of three models include leadership by the clinical
pharmacist, specific therapeutic recommendations, procurement of medications for off-label use,
and a research component. These three practice models function as interprofessional training
sites for pharmacy and medical students and residents, providing an important training resource
at these institutions. Key implementation strategies include interprofessional involvement,
institutional support, integration into clinical workflow, and selection of model by payer mix.
MTBs are a pathway for clinical implementation of genomic medicine in oncology and are an
emerging practice model for oncology pharmacists."

According to the news editors, the research concluded: "Because pharmacists must
be prepared to participate fully in contemporary practice, oncology pharmacy residents must be
trained in genomic oncology, schools of pharmacy should expand precision medicine and
genomics education, and opportunities for continuing education in precision medicine should be
made available to practicing pharmacists."

For more information on this research see: Precision medicine in oncology: New
practice models and roles for oncology pharmacists. American Journal of Health-System
Pharmacy, 2016;73(23):1935-1942. American Journal of Health-System Pharmacy can be
contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD
Reports from C.L.M. Storrer et al Highlight Recent Findings in Alveolar Bone Loss (Effect of alendronate on the progression of periodontitis induced by Porphyromonas gingivalis and Fusobacterium nucleatum: a study in rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Alveolar Bone Loss. According to news reporting from Curitiba, Brazil, by NewsRx journalists, research stated, "The study aimed to investigate the effect of alendronate (ALN) on the inhibition of alveolar bone loss in experimental periodontitis in Wistar rats. Periodontitis was induced by oral inoculation of Porphyromonas gingivalis with Fusobacterium nucleatum."

Financial support for this research came from Positivo University.

The news correspondents obtained a quote from the research, "The rats (n = 80) were randomized as follows: negative control (n = 10); positive control (n = 10); ALN groups: test 8 (n = 10), test 12 (n = 10), and test 16 (n = 10); and placebo groups: control 8 (n = 10), control 12 (n = 10), and control 16 (n = 10). Two milligrams per kilogram of ALN or placebo was administered twice weekly for 8, 12, and 16 weeks. Bone loss was determined by morphological and histological analyses. One independent, blinded examiner (ICC, 0.91) performed the measurements. The distance from the cement enamel junction to the alveolar bone crest of the second lower molar was measured: distal-vestibular (d), furca (f), mesial-vestibular (h), and area. Histometry was performed on the second contralateral molar. Sections (6 μm) were used to determine the furcation bone area (A-FB). The following statistical analyses were conducted: Mann-Whitney and Kruskal-Wallis. PC group developed periodontitis (p < 0.0001). Morphometric analysis determined that ALN was effective in T8 for linear measurements d, f, and h (p < 0.05). No significant differences occurred at test 8, test 12, and test 16. Analysis of A-FB revealed no significant differences between the ALN and placebo groups at 8 and 16 weeks (p > 0.05). ALN was effective against bone loss in relation to A-FB after 12 weeks (p < 0.0001). According to the methodology used, the results suggest that oral administration of ALN could influence alveolar bone loss in rats submitted to experimental periodontitis."

According to the news reporters, the research concluded: "ALN could be a potential therapeutic approach when associated with periodontal treatment."

For more information on this research see: Effect of alendronate on the progression

Our news journalists report that additional information may be obtained by contacting C.L.M. Storrer, Univ Positivo, Grad Program Clin Dental, BR-81280330 Curitiba, PR, Brazil. Additional authors for this research include T.M. Deliberador, A.F. Giovanini, V. Crivellaro, J.C. Zielak and G.A. Romito.

Immunology - Antigen-Presenting Cells

Reports from CNIC Advance Knowledge in Antigen-Presenting Cells [Optimal Generation of Tissue-Resident but Not Circulating Memory T Cells during Viral Infection Requires Crosspriming by DNGR-1(+) Dendritic Cells]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Antigen-Presenting Cells have been published. According to news originating from Madrid, Spain, by NewsRx correspondents, research stated, "Despite the crucial role of tissue-resident memory T (Trm) cells in protective immunity, their priming remains poorly understood. Here, we have shown differential priming requirements for Trm versus circulating memory CD8(+) T cells."

Our news journalists obtained a quote from the research from CNIC, "In vaccinia cutaneous- infected mice, DNGR-1-mediated crosspresentation was required for optimal Trm cell priming but not for their skin differentiation or for circulating memory T cell generation. DNGR-1(+) dendritic cells (DCs) promoted T-bet transcription-factor induction and retention of CD8(+) T cells in the lymph nodes (LNs). Inhibition of LN egress enhanced Trm cell generation, whereas genetic or antibody blockade of DNGR-1 or specific signals provided during priming by DNGR-1(+) DCs, such as interleukin-12 (IL-12), IL-15, or CD24, impaired Trm cell priming. DNGR-1 also regulated Trm cell generation during influenza infection. Moreover, protective immunity depended on optimal Trm cell induction by DNGR-1(+) DCs."

According to the news editors, the research concluded: "Our results reveal specific priming requirements for CD8(+) Trm cells during viral infection and vaccination."
For more information on this research see: Optimal Generation of Tissue-Resident but Not Circulating Memory T Cells during Viral Infection Requires Crosspriming by DNGR-1 (+) Dendritic Cells. *Immunity*, 2016;45(4):847-860. *Immunity* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Immunity - www.journals.elsevier.com/immunity/)

The news correspondents report that additional information may be obtained from S. Iborra, Center Nacl Invest Cardiovasc Carlos III CNIC, Madrid 28029, Spain. Life Science Research - Cell Biology

**Reports from CNIO Advance Knowledge in Cell Biology (Extracellular Vesicles in Cancer: Cell-to-Cell Mediators of Metastasis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Life Science Research - Cell Biology have been published. According to news originating from Madrid, Spain, by NewsRx correspondents, research stated, "Tumor-secreted extracellular vesicles (EVs) are critical mediators of intercellular communication between tumor cells and stromal cells in local and distant microenvironments."

Financial supporters for this research include National Cancer Institute, Department of Defense, Hartwell Foundation, Manning Foundation, Sohn Foundation, STARR Consortium, POETIC Consortium, James Paduano Foundation, Alex’s Lemonade Stand Foundation, Champalimaud Foundation, 5th District AHEPA Cancer Research Foundation, Daedalus Fund, MINECO, AXA, Asociacion Espanola Contra el Cancer, WHRI Academy, Worldwide Cancer Research, Jose Carreras Leukemia Foundation, Physician-Scientist Program, NIH.

Our news journalists obtained a quote from the research from CNIO, "Accordingly, EVs play an essential role in both primary tumor growth and metastatic evolution. EVs orchestrate multiple systemic pathophysiological processes, such as coagulation, vascular leakiness, and reprogramming of stromal recipient cells to support pre-metastatic niche formation and subsequent metastasis."

According to the news editors, the research concluded: "Clinically, EVs may be biomarkers and novel therapeutic targets for cancer progression, particularly for predicting and preventing future metastatic development."

The news correspondents report that additional information may be obtained from H. Peinado, Spanish Natl Canc Res Center CNIO, Microenvironment & Metastasis Lab, Dept. of Mol Oncol, Madrid 28029, Spain. Additional authors for this research include B.K. Thakur, J.M. Weiss, H.S. Kim, H. Peinado and D. Lyden.
Reports from Cancer Center Advance Knowledge in Prostate Cancer
(Androgen-glucocorticoid interactions in the era of novel prostate cancer therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news originating from Stanford, California, by NewsRx correspondents, research stated, "Great strides have been made in the treatment of castration-resistant prostate cancer (CRPC) with the development of new antiandrogens (enzalutamide) and more potent androgen synthesis inhibitors (abiraterone) that have both improved patient outcomes. These new drugs have also helped unravel the complex biology of androgen-androgen receptor driven prostate cancer and brought into prominence various mechanisms triggering the development of drug resistance and tumor cell survival despite use of androgen deprivation therapy (ADT)."

Our news journalists obtained a quote from the research from Cancer Center, "The complex role of glucocorticoids in the treatment, management and progression of patients with CRPC is integral to these advances. Historically, glucocorticoid treatment has resulted in both subjective and objective responses in patients with advanced-stage prostate cancer. With the use of these new therapeutic agents, however, unexpected glucocorticoid-related mechanisms that can cause iatrogenic stimulation of prostate cancer growth have emerged, which might contribute to drug resistance and disease progression despite optimal ADT. For example, the upregulation of glucocorticoid receptors (GRs) during enzalutamide therapy results in glucocorticoid-GR-mediated regulation of androgen target genes, leading to escape from enzalutamide blockade."

According to the news editors, the research concluded: "Thus, understanding the biological role of glucocorticoids in patients with prostate cancer is of major importance in the era of new and evolving antiandrogen therapies."

The news correspondents report that additional information may be obtained from S. Narayanan, Stanford Cancer Centre, 875 Blake Wilbur Drive, Stanford, California 94305, United States. Additional authors for this research include S. Srinivas and D. Feldman.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrurol.2015.254. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Pancreatic Cancer

Reports from Cancer Center Describe Recent Advances in Pancreatic Cancer (Meta-analyses of treatment standards for pancreatic cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news reporting originating from Los Angeles, California, by NewsRx correspondents, research stated, "Pancreatic cancer is the most lethal common cancer with an estimated 5-year survival rate of 6-7% (across all stages). The only potential curative therapy is surgical resection in those with localized disease."

Our news editors obtained a quote from the research from Cancer Center, "Adjuvant (postoperative) therapy confers a survival advantage over postoperative observation alone. Neoadjuvant (preoperative) therapy offers the potential to downstage initially unresectable tumors for resection, sterilize resection margins and decrease locoregional recurrence, and identify a subset of patients with aggressive disease for whom surgery will not be beneficial. Induction chemotherapy followed by consolidation chemoradiation is another recommended approach in those with locally advanced disease. For those who cannot be downstaged, cannot tolerate surgery, or were diagnosed with metastatic disease, treatment remains palliative with chemotherapy being a critical component of this approach. Recently, intensive combination chemotherapy has been shown to improve survival rates in comparison to gemcitabine alone in advanced disease. The past few decades have afforded an accumulation of high-level evidence regarding neoadjuvant, adjuvant and palliative therapies in pancreatic cancer. There are numerous reviews discussing recent retrospective studies, prospective studies and randomized controlled trials in each of these areas. However, reviews of optimal and recommended treatment strategies across all stages of pancreatic cancer that focus on the highest levels of hierarchical evidence, such as meta-analyses, are limited. The discussion of novel therapeutics is beyond the scope of this review."

According to the news editors, the research concluded: "However, an extensive and the most current collection of meta-analyses of first-line systemic and locoregional treatment options for all stages of pancreatic cancer to date has been accumulated."

For more information on this research see: Meta-analyses of treatment standards for pancreatic cancer. Molecular and Clinical Oncology, 2015;4(3):315-325.

The news editors report that additional information may be obtained by contacting J. Gong, Dept. of Internal Medicine, Samuel Oschin Cancer Center, Cedars-Sinai Medical Center, Los Angeles, CA 90048, United States. Additional authors for this research include R. Tuli, A. Shinde and A.E Hendifar.

Keywords for this news article include: Surgery, Oncology, California, Los Angeles, Chemotherapy, United States, Gastroenterology, Clinical Research, Pancreatic Cancer, Drugs and Therapies, Post Trial Research, Pancreatic Neoplasms, North and Central America, Clinical Trials and Studies.

Reports from Capital Medical University Describe Recent Advances in Nasal Polyps (Role of IFN-g, IL-13, and IL-17 on mucociliary differentiation of nasal epithelial cells in chronic rhinosinusitis with nasal polyps)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nose Diseases and Conditions - Nasal Polyps is now available. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Mucociliary dysfunction is a prominent pathophysiological feature of chronic rhinosinusitis with nasal polyps (CRSwNP); however, the precise mechanisms underlying mucociliary dysfunction are still unclear. The aim of this study was therefore to evaluate the effects of IFN-g, IL-13, and IL-17 on human nasal mucociliary differentiation and ciliary beat frequency (CBF) in patients with CRSwNP."

Financial supporters for this research include Program for Changjiang Scholars and Innovative Research Team, National Science Fund for the Major International Joint Research Program, National Natural Science Foundation of China, Natural Science Foundation of Beijing Municipality, Ministry of Health Foundation, Beijing Municipal Administration of Hospitals Clinical Medicine Development of Special Funding Support, Capital Health Research and Development of Special, Specialized Research Fund for the Doctoral Program of Higher Education of China, Special Fund of Sanitation Elite Reconstruction of Beijing, Beijing Health Bureau Program for high level talents.

Our news journalists obtained a quote from the research from Capital Medical University, "Human nasal epithelial cells from tissue of patients with CRSwNP and control subjects were established as air-liquid interface (ALI) primary cultures. Confluent cultures were incubated with 10 ng/mL each of IFN-g, IL-13, or IL-17 for 14 days and assessed for expression of specific morphological markers and factors associated with mucociliary differentiation, the percentage of ciliated and goblet cells, and CBF. In comparison with control subjects, percentage of ciliated cells and CBF were decreased; while percentage of goblet cells, FOXJ1, and MUC5AC mRNA expression were increased in nasal polyp-derived epithelial cultures. Treatment with IFN-g and IL-13 significantly decreased the expression of b-tubulin IV (specific cilia marker), ciliated cell number, and expression of FOXJ1 and DNAI2, in epithelial cultures derived from both CRSwNP patients and control subjects. Furthermore, while both IFN-g and IL-13 treatment significantly decreased the CBF of cells from both CRSwNP patients and control subjects, IL-13 additionally significantly increased goblet cell number and the expression of MUC5AC and CLCA1, in these cultures. IL-17 treatment did not significantly affect ciliated or goblet cell differentiation, CBF, nor MUC5AC and CLCA1 expression, but increased both MUC5B mRNA and protein expression in these cultures."

According to the news editors, the research concluded: "The demonstration that IFN-g and IL-13 both significantly reduce ciliated cell differentiation and CBF in CRSwNP patients, and IL-13 additionally induces significant goblet cell hyperplasia and MUC5AC mucin expression, as well as IL-17 significantly increases MUC5B mucin expression, suggests that these inflammatory cytokines may be potential therapeutic targets in the management of CRSwNP."
For more information on this research see: Role of IFN-γ, IL-13, and IL-17 on mucociliary differentiation of nasal epithelial cells in chronic rhinosinusitis with nasal polyps. *Clinical & Experimental Allergy*, 2016;46(3):449-60. **Transplant Medicine - Kidney Transplants**

**Reports from Careggi University Hospital Describe Recent Advances in Kidney Transplants (1,25 Dihydroxyvitamin D circulating levels, calcitriol administration, and incidence of acute rejection, CMV infection, and polyoma virus infection in ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Transplant Medicine - Kidney Transplants. According to news originating from Florence, Italy, by NewsRx correspondents, research stated, "Observation that 1,25-Dihydroxyvitamin-D3 has an immunomodulatory effect on innate and adaptive immunity raises the possible effect on clinical graft outcome. Aim of this study was to evaluate the correlation of biopsy-proven acute rejection, CMV infection, BKV infection, with 1,25-Dihydroxyvitamin-D3 deficiency and the benefit of calcitriol supplementation before and during the transplantation."

Our news journalists obtained a quote from the research from Careggi University Hospital, "Risk factors and kidney graft function were also evaluated. All RTRs received induction therapy with basiliximab, cyclosporine, mycophenolic acid, and steroids. During the first year, the incidence of BPAR (4% vs 11%, P=.04), CMV infection (3% vs 9%, P=.04), and BKV infection (6% vs 19%, P=.04) was significantly lower in users compared to controls. By multivariate Cox regression analysis, 1,25-Dihydroxyvitamin-D3 deficiency and no calcitriol exposure were independent risk factors for BPAR (HR=4.30, P<.005 and HR=3.25, P<.05), for CMV infection (HR=2.33, P<.05 and HR=2.31, P=.001), and for BKV infection (HR=2.41, P<.05 and HR=2.45, P=.001). After one year, users had a better renal function: eGFR was 62.5 +/- 6.7mL/min vs 51.4 +/- 7.6mL/min (P <.05). Only one user developed polyomavirus-associated nephropathy vs 15 controls. Two users lost their graft vs 11 controls. 1,25(OH)2-D3 deficiency circulating levels increased the risk of BPAR, CMV infection, BKV infection after kidney transplantation."

According to the news editors, the research concluded: "Administration of calcitriol
is a way to obtain adequate 1,25(OH)2-D3 circulating levels."

For more information on this research see: 1,25 Dihydroxyvitamin D circulating levels, calcitriol administration, and incidence of acute rejection, CMV infection, and polyoma virus infection in renal transplant recipients. Clinical Transplantation, 2016;39(10):1347-1359. Clinical Transplantation can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Eye Diseases and Conditions - Conjunctivitis

Reports from Carthage University Describe Recent Advances in Conjunctivitis (Molecular detection and characterization through analysis of the hexon and fiber genes of Adenoviruses causing conjunctivitis in Tunisia, North Africa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Conjunctivitis. According to news reporting originating from Tunis, Tunisia, by NewsRx correspondents, research stated, "Human adenoviruses (HAdVs) are common causes of conjunctivitis. This study describes the epidemiological features and characterizes by phylogenetic analysis HAdVs isolated from patients with conjunctivitis in Tunisia, North Africa."

Our news editors obtained a quote from the research from Carthage University, "Data on out-patients presenting with conjunctivitis during 2 years (2012-2013) were analyzed. Conjunctival swabs obtained from 240 patients were assessed for the presence of HAdVs by PCR amplification on the fiber and hexon genes. Positive PCR products, together with those of nine viral isolates from previous years, were sequenced and analyzed phylogenetically. Conjunctivitis represented 11.5% of all reasons of consultations with a slight increase between mid-March and mid-June. Sixty-five percent of samples (n=156) revealed positive by at least one PCR test. PCR amplification in the hexon gene was slightly more sensitive as compared to the fiber gene. Genotyping in the two genomic regions gave concordant results for almost all isolates. HAdV-D8 was the most predominant genotype (87.6%) and was detected continuously from 2000 to 2013. Minor co-circulating genotypes including HAdV-E4, HAdV-B3, HAdV-
B55, and HAdV-D37 were identified; most of them were detected by amplification in the hexon gene."

According to the news editors, the research concluded: "This work reports molecular data on adenoviral conjunctivitis from a region where such information is scarce and contributes to a better knowledge of the worldwide distribution of causative genotypes. It revealed a predominance and endemic circulation of HAdV-D8, a genotype that was mainly reported from epidemic keratoconjunctivitis. It shows that PCR amplification in two different genomic regions enhances the sensitivity of HAdV detection in clinical samples and the identification of minor genotypes. J. Med. Virol. 89:304-312, 2017."

The news editors report that additional information may be obtained by contacting N. Fedaoui, Univ Carthage, Fac Sci Bizerte, Tunis, Tunisia. Additional authors for this research include N. Ben Ayed, A. Ben Yahia, W. Hammami, L. Matri, L. Nacef and H. Triki.

Heart Disorders and Diseases - Atrial Fibrillation

Reports from Case Western Reserve University Add New Data to Findings in Atrial Fibrillation (Impact of Voltage Mapping to Guide Whether to Perform Ablation of the Posterior Wall in Patients With Persistent Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting from Cleveland, Ohio, by NewsRx journalists, research stated, "Fibrosis as a substrate for atrial fibrillation (AF) has been shown in numerous preclinical models. Voltage mapping enables in vivo assessment of scar in the left atrium (LA), which can be targeted with catheter ablation."

The news correspondents obtained a quote from the research from Case Western Reserve University, "We hypothesized that using the presence or absence of low voltage to guide ablation beyond pulmonary vein antral isolation (PVAI) will improve atrial arrhythmia (AF/AT)-free survival in persistent AF. Single-center retrospective analysis of 2 AF ablation strategies: (1) standard ablation (SA) versus (2) voltage-guided ablation (VGA). PVAI was performed in both groups. With SA, additional lesions beyond PVAI were performed at the discretion of the operator. With VGA, additional lesions to isolate the LA posterior wall were performed if voltage mapping of this region in sinus rhythm showed scar (LA voltage <0.5 mV). AF-/AT-free endpoint was defined as no sustained AF/AT seen off antiarrhythmic medications after a 2-month postablation blanking period. Seventy-six patients underwent SA and 65
underwent VGA. Patients were well matched for comorbidities, LVEF, and left atrial size. Posterior wall ablation was performed in 57% of patients with SA compared to 42% with VGA. VGA ablation increased 1-year AF-/AT-free survival in patients when compared to SA (80% vs. 57%; p=0.005). In a multivariate analysis, VGA was the only independent predictor of AF-/AT-free survival (hazard ratio of 0.30; p=0.002). The presence of LA posterior wall scar may be an important ablation target in persistent AF."

According to the news reporters, the research concluded: "A prospective randomized trial is needed to confirm these data."

Our news journalists report that additional information may be obtained by contacting M.J. Cutler, Heart and Vascular Center, MetroHealth Campus, Case Western Reserve University, Cleveland, Ohio, United States. Additional authors for this research include J. Johnson, K. Abozguia, S. Rowan, W. Lewis, O. Costantini, A. Natale and O. Ziv.

Neutral Amino Acids

Reports from Case Western Reserve University Add New Data to Findings in Neutral Amino Acids (Phosphorylation at Connexin43 Serine-368 Is Necessary for Myocardial Conduction During Metabolic Stress)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neutral Amino Acids. According to news originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Connexin43 (Cx43) phosphorylation alters gap junction localization and function. In particular, phosphorylation at serine-368 (S368) has been suggested to alter gap junctional conductance, but previous reports have shown inconsistent results for both timing and functional effects of S368 phosphorylation."

Financial support for this research came from NIH.

Our news journalists obtained a quote from the research from Case Western Reserve University, "The objective of this study was to determine the functional effects of isolated S368
phosphorylation. We evaluated wild-type Cx43 (AdCx43) and mutations simulating permanent phosphorylation (Ad368E) or preventing phosphorylation (Ad368A) at S368. Function was assessed by optical mapping of electrical conduction in patterned cultures of neonatal rat ventricular myocytes, under baseline and metabolic stress (MS) conditions. Baseline conduction velocity (CV) was similar for all groups. In the AdCx43 and Ad368E groups, MS moderately decreased CV. Ad368A caused complete conduction block during MS. Triton-X solubility assessment showed no change in Cx43 location during conduction impairment. Western blot analysis showed that Cx43-S368 phosphorylation was present at baseline, and that it decreased during MS. Our data indicate that phosphorylation at S368 does not affect CV under baseline conditions, and that preventing S368 phosphorylation makes Cx43 hypersensitive to MS.

According to the news editors, the research concluded: "These results show the critical role of S368 phosphorylation during stress conditions."

The news correspondents report that additional information may be obtained from M.M. Nassal, Heart and Vascular Research Center and Dept. of Physiology & Biophysics, Case Western Reserve University, Cleveland, OH, United States. Additional authors for this research include A.A. Werdich, X. Wan, M. Hoshi, I. Deschene, D.S. Rosenbaum and J.K Donahue.

Ebola Virus

Reports from Centers for Disease Control and Prevention Highlight Recent Findings in Ebola Virus (Ebola Virus Disease Diagnostics, Sierra Leone: Analysis of Real-time Reverse Transcription-Polymerase Chain Reaction Values for Clinical Blood and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Ebola Virus have been published. According to news reporting originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "During the Ebola virus outbreak of 2013-2016, the Viral Special Pathogens Branch field laboratory in Sierra Leone tested approximately 26 000 specimens between August 2014 and October 2015."

Our news editors obtained a quote from the research from Centers for Disease Control and Prevention, "Analysis of the B2M endogenous control Ct values showed its utility
in monitoring specimen quality, comparing results with different specimen types, and interpretation of results. For live patients, blood is the most sensitive specimen type and oral swabs have little diagnostic utility."

According to the news editors, the research concluded: "However, swabs are highly sensitive for diagnostic testing of corpses."

Keywords for this news article include: Atlanta, Georgia, United States, North and Central America, Diagnosis, Diagnostics and Screening, Epidemiology, Viral Hemorrhagic Diseases and Conditions, Virus Diseases and Conditions, Enzymes and Coenzymes, Mononegavirales, Viral Disease, RNA Viruses, Filoviridae, Ebola Virus, Polymerase, Virology, Centers for Disease Control and Prevention.

**Oncology - Colon Cancer**

Reports from Central Hospital Advance Knowledge in Colon Cancer (Enhanced expression of long non-coding RNA Sox2ot promoted cell proliferation and motility in colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Xinxiang, People's Republic of China, by NewsRx journalists, research stated, "Colorectal cancer (CRC) is one of the most common carcinomas throughout the world. Although the diagnostic and therapeutic strategies have made some progression in the treatment of CRC patients, the mortality of CRC remains relatively high."

The news reporters obtained a quote from the research from Central Hospital, "Hence, it is an urgency to find out the detailed mechanisms of how CRC occurs. LncRNA Sox2ot expression was explored in CRC tissues and cell lines by using quantitative real-time PCR (qRT-PCR). Cell proliferation, migration and invasion ability was measured following downregulated expression of IncRNA Sox2ot by siRNA in CRC cells. Furthermore, western blot was used to detected the expression of Cyclin B1, Cdc 25C, N-cadherin, and E-cadherin in si-Sox2ot transfected CRC cells. We found that IncRNA Sox2ot was increased in CRC tissues and cell lines. High expression of Sox2ot was associated with the progression of CRC patients. Decreased Sox2ot expression inhibited the proliferation capacity and caused cell cycle arrested in G0/G1 phase in CRC cells. The key cell cycle regulators Cyclin B1 and Cdc 25C were consistently downregulated by knockdown of Sox2ot. Furthermore, knockdown of Sox2ot
suppressed cell migration and invasion and decreased the expression of mesenchymal protein N-cadherin, while it increased the expression of epithelial protein E-cadherin in CRC cells."

According to the news reporters, the research concluded: "LncRNA Sox2ot could promoted CRC cell proliferation and motility and associated with the outcome of CRC patients, suggesting Sox2ot could serve as a potential therapeutic target in the treatment of CRC."

Our news correspondents report that additional information may be obtained by contacting S.J. Liu, Xinxiang Cent Hosp, Dept. of Gen Surg, Xinxiang 453000, People's Republic of China. Additional authors for this research include B. Xu and D.H. Yan.

**Peptides - Glycopeptides**

**Reports from Central South University Advance Knowledge in Glycopeptides (p53 activates miR-192-5p to mediate vancomycin induced AKI)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptides - Glycopeptides. According to news reporting from Changsha, People's Republic of China, by NewsRx journalists, research stated, "Pathogenic role of p53 in AKI remains controversial and the underlying mechanism is unclear. Here, we tested whether the inhibition of p53 may ameliorate vancomycin (VAN) induced acute kidney injury (AKI)."

The news correspondents obtained a quote from the research from Central South University, "Mice with p53 knock out (p53-KO) were resistant to VAN induced AKI, indicated by the analysis of renal function, histology, and apoptosis. Mechanistically, AKI was associated with the upregulation of several known p53 target genes, including Bax and p21, and this association was attenuated in p53-KO mice. Furthermore, the expression of miR-192-5p was significantly decreased in the p53-KO kidney tissues. In human renal tubular epithelial cell line (HK-2), VAN induced p53 accumulation and miR192-5p expression. Both apoptosis of HK-2 cells and expression of miR-192-5p were also suppressed by pifithrin-alpha. Anti-miR-192-5p significantly blocked VAN-induced apoptosis and caspase activity in HK-2 cells. Consistently, in vivo inhibition of miR-192-5p also suppressed VAN induced AKI."

According to the news reporters, the research concluded: "Thus, we provided clinical and genetic evidence that p53 was associated with the development of VAN induced AKI through upregulation of miR-192-5p."

For more information on this research see: p53 activates miR-192-5p to mediate vancomycin induced AKI. *Scientific Reports*, 2016;6():1-11. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW,
Reports from Chang Gung University Describe Recent Advances in Chronic Hepatitis B Virus (Clinical Relapse After Cessation of Tenofovir Therapy in Hepatitis B e Antigen-Negative Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Chronic Hepatitis B Virus is now available. According to news reporting from Taoyuan, Taiwan, by NewsRx journalists, research stated, "Of the hepatitis B e antigen-negative chronic hepatitis B patients with more than 1 year of sustained hepatitis B virus (HBV) suppression during therapy, the 1-year clinical relapse rate after cessation of entecavir therapy was 45%, of which 25.6% occurred within 6 months. The events after cessation of another preferred drug tenofovir were investigated."

The news correspondents obtained a quote from the research from Chang Gung University, "A retrospective-prospective study was conducted in 85 hepatitis B e antigen-negative chronic hepatitis B patients with sustained HBV suppression who had stopped tenofovir therapy and were monitored every 1 to 3 months for a median duration of 39 weeks (range, 4-133 wk). Clinical relapse occurred in 38 patients, 57.9% and 86.8% within 3 and 6 months, respectively, with an estimated 1-year cumulative incidence of 52%. The optimal duration of therapy and consolidation therapy were calculated to be 3 and 2 years, respectively. Of the relapsers, 81.6% and 57.9% showed an alanine aminotransferase level greater than 5 and 10 times the upper limit of normal, respectively, 23.7% showed a bilirubin level of 2 mg/dL or greater, and 2 developed hepatic decompensation. Relapsers had significantly higher pretherapy baseline hepatitis B surface antigen level, more prior anti-HBV therapy experience, later alanine aminotransferase level normalization, and a shorter duration of treatment and consolidation therapy. Cox regression analyses showed that treatment for more than 3 years combined with consolidation therapy for more than 2 years was an independent significant manageable factor of clinical relapse (adjusted hazard ratio, 0.387; P = .008). With this combination, the clinical relapse rate was reduced to 30%. Clinical relapses occurred mostly within 6 months, with high alanine aminotransferase and serum bilirubin levels."

According to the news reporters, the research concluded: "Closer monitoring, monthly in the first 3 to 6 months, with timely re-treatment is mandatory for a safe cessation of tenofovir therapy."

For more information on this research see: Clinical Relapse After Cessation of Tenofovir Therapy in Hepatitis B e Antigen-Negative Patients. Clinical Gastroenterology and
**Reports from Changhai Hospital Describe Recent Advances in Cytokines (MicroRNA-126a Directs Lymphangiogenesis Through Interacting With Chemokine and Flt4 Signaling in Zebrafish)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Intercellular Signaling Peptides and Proteins - Cytokines is the subject of a report. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "MicroRNA-126 (miR-126) is an endothelium-enriched miRNA and functions in vascular integrity and angiogenesis. The application of miRNA as potential biomarker and therapy target has been widely investigated in various pathological processes."

Our news journalists obtained a quote from the research from Changhai Hospital, "However, its role in lymphatic diseases had not been widely explored. We aimed to reveal the role of miR-126 in lymphangiogenesis and the regulatory signaling pathways for potential targets of therapy. Approach and Results-Loss-of-function studies using morpholino oligonucleotides and CRISPR/Cas9 (clustered regularly interspaced short palindromic repeats/CRISPR-associated protein 9) system showed that silencing of miR-126a severely affected the formation of parachordal lymphangioblasts and thoracic duct in zebrafish embryos, although their development in miR-126b knockdown embryos was normal. Expression analyses by in situ hybridization and immunofluorescence indicated that miR-126a was expressed in lymphatic vessels, as well as in blood vessels. Time-lapse confocal imaging assay further revealed that knockdown of miR-126a blocked both lymphangiogenic sprouts budding from the posterior cardinal vein and lymphangioblasts extension along horizontal myoseptum. Bioinformatics analysis and in vivo report assay identified that miR-126a upregulated Cxcl12a by targeting its 5’ untranslated region. Moreover, loss-and gain-of-function studies revealed that Cxcl12a signaling acted downstream of miR-126a during parachordal lymphangioblast extension, whereby Flt4 signaling acts as a cooperator of miR-126a, allowing it to modulate lymphangiogenic sprout formation. These findings demonstrate that miR-126a directs lymphatic
endothelial cell sprouting and extension by interacting with Cxcl12a-mediated chemokine signaling and Vegfc-Flt4 signal axis."

According to the news editors, the research concluded: "Our results suggest that these key regulators of lymphangiogenesis may be involved in lymphatic pathogenesis of cardiovascular diseases."

For more information on this research see: MicroRNA-126a Directs Lymphangiogenesis Through Interacting With Chemokine and Flt4 Signaling in Zebrafish. Arteriosclerosis Thrombosis and Vascular Biology, 2016;36(12):2381-2393. Cardiology

Reports from Children's Medical Center Describe Recent Advances in Cardiology (Smaller-Sized Expanded Polytetrafluoroethylene Conduits With a Fan-Shaped Valve and Bulging Sinuses for Right Ventricular Outflow Tract Reconstruction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiology. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "One of the critical factors limiting conduit longevity in right ventricular outflow tract (RVOT) reconstruction with homografts and xenografts is the small size of the conduit. The aim of our study was to assess the outcome of using smaller-sized expanded polytetrafluoroethylene (ePTFE) conduits with a fan-shaped valve and bulging sinuses for RVOT reconstruction."

Our news editors obtained a quote from the research from Children's Medical Center, "This retrospective review examined 303 patients who underwent RVOT reconstruction with ePTFE conduits at 63 Japanese hospitals between 2003 and 2014. Inclusion criteria were a conduit size less than or equal to 16 mm and the use of operative treatment as the primary correction for underlying heart disease. Patients undergoing palliative procedures were excluded. Median follow-up was 1.7 years. Freedom from conduit replacement and freedom from conduit reintervention were 90.1% +/- 4.8% and 77.2% +/- 5.6%, respectively. The most common indication for conduit reintervention was pulmonary artery (PA) bifurcation stenosis (82%). Modeling z-scores as a dichotomous variable revealed that freedom from conduit reintervention for PA bifurcation stenosis was significantly decreased for conduits with a z-score greater than or equal to 1.4 compared with z-scores less than 1.4 (p=0.036). There were 30 patients (9.9%) who experienced at least moderate conduit stenosis and 21 patients (6.9%) with..."
at least moderate conduit insufficiency. Univariate Cox regression analysis showed that conduit size was a significant factor for conduit stenosis (p=0.006). Excellent midterm outcomes were achieved with ePTFE valved conduits, even when using smaller sizes."

According to the news editors, the research concluded: "Conduit z-scores around 1.4 were optimal for RVOT reconstruction in younger patients."

The news editors report that additional information may be obtained by contacting E. Yamashita, Tokyo Metropolitan Children's Med Center, Dept. of Pediat Cardiovascular Surg, Tokyo, Japan. Additional authors for this research include M. Yamagishi, T. Miyazaki, Y. Maeda, Y. Yamamoto, K. Nato, S. Asada, H. Hongu and H. Yaku.

Reports from Children's Memorial Hermann Hospital Highlight Recent Findings in Twin-to-Twin Transfusion Syndrome (Aortic distensibility as a surrogate for intertwin pulse pressure differences in monochorionic pregnancies with and without ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pregnancy Complications - Twin-to-Twin Transfusion Syndrome. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Twin-twin transfusion syndrome (TTTS) complicates 10-15% of monochorionic diamniotic (MCDA) twin pregnancies. The donor response to hypovolemia allows the transfer of vasoactive mediators to the recipient, causing increased recipient afterload and hypertension."

Our news editors obtained a quote from the research from Children's Memorial Hermann Hospital, "Our objective was to apply a novel speckle-tracking technique to measure the aortic fractional area change (AFAC) during the cardiac cycle in MCDA twins with and without TTTS, and identify intertwin differences in AFAC and parameters of cardiac function. High-frame rate four-chamber views of the fetal heart, including the mid-thoracic aorta, were collected prospectively in MCDA twin pairs referred to our center between June 2014 and April 2015. Using speckle-tracking software, the endovascular border of the aorta was traced manually during systole, with guidance on cardiac cycle timing by anatomical M-mode. AFAC, defined as the difference between maximum and minimum area divided by minimum area, expressed as a percentage, was calculated offline and averaged over three cardiac cycles. Tissue
Doppler and displacement were used to measure long-axis cardiac function. Intra- and interclass correlation coefficients were used to test observer variability. Fifty-one MCDA twin pregnancies were included, comprising uncomplicated MCDA (n=14), TTTS Stages 1/2 (n=21) and TTTS Stages 3/4 (n=16). Median gestational age was 20.4 (range, 16.2-27.5) weeks. Mean +/- SD heart rate was 142.6 +/- 7.2 bpm with no significant intertwin pair differences. AFAC was significantly higher in recipients than in donors of TTTS pairs (Stages 1/2: 72.3 +/- 29.9% vs 43.7 +/- 19.3%, P<0.001; Stages 3/4: 75.2 +/- 29.2% vs 42.5 +/- 18.4%, P=0.002), consistent with higher recipient pulse pressure. No intertwin differences in AFAC were seen in uncomplicated MCDA pairs. Inter-and intraclass correlation coefficients for AFAC were 0.894 and 0.888. AFAC correlated significantly with combined cardiac output (r=0.252, P=0.011) and left and right E/E' ratio (left: r=0.302, P=0.004; right: r=0.247, P=0.030).

According to the news editors, the research concluded: "AFAC is a quantifiable and reproducible method to assess aortic distensibility and is a promising tool to monitor the response to prelaser therapeutic interventions in pregnancies with TTTS."

The news editors report that additional information may be obtained by contacting H.M. Gardiner, UT Hlth McGovern Med Sch, Dept. of Obstet Gynecol & Reprod Sci, Childrens Mem Hermann Hosp, Fetal Center, Houston, TX, United States. Additional authors for this research include F.A. Osei, K.J. Moise, A. Johnson, R. Papanna, M. Bebbington and H.M. Gardiner.

Hematology - Blood Coagulation Factors
Reports from Chinese Academy of Sciences Advance Knowledge in Blood Coagulation Factors (Determination of the platelet-derived growth factor BB by a competitive thrombin-linked aptamer-based Fluorometric assay)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematology - Blood Coagulation Factors is the subject of a report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "The authors describe a competitive aptamer based assay for detection of the platelet-derived growth factor BB (PDGF-BB; used as a model protein). The assay is making use of thrombin (a serine protease) as an enzyme label for reporting signals."

Financial support for this research came from National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from the Chinese
Academy of Sciences, "It is taking advantage of a highly selective aptamer and of the fairly specific enzymatic activity of thrombin in terms of cleaving artificial fluorogenic peptide substrates. In a first step, the surface of wells of microplates is coated with PDGF-BB. On addition of a sample containing PDGF-BB, free and bound PDGF-BB compete with each other for binding to a DNA probe that consists of an aptamer sequence for PDGF-BB and a 29-mer aptamer sequence for thrombin. After washing, thrombin is added and will attach to the DNA probe that bound to the PDGF-BB on the microplates. Following addition of a fluorogenic peptide substrate, the bound thrombin will catalyze the cleavage of the substrate to generate a fluorescent product whose fluorescence intensity is measured at excitation/emission wavelengths of 370/440 nm. Fluorescence intensity decreases with increasing PDGF-BB concentration in the sample because less thrombin will bind to the PDGF-BB coated surface of the microplate. Under optimal conditions, PDGF-BB can be quantified in the 0.125 to 3 nM concentration range."

According to the news reporters, the research concluded: "This assay was successfully applied to the determination of PDGF-BB in spiked 100-fold diluted human serum."

For more information on this research see: Determination of the platelet-derived growth factor BB by a competitive thrombin-linked aptamer-based Fluorometric assay. *Microchimica Acta*, 2016;183(12):3229-3235. *Microchimica Acta* can be contacted at: Springer Wien, Sachsenplatz 4-6, PO Box 89, A-1201 Wien, Austria. (Springer - www.springer.com; Microchimica Acta - www.springerlink.com/content/0026-3672/)

Our news journalists report that additional information may be obtained by contacting Q. Zhao, Chinese Academy Sci. Res Center Ecoenvironn Sci, State Key Lab Environm Chem & Ecotoxicol, Beijing 100085, People's Republic of China.

**Drugs and Therapies - Chemotherapy**

**Reports from Chinese Academy of Sciences Provide New Insights into Chemotherapy (Intracellularly Acid-Switchable Multifunctional Micelles for Combinational Photo/Chemotherapy of the Drug-Resistant Tumor)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Chemotherapy have been published. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "The intrinsic or acquired drug resistance is the main challenge for cancer chemotherapy today. So far, many nanosized drug delivery systems (NDDS) have been exploited to combat cancer drug resistance."

Financial supporters for this research include Ministry of Science and Technology of
the People's Republic of China, Youth Innovation Promotion Association of the Chinese Academy of Sciences, National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the Chinese Academy of Sciences, "However, the therapy efficacy of current NDDS is severely impaired by the limited tumor penetration of the nanoparticles due to the existence of physiological and pathological barriers in the solid tumor. In this study, we report on the design and fabrication of intracellularly acid-switchable multifunctional micelles for combinational photo-and chemotherapy of the drug-resistant tumor. The micelles were composed of a pH-responsive diblock copolymer, a photosensitizer, and a polymeric prodrug of doxorubicin. The micelle displayed silenced fluorescence and photoactivity during the blood circulation and switched to an active state in weakly acid conditions (i.e., pH (<=) 6.2) in the endocytic vesicles to dramatically induce a 7.5-fold increase of the fluorescence signal for fluorescence imaging. Upon near-infrared (NIR) laser irradiation, the micelle induced notable reactive oxygen species generation to trigger cytosol release of the chemotherapeutics and perform photodynamic therapy (PDT). Moreover, the micelle efficiently converted the NIR light to local heat for enhancing tumor penetration of the anticancer drug, tumor specific photothermal therapy, and photoacoustic (PA) imaging. Furthermore, the micelles could generate amplified magnetic resonance (MR) signal in an acidic microenvironment to perform MR imaging."

According to the news editors, the research concluded: "Collectively, this study presents a robust nanoplatform for multimodal imaging and combinational therapy of the drug-resistant tumor, which might provide an insight for developing polymer-based NDDS for cancer therapy."

The news correspondents report that additional information may be obtained from T. Wang, State Key Laboratory of Drug Research & Center of Pharmaceutics, Shanghai Institute of Materia Medica, Chinese Academy of Sciences, Shanghai 201203, People's Republic of China. Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Esophageal Cancer is now available. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Naked cuticle homolog 2 (NKD2) was found to be frequently methylated in human breast and gastric cancers. However, the epigenetic changes and mechanisms of NKD2 in human esophageal cancer remain unclear."

Financial supporters for this research include National Basic Research Program of China, National High-Tech R&D Program of China, National Key Scientific Instrument Special Program of China, National Science Foundation of China.

Our news journalists obtained a quote from the research from Chinese People's Liberation Army General Hospital, "Nine esophageal cancer cell lines and 154 cases of primary esophageal cancer samples were analyzed using methylation-specific polymerase chain reaction, immunohistochemical analysis, Western blot, and xenograft mouse models. Loss of NKD2 expression and complete methylation were found in KYSE150 and TE1 cells. Reduced NKD2 expression and partial methylation of the promoter region were observed in KYSE30, KYSE70, ICYSE410, KYSE140, and COL0680 cells. High levels of NKD2 expression and unmethylation were detected in KYSE450 and TE8 cells. Reexpression of NKD2 was induced by 5-aza-2'-deoxycytidine in cells in which NKD2 was not expressed or cells in which NKD2 expression was reduced. NKD2 was methylated in 53.2% of human primary esophageal cancer samples (82 of 154), and promoter region hypermethylation was significantly associated with reduced expression of NKD2 (p < 0.01). NKD2 methylation was associated with tumor, node, and metastasis stage and lymph node metastasis (p < 0.01). Our results suggest that NKD2 is regulated by promoter region methylation and that methylation of NKD2 may serve as a prognostic marker in esophageal cancer. Our further studies demonstrate that NKD2 suppresses cell proliferation, colony formation, cell invasion, and migration and also induces G1/S checkpoint arrest in esophageal cancer cells. NKD2 suppressed xenograft tumor growth and inhibited Wnt signaling in human esophageal cancer cells. NKD2 is frequently methylated in human esophageal cancer, and the expression of NKD2 is regulated by promoter region methylation."

According to the news editors, the research concluded: "NKD2 suppresses esophageal cancer progression by inhibiting Wnt signaling both in vitro and in vivo."

Our news journalists report that additional information may be obtained by contacting M.Z. Guo, Chinese Peoples Liberat Army Gen Hosp, Dept. of Gastroenterol & Hepatol, Beijing 100853, People's Republic of China. Additional authors for this research include W.L. Yang, Y.S. Jin, M.Y. Zhang, T. He, Q.M. Zhan, J.G. Herman, G.L. Zhong and M.Z. Guo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jtho.2016.06.015. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from Chung Shan Medical University Provide New Insights into Pneumonia (Utility of Plasma Osteopontin Levels in Management of Community-Acquired Pneumonia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Pneumonia. According to news reporting originating from Taichung, Taiwan, by NewsRx correspondents, research stated, "Osteopontin (OPN) is an essential cytokine involved in immune cell recruitment and an important regulator of inflammation. The purpose of this study was to examine differences in OPN plasma levels between before and after antibiotic treatment in hospitalized adult patients with community-acquired pneumonia (CAP)."

Our news editors obtained a quote from the research from Chung Shan Medical University, "OPN levels were measured in 93 patients with CAP and 54 healthy controls using a commercial enzyme-linked immunosorbent assay (ELISA). The CURB-65, Pneumonia Severity Index (PSI), and Acute Physiology and Chronic Health Evaluation II (APACHE II) scores were used to determine the CAP severity in patients upon initial hospitalization. A decline in the number of white blood cells (WBCs) and neutrophils, and decreases in the levels of OPN and C-reactive protein (CRP) were observed after antibiotic treatment. Only the plasma level of OPN, but not CRP, was correlated with the severity of CAP based on the PSI (r = 0.514, p< 0.001), CURB-65 (r = 0.396, p< 0.001), and APACHE II scores (r = 0.473, p< 0.001). The OPN level also showed a significant correlation with the length of hospital stay (r = 0.210, p = 0.044)."

According to the news editors, the research concluded: "Plasma level of OPN may act as diagnostic adjuvant biomarkers for CAP and further play a role in clinical assessment of the severity of CAP, which could potentially guide the development of treatment strategies."

For more information on this research see: Utility of Plasma Osteopontin Levels in Management of Community-Acquired Pneumonia. International Journal of Medical Sciences, 2016;13(9):673-679. International Journal of Medical Sciences can be contacted at: Ivyspring Int Publ, PO Box 4546, Lake Haven, Nsw 2263, Australia.

The news editors report that additional information may be obtained by contacting S.F. Yang, Chung Shan Medical University, Dept. of Med Res, Taichung, Taiwan. Additional authors for this research include W.Y. Hung, K.J. Bai, S.F. Yang and M.H. Chien.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.7150/ijms.16175. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiology

Reports from Cleveland Clinic Add New Data to Findings in Cardiology (Etomidate and the Risk of Complications After Cardiac Surgery: A Retrospective Cohort Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiology is now available. According to news reporting originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "To compare incidence of atrial arrhythmia, duration of care, and major complications after cardiac surgery between patients who received etomidate and those who received other induction agents. Retrospective cohort study utilizing propensity score matching."

Our news editors obtained a quote from the research from Cleveland Clinic, "A single academic, tertiary care hospital. Eight thousand nine hundred seventy-eight patients undergoing coronary artery bypass grafting (CABG), valve, or combined valve/CABG surgery requiring cardiopulmonary bypass between January 2005 and December 2010. Patients were divided into those who received etomidate at anesthetic induction and those who received another induction agent. Patients given etomidate were propensity-score matched to patients given other induction agents in a 2:1 ratio. Of 8,978 patients who underwent CABG, valve, or combined valve/surgery, 6,313 received etomidate and 2,665 received other induction agents. Among these, the authors successfully matched 4,094 etomidate patients with 2,524 non-etomidate patients. The authors did not find a significant association between receiving etomidate and odds of experiencing postoperative atrial arrhythmia (odds ratio [98.3% confidence interval] of 1.07 [0.92, 1.23], p = 0.29). Etomidate was not associated significantly with either intensive care unit or hospital stay. Etomidate was associated significantly with use of packed red blood cells (odds ratio [99.6% confidence interval] of 1.32 [1.02, 1.70], p = 0.002), but not with use of fresh frozen plasma, platelets, or cryoprecipitate. None of the other complications differed significantly between the groups."

According to the news editors, the research concluded: "Etomidate was not associated with increased incidence of postoperative atrial arrhythmia or increased intensive care unit or hospital stay."

The news editors report that additional information may be obtained by contacting A. Turan, Cleveland Clinic, Dept. of Outcomes Res, Inst Anesthesiol, Cleveland, OH 44195, United States. Additional authors for this research include N. Makarova, J. You, D.I. Sessler, D.G. Anthony, Y. Kasuya, E.G. Soltesz and A. Turan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1053/j.jvca.2016.04.022. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Prostate Cancer

Reports from Cleveland Clinic Add New Data to Findings in Prostate Cancer (Molecular Analysis of Low Grade Prostate Cancer Using a Genomic Classifier of Metastatic Potential)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "We determined how frequently histological Gleason 3 + 3 = 6 tumors have the molecular characteristics of disease with metastatic potential. We analyzed prostatectomy tissue from 337 patients with Gleason 3 + 3 disease."

Our news journalists obtained a quote from the research from Cleveland Clinic, "All tissue was re-reviewed in blinded fashion by genitourinary pathologists using 2005 ISUP (International Society of Urological Pathology) Gleason grading criteria. A previously validated Decipher ® metastasis signature was calculated in each case based on a locked model. To compare patient characteristics across pathological Gleason score categories we used the Fisher exact test or the ANOVA F test. The distribution of Decipher scores among different clinicopathological groups was compared with the Wilcoxon rank sum test. The association of Decipher score with adverse pathology features was examined using logistic regression models. The significance level of all statistical tests was 0.05. Of men with Gleason 3 + 3 = 6 disease only 269 (80%) had a low Decipher score with intermediate and high scores in 43 (13%) and 25 (7%), respectively. Decipher scores were significantly higher among pathological Gleason 3 + 3 = 6 specimens from cases with adverse pathological features such as extraprostatic extension, seminal vesicle involvement or positive margins (p < 0.001). The median Decipher score in patients with margin negative pT2 disease was 0.23 (IQR 0.09-0.42) compared to 0.30 (IQR 0.17-0.42) in patients with pT3 disease or positive margins (p = 0.005). Using a robust and validated prognostic signature we found that a small but not insignificant proportion of histological Gleason 6 tumors harbored molecular characteristics of aggressive cancer."

According to the news editors, the research concluded: "Molecular profiling of such tumors at diagnosis may better select patients for active surveillance at diagnosis and trigger appropriate intervention during followup."

Heart Disorders and Diseases - Atrioventricular Block

Reports from Cleveland Clinic Advance Knowledge in Atrioventricular Block (Incidence and predictors of right ventricular pacing-induced cardiomyopathy in patients with complete atrioventricular block and preserved left ventricular systolic block...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrioventricular Block. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "Right ventricular (RV) pacing may worsen left ventricular cardiomyopathy in patients with reduced left ventricular ejection fraction (LVEF) and advanced atrioventricular block. The objectives of this study were to calculate incidence and identify predictors of RV pacing-induced cardiomyopathy (PICM) in complete heart block (CHB) with preserved LVEF and to describe outcomes of subsequent cardiac resynchronization therapy (CRT) upgrade."

The news reporters obtained a quote from the research from Cleveland Clinic, "An analysis of consecutive patients receiving permanent pacemaker (PPM) from 2000 to 2014 for CHB with LVEF >50% was performed. PICM was defined as CRT upgrade or post-PPM LVEF <= 40%. PICM association was determined via multivariable regression analysis. CRT response was defined by LVEF increase >= 10% or left ventricular end-systolic volume decrease >= 15%. Of the 823 study patients, 101 (12.3%) developed PICM over the mean follow-up of 4.3 +/- 3.9 years, with post-PPM LVEF being 33.7% +/- 7.4% in patients with PICM vs 57.6% +/- 6.1% in patients without PICM (P < .001). In multivariable analysis, lower pre-PPM LVEF (hazard ratio [HR] 1.047 per 1% LVEF decrease; 95% confidence interval [CI] 1.002-1.087; P = .042) and RV pacing % both as a continuous (HR 1.011 per 1% RV pacing; 95% CI 1.002-1.02; P = .021) and as a categorical (<20% or >= 20% RV pacing) (HR 6.76; 95% CI 2.08-22.0; P = .002) variable were independently associated with PICM. Only 29 patients with PICM (28.7%) received CRT upgrade despite an 84% responder rate (LVEF increase 18.5% +/- 8.1% and left ventricular end-systolic volume decrease 45.1% +/- 15.0% in responders). CRT upgrade was associated with greater post-PPM LVEF decrease, lower post-PPM LVEF, and post-PPM LVEF <35% (P = .006, P = .004, and P = .004, respectively). PICM is not uncommon in patients receiving PPM for CHB with preserved LVEF and is strongly associated with RV pacing burden >20%.

According to the news reporters, the research concluded: "CRT response rate is high in PICM, but is perhaps underutilized."

For more information on this research see: Incidence and predictors of right ventricular pacing-induced cardiomyopathy in patients with complete atrioventricular block and preserved left ventricular systolic function. Heart Rhythm, 2016;13(12):2272-2278. Heart Rhythm can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-
Reports from Cleveland Clinic Provide New Insights into Aortic Dissection (Stent Grafting Acute Aortic Dissection: Comparison of DeBakey Extent IIIA Versus IIIB)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Aortic Dissection are discussed in a new report. According to news originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Thoracic endovascular aortic repair (TEVAR) with stent grafting is effective for acute dissection in selected patients, but most remain at risk for reintervention. The effect of the extent of dissection on outcome is unclear."

Our news journalists obtained a quote from the research from Cleveland Clinic, "Objectives of this study were to compare characteristics, outcomes, and aortic remodeling after TEVAR between patients with DeBakey extent IIIA and IIIB dissection. From 2005 to 2013, 520 patients presented with acute aortic syndrome. TEVAR was performed in 108 (41 IIIA, 67 IIIB) during the acute phase. Detailed three-dimensional computed tomography imaging analysis was performed in all patients. Patients with IIIA dissection were older (69.9 +/- 10 vs 59.5 +/- 13 years; p< 0.001) and more likely to have had prior cardiovascular operations (p = 0.01) than IIIB. The most common indication for TEVAR was ischemia in IIIB (66%), and pain (34%) in IIIA. Rupture was more common in IIIA (24.3% vs 1.5%; p< 0.001). Aortic diameters were similar between groups, but IIIB patients had smaller true/false lumen ratio (0.89 +/- 1.08 vs 1.76 +/- 1.27; p = 0.003). Stent graft coverage was 152 +/- 42 mm for IIIA vs 212 +/- 85 mm for IIIB (p < 0.001). Additional branch stents were used in 20 IIIB patients (30%), and 7 had infrarenal stenting. Early mortality and complications were similar between groups, except for renal failure (4.4% IIIIB vs 0% IIIA; p = 0.04). Mean follow-up was 30 +/- 28 months. Estimated survival at 1, 3 and 5 years was 84%, 65%, and 38% for IIIA, and 70%, 66%, and 59% for IIIB, respectively, with no significant difference. Significant expansion of the true lumen occurred in both groups after stenting, and the aortic and false lumen diameter increased only at the level of the abdominal aorta in IIIB patients. The false lumen was thrombosed in 91% of IIIA vs 62% of IIIB patients at the mid-descending aorta. Intervention was required in 15% (6 of 39) of IIIA and
in 26% (15 of 58) of IIIB patients. In patients requiring TEVAR for acute dissection, patient factors and aortic morphology differ by the extent of the dissection. Aortic remodeling after TEVAR was better in patients with limited extent (IIIA) dissection than in patients with extensive (IIIB) dissection.

According to the news editors, the research concluded: "Despite these differences, very little difference was noted in early and late outcomes, which may be explained by differences in patient characteristics."

The news correspondents report that additional information may be obtained from A. Arafat, Cleveland Clinic, Inst Heart & Vasc, Aorta Center, Dept. of Cardiovasc Med, Cleveland, OH 44106, United States. Additional authors for this research include E.E. Roselli, J.J. Idrees, K. Feng, L. Banaszak, M. Eagleton, V. Menon and L.G. Svensson.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.atheracsur.2016.04.085. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Cleveland, Ohio, United States, North and Central America, Aortic Dissection, Cardiology, Angiology, Cleveland Clinic.

**Reports from Columbia University Add New Data to Findings in Bisphosphonates (Differential Effects of Teriparatide and Zoledronic Acid on Bone Mineralization Density Distribution at 6 and 24 Months in the SHOTZ Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Bisphosphonates have been presented. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "The Skeletal Histomorphometry in Patients on Teriparatide or Zoledronic Acid Therapy (SHOTZ) study assessed the progressive effects of teriparatide (TPTD) and zoledronic acid (ZOL) on bone remodeling and material properties in postmenopausal women with osteoporosis. Previously, we reported that biochemical and histomorphometric bone formation indices were significantly higher in patients receiving TPTD versus ZOL."

Our news journalists obtained a quote from the research from Columbia University, "Here we report bone mineralization density distribution (BMDD) results based on quantitative backscattered electron imaging (qBEI). The 12-month primary study was randomized and double blind until the month 6 biopsy, then open label. Patients (TPTD, n = 28; ZOL, n = 31) were then eligible to enter a 12-month open-label extension with their original treatment: TPTD 20 mu g/d (subcutaneous injection) or ZOL 5 mg/yr (intravenous infusion). A second biopsy was collected from the contralateral side at month 24 (TPTD, n = 10; ZOL, n = 10). In
cancellous bone, ZOL treatment was associated at 6 and 24 months with significantly higher average degree of mineralization (Ca-MEAN, +2.2%, p = 0.018; +3.9%, p = 0.009, respectively) and with lower percentage of low mineralized areas (Ca-LOW, -34.6%, p = 0.029; -33.7%, p = 0.025, respectively) and heterogeneity of mineralization Ca-WIDTH (-12.3%, p = 0.003; -9.9%, p = 0.012, respectively), indicating higher mineralization density and more homogeneous mineral content versus TPTD. Within the ZOL group, significant changes were found in all parameters from month 6 to 24, indicating a progressive increase in mineralization density. In sharp contrast, mineralization density did not increase over time with TPTD, reflecting ongoing deposition of new bone. Similar results were observed in cortical bone. In this study, TPTD stimulated new bone formation, producing a mineralized bone matrix that remained relatively heterogeneous with a stable mean mineral content. ZOL slowed bone turnover and prolonged secondary mineralization, producing a progressively more homogeneous and highly mineralized bone matrix."

According to the news editors, the research concluded: "Although both TPTD and ZOL increase clinical measures of bone mineral density (BMD), this study shows that the underlying mechanisms of the BMD increases are fundamentally different."

Keywords for this news article include: New York City, New York, United States, North and Central America, Parathyroid Hormone and Analogs, Drugs and Therapies, Peptide Proteins, Zoledronic Acid, Bisphosphonates, Pharmaceuticals, Bone Research, Teriparatide, Hormones, Columbia University.

Amphetamines
Reports from Columbia University Advance Knowledge in Amphetamines (Mechanisms of amphetamine action illuminated through optical monitoring of dopamine synaptic vesicles in Drosophila brain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Amphetamines have been published. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Amphetamines elevate extracellular dopamine, but the underlying mechanisms remain uncertain. Here we show in rodents that acute pharmacological inhibition of the vesicular monoamine transporter (VMAT) blocks amphetamine-induced locomotion and self-administration without impacting cocaine-induced behaviours."
Our news journalists obtained a quote from the research from Columbia University, "To study VMAT's role in mediating amphetamine action in dopamine neurons, we have used novel genetic, pharmacological and optical approaches in Drosophila melanogaster. In an ex vivo whole-brain preparation, fluorescent reporters of vesicular cargo and of vesicular pH reveal that amphetamine redistributes vesicle contents and diminishes the vesicle pH-gradient responsible for dopamine uptake and retention. This amphetamine-induced deacidification requires VMAT function and results from net H(+) antiport by VMAT out of the vesicle lumen coupled to inward amphetamine transport. Amphetamine-induced vesicle deacidification also requires functional dopamine transporter (DAT) at the plasma membrane."

According to the news editors, the research concluded: "Thus, we find that at pharmacologically relevant concentrations, amphetamines must be actively transported by DAT and VMAT in tandem to produce psychostimulant effects."

For more information on this research see: Mechanisms of amphetamine action illuminated through optical monitoring of dopamine synaptic vesicles in Drosophila brain. Nature Communications, 2016;7():10652. (Nature Publishing Group - www.nature.com/; Nature Communications - www.nature.com/ncomms/)

University, "Fetuses with additional congenital anomalies and those with incomplete follow-up were excluded. Prenatal diagnostic accuracy and short-term survival were analyzed for the different types of TGA. The TGA type was correctly ascertained prenatally in 93.3%. Most fetuses were diagnosed with simple TGA (62.7%). There were 6 discrepancies: 5 fetuses with simple TGA had postnatally TGA + ventricular septal defect (VSD; n=3) or TGA + VSD + coarctation of the aorta (n=2), and 1 fetus with TGA + VSD postnatally showed severe left ventricular outflow tract obstruction. The mortality rate was 6.6%; it was higher in complex versus simple forms (12.8 vs. 1.9%, p=0.038), and in cases with intramural coronary artery versus those without (60 vs. 3.5%, p<0.001). We found no relationship between the arrangement of the great arteries and coronary arterial abnormalities. Simple TGA has a better outcome than the complex forms."

According to the news reporters, the research concluded: "A discrepancy rate of 7% with potential influence on the prognosis of survival between the prenatal diagnosis of the TGA type and the definitive diagnosis was found."

For more information on this research see: Transposition of the Great Arteries in Fetal Life: Accuracy of Diagnosis and Short-Term Outcome. *Fetal Diagnosis and Therapy*, 2016;40(4):268-276. Heart Disorders and Diseases - Hypertrophic…

Reports from Concord Repatriation General Hospital Provide New Insights into Hypertrophic Cardiomyopathy (Fixed left ventricular outflow tract obstruction mimicking hypertrophic obstructive cardiomyopathy: pitfalls in diagnosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Hypertrophic Cardiomyopathy. According to news reporting originating from Sydney, Australia, by NewsRx correspondents, research stated, "We present a case series that highlights the diagnostic challenges with left ventricular hypertrophy (LVH) and left ventricular outflow tract obstruction (LVOTO). Fixed structural lesions causing LVOTO with secondary LVH may mimic hypertrophic obstructive cardiomyopathy (HOCM)."

Our news editors obtained a quote from the research from Concord Repatriation General Hospital, "Management of these two entities is critically different. Misdiagnosis and failure to recognize fixed left ventricular outflow tract (LVOT) lesions may result in morbidity
as a result of inappropriate therapy and delay of definitive surgical treatment."

According to the news editors, the research concluded: "It is thus necessary to identify the correct type and level of obstruction in the LVOT by careful correlation of clinical examination, Doppler evaluation, and advanced imaging findings."

The news editors report that additional information may be obtained by contacting J. Yiannikas, Concord Repatriation General Hospital, Dept. of Cardiol, Sydney, NSW, Australia. Additional authors for this research include D. Briege, R. Chard and J. Yiannikas.

**Genetics - Human Mutation**

**Reports from Copenhagen University Hospital Describe Recent Advances in Human Mutation (Germline Chromothripsis Driven by L1-Mediated Retrotransposition and Alu/Alu Homologous Recombination)***

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Genetics - Human Mutation. According to news reporting from Glostrup, Denmark, by NewsRx journalists, research stated, "Chromothripsis (CTH) is a phenomenon where multiple localized double-stranded DNA breaks result in complex genomic rearrangements. Although the DNA-repair mechanisms involved in CTH have been described, the mechanisms driving the localized 'shattering' process remain unclear."

Funders for this research include Lundbeck Foundation, American Cancer Society, University of Copenhagen.

The news correspondents obtained a quote from the research from Copenhagen University Hospital, "High-throughput sequence analysis of a familial germline CTH revealed an inserted SVAE retrotransposon associated with a 110-kb deletion displaying hallmarks of L1-mediated retrotransposition. Our analysis suggests that the SVAE insertion did not occur prior to or after, but concurrent with the CTH event. We also observed L1-endonuclease potential target sites in other breakpoints. In addition, we found four Alu elements flanking the 110-kb deletion and associated with an inversion. We suggest that chromatin looping mediated by homologous Alu elements may have brought distal DNA regions into close proximity facilitating DNA cleavage by catalytically active L1-endonuclease."
According to the news reporters, the research concluded: "Our data provide the first evidence that active and inactive human retrotransposons can serve as endogenous mutagens driving CTH in the germline."

Our news journalists report that additional information may be obtained by contacting L. Nazaryan-Petersen, Applied Human Molecular Genetics, Kennedy Center, Dept. of Clinical Genetics, Copenhagen University Hospital, Rigshospitalet, Glostrup, 2600, Denmark. Mental Health Diseases and Conditions - Bipolar...

Reports from D. Dima and Colleagues Advance Knowledge in Bipolar Disorders (The polygenic risk for bipolar disorder influences brain regional function relating to visual and default state processing of emotional information)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Mental Health Diseases and Conditions - Bipolar Disorders are discussed in a new report. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Genome-wise association studies have identified a number of common single-nucleotide polymorphisms (SNPs), each of small effect, associated with risk to bipolar disorder (BD). Several risk-conferring SNPs have been individually shown to influence regional brain activation thus linking genetic risk for BD to altered brain function."

Financial supporters for this research include Psychiatric Research Trust, National Institute of Mental Health, NARSAD Young Investigator Grant, European Union's Horizon 2020 Research and Innovation Programme, National Institute for Health Research.

Our news editors obtained a quote from the research, "The current study examined whether the polygenic risk score method, which models the cumulative load of all known risk-conferring SNPs, may be useful in the identification of brain regions whose function may be related to the polygenic architecture of BD. We calculated the individual polygenic risk score for BD (PGR-BD) in forty-one patients with the disorder, twenty-five unaffected first-degree relatives and forty-six unrelated healthy controls using the most recent Psychiatric Genomics Consortium data. Functional magnetic resonance imaging was used to define task-related brain activation patterns in response to facial affect and working memory processing. We found significant effects of the PGR-BD score on task-related activation irrespective of diagnostic
There was a negative association between the PGR-BD score and activation in the visual association cortex during facial affect processing. In contrast, the PGR-BD score was associated with failure to deactivate the ventromedial prefrontal region of the default mode network during working memory processing. These results are consistent with the threshold-liability model of BD, and demonstrate the usefulness of the PGR-BD score in identifying brain functional alternations associated with vulnerability to BD.

According to the news editors, the research concluded: "Additionally, our findings suggest that the polygenic architecture of BD is not regionally confined but impacts on the task-dependent recruitment of multiple brain regions."

The news editors report that additional information may be obtained by contacting D. Dima, SLaM NHS Trust, London, United Kingdom. Additional authors for this research include S. de Jong, G. Breen and S. Frangou.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.nicl.2016.10.022. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: London, United Kingdom, Europe, Mental Health Diseases and Conditions, Manic-Depressive Illness, Risk and Prevention, Bipolar Disorders, Psychiatry, Genetics.

**Clinical Research - Clinical Trials and Studies**

**Reports from D.F. Abbas and Colleagues Advance Knowledge in Clinical Trials and Studies (Simultaneous Administration Compared With a 24-Hour Mifepristone-Misoprostol Interval in Second-Trimester Abortion A Randomized Controlled Trial)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Research - Clinical Trials and Studies. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "To compare outcomes with simultaneous administration of mifepristone and misoprostol with a regimen in which the drugs are administered at a 24-hour interval for second-trimester abortion. In this placebo-controlled, double-blind trial, participants were randomized to receive mifepristone either 24 hours before or at the same time as misoprostol."

The news correspondents obtained a quote from the research, "Participants were hospitalized to receive 400 micrograms buccal misoprostol at 3-hour intervals up to 48 hours or until uterine expulsion. The primary outcome was the proportion of women who experienced uterine expulsion within 24 hours after the first misoprostol dose and this required 504 women to examine our hypothesis that this rate would be 85% in the 24-hour interval arm compared with 70% in the simultaneous arm. Secondary outcomes included total abortion time from mifepristone and misoprostol. From February 2013 to April 2014, 509 women were enrolled."
Women in the 24-hour interval arm were more likely to abort within 24 hours (94.4% compared with 85.0%, relative risk 1.11, 95% confidence interval [CI] 1.05-1.18). At 48 hours, the rate was similar in the two arms (96.8% [24-hour interval] and 95.7% [simultaneous], relative risk 1.01, 95% CI 0.97-1.04). Median misoprostol dosing time was shorter in the 24-hour interval arm (7.7 compared with 13 hours; P<.001) and consistent with the median misoprostol doses required (three compared with five; P<.001). Median time from mifepristone to uterine expulsion was longer in the 24-hour interval arm (32.3 compared with 13 hours; P<.001). Both regimens had high acceptability rates and reported similar side effects and pain scores. Administering mifepristone and misoprostol simultaneously results in lower expulsion rates within 24 hours of taking misoprostol, longer median misoprostol treatment times, and requires more misoprostol doses. At 48 hours, both regimens work equally well."

According to the news reporters, the research concluded: "Simultaneous dosing results in less total time from the first clinical contact to complete abortion."

For more information on this research see: Simultaneous Administration Compared With a 24-Hour Mifepristone-Misoprostol Interval in Second-Trimester Abortion A Randomized Controlled Trial. Obstetrics and Gynecology, 2016;128(5):1077-1083. Obstetrics and Gynecology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Reports from Dalian University of Technology Highlight Recent Findings in Mesenchymal Stem Cells (Synergistic effect of bioactive lipid and condition medium on cardiac differentiation of human mesenchymal stem cells from different tissues)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Stem Cell Research - Mesenchymal Stem Cells. According to news reporting originating in Dalian, People's Republic of China, by NewsRx journalists, research stated, "Human umbilical cord mesenchymal stem cells (hUCMSCs) and human adipose tissue mesenchymal stem cells (hATMSCs) have the potential to differentiate into cardiomyocytes, making them promising therapeutic candidates for treating damaged cardiac tissues. Currently, however, the differentiated cells induced from hUCMSCs or hATMSCs can hardly display functional characteristics similar to cardiomyocytes."

Funders for this research include National Natural Science Foundation of China,
Fundamental Research Funds for the Central Universities, UK Engineering and Physical Sciences Research Council, Technology and Strategy Board.

The news reporters obtained a quote from the research from the Dalian University of Technology, "In this study, we have investigated the effects of bioactive lipid sphingosine-1-phosphate (S1P) on cardiac differentiations of hUCMSCs and hATMSCs in condition medium composed of cardiac myocytes culture medium or 5-azacytidine. Cardiac differentiations were identified through immunofluorescence staining, and the results were observed with fluorescence microscopy and confocal microscopy. Synergistic effects of S1P and condition medium on cell viability were evaluated by MTT assays. Functional characteristics similar to cardiomyocytes were evaluated through detecting calcium transient. The differentiated hUCMSCs or hATMSCs in each group into cardiomyocytes showed positive expressions of cardiac specific proteins, including a-actin, connexin-43 and myosin heavy chain-6 (MYH-6). MTT assays showed that suitable differentiation time was 14 days and that the optimal concentration of S1P was 0.5 mM. Moreover, incorporation of S1P and cardiac myocytes culture medium gave rise to calcium transients, an important marker for displaying in vivo electrophysiological properties."

According to the news reporters, the research concluded: "This feature was not observed in the S1P-5-azacytidine group, indicating the possible lack of cellular stimuli such as transforming growth factor-beta, TGF-b."

Our news correspondents report that additional information may be obtained by contacting L. Jiang, Dalian R&D Center for Stem Cell and Tissue Engineering, Faculty of Chemical Environmental and Biological Science and Technology, Dalian University of Technology, Dalian, People's Republic of China. Additional authors for this research include Y. Wang, F. Pan, X. Zhao, H. Zhang, M. Lei, T. Liu and J.R Lu.

between markers of genetic variation, or gene-gene interactions, are believed to play an important role in the etiology of many multifactorial diseases and other complex phenotypes. Unfortunately, detecting gene-gene interactions is extremely challenging due to the large number of potential interactions and ambiguity regarding marker coding and interaction scale."

Our news journalists obtained a quote from the research from Dartmouth College, "For many data sets, there is insufficient statistical power to evaluate all candidate gene-gene interactions. In these cases, a global test for gene-gene interactions may be the best option. Global tests have much greater power relative to multiple individual interaction tests and can be used on subsets of the markers as an initial filter prior to testing for specific interactions. In this paper, we describe a novel global test for gene-gene interactions, the global epistasis test (GET), that is based on results from random matrix theory. As we show via simulation studies based on previously proposed models for common diseases including rheumatoid arthritis, type 2 diabetes, and breast cancer, our proposed GET method has superior performance characteristics relative to existing global gene-gene interaction tests."

According to the news editors, the research concluded: "A glaucoma GWAS data set is used to demonstrate the practical utility of the GET method."

The news correspondents report that additional information may be obtained from H.R. Frost, Dartmouth College, Geisel Sch Med, Dept. of Biomed Data Sci, Hanover, NH 03755, United States. Additional authors for this research include C.I. Amos and J.H. Moore.

Aneuploidy
Reports from Dartmouth-Hitchcock Medical Center Highlight Recent Findings in Aneuploidy (Human embryo mosaicism: did we drop the ball on chromosomal testing?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Aneuploidy. According to news reporting originating in Lebanon, New Hampshire, by NewsRx journalists, research stated, "There are newly recognized challenges presented by the occurrence of mosaicism in the context of trophectoderm (TE) biopsy for pre-implantation genetic screening (PGS) in in vitro fertilization (IVF) embryos. Chromosomal mosaicism, known to be significantly higher in IVF embryos than in later prenatal samples, may contribute to errors in diagnosis."

The news reporters obtained a quote from the research from Dartmouth-Hitchcock Medical Center, "In particular, PGS may result in discarding embryos diagnosed as aneuploid but in which the inner cell mass may be completely or mainly euploid, thus representing a false
positive diagnosis. Although less likely, some embryos diagnosed as euploid could be mosaic and contain some aneuploid cells, possibly impacting their implantation potential. The ability of current diagnostic techniques to detect mosaicism is limited by the number and location of TE cells in the biopsy and by the methodology used for chromosomal assessment. The clinical consequences of mosaicism are dependent on the chromosome(s) involved, the developmental stage at which the mosaicism evolved, and whether TE biopsy accurately reflects the status of the inner cell mass that forms the fetus. Consequently, in patients with no euploid embryos identified on PGS, it may be appropriate to consider the transfer of diagnosed aneuploid embryos if the TE biopsy result is a non-viable chromosomal monosomy or triploidy that could not result in a birth. It should be acknowledged in consent forms that mosaicism has the potential to impact test results and that its detection may be below the resolution of the genetic tests being used."

According to the news reporters, the research concluded: "This concept represents a major shift in current IVF practice and ought to be considered given the data, or lack thereof, of the impact of mosaicism on IVF/PGS outcomes."

Our news correspondents report that additional information may be obtained by contacting N. Esfandiari, Dartmouth Hitchcock Medical Center, Geisel Sch Med, Dept. of OB GYN, Div Reprod Endocrinol & Infertil, Lebanon, NH 03766, United States. Additional authors for this research include M.E. Bunnell and R.F. Casper.

Animal Diseases and Conditions - Bluetongue

Reports from Department of Agriculture Advance Knowledge in Bluetongue (Effect of Culicoides sonorensis salivary proteins on clinical disease outcome in experimental bluetongue virus serotype 8 infection of Dorset sheep)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Animal Diseases and Conditions - Bluetongue are discussed in a new report. According to news reporting from Manhattan, Kansas, by NewsRx journalists, research stated, "The severity of bluetongue clinical disease in ruminants varies greatly depending on the outbreak serotype/strain, animal species/breed, and immune status of the herd. To predict disease risk from any of the 26 bluetongue virus (BTV) serotypes identified to date, experimental animal susceptibility studies are often conducted."
The news correspondents obtained a quote from the research from the Department of Agriculture, "Although sheep are the most susceptible livestock species in the US, infection of domestic breeds by injection of field isolates rarely produces the level of clinical disease observed in natural Culicoides midge-transmitted outbreaks. Thus, outbreak risk assessments based on experimental animal infections can underestimate the severity posed by a potential outbreak with a given virus serotype or strain. The aim of this study was to determine whether secreted Culicoides salivary proteins injected simultaneously with virus, to more closely mimic midge-delivered virus, would affect clinical disease outcome in a BTV-8 sheep susceptibility study. Eight sheep were intradermally inoculated with BTV-8; 4 received virus mixed with secreted Culicoides salivary proteins (BTV-8 + Cu SP), 4 received virus alone. Clinical signs were monitored daily for type, severity and duration. In sheep receiving the BTV-8 + Cu SP inoculum, clinical signs were more varied, more severe, and duration was three times longer compared to sheep receiving virus alone."

According to the news reporters, the research concluded: "These results suggest that Culicoides salivary proteins may play a contributing role in BTV pathology and that use of these proteins in experimental animal infections may allow development of a more robust target-host animal model."

For more information on this research see: Effect of Culicoides sonorensis salivary proteins on clinical disease outcome in experimental bluetongue virus serotype 8 infection of Dorset sheep. *Veterinaria Italiana*, 2015;51(4):379-84.

Our news journalists report that additional information may be obtained by contacting B.S. **Drugs and Therapies - Glucagon Therapy**

**Reports from Department of Anesthesiology Highlight Recent Findings in Glucagon Therapy (Glucagon-induced hypertensive emergency: a case report)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Glucagon Therapy are presented in a new report. According to news reporting originating from New Haven, Connecticut, by NewsRx correspondents, research stated, "Glucagon is well acknowledged as a sphincter of Oddi relaxant for both diagnostic and therapeutic uses in choledocho lithiasis, and an empiric treatment for beta-blocker overdose. Although it has been implicated in inducing cardiovascular crises in patients with asymptomatic pheochromocytoma, adverse effects in other patient populations have not been characterized."

Our news editors obtained a quote from the research from the Department of...
Anesthesiology, "This case report describes a patient with hypertension controlled on beta blockers who, after glucagon administration during an intraoperative cholangiography, experienced hypertensive emergency despite adequate pain control. Nitroglycerin acted as a key agent to decrease the patient's blood pressure as well as a secondary relaxant of the sphincter of Oddi. The patient had no radiographic evidence of pheochromocytoma."

According to the news editors, the research concluded: "As out-of-operating room and intraoperative uses of glucagon continue to increase, perioperative physicians should be aware of its potential hemodynamic effects even in healthy populations."

The news editors report that additional information may be obtained by contacting A. Legler, Yale New Haven Med Center, Dept. of Anesthesiol, New Haven, CT 06504, United States. Additional authors for this research include R.K. Kim and N. Chawla.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jclinane.2016.08.033. This DOI is a link to an online electronic document that is either free or for purchase.

Hydrochloric Acid

Reports from Department of Biochemistry & Molecular Biology Highlight Recent Findings in Hydrochloric Acid (Occupational exposures at a polyvinyl chloride production facility are associated with significant changes to the plasma metabolome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hydrochloric Acid are presented in a new report. According to news reporting from Louisville, Kentucky, by NewsRx journalists, research stated, "Occupational vinyl chloride (VC) exposures have been associated with toxicant-associated steatohepatitis and liver cancer. Metabolomics has been used to clarify mode of action in drug-induce liver injury but has not been performed following VC exposures."

The news correspondents obtained a quote from the research from the Department of Biochemistry & Molecular Biology, "Plasma samples from 17 highly exposed VC workers without liver cancer and 27 unexposed healthy volunteers were obtained for metabolite extraction and GC/MS and LC/MS2 analysis. Following ion identification/quantification, Ingenuity pathway analysis was performed. 613 unique named metabolites were identified. Of these, 189 metabolites were increased in the VC exposure group while 94 metabolites were decreased. Random Forest analysis indicated that the metabolite signature could separate the groups with 94% accuracy. VC exposures were associated with increased long chain (including
arachidonic acid) and essential (including linoleic acid) fatty acids. Occupational exposure increased lipid peroxidation products including monohydroxy fatty acids (including 13-HODE); fatty acid dicarboxylates; and oxidized arachidonic acid products (including 5,9, and 15-HETE). Carnitine and camitine esters were decreased, suggesting peroxisomal/mitochondrial dysfunction and alternate modes of lipid oxidation. Differentially regulated metabolites were shown to interact with extracellular-signal-regulated kinase 1/2 (ERK1/2), Akt, AMP activated protein kinase (AMPK), and the N-Methyl-D-aspartate (NMDA) receptor. The top canonical pathways affected by occupational exposure included tRNA charging, nucleotide degradation, amino acid synthesis/degradation and urea cycle. Methionine and homocysteine was increased with decreased cysteine, suggesting altered 1-carbon metabolism. Occupational exposure generated a distinct plasma metabolome with markedly altered lipid and amino acid metabolites.

According to the news reporters, the research concluded: "ERK1/2, Akt, AMPK, and NMDA were identified as protein targets for vinyl chloride toxicity."

For more information on this research see: Occupational exposures at a polyvinyl chloride production facility are associated with significant changes to the plasma metabolome. Toxicology and Applied Pharmacology, 2016;313():47-56. Toxicology and Applied Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Health and Medicine - Cardiovascular Interventions

Reports from Department of Cardiology Describe Recent Advances in Cardiovascular Interventions (Early experience of percutaneous paravalvular leak closure using a novel Occlutech occluder)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Health and Medicine - Cardiovascular Interventions. According to news reporting originating in Istanbul, Turkey, by NewsRx journalists, research stated, "Paravalvular regurgitation is an important complication of mitral valve replacement. Although surgical repair is mostly recommended, it is associated with significant morbidity."

The news reporters obtained a quote from the research from the Department of Cardiology, "On the other hand, percutaneous closure is a less invasive alternative approach. Percutaneous approaches to treatment of paravalvular prosthetic regurgitation have emerged recently. One of them is the Occlutech Paravalvular Leak Device. The aim of this study was to evaluate early and midterm outcomes of percutaneous paravalvular leak closure utilising a novel occluder. Twenty-one consecutive symptomatic patients who had moderate or severe paravalvular prosthetic regurgitation on transoesophageal echocardiography were included in the study. All the patients were clinically evaluated and found inoperable for surgery. They
underwent transapical repair with the Occlutech Paravalvular Leak Device. The patients were followed for 17?5 months. Attempts were made to rectify 41 defects in 21 patients with 100% success. Mean procedure time was 76?40 min and fluoroscopy time was 44?37 min. Early post-procedural outcome was uneventful in all cases, with (>=)1 grade reduction in regurgitation in all of the patients. There was no mortality during hospital stay. There was one case of haemothorax in one patient and one case of pneumothorax in another. Post-implantation 90-day follow-up data were obtained for 19 patients, and 12-month data were obtained for 12 patients. No deaths due to any cause, stroke or surgery for prosthetic impingement, worsening or relapse of paravalvular leak during follow-up were recorded. One patient underwent reintervention and was treated successfully with the same occluder 11 months after the index procedure."

According to the news reporters, the research concluded: "The novel Occlutech Paravalvular Leak Device, which was designed specifically for mitral and aortic paravalvular regurgitation, is an additional, useful tool in the device armamentarium for the treatment of PVL."

Our news correspondents report that additional information may be obtained by contacting O. Goktekin, Dept. of Cardiology, Bezmialem University, Istanbul, Turkey. Additional authors for this research include M.A. Vatankulu, H. Ozhan, Y. Ay, M. Ergelen, A. Tasal, C. Aydin, Z. Ismail, I. Ates and Z. Hijazi.

**Heart Disorders and Diseases - Heart Failure**

**Reports from Department of Cardiovascular Medicine Provide New Insights into Heart Failure (Subspecialisation in cardiology care and outcome: should clinical services be redesigned, again?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Failure are discussed in a new report. According to news reporting out of Bedford Park, Australia, by NewsRx editors, research stated, "Inpatient management of cardiac patients by cardiologists results in reduced mortality and hospitalisation. With increasing subspecialisation of the field because of growing management complexity and use of technological innovations, the impact of sub-specialisation on patient outcomes is unclear."

Our news journalists obtained a quote from the research from the Department of Cardiovascular Medicine, "To investigate whether management by subspecialty cardiologists impacts the outcomes of patients with subspecialty-specific diseases. All patients admitted to a tertiary centre over nine years with a diagnosis of heart failure, acute coronary syndrome (ACS) or primary arrhythmia were reviewed. The outcomes of these patients managed by cardiologists
subspecialised in their admission diagnosis (heart failure specialists, interventionalists and electrophysiologists) were compared with those treated by general cardiologists. Heart failure was diagnosed in 1704 patients, ACS in 7763 and arrhythmia in 4398. There was no difference in length of stay (LOS) (p=0.26), mortality (p=0.57) or cardiovascular readmissions (p=0.50) in heart failure patients treated by general cardiologists compared with subspecialists. In ACS patients, subspecialty management was associated with reduced LOS, cardiovascular readmissions and mortality (all p<0.05). This reduction in mortality was seen mainly in lower risk patients (p <0.05). There was a reduction in LOS and cardiovascular readmissions in arrhythmia patients receiving subspecialty management (both p<0.05) but no difference in mortality (p=0.14). ACS patients managed by interventionalists were more likely to undergo coronary intervention (p <0.05). Electrophysiologists more frequently referred patients for catheter ablation and pacemaker implantation than general cardiologists (p <0.05). The benefits of subspecialty care seem attributable to the appropriate selection of patients who would benefit from technological innovations in care."

According to the news editors, the research concluded: "These results suggest that the development of healthcare systems which align cardiovascular disease with the subspecialist may be more effective."

Our news journalists report that additional information may be obtained by contacting B. Pathik, Dept. of Cardiovascular Medicine, Flinders Medical Centre, Bedford Park, South Australia, Australia. Additional authors for this research include C.G. De Pasquale, A.D. McGavigan, A. Sinhal, J. Vaile, P.A. Tideman, D. Jones, C. Bridgman, J.B. Selvanayagam, W. Heddle and D.P Chew.

Reports from Department of Emergency and Critical Care Advance Knowledge in Disseminated Intravascular Coagulation (Efficacy and safety of anticoagulant therapy in three specific populations with sepsis: a meta-analysis of randomized controlled ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematologic Diseases and Conditions - Disseminated Intravascular Coagulation is the subject of a report. According to news reporting originating from Osaka, Japan, by NewsRx correspondents, research stated, "ESSENTIALS: Most anticoagulant therapy has failed to demonstrate a survival benefit in the overall sepsis
population. We conducted separate meta-analyses of anticoagulant therapy in three different populations."

Our news editors obtained a quote from the research from the Department of Emergency and Critical Care, "Survival benefit was observed only in the septic disseminated intravascular coagulation (DIC) population. Further randomized controlled trials should focus on specific populations with septic DIC. Although many preclinical trials have indicated the effectiveness and safety of anticoagulant therapy as an adjuvant therapy against sepsis, there is little evidence to support its effectiveness to reduce mortality in the overall population with sepsis in clinical situations. However, several studies suggested that specific anticoagulant therapy may potentially reduce mortality in patients with sepsis-induced disseminated intravascular coagulation (DIC). We investigated whether the survival benefit of anticoagulant therapy might pertain to the coagulopathic population with sepsis. We conducted separate meta-analyses of randomized controlled trials for anticoagulant therapy in three different populations: (i) overall population with sepsis, (ii) population with sepsis-induced coagulopathy, and (iii) population with sepsis-induced DIC. We searched MEDLINE, Scopus, and the Cochrane Central Register of Controlled Trials comparing anticoagulant therapy with placebo or no intervention in sepsis patients. We measured all-cause mortality as the primary outcome and bleeding complications as the secondary outcome. We analyzed 24 trials enrolling 14,767 patients. There were no significant reductions in mortality in the overall sepsis population and the population with sepsis-induced coagulopathy. Otherwise, we observed significant reductions in mortality (risk ratio 0.72, 95% confidence interval 0.62-0.85) in the population with sepsis-induced DIC. As adverse events, bleeding complications tended to increase similarly with anticoagulant therapy in all three populations."

According to the news editors, the research concluded: "Although associated with an increased risk of bleeding, anticoagulant therapy resulted in no survival benefits in the overall sepsis population and even the population with sepsis-induced coagulopathy; beneficial effects on mortality were observed only in the population with sepsis-induced DIC."

The news editors report that additional information may be obtained by contacting Y. Umemura, Dept. of Emergency and Critical Care, Osaka General Medical Center, Osaka, Japan. Additional authors for this research include K. Yamakawa, H. Ogura, H. Yuhara and S. Fujimi. Digestive System Diseases and Conditions -

Reports from Department of Gastroenterology Highlight Recent Findings in Inflammatory Bowel Disease (Characterisation and therapeutic manipulation of the gut microbiome in inflammatory bowel disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Digestive System Diseases and Conditions - Inflammatory Bowel Disease is the subject of a report. According to news reporting originating in Melbourne, Australia, by NewsRx journalists, research stated, "Inflammatory bowel diseases are thought to develop as a result of dysregulation of the relationship that exists between the gut microbiota, host genetics and the immune system. The advent of culture-independent techniques has revolutionised the ability to characterise the role of the gut microbiota in health and disease based on the microbiota's genetic make-up."

The news reporters obtained a quote from the research from the Department of Gastroenterology, "Inflammatory bowel diseases are characterised by dysbiosis which is an imbalance between pro-and anti-inflammatory bacteria and a reduction in bacterial diversity. Emerging data suggest that it is not only the presence of the gut microbiota but the functional activity of the microbiota that appears to play an important role in health and disease. Current strategies to manipulate therapeutically the gut microbiota using dietary modification, prebiotics, probiotics, antibiotics and faecal microbiota transplantation aim to restore the balance to a state of normobiosis."

According to the news reporters, the research concluded: "However, the ability of such strategies to correct dysbiosis and thereby achieve therapeutic benefit is yet to be fully characterised."

Our news correspondents report that additional information may be obtained by contacting J. Schulberg, Dept. of Gastroenterology, Austin Hospital, Melbourne, Victoria, Australia.

RNA Viruses - Norovirus

Reports from Department of Internal Medicine Advance Knowledge in Norovirus (Clinical outcome of norovirus infection in renal transplant patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on RNA Viruses - Norovirus is the subject of a report. According to news reporting originating from Berlin, Germany, by NewsRx correspondents, research stated, "Transplant patients are at increased risk for developing severe norovirus (NoV) infections with secondary complications such as rejection episodes and acute transplant failure. This single-center retrospective study included all kidney transplant patients tested positive for NoV RNA between January 2007 and December 2011."

Our news editors obtained a quote from the research from the Department of Internal Medicine, "Data were compared to a control group of 528 kidney transplant patients without NoV infection. Sixty-five kidney transplant patients were recorded NoV RNA positive. Of these, 26 patients (40%) presented with acute transplant failure (AKI). In 43 patients (66.2%), dose reduction in immunosuppression was performed, and of 22 patients receiving tacrolimus, four patients (18.2%) showed toxic trough levels above 15ng/mL at time of diagnosis. In three patients (4.6%), indicated therapeutic procedures had to be postponed due to prolonged severe diarrhea. Ten patients (15.4%) developed chronic NoV infection. One-year patient and graft survival in NoV patients and controls was 92.3% and 96.4%, respectively (n.s.). Compared to controls, eGFR was already significantly lower before NoV infection and loss of eGFR relative to baseline over 12 and 36months was significantly higher in NoV-infected patients. In particular, patients initially presenting with AKI experienced a long-term loss of transplant function."

According to the news editors, the research concluded: "Risk factors for NoV infection were immunosuppression containing steroids and antirejection therapy."

The news editors report that additional information may be obtained by contacting S. Brakemeier, Charite Campus Mitte, Dept. of Internal Med, Div Nephrol, Berlin, Germany. Additional authors for this research include S.I. Taxeidi, M. Durr, J. Hofmann, D. Schmidt, F. Bachmann, J. Gaedeke and K. Budde.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ctr.12820. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from Department of Radiation Oncology Describe Recent Advances in Melanoma (Prognostic factors for melanoma brain metastases treated with stereotactic radiosurgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Melanoma is now available. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "Stereotactic radiosurgery (SRS) is routinely used to treat brain metastases from melanoma due to their radioresistant nature. The median survival for these patients is 4-6 months, according to earlier studies."

Our news journalists obtained a quote from the research from the Department of Radiation Oncology, "The aim of this study was to evaluate prognostic factors that influence survival in patients with metastatic melanoma to the brain treated with SRS. This retrospective analysis included all patients with melanoma brain metastases treated with SRS at the University of Southern California between 1994 and 2015. For the entire cohort, the authors performed a multivariable Cox regression analysis with an end point of survival. Covariates included number of lesions, total intracranial tumor volume, age, sex, and treatment date prior to 2005 or 2005 onward. In the subset of patients with > 1 lesion, additional multivariable Cox regression was performed, with covariates of Karnofsky Performance Scale, Graded Prognostic Assessment, Recursive Partitioning Analysis, timing of metastases (synchronous/metachronous), change in lesion number, and previous whole-brain radiation therapy or resection in addition to the previously mentioned covariates. Overall survival (OS) was calculated from the day SRS was performed to the date of last follow-up or date of death. A total of 401 patients were available for analysis. The median follow-up was 35.1 months for patients alive at the time of analysis, and the median OS was 7.7 months for the entire cohort (95% CI 6.7-8.3 months). In the entire cohort, greater number of brain lesions, higher total intracranial tumor volume, age > 50 years, treatment prior to 2005, and male sex were found to be statistically significant factors associated with worse survival. The strongest risk factors for decreased OS were tumor volume > 10 cm(3) and >= 5 lesions, with hazard ratios for risk of death of 1.7 and 2.2, respectively. In the subset of patients with > 1 lesion, tumor volume > 10 cm(3) and no resection were the only factors significantly associated with decreased OS, with hazard ratios of 1.9 and 2.0 (hazard ratio of 0.49 for resection), respectively. This study suggests that greater lesion number, higher intracranial tumor volume, older age, treatment prior to 2005, and male sex have prognostic significance for decreased OS in patients with melanoma brain metastases treated with SRS."

According to the news editors, the research concluded: "Additionally, in the subset of patients with > 1 lesion, only higher total tumor volume and no resection were associated with worse survival."

For more information on this research see: Prognostic factors for melanoma brain metastases treated with stereotactic radiosurgery. *Journal of Neurosurgery*, 2016;125():31-39. *Journal of Neurosurgery* can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

Our news journalists report that additional information may be obtained by contacting S.X. Bian, Univ Southern Calif, Keck Sch Med, Dept. of Radiat Oncol, Los Angeles, CA, United States. Additional authors for this research include D. Routman, J. Liu, D.Y. Yang, S. Groshen, G. Zada, N. Trakul, M.K. Wong, C. Yu and E.L. Chang.
Autoimmune Diseases and Conditions - Rheumatoid...

Reports from Department of Rheumatology Add New Data to Findings in Rheumatoid Arthritis (Risk of postoperative infections and the discontinuation of TNF inhibitors in patients with rheumatoid arthritis: A meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Autoimmune Diseases and Conditions - Rheumatoid Arthritis are presented in a new report. According to news reporting originating from Echirolles, France, by NewsRx correspondents, research stated, "To determine whether continuation of tumor necrosis factor inhibitors (TNFi) before surgery increases the risk of surgical site infection (SSI) in rheumatoid arthritis (RA) patients. A systematic review of the literature was conducted from January 2000 to May first 2014, using the databases of PubMed, Cochrane review, Embase, and manual research of abstracts presented in scientific congresses."

Our news editors obtained a quote from the research from the Department of Rheumatology, "Most included studies were retrospective. We compared the risk of SSI in the case of discontinuation of TNFi versus continuing TNFi treatment before a surgery. Six studies, with a total of 2743 patients (1360 in the group continuing TNFi agent and 1383 in the group discontinuing TNFi) were included. There was a decreased risk of SSI in patients stopping TNFi (relative risk [RR] = 0.62 [95% confidence interval [CI] 0.43-0.89], P = 0.99, I-2 = 0%). Concerning overall complications, there was also a decreased risk in patients discontinuing TNFi treatment (RR = 0.60 [95% CI 0.42-0.87], P = 0.26, I-2 = 25%)."

According to the news editors, the research concluded: "This meta-analysis showed an increased risk of SSI in patients under TNF inhibitor, and a decreased risk of SSI in case of interruption of treatment during the perioperative time."

The news editors report that additional information may be obtained by contacting M. Clay, Grenoble Teaching Hosp, Hopital Sud, Dept. of Rheumatol, F-38130 Echirolles, France. Additional authors for this research include A. Mazouyes, M. Gilson, P. Gaudin and A. Baillet.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jbspin.2015.10.019. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from Dixie Regional Medical Center Advance Knowledge in Blood Transfusion (Bilirubin levels and phototherapy use before and after neonatal red blood cell transfusions)

Transfusion Medicine - Blood Transfusion

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Transfusion Medicine - Blood Transfusion is the subject of a report. According to news reporting out of St. George, Utah, by NewsRx editors, research stated, "Our previous retrospective study suggested that red blood cell (RBC) transfusion of preterm neonates can be associated with an increase in bilirubin, but this has not been tested prospectively. We studied neonates before and after RBC transfusions, recording serial bilirubin levels and whether they qualified for phototherapy."

Our news journalists obtained a quote from the research from Dixie Regional Medical Center, "Because lysed RBCs release plasma-free hemoglobin (Hb), a precursor to bilirubin, we also measured plasma free Hb and bilirubin from the donor blood. We studied 50 transfusions given to 39 neonates. Gestation ages of transfused neonates, at birth, were 26 (24-29) weeks (median [interquartile range]); birthweights were 750 (620-1070) g. The study transfusion was given on Day of Life 9.9 (3.4-19.2). In 20% (10/50) phototherapy was being administered at the beginning of and during the transfusion. In these patients neither the 4- to 6- nor the 24- to 36-hour-posttransfusion bilirubin levels were significantly higher than before transfusion. However, in 30% of the others (12/40) phototherapy was started (or restarted) after the transfusion and 15% had a posttransfusion bilirubin increase of at least 2.5 mg/dL. These neonates received donor blood with a higher plasma-free Hb (p < 0.05). Neonates commonly qualify for phototherapy after transfusion. A minority (15% in this series) have a posttransfusion bilirubin increase of at least 2.5 mg/dL."

According to the news editors, the research concluded: "We speculate that neonates qualifying for a RBC transfusion, who are judged to be at high risk for bilirubin-induced neurotoxicity, might benefit from checking their serum bilirubin level after the transfusion and providing donor blood with low plasma-free Hb levels."

Our news journalists report that additional information may be obtained by contacting P.D. Carroll, Dixie Reg Med Center, Neonatol, St George, UT, United States. Additional authors for this research include R.D. Christensen, V.L. Baer, M.J. Sheffield, E. Gerday and S.J. Ilstrup.

Keywords for this news article include: St. George, Utah, United States, North and Central America, Transfusion Medicine, Drugs and Therapies, Biological Factors, Blood Transfusion, Medical Devices, Bile Pigments, Photomedicine, Phototherapy, Blood Cells, Hematology, Bilirubin, Therapy, Plasma, Dixie Regional Medical Center.
Reports from Dongguk University Highlight Recent Findings in Angiotensin II Inhibitors (Alteration of the intravenous and oral pharmacokinetics of valsartan via the concurrent use of gemfibrozil in rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Angiotensin II Inhibitors have been presented. According to news reporting originating in Goyang, South Korea, by NewsRx journalists, research stated, "The present study aimed to examine the potential pharmacokinetic drug interaction between valsartan and gemfibrozil. Compared with the control given valsartan (10 mg/kg) alone, the concurrent use of gemfibrozil (10 mg/kg) significantly (p <0.05) increased the oral exposure of valsartan in rats."

The news reporters obtained a quote from the research from Dongguk University, "In the presence of gemfibrozil, the C-max and AUC of oral valsartan increased by 1.7- and 2.5-fold, respectively. Consequently, the oral bioavailability of valsartan was significantly higher (p <0.05) in the presence of gemfibrozil compared with that of the control group. Furthermore, the intravenous pharmacokinetics of valsartan (1 mg/kg) was also altered by pretreatment with oral gemfibrozil (10 mg/kg). The plasma clearance of valsartan was decreased by two-fold in the presence of gemfibrozil, while the plasma half-life was not altered. In contrast, both the oral and intravenous pharmacokinetics of gemfibrozil were not affected by the concurrent use of valsartan. The cellular uptake of valsartan and gemfibrozil was also investigated by using cells overexpressing OATP1B1 or OATP1B3. Gemfibrozil and gemfibrozil 1-O-beta glucuronide inhibited the cellular uptake of valsartan with IC50 values (\mu M) of 39.3 and 20.4, respectively, in MDCK/OATP1B1, while they were less interactive with OATP1B3. The cellular uptake of gemfibrozil was not affected by co-incubation with valsartan in both cells."

According to the news reporters, the research concluded: "Taken together, the present study suggests the potential drug interaction between valsartan and gemfibrozil, at least in part, via the OATP1B1-mediated transport pathways during hepatic uptake."

Our news correspondents report that additional information may be obtained by contacting H.K. Han, Dongguk Univ Seoul, Coll Pharm, Plus Project Team BK21, Goyang 410820, South Korea. Additional authors for this research include B.J. Kim, L.X. Mo and H.K. Han.

Keywords for this news article include: Goyang, South Korea, Asia, Antihyperlipidemic Agents, Angiotensin II Inhibitors, Fibric Acid Derivatives, Cardiovascular Agents, Drugs and Therapies, Gemfibrozil Therapy, Organic Chemicals, Valsartan Therapy, Pharmacokinetics, Carboxylic Acids, Pharmaceuticals, Pentanoic Acids, Clofibric Acid, Dongguk University.
Digestive System Diseases and Conditions - Crohn's...

Reports from E.D. Deeks and Colleagues Advance Knowledge in Crohn's Disease (Certolizumab Pegol: A Review in Inflammatory Autoimmune Diseases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Crohn's Disease. According to news reporting originating from Auckland, New Zealand, by NewsRx editors, the research stated, "Certolizumab pegol (Cimzia(A®)) is a subcutaneously administered polyethylene glycolylated (PEGylated) antigen-binding fragment of a recombinant human monoclonal antibody that selectively neutralizes TNF alpha. The drug is indicated for a variety of inflammatory autoimmune diseases, including Crohn's disease (CD), rheumatoid arthritis (RA), psoriatic arthritis (PsA) and axial spondyloarthritis (axSpA), based on its benefit in these settings in well-designed clinical trials."

Our news editors obtained a quote from the research, "In these studies, certolizumab pegol (as first- or subsequent-line therapy) reduced the severity of CD when used as an induction or maintenance therapy, and improved the signs/symptoms and slowed the radiographic progression of RA (with or without concomitant methotrexate), PsA and axSpA. Certolizumab pegol is generally well tolerated, with upper respiratory tract infections, rash and urinary tract infections being among the most frequent adverse reactions."

According to the news editors, the research concluded: "Thus, certolizumab pegol is an effective option for the management of these autoimmune diseases."

The news editors report that additional information may be obtained by contacting E.D. Deeks, Springer, Auckland 0754, New Zealand.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s40259-016-0197-y. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from E.D. Deeks et al Highlight Recent Findings in Clinical Dermatology (Deoxycholic Acid: A Review in Submental Fat Contouring)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Dermatology - Clinical Dermatology.

According to news reporting from Auckland, New Zealand, by NewsRx editors, the research stated, "Deoxycholic acid is a secondary bile acid involved in dietary fat emulsification/solubilization that causes adipocyte lysis when injected into subcutaneous fat tissue. A 10 mg/mL injectable solution of synthetic deoxycholic acid (Kybella™; Belkyra™) is indicated in various countries, including the USA and several within Europe/the EU, to improve the appearance of moderate to severe convexity or fullness associated with submental fat (SMF) in adults, where it is currently the only approved treatment for fat below the chin."

The news correspondents obtained a quote from the research, "In several phase III trials conducted in this setting, injecting deoxycholic acid 2 mg/cm(2) into the SMF reduced the convexity/fullness of moderate to severe SMF relative to placebo (with a single treatment comprising up to 50 injections, and up to six treatments given at least 1 month apart). These SMF benefits (which were measured subjectively by clinicians and recipients, as well as objectively, 12 weeks after the last treatment session) generally occurred without detriment to skin laxity and were largely maintained over extended follow-up (e.g. 2 years after treatment). Deoxycholic acid injections are generally well tolerated, with adverse events usually involving the treatment area, being mild to moderate in severity and resolving within approximately one treatment interval. However, not all patients with SMF may be suitable for deoxycholic acid therapy, making patient selection key to achieving desired aesthetic outcomes."

According to the news reporters, the research concluded: "Thus, deoxycholic acid injections are an effective and generally well tolerated, minimally invasive option for the treatment of moderate to severe SMF in select adults."

Our news journalists report that additional information may be obtained by contacting E.D. Deeks, Springer, Auckland 0754, New Zealand.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s40257-016-0231-3. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from Eli Lilly Advance Knowledge in Immunoglobulins (Therapeutic Antibody Engineering To Improve Viscosity and Phase Separation Guided by Crystal Structure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immunoglobulins have been published. According to news reporting originating from Indianapolis, Indiana, by NewsRx correspondents, research stated, "Antibodies at high concentrations often reveal unanticipated biophysical properties suboptimal for therapeutic development. The purpose of this work was to explore the use of point mutations based on crystal structure information to improve antibody physical properties such as viscosity and phase separation (LLPS) at high concentrations."

Our news editors obtained a quote from the research from Eli Lilly, "An IgG4 monoclonal antibody (Mab4) that exhibited high viscosity and phase separation at high concentration was used as a model system. Guided by the crystal structure, four CDR point mutants were made to evaluate the role of hydrophobic and charge interactions on solution behavior. Surprisingly and unpredictably, two of the charge mutants, R33G and N35E, showed a reduction in viscosity and a lower propensity to form LLPS at high concentration compared to the wild-type (WT), while a third charge mutant S28K showed an increased propensity to form LLPS compared to the WT. A fourth mutant, F102H, had reduced hydrophobicity, but unchanged viscosity and phase separation behavior. We further evaluated the correlation of various biophysical measurements including second virial coefficient (A2), interaction parameter (kD), weight-average molecular weight (WAMW), and hydrodynamic diameters (DH), at relatively low protein concentration (4 to 15 mg/mL) to physical properties, such as viscosity and liquid-liquid phase separation (LLPS), at high concentration. Surprisingly, kD measured using dynamic light scattering (DLS) at low antibody concentration correlated better with viscosity and phase separation than did A2 for Mab4."

According to the news editors, the research concluded: "Our results suggest that the high viscosity and phase separation observed at high concentration for Mab4 are mainly driven by charge and not hydrophobicity."

For more information on this research see: Therapeutic Antibody Engineering To Improve Viscosity and Phase Separation Guided by Crystal Structure. Molecular Pharmaceutics, 2016;13(3):915-23. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

Reports from Erasmus University Medical Center Add New Data to Findings in Pharmacokinetics (Facilitating the implementation of pharmacokinetic-guided dosing of prophylaxis in haemophilia care by discrete choice experiment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Pharmacokinetics are discussed in a new report. According to news originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, 'Patients', parents' and providers' preferences with regard to medical innovations may have a major impact on their implementation. To evaluate barriers and facilitators for individualized pharmacokinetic (PK)-guided dosing of prophylaxis in haemophilia patients, parents of young patients, and treating professionals by discrete choice experiment (DCE) questionnaire.'

Funders for this research include ZonMw, Novartis, Dutch Organization for Health Research and Development, ASPIRE, Pfizer, Baxter International, Bayer Schering Pharma and Sanquin, CSL Behring, Eurocept, Novo Nordisk.

Our news journalists obtained a quote from the research from Erasmus University Medical Center, "The study population consisted of patients with haemophilia currently or previously on prophylactic treatment with factor concentrate (n=114), parents of patients aged 12-18 years (n=19) and haemophilia professionals (n =91). DCE data analysis was performed, taking preference heterogeneity into account. Overall, patients and parents, and especially professionals were inclined to opt for PK-guided dosing of prophylaxis. In addition, if bleeding was consequently reduced, more frequent infusions were acceptable. However, daily dosing remained an important barrier for all involved. 'Reduction of costs for society' was a facilitator for implementation in all groups. To achieve implementation of individualized PK-guided dosing of prophylaxis in haemophilia, reduction of bleeding risk and reduction of costs for society should be actively discussed as they are motivating for implementation; daily dosing is still reported to be a barrier for all groups.'"

According to the news editors, the research concluded: "The knowledge of these preferences will enlarge support for this innovation, and aid in the drafting of implementable guidelines and information brochures for patients, parents and professionals."

The news correspondents report that additional information may be obtained from J. Lock, Dept. of Paediatric Haematology, Erasmus University Medical Centre - Sophia Children's Hospital, Rotterdam, Netherlands. Additional authors for this research include E.W. de Bekker-Grob, G. Urhan, M. Peters, K. Meijer, P. Brons, F.J. van der Meer, M.H. Driessens, P.W. Collins, K. Fijnvandraat, F.W. Leebeek and M.H Cnossen.

Reports from Exponent Add New Data to Findings in Environmental Health Research (Systematic review and meta-analysis of glyphosate exposure and risk of lymphohematopoietic cancers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Environmental Health - Environmental Health Research have been presented. According to news originating from Menlo Park, California, by NewsRx correspondents, research stated, "This systematic review and meta-analysis rigorously examines the relationship between glyphosate exposure and risk of lymphohematopoietic cancer (LHC) including NHL, Hodgkin lymphoma (HL), multiple myeloma (MM), and leukemia. Meta-relative risks (meta-RRs) were positive and marginally statistically significant for the association between any versus no use of glyphosate and risk of NHL (meta-RR=1.3, 95% confidence interval (CI)=1.0-1.6, based on six studies) and MM (meta-RR=1.4, 95% CI=1.0-1.9; four studies)."

Our news journalists obtained a quote from the research from Exponent, "Associations were statistically null for HL (meta-RR=1.1, 95% CI=0.7-1.6; two studies), leukemia (meta-RR=1.0, 95% CI=0.6-1.5; three studies), and NHL subtypes except B-cell lymphoma (two studies each). Bias and confounding may account for observed associations. Meta-analysis is constrained by few studies and a crude exposure metric, while the overall body of literature is methodologically limited and findings are not strong or consistent."

According to the news editors, the research concluded: "Thus, a causal relationship has not been established between glyphosate exposure and risk of any type of LHC."

The news correspondents report that additional information may be obtained from E.T. Chang, a Center for Epidemiology and Computational Biology, Health Sciences Practice, Exponent, Inc, Menlo Park, California and Alexandria, Virginia, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1080/03601234.2016.1142748. This DOI is a link to an online electronic document that is either free or for purchase.

Nutritional and Metabolic Diseases and Conditions - …

Reports from Faculty of Medicine Describe Recent Advances in Dyslipidemias (Retinal oximetry during treatment of retina vein occlusion by ranibizumab in patients with high blood pressure and dyslipidemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Dyslipidemias have been published. According to news reporting originating in Paris, France, by NewsRx journalists, research stated, "- In the present study, we examined retinal vascular oxygen saturation in patients with retinal vein occlusion (RVO), high blood pressure (HBP) and dyslipidemia, before and during intravitreal vascular endothelial growth factor (VEGF) injection (ranibizumab). - We retrospectively reviewed the medical records of six patients with visual acuity (VA) reduced by macular edema (ME) secondary to RVO with HBP and dyslipidemia, who underwent intravitreal anti-VEGF injection between October 2014 and February 2015 in the department of ophthalmology of Francois-Quesnay Hospital at Mantes-la-Jolie (France)."

The news reporters obtained a quote from the research from the Faculty of Medicine, "The main inclusion criterion was the presence of RVO with ME and decreased VA. The primary end-point was improvement of retinal venous oxygen saturation in patients with RVO before and 3 months after intravitreal ranibizumab injection. Secondary outcomes were improvement of retinal arterial oxygen saturation, improvement of best-corrected visual acuity (BCVA) on the Early Treatment Diabetic Retinopathy Study (ETDRS) scale, regression of ME measured by the central macular thickness (CMT) in nm and studying the correlation between blood pressure (BP) and retinal venous oxygen saturation before and after ranibizumab. - Six eyes of six patients were included. Before treatment, the mean (standard deviation [SD]) of the retinal venous saturation (%) was 38.1 +/- 14.2. Three months after the injections, the mean (SD) of the retinal venous saturation (%) increased statistically significantly 49.2 +/- 11 (P=0.03)."

According to the news reporters, the research concluded: "- In this study, retinal venous oxygen saturation in patients with RVO, HBP and dyslipidemia was partially normalized during intravitreal ranibizumab treatment."

Our news correspondents report that additional information may be obtained by contacting C. Keilani, Pierre & Marie Curie Paris VI, Fac Med, Dept. of Vasc Neurol, Hopital Univ Pitie Salpetriere, F-75013 Paris, France. Additional authors for this research include A. Halalchi, D.W. Djeugue, A. Regis and S. Abada.

Oncology - Non-Hodgkin Lymphoma

Reports from Faculty of Sciences Advance Knowledge in Non-Hodgkin Lymphoma (Early manifestation of mild cognitive impairment in B-cell non-Hodgkin's lymphoma patients receiving CHOP and rituximab-CHOP chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Non-Hodgkin Lymphoma is the subject of a report. According to news reporting originating in New Delhi, India, by NewsRx journalists, research stated, "Existing evidence suggests that pro-inflammatory cytokines increases during chemotherapy which plays an intermediary role in Chemotherapy related cognitive impairment (CRCI) and thyroid dysregulation. Previous studies suggest that thyroid hormones are essential for neuronal development and neurotransmitter release."

The news reporters obtained a quote from the research from the Faculty of Sciences, "CHOP regimen has been the backbone of Non-Hodgkin's lymphoma (NHL) treatment from a decade but rituximab addition to CHOP (R-CHOP) has improved cure rates. However, their adverse event profile on behavior is not well studied on patients. In this study total 68 NHL patients were enrolled and divided equally in 2 groups as CHOP receiving (n = 34) and R-CHOP receiving (n = 34). Effects of R-CHOP and CHOP regimen on thyroid function, pro-inflammatory cytokines and cognitive function were determined at four time points that was from one day before 1st (TP0), 2nd (TP1), 3rd (TP2) and 4th (TP3) cycle of chemotherapy. Results indicated significant increase in levels of pro-inflammatory cytokines after each time point from TP0 to TP3 of chemotherapy. Thyroid hormone levels i.e. T3, T4 were found significantly decreased and TSH was increased after each time point of both groups. MMSE score was found significantly decreased after each cycle of both groups. However, an inverse association was found between IL-1 beta levels with TSH by applying correlation coefficient. Cognitive function was decreased in patients with decreased T3 and T4 levels and increased TSH."

According to the news reporters, the research concluded: "To conclude, patients receiving R-CHOP regimen were found to have more increased IL-6 and IL-1 beta with more cognitive decline and thyroid abnormality as comparison to CHOP receiving patients."

For more information on this research see: Early manifestation of mild cognitive impairment in B-cell non-Hodgkin's lymphoma patients receiving CHOP and rituximab-CHOP chemotherapy. *Naunyn-Schmiedebergs Archives of Pharmacology*, 2016;389(12):1253-1265. *Naunyn-Schmiedebergs Archives of Pharmacology* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

**Biological Factors - Metalloporphyrins**

**Reports from Federal University Add New Data to Findings in Metalloporphyrins (Protein aggregation as a cellular response to oxidative stress induced by heme and iron)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biological Factors - Metalloporphyrins.

According to news originating from Rio de Janeiro, Brazil, by NewsRx correspondents, research stated, "Hemolytic diseases include a variety of conditions with diverse etiologies in which red blood cells are destroyed and large amounts of heme proteins are released. Heme has been described as a potent proinflammatory molecule that is able to induce multiple innate immune responses, such as those triggered by TLR4 and the NLRP3 inflammasome, as well as necroptosis in macrophages."

Our news journalists obtained a quote from the research from Federal University, "The mechanisms by which eukaryotic cells respond to the toxic effects induced by heme to maintain homeostasis are not fully understood, however. Here we describe a previously uncharacterized cellular response induced by heme: the formation of p62/SQTM1 aggregates containing ubiquitinated proteins in structures known as aggresome-like induced structures (ALIS). This action is part of a response driven by the transcription factor NRF2 to the excessive generation of reactive oxygen species induced by heme that results in the expression of genes involved in antioxidant responses, including p62/SQTM1. Furthermore, we show that heme degradation by HO-1 is required for ALIS formation, and that the free iron released on heme degradation is necessary and sufficient to induce ALIS. Moreover, ferritin, a key protein in iron metabolism, prevents excessive ALIS formation. Finally, in vivo, hemolysis promotes an increase in ALIS formation in target tissues."

According to the news editors, the research concluded: "Our data unravel a poorly understood aspect of the cellular responses induced by heme that can be explored to better understand the effects of free heme and free iron during hemolytic diseases such as sickle cell disease, dengue fever, malaria, and sepsis."

The news correspondents report that additional information may be obtained from L.H. Travassos, Federal University of Rio de Janeiro, Inst Biofis Carlos Chagas Filho, Lab Imunoreceptores & Sinalizacao, BR-21941902 Rio De Janeiro, RJ, Brazil. Reports from Federal University Add New Data to Findings in Obesity (Chewing in adolescents with overweight and obesity: An exploratory study with behavioral approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news reporting originating from Diadema, Brazil, by NewsRx correspondents, research stated, "Physiological and behavioral aspects of masticatory function may have an impact on nutritional status, which has been little studied. The aim was to perform a comprehensive evaluation of objective, subjective and behavioral aspects of masticatory function in 231 adolescents, aged 14-17 years and compare these parameters between normal-weight (n = 115) and adolescents with overweight/obesity (n = 116)."

Our news editors obtained a quote from the research from Federal University, "Objective aspects were examined by the Oro-facial Myofunctional Evaluation-expanded protocol (OMES-e), determining the masticatory type, chewing time/frequency, abnormal movements, and other; masticatory performance (color changeable chewing gum) and bite force were also explored. The subjective and behavioral evaluations were assessed using the Quality of Mastication Function Questionnaire, which explores the masticatory behavior and frequency/intensity of difficulty in chewing different types of foods. Results were submitted to normality tests, Chi-square, unpaired t-test and Mann-Whitney. A multiple linear regression model was used to evaluate which of the variables under study contributed to the variation in Percent Body Fat (alpha = 0.05). The results showed that OMES-e total score differed significantly between groups, that is, individuals with overweight showed more changes in oro-facial myofunctional aspects than normal-weight ones. Unilateral mastication was more frequent among females with overweight/obesity. They also showed greater difficulty on Habits and Fruit domains, reporting the need of adding sauce to the meal to facilitate swallowing and peeling and cutting fruit (apples) in small pieces in order to better chew them. OMES-e total score also showed a significant relationship with Percent Body Fat. Masticatory performance evaluated by chewing gum and bite force did not differ between groups."

According to the news editors, the research concluded: "This study showed that adolescents with excess weight presented changes in masticatory behavior and greater difficulty in performing the masticatory function comparing to normal-weight ones."

The news editors report that additional information may be obtained by contacting P.M. Castelo, Federal University of Sao Paulo, Dept. of Biol Sci, UNIFESP, BR-09913030 Diadema, SP, Brazil. Additional authors for this research include D.S. Araujo, K.G.D. Scudine, D.G.D. Prado, D. Lima and P.M. Castelo.
Oncology - Breast Cancer

Reports from Federal University Provide New Insights into Breast Cancer (Physical activity, fatigue and quality of life in breast cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting out of Natal, Brazil, by NewsRx editors, research stated, "to evaluate the relationship between levels of physical activity, fatigue and quality of life (QOL) in women diagnosed with breast cancer. 215 women between the ages of 40 and 65 years were recruited at a cancer clinic."

Our news journalists obtained a quote from the research from Federal University, "Physical activity levels were assessed by using the International Physical Activity Questionnaire (IPAQ), fatigue levels by using the revised Piper scale, and QOL by means of EORTC QLQ-C30 and WHOQOL-Bref. Statistical analysis was performed using Minitab statistical software, version 16. the mean age of subjects was 52.66 years (SD=8.6); patients were mostly white (58.14%) and overweight (55.81%). Most women were fatigued (72.09%) while physically active women showed lower symptoms of fatigue (p <0.001). Mean scores for QOL were significantly lower among fatigued women (p <0.001). More active women scored higher on all scales of QOL (EORTC), especially for functional capacity (p <0.001), compared with the sedentary patients. A significant association was found between level of physical activity and overall QOL (WHOQOL-Bref) for all domains (p <0.001). Climacteric symptoms ranged from mild to strong and did not show any statistically significant results; however, the most active women had the fewest symptoms."

According to the news editors, the research concluded: "Physical activity appears to positively influence fatigue and QOL in women diagnosed with breast cancer."

Our news journalists report that additional information may be obtained by contacting A.C. Canario, Health Sciences Graduate Program, Universidade Federal do Rio Grande do Norte, Natal, RN, Brazil. Additional authors for this research include P.U. Cabral, L.C. de Paiva, G.L. Florencio, M.H. Spyrides and A.K Goncalves.

Reports from First Affiliated Hospital Highlight Recent Findings in Experimental Autoimmune Encephalomyelitis [Enhanced Neuroprotective Effects of Combination Therapy with Bone Marrow-Derived Mesenchymal Stem Cells and Ginkgo biloba Extract...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Autoimmune Diseases and Conditions - Experimental Autoimmune Encephalomyelitis have been published. According to news reporting originating from Dalian, People's Republic of China, by NewsRx correspondents, research stated, "We investigated whether Ginkgo biloba extract (EGb761) can provide neuroprotective effects and enhance the efficacy of bone marrow-derived mesenchymal stem cells (BMSCs) in a rat model of experimental autoimmune encephalomyelitis (EAE). We examined the synergistic action of BMSCs combined with EGb761 treatment in EAE rats."

Our news editors obtained a quote from the research from First Affiliated Hospital, "The immunized rats received an intravenous injection of BMSCs or intraperitoneal administration of EGb761 or both on the day of the onset of clinical symptoms and for the following 21 days. Clinical severity scores were recorded daily and histopathological examination of the spinal cord and cytokine concentrations in the serum were studied on days 14 and 31 postimmunization. Our results showed that combined treatment with BMSCs and EGb761 further decreased the disease severity, maximal clinical score and number of infiltrated mononuclear cells, especially CD3-positive T cells. We observed that the demyelination score and the density of axonal loss in the spinal cord were significantly reduced in mice receiving the combination therapy. The serum concentrations of the phosphorylated neurofilament heavy chain, tumor necrosis factor-a and interferon-g were reduced in the combination-treatment group."

According to the news editors, the research concluded: "Our results suggest that combined treatment with BMSCs and EGb761 have a synergistic effect in rats with EAE by inhibiting the secretion of proinflammatory cytokines, demyelination and protecting axons and neurons."

For more information on this research see: Enhanced Neuroprotective Effects of Combination Therapy with Bone Marrow-Derived Mesenchymal Stem Cells and Ginkgo biloba Extract (EGb761) in a Rat Model of Experimental Autoimmune Encephalomyelitis. Neuroimmunomodulation, 2015;23(1):41-57. (Karger - www.karger.com/; Neuroimmunomodulation - content.karger.com/ProdukteDB/produkte.asp?Aktion=JournalHome&ProduktNr=224176)

Congenital Diseases and Conditions - Congenital...

Reports from Florida Hospital Describe Recent Advances in Congenital Heart Disease (Prevalence of Noncardiac and Genetic Abnormalities in Neonates Undergoing Cardiac Operations: Analysis of The Society of Thoracic Surgeons Congenital Heart ...

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Congenital Diseases and Conditions - Congenital Heart Disease. According to news reporting out of Orlando, Florida, by NewsRx editors, research stated, "Among patients with congenital heart disease (CHD), the coexistence of noncardiac congenital anatomic abnormalities (NC), genetic abnormalities (GA), and syndromes (S) may influence therapeutic strategies and outcomes. The appreciated prevalence of these abnormalities has risen because increased screening and improved diagnostic precision enable identification of these comorbidities in a larger fraction of neonates with CHD."

Our news journalists obtained a quote from the research from Florida Hospital, "We examined the contemporary prevalence and distribution of NC/GA/S across diagnostic groups among neonates undergoing cardiac operations using a large nationally representative clinical registry. The Society of Thoracic Surgeons Congenital Heart Surgery Database (STS-CHSD) was queried to identify neonates (<= 30 days) who underwent index cardiac operations from 2010 to 2013. The fundamental cardiac diagnosis was used to identify 10 diagnostic groups. The prevalence of NC/GA/S was reported across each group. The cohort included 15,576 index neonatal operations from 112 centers. Overall, 18.8% (2,894 of 15,376) of operations were performed in neonates with NC/GA/S. Patients with atrioventricular septal defect (212 of 357 [59.4%]), interrupted aortic arch (248 of 567 [43.7%]), truncus arteriosus (204 of 554 [36.8%]), and tetralogy of Fallot (417 of 1,383 [30.2%]) had the highest prevalence of NC/GA/S abnormalities, whereas those with transposition of the great arteries (111 of 2,778 [4.0%]) had the lowest prevalence. The most commonly identified NC/GA/S included heterotaxy (597 of 15,376 [3.9%]), DiGeorge syndrome or 22q11 deletion (550 of 15,376 [3.6%]), Down syndrome or trisomy 21 (318 of 15,376 [2.1%]), intestinal malrotation (220 of 15,376 [1.4%]), and Turner syndrome or 45XO (189 of 15,376 [1.2%]). The prevalence of NC/GA/S varies widely across CHD diagnostic groups."

According to the news editors, the research concluded: "This information may be useful for patient counseling, recommendations for screening for anomalies and genetic disorders, and perioperative management."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.04.008. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Bone Cancer

Reports from Fourth Military Medical University Highlight Recent Findings in Bone Cancer (The analgesic effect of rolipram is associated with the inhibition of the activation of the spinal astrocytic JNK/CCL2 pathway in bone cancer pain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Bone Cancer are presented in a new report. According to news reporting originating in Shaanxi, People's Republic of China, by NewsRx journalists, research stated, "Bone cancer pain (BCP) is one of the most difficult and intractable tasks for pain management, which is associated with spinal 'neuron-astrocytic' activation. The activation of the c-Jun N-terminal kinase (JNK)/chemokine (C-C motif) ligand (CCL2) signaling pathway has been reported to be critical for neuropathic pain."

The news reporters obtained a quote from the research from Fourth Military Medical University, "Rolipram (ROL), a selective phosphodiesterase 4 inhibitor, possesses potent anti-inflammatory and anti-nociceptive activities. The present study aimed to investigate whether the intrathecal administration of ROL has an analgesic effect on BCP in rats, and to assess whether the inhibition of spinal JNK/CCL2 pathway and astrocytic activation are involved in the analgesic effects of ROL. The analgesic effects of ROL were evaluated using the Von Frey and Hargreaves tests. Immunofluorescence staining was used to determine the number of c-Fos immunoreactive neurons, and the expression of spinal astrocytes and microglial activation on day 14 after tumor cell inoculation. Enzyme-linked immunosorbent assay (ELISA) was used to detect the expression of pro-inflammatory cytokines [interleukin (IL)-1, IL-6 and tumor necrosis factor (TNF)-] and chemokines (CCL2), and western blot analysis was then used to examine the spinal phosphodiesterase 4 (PDE4), ionized calcium binding adapter molecule-1 (IBA-1) and JNK levels on day 14 after tumor cell inoculation. The results revealed that ROL exerted a short-term analgesic effect in a dose-dependent manner, and consecutive daily injections of ROL exerted continuous analgesic effects. In addition, spinal 'neuron-astrocytic' activation was suppressed and was associated with the downregulation of spinal IL-1, IL-6 and TNF-expression, and the inhibition of PDE4B and JNK levels in the spine was also observed. In addition, the level of CCL2 was decreased in the rats with BCP. The JNK inhibitor, SP600125,
decreased CCL2 expression and attenuated pain behavior. Following co-treatment with ROL and SP600125, no significant increases in thermal hyperalgesia and CCL2 expression were observed compared with the ROL group."

According to the news reporters, the research concluded: "Thus, our findings suggest that the analgesic effects of ROL in BCP are mainly mediated through the inhibition of 'neuron-astrocytic' activation, which occurs via the suppression of spinal JNK/CCL2 signaling."

For more information on this research see: The analgesic effect of rolipram is associated with the inhibition of the activation of the spinal astrocytic JNK/CCL2 pathway in bone cancer pain. *International Journal of Molecular Medicine*, 2016;38(5):1433-1442. *International Journal of Molecular Medicine* can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

**DNA Research**

**Reports from Fred Hutchinson Cancer Research Center Provide New Insights into DNA Research (Unexpected DNA context-dependence identifies a new determinant of Chi recombination hotspots)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on DNA Research have been presented. According to news reporting out of Seattle, Washington, by NewsRx editors, research stated, "Homologous recombination occurs especially frequently near special chromosomal sites called hotspots. In Escherichia coli, Chi hotspots control RecBCD enzyme, a protein machine essential for the major pathway of DNA break-repair and recombination."

Our news journalists obtained a quote from the research from Fred Hutchinson Cancer Research Center, "RecBCD generates recombinogenic single-stranded DNA ends by unwinding DNA and cutting it a few nucleotides to the 3' side of 5' GCTGGTGG 3', the sequence historically equated with Chi. To test if sequence context affects Chi activity, we deep-sequenced the products of a DNA library containing 10 random base-pairs on each side of the Chi sequence and cut by purified RecBCD. We found strongly enhanced cutting at Chi with certain preferred sequences, such as A or G at nucleotides 4-7, on the 3' flank of the Chi octamer. These sequences also strongly increased Chi hotspot activity in E. coli cells."

According to the news editors, the research concluded: "Our combined enzymatic and genetic results redefine the Chi hotspot sequence, implicate the nuclease domain in Chi recognition, indicate that nicking of one strand at Chi is RecBCD's biologically important
reaction in living cells, and enable more precise analysis of Chi's role in recombination and genome evolution."

Our news journalists report that additional information may be obtained by contacting G.R. Smith, Fred Hutchinson Canc Res Center, Div Basic Sci, Seattle, WA 98109, United States. Additional authors for this research include S.K. Amundsen and G.R. Smith.

**Ebola Virus**

**Reports from French National Institute of Health and Medical Research (INSERM) Advance Knowledge in Ebola Virus [Experimental Treatment with Favipiravir for Ebola Virus Disease (the JIKI Trial): A Historically Controlled, Single-Arm ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Ebola Virus are presented in a new report. According to news reporting originating in Bordeaux, France, by NewsRx journalists, research stated, "Ebola virus disease (EVD) is a highly lethal condition for which no specific treatment has proven efficacy. In September 2014, while the Ebola outbreak was at its peak, the World Health Organization released a short list of drugs suitable for EVD research."

The news reporters obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "Favipiravir, an antiviral developed for the treatment of severe influenza, was one of these. In late 2014, the conditions for starting a randomized Ebola trial were not fulfilled for two reasons. One was the perception that, given the high number of patients presenting simultaneously and the very high mortality rate of the disease, it was ethically unacceptable to allocate patients from within the same family or village to receive or not receive an experimental drug, using a randomization process impossible to understand by very sick patients. The other was that, in the context of rumors and distrust of Ebola treatment centers, using a randomized design at the outset might lead even more patients to refuse to seek care. Therefore, we chose to conduct a multicenter non-randomized trial, in which all patients would receive favipiravir along with standardized care. The objectives of the trial were to test the feasibility and acceptability of an emergency trial in the context of a large Ebola outbreak, and to collect data on the safety and effectiveness of favipiravir in reducing mortality and viral load in patients with EVD. The trial was not aimed at directly informing future guidelines on Ebola treatment but at quickly gathering standardized preliminary data to optimize the design of future studies. Inclusion criteria were positive Ebola virus reverse
transcription PCR (RT-PCR) test, age (>=) 1 y, weight (>=) 10 kg, ability to take oral drugs, and informed consent. All participants received oral favipiravir (day 0: 6,000 mg; day 1 to day 9: 2,400 mg/d). Semi-quantitative Ebola virus RT-PCR (results expressed in 'cycle threshold' [Ct]) and biochemistry tests were performed at day 0, day 2, day 4, end of symptoms, day 14, and day 30. Frozen samples were shipped to a reference biosafety level 4 laboratory for RNA viral load measurement using a quantitative reference technique ( genome copies/milliliter).

Outcomes were mortality, viral load evolution, and adverse events. The analysis was stratified by age and Ct value. A 'target value' of mortality was defined a priori for each stratum, to guide the interpretation of interim and final analysis. Between 17 December 2014 and 8 April 2015, 126 patients were included, of whom 111 were analyzed (adults and adolescents, (>=)13 y, n= 99; young children, (<=)6 y, n=12). Here we present the results obtained in the 99 adults and adolescents. Of these, 55 had a baseline Ct value (>=) 20 (Group A Ct (>=) 20), and 44 had a baseline Ct value <20 (Group A Ct <20). Ct values and RNA viral loads were well correlated, with Ct=20 corresponding to RNA viral load=7.7 log10 genome copies/ml. Mortality was 20% (95% CI 11.6%-32.4%) in Group A Ct (>=) 20 and 91% (95% CI 78.8%-91.1%) in Group A Ct <20. Both mortality 95% CIs included the predefined target value (30% and 85%, respectively). Baseline serum creatinine was (>=)110 mmol/l in 48% of patients in Group A Ct (>=) 20 ( (>=) 300 mmol/l in 14%) and in 90% of patients in Group A Ct <20 ( (>=)300 mmol/l in 44%). In Group A Ct (>=) 20, 17% of patients with baseline creatinine (>=)110 mmol/l died, versus 97% in Group A Ct <20. In patients who survived, the mean decrease in viral load was 0.33 log10 copies/ml per day of follow-up. RNA viral load values and mortality were not significantly different between adults starting favipiravir within <72 h of symptoms compared to others. Favipiravir was well tolerated. In the context of an outbreak at its peak, with crowded care centers, randomizing patients to receive either standard care or standard care plus an experimental drug was not felt to be appropriate. We did a non-randomized trial. This trial reaches nuanced conclusions. On the one hand, we do not conclude on the efficacy of the drug, and our conclusions on tolerance, although encouraging, are not as firm as they could have been if we had used randomization. On the other hand, we learned about how to quickly set up and run an Ebola trial, in close relationship with the community and non-governmental organizations; we integrated research into care so that it improved care; and we generated knowledge on EVD that is useful to further research. Our data illustrate the frequency of renal dysfunction and the powerful prognostic value of low Ct values. They suggest that drug trials in EVD should systematically stratify analyses by baseline Ct value, as a surrogate of viral load."

According to the news reporters, the research concluded: "They also suggest that favipiravir monotherapy merits further study in patients with medium to high viremia, but not in those with very high viremia."

For more information on this research see: Experimental Treatment with Favipiravir for Ebola Virus Disease (the JIKI Trial): A Historically Controlled, Single-Arm Proof-of-Concept Trial in Guinea. Reports from French National Institute of Health and Medical Research (INSERM) Highlight Recent Findings in Antibiotics (A Population and Developmental Pharmacokinetic Analysis To Evaluate and Optimize Cefotaxime Dosing Regimen in Neonates and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a new report. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "Cefotaxime is one of the most frequently prescribed antibiotics for the treatment of Gram-negative bacterial sepsis in neonates. However, the dosing regimens routinely used in clinical practice vary considerably."

Our news editors obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "The objective of the present study was to conduct a population pharmacokinetic study of cefotaxime in neonates and young infants in order to evaluate and optimize the dosing regimen. An opportunistic sampling strategy combined with population pharmacokinetic analysis using NONMEM software was performed. Cefotaxime concentrations were measured by high-performance liquid chromatography-tandem mass spectrometry. Developmental pharmacokinetics-pharmacodynamics, the microbiological pathogens, and safety aspects were taken into account to optimize the dose. The pharmacokinetic data from 100 neonates (gestational age [GA] range, 23 to 42 weeks) were modeled with an allometric two-compartment model with first-order elimination. The median values for clearance and the volume of distribution at steady state were 0.12 liter/h/kg of body weight and 0.64 liter/kg, respectively. The covariate analysis showed that current weight, GA, and postnatal age (PNA) had significant impacts on cefotaxime pharmacokinetics. Monte Carlo simulations demonstrated that the current dose recommendations underdosed older newborns. A model-based dosing regimen of 50 mg/kg twice a day to four times a day, according to GA and PNA, was established. The associated risk of overdose for the proposed dosing regimen was 0.01%.

According to the news editors, the research concluded: "We determined the population pharmacokinetics of cefotaxime and established a model-based dosing regimen to optimize treatment for neonates and young infants."

For more information on this research see: A Population and Developmental Pharmacokinetic Analysis To Evaluate and Optimize Cefotaxime Dosing Regimen in Neonates and Young Infants. Cardiovascular Diseases and Conditions --

Reports from Friedrich-Alexander-University Add New Data to Findings in Atherosclerosis (Role of the receptor Mas in macrophage-mediated inflammation in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news originating from Erlangen, Germany, by NewsRx correspondents, research stated, "Recently, an alternative renin-angiotensin system pathway has been described, which involves binding of angiotensin-(1-7) to its receptor Mas. The Mas axis may counterbalance angiotensin-II-mediated proinflammatory effects, likely by affecting macrophage function."

Financial support for this research came from Deutsche Forschungsgemeinschaft (DFG).

Our news journalists obtained a quote from the research from Friedrich-Alexander-University, "Here we investigate the role of Mas in murine models of autoimmune neuroinflammation and atherosclerosis, which both involve macrophage-driven pathomechanisms. Mas signaling affected macrophage polarization, migration, and macrophage-mediated T-cell activation. Mas deficiency exacerbated the course of experimental autoimmune encephalomyelitis and increased macrophage infiltration as well as proinflammatory gene expression in the spleen and spinal cord. Furthermore, Mas deficiency promoted atherosclerosis by affecting macrophage infiltration and migration and led to increased oxidative stress as well as impaired endothelial function in ApoE-deficient mice. In summary, we identified the Mas axis as an important factor in macrophage function during inflammation of the central nervous and vascular system in vivo."

According to the news editors, the research concluded: "Modulating the Mas axis may constitute an interesting therapeutic target in multiple sclerosis and/or atherosclerosis."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1073/pnas.1612668113. This DOI is a link to an online electronic document that is either free or for purchase.

Kidney Diseases and Conditions - Chronic Kidney…

Reports from Gazi University Advance Knowledge in Chronic Kidney Disease (Prevalence of Chronic Kidney Disease in Turkish Adults With Obesity and Metabolic Syndrome: A Post Hoc Analysis from Chronic Renal Disease in Turkey Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Kidney Diseases and Conditions - Chronic Kidney Disease. According to news originating from Ankara, Turkey, by NewsRx correspondents, research stated, "Obesity confers an increased risk of chronic kidney disease (CKD), which is increased further by accompanying metabolic abnormalities. To investigate the relationship of the risk of CKD with obesity and metabolic syndrome (MS) in adults by means of post hoc analysis of data from the Chronic Renal Disease in Turkey (CREDIT) study."

Our news journalists obtained a quote from the research from Gazi University, "The anthropometric measurements of a total of 9,100 adult participants in the CREDIT study were included in the analyses. Subjects were classified according to the presence or absence of obesity (body mass index [BMI] > 30) and MS. Logistic regression analyses were used to estimate odds ratio for CKD. Effect modification analyses were also performed. The prevalence of obesity was 20.6% and that of MS was 31.3%. The prevalence of CKD was higher among obese subjects compared to those with a normal BMI (20.5% vs. 14%; P< .001). The odds ratio (OR) for CKD was 1.296 (95% confidence interval [CI], 1.121-1.498) for subjects who were overweight, 1.718 (95% CI, 1.444-2.044) for those with class I obesity, 1.983 (95% CI, 1.489-2.641) for those with class II obesity and 2.799 (95% CI, 1.719-4.557) for subjects with extreme obesity (P <.001 for each subgroup) compared to subjects with a normal BMI. CKD was significantly more prevalent in subjects with MS (21.9% vs. 12.3%, P< .001). The OR for CKD was higher in obese subjects with MS (adjusted OR, 1.321; 95% CI, 1.109-1.573; P = .002)."

According to the news editors, the research concluded: "The stratification of obese individuals based on their metabolic phenotype is important for prevention and treatment of CKD."

The news correspondents report that additional information may be obtained from S.M. Deger, Gazi University, Dept. of Nephrol, Fac Med, Ankara, Turkey. Additional authors for this research include S.M. Deger, K. Ates, B. Altun, T. Ecder, T. Camsari, K. Serdengecti and G. Suleymanlar.

**Immunology - Immunoglobulins**

**Reports from Genentech, Inc. Advance Knowledge in Immunoglobulins [Custom-Designed Affinity Capture LC-MS F(ab')2 Assay for Biotransformation Assessment of Site-Specific Antibody Drug Conjugates]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immunoglobulins have been published. According to news reporting out of San Francisco, California, by NewsRx editors, research stated, "Affinity capture liquid chromatography mass spectrometry (LC-MS) intact antibody assay has been widely used for direct drug-to-antibody ratio (DAR) and catabolite characterization of antibody-drug conjugates (ADCs). However, the intact mass spectra of new ADCs, which incorporate new types of linkers and payloads other than maytansines and auristatins, are more complex than those examined previously."

Our news journalists obtained a quote from the research from Genentech, Inc., "The current method has showed some limitations in elucidating certain structural modifications. Herein, we report an alternative analytical approach for ADCs, such as THIOMAB antibody-drug conjugates (TDCs), where the linker drugs are site-specifically conjugated in the Fab region. The newly developed affinity capture LC-MS F(ab')2 assay incorporates affinity capture of human IgGs via binding to the Fab region, followed by on-bead IdeS digestion to remove the Fc domain specifically and uniformly. The resulting F(ab')2 (similar to 100 kDa) fragments contain the key ADC biotransformation information, such as drug-to-antibody ratio and drug metabolism and are more readily analyzed by electrospray ionization LC-MS than the intact ADC (similar to 150 kDa). The reduced size of analytes results in improved mass spectral sensitivity and resolution. In addition, the reduced and optimized sample preparation time, for example, rapid removal of the Fc fragment by IdeS digestion, minimizes assay artifacts of drug metabolism and skewed DAR profiles that may result from the prolonged incubation times (e.g., overnight enzymatic treatment for Fc deglycosylation)."
According to the news editors, the research concluded: "The affinity capture LC-MS F(ab')2 assay provides more detailed and accurate information on ADC biotransformations in vivo, enabling analysis of low-dose, labile, and complex site-specific ADCs with linker-drug conjugated in the Fab region."

For more information on this research see: Custom-Designed Affinity Capture LC-MS F(ab')2 Assay for Biotransformation Assessment of Site-Specific Antibody Drug Conjugates. Analytical Chemistry, 2016;88(23):11340-11346. Analytical Chemistry can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; Analytical Chemistry - www.pubs.acs.org/journal/ancham)

Our news journalists report that additional information may be obtained by contacting D. Su, Genentech Inc, San Francisco, CA 94080, United States. Additional authors for this research include C. Ng, M. Khosraviani, S.F. Yu, E. Cosino, S. Kaur and K.Y. Xu.

Health and Medicine - Medicinal Chemistry

Reports from Genentech, Inc. Highlight Recent Findings in Medicinal Chemistry [Discovery of a Potent and Selective in Vivo Probe (GNE-272) for the Bromodomains of CBP/EP300]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Health and Medicine - Medicinal Chemistry. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated, "The single bromodomain of the closely related transcriptional regulators CBP/EP300 is a target of much recent interest in cancer and immune system regulation."

The news reporters obtained a quote from the research from Genentech, Inc., "A co-crystal structure of a ligand-efficient screening hit and the CBP bromodomain guided initial design targeting the LPF shelf, ZA loop, and acetylated lysine binding regions. Structure activity relationship studies allowed us to identify a more potent analogue."

According to the news reporters, the research concluded: "Optimization of permeability and microsomal stability and subsequent improvement of mouse hepatocyte stability afforded 59 (GNE-272, TR-FRET IC50 = 0.02 μM, BRET IC50 = 0.41 μM, BRD4 (1) IC50 = 13 μM) that retained the best balance of cell potency, selectivity, and in vivo PK. Compound 59 showed a marked antiproliferative effect in hematologic cancer cell lines and modulates MYC expression in vivo that corresponds with antitumor activity in an AML tumor model."

Lung Diseases and Conditions - Acute Lung Injury

Reports from General Hospital Add New Data to Findings in Acute Lung Injury (Acute lung injury induced by lipopolysaccharide is inhibited by wogonin in mice via reduction of Akt phosphorylation and RhoA activation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Acute Lung Injury are discussed in a new report. According to news originating from Kaohsiung, Taiwan, by NewsRx correspondents, research stated, "Neutrophil infiltration into the lung is the critical characteristic of acute lung injury (ALI), which is a clinical state with acute inflammatory syndrome. Up to now, there is no effective medicine for ALI."

Financial supporters for this research include Ministry of Science and Technology, Taiwan, Kaohsiung Armed Forces General Hospital of Taiwan.

Our news journalists obtained a quote from the research from General Hospital, "Wogonin has been shown to posses serval biological activities including anti-inflammation, anti-oxidant and anti-carcinoma. Acute lung injury was induced by intratracheal injection of LPS, and wogonin at various concentrations was injected intraperitoneally 30 min prior to LPS. Contents of myeloperoxidase (MPO) and expression of chemokines and adhesion molecules were determined by commercially and ELISA assay kits, respectively. Akt phosphorylation and RhoA activation were measured by western blot and RhoA pull-down activation assay, respectively. Neutrophil infiltration was reduced by wogonin in a concentration-dependent manner in the LPS-induced ALI mice model. LPS-induced proinflammatory cytokines and adhesion molecules were inhibited by wogonin in bronchoalveolar lavage fluid (BALF) with LPS-induced ALI. Furthermore, wogonin suppressed Akt phosphorylation and RhoA activation in lungs in LPS-induced ALI. The similar parallel trend was observed as wogonin reduced LPS-induced neutrophils infiltration, proinflammatory cytokines generation, adhesion molecules expression, Akt phosphorylation, and RhoA activation."

According to the news editors, the research concluded: "These results suggested that the effects of wogonin in LPS-induced ALI were induced by inhibition of Akt phosphorylation and RhoA activation."

For more information on this research see: Acute lung injury induced by lipopolysaccharide is inhibited by wogonin in mice via reduction of Akt phosphorylation and RhoA activation.

The news correspondents report that additional information may be obtained from Y.C. Yeh, Dept. of Internal Medicine, Kaohsiung Armed Forces General Hospital, Kaohsiung, Taiwan. Additional authors for this research include C.P. Yang, S.S. Lee, C.T. Horng, H.Y. Chen, T.H. Cho, M.L. Yang, C.Y. Lee, M.C. Li and Y.H Kuan.

*Musculoskeletal Diseases and Conditions - Arthritis*

**Reports from General Hospital Advance Knowledge in Arthritis**

**(Tuberculous arthritis of the hip with Staphylococcus aureus superinfection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Musculoskeletal Diseases and Conditions - Arthritis is the subject of a report. According to news reporting originating in Hyogo, Japan, by NewsRx journalists, research stated, "Skeletal tuberculosis (TB) accounts for a small percentage of all cases of TB. It is often difficult to diagnose, especially in the hip joint."

The news reporters obtained a quote from the research from General Hospital, "TB arthritis can be masked by superinfection with other pathogens, leading to a delay in diagnosis and treatment. Trauma or surgery is a reported risk factor of TB arthritis. In contrast, descriptions of TB arthritis after a closed bone fracture are rare. We herein report a case involving an 81-year-old woman with septic arthritis superinfected with methicillin-resistant Staphylococcus aureus (MRSA) and Mycobacterium tuberculosis. Three months before presentation, she sustained a bone fracture of the left femur and was treated conservatively without surgery. She developed a fever at another hospital and was transferred to our institution. Computed tomography revealed the presence of abnormal fluid around the left hip joint. MRSA was detected from the fluid and blood cultures. The patient was diagnosed with MRSA arthritis and treated with antibiotics and surgical drainage. However, her fever persisted, and the abscess further developed and enlarged around the left hip. It was punctured and cultured again. Three weeks later, Mycobacterium tuberculosis was identified from the abscess culture. The septic arthritis was confirmed to have been caused by MRSA and M. tuberculosis. After the initiation of antituberculosis therapy, her fever subsided and the treatment was continued."

According to the news reporters, the research concluded: "This case demonstrates that the diagnosis of TB arthritis can be hindered by the existence of other pathogens and that TB arthritis can occur at a closed fracture site in the hip joint."

For more information on this research see: Tuberculous arthritis of the hip with Staphylococcus aureus superinfection. *Journal of Infection and Chemotherapy*, 2016;22 (11):752-754. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science
Reports from General Hospital Describe Recent Advances in Breast Cancer (Comparison of the Adipose and Luminal Mammary Gland Compartment as Orthotopic Inoculation Sites in a 4T1-Based Immunocompetent Preclinical Model for Triple-Negative Breast ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting from Antwerp, Belgium, by NewsRx journalists, research stated, "Breast tumorigenesis is classically studied in mice by inoculating tumor cells in the fat pad, the adipose compartment of the mammary gland. Alternatively, the mammary ducts, which constitute the luminal mammary gland compartment, also provide a suitable inoculation site to induce breast cancer in murine models."

Financial supporters for this research include Kom op tegen Kanker, Fund for Scientific Research Flanders.

The news correspondents obtained a quote from the research from General Hospital, "The microenvironments in these compartments influence tumor cell progression, yet this effect has not been investigated in an immunocompetent context. Here, we compared both mammary gland compartments as distinct inoculation sites, taking into account the immunological aspect by inoculating 4T1 tumor cells in immunocompetent mice. Following tumor cell inoculation in the adipose compartment of non-pretreated/naive, hormonally pretreated/naive and non-pretreated/lactating mice, the primary tumors developed similarly. However, a slower onset of primary tumor growth was found after inoculations in the luminal compartment of non-pretreated/lactating mice. Despite this difference in tumor development rate, metastasis to the liver and lungs was equally observed and was accompanied by lymphatic spreading of tumor cells and progressive splenomegaly with both inoculation types. Chitinase 3-like 1 (CHI3L1)
and lipocalin 2 (LCN2) served as innovative biomarkers for disease progression showing increased levels in primary tumors and sera of the non-pretreated/lactating inoculation groups. A slower increase in circulating CHI3L1 but not LCN2 levels, was observed after inoculations in the luminal compartment which corroborated the slower tumor development at this inoculation site.

According to the news reporters, the research concluded: "Our results highlight the critical impact of different mammary gland compartments on tumor development in syngeneic murine models and support the use of novel tumor progression biomarkers in an immune-competent environment."

Our news journalists report that additional information may be obtained by contacting J. Steenbrugge, Gen Hosp Sint Augustinus, Translat Canc Res Unit Antwerp, Oncol Res Center, Antwerp, Belgium. Additional authors for this research include K. Breyne, S. Denies, M. Dekimpe, K. Demeyere, O. De Wever, P. Vermeulen, S. Van Laere, N.N. Sanders and E. Meyer.

**Palliative and Supportive Care**

**Reports from Ghent University Describe Recent Advances in Palliative and Supportive Care (Palliative care needs at different phases in the illness trajectory: a survey study in patients with cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Palliative and Supportive Care is the subject of a report. According to news reporting originating in Brussels, Belgium, by NewsRx journalists, research stated, "Despite the growing consensus on the benefits of initiating palliative care early in the disease trajectory, it remains unclear at what point palliative care needs emerge. This study investigates quality of life and unmet palliative care needs at three phases in the cancer trajectory, curative, life-prolonging and most advanced (prognosis <6 months/no further disease-modifying treatment)."

Financial support for this research came from Agentschap voor Innovatie door Wetenschap en Technologie.

The news reporters obtained a quote from the research from Ghent University, "We collected self-reported data from 620 patients with cancer in the University Hospital of Ghent,
Belgium. They completed a questionnaire on quality of life (using the EORTC QLQ-C30) and unmet care needs within the domains of palliative care. We used European reference values of the EORTC QLQ-C30 to compare the mean scores with a norm group. The groups further on in the cancer trajectory reported statistically and clinically poorer functioning compared with earlier phases, also when controlled for the effects of sex, age or type of cancer. Higher symptom burdens for fatigue, pain, dyspnoea and appetite loss were found in groups further into the trajectory, p<.001. Patients in the curative phase experienced physical symptoms and had clinically worse functioning than a European reference group."

According to the news reporters, the research concluded: "This paper demonstrates the ongoing need for oncologists to address the broader palliative care needs of patients from diagnosis onwards."

Our news correspondents report that additional information may be obtained by contacting K. Beernaert, University of Ghent, Brussels, Belgium. Additional authors for this research include K. Pardon, L. Van den Block, D. Devroey, M.D.L. Msc, K. Geboes, V. Surmont, L. Deliens and J. Cohen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ecc.12522. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions -...

Reports from Guangzhou University Describe Recent Advances in Hypertension (Cerebral Targeting of Acupuncture at Combined Acupoints in Treating Essential Hypertension: An Rs-fMRI Study and Curative Effect Evidence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "The study attempted to explore that the synergistic effect of acupoints combination is not a simple superposition of single acupoint's effect by comparing and analyzing the changes of blood pressure (BP), SF-36, and brain regions after acupuncture treatment. 47 patients were randomly divided into LR3+KI3 group, LR3 group, and KI3 group. Subjects received Rs-fMRI scan, BP measurement, and SF-36 questionnaires before and after treatment and short-term acupuncture treatment."

Financial support for this research came from National Key Basic Research and Development Project.
Our news editors obtained a quote from the research from Guangzhou University, "After treatment, there were no significant differences in BP and SF-36 among 3 groups, compared to the case before treatment. SBP of 3 groups decreased, and DBP significantly decreased while vitality and mental health significantly increased in LR3+KI3 group. Both number and scopes of changes of brain regions in LR3+KI3 group were the largest, which mainly included BAs 3, 4, 8, 19, 21, 24, 32, 44, and 45."

According to the news editors, the research concluded: "Acupuncture at LR3+KI3 may auxiliary reduce BP and improve the vitality and mental health of patients, and the changes of brain regions were related to somatesthesia, movement, vision, audition, emotion and mood, language, memory, etc. BAs 4, 9, 10, 24, 31, 32, and 46 may be the targeting brain areas of acupuncture in assisting hypotension. It is suggested that acupoints combination of LR3 + KI3 maybe generates a synergistic effect, and it is not simple sum of single acupoint effect."

For more information on this research see: Cerebral Targeting of Acupuncture at Combined Acupoints in Treating Essential Hypertension: An Rs-fMRI Study and Curative Effect Evidence. Evidence-Based Complementary and Alternative Medicine, 2016();1-12. Lung Diseases and Conditions - Pulmonary...

Reports from Gyeongsang National University Add New Data to Findings in Pulmonary Emphysema (Severity of pulmonary emphysema and lung cancer: analysis using quantitative lobar emphysema scoring)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lung Diseases and Conditions - Pulmonary Emphysema. According to news originating from Chang Won, South Korea, by NewsRx correspondents, research stated, "The aim of this study was to determine the relationship between lobar severity of emphysema and lung cancer using automated lobe segmentation and emphysema quantification methods. This study included 78 patients (74 males and 4 females; mean age of 72 years) with the following conditions: pathologically proven lung cancer, available chest computed tomographic (CT) scans for lobe segmentation, and
quantitative scoring of emphysema."

Our news journalists obtained a quote from the research from Gyeongsang National University, "The relationship between emphysema and lung cancer was analyzed using quantitative emphysema scoring of each pulmonary lobe. The most common location of cancer was the left upper lobe (LUL) (n = 28), followed by the right upper lobe (RUL) (n = 27), left lower lobe (LLL) (n = 13), right lower lobe (RLL) (n = 9), and right middle lobe (RML) (n = 1). Emphysema ratio was the highest in LUL, followed by that in RUL, LLL, RML, and RLL. Multivariate logistic regression analysis revealed that upper lobes (odds ratio: 1.77; 95% confidence interval: 1.01-3.11, P = 0.048) and lobes with emphysema ratio ranked the 1st or the 2nd (odds ratio: 2.48; 95% confidence interval: 1.48-4.15, P< 0.001) were significantly and independently associated with lung cancer development."

According to the news editors, the research concluded: "In emphysema patients, lung cancer has a tendency to develop in lobes with more severe emphysema."

For more information on this research see: Severity of pulmonary emphysema and lung cancer: analysis using quantitative lobar emphysema scoring. Medicine, 2016;95(48):188-192. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

The news correspondents report that additional information may be obtained from K.N. Jeon, Gyeongsang National University, Dept. of Radiol, Changwon Hosp, Chang Won 51472, South Korea. Oncology - Non-Small Cell Lung Cancer

Reports from H. Lee Moffitt Cancer Center and Research Institute Provide New Insights into Non-Small Cell Lung Cancer (ZEB1 Mediates Acquired Resistance to the Epidermal Growth Factor Receptor-Tyrosine Kinase Inhibitors in Non-Small Cell Lung ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news reporting originating in Tampa, Florida, by NewsRx journalists, research stated, "Epithelial-mesenchymal transition (EMT) is one mechanism of acquired resistance to inhibitors of the epidermal growth factor receptor-tyrosine kinases (EGFR-TKIs) in non-small cell lung cancer (NSCLC). The precise mechanisms of EMT-related acquired resistance to EGFR-TKIs in NSCLC remain unclear."

The news reporters obtained a quote from the research from H. Lee Moffitt Cancer Center and Research Institute, "We generated erlotinib-resistant HCC4006 cells (HCC4006ER) by chronic exposure of EGFR-mutant HCC4006 cells to increasing concentrations of erlotinib. HCC4006ER cells acquired an EMT phenotype and activation of the TGF-b/SMAD pathway, while lacking both T790M secondary EGFR mutation and MET gene amplification. We
employed gene expression microarrays in HCC4006 and HCC4006ER cells to better understand the mechanism of acquired EGFR-TKI resistance with EMT. At the mRNA level, ZEB1 (TCF8), a known regulator of EMT, was >20-fold higher in HCC4006ER cells than in HCC4006 cells, and increased ZEB1 protein level was also detected. Furthermore, numerous ZEB1 responsive genes, such as CDH1 (E-cadherin), ST14, and vimentin, were coordinately regulated along with increased ZEB1 in HCC4006ER cells. We also identified ZEB1 overexpression and an EMT phenotype in several NSCLC cells and human NSCLC samples with acquired EGFR-TKI resistance. Short-interfering RNA against ZEB1 reversed the EMT phenotype and, importantly, restored erlotinib sensitivity in HCC4006ER cells. The level of micro-RNA-200c, which can negatively regulate ZEB1, was significantly reduced in HCC4006ER cells. Our results suggest that increased ZEB1 can drive EMT-related acquired resistance to EGFR-TKIs in NSCLC.

According to the news reporters, the research concluded: "Attempts should be made to explore targeting ZEB1 to resensitize TKI-resistant tumors."

Our news correspondents report that additional information may be obtained by contacting T. Yoshida, Dept. of Thoracic Oncology, H Lee Moffitt Cancer Center and Research Institute, Tampa, Florida, United States. Additional authors for this research include L. Song, Y. Bai, F. Kinose, J. Li, K.C. Ohaegbulam, T. Munoz-Antonia, X. Qu, S. Eschrich, H. Uramoto, F. Tanaka, P. Nasarre, R.M. Gemmill, J. Roche, H.A. Drabkin and E.B Haura.

**Proteins - Heparan Sulfate Proteoglycans**

**Reports from Hackensack University Medical Center Provide New Insights into Heparan Sulfate Proteoglycans (Molecular and clinical profiles of syndecan-1 in solid and hematological cancer for prognosis and precision medicine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - Heparan Sulfate Proteoglycans have been published. According to news reporting originating in Hackensack, New Jersey, by NewsRx journalists, research stated, "Syndecan-1 (SDC1, CD138) is a key cell surface adhesion molecule essential for maintaining cell morphology and interaction with the surrounding microenvironment. Deregulation of SDC1 contributes to cancer progression by promoting cell
proliferation, metastasis, invasion and angiogenesis, and is associated with relapse through chemoresistance."

The news reporters obtained a quote from the research from Hackensack University Medical Center, "SDC1 expression level is also associated with responses to chemotherapy and with prognosis in multiple solid and hematological cancers, including multiple myeloma and Hodgkin lymphoma. At the tissue level, the expression levels of SDC1 and the released extracellular domain of SDC1 correlate with tumor malignancy, phenotype, and metastatic potential for both solid and hematological tumors in a tissue-specific manner. The SDC1 expression profile varies among cancer types, but the differential expression signatures between normal and cancer cells in epithelial and stromal compartments are directly associated with aggressiveness of tumors and patient's clinical outcome and survival. Therefore, relevant biomarkers of SDC signaling may be useful for selecting patients that would most likely respond to a particular therapy at the time of diagnosis or perhaps for predicting relapse."

According to the news reporters, the research concluded: "In addition, the reciprocal expression signature of SDC between tumor epithelial and stromal compartments may have synergistic value for patient selection and the prediction of clinical outcome."

For more information on this research see: Molecular and clinical profiles of syndecan-1 in solid and hematological cancer for prognosis and precision medicine. Oncotarget, 2015;6(30):28693-715.

Our news correspondents report that additional information may be obtained by contacting M.R. Autoimmune Diseases and Conditions - Lupus

Reports from Harvard School of Medicine Add New Data to Findings in Lupus (T cells in Systemic Lupus Erythematosus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Autoimmune Diseases and Conditions - Lupus are presented in a new report. According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Systemic Lupus Erythematosus is an autoimmune disorder caused by a complex combination of genetic, epigenetic and environmental factors."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Different polymorphisms and epigenetic modifications lead to altered gene expression and function of several molecules which lead to abnormal T cell responses."

Oncotarget
Metabolic and functional alterations result in peripheral tolerance failures and biased differentiation of T cells into pro inflammatory and B cell-helper phenotypes as well as the accumulation of disease-promoting memory T cells."

According to the news editors, the research concluded: "Understanding these T cell alterations and their origins is necessary to develop more accurate patient classification systems and to discover new therapeutic targets."

For more information on this research see: T cells in Systemic Lupus Erythematous. Current Opinion in Immunology, 2016;43():32-38. Current Opinion in Immunology can be contacted at: Current Biology Ltd, 84 Theobalds Rd, London WC1X 8RR, England. Cardiovascular Diseases and Conditions - Aneurysm

Reports from Health Science Center Add New Data to Findings in Aneurysm (LVIS Jr 'shelf' technique: an alternative to Y stent-assisted aneurysm coiling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Aneurysm. According to news reporting from Halifax, Canada, by NewsRx journalists, research stated, "Wide-necked bifurcation intracranial aneurysms have traditionally not been amenable to coil embolization with the use of a single stent due to the high risk of coil prolapse. Y-configuration double stent-assisted coil embolization ('Y-stenting') of this aneurysm type has been shown to have generally good clinical outcomes, although the technique is complex with various challenges described in the literature."

The news correspondents obtained a quote from the research from Health Science Center, "The compliant and flexible closed-cell design of braided stents such as the LVIS Jr allows for the creation of a 'shelf' across the aneurysm neck sufficient to prevent coil prolapse. We describe this novel 'shelf' technique and present a small case series of LVIS Jr stent-assisted wide-necked bifurcation intracranial aneurysm coiling in eight patients."

According to the news reporters, the research concluded: "Our small, albeit important, case series demonstrates that the 'shelf' technique is feasible and safe with very good short-term clinical and angiographic outcomes, and may obviate the need for Y-stenting."

For more information on this research see: LVIS Jr 'shelf' technique: an alternative...

Apoptosis

Reports from Hebei Medical University Highlight Recent Findings in Apoptosis (Role of Sirtuin3 in high glucose-induced apoptosis in renal tubular epithelial cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Apoptosis. According to news reporting originating in Shijiazhuang, People's Republic of China, by NewsRx journalists, research stated, "The apoptosis of renal tubular epithelial cells contributes to the pathogenesis of diabetic nephropathy. High glucose-induced mitochondrial oxidative stress is considered to be an important mediator for renal tubular cell apoptosis."

The news reporters obtained a quote from the research from Hebei Medical University, "Sirtuin3(Sirt3), a kind of mitochondria-localized nicotinamide adenine dinucleotide (NAD(+))-dependent protein deacetylase, has been reported to regulate the generation of ROS in mitochondria through regulating acetylation level and activity of several key mitochondrial enzymes. In this study, we investigated the role of Sirt3 on high glucose-induced apoptosis in HK-2 cells. High glucose decreased the protein and mRNA expression of Sirt3 in a time-dependent manner, along with increased cell apoptosis in HK-2 cells. Furthermore, high glucose-induced oxidative stress and apoptosis were reversed by Sirt3 overexpression or antioxidant treatment. Meanwhile, we also found that over expression of Sirt3 or antioxidant could regulate the activity of Akt/FoxO signaling pathway associated with cell apoptosis in diabetic nephropathy."

According to the news reporters, the research concluded: "Our data suggest that Sirt3 overexpression antagonize high glucose-induced apoptosis by controlling ROS accumulation and ROS-sensitive Akt/FoxO signaling pathway in HK-2 cells."

For more information on this research see: Role of Sirtuin3 in high glucose-induced apoptosis in renal tubular epithelial cells. *Biochemical and Biophysical Research Communications*, 2016;480(3):387-393. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Reports from Helmholtz-Zentrum Describe Recent Advances in Type 2 Diabetes**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news reporting out of Munich, Germany, by NewsRx editors, research stated, "The exact mechanism of premature atherosclerosis in diabetes is still unclear. Inappropriate activation of the renin-aldosterone-angiotensin system may be an important risk factor for cardiovascular disease."

Funders for this research include German Federal Ministry of Education, Virtual Diabetes Institute, Clinical Cooperation Group Diabetes, Federal Ministry of Health, Ministry of Innovation, German Research Foundation (DFG).

Our news journalists obtained a quote from the research from Helmholtz-Zentrum, "We investigated whether renin and aldosterone are associated with vasoactive peptides midregional-pro atrial natriuretic peptide (MR-proANP) and midregional-pro adrenomedullin (MR-proADM), or with intima media thickness (IMT) as a marker for early atherosclerotic alterations in the general community and in subjects with type 2 diabetes. In 1261 participants in the KORA F4 study, the associations of renin, aldosterone and aldosterone to renin ratio with MR-proANP, MR-proADM and IMT were assessed using linear regression models stratified for the presence of prediabetes and type 2 diabetes. After adjustment for confounding factors, an inverse association of MR-proANP with renin (p = 0.002) and aldosterone (p = 0.021) and a direct association of MR-proADM with renin (p < 0.001) and aldosterone (p = 0.019) were seen in nondiabetic individuals. In diabetic subjects, there was no significant correlation of MR-proANP or MR-proADM with renin or aldosterone. Renin and aldosterone were not directly associated with IMT in non-diabetic subjects and the total cohort, whereas aldosterone was associated with IMT in diabetic participants (p = 0.005). This study shows associations between renin, aldosterone and MR-proANP/MR-proADM plasma levels that are altered in type 2 diabetes."

According to the news editors, the research concluded: "Plasma renin and aldosterone are not independent biomarkers for early atherosclerotic damages of the carotid arteries in the general community."

Our news journalists report that additional information may be obtained by contacting C. Then, Helmholtz Zentrum Munchen, Munich, Germany. Additional authors for this research include M. Rottenkolber, A. Lechner, C. Meisinger, M. Heier, W. Koenig, A. Peters, W. Rathmann, M. Bidlingmaier, M. Reincke and J. Seissler. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.atherosclerosis.2016.07.905. **Biotechnology - Liposomes**

**Reports from Hiroshima University Highlight Recent Findings in Liposomes (Photodynamic Activity of Fullerenes and Other Molecules Incorporated into Lipid Membranes by Exchange)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biotechnology - Liposomes have been published. According to news reporting out of Higashi Hiroshima, Japan, by NewsRx editors, the research stated, "An effective exchange method is described whereby liposomal drug carriers of hydrophobic guest biomolecules are used to incorporate the guests into lipid membranes. The exchange method transfers the guest molecule from a cyclodextrin cavity to a liposome in water."

Our news journalists obtained a quote from the research from Hiroshima University, "Lipid-membrane-incorporated fullerenes (LMICx : x=60 or 70) prepared by the exchange method have much higher liposomal stability and fullerene water solubility than those prepared by conventional methods. The LMIC60 have high photodynamic activities with respect to human cancer cells under 350-500 nm excitation."

According to the news editors, the research concluded: "Furthermore, the LMIC60 bilayers, containing light-harvesting antenna molecules in addition to the C60, showed improved activities at the optimal wavelength for photodynamic therapy."

Our news journalists report that additional information may be obtained by
Digestive System Diseases and Conditions - Colitis

Reports from Hokkaido University Provide New Insights into Colitis (Cytomegalovirus colitis in a patient undergoing postoperative adjuvant chemotherapy for lung adenocarcinoma with uracil-tegafur)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Digestive System Diseases and Conditions - Colitis is the subject of a report. According to news reporting from Hokkaido, Japan, by NewsRx journalists, research stated, "When we examine a patient with symptoms of acute enteritis in the course of chemotherapy with oral fluoropyrimidines such as uracil-tegafur (often referred to as UFT), we usually suspect 5-fluorouracil-induced enterocolitis."

The news correspondents obtained a quote from the research from Hokkaido University, "In case of persistent clinical symptoms despite discontinuation of chemotherapy, cytomegalovirus colitis should be considered in the differential diagnosis of chemotherapy-induced enterocolitis. We herein report the case of a patient who underwent surgery for lung adenocarcinoma followed by postoperative adjuvant chemotherapy with uracil-tegafur and was diagnosed as having cytomegalovirus colitis during the therapy."

According to the news reporters, the research concluded: "In the course of chemotherapy, cytomegalovirus colitis occasionally occurs even though the patient does not experience severe myelosuppression; thus, it is necessary that we recognize its potential occurrence."

For more information on this research see: Cytomegalovirus colitis in a patient undergoing postoperative adjuvant chemotherapy for lung adenocarcinoma with uracil-tegafur. Journal of Infection and Chemotherapy, 2016;22(12):826-829. Journal of Infection and Chemotherapy can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Springer - www.springer.com; Journal of Infection and Chemotherapy - www.springerlink.com/content/1341-321x/)

Our news journalists report that additional information may be obtained by contacting H. Hayashi, Hokkaido University, Grad Sch Med, Dept. of Gastroenterol & Hepatol, Sapporo, Hokkaido, Japan. Additional authors for this research include Y. Komatsu, T. Uchida, N. Abe, K. Ito, K. Hirata, K. Matsuda and A. Fujinaga.

Reports from Hospital Center Describe Recent Advances in Colon Cancer (Endogenous erythropoietin and erythropoietin receptors in colorectal cancer; can we answer the questions?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting out of Rijeka, Croatia, by NewsRx editors, research stated, "Erythropoietin (Epo) is glycoprotein hormone which binds on erythropoietin receptors (EpoR) promoting proliferation and differentiation. Studies have shown that EpoR, apart from erythrocyte precursors, is expressed on no hematopoietic tissue and various tumor cells."

Our news journalists obtained a quote from the research from Hospital Center, "Despite the progress in modern medicine, colorectal carcinoma (CRC) is still the leading cause of increased morbidity and mortality between oncology patients worldwide. Its precursors are benign villous adenomas, which in certain percentage progress to cancer. Anemia of chronic disease is common finding in CRC patients. Some of them are treated with Epo. Epo/EpoR seems to correlate with tumor progression and metastasizing. Therefore, the identification of at-risk group remains a clinical challenge. Vascular endothelial growth factor (VEGF) is a signal protein that stimulates angiogenesis and concentration of VEGF is positive correlated with tumor growth in numerous tumors. The importance of Epo in tumor pathogenesis has led to a growing interest in the potential prognostic value."

According to the news editors, the research concluded: "By our point of view there are many open questions about role of Epo/EpoR in CRC."

For more information on this research see: Endogenous erythropoietin and erythropoietin receptors in colorectal cancer; can we answer the questions? Medical Hypotheses, 2016;96():16-19. Medical Hypotheses can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. Oncology - Breast Cancer

Reports from Huazhong University of Science and Technology Advance Knowledge in Breast Cancer (Epidemiology of breast cancer: retrospective study in the Central African Republic)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting originating in Wuhan, People's Republic of China, by NewsRx journalists, research stated, "Breast cancer is recognised as a major public health problem in developing countries; however, there is very limited evidence about its epidemiology in the Central African Republic. The aim of this study was to investigate the epidemiological and histopathological characteristics of breast cancer in Bangui."

The news reporters obtained a quote from the research from the Huazhong University of Science and Technology, "This is a retrospective study based on the data collected from pathological anatomy records from 2003 to 2015 in Bangui. A questionnaire was designed to collect information and data was analysed using descriptive and inferential statistical methods. The mean age was 45.83 (SD = 13.5) years. The age group of 45-54 years represented the majority of the study population (29.3%). Over 69.5% of the women were housewives with a moderate economic status (56.9%). Less than 14% of the study population had a level of academic degree and 85.6% lived in cities. The breast cancer prevalence was 15.27%. The age-standardized incidence and death by world population (ASW) were 11.19/100,000 and 9.97/100,000 respectively. 50-54 years were most affected. Left breast cancer is mainly common and the time between first symptoms and consultation is more than 48 months. Most (69%) of the samples analysed were lumpectomy. The most common morphology of breast cancer was invasive ductal carcinoma (64.9%). Scarff Bloom Richardson III was the main grade in both common pathological types, but their proportion showed no significant increase along with time (.2 = 7.06, p = 0.54). Invasion of regional lymph node differed significantly among the pathological type of breast cancer (.2 = 24.6, p = 0.02). Surgery and chemotherapy were appropriate treatment yet 84.5% of the cases died. The findings of this study showed that breast cancer is common and mostly affected women. Epidemiological trends are more or less common to those of developing countries with a predominance of invasive ductal carcinoma. However, most of the women studied live in an urban area and developed the disease in advanced stage."

According to the news reporters, the research concluded: "The establishment of an appropriate framework will effectively contribute to promoting the early detection and reducing the incidence of this disease in the population."

Keywords for this news article include: Wuhan, People's Republic of China, Asia, Women's Health, Breast Cancer, Epidemiology, Oncology, Huazhong University of Science and Technology.

Oncology - Pancreatic Cancer

Reports from Huazhong University of Science and Technology Describe Recent Advances in Pancreatic Cancer (Blocking NF-kappa B Is Essential for the Immunotherapeutic Effect of Recombinant IL18 in Pancreatic Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Pancreatic Cancer have been published. According to news reporting from Wuhan, People's Republic of China, by NewsRx journalists, research stated, "We sought to find new immune-based treatments for pancreatic cancer. We detected IL18 expression in plasma and specimens from patients with pancreatic cancer."

The news correspondents obtained a quote from the research from the Huazhong University of Science and Technology, "We then investigated whether IL18 had a therapeutic effect for pancreatic cancer in vitro and in vivo and any underlying mechanisms. Higher plasma IL18 was associated with longer overall survival (OS), but higher IL18 in pancreatic cancer tissues was associated with shorter OS and increased invasion and metastasis. Recombinant IL18 alone had no antitumor effect in the syngeneic mice with orthotopically transplanted tumors and promoted tumors in immunocompromised mice; it also facilitated immune responses in vitro and in vivo by augmenting the activity of cytotoxic T cells and NK cells in peripheral blood and lymph nodes. However, IL18 promoted the proliferation and invasion of pancreatic cancer cells, in vitro and in vivo, through the NF-kappa B pathway. Nevertheless, by coadministering IL18 with BAY11-7082, an NF-kappa B inhibitor, we were able to prevent the procancerous effects of IL18 and prolong the survival time of the mice. IL18 has both cancer-promoting and cancer-suppressing functions. Although its single-agent treatment has no therapeutic effect on pancreatic cancer, when combined with the NF-kappa B pathway inhibitor, IL18 improved survival in a murine pancreatic cancer model."

According to the news reporters, the research concluded: "Our study implies the possibility of a combinational immunotherapy that uses IL18 and targets NF-kappa B pathway."

For more information on this research see: Blocking NF-kappa B Is Essential for the Immunotherapeutic Effect of Recombinant IL18 in Pancreatic Cancer. Clinical Cancer Research, 2016;22(23):5939-5950. Clinical Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. (American Association for Cancer Research - www.aacr.com; Clinical Cancer Research -
Reports from Human Oncology and Pathogenesis Program Add New Data to Findings in Health and Medicine (Loss of BAP1 function leads to EZH2-dependent transformation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine have been published. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "The tumor suppressors BAP1 and ASXL1 interact to form a polycomb deubiquitinase complex that removes monoubiquitin from histone H2A lysine 119 (H2AK119Ub). However, BAP1 and ASXL1 are mutated in distinct cancer types, consistent with independent roles in regulating epigenetic state and malignant transformation."

The news correspondents obtained a quote from the research from Human Oncology and Pathogenesis Program, "Here we demonstrate that Bap1 loss in mice results in increased trimethylated histone H3 lysine 27 (H3K27me3), elevated enhancer of zeste 2 polycomb repressive complex 2 subunit (Ezh2) expression, and enhanced repression of polycomb repressive complex 2 (PRC2) targets. These findings contrast with the reduction in H3K27me3 levels seen with Asxl1 loss. Conditional deletion of Bap1 and Ezh2 in vivo abrogates the myeloid progenitor expansion induced by Bap1 loss alone. Loss of BAP1 results in a marked decrease in H4K20 monomethylation (H4K20me1). Consistent with a role for H4K20me1 in the transcriptional regulation of EZH2, expression of SETD8-the H4K20me1 methyltransferase-reduces EZH2 expression and abrogates the proliferation of BAP1-mutant cells."

According to the news reporters, the research concluded: "Furthermore, mesothelioma cells that lack BAP1 are sensitive to EZH2 pharmacologic inhibition, suggesting a novel therapeutic approach for BAP1-mutant malignancies."

Our news journalists report that additional information may be obtained by contacting L.M. LaFave, Human Oncology and Pathogenesis Program, Memorial Sloan Kettering Cancer Center, New York, New York, United States. Additional authors for this research include W. Beguelin, R. Koche, M. Teater, B. Spitzer, A. Chramiec, E. Papalexi, M.D.
Reports from IIT Advance Knowledge in Antimicrobials (Cyclization Improves Membrane Permeation by Antimicrobial Peptoids)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antimicrobials have been published. According to news reporting from Chicago, Illinois, by NewsRx journalists, research stated, "The peptidomimetic approach has emerged as a powerful tool for overcoming the inherent limitations of natural antimicrobial peptides, where the therapeutic potential can be improved by increasing the selectivity and bioavailability. Restraining the conformational flexibility of a molecule may reduce the entropy loss upon its binding to the membrane."

Financial supporters for this research include Division of Chemistry, Division of Astronomical Sciences, Defense Advanced Research Projects Agency, National Institute of Allergy and Infectious Diseases.

The news correspondents obtained a quote from the research from IIT, "Experimental findings demonstrate that the cyclization of linear antimicrobial peptoids increases their bactericidal activity against Staphylococcus aureus while maintaining high hemolytic concentrations. Surface X-ray scattering shows that macrocyclic peptoids intercalate into Langmuir monolayers of anionic lipids with greater efficacy than for their linear analogues."

According to the news reporters, the research concluded: "It is suggested that cyclization may increase peptoid activity by allowing the macrocycle to better penetrate the bacterial cell membrane."

Our news journalists report that additional information may be obtained by contacting D. Gidalevitz, IIT, Pritzker Inst Biomed Sci & Engn, Dept. of Phys, Center Mol Study Condensed Soft Matter CoSM, Chicago, IL 60616, United States. Additional authors for this research include M.W. Martynowycz, A. Ivankin, M.L. Huang, I. Kuzmenko, M. Meron, B.H. Lin, K. Kirshenbaum and D. Gidalevitz.

Reports from ISF College of Pharmacy Add New Data to Findings in Diarylheptanoids (Neuroprotective Activity of Curcumin in Combination with Piperine against Quinolinic Acid Induced Neurodegeneration in Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Diarylheptanoids are presented in a new report. According to news originating from Moga, India, by NewsRx correspondents, research stated, "Quinolinic acid (QA) is an excitotoxin that induces Huntington's-like symptoms in animals and humans. Curcumin (CMN) is a well-known antioxidant but the major problem is its bioavailability."

Our news journalists obtained a quote from the research from the ISF College of Pharmacy, "Therefore, the present study was designed to investigate the effect of CMN in the presence of piperine against QA-induced excitotoxic cell death in rats. QA was administered intrastriatally at a dose of 200 nmol/μl saline, bilaterally. CMN (25 and 50 mg/kg/day, p.o.) and combination of CMN (25 mg/kg/day, p.o.) with piperine (2.5 mg/kg/day, p.o.) was administered daily for the next 21 days. Body weight and behavioral parameters were observed on 1st, 7th, 14th and 21st day. On the 22nd day, animals were sacrificed and striatum was isolated for biochemical (LPO, nitrite and GSH), neuroinflammatory (interleukin (IL)-1b, IL-6 and TNF-a) and neurochemical (dopamine, norepinephrine, GABA, glutamate, 5-HT, 3,4-dihydroxyphenylacetic acid and homovanillic acid) estimation. CMN treatment showed beneficial effect against QA-induced motor deficit, biochemical and neurochemical abnormalities in rats. Combination of piperine (2.5 mg/kg/day, p.o.) with CMN (25 mg/kg/day, p.o.) significantly enhanced its protective effect as compared to treatment with CMN alone."

According to the news editors, the research concluded: "This study has revealed that the combination of CMN and piperine showed strong antioxidant and protective effect against QA-induced behavioral and neurological alteration in rats."

For more information on this research see: Neuroprotective Activity of Curcumin in Combination with Piperine against Quinolinic Acid Induced Neurodegeneration in Rats. Pharmacology, 2016;97(3-4):151-60. (Karger - www.karger.com; Pharmacology - content.karger.com/ProdukteDB/produkte.asp?Aktion=JournalHome&ProduktNr=224274)

Amenorrhea

Reports from Indiana University Provide New Insights into Amenorrhea (Association of baseline bleeding pattern on amenorrhea with levonorgestrel intrauterine system use)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Amenorrhea have been presented. According to news reporting out of Bloomington, Indiana, by NewsRx editors, research stated, "This study aims to evaluate the effect of baseline bleeding patterns on rates of amenorrhea reported at 12 months in levonorgestrel (LNG) 52 mg intrauterine system (IUS) users. We also assessed the effect of baseline bleeding patterns at 3 and 6 months postinsertion."

Financial support for this research came from Kennedy Shriver National Institute of Child Health and Human Development.

Our news journalists obtained a quote from the research from Indiana University, "In this secondary analysis of the Contraceptive CHOICE Project, we included participants who had an LNG-IUS inserted within 1 month of enrollment and continued use for 12 months. Using 12-month telephone survey data, we defined amenorrhea at 12 months of use as no bleeding or spotting during the previous 6 months. We used chi-square and multivariable logistic regression to assess the association of baseline bleeding pattern with amenorrhea while controlling for confounding variables. Of 1802 continuous 12-month LNG-IUS users, amenorrhea was reported by 4.9%, 14.8% and 15.4% of participants at 3, 6 and 12 months, respectively. Participants with light baseline bleeding or short duration of flow reported higher rates of amenorrhea at 3 and 6 months postinsertion (p <.03), while LNG-IUS users with heavy or prolonged flow were less likely to report amenorrhea at 3 and 6 months (p <.03). In a multivariable analysis, participants with self-reported heavy bleeding at baseline were less likely to report amenorrhea at 12 months than those who reported moderate bleeding (ORadj, 0.36; 95% CI, 0.16-0.69). Women with heavier menstrual bleeding are less likely than women with moderate flow to report amenorrhea following 12 months of LNG-IUS use. Baseline heavy menstrual flow reduces the likelihood of amenorrhea with LNG-IUS use, information that could impact contraceptive counseling."

According to the news editors, the research concluded: "Anticipatory counseling can improve method satisfaction and continuation, an important strategy to continue to reduce unintended pregnancy and abortion rates."

For more information on this research see: Association of baseline bleeding pattern on amenorrhea with levonorgestrel intrauterine system use. Contraception, 2016;94(5):556-560. Contraception can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Contraception - www.journals.elsevier.com/contraception/)

Our news journalists report that additional information may be obtained by contacting J.F. Peipert, Indiana University, Bloomington, IN 47405, United States. Additional authors for this research include C. McNicholas, T. Madden and J.F. Peipert.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.contraception.2016.06.013. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from Inha University Add New Data to Findings in Diabetes Mellitus (Temporal changes in physiological parameters of systemic inflammatory response syndrome during the three days prior to a diagnosis of sepsis: a case-control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Diabetes Mellitus is the subject of a report. According to news reporting originating in Inchon, South Korea, by NewsRx journalists, research stated, "Aims and objectives. This study was conducted to determine temporal patterns of early changes in physiological parameters of systemic inflammatory response syndrome over three days prior to a diagnosis of sepsis."

The news reporters obtained a quote from the research from Inha University, "Early detection and timely management of systemic inflammatory response syndrome are often not implemented due to a failure to recognise or diagnose systemic inflammatory response syndrome. A retrospective case-control study design was adopted. All 81 study subjects in an intensive care unit were included: 33 case subjects who received a definitive diagnosis of sepsis and 48 control patients who were not diagnosed with systemic inflammatory response syndrome or sepsis. Vital signs (temperatures, heart rates, blood pressures and respiratory rates) and white blood cell count, urine output, serum creatinine concentration, platelet count and serum glucose level data were collected for one, two and three days prior to sepsis diagnosis. Homogeneity test revealed greater proportions of the aged and subjects with diabetes mellitus, hypertension and wound in the case group. Analysis also showed significant intergroup differences in systemic inflammatory response syndrome criteria score, heart rates, platelet counts and blood glucose levels, but no intergroup differences in body temperatures, blood pressures, respiratory rates, urine outputs or serum creatinine levels. A larger proportion of case subjects were fitted with a central venous or Foley catheter. The presence of a wound, hypertension or diabetes mellitus, and the use of an invasive medical device may increase the risk of systemic inflammatory response syndrome. Of the physiological parameters examined, heart rate, platelet counts, and blood glucose levels might serve as significant early signs of systemic inflammatory response syndrome. Relevance to clinical practice."

According to the news reporters, the research concluded: "Caution should be observed whenever diabetic or hypertension patients develop sudden and persistent hyperglycaemia or tachycardia, and nurses should also be aware of the potential for systemic inflammatory response syndrome in patients with a central venous or indwelling urinary catheter."

Our news correspondents report that additional information may be obtained by contacting W.S. Seo, Inha University, Dept. of Nursing, Inchon, South Korea. Additional authors for this research include E.K. Bae, S.Y. Lim, J. Oh, S.Y. Han and W.S. Seo.

Central Nervous System Diseases and Conditions –…

Reports from Inha University Describe Recent Advances in Cerebral Infarction (Sleep Disturbances at 3 Months after Cerebral Infarction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions - Cerebral Infarction have been presented. According to news originating from Incheon, South Korea, by NewsRx correspondents, research stated, "Post-stroke sleep disturbances (PSSD) are common and associated with various adverse outcomes. However, PSSD in the sub-acute stages of stroke have been scarcely studied."

Our news journalists obtained a quote from the research from Inha University, "We aimed to evaluate the characteristics of and the factors related to PSSD in stroke patients 3 months post stroke. A total of 199 patients were evaluated for PSSD at 3 months after stroke. The qualities of nighttime sleep and excessive daytime sleepiness (EDS) were assessed using the Verran Snyder-Halpern sleep scale and Epworth Sleepiness Scale, respectively. Presence of motor dysfunction and post-stroke pain, post-stroke depression, fatigue and social support were evaluated. Eighty-eight patients (44.2%) had poor quality of nighttime sleep. Twenty-eight patients (14.4%) reported EDS. Poor quality of nighttime sleep was independently associated with depression (p=0.044) and EDS (p=0.041) whereas fatigue (p <0.001) and poor nighttime sleep (p=0.045) were independently associated with EDS. Post-stroke pain and social support showed no association with PSSD. We found that the occurrence of PSSD 3 months after stroke is common."

According to the news editors, the research concluded: "Although causality remained to be determined, depression and nighttime sleep disturbances were related, whereas fatigue and nighttime sleep disturbances were related to EDS."

The news correspondents report that additional information may be obtained from M. Suh, Dept. of Nursing, Inha University, Incheon, South Korea. Additional authors for this research include S. Choi-Kwon and J.S Kim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000443763. This DOI is a link to an online electronic document that is

**Oncology - Renal Cell Carcinoma**

**Reports from Institute Gustave Roussy Advance Knowledge in Renal Cell Carcinoma (Open-label phase 2 trial of first-line everolimus monotherapy in patients with papillary metastatic renal cell carcinoma: RAPTOR final analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Renal Cell Carcinoma have been published. According to news reporting out of Villejuif, France, by NewsRx editors, research stated, "Papillary histology accounts for 10-15% of renal cell carcinoma (RCC), and treatment options for patients with this subtype are limited. The RAPTOR (RAD001 in Advanced Papillary Tumor Program in Europe; ClinicalTrials.gov, NCT00688753) study evaluated first-line everolimus in patients with papillary metastatic RCC (mRCC)."

Financial support for this research came from Novartis Pharmaceuticals.

Our news journalists obtained a quote from the research from Institute Gustave Roussy, "This phase 2 trial enrolled previously untreated patients with type 1 or type 2 papillary mRCC. Papillary histology was confirmed by central review and was performed for every patient. Patients received oral everolimus 10 mg once daily until disease progression or unacceptable toxicity. The primary end-point was progression-free survival (PFS) rate at 6 months among the first 44 patients of the per protocol (PP) population. Secondary end-points included PFS, tumour response, overall survival (OS), and safety. Analysis sets included safety (NZ 92; 100%), intent-to-treat (ITT) (n=88), and PP populations (n = 46). In the safety population, most patients were men (78%) and the mean age was 60 years (range 23-84). Papillary histology was confirmed in 78% of patients (type 1, 32%; type 2, 64%; missing information, 4%). PFS rate at 6 months was 34% (80% confidence interval [CI] 25-45). In the ITT population, median PFS was 4.1 months (95% CI 3.6-5.5), 65% of patients achieved stable disease, and median OS was 21.4 months (95% CI 15.4-28.4). Among patients with type 1 or type 2 histology, median PFS was 7.9 months (95% CI 2.1 -11.0) and 5.1 months (95% CI 3.3-5.5), respectively, and median OS was 28.0 months (95% CI 7.6-not estimable) and 24.2 months (95% CI 15.8-32.8), respectively. Common grade > 2 adverse events were asthenia (13%), anaemia (7%), and fatigue (5%)."

According to the news editors, the research concluded: "Results of this large prospective study in papillary mRCC demonstrated that everolimus provides some clinical benefit to this patient population and highlight the need for central pathological review of this rare tumour."

Reports from Institute for Biology Research Describe Recent Advances in Gastric Cancer (MiR-16 mediates trastuzumab and lapatinib response in ErbB-2-positive breast and gastric cancer via its novel targets CCNJ and FUBP1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news reporting originating from Buenos Aires, Argentina, by NewsRx correspondents, research stated, "ErbB-2 amplification/overexpression accounts for an aggressive breast cancer (BC) subtype (ErbB-2-positive). Enhanced ErbB-2 expression was also found in gastric cancer (GC) and has been correlated with poor clinical outcome."

Our news editors obtained a quote from the research from Institute for Biology Research, "The ErbB-2-targeted therapies trastuzumab (TZ), a monoclonal antibody, and lapatinib, a tyrosine kinase inhibitor, have proved highly beneficial. However, resistance to such therapies remains a major clinical challenge. We here revealed a novel mechanism underlying the antiproliferative effects of both agents in ErbB-2-positive BC and GC. TZ and lapatinib ability to block extracellular signal-regulated kinases 1/2 and phosphatidylinositol-3 kinase (PI3K)/AKT in sensitive cells inhibits c-Myc activation, which results in upregulation of miR-16. Forced expression of miR-16 inhibited in vitro proliferation in BC and GC cells, both sensitive and resistant to TZ and lapatinib, as well as in a preclinical BC model resistant to these agents. This reveals miR-16 role as tumor suppressor in ErbB-2-positive BC and GC. Using genome-wide expression studies and miRNA target prediction algorithms, we identified cyclin J and far upstream element-binding protein 1 (FUBP1) as novel miR-16 targets, which mediate miR-16 antiproliferative effects. Supporting the clinical relevance of our results, we found that high levels of miR-16 and low or null FUBP1 expression correlate with TZ response in ErbB-2-positive primary BCs. These findings highlight a potential role of miR-16 and FUBP1 as biomarkers of sensitivity to TZ therapy."

According to the news editors, the research concluded: "Furthermore, we revealed
miR-16 as an innovative therapeutic agent for TZ-and lapatinib-resistant ErbB-2-positive BC and GC."

For more information on this research see: MiR-16 mediates trastuzumab and lapatinib response in ErbB-2-positive breast and gastric cancer via its novel targets CCNJ and FUBP1. Central Nervous System Diseases and Conditions - 

Reports from Institute for Cancer Research and Treatment (IRCCS) Add New Data to Findings in Epilepsy (The direct costs of epilepsy in Russia. A prospective cost-of-illness study from a single center in Moscow)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Central Nervous System Diseases and Conditions - Epilepsy is now available. According to news reporting out of Milan, Italy, by NewsRx editors, research stated, "The objective of this study was to investigate prospectively the direct costs of epilepsy in Russia, taking a patient perspective and a bottom-up approach. The study was conducted in adolescents and adults with epilepsy seen in the ambulatory services of a city hospital in Moscow."

Our news journalists obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Patients were assigned to different prognostic categories: newly diagnosed epilepsy; epilepsy in remission for 2+ years; epilepsy in remission for <2 years or with occasional seizures; active, non drug-resistant epilepsy; drug-resistant epilepsy; and drug-resistant epilepsy in surgical candidates. Patients were followed prospectively for 12 months. Demographic and clinical features at admission were collected and correlated with costs. Cost estimates were based on the Russian National Health Service perspective and its implementation in Moscow. Cost items included drugs and laboratory/instrumental tests. The costs per patient were calculated for the entire sample and for each prognostic category."
separately. Univariate and multivariate analyses were performed. Included were 738 patients (393 men, 345 women aged 14-85 years). The median annual cost/patient was an element of 955 (IQR 521-2134; range 51-10,904). The median cost of drugs was an element of 643 (IQR 288-1866; range 0-9660), and the median cost of laboratory/instrumental testing was an element of 202 (IQR 160-270; range 20-1217). Mean costs varied across prognostic categories ranging from an element of 782 in newly diagnosed patients to 3777 in patients with drug-resistant epilepsy. Mean (SD) hospital costs ranged from an element of 646.7 (109.0) in patients with occasional seizures to an element of 950.0 (28.3) in surgical candidates. Independent predictors of total costs were younger age at diagnosis, disability status, generalized seizures, multiple seizure types, seizure severity, and etiology.

According to the news editors, the research concluded: "The cost of epilepsy in Moscow varies significantly depending on disease characteristics and response to drug treatment."

For more information on this research see: The direct costs of epilepsy in Russia. A prospective cost-of-illness study from a single center in Moscow. Epilepsy & Behavior, 2016;64():122-126. Epilepsy & Behavior can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Epilepsy & Behavior - www.journals.elsevier.com/epilepsy-and-behavior)

Our news journalists report that additional information may be obtained by contacting E. Beghi, IRCCS Inst Pharmacol Res Mario Negri, Milan, Italy. Additional authors for this research include M. Mizinova, I. Kaimovsky, O. Danilenko, E. Bianchi and E. Beghi.

Mycobacterium Infections - Tuberculosis

Reports from Institute of Applied Microbiology Highlight Recent Findings in Tuberculosis (A Physiologically Based Pharmacokinetic Model of Isoniazid and Its Application in Individualizing Tuberculosis Chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news originating from Aachen, Germany, by NewsRx correspondents, research stated, "Due to its high early bactericidal activity, isoniazid (INH) plays an essential role in tuberculosis treatment. Genetic polymorphisms of N-acetyltransferase type 2 (NAT2) cause a trimodal distribution of INH pharmacokinetics in slow, intermediate, and fast acetylators."

Our news journalists obtained a quote from the research from the Institute of Applied
Microbiology, "The success of INH-based chemotherapy is associated with acetylator and patient health status. Still, a standard dose recommended by the FDA is administered regardless of acetylator type or immune status, even though adverse effects occur in 5 to 33% of all patients. Slow acetylators have a higher risk of development of drug-induced toxicity, while fast acetylators and immune-deficient patients face lower treatment success rates. To mechanistically assess the trade-off between toxicity and efficacy, we developed a physiologically based pharmacokinetic (PBPK) model describing the NAT2-dependent pharmacokinetics of INH and its metabolites. We combined the PBPK model with a pharmacodynamic (PD) model of antimycobacterial drug effects in the lungs. The resulting PBPK/PD model allowed the simultaneous simulation of treatment efficacies at the site of infection and exposure to toxic metabolites in off-target organs. Subsequently, we evaluated various INH dosing regimens in NAT2-specific immunocompetent and immune-deficient virtual populations. Our results suggest the need for acetylator-specific dose adjustments for optimal treatment outcomes. A reduced dose for slow acetylators substantially lowers the exposure to toxic metabolites and thereby the risk of adverse events, while it maintains sufficient treatment efficacies. Vice versa, intermediate and fast acetylators benefit from increased INH doses and a switch to a twice-daily administration schedule."

According to the news editors, the research concluded: "Our analysis outlines how PBPK/PD modeling may be used to design and individualize treatment regimens."

For more information on this research see: A Physiologically Based Pharmacokinetic Model of Isoniazid and Its Application in Individualizing Tuberculosis Chemotherapy. Antimicrobial Agents and Chemotherapy, 2016;60(10):6134-6145. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Enzymes and Coenzymes - ADP Ribose Transferases

Reports from Institute of Cancer Describe Recent Advances in ADP Ribose Transferases [Leveraging an NQO1 Bioactivatable Drug for Tumor-Selective Use of Poly(ADP-ribose) Polymerase Inhibitors]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
Wellness Week -- New research on Enzymes and Coenzymes - ADP Ribose Transferases is the subject of a report. According to news reporting originating from Morgantown, West Virginia, by NewsRx correspondents, research stated, "Therapeutic drugs that block DNA repair, including poly(ADP-ribose) polymerase (PARP) inhibitors, fail due to lack of tumor-selectivity. When PARP inhibitors and beta-lapachone are combined, synergistic antitumor activity results from sustained NAD(P)H levels that refuel NQO1-dependent futile redox drug recycling."

Funders for this research include UTSW SCCC, Institute for Innovations in Medical Technology, CPRIT, NCI, UTSW-MD Anderson SPORE, AACR/PanCan.

Our news editors obtained a quote from the research from the Institute of Cancer, "Significant oxygen-consumption-rate/reactive oxygen species cause dramatic DNA lesion increases that are not repaired due to PARP inhibition. In NQO1(+) cancers, such as non-small-cell lung, pancreatic, and breast cancers, cell death mechanism switches from PARP1 hyperactivation-mediated programmed necrosis with beta-lapachone monotherapy to synergistic tumor-selective, caspase-dependent apoptosis with PARP inhibitors and beta-lapachone."

According to the news editors, the research concluded: "Synergistic antitumor efficacy and prolonged survival were noted in human orthotopic pancreatic and non-small-cell lung xenograft models, expanding use and efficacy of PARP inhibitors for human cancer therapy."

For more information on this research see: Leveraging an NQO1 Bioactivatable Drug for Tumor-Selective Use of Poly(ADP-ribose) Polymerase Inhibitors. *Cancer Cell*, 2016;30(6):940-952. *Cancer Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cancer Cell - www.journals.elsevier.com/cancer-cell/)

The news editors report that additional information may be obtained by contacting E.A. Bey, West Virginia Univ, Dept. of Pharmaceut Sci, Inst Canc, Morgantown, WV 26506, United States. Heart Disorders and Diseases - Heart Failure

Reports from Institute of Cardiology Describe Recent Advances in Heart Failure (Positive Effects of the Reversion of Depression on the Sympathovagal Balance after Telerehabilitation in Heart Failure Patients)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Failure are discussed in a new report. According to news reporting originating in Warsaw, Poland, by NewsRx journalists, research stated, "Autonomic nervous system (ANS) dysfunction appears in the course of both chronic heart failure (CHF) and depression. Comprehensive cardiac rehabilitation (CCR), apart from improving physical capacity, can reduce depressive symptoms and leads to the restoration of ANS function among CHF patients."

The news reporters obtained a quote from the research from the Institute of Cardiology, "The purpose was to evaluate the influence of the reversion of depression (measured by Beck Depression Inventory [BDI] score, cut point <10) and the physical capacity improvement (measured by peak oxygen consumption [peak VO2; ml/kg per minute]) on the sympathovagal balance (measured by low/high frequency ratio [LF/ HF]) after CCR in CHF patients. The study group comprised 111 CHF patients (New York Heart Association II-III; left ventricular ejection fraction <= 40%). Patients were randomized (2:1) to 8-week CCR based on Nordic walking training (five times weekly) at 40-70% of maximal heart rate, training group (TG) n = 77, or to control group (CG) n = 34. The effectiveness of CCR was assessed by changes-delta (Delta) in LF/HF, BDI score, and peak VO2, as a result of comparing these parameters from the beginning and the end of the program. Eventually, 46 patients in TG and 23 patients in CG were eligible for simultaneous ANS and psychological status analysis. Only in TG the LF/HF decreased 2.06 +/- 1.14 versus 1.19 +/- 0.80 (P < 0.0001) and peak VO2 increased 16.83 +/- 3.72 versus 19.14 +/- 4.20 ml/kg per minute (P < 0.0001). Favorable results in CG were not observed. The differences between TG and CG were significant: Delta peak VO2 (P < 0.0001); Delta LF/HF (P = 0.0001). Depressive symptoms were substantially reduced in both groups (TG, P = 0.0006; CG, P = 0.0490). Nevertheless, the greatest improvement of sympathovagal balance was observed in patients whose depression was reversed, thanks to the CCR in comparison to other patients from TG and the entire CG."

According to the news reporters, the research concluded: "Positive effect of the sympatho-parasympathetic balance obtained during the home CCR based on Nordic walking training results from the additive effects of the reversion of depression and physical capacity improvement in CHF patients."

Our news correspondents report that additional information may be obtained by contacting E. Piotrowicz, Telecardiol Center, Inst Cardiol, PL-04628 Warsaw, Poland. Additional authors for this research include W. Piotrowski and R. Piotrowicz.

Oncology

Reports from Institute of Himalayan Bioresource Technology Highlight Recent Findings in Oncology (Impact of point mutation P29S in RAC1 on tumorigenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology. According to news reporting from Himachal Prades, India, by NewsRx journalists, research stated, "A point mutation (P29S) in the RAS-related C3 botulinum toxin substrate 1 (RAC1) was considered to be a trigger for melanoma, a form of skin cancer with highest mortality rate. In this study, we have investigated the pathogenic role of P29S based on the conformational behavior of RAC1 protein toward guanosine triphosphate (GTP)."

The news correspondents obtained a quote from the research from the Institute of Himalayan Bioresource Technology, "Molecular interaction, molecular dynamics trajectory analysis (RMSD, RMSF, Rg, SASA, DSSP, and PCA), and shape analysis of binding pocket were performed to analyze the interaction energy and the dynamic behavior of native and mutant RAC1 at the atomic level. Due to this mutation, the RAC1 switch I region acquired more flexibility and, to compensate it, the switch II region becomes rigid in their conformational space, as a result of which the interaction energy of the protein for GTP increased. The overall results strongly implied that the changes in atomic conformation of the switch I and II regions in mutant RAC1 protein were a significant reason for its malignant transformation and tumorigenesis."

According to the news reporters, the research concluded: "We raised the opportunity for researchers to design possible therapeutic molecule by considering our findings."

For more information on this research see: Impact of point mutation P29S in RAC1 on tumorigenesis. Tumor Biology, 2016;37(11):15293-15304. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Our news journalists report that additional information may be obtained by contacting R. Purohit, CSIR, Inst Himalayan Bioresource Technol, Div Biotechnol, Palampur, Himachal Prades, India. Additional authors for this research include C. Gopalakrishnan and R. Purohit.

Oncology - Breast Cancer

Reports from Institute of Molecular Cell Biology Provide New Insights into Breast Cancer (Transposon mutagenesis identifies genes that cooperate with mutant Pten in breast cancer progression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Triple-negative breast cancer (TNBC) has the worst prognosis of any breast cancer subtype. To better understand the genetic forces driving TNBC, we performed a transposon mutagenesis screen in a phosphatase and tensin homolog (Pten) mutant mice and identified 12 candidate trunk drivers and a much larger number of progression genes."

Financial support for this research came from Cancer Prevention and Research Institute of Texas (CPRIT).

Our news journalists obtained a quote from the research from the Institute of Molecular Cell Biology, "Validation studies identified eight TNBC tumor suppressor genes, including the GATA-like transcriptional repressor TRPS1. Down-regulation of TRPS1 in TNBC cells promoted epithelial-to-mesenchymal transition (EMT) by deregulating multiple EMT pathway genes, in addition to increasing the expression of SERPINE1 and SERPINB2 and the subsequent migration, invasion, and metastasis of tumor cells."

According to the news editors, the research concluded: "Transposon mutagenesis has thus provided a better understanding of the genetic forces driving TNBC and discovered genes with potential clinical importance in TNBC."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1073/pnas.1613859113. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from Institute of Neurology Describe Recent Advances in Neuroscience (Copy number variations and stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nervous System Research - Neuroscience. According to news reporting out of Mangone, Italy, by NewsRx editors, research stated, "Stroke is the third leading cause of death worldwide after heart disease and all forms of cancers. Monogenic disorders, genetic, and environmental risk factors contribute to damaging cerebral blood vessels and, consequently, cause stroke."

Our news journalists obtained a quote from the research from the Institute of Neurology, "Developments in genomic research led to the discovery of numerous copy number variants (CNVs) that have been recently identified as a new tool for understanding the genetic basis of many diseases. This review discusses the current understanding of the types of stroke, the existing knowledge on the involvement of specific CNVs in stroke as well as the limitations of the methods used for detecting CNVs like SNP-microarray."

According to the news editors, the research concluded: "To confirm an unequivocally association between CNVs and stroke and extend the current findings, it would be desirable to use another methodology to detect smaller CNVs or CNVs in genomic regions poorly covered by this technique, for instance, CGH-array."

For more information on this research see: Copy number variations and stroke. *Neurological Sciences*, 2016;37(12):1895-1904. *Neurological Sciences* can be contacted at: Springer-Verlag Italia Srl, Via Decembrio, 28, Milan, 20137, Italy. (Springer - www.springer.com; Neurological Sciences - www.springerlink.com/content/1590-1874/)

Our news journalists report that additional information may be obtained by contacting R. Mazzei, CNR, Inst Neurol Sci, I-87050 Mangone, MS, Italy. Additional authors for this research include R. Mazzei and S. Cavallaro.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s10072-016-2658-y. This DOI is a link to an online electronic document that is either free or for purchase.

Health and Medicine - Integrative Medicine

Reports from Integral University Advance Knowledge in Integrative Medicine (Evaluation of cytotoxic potential and apoptotic effect of a methanolic extract of Bauhinia racemosa Lam. against a human cancer cell line, HeLa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Integrative Medicine have
been published. According to news originating from Uttar Pradesh, India, by NewsRx correspondents, research stated, "The tropical medicinal plant Bauhinia racemosa Lam. (family: Caesalpiniaceae) is used within several systems of medicine and is popular among ethnic communities for the treatment of a variety of health problems. The aim of this study was to evaluate the cytotoxic activity and apoptotic effect of the methanolic extract of B. racemosa bark (MEBR) on a cancer cell line, HeLa."

Our news journalists obtained a quote from the research from Integral University, "The cytotoxic activity and apoptotic effects of MEBR were evaluated by methylthiazolyltetrazolium assay and 4',6-diamidino-2-phenylindole staining test respectively on HeLa, a cancer cell line. Changes in mitochondrial membrane potential and intracellular reactive oxygen species (ROS) level were also assessed by 5,5',6,6'-tetrachloro-1,1',3,3'-tetraethylbenzimidazol-carbocyanine iodide and dichlorodihydrofluorescein diacetate staining tests respectively. Total phenolic content was determined by colorimetric principle using gallic acid calibration curve. MEBR exposure of HeLa cells significantly decreased the cell viability (p < 0.001, IC50 = 80 mu g/ml) comparable to that of tamoxifen (p < 0.001, IC50 = 48 mu g/ml) in a concentration dependent manner. It also led to the depolarization of mitochondria and induced production of ROS initiating apoptotic effect in a concentration dependent manner. Total phenolic content was 886.8252 mg gallic acid equivalent per gram dried extract. MEBR seems to possess potent cytotoxic activity against a cancer cell line, HeLa and induces apoptosis."

According to the news editors, the research concluded: "This may provide a novel potent chemotherapeutic agent for human cancer which could be considered for further clinical studies for future drug development."

The news correspondents report that additional information may be obtained from M.A. Rahman, Integral Univ, Fac Pharm, UP CST Sponsored Project Lab, Lucknow 226026, Uttar Pradesh, India. Additional authors for this research include J. Akhtar, Sahabajda and M. Arshad.

**Pyruvate Kinase Deficiency**

**Reports from Intermountain Healthcare Describe Recent Advances in Pyruvate Kinase Deficiency (Siblings with Severe Pyruvate Kinase Deficiency and a Complex Genotype)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pyruvate Kinase Deficiency. According to news originating from Salt Lake City, Utah, by NewsRx correspondents, research stated, "Siblings presented as neonates with severe jaundice and transfusion-dependent hemolytic anemia."

Our news journalists obtained a quote from the research from Intermountain Healthcare, "Next-generation sequencing revealed both to have three heterozygous mutations in the gene encoding erythrocyte pyruvate kinase (PKLR), plus a heterozygous splice mutation in the beta-spectrin gene (SPTB). In addition, both have a different 5th mutation in a gene encoding other erythrocyte membrane proteins."

According to the news editors, the research concluded: "The asymptomatic parents and all three asymptomatic siblings have different sets of these mutations."

The news correspondents report that additional information may be obtained from R.D. Christensen, Intermountain Healthcare, Women & Newborns Clin Program, Salt Lake City, UT, United States. Additional authors for this research include H.M. Yaish, R.H. Nussenzveig and A.M. Agarwal.

**Oncology - Thyroid Cancer**

**Reports from International Agency for Research on Cancer Highlight Recent Findings in Thyroid Cancer (Thyroid cancer burden in Central and South America)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Thyroid Cancer. According to news reporting originating in Lyon, France, by NewsRx journalists, research stated, "Rationale and objective: Incidence of thyroid cancer (TC) is rapidly increasing worldwide, but little is known about the TC burden in Central and South America (CSA). We describe the geographic patterns and trends of TC by sex in CSA."

The news reporters obtained a quote from the research from International Agency for Research on Cancer, "We obtained regional-and national-level incidence data from 48 population-based cancer registries in 13 countries and nationwide cancer deaths from the WHO
mortality database for 18 countries. We estimated world population age-standardized incidence rates (ASRs) and age-standardized mortality rates (ASMRs) per 100,000 person-years. We calculated ASRs by histological subtype. We estimated the annual percentage change (EAPC) to describe time trends. Between CSA countries, TC incidence and mortality rates varied from 8-fold to 12-fold and from 2-fold to 5-fold, respectively. In 2003-2007, the highest TC ASRs in females and males were in Ecuador (16.0 and 3.5, respectively), Brazil (14.4 and 3.4), Costa Rica (12.6 and 2.1) and Colombia (10.7 and 2.5). The highest ASMRs were in Ecuador, Colombia, Mexico, Peru and Panama (0.68-0.91 in females and 0.41-0.48 in males). Papillary TC was the most commonly diagnosed histological subtype, following the same incidence pattern as overall TC. In Argentinean, Brazilian, Chilean and Costa Rican females TC incidence increased by 2.2-17.9% annually, and papillary TC increased by 9.1-15.0% annually, while mortality remained stable between 1997 and 2008. In males, trends in TC were stable. TC occurred more frequently in females than in males."

According to the news reporters, the research concluded: "The overall high incidence and low mortality of TC suggest identification of subclinical disease due to improved detection methods."

For more information on this research see: Thyroid cancer burden in Central and South America. Cancer Epidemiology, 2016;44():S150-S157. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. 2012, through December 31, 2013, for adults with a primary diagnosis of PE initiating treatment with rivaroxaban or warfarin."

The news reporters obtained a quote from the research, "Warfarin patients were matched 1:1 to rivaroxaban patients using exact and propensity score matching. Hospital LOS, treatment patterns, and hospitalization costs were evaluated. Matched cohorts included 751 rivaroxaban-treated patients and 751 warfarin-treated patients. Adjusted mean LOS was 3.77 days for rivaroxaban patients (95% CI, 3.66-3.87 days) and 5.48 days for warfarin patients (95% CI, 5.33-5.63 days; P < .001). Mean (SD) LOS was shorter for patients taking rivaroxaban whether admission was for provoked PE (rivaroxaban: 5.2 [5.1] days; warfarin: 7.0 [6.5] days; P < .001) or unprovoked PE (rivaroxaban: 3.4 [2.3] days; warfarin: 5.1 [2.7] days; P < .001). Mean (SD) days from first dose to discharge were 2.5 (1.7) (rivaroxaban) and 4.0 (2.9) (warfarin) when initiated with parenteral anticoagulants (P < .001) and 2.7 (1.7) (rivaroxaban) and 4.0 (2.2) (warfarin) without parenteral anticoagulants (P < .001). The rivaroxaban cohort incurred significantly lower unadjusted mean (SD) hospitalization costs (rivaroxaban: $8473 [9105]; warfarin: $10,291 [9185]; P < .001), confirmed by covariate adjustment with generalized linear modeling estimating predicted mean hospitalization costs of $8266 for rivaroxaban patients (95% CI, $7851-$8681) and $10,511 for warfarin patients (95% CI, $10,031-$10,992; P < .001)."

According to the news reporters, the research concluded: "Patients with PE treated with rivaroxaban incurred significantly lower hospitalization costs by $2245 per admission compared with patients treated with warfarin, which was attributable to cost offsets from 1.71 fewer days of stay in the hospital."

For more information on this research see: Pulmonary Embolism Inpatients Treated With Rivaroxaban Had Shorter Hospital Stays and Lower Costs Compared With Warfarin. Clinical Therapeutics, 2016;37(11):2496-2503. Clinical Therapeutics can be contacted at: Elsevier, 685 Route 202-206, Bridgewater, NJ 08807, USA. (Elsevier - www.elsevier.com; Clinical Therapeutics - www.journals.elsevier.com/clinical-therapeutics/)

Our news correspondents report that additional information may be obtained by contacting J.M. Margolis, Truven Hlth Analyt, Bala Cynwyd, PA 19004, United States. Additional authors for this research include S. Deitelzweig, J. Kline, O. Tran, D.M. Smith, C. Crivera, B. Bookhart and J. Schein.

Reports from J.M. Sanders and Colleagues Advance Knowledge in Antibiotics (Inclusion of Vancomycin as Part of Broad-Spectrum Coverage Does Not Improve Outcomes in Patients with Intra-Abdominal Infections: A Post Hoc Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antibiotics have been published. According to news originating from Fort Worth, Texas, by NewsRx correspondents, research stated, "Management of complicated intra-abdominal infections (cIAIs) includes broad-spectrum antimicrobial coverage and commonly includes vancomycin for the empiric coverage of methicillin-resistant Staphylococcus aureus (MRSA). Ideally, culture-guided de-escalation follows to promote robust antimicrobial stewardship."

Our news journalists obtained a quote from the research, "This study assessed the impact and necessity of vancomycin in cIAI treatment regimens. A post hoc analysis of the Study to Optimize Peritoneal Infection Therapy (STOP-IT) trial was performed. Patients receiving piperacillin-tazobactam (P/T) and/or a carbapenem were included with categorization based on use of vancomycin. Univariate and multivariable analyses evaluated effects of including vancomycin on individual and the composite of undesirable outcomes (recurrent IAI, surgical site infection [SSI], or death). The study cohort included 344 patients with 110 (32%) patients receiving vancomycin. Isolation of MRSA occurred in only eight (2.3%) patients. Vancomycin use was associated with a similar composite outcome, 29.1%, vs. no vancomycin, 22.2% (p=0.17). Patients receiving vancomycin had (mean [standard deviation]) higher Acute Physiology and Chronic Health Evaluation II scores (13.1 [6.6] vs. 9.4 [5.7], p<0.0001), extended length of stay (12.6 [10.2] vs. 8.6 [8.0] d, p<0.001), and prolonged antibiotic courses (9.1 [8.0] vs. 7.1 [4.9] d, p=0.02). After risk adjustment in a multivariate model, no significant difference existed for the measured outcomes. This post hoc analysis reveals that addition of vancomycin occurred in nearly one third of patients and more often in sicker patients."

According to the news editors, the research concluded: "Despite this selection bias, no appreciable differences in undesired outcomes were demonstrated, suggesting limited utility for adding vancomycin to cIAI treatment regimens."

For more information on this research see: Inclusion of Vancomycin as Part of Broad-Spectrum Coverage Does Not Improve Outcomes in Patients with Intra-Abdominal Infections: A Post Hoc Analysis. Surgical Infections, 2016;17(6):694-699. Surgical Infections can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Oncology - Liver Cancer

Reports from James Cook University Advance Knowledge in Liver Cancer (Hepatocellular carcinoma and non-alcoholic steatohepatitis: The state of play)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Liver Cancer. According to news reporting out of Townsville, Australia, by NewsRx editors, research stated, "Hepatocellular carcinoma (HCC) is now the fifth cancer of greatest frequency and the second leading cause of cancer related deaths worldwide. Chief amongst the risks of HCC are hepatitis B and C infection, aflatoxin B1 ingestion, alcoholism and obesity."

Our news journalists obtained a quote from the research from James Cook University, "The latter can promote non-alcoholic fatty liver disease (NAFLD), that can lead to the inflammatory form non-alcoholic steatohepatitis (NASH), and can in turn promote HCC. The mechanisms by which NASH promotes HCC are only beginning to be characterized. Here in this review, we give a summary of the recent findings that describe and associate NAFLD and NASH with the subsequent HCC progression. We will focus our discussion on clinical and genomic associations that describe new risks for NAFLD and NASH promoted HCC."

According to the news editors, the research concluded: "In addition, we will consider novel murine models that clarify some of the mechanisms that drive NASH HCC formation."

Our news journalists report that additional information may be obtained by contacting B. Charrez, Berenice Charrez, Lionel Hebbard, Dept. of Molecular and Cell Biology, James Cook University, Townsville, QLD 4811, Australia. Additional authors for this research include L. Qiao and L. Hebbard.

Reports from Japan Women's University Advance Knowledge in Pulmonary Hypertension (Fluidic Culture and Analysis of Pulmonary Artery Smooth Muscle Cells for the Study of Pulmonary Hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Pulmonary Hypertension is the subject of a report. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "There is an urgent need to develop novel in-vitro models to mimic the disease conditions in pulmonary hypertension (PH)."

Our news journalists obtained a quote from the research from Japan Women's University, "We developed a microfluidic cell culture device for PH studies that withstood high shear stress. Techniques were also developed for cell recovery from the microchannel and mRNA isolation from the collected cells."

According to the news editors, the research concluded: "Using this device, we found that shear stress caused a 7.5-fold increase in the transcription levels of a PH-related molecule, Cyclin D1."

The news correspondents report that additional information may be obtained from K. Sato, Japan Womens Univ, Dept. of Chem & Biol Sci, Fac Sci, Bunkyo Ku, Tokyo 1128681, Japan. Additional authors for this research include M. Nakajima, S. Tokuda and A. Ogawa.

Cardiovascular Diseases and Conditions -...

Reports from Jichi Medical University Describe Recent Advances in Hypertension (Add-On Use of Eplerenone Is Effective for Lowering Home and Ambulatory Blood Pressure in Drug-Resistant Hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Hypertension are presented in a new report. According to news reporting from Tochigi, Japan, by NewsRx journalists, research stated, "The authors aimed to investigate the blood pressure (BP)-lowering ability of eplerenone in drug-resistant hypertensive patients. A total of 57 drug-resistant hypertensive patients whose home BP was 135/85 mm Hg were investigated."
The news correspondents obtained a quote from the research from Jichi Medical University. "The patients were randomized to either an eplerenone group or a control group and followed for 12 weeks. The efficacy was evaluated by clinic, home, and ambulatory BP monitoring. Urinary albumin, pulse wave velocity, and flow-mediated vasodilation (FMD) were also evaluated. Home morning systolic BP (148 +/- 15 vs 140 +/- 15 mm Hg) and evening systolic BP (137 +/- 16 vs 130 +/- 16 mm Hg) were significantly lowered in the eplerenone group (n=35) compared with baseline (both P<.05), while unchanged in the control group (n=22). BP reductions in the eplerenone group were most pronounced for ambulatory awake systolic BP (P=.04), awake diastolic BP (P=.004), and 24-hour diastolic BP (P=.02). FMD was significantly improved in the eplerenone group."

According to the news reporters, the research concluded: "In patients with drug-resistant hypertension, add-on use of eplerenone was effective in lowering BP, especially home and ambulatory awake BP."

Our news journalists report that additional information may be obtained by contacting K. Eguchi, Jichi Med Univ, Sch Med, Dept. of Med, Div Cardiovasc Med, Tochigi, Japan. Additional authors for this research include T. Kabutoya, S. Hoshide, S. Ishikawa and K. Kario.

Drugs and Therapies - Combination Therapy

Reports from Jikei University Provide New Insights into Combination Therapy (Three-year visual outcomes of intravitreal ranibizumab with or without photodynamic therapy for polypoidal choroidal vasculopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Combination Therapy is now available. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "PurposeTo compare 3-year visual outcomes after intravitreal ranibizumab (IVR) monotherapy and combination therapy of photodynamic therapy (PDT) with IVR for polypoidal choroidal vasculopathy (PCV). MethodsMedical records for 45 eyes in 45 patients (34 men, 11 women; mean age, 73.8years old; range, 62-86years old) with treatment-naive PCV were reviewed retrospectively."

Reports from Jikei University Provide New Insights into Combination Therapy (Three-year visual outcomes of intravitreal ranibizumab with or without photodynamic therapy for polypoidal choroidal vasculopathy)
Our news journalists obtained a quote from the research from Jikei University, "Of the 45 eyes, 20 were treated with IVR monotherapy and 25 with combination therapy. Mean change in best-corrected visual acuity, numbers of injections of IVR and length of treatment-free period from baseline at month 36 were observed. Adverse events were monitored. Results: The change in visual acuity after combination therapy was significantly better than that after IVR monotherapy (p=0.0399). At 36 months, improvement in visual acuity was seen in five eyes (25.0%) in the IVR monotherapy group and 13 eyes (52.0%) in the combination therapy group. The treatment-free period was significantly longer in the combination therapy group (p=0.0008). Additional IVR therapy was required significantly more frequently in the IVR monotherapy group (p=0.0026). Post-treatment subretinal haemorrhage or retinal pigment epithelium tear occurred only in the IVR monotherapy group, in one eye (5.0%) and one eye (5.0%), respectively. Conclusion: Initial therapy consisting of a single session of PDT combined with IVR improves vision in treatment-naive PCV."

According to the news editors, the research concluded: "Compared with IVR monotherapy, this combination therapy may be more effective for PCV."

Our news journalists report that additional information may be obtained by contacting T. Sakai, Jikei Univ, Dept. of Ophthalmol, Sch Med, Tokyo, Japan. Additional authors for this research include K. Okano, H. Kohno and H. Tsuneoka.

Peptide Proteins - Proinsulin

Reports from Jilin University Add New Data to Findings in Proinsulin [Effects of Di-(2-ethylhexyl) Phthalate on Lipid Metabolism by the JAK/STAT Pathway in Rats]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Peptide Proteins - Proinsulin is the subject of a report. According to news originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "The most widely used plasticizer, di-(2-ethylhexyl) phthalate (DEHP), is known to affect lipid metabolism and adipogenesis. We studied the effects of dietary DEHP exposure on metabolism in rats as well as the role of the JAK/STAT pathway in this process."
Our news journalists obtained a quote from the research from Jilin University, "Eighty rats were exposed to DEHP (0, 5, 50 and 500 mg/kg/d) through dietary intake for 4 weeks. We then collected blood samples, liver, and adipose tissues to detect modifications in the levels of serum lipids, leptin, adiponectin and insulin. JAK3, STAT5a and PPAR gamma expression were detected at both the gene and protein levels. The activation of JAK3 and STAT5a was also detected. The DEHP-exposed rats had increased body weight, serum lipid, insulin, and leptin levels. Moreover, the JAK3/STAT5a pathway was activated in the adipose tissue; however, this pathway was not activated in the liver. The mRNA of SREBP-1c in the liver was increased significantly among each of the groups, in contrast to the levels found in the mature SREBP-1c protein form. Furthermore, the expression of FABP4, Acox and FASN was decreased in the liver, but increased in adipose tissue."

According to the news editors, the research concluded: "Thus, we conclude that exposure to DEHP reduces the hydrolysis of lipid and promotes triglyceride accumulation by oppositely regulating the activation state of JAK/STAT pathway in the liver and adipose tissue, resulting in the disorder of body lipid metabolism and obesity."

Enzymes and Coenzymes - Phosphotransferases...

Reports from Jilin University Advance Knowledge in Phosphotransferases (Alcohol Group Acceptor) [The Role of Deoxycytidine Kinase (dCK) in Radiation-Induced Cell Death]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Enzymes and Coenzymes - Phosphotransferases (Alcohol Group Acceptor) is the subject of a report. According to news reporting out of Changchun, People's Republic of China, by NewsRx editors, research stated, "Deoxycytidine kinase (dCK) is a key enzyme in deoxyribonucleoside salvage and the anti-tumor activity for many nucleoside analogs. dCK is activated in response to ionizing radiation (IR)-induced DNA damage and it is phosphorylated on Serine 74 by the Ataxia-Telangiectasia Mutated (ATM) kinase in order to activate the cell cycle G2/M checkpoint. However, whether dCK plays a role in radiation-induced cell death is less clear."

Our news journalists obtained a quote from the research from Jilin University, "In this study, we genetically modified dCK expression by knocking down or expressing a WT
(wild-type), S74A (abrogates phosphorylation) and S74E (mimics phosphorylation) of dCK. We found that dCK could decrease IR-induced total cell death and apoptosis. Moreover, dCK increased IR-induced autophagy and dCK-S74 is required for it. Western blotting showed that the ratio of phospho-Akt/Akt, phospho-mTOR/mTOR, phospho-P70S6K/P70S6K significantly decreased in dCK-WT and dCK-S74E cells than that in dCK-S74A cells following IR treatment. Reciprocal experiment by co-immunoprecipitation showed that mTOR can interact with wild-type dCK. IR increased polyploidy and decreased G2/M arrest in dCK knock-down cells as compared with control cells."

According to the news editors, the research concluded: "Taken together, phosphorylated and activated dCK can inhibit IR-induced cell death including apoptosis and mitotic catastrophe, and promote IR-induced autophagy through PI3K/Akt/mTOR pathway."

For more information on this research see: The Role of Deoxycytidine Kinase (dCK) in Radiation-Induced Cell Death. International Journal of Molecular Sciences, 2016;17 (11):2469-2484. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Our news journalists report that additional information may be obtained by contacting R. Zhong, Jilin University, Sch Public Hlth, Key Lab Radiobiol, Minist Hlth, Changchun 130021, People's Republic of China. Additional authors for this research include R. Xin, Z.Y. Chen, N. Liang, Y. Liu, S.M. Ma and X.D. Liu.

Keywords for this news article include: Changchun, People's Republic of China, Asia, Phosphotransferases (Alcohol Group Acceptor), Enzymes and Coenzymes, Deoxycytidine Kinase, Genetics, Jilin University.

**Abdominal Aortic Aneurysm**

**Reports from Johns Hopkins University Add New Data to Findings in Abdominal Aortic Aneurysm (Abdominal aortic aneurysm repair in octogenarians is associated with higher mortality compared with nonoctogenarians)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Abdominal Aortic Aneurysm is the subject of a report. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Age is a well-known independent risk factor for death after abdominal aortic aneurysm (AAA) repair. However, there is significant debate about the utility of AAA repair in older patients."

Our news journalists obtained a quote from the research from Johns Hopkins University, "In this study, mortality outcomes after endovascular AAA repair (EVAR) and open AAA repair (OAR) in octogenarians (aged >= 80 years) were compared with younger patients (aged < 80 years). All patients recorded in the Vascular Quality Initiative database (2002-2012) who underwent infrarenal AAA repair were included. Univariable and multivariable statistics were used to compare perioperative (30-day) and 1-year mortality outcomes between octogenarians vs nonoctogenarians for OAR and EVAR. During the study period, 21,874 patients underwent AAA repair (OAR, 5765; EVAR, 16,109), including 4839 octogenarians (OAR, 765; EVAR, 4074) and 17,035 nonoctogenarians (OAR, 5000; EVAR, 12,035). Octogenarians (mean age, 83.0 +/- 0.1 years) were less frequently male (66% vs 75%) and had a
higher prevalence of congestive heart failure (9.9% vs 7.1%), chronic renal insufficiency (12.2% vs 7.5%), and a history of aortic surgery (14.3% vs 7.7%) compared with nonoctogenarians (P < .01 for all). Intraoperative use of blood transfusions and vasopressors was more common in octogenarians for OAR (blood: 3.3 +/- 4.4 vs 1.8 +/- 3.7 units; vasopressors: 45.2% vs 32.8%) and EVAR (blood: 0.43 +/- 1.7 vs 0.31 +/- 1.6 units; vasopressors: 7.6% vs 5.7%; P < .01 for all). Contrast dye volumes used during EVAR were similar in octogenarians and nonoctogenarians (108 +/- 71 vs 107 +/- 68 mL; P = .18). Perioperative mortality after OAR was 20.1% in octogenarians compared with 7.1% in nonoctogenarians (P < .01). Perioperative mortality after EVAR was 3.8% in the octogenarians compared with 1.6% in nonoctogenarians (P < .01). One-year mortality among octogenarians vs nonoctogenarians was 26% vs 9.7% for OAR and 8.9% vs 4.3% for EVAR (log-rank test, P < .01 for both). Multivariable analysis controlling for baseline and intraoperative differences between groups demonstrated that age >= 80 years increased the risk of 30-day and 1-year mortality after AAA repair by 223% and 187%, respectively (P < .01 for both). AAA repair should be approached with extreme caution in octogenarians.

According to the news editors, the research concluded: "Perioperative and 1-year mortality rates after OAR are particularly high in the older population, suggesting that the appropriate aneurysm size threshold for OAR might be larger due to the greater operative risk in octogenarian patients."

Our news journalists report that additional information may be obtained by contacting M.B. Malas, Johns Hopkins Med Inst, Div Vasc & Endovasc Therapy, Baltimore, MD 21205, United States. Additional authors for this research include T. Obeid, I. Arhuidese, U. Qazi and M.B. Malas.

available. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Using a mouse model of experimental autoimmune myocarditis (EAM), we showed for the first time that IL-23 stimulation of CD4(+) T cells is required only briefly at the initiation of GM-CFS-dependent cardiac autoimmunity. IL-23 signal, acting as a switch, turns on pathogenicity of CD4(+) T cells, and becomes dispensable once autoreactivity is established."

Our news journalists obtained a quote from the research from Johns Hopkins University, "Il23a(-/-) mice failed to mount an efficient Th17 response to immunization, and were protected from myocarditis. However, remarkably, transient IL-23 stimulation ex vivo fully restored pathogenicity in otherwise nonpathogenic CD4(+) T cells raised from Il23a(-/-) donors. Thus, IL-23 may no longer be necessary to uphold inflammation in established autoimmune diseases. In addition, we demonstrated that IL-23-induced GM-CSF mediates the pathogenicity of CD4(+) T cells in EAM. The neutralization of GM-CSF abrogated cardiac inflammation. However, sustained IL-23 signaling is required to maintain IL-17A production in CD4(+) T cells. Despite inducing inflammation in Il23a(-/-) recipients comparable to wild-type (WT), autoreactive CD4(+) T cells downregulated IL-17A production without persistent IL-23 signaling."

According to the news editors, the research concluded: "This divergence on the controls of GM-CSF-dependent pathogenicity on one side and IL-17A production on the other side may contribute to the discrepant efficacies of anti-IL-23 therapy in different autoimmune diseases."

The news correspondents report that additional information may be obtained from L. Wu, W Harry Feinstone Dept. of Molecular Microbiology and Immunology, Bloomberg School of Public Health, Johns Hopkins University, Baltimore, MD, United States. **Immune System Diseases and Conditions - HIV/AIDS**

**Reports from Kaiser Permanente Advance Knowledge in HIV/AIDS**

*(Preexposure Prophylaxis for HIV Prevention in a Large Integrated Health Care System: Adherence, Renal Safety, and Discontinuation)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Researchers detail new data in Immune System Diseases and Conditions - HIV/AIDS. According to news reporting out of Oakland, California, by NewsRx editors, research stated, "Placebo-controlled and open-label studies have demonstrated the safety and efficacy of daily oral preexposure prophylaxis (PrEP) in preventing HIV infection, but data are limited on real-world PrEP use. We conducted a cohort study from July 2012 through June 2015 of Kaiser Permanente Northern California members initiating PrEP."

Our news journalists obtained a quote from the research from Kaiser Permanente, "We assessed pharmacy refill adherence and discontinuation, decreases in estimated glomerular filtration rate (eGFR), and sexually transmitted infection (STI)/HIV incidence. Overall, 972 individuals initiated PrEP, accumulating 850 person-years of PrEP use. Mean adherence was 92% overall. Black race/ethnicity [adjusted risk ratio (aRR) 3.0; 95% confidence interval: 1.7 to 5.1, P<0.001], higher copayments (aRR 2.0; 1.2 to 3.3, P=0.005), and smoking (aRR 1.6; 1.1 to 2.3, P=0.025) were associated with 80% adherence. PrEP was discontinued by 219 (22.5%); female sex (aRR 2.6; 1.5 to 4.6, P<0.001) and drug/alcohol abuse (aRR 1.8; 1.3 to 2.6, P=0.002) were associated with discontinuation. Among 909 with follow-up creatinine testing, 141 (15.5%) had an eGFR,70 mL.min⁻¹.1.73 m⁻² and 5 (0.6%) stopped PrEP because of low eGFR. Quarterly STI positivity was high and increased over time for rectal chlamydia (P<0.001) and urethral gonorrhea (P=0.012). No HIV seroconversions occurred during PrEP use; however, 2 occurred in individuals who discontinued PrEP after losing insurance coverage. PrEP adherence was high in clinical practice, consistent with the lack of HIV seroconversions during PrEP use. Discontinuation because of renal toxicity was rare. STI screening every 6 months, as recommended by current guidelines, may be inadequate."

According to the news editors, the research concluded: "Strategies are needed to increase PrEP access during gaps in insurance coverage."

Our news journalists report that additional information may be obtained by contacting J.L. Marcus, Kaiser Permanente Northern Calif, Div Res, Oakland, CA 94612, United States. Additional authors for this research include L.B. Hurley, C.B. Hare, D.P. Nguyen, T. Phengrasamy, M.J. Silverberg, J.E. Stoltey and J.E. Volk.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating from Kaohsiung, Taiwan, by NewsRx correspondents, research stated, "Pregnancy is a critical time for fetal programming of hypertension. Nitric oxide deficiency during pregnancy causes hypertension in adult offspring."

Our news editors obtained a quote from the research from Kaohsiung Medical University, "We examined whether maternal melatonin or N-acetylcysteine therapy can prevent N-G-nitro-L-arginine-methyl ester induced fetal programming of hypertension in adult offspring. Next, we aimed to identify potential gatekeeper pathways that contribute to N-G nitro-L-arginine-methyl ester-induced programmed hypertension using the next generation RNA sequencing technology. Pregnant Sprague-Dawley rats were assigned to 4 groups: control, N-G-nitro-L-arginine-methyl ester, N-G-nitro-L-arginine-methyl-ester + melatonin, and N-G-nitro-L-arginine-methyl ester+N-acetylcysteine. Pregnant rats received N-G-nitro-L-arginine-methyl ester administration at 60 mg/kg/d subcutaneously during pregnancy alone, with additional 0.01% melatonin in drinking water, or with additional 1% N-acetylcysteine in drinking water during the entire pregnancy and lactation. Male offspring (n = 8/group) were killed at 12 weeks of age. N-G-nitro-L-arginine-methyl ester exposure during pregnancy induced programmed hypertension in adult male offspring, which was prevented by maternal melatonin or N-acetylcysteine therapy. Protective effects of melatonin and N-acetylcysteine against N-G-nitro-L-arginine-methyl ester-induced programmed hypertension were associated with an increase in hydrogen sulfide-generating enzymes and hydrogen sulfide synthesis in the kidneys. Nitric oxide inhibition by N-G nitro-L-arginine-methyl ester in pregnancy caused > 2000 renal transcripts to be modified during nephrogenesis stage in 1-day-old offspring kidney. Among them, genes belong to the renin-angiotensin system, and arachidonic acid metabolism pathways were potentially involved in the N-G nitro-L-arginine-methyl ester-induced programmed hypertension. However, melatonin and N-acetylcysteine reprogrammed the renin-angiotensin system and arachidonic acid pathway differentially. Our results indicated that antioxidant therapy, by melatonin or N-acetylcysteine, in pregnant rats with nitric oxide deficiency can prevent programmed hypertension in male adult offspring. Early intervention with specific antioxidants that target redox imbalance in pregnancy to reprogram hypertension may well allow us to reduce the future burden of hypertension."

According to the news editors, the research concluded: "The roles of transcriptome changes that are induced by N-G-nitro-L-arginine-methyl ester in the offspring kidney require further clarification."

The news editors report that additional information may be obtained by contacting C.N. Hsu, Kaohsiung Medical University, Sch Pharm, Kaohsiung, Taiwan. Additional authors for this research include C.T. Lee, J.Y.H. Chan and C.N. Hsu.

Reports from Karolinska Institute Add New Data to Findings in Heart Attack (Time Trends in Incidence and Mortality of Acute Myocardial Infarction, and All-Cause Mortality following a Cardiovascular Prevention Program in Sweden)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting originating in Stockholm, Sweden, by NewsRx journalists, research stated, "In 1988, a cardiovascular prevention program which combined an individual and a population-based strategy was launched within primary health-care in Sollentuna, a municipality in Stockholm County. The aim of this study was to investigate time trends in the incidence of and mortality from acute myocardial infarction and all-cause mortality in Sollentuna compared with the rest of Stockholm County during a period of two decades following the implementation of a cardiovascular prevention program."

The news reporters obtained a quote from the research from Karolinska Institute, "The average population in Sollentuna was 56,589 (49% men) and in Stockholm County (Sollentuna included) 1,795,504 (49% men) during the study period of 1987-2010. Cases of hospitalized acute myocardial infarction and death were obtained for the population of Sollentuna and the rest of Stockholm County using national registries of hospital discharges and deaths. Acute myocardial infarction incidence and mortality were estimated using the average population of Sollentuna and Stockholm in 1987-2010. During the observation period, the incidence of acute myocardial infarction decreased more in Sollentuna compared with the rest of Stockholm County in women (-22% vs. -7%; for difference in slope <0.05). There was a trend towards a greater decline in Sollentuna compared to the rest of Stockholm County in the incidence of acute myocardial infarction (in men), acute myocardial mortality, and all-cause mortality but the differences were not significant."

According to the news reporters, the research concluded: "During a period of steep decline in acute myocardial infarction incidence and mortality in Stockholm County the municipality of Sollentuna showed a stronger trend in women possibly compatible with favorable influence of a cardiovascular prevention program."

For more information on this research see: Time Trends in Incidence and Mortality of Acute Myocardial Infarction, and All-Cause Mortality following a Cardiovascular Prevention Program in Sweden. Plos One, 2015;10(11):e0140201. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news correspondents report that additional information may be obtained by contacting G. Journath, Unit of Cardiology, Dept. of Medicine, Karolinska Institutet, Stockholm, Sweden. Additional authors for this research include N. Hammar, S. Elofsson, A.

Cardiovascular Diseases and Conditions - Venous...

Reports from Karolinska Institute Describe Recent Advances in Venous
Thromboembolism (Development and validation of risk prediction
model for venous thromboembolism in postpartum women:
multinational cohort study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Venous
Thromboembolism are discussed in a new report. According to news originating from
Stockholm, Sweden, by NewsRx correspondents, research stated, "To develop and validate a
risk prediction model for venous thromboembolism in the first six weeks after delivery (early
postpartum). Cohort study. Records from England based Clinical Practice Research Datalink
(CPRD) linked to Hospital Episode Statistics (HES) and data from Sweden based registry."

Our news journalists obtained a quote from the research from Karolinska Institute,
"All pregnant women registered with CPRD-HES linked data between 1997 and 2014 and
Swedish medical birth registry between 2005 and 2011 with postpartum follow-up. MAIN
OUTCOME E Multivariable logistic regression analysis was used to develop a risk prediction
model for postpartum venous thromboembolism based on the English data, which was
externally validated in the Swedish data. 433 353 deliveries were identified in the English
cohort and 662 387 in the Swedish cohort. The absolute rate of venous thromboembolism was
7.2 per 10 000 deliveries in the English cohort and 7.9 per 10 000 in the Swedish cohort.
Emergency caesarean delivery, stillbirth, varicose veins, pre-eclampsia/eclampsia, postpartum
infection, and comorbidities were the strongest predictors of venous thromboembolism in the
final multivariable model. Discrimination of the model was similar in both cohorts, with a C
statistic above 0.70, with excellent calibration of observed and predicted risks. The model
identified more venous thromboembolism events than the existing national English (sensitivity
68% v 63%) and Swedish guidelines (30% v 21%) at similar thresholds. A new prediction
model that quantifies absolute risk of postpartum venous thromboembolism has been developed
and externally validated."

According to the news editors, the research concluded: "It is based on clinical
variables that are available in many developed countries at the point of delivery and could serve
as the basis for real time decisions on obstetric thromboprophylaxis."

For more information on this research see: Development and validation of risk
prediction model for venous thromboembolism in postpartum women: multinational cohort

Reports from Kerman University of Medical Sciences Highlight Recent Findings in Pruritus (Role of Pregabalin in Management of Pruritus: A Literature Review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Skin Diseases and Conditions - Pruritus have been published. According to news reporting from Kerman, Iran, by NewsRx journalists, research stated, "Pruritus can be one of the distressing symptoms of many dermatologic, systemic, neurologic or psychiatric disorders. In each case, the origin of itch is in the skin and/or the nervous system."

The news correspondents obtained a quote from the research from the Kerman University of Medical Sciences, "Involvement of the nervous system causes neurogenic, psychogenic or neuropathic itch. Itch sensation is transferred to the central nervous system via unmyelinated C-type nerve fibers, and many mediators and receptors engage in the its induction and transmission. Also it has been demonstrated that there are similarities and interactions between neurotransmitters and pathways of pain and itch sensation. Hence, effective drugs in reducing the neuropathic pain such as pregabalin have been studied and used in the management of different itchy conditions. In this narrative review we considered the available published papers dealing with the antipruritic effects of pregabalin. Results of studies conducted in uremic patients show that pregabalin is an effective option in reducing uremic pruritus especially in those who have not responded to antihistamines and topical moisturizers. Data about the effects of pregabalin on other itchy conditions are very limited; however results of the available studies show beneficial effects of this drug in burn patients with more than 5% involvement of the total body surface area, in prurigo nodularis, and in chronic and idiopathic itch. One considerable issue is that the therapeutic effects of pregabalin on uremic pruritus and post burn itch may appear more rapidly than its effects in the other conditions (1-2 weeks vs > 4 weeks). The most reported adverse effects of pregabalin are sedation, dizziness and drowsiness."

According to the news reporters, the research concluded: "Whether pregabalin can be unequivocally considered as an effective and reasonable choice in the management of pruritus with different causes is a question that should be answered through large scale randomized controlled studies."

For more information on this research see: Role of Pregabalin in Management of Pruritus: A Literature Review. Journal of Pharmacy and Pharmaceutical Sciences, 2016;19 (4):465-474. Journal of Pharmacy and Pharmaceutical Sciences can be contacted at: Canadian
Oncology - Non-Small Cell Lung Cancer

Reports from Kinki University Faculty of Medicine Provide New Insights into Non-Small Cell Lung Cancer (Clinical development of nintedanib for advanced non-small-cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Non-Small Cell Lung Cancer are discussed in a new report. According to news originating from Osaka, Japan, by NewsRx correspondents, research stated, "Angiogenesis is an essential process in the development, growth, and metastasis of malignant tumors including lung cancer. Several angiogenesis inhibitors have been developed as potential therapies for non-small-cell lung cancer (NSCLC)."

Our news journalists obtained a quote from the research from the Kinki University Faculty of Medicine, "Nintedanib is a small-molecule tyrosine kinase inhibitor that targets receptors for vascular endothelial growth factor, platelet-derived growth factor, and fibroblast growth factor as well as RET (rearranged during transfection) and Flt3. When administered as monotherapy, nintedanib was well tolerated at doses up to 250 mg or 200 mg twice daily in European and Japanese patients, respectively, with liver toxicity featuring prominently among dose-limiting toxicities in both populations. A recent Phase III trial demonstrated that treatment with the combination of nintedanib and docetaxel resulted in a significant and clinically meaningful improvement in both progression-free survival and overall survival compared with docetaxel alone in predefined NSCLC patients with adenocarcinoma tumor histology. Although the incidence of elevated alanine aminotransferase or aspartate aminotransferase as well as of diarrhea was higher in patients treated with nintedanib plus docetaxel, most of these adverse events were manageable with supportive treatment or dose reduction."

According to the news editors, the research concluded: "The results of completed and ongoing clinical trials of nintedanib monotherapy and combination therapy for the treatment of NSCLC are summarized in this study."

The news correspondents report that additional information may be obtained from...
Liver Diseases and Conditions - Hepatitis

Reports from Kirby Institute Provide New Insights into Hepatitis
(Tenofovir-based antiretroviral therapy in HBV-HIV coinfection: results from the TREAT Asia HIV Observational Database)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Hepatitis have been presented. According to news reporting originating from Sydney, Australia, by NewsRx correspondents, research stated, "The World Health Organization recommends HBV-HIV-coinfected individuals start antiretroviral therapy containing tenofovir. Here we describe first-line tenofovir use and treatment outcomes in coinfected patients in Asia."

Our news editors obtained a quote from the research from Kirby Institute, "HBV surface antigen positive patients enrolled in the TREAT Asia HIV Observational Database who started first-line antiretroviral therapy were included. Logistic regression adjusted for period of treatment initiation was used to determine factors associated with tenofovir use. Generalized estimating equations were used to evaluate factors associated with alanine transaminase levels and CD4(+) T-cell count on treatment. There were 548 eligible patients, of whom 149 (27.2%) started tenofovir. Patients treated in high/high-middle income countries (odds ratio 4.4 versus low/low-middle, 95% CI 2.6, 7.4; P<0.001) and those with elevated baseline alanine transaminase (odds ratio 4.2 versus normal, 95% CI 2.4, 7.2; P<0.001) were more likely to receive tenofovir. Hepatitis C antibody positive patients (odds ratio 0.4 versus negative, 95% CI 0.2, 0.8; P=0.008) were less likely. In those starting antiretroviral therapy with elevated alanine transaminase, mean reduction after tenofovir initiation was 11.2 IU/I (95% CI 0.9, 21.6; P=0.034) lower compared with those using a non-tenofovir-based regimen although this did not significantly increase the chance of alanine transaminase normalization. Tenofovir use was not associated with a superior CD4(+) T-cell response. HBV-HIV-coinfected patients in Asia are most likely to receive tenofovir if they are treated in a high/high-middle income country, have elevated alanine transaminase levels and are hepatitis C antibody negative."

According to the news editors, the research concluded: "Compared to other antiretroviral therapies, tenofovir-based regimens more effectively reduce liver inflammation in HBV-HIV-coinfection but do not result in superior CD4(+) T-cell recovery."

For more information on this research see: Tenofovir-based antiretroviral therapy in HBV-HIV coinfection: results from the TREAT Asia HIV Observational Database. Antiviral Therapy, 2016;21(1):27-35. Antiviral Therapy can be contacted at: Int Medical Press Ltd, 2-4
Oncology - Lung Cancer

Reports from Korea Institute of Radiological and Medical Sciences Highlight Recent Findings in Lung Cancer (TGF-b and Hypoxia/Reoxygenation Promote Radioresistance of A549 Lung Cancer Cells through Activation of Nrf2 and EGFR)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Although many studies have examined the roles of hypoxia and transforming growth factor-beta (TGF-b) separately in the tumor microenvironment, the effects of simultaneous treatment with hypoxia/reoxygenation and TGF-b on tumor malignancy are unclear. Here, we investigated the effects of redox signaling and oncogenes on cell proliferation and radioresistance in A549 human lung cancer cells in the presence of TGF-b under hypoxia/reoxygenation conditions."

Financial supporters for this research include Basic Science Research Program, Nuclear Research & Development Program, Ministry of Science ICT and Future Planning.

The news correspondents obtained a quote from the research from the Korea Institute of Radiological and Medical Sciences, "Combined treatment with TGF-b and hypoxia activated epidermal growth factor receptor (EGFR) and nuclear factor (erythroid-derived 2)-like 2 (Nrf2), a redox-sensitive transcription factor. Interestingly, Nrf2 knockdown suppressed the effects of combined treatment on EGFR phosphorylation. In addition, blockade of EGFR signaling also suppressed induction of Nrf2 following combined treatment with hypoxia and TGF-b, indicating that the combined treatment induced positive crosstalk between Nrf2 and EGFR. TGF-b and hypoxia/reoxygenation increased the accumulation of reactive oxygen species (ROS), while treatment with N-acetyl-l-cysteine abolished the activation of Nrf2 and EGFR. Treatment with TGF-b under hypoxic conditions increased the proliferation of A549 cells compared with that after vehicle treatment. Moreover, cells treated with the combined treatment exhibited resistance..."
to ionizing radiation (IR), and knockdown of Nrf2 increased IR-induced cell death under these conditions."

According to the news reporters, the research concluded: "Thus, taken together, our findings suggested that TGF-b and hypoxia/reoxygenation promoted tumor progression and radioresistance of A549 cells through ROS-mediated activation of Nrf2 and EGFR."

For more information on this research see: TGF-b and Hypoxia/Reoxygenation Promote Radioresistance of A549 Lung Cancer Cells through Activation of Nrf2 and EGFR. Oxidative Medicine and Cellular Longevity, 2016;2016():6823471. (Hindawi Publishing - www.hindawi.com; Oxidative Medicine and Cellular Longevity - www.hindawi.com/journals/oximed/)

Granulocytes

Reports from Korea University Highlight Recent Findings in Granulocytes (Silibinin Inhibits Neutrophilic Inflammation and Mucus Secretion Induced by Cigarette Smoke via Suppression of ERK-SP1 Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Granulocytes have been published. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Silibinin, the main ingredient of silymarin, has been used as a traditional drug for over 2000 years to treat a range of liver diseases. Recent studies have also demonstrated that silibinin possesses antiinflammatory and anticancer properties."

The news correspondents obtained a quote from the research from Korea University, "In the study, we researched the efficacy of silibinin on the development of COPD using a cigarette smoke (CS)-induced and lipopolysaccharide (LPS)-induced COPD model mice and stimulation of NCI-H292 cells with CS condensate. Silibinin was administered to mice by oral gavage 1 h before CS exposure for 10 days. In in vitro experiment, we evaluated the effect of silibinin on the expression of MUC5AC in H292 cells stimulated with CS condensate. Furthermore, silibinin suppressed the CS and LPS treatment-induced extracellular signal-regulated kinase (ERK) phosphorylation and SP-1 expression. Silibinin also decreased airway inflammation and reduced the expression of MUC5AC and myeloperoxidase. Furthermore, co-
treatment with silibinin and ERK inhibitors considerably decreased the levels of pro-inflammatory mediators, ERK phosphorylation, and SP-1 expression. Taken together, the results indicate that silibinin effectively suppressed the neutrophilic airway inflammation provoked by treatment with LPS and CS, which was closely associated with downregulation of ERK phosphorylation."

According to the news reporters, the research concluded: "Therefore, our searching offers that silibinin has a remedical probable for COPD disease."

Liver Diseases and Conditions - Hepatitis C Virus

**Reports from Kunming General Hospital Highlight Recent Findings in Hepatitis C Virus (Inhibition of STAT Pathway Impairs Anti Hepatitis C Virus Effect of Interferon Alpha)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Liver Diseases and Conditions - Hepatitis C Virus is the subject of a report. According to news originating from Kunming, People's Republic of China, by NewsRx correspondents, research stated, "Signal transducer and activator of transcription (STAT) pathway plays an important role in antiviral efficacy of interferon alpha (IFN-alpha). IFN-alpha is the main therapeutic against hepatitis C virus (HCV) infection."

Our news journalists obtained a quote from the research from Kunming General Hospital, "We explored effects of IFN-alpha on HCV replication and antiviral gene expression by targeting STAT. In response to IFN-alpha, STAT status, HCV replication, and antiviral gene expression were analyzed in human hepatoma Huh7.5.1 cells before and after cell culture-derived HCV infection. IFN-alpha treatment induced expression and phosphorylation of STAT1 and STAT2 in Huh7.5.1 cells. Pretreatment of Huh7.5.1 cells with a mAb to IFN alpha receptor (TENAR) 2 decreased TEN-alpha-dependent phosphorylation of STAT1 and STAT2, whereas pretreatment with an IFNAR1 mAb increased such phosphorylation, suggesting that IFNAR mediates IFN-alpha-triggered STAT signaling. During HCV infection, STAT1 and STAT2 phosphorylation could be rescued by IFN-alpha and IFN a-induced phosphorylation of STAT1 and STAT2 was impaired. Inhibition of STAT pathway by Jak inhibitor I significantly enhanced HCV RNA replication and viral protein expression. Antiviral genes coding for IFN regulatory
factor 9 and IFN-stimulated gene 15 were up regulated by IFN a during HCV infection but such up-regulation was abrogated by Jak inhibitor I. These results establish that activation of STAT pathway is essential for anti-HCV efficacy of IFN-a.

According to the news editors, the research concluded: "Impairment of IFN-alpha-triggered STAT signaling by HCV may account for evading IFN-a response."

For more information on this research see: Inhibition of STAT Pathway Impairs Anti Hepatitis C Virus Effect of Interferon Alpha. Cellular Physiology and Biochemistry, 2016;40(1-2):77-90. Cellular Physiology and Biochemistry can be contacted at:  Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. Reports from Kyorin University Provide New Insights into Hypersensitivity (Importance of Water Content of the Stratum Corneum in Mouse Models for Contact Hypersensitivity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immune System Diseases and Conditions - Hypersensitivity. According to news reporting originating from Mitaka, Japan, by NewsRx correspondents, research stated, "Although a marked rise in the prevalence of allergic diseases over the past few decades may be related to environmental factors in industrialized countries, evidence for the protective effect of humidity on the barrier function of the skin is still awaited. We asked whether an increase in the water content of stratum corneum at the site of hapten application had a strong impact on the magnitude of contact hypersensitivity (CHS)."

Our news editors obtained a quote from the research from Kyorin University, "The magnitude of CHS, induced by either lipid-soluble or water-soluble hapten, was inversely correlated with the water content of stratum corneum at the hapten application site in the elicitation phase. An increase in the water content induced by exposure to high humidity for 6 hours was sufficient to ameliorate the magnitude of CHS even in mice with the genetic defect in attenuating the CHS responses, such as flaky tail mice. The reduced CHS was associated with downregulation of IL-1 alpha, IL-4, and IFN-gamma mRNA expression. Epicutaneously applied hapten can penetrate more readily through the stratum corneum with lower water content than that with higher water content, even after tape-stripping."
According to the news editors, the research concluded: "These findings indicate that increased levels of water in the stratum corneum serve to ameliorate the CHS beyond the genetic effects."

The news editors report that additional information may be obtained by contacting Y. Mizukawa, Kyorin University, Dept. of Dermatol, Sch Med, Mitaka, Tokyo 1818611, Japan. Additional authors for this research include Y. Mizukawa, Y. Shimoda, Y. Yamazaki and T. Shiohara.

Keywords for this news article include: Mitaka, Japan, Asia, Immune System Diseases and Conditions, Epidemiology, Hypersensitivity, Genetics, Kyorin University.

**Reports from Laboratory for Molecular Biology Advance Knowledge in Camptothecin Therapy**

**[Poly(ADP-ribose) polymers regulate DNA topoisomerase I (Top1) nuclear dynamics and camptothecin sensitivity in living cells]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Camptothecin Therapy have been presented. According to news reporting from Kolkata, India, by NewsRx journalists, research stated, "Topoisomerase 1 (Top1) is essential for removing the DNA supercoiling generated during replication and transcription. Anticancer drugs like camptothecin (CPT) and its clinical derivatives exert their cytotoxicity by reversibly trapping Top1 in covalent complexes on the DNA (Top1cc)."

The news correspondents obtained a quote from the research from Laboratory for Molecular Biology, "Poly(ADP-ribose) polymerase (PARP) catalyses the addition of ADP-ribose polymers (PAR) onto Top1. PARP inhibitors enhance the cytotoxicity of CPT in the clinical trials. However, the molecular mechanism by which PARylation regulates Top1 nuclear dynamics is not fully understood. Using live-cell imaging of enhanced green fluorescence tagged-human Top1, we show that PARP inhibitors (Veliparib, ABT-888) delocalize Top1 from the nucleolus to the nucleoplasm, which is independent of Top1-PARP1 interaction. Using fluorescence recovery after photobleaching and subsequent fitting of the data employing kinetic modelling we demonstrate that ABT-888 markedly increase CPT-induced bound/immobile fraction of Top1 (Top1cc) across the nuclear genome, suggesting Top1-PARylation counteracts CPT-induced stabilization of Top1cc. We further show Trp205 and Asn722 of Top1 are critical for subnuclear dynamics. Top1 mutant (N722S) was restricted to the nucleolus in the presence of CPT due to its deficiency in the accumulation of CPT-induced Top1-PARylation and Top1cc formation."

According to the news reporters, the research concluded: "This work identifies ADP-
ribose polymers as key determinant for regulating Top1 subnuclear dynamics.”

Our news journalists report that additional information may be obtained by contacting B.B. Das, Indian Assoc Cultivat Sci, Dept. of Phys Chem, Lab Mol Biol, Kolkata 700032, India. Additional authors for this research include I. Rehman, A. Ghosh, S. Sengupta, P. Majumdar, B. Jana and B.B. Das.

**Neurology - Neurodegeneration**

**Reports from Lanzhou University Add New Data to Findings in Neurodegeneration (DNA damage preceding dopamine neuron degeneration in A53T human alpha-synuclein transgenic mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neurology - Neurodegeneration. According to news reporting from Lanzhou, People's Republic of China, by NewsRx journalists, research stated, "Defective DNA repair has been linked with age-associated neurodegenerative disorders. Parkinson's disease (PD) is a progressive neurodegenerative disorder caused by genetic and environmental factors."

The news correspondents obtained a quote from the research from Lanzhou University, "Whether damages to nuclear DNA contribute to neurodegeneration of PD still remain obscure. in this study we aim to explore whether nuclear DNA damage induce dopamine neuron degeneration in A53T human α-Synuclein over expressed mouse model. We investigated the effects of X-ray irradiation on A53T-alpha-Syn MEFs and A53T-alpha-Syn transgene mice. Our results indicate that A53T-alpha-Syn MEFs show a prolonged DNA damage repair process and senescence phenotype. DNA damage preceded onset of motor phenotype in A53T-beta-Syn transgenic mice and decrease the number of nigrostriatal dopaminergic neurons."

According to the news reporters, the research concluded: "Neurons of A53T-alpha-Syn transgenic mice are more fragile to DNA damages."

For more information on this research see: DNA damage preceding dopamine neuron degeneration in A53T human alpha-synuclein transgenic mice. *Biochemical and Biophysical Research Communications*, 2016;481(1-2):104-110. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Immunology - Immunoglobulins

**Reports from Leiden University Describe Recent Advances in Immunoglobulins (Type I CD20 Antibodies Recruit the B Cell Receptor for Complement-Dependent Lysis of Malignant B Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immunology - Immunoglobulins is the subject of a report. According to news originating from Leiden, Netherlands, by NewsRx correspondents, research stated, "Human IgG1 type I CD20 Abs, such as rituximab and ofatumumab (OFA), efficiently induce complement-dependent cytotoxicity (CDC) of CD20(+) B cells by binding of C1 to hexamerized Fc domains. Unexpectedly, we found that type I CD20 Ab F(ab')2 fragments, as well as C1q-binding-deficient IgG mutants, retained an ability to induce CDC, albeit with lower efficiency than for whole or unmodified IgG."

Our news journalists obtained a quote from the research from Leiden University, "Experiments using human serum depleted of specific complement components demonstrated that the observed lytic activity, which we termed 'accessory CDC,' remained to be dependent on C1 and the classical pathway. We hypothesized that CD20 Ab-induced clustering of the IgM or IgG BCR was involved in accessory CDC. Indeed, accessory CDC was consistently observed in B cell lines expressing an IgM BCR and in some cell lines expressing an IgG BCR, but it was absent in BCR- B cell lines. A direct relationship between BCR expression and accessory CDC was established by transfecting the BCR into CD20(+) cells: OFA-F(ab')(2) fragments were able to induce CDC in the CD20(+)BCR(+) cell population, but not in the CD20(+)BCR(-) population. Importantly, OFA-F(ab')(2) fragments were able to induce CDC ex vivo in malignant B cells isolated from patients with mantle cell lymphoma and Waldenstrom macroglobulinemia. In summary, accessory CDC represents a novel effector mechanism that is dependent on type I CD20 Ab-induced BCR clustering."

According to the news editors, the research concluded: "Accessory CDC may contribute to the excellent capacity of type I CD20 Abs to induce CDC, and thereby to the antitumor activity of such Abs in the clinic."

For more information on this research see: Type I CD20 Antibodies Recruit the B Cell Receptor for Complement-Dependent Lysis of Malignant B Cells. *Journal of Immunology*, 2016;197(12):4829-4837. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Cytometry

Reports from Linkoping University Add New Data to Findings in Cytometry (Platelet Function Determined by Flow Cytometry: New Perspectives?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cytometry have been published. According to news reporting originating from Linkoping, Sweden, by NewsRx correspondents, research stated, "Flow cytometry enables studies of several different aspects of platelet function in response to a variety of platelet agonists. This can be done using only a small volume of whole blood, and also in blood with low platelet counts."

Our news editors obtained a quote from the research from Linkoping University, "These properties, together with the increasing number of flow cytometers available in hospitals worldwide, make flow cytometry an interesting option for laboratories interested in studies of platelet function in different clinical settings. This review focuses on practical issues regarding the use of flow cytometry for platelet function testing. It provides an overview of available activation markers, platelet agonists, and experimental setup issues. The review summarizes previous experience and factors important to consider to perform high-quality platelet function testing by flow cytometry."

According to the news editors, the research concluded: "It also discusses its current use and possibilities and challenges for future use of flow cytometry in clinical settings."

For more information on this research see: Platelet Function Determined by Flow Cytometry: New Perspectives? Seminars In Thrombosis and Hemostasis, 2016;42(3):268-81. (Thieme - www.thieme.com)

The news editors report that additional information may be obtained by contacting S. Ramstrom, Dept. of Clinical and Experimental Medicine, Linkoping University, Linkoping, Sweden. Additional authors for this research include A.L. Sodergren, N. Tynngard and T.L Lindahl.

Reports from Lombardi Comprehensive Cancer Center Highlight Recent Findings in Immunotherapy (Predictive biomarkers for checkpoint inhibitor-based immunotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Immunotherapy are discussed in a new report. According to news reporting originating from Washington, District of Columbia, by NewsRx correspondents, research stated, "The clinical development of checkpoint inhibitor-based immunotherapy has ushered in an exciting era of anticancer therapy. Durable responses can be seen in patients with melanoma and other malignancies."

Our news editors obtained a quote from the research from Lombardi Comprehensive Cancer Center, "Although monotherapy with PD-1 or PD-L1 agents are typically well tolerated, the risk of immune-related adverse events increases with combination regimens. The development of predictive biomarkers is needed to optimise patient benefit, minimise risk of toxicities, and guide combination approaches. The greatest focus has been on tumour-cell PD-L1 expression. Although PD-L1 positivity enriches for populations with clinical benefit, PD-L1 testing alone is insufficient for patient selection in most malignancies. In this Review, we discuss the status of PD-L1 testing and explore emerging data on new biomarker strategies with tumour-infiltrating lymphocytes, mutational burden, immune gene signatures, and multiplex immunohistochemistry."

According to the news editors, the research concluded: "Future development of an effective predictive biomarker for checkpoint inhibitor-based immunotherapy will integrate multiple approaches for optimal characterisation of the immune tumour microenvironment."

The news editors report that additional information may be obtained by contacting G.T. Gibney, MedStar Georgetown Univ Hosp, Lombardi Comprehens Canc Center, Washington, DC 20007, United States. Additional authors for this research include L.M. Weiner and M.B. Atkins.

Intercellular Signaling Peptides and Proteins...

Reports from Lovelace Respiratory Research Institute Advance Knowledge in Cytokines (Quercetin Inhibits Multiple Pathways Involved in Interleukin 6 Secretion From Human Lung Fibroblasts and Activity in Bronchial Epithelial Cell Transformation ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Intercellular Signaling Peptides and Proteins - Cytokines is now available. According to news originating from Albuquerque, New Mexico, by NewsRx correspondents, research stated, "The interaction between epithelial and stromal cells through soluble factors such as cytokines plays an important role in carcinogenesis. Breaking this cancer-promoting interaction poses an opportunity for cancer prevention."

Our news journalists obtained a quote from the research from Lovelace Respiratory Research Institute, "The tumor-promoting function of interleukin 6 (IL-6) has been documented; however, the underlying mechanisms of this function in lung carcinogenesis are not well elucidated. Here, we show that benzo[a]pyrene diol epoxide (BPDE, the active metabolite of cigarette smoke carcinogen benzo[a]pyrene)-induced human bronchial epithelial cell (HBEC) transformation was enhanced by IL-6 in vitro. The carcinogen/IL-6-transformed cells exhibited higher expression of STAT3 (signal transducer and activator of transcription 3) when compared with cells transformed by BPDE alone. Constitutive STAT3 activation drove cell proliferation and survival through anti-apoptosis gene expression. We further show that quercetin, a dietary compound having preventive properties for lung cancer, decreased BPDE-stimulated IL-6 secretion from human lung fibroblasts through inhibition of the NF-kappa B and ERK pathways. The inhibition was accomplished at clinically achievable concentrations of the compound. Finally, quercetin blocked IL-6-induced STAT3 activation in HBECs, and IL-6 enhancement of HBEC transformation by BPDE was abolished by quercetin treatment."

According to the news editors, the research concluded: "Altogether, our data reveal novel mechanisms for IL-6 in lung carcinogenesis and for the preventive role of quercetin in the process."

The news correspondents report that additional information may be obtained from W.S. Chen, Lovelace Resp Res Inst, Mol Biol & Lung Canc Program, Albuquerque, NM 87108, United States. Additional authors for this research include M.T. Padilla, X.L. Xu, D. Desai, J. Krzeminski, S. Amin and Y. Lin.

Antioxidants

Reports from M. Dattilo and Colleagues Advance Knowledge in Antioxidants (Improvement of gamete quality by stimulating and feeding the endogenous antioxidant system: mechanisms, clinical results, insights on gene-environment interactions and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Antioxidants. According to news reporting out of Lugano, Switzerland, by NewsRx editors, research stated, "Oxidative damage triggers extensive repair in gametes and thereafter in the zygote but it results in clinically relevant damage when affecting the maturation of the gametes chromatin, i.e. padlocking and epigenetic marking. It associates with defective DNA methylation and/or with oxidation of the methyl marks leading to derangement of gamete epigenetics, defects of chromatin condensation and aneuploidy."

Our news journalists obtained a quote from the research, "A proper feed to the one carbon cycle has the potential to stimulate the endogenous antioxidant defences, i.e. glutathione synthesis, and to activate compensative homeostatic mechanisms restoring both the oxy-redox balance and DNA methylation, which are indeed strictly cross-regulated. This has been shown to produce measurable clinical improvements of male reproductive potential in pilot studies herein summarised. However, the effects of dietary habits and of supplementations are variable according to the individual genetic substrate, as genetic variants of several of the concerned enzymes occur with high frequency. Individual risk assessments and personalised interventions are still difficult to implement, in the meantime, a very varied diet may facilitate metabolic compensation in the majority of the cases."

According to the news editors, the research concluded: "This review aims to report on the mechanisms of damage, on the opportunities to modulate the physiologic oxy-redox homeostasis by means of a varied diet or dietary supplements and on the open issues related to the genetic variability of the population."

Our news journalists report that additional information may be obtained by contacting M. Dattilo, Parthenogen, CH-6900 Lugano, Switzerland. Additional authors for this research include D. Giuseppe, C. Ettore and Y. Menezo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s10815-016-0767-4. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Hepatitis C Virus

Reports from M. El-Bendary and Colleagues Advance Knowledge in Hepatitis C Virus (Associations of human leucocyte antigen class II-DQB1 alleles with hepatitis C virus infection in Egyptian population: a multicentre family-based study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Hepatitis C Virus is now available. According to news reporting originating in Mansoura, Egypt, by NewsRx journalists, research stated, "Hepatitis C infection is a global pandemic. HLA-DQB1 alleles are believed to have an effective role in immune response against HCV including susceptibility to or protection from this infection."

Financial support for this research came from Science and Technology Development Fund.

The news reporters obtained a quote from the research, "The aim of this study was to investigate the contribution of HLA-DQB1 alleles in the outcome of HCV genotype-4 infection through a family-based association study. Egyptian families with HCV (324) were recruited for this study (324 index positive for RNA-HCV, 225 positive relatives representing chronic hepatitis C cases and 582 family members negative for HCV-RNA [control], 63 of whom spontaneously cleared the virus. All subjects were genotyped for HLA-DQB1 alleles by sequence-specific primers (SSP-PCR) and sequence-based typing (SBT) methods. The frequency of DQB1*02:01:01 carriage was significantly higher in infected patients when compared to controls and those who spontaneously cleared virus (OR=5.47, P<.0001 and OR=6.5234, P<.0001, respectively), and the carriage of the DQB1*03:01:01:01 allele was significantly higher in those who cleared and controls when compared to the infected patients (OR=0.2889, P<.0001 and OR=0.3016, P<.0001, respectively). On the other hand, the frequency of DQB1*06:01:01 and QB1*05:01:01:01 alleles was not associated with infection (comparison of infected and cleared patients showed OR of 2.1598 [P <.01]), but it becomes nonsignificant after adjustments with the Bonferroni formula (P-C >0.05) and OR= 1.3523, P>.05, respectively."

According to the news reporters, the research concluded: "This study shows that clearance of HCV is associated with DQB1*03:01:01:01 allele and chronicity of HCV infection associated with the risk allele: DQB1*02:01:01."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jvh.12573. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Pancreatic Cancer

Reports from M. Seifert and Co-Researchers Add New Data to Findings in Pancreatic Cancer (Inducing a humoral immune response to pancreatic cancer antigen)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Pancreatic Cancer is now available. According to news reporting from Freiburg, Germany, by NewsRx journalists, research stated, "Patients with pancreatic carcinoma have a grim prognosis. Here, we examine the induction of an in vitro antibody response of human B cells to pancreatic carcinoma antigens."

The news correspondents obtained a quote from the research, "Cells of five cultured pancreatic ductal adenocarcinoma lines were lysed and their plasma membrane fragments isolated in an aqueous two-phase-system. The plasma membrane fragments were then added to cultures of isolated peripheral blood mononuclear cells from healthy volunteers for 14 days to act as a tumor antigen. Also, we added combinations of IL-2, IL-4, IL-21, anti-CD40 mAb and varying protein concentrations of the plasma membrane fragments to these cultures. We then tested characteristics and binding of resulting IgG and IgM against aforementioned tumor plasma membrane fragments and their respective cells using ELISAs. The combination of IL-2, IL-4 and anti-CD40 mAb elicited IgM production showing significant binding (p < 0.05) to plasma membrane fragments. PANC-1 antigen and the combination of IL-4, IL-21 and anti-CD40 mAb was able to produce a significant and specific IgG formation against PANC-1 plasma membrane fragments (p < 0.05). Tumor antigen, interleukins and anti-CD40 mAb had a significant impact on the binding capacity of these antibodies (p < 0.05). IgG binding pancreatic carcinoma cells was observed when the tumor antigen concentration was increased during stimulation (p < 0.05). BxPC3 plasma membrane fragments showed inhibitory effects on IgG binding BxPC3 antigens (p < 0.05). A human anti-tumor antibody formation can be induced in vitro using PANC-1 antigens and B cell stimulating agents. This response has the potential to generate antibodies specific to PANC-1 antigens. Precis: The concept presented is novel and a promising approach to eliciting a specific B cell response to tumor antigen."

According to the news reporters, the research concluded: "The method may prove useful in understanding and developing anti-tumor immunity."

For more information on this research see: Inducing a humoral immune response to pancreatic cancer antigen. Cellular Immunology, 2016;310():150-155. Heptanes

Reports from Mahidol University Add New Data to Findings in Heptanes (Protective Effects of a Diarylheptanoid from Curcuma comosa Against Hydrogen Peroxide-Induced Astroglial Cell Death)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heptanes. According to news reporting from Bangkok, Thailand, by NewsRx journalists, research stated, "Oxidative stress is one of the major mechanisms causing neuronal and astroglial cell death in various neurological disorders such as Alzheimer's disease, Parkinson's disease, and brain ischemia. Two diarylheptanoids, (3R)-1,7-diphenyl-(4E,6E)4,6-heptadien-3-ol (ASPP 049) and (3S)-7-(3,4-dihydroxyphenyl)-1-phenyl-(1E)-1-hepten-3-ol (ASPP 092), isolated from Curcuma comosa were investigated for cytoprotective effects on C6 astroglial cells using hydrogen peroxide (H2O2) exposure as a model of oxidative stress."

The news correspondents obtained a quote from the research from Mahidol University, "ASPP 092 demonstrated free radical scavenging activity comparable to that of vitamin C, while ASPP 049 showed no antioxidant activity. Treatment with H2O2 at 400 mu M for 12 h caused 79% C6 astroglial cell death which was significantly reduced to 37% by pretreatment with ASPP 092 (5 mu M). In addition, ASPP 092 attenuated the increase in reactive oxygen species production and the decrease in total glutathione level induced by H2O2. The mechanism of ASPP 092 protection against H2O2-induced apoptotic signaling appeared to involve prevention of increase in the level of phosphorylated p53 and the Bax/Bcl-2 ratio as well as cleaved caspase-3."

According to the news reporters, the research concluded: "These findings provide new evidence that the diarylheptanoid ASPP 092 from C. comosa possesses antiapoptotic properties and could be further developed as a potential treatment for oxidative stress-related neuronal diseases."

For more information on this research see: Protective Effects of a Diarylheptanoid from Curcuma comosa Against Hydrogen Peroxide-Induced Astroglial Cell Death. Planta Medica, 2016;82(17):1456-1462. Oncology - Cancer Risk

Reports from Makerere University Advance Knowledge in Cancer Risk (Awareness of cervical cancer risk factors and symptoms: cross-sectional community survey in post-conflict northern Uganda)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Cancer Risk. According to news reporting originating from Kampala, Uganda, by NewsRx correspondents, research stated, "Lack of awareness of risk factors and symptoms for cancer may lead to late diagnosis and poor prognosis. We assessed community awareness about cervical cancer risk factors and symptoms and perceptions about prevention and cure of cervical cancer in order to contribute data to inform interventions to improve cervical cancer survival."

Funders for this research include Training Health Researchers into Vocational Excellence (THRiVE) in East Africa, Wellcome Trust.

Our news editors obtained a quote from the research from Makerere University, "Cross-sectional population-based survey. We conducted this study in Gulu, a post-conflict district in Uganda in 2012. The sample included 448 persons aged 18 years and above, selected through a multi-stage stratified cluster sampling process. Data collection methods and analysis We collected data using a pretested structured questionnaire. Logistic regressions were used to determine magnitudes of associations between socio-demographic and outcome variables. Most participants (444/448) had heard about cervical cancer. Known risk factors including multiple sexual partners, human papillomavirus infection, and early onset of sexual activity, were recognized by 88%, 82%, and 78% of respondents respectively. 63% of participants believed that prolonged use of family planning pills and injections caused cervical cancer. The majority of participants recognized symptoms of cervical cancer including intermenstrual bleeding (85%), post-menopausal bleeding (84%), and offensive vaginal discharge (83%). 70% of participants believed that cervical cancer is preventable and 92% believed that it could be cured if diagnosed at an early stage. Recognition of cervical cancer risk factors and symptoms was high among study participants."

According to the news editors, the research concluded: "Targeted interventions including increasing availability of HPV vaccination, population-based cervical screening and diagnostic services can translate high awareness into actual benefits."

For more information on this research see: Awareness of cervical cancer risk factors

The news editors report that additional information may be obtained by contacting A.D. Mwaka, Makerere Univ, Sch Med, Dept. of Med, Coll Hlth Sci, Kampala, Uganda. Additional authors for this research include C.G. Orach, E.M. Were, G. Lyratzopoulos, H. Wabinga and M. Roland.

*Influenza A Virus Subtype H1N1*

**Reports from Makerere University Advance Knowledge in Influenza A Virus Subtype H1N1 [Whole-genome analysis of influenza A(H1N1)pdm09 viruses isolated in Uganda from 2009 to 2011]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Influenza A Virus Subtype H1N1 have been published. According to news reporting out of Kampala, Uganda, by NewsRx editors, research stated, "We report a whole-genome analysis of 19 influenza A(H1N1)pdm09 isolates from four Ugandan hospitals between 2009 and 2011."

Our news journalists obtained a quote from the research from Makerere University, "The isolates differed from the vaccine strain A/California/07/2009 by three amino acid substitutions P100S, S220T, and I338V in the hemagglutinin and by two amino acid substitutions V106I and N248D in the neuraminidase proteins with consistent mutations in all gene segments distinguishing isolates from the 2009/2010 to 2010/2011 seasons. Phylogenetic analysis showed low genetic evolution, with genetic distances of 0%-1.3% and 0.1%-1.6% for HA and NA genes, respectively."

According to the news editors, the research concluded: "The amino acid substitutions did not lead to antigenic differences from the reference strains."

Our news journalists report that additional information may be obtained by contacting D.K. Byarugaba, Makerere Univ, Walter Reed Project, Kampala, Uganda. Additional authors for this research include B. Erima, M. Millard, H. Kibuuka, L. Kdwago, J. Bwogi, D. Mimbe, J.B. Kiconco, T. Tugume, E.A. Mworori, J. Turner, P.P. Mckenzie, R.R.J. Webby,
Reports from Mayo Clinic Add New Data to Findings in Carcinomas (In vivo anti-tumor activity of the PARP inhibitor niraparib in homologous recombination deficient and proficient ovarian carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Carcinomas are discussed in a new report. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "Poly(ADP-ribose) polymerase (PARP) inhibitors have yielded encouraging responses in high-grade serous ovarian carcinomas (HGSOCs), but the optimal treatment setting remains unknown. We assessed the effect of niraparib on HGSOC patient-derived xenograft (PDX) modeE as well as the relationship between certain markers of homologous recombination (HR) status, including BRCA1/2 mutations and formation of RAD51 foci after DNA damage, and response of these PDX5 to niraparib in vivo."

The news correspondents obtained a quote from the research from Mayo Clinic, "Massively parallel sequencing was performed on HGSOCs to identify mutations contributing to HR deficiency. HR pathway integrity was assessed using fluorescence microscopy-based RAD51 focus formation assays. Effects of niraparib (MK-4827) on treatment-naive PDX tumor growth as monotherapy, in combination with carboplatin/paclitaxel, and as maintenance therapy were assessed by transabdominal ultrasound. Niraparib responses were correlated with changes in levels of poly(ADP-ribose), PARP1, and repair proteins by western blotting. Five PDX models were evaluated in vivo. Tumor regressions were induced by single-agent niraparib in one of two PDX models with deleterious BRCA2 mutations and in a PDX with RAD51C promoter methylation. Diminished formation of RAD51 foci failed to predict response, but Artemis loss was associated with resistance. Niraparib generally failed to enhance responses to carboplatin/paclitaxel chemotherapy, but maintenance niraparib therapy delayed progression in a BRCA2-deficient PDX. Mutations in HR genes are neither necessary nor sufficient to predict response to niraparib."

According to the news reporters, the research concluded: "Assessment of repair status through multiple complementary assays is needed to guide PARP inhibitor therapy, design future clinical trials and identify ovarian cancer patients most likely to benefit from PARP inhibition."

For more information on this research see: In vivo anti-tumor activity of the PARP inhibitor niraparib in homologous recombination deficient and proficient ovarian carcinoma. Gynecologic Oncology, 2016;143(2):379-388. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA.

Digestive System Diseases and Conditions - Crohn's

Reports from Mayo Clinic Advance Knowledge in Crohn's Disease (Safety of Long-term Treatment With Certolizumab Pegol in Patients With Crohn's Disease, Based on a Pooled Analysis of Data From Clinical Trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Digestive System Diseases and Conditions - Crohn's Disease have been presented. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "Treatments for Crohn's disease (CD) have been linked to serious infections, malignancies, and dermatologic complications. We pooled and analyzed clinical trials of certolizumab pegol, a pegylated humanized Fab' fragment against tumor necrosis factor, to quantify safety events in patients with CD."

Our news journalists obtained a quote from the research from Mayo Clinic, "We collected data from 5 placebo-controlled trials, 9 open-label studies, and 1 dose-regimen study, conducted globally through April 2014. A total of 2570 patients with moderate to severe CD were treated with certolizumab pegol, with 4378.1 patient-years of exposure. Data were analyzed in 2 groups: patients from placebo-controlled (PC) trials treated with placebo (n = 875) or certolizumab pegol (n = 919) for 6 to 38 weeks (the PC group) or all patients exposed to certolizumab pegol (n = 2570), for durations of 6 to 362 weeks (the all-studies group). Incidence rates (IRs; incidence/100 patient-years) of adverse events (AEs) were calculated from first dose through 70 days (approximately 5 half-lives) after the last dose. In the PC group, IRs for serious AEs were similar among patients given certolizumab pegol (31.35/100 patient-years) vs placebo (24.33/100 patient-years). IRs of serious infections or malignancies were low among patients receiving short-term treatment with certolizumab pegol (8.49/100 patient-years and 1.01/100 patient-years, respectively, in the PC group) and did not increase with long-term treatment (6.47/100 patient-years and 0.80/100 patient-years, respectively, in the all-studies group). IRs of psoriasis or psoriasiform dermatitis were low in the PC group (1.01/100 patient-years and 0/100 patient-years, respectively); in the placebo group, these IRs were 0.38 per 100 patient-years and 0 per 100 patient-years, respectively. IRs of psoriasis or psoriasiform dermatitis did not increase
with long-term treatment (0.93/100 patient-years and 0.09/100 patient-years, respectively, in the all-studies group). Based on an analysis of data pooled from 15 trials of patients with CD, the safety profile for long-term therapy with certolizumab pegol therapy is similar to that reported from short-term studies."

According to the news editors, the research concluded: "Overall rates of AEs, serious infections, malignancies, and psoriasis did not increase with long-term treatment, suggesting a favorable risk-benefit ratio with long-term certolizumab pegol therapy in CD."

For more information on this research see: Safety of Long-term Treatment With Certolizumab Pegol in Patients With Crohn's Disease, Based on a Pooled Analysis of Data From Clinical Trials. Clinical Gastroenterology and Hepatology, 2016;14(12):1753-1762. Clinical Gastroenterology and Hepatology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Drugs and Therapies - Smoking Cessation Agents

Reports from Mayo Clinic Describe Recent Advances in Smoking Cessation Agents (Varenicline for Smoking Cessation in Light Smokers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Smoking Cessation Agents have been presented. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "As the prevalence of cigarette smoking has declined, the proportion of smokers who smoke less than 10 cigarettes/day (cpd) has increased. Varenicline may provide an effective pharmacotherapeutic treatment option for increasing smoking abstinence rates among light smokers."

Financial support for this research came from Pfizer.

The news correspondents obtained a quote from the research from Mayo Clinic, "We conducted a randomized, placebo-controlled clinical trial evaluating the efficacy of varenicline for increasing smoking abstinence rates among light smokers (5-10 cpd). Participants received varenicline or placebo for 12 weeks. Outcomes were assessed at 3 and 6 months. Ninety-three participants were randomized. Fifty-two percent of participants terminated the study early. At end-of-treatment (3 months), the point prevalence smoking abstinence rate was 53.3% in the
varenicline group compared to 14.5% in placebo (odds ratio [OR]: 6.69, 95% confidence interval [CI]: 2.48-18.06, \( P < .001 \)), and the prolonged smoking abstinence rate was 40.0% and 8.3%, respectively (OR: 7.33, 95% CI: 2.24-23.98, \( P = .001 \)). At end-of-study (6 months), the point prevalence smoking abstinence rate was 40.0% in the varenicline group compared to 20.8% in placebo (OR: 2.53, 95% CI: 1.01-6.34, \( P = .047 \)), and the prolonged smoking abstinence rate was 31.1% and 8.3%, respectively (OR: 4.97, 95% CI: 1.49-16.53, \( P = .009 \)). The estimated magnitude of the treatment effect remained consistent across the various missing data assumptions and in analyses that adjusted for gender. Nausea and sleep disturbance were more commonly reported in the varenicline group. Varenicline was safe and effective for increasing long-term smoking abstinence rates in a population of predominantly White light cigarette smoker. The efficacy of varenicline in this study was comparable to that observed in heavier smokers. Our findings demonstrate that varenicline is effective for increasing smoking cessation in light smokers."

According to the news reporters, the research concluded: "Our findings have implications for advancing the treatment of light smokers in clinical practice."

Our news journalists report that additional information may be obtained by contacting J.O. Ebbert, Mayo Clinic, Rochester, MN 55905, United States. Additional authors for this research include I.T. Croghan, R.T. Hurt, D.R. Schroeder and J.T. Hays.

**Heart Disorders and Diseases - Heart Disease**

**Reports from Mayo Clinic Provide New Insights into Heart Disease (Outcomes After Curative Thoracic Radiotherapy in Patients With Coronary Artery Disease and Existing Cardiac Stents)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Disease is the subject of a report. According to news reporting originating in Rochester, Minnesota, by NewsRx journalists, research stated, "To evaluate outcomes among cancer patients with preexisting coronary artery disease and cardiac stenting who subsequently underwent thoracic radiotherapy (RT). From 1998 to 2012, 147 patients received percutaneous coronary intervention (PCI) and then curative external beam RT (> 30 Gy, except for Hodgkin lymphoma patients) involving the heart and the lungs."

The news reporters obtained a quote from the research from Mayo Clinic, "Heart-
specific and lung-specific dosimetric parameters were correlated to overall survival (OS) and cardiac-specific survival by Cox variate methods. The mean interval between PCI and cancer diagnosis was 1.8 years (range, 0.1 to 14.2 y). Hypertension was present in 105 patients (71%), and hyperlipidemia in 82 (56%). At the time of analysis, 69 patients (47%) were alive, 3 (2%) died of cardiac causes, and 53 (36%) died of cancer. In multivariate analyses, OS since PCI was related to cancer type (P=0.004). Decreased OS since cancer diagnosis was related to older age (P <0.001) and increased percentage of targeted volume or organ receiving 20 Gy or more for lung (P <0.001), even after controlling for sex, cancer type, and stage. However, for non-cancer-specific survival and major adverse cardiac event-free survival, older age and underlying cardiopulmonary comorbidities dominated (rather than heart and lung dosimetric parameters) in predicting worse outcome for these patients with preexisting coronary artery disease who later underwent RT. Cancer type, older age, and preexisting cardiopulmonary comorbidities and risk factors most significantly predicted clinical outcome and survival for these patients with existing coronary stents who subsequently received thoracic RT."

According to the news reporters, the research concluded: "Dosimetric detrimental effects were not significant in our study."

For more information on this research see: Outcomes After Curative Thoracic Radiotherapy in Patients With Coronary Artery Disease and Existing Cardiac Stents. *American Journal of Clinical Oncology-Cancer Clinical Trials*, 2016;39(6):549-555. *American Journal of Clinical Oncology-Cancer Clinical Trials* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Our news correspondents report that additional information may be obtained by contacting R.C. Miller, Mayo Clinic, Dept. of Radiat Oncol, Rochester, MN 55905, United States. Additional authors for this research include J.J. Liang, K. Chang, P.J. Novotny, A. Prasad and R.C. Miller.

**Reports from Medical College Advance Knowledge in Clostridium difficile (Rifamycin Resistance in Clostridium difficile Is Generally Associated with a Low Fitness Burden)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Positive Bacteria - Clostridium difficile. According to news reporting out of Bryan, Texas, by NewsRx editors, research stated, "We characterized clinically occurring and novel mutations in the beta subunit of RNA polymerase in Clostridium difficile (CdRpoB), conferring rifamycin (including rifaximin) resistance."

Financial supporters for this research include HHS | NIH | National Center for Advancing Translational Sciences (NCATS), HHS | NIH | National Center for Complementary
and Integrative Health (NCCIH), American Society for Microbiology (ASM).

Our news journalists obtained a quote from the research from Medical College, "The Arg(505)Lys substitution did not impose an in vitro fitness cost, which may be one reason for its dominance among rifamycin-resistant clinical isolates. These observations were supported through the structural modeling of CdRpoB."

According to the news editors, the research concluded: "In general, most mutations lacked in vitro fitness costs, suggesting that rifamycin resistance may in some cases persist in the clinic."

For more information on this research see: Rifamycin Resistance in Clostridium difficile Is Generally Associated with a Low Fitness Burden. Antimicrobial Agents and Chemotherapy, 2016;60(9):5604-5607. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Oncology - Non-Small Cell Lung Cancer

Reports from Memorial Sloan-Kettering Cancer Center Highlight Recent Findings in Non-Small Cell Lung Cancer (Cranial irradiation in patients with EGFR-mutant non-small cell lung cancer brain metastases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Non-Small Cell Lung Cancer is now available. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "The most effective treatment approach for brain metastases in patients with non-small cell lung cancer (NSCLC) and activating epidermal growth factor receptor (EGFR) mutations is a current subject of investigation. Cranial irradiation is the standard treatment for brain metastases, but tyrosine kinase inhibitors (TKIs) such as erlotinib have also activity against brain metastases in this subset of patients."

The news correspondents obtained a quote from the research from Memorial Sloan-Kettering Cancer Center, "The combination of TKI and radiotherapy is a promising one, but data is lacking to indicate whether this is superior to erlotinib or whole brain radiation therapy (WBRT) alone. Retrospective data suggest that WBRT achieves more durable intracranial control compared to erlotinib alone."

According to the news reporters, the research concluded: "Randomized, prospective
studies will be necessary to determine whether TKI, cranial irradiation, or both is the optimal initial treatment for brain metastases in EGFR-mutant NSCLC."

Our news journalists report that additional information may be obtained by contacting T.J. Yang, Dept. of Radiation Oncology, Memorial Sloan Kettering Cancer Center, New York, NY 10065, United States.

Keywords for this news article include: Antineoplastics, Genetics, Oncology, Radiotherapy, New York City, United States, Lung Neoplasms, EGFR Inhibitors, Erlotinib Therapy, Membrane Proteins, Cranial Irradiation, Drugs and Therapies, Phosphotransferases, North and Central America, Protein Kinase Inhibitors, Non Small Cell Lung Cancer, Non-Small Cell Lung Cancer.

Transplant Medicine - Cell Transplants

Reports from N. Mirza and Colleagues Advance Knowledge in Cell Transplants [Graft versus self (GvS) against T-cell autoantigens is a mechanism of graft-host interaction]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Transplant Medicine - Cell Transplants are discussed in a new report. According to news reporting from Tubingen, Germany, by NewsRx journalists, research stated, "Graft-versus-host disease (GVHD) represents the major nonrelapse complication of allogeneic hematopoietic cell transplantation. Although rare, the CNS and the eye can be affected."

The news correspondents obtained a quote from the research, "In this study, manifestation in the retina as part of the CNS and T-cell epitopes recognized by the allogeneic T cells were evaluated. In 2 of 6 patients with posttransplantation retina diseases and 6 of 22 patients without ocular symptoms, antigen-specific T-cell responses against retina-specific epitopes were observed. No genetic differences between donor and recipient could be identified indicating T-cell activation against self-antigens (graft versus self). Transplantation of a preexisting immunity and cross-reactivity with ubiquitous epitopes was excluded in family donors and healthy individuals."

According to the news reporters, the research concluded: "In summary, an immunological reaction against retina cells represents a mechanism of graft-versus-host interaction following hematopoietic cell transplantation."

For more information on this research see: Graft versus self (GvS) against T-cell autoantigens is a mechanism of graft-host interaction. Proceedings of the National Academy of Sciences of the United States of America, 2016;113(48):13827-13832. Proceedings of the National Academy of Sciences of the United States of America can be contacted at: Natl Acad Sciences, 2101 Constitution Ave NW, Washington, DC 20418, USA. Chemistry - Biochemistry

Reports from Nanchang University Advance Knowledge in Biochemistry (CUL4A functions as an oncogene in ovarian cancer and is directly regulated by miR-494)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Chemistry - Biochemistry. According to news originating from Nanchang, People's Republic of China, by NewsRx correspondents, research stated, "Cullin 4A (CUL4A), as a well-defined oncogene, has been reported to be upregulated in ovarian cancer clinically. However, the biological functions of CUL4A and the molecular mechanism underlying its upregulation in ovarian cancer remains unknown throughly."

Financial supporters for this research include Science and Technology Foundation of Jiangxi Province, Young Scientist Training Program of Jiangxi Province, Graduate Student Innovation Foundation of Jiangxi Province, China Scholarship Council.

Our news journalists obtained a quote from the research from Nanchang University, "Here, we show that expression of CUL4A is significantly higher in ovarian cancer tissues compared to corresponding non-cancerous tissues. Moreover, silencing of CUL4A by siRNA markedly inhibits cell proliferation, invasion and epithelial-mesenchymal transition (EMT). We identified CUL4A as a novel target gene of miR-494. Further investigations showed that miR-494 was remarkably downregulated and correlated with poor prognosis in ovarian cancer. Overexpression of miR-494 inhibited proliferation, migration, invasion and EMT of ovarian cancer cells by directly suppressing CUL4A expression."

According to the news editors, the research concluded: "Therefore, our findings indicate that miR-494/CUL4A axis is important in the control of ovarian cancer tumorigenesis."

For more information on this research see: CUL4A functions as an oncogene in ovarian cancer and is directly regulated by miR-494. Biochemical and Biophysical Research Communications, 2016;480(4):675-681. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Oncology - Colon Cancer

Reports from Nanchang University Describe Recent Advances in Colon Cancer (Prognostic value of the lymphocyte monocyte ratio in patients with colorectal cancer A meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news reporting originating in Nanchang, People's Republic of China, by NewsRx journalists, research stated, "Inflammation plays a critical role in the pathogenesis and progression of cancer. A low lymphocyte-to-monocyte ratio (LMR) is reported be a poor prognostic factor in multiple malignancies."

The news reporters obtained a quote from the research from Nanchang University, "We performed a meta-analysis to evaluate the prognostic role of preoperative LMR in colorectal cancer (CRC). Studies investigating the prognostic role of preoperative LMR on survival in patients with CRC were systematically searched for in MEDLINE, EMBASE, Cochrane databases from inception up to August 2016. Pooled hazard ratios (HRs) for overall survival (OS), disease-free survival (DFS), and recurrence-free survival (RFS) were calculated using fixed-effects/random-effects models. A total of nine studies comprising 8626 patients with CRC were included in the meta-analysis. The pooled analysis demonstrated that low LMR was significantly associated with decreased OS (HR: 0.63, 95% CI: 0.56-0.70, P<0.001) and DFS/RFS (HR: 0.76, 95% CI: 0.68-0.84, P<0.001). The negative prognostic impact of low LMR on OS was observed in patients with different ethnicity, treatment methods, cut-off values, and across disease stages."

According to the news reporters, the research concluded: "This meta-analysis demonstrates that low preoperative LMR is associated with worse survival in patients with CRC."

For more information on this research see: Prognostic value of the lymphocyte monocyte ratio in patients with colorectal cancer A meta-analysis. Medicine, 2016;95(49):324-328. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Gram-Negative Bacteria - Helicobacter pylori

Reports from Nanjing Medical University Describe Recent Advances in Helicobacter pylori (The Association between Arrhythmia and Helicobacter pylori Infection: A Meta-Analysis of Case-Control Studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Helicobacter pylori are discussed in a new report. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Arrhythmia is a common disease around the world and Helicobacter pylori (H. pylori) is a bacterium infecting 28% to 84% of subjects, depending on the population tested. However, the implication of H. pylori in cardiac arrhythmia is poorly understood."

The news correspondents obtained a quote from the research from Nanjing Medical University, "We performed this meta-analysis with an aim to identify the association between arrhythmia and H. pylori. We searched PubMed, Embase, Web of Science, and the Cochrane library databases to select studies on the association between arrhythmia and H. pylori. In the arrhythmia group, 392 (58.1%) were H. pylori-positive and in the control group 640 (47.8%) were H. pylori-positive. Compared to the controls, the infection rate of H. pylori was higher in patients with arrhythmia than in controls (odds ratio (OR) = 1.797, 95% confidence interval (CI): 1.081-2.988, p< 0.05). Subgroup analysis indicated that H. pylori infection was a risk factor for atrial fibrillation in Asia and Africa."

According to the news reporters, the research concluded: "Therefore, a correlation between H. pylori infection and arrhythmia may exist and H. pylori eradication may decrease the occurrence of arrhythmia, especially in Asia and Africa."

Our news journalists report that additional information may be obtained by contacting J. Yan, Nanjing Medical University, Clin Med Coll 1, Nanjing 210029, Jiangsu, People's Republic of China. Additional authors for this research include Q. She, Y.F. Zhang, C. Cui and G.X. Zhang.

Reports from National Cancer Center Hospital Highlight Recent Findings in Hematopoietic Stem Cells (Analysis of non-relapse mortality and causes of death over 15 years following allogeneic hematopoietic stem cell transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Stem Cell Research - Hematopoietic Stem Cells are presented in a new report. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Allogeneic hematopoietic stem cell transplantation (allo-HSCT) has curative potential against hematological malignancies. However, there are concerns about the associated risk of non-relapse mortality (NRM)."

Our news editors obtained a quote from the research from National Cancer Center Hospital, "We performed a retrospective single-center study to assess changes in outcomes after allo-HSCT and causes of NRM over three 5-year periods. The rates of 2-year NRM and overall survival (OS) were 16% and 59%, respectively. We found a significant decrease in NRM (p <0.001), with 2-year NRM of 26, 14 and 9%, and a significant increase in OS (p=0.005), with 2-year OS of 52%, 58% and 65%, over the three periods (1998-2002, 2003-2007 and 2008-2012), respectively. Of note, a steady improvement was observed in NRM, period by period, among patients aged 50 years or older, patients who underwent HSCT from an unrelated bone marrow donor and patients who underwent HSCT with a reduced-intensity conditioning regimen."

According to the news editors, the research concluded: "Our data showed that the improved NRM can mainly be attributed to a decreased mortality related to infection after starting systemic steroid as GVHD treatment, and a decreased mortality related to organ failure."

For more information on this research see: Analysis of non-relapse mortality and causes of death over 15 years following allogeneic hematopoietic stem cell transplantation. Bone Marrow Transplantation, 2016;51(4):553-9. Bone Marrow Transplantation can be contacted at: Nature Publishing Group, 345 Park Avenue South, New York, NY 10010-1707, USA. Reports from National Institute of Cardiology Provide New Insights into Cardiovascular Diseases (Possible role of intronic polymorphisms in the PHACTR1 gene on the development of cardiovascular disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases is the subject of a report. According to news reporting originating from Mexico City, Mexico, by NewsRx correspondents, research stated, "Cardiovascular disease (CVD) is a complex multifactorial and polygenetic disease in which the interaction of numerous genes, genetic variants, and environmental factors plays a major role in its development. In an attempt to demonstrate the association between certain genetic variants and CVD, researchers have run large genomic wild association studies (GWAS) in recent decades."

Financial support for this research came from CONACYT.

Our news editors obtained a quote from the research from the National Institute of Cardiology, "These studies have correlated several genomic variants with the presence of CVD. Recently, certain polymorphisms in the phosphatase and actin regulator 1 (PHACTR1) gene have been shown to be associated with CVD (i.e., coronary artery disease, coronary artery calcification, early onset myocardial infarction, cervical artery dissection and hypertension) in different ethnic groups. It is important to state that all of the described PHACTR1 genetic variants associated with CVD are located in non-translating gene regions known as introns. Thus, the purpose of this article is to hypothesize the effect of certain intronic polymorphisms in the PHACTR1 gene on pathological processes in the cardiovascular system."

According to the news editors, the research concluded: "In addition, we present compelling evidence that supports this hypothesis as well as a methodology that could be used to assess the allelic effect using in vitro and in vivo models, which will ultimately demonstrate the pathophysiological contribution of PHACTR1 intronic polymorphisms to the development of CVD."

For more information on this research see: Possible role of intronic polymorphisms in the PHACTR1 gene on the development of cardiovascular disease. Medical Hypotheses, 2016;97():64-70. Medical Hypotheses can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. Oncology - Small Cell Lung Cancer

Reports from National Koranyi Institute of Pulmonology Highlight Recent Findings in Small Cell Lung Cancer [From Bench to Bedside: Attempt to Evaluate Repositioning of Drugs in the Treatment of Metastatic Small Cell Lung Cancer (SCLC)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Small Cell Lung Cancer is the subject of a report. According to news originating from Budapest, Hungary, by NewsRx correspondents, research stated, "Based on in vitro data and results of a recent drug repositioning study, some medications approved by the FDA for the treatment of various non-malignant disorders were demonstrated to have anti-SCLC activity in preclinical models. The aim of our study is to confirm whether use of these medications is associated with survival benefit."

Our news journalists obtained a quote from the research from the National Koranyi Institute of Pulmonology, "Consecutive patients with pathologically confirmed, stage 4 SCLC were analyzed in this retrospective study. Patients that were prescribed statins, aspirin, clomipramine (tricyclic antidepressant; TCA), selective serotonin reuptake inhibitors (SSRIs), doxazosin or prazosin (a1-adrenergic receptor antagonists; ADRA1) were identified. There were a total of 876 patients. Aspirin, statins, SSRIs, ADRA1, and TCA were administered in 138, 72, 20, 28, and 5 cases, respectively. A statistically significant increase in median OS was observed only in statin-treated patients when compared to those not receiving any of the aforementioned medications (OS, 8.4 vs. 6.1 months, respectively; p=0.002). The administration of SSRIs, aspirin, and ADRA1 did not result in a statistically significant OS benefit (median OS, 8.5, 6.8, and 6.0 months, respectively). The multivariate Cox model showed that, besides age and ECOG PS, radiotherapy was an independent survival predictor (Hazard Ratio, 2.151; 95% confidence interval, 1.828-2.525; p<0.001). Results of drug repositioning studies using only preclinical data or small numbers of patients should be treated with caution before application in the clinic."

According to the news editors, the research concluded: "Our data demonstrated that radiotherapy appears to be an independent survival predictor in stage 4 SCLC, therefore confirming the results of other prospective and retrospective studies."

The news correspondents report that additional information may be obtained from Z. Lohinai, National Koranyi Institute of Pulmonology, Budapest, Hungary. Additional authors for this research include P. Dome, Z. Szilagyi, G. Ostoros, J. Moldvay, B. Hegedus, B. Dome and G.J Weiss.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1371/journal.pone.0144797. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from National Polytechnic Institute Describe Recent Advances in Bradykinin (Early kidney damage induced by subchronic exposure to PM2.5 in rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neuropeptides - Bradykinin. According to news reporting out of Mexico City, Mexico, by NewsRx editors, research stated, "Particulate matter exposure is associated with respiratory and cardiovascular system dysfunction. Recently, we demonstrated that fine particles, also named PM2.5, modify the expression of some components of the angiotensin and bradykinin systems, which are involved in lung, cardiac and renal regulation."

Our news journalists obtained a quote from the research from National Polytechnic Institute, "The endocrine kidney function is associated with the regulation of angiotensin and bradykinin, and it can suffer damage even as a consequence of minor alterations of these systems. We hypothesized that exposure to PM2.5 can contribute to early kidney damage as a consequence of an angiotensin/bradykinin system imbalance, oxidative stress and/or inflammation. After acute and subchronic exposure to PM2.5, lung damage was confirmed by increased bronchoalveolar lavage fluid (BALF) differential cell counts and a decrease of surfactant protein-A levels. We observed a statistically significant increment in median blood pressure, urine volume and water consumption after PM2.5 exposure. Moreover, increases in the levels of early kidney damage markers were observed after subchronic PM2.5 exposure: the most sensitive markers, beta-2-microglobulin and cystatin-C, increased during the first, second, sixth and eighth weeks of exposure. In addition, a reduction in the levels of specific cytokines (IL-1 beta, IL-6, TNF-alpha, IL-4, IL-10, INF-gamma, IL-17a, MIP-2 and RANTES), and up-regulated angiotensin and bradykinin system markers and indicators of a depleted antioxidant response, were also observed. All of these effects are in concurrence with the presence of renal histological lesions and an early pro-fibrotic state. Subchronic exposure to PM2.5 induced an early kidney damage response that involved the angiotensin/bradykinin systems as well as antioxidant and immune imbalance."

According to the news editors, the research concluded: "Our study demonstrates that PM2.5 can induce a systemic imbalance that not only affects the cardiovascular system, but also affects the kidney, which may also overall contribute to PM-related diseases."

For more information on this research see: Early kidney damage induced by subchronic exposure to PM2.5 in rats. Particle and Fibre Toxicology, 2016;13():15-34.

Particle and Fibre Toxicology can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. (BioMed Central - www.biomedcentral.com/; Particle and Fibre Toxicology - www.particleandfibretoxicology.com)

Reports from National Yang Ming University Advance Knowledge in Arrhythmogenic Right Ventricular Dysplasia (The Application of Ambulatory Electrocardiographically-Based T-Wave Alternans in Patients with Arrhythmogenic Right Ventricular ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Arrhythmogenic Right Ventricular Dysplasia have been published. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Patients with arrhythmogenic right ventricular dysplasia/ cardiomyopathy (ARVD/C) carry the risk of ventricular arrhythmias and sudden cardiac death (SCD). This study investigated the prognostic information of modified moving average T-wave alternans (MMA TWA) in patients with ARVD/C."

Our news editors obtained a quote from the research from National Yang Ming University, "A total of 63 consecutive patients (mean age, 44.7 +/- 14.8 years; 38 men) with ARVD/C were enrolled. Baseline characteristics and structural and electrocardiographic parameters were obtained. All patients underwent ambulatory electrocardiographic examination at the time of diagnosis, and MMA TWA data were exported for further analysis. Events were defined as documented SCD or ventricular tachyarrhythmias during clinical follow-up. During a mean follow-up of 28.1 +/- 15.4 months, 19 of 63 (30.2%) patients experienced events, including SCD in 2 patients (10.5%) and ventricular tachyarrhythmias in 17 patients (89.5%). Patients with events had higher TWA within modified V-5 and V-1 channels than did those without events (54.7 +/- 24.9 mu V vs 35.0 +/- 18.3 mu V; P = 0.004; 58.8 +/- 27.6 mu V vs 38.4 +/- 18.6 mu V; P = 0.007, respectively). After multivariate Cox regression analysis, maximal TWA derived from either the modified CM5 or NASA channel predicted the occurrence of events (P < 0.001; hazard ratio, 1.06; 95% confidence interval, 1.03-1.10). At the cutoff value of > 66 mu V, maximal TWA yielded a sensitivity and a specificity of 89.5% and 90.5%, respectively, in predicting SCD or ventricular tachyarrhythmias."

According to the news editors, the research concluded: "The initial analysis of MMA TWA could provide prognostic implications in the prediction of SCD or ventricular tachyarrhythmias in patients with ARVD/C."

The news editors report that additional information may be obtained by contacting S.A. Chen, Natl Yang Ming Univ Taipei, Cardiovasc Res Center, Taipei, Taiwan. Additional authors for this research include Y.J. Lin, E. Chong, S.L. Chang, L.W. Lo, Y.F. Hu, T.C. Tuan, T.F. Chao, J.N. Liao and S.A. Chen.

Reports from New University of Lisbon Add New Data to Findings in Inorganic Chemistry (Inhibition of the STAT3 Protein by a Dinuclear Macrocyclic Complex)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Chemistry - Inorganic Chemistry are discussed in a new report. According to news reporting out of Oeiras, Portugal, by NewsRx editors, research stated, "A new diethylenetriamine-derived macrocycle bearing 2-methylpyridyl arms and containing m-xylyl spacers, L, was prepared, and its dinuclear copper(II) and zinc(II) complexes were used as receptors for the recognition in aqueous solution of a phosphorylated peptide derived from a sequence of the STAT3 protein. A detailed study of the acid-base behavior of L and of its complexation properties as well as of the association of the phosphorylated peptide to the receptor was carried out by potentiometry in aqueous solution at 298.2 K and I=0.10 M in KNO3."

Financial support for this research came from Fundacao para a Ciencia e a Tecnologia.

Our news journalists obtained a quote from the research from the New University of Lisbon, "The data revealed that the receptor forms stable associations with several protonated forms of the substrate, with constant values ranging from 3.32 to 4.25 log units. The affinity of the receptor for the phosphorylated substrate studied is higher at a pH value where the receptor is mainly in the [Cu2L](4+) form and the pY residue of the substrate is in the dianionic form (pH 6.55). These results, also supported by (31)P NMR studies, showed that the phosphopeptide is bound through the phosphoryl group in a bridging mode. Additionally, the receptor inhibited binding between active (phosphorylated) STAT3 and its target DNA sequence in a dose-dependent manner (IC[50] 63 ? 3.4 mM) in human nuclear extracts in vitro."

According to the news editors, the research concluded: "Treatment of whole cells with the inhibitor revealed that it is bioactive in living cells and has oncostatic properties that could be interesting for the fight against cancer and other pathologies involving the STAT3 protein."

For more information on this research see: Inhibition of the STAT3 Protein by a Dinuclear Macrocyclic Complex. Inorganic Chemistry, 2016;55(7):3589-98. (American Chemical Society - www.acs.org; Inorganic Chemistry - www.pubs.acs.org/journal/inocaj)

Our news journalists report that additional information may be obtained by contacting L.M. Mesquita, Instituto de Tecnologia Quimica e Biologica Antonio Xavier, Universidade Nova de Lisboa , Avenida da Republica, 2780-157 Oeiras, Portugal. Additional authors for this research include F. Herrera, C.V. Esteves, P. Lamosa, V. Andre, P. Mateus and R. Delgado.

Reports from Northeast Agriculture University Add New Data to Findings in Genistein Therapy [The Cooperative Effect of Genistein and Protein Hydrolysates on the Proliferation and Survival of Osteoblastic Cells (hFOB 1.19)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Genistein Therapy are discussed in a new report. According to news reporting from Harbin, People's Republic of China, by NewsRx journalists, research stated, "Chum salmon skin gelatin, de-isoflavoned soy protein, and casein were hydrolyzed at two degrees of hydrolysis. Genistein, the prepared hydrolysates, and genistein-hydrolysate combinations were assessed for their proliferative and anti-apoptotic effects on human osteoblasts (hFOB 1.19) to clarify potential cooperative effects between genistein and these hydrolysates in these two activities."

The news correspondents obtained a quote from the research from Northeast Agriculture University, "Genistein at 2.5 μg/L demonstrated the highest proliferative activity, while the higher dose of genistein inhibited cell growth. All hydrolysates promoted osteoblast proliferation by increasing cell viability to 102.9%-131.1%. Regarding etoposide-or NaF-induced osteoblast apoptosis, these hydrolysates at 0.05 g/L showed both preventive and therapeutic effects against apoptosis. In the mode of apoptotic prevention, the hydrolysates decreased apoptotic cells from 32.9% to 15.2%-23.7% (etoposide treatment) or from 23.6% to 14.3%-19.6% (NaF treatment). In the mode of apoptotic rescue, the hydrolysates lessened the extent of apoptotic cells from 15.9% to 13.0%-15.3% (etoposide treatment) or from 13.3% to 10.9%-12.7% (NaF treatment). Gelatin hydrolysates showed the highest activities among all hydrolysates in all cases."

According to the news reporters, the research concluded: "All investigated combinations (especially the genistein-gelatin hydrolysate combination) had stronger proliferation, apoptotic prevention, and rescue than genistein itself or their counterpart hydrolysates alone, suggesting that genistein cooperated with these hydrolysates, rendering greater activities in osteoblast proliferation and anti-apoptosis."

For more information on this research see: The Cooperative Effect of Genistein and Protein Hydrolysates on the Proliferation and Survival of Osteoblastic Cells (hFOB 1.19). Molecules, 2016;21(11):1006-1021. Molecules can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. (Springer - www.springer.com; Molecules - www.springerlink.com/content/1420-3049/)

Reports from Northeast Forestry University Add New Data to Findings in Materials Science (Fluorescence Probe Based on an Amino-Functionalized Fluorescent Magnetic Nanocomposite for Detection of Folic Acid in Serum)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science - Materials Science have been published. According to news originating from Harbin, People's Republic of China, by NewsRx correspondents, research stated, "A new fluorescence probe constructed with a multifunctional nanocomposite, Fe3O4ZnS:Mn2+/SiO2NH2, was successfully synthesized and then used to detect folic acid in real serum samples. The nanocomposite was characterized by fluorescence spectroscopy, transmission electron microscopy, Fourier transform infrared spectroscopy, X-ray powder diffraction, and physical property measurement system."

Financial supporters for this research include Ministry of Education of the People's Republic of China, Heilongjiang Province Science Foundation for Youths, Harbin Science and Technology Innovation Talent Research Special Funds.

Our news journalists obtained a quote from the research from Northeast Forestry University, "With the addition of analyte, the Fe3O4ZnS:Mn2+/SiO2NH2 composite and folic acid formed a new complex because cross-linking of the amino and carboxyl groups participated in the condensation reaction. Then, the energy of quantum dots was transferred to the complex and led to quenching of the fluorescence. Moreover, the fluorescence intensity decreased significantly as the concentration of folic acid increased, and the fluorescence quenching ratio F-0/F was related to the folic acid concentration in the range from 0.1 to 5 ng mL(-1). This method was used for detecting folic acid in real serum samples and gave recoveries in the range of 89.0%-96.0%, with relative standard deviations of 1.2%-3.9%. The detection limit was 9.6 ng mL(-1) (S/N = 3)."

According to the news editors, the research concluded: "These satisfactory and simple results showed the great potential of this fluorescence probe in the field of pharmaceutical analysis."

Gram-Negative Bacteria - Salmonella enterica

Reports from Novartis Animal Health Highlight Recent Findings in Salmonella enterica (Toll-Like Receptor Activation by Generalized Modules for Membrane Antigens from Lipid A Mutants of Salmonella enterica Serovars Typhimurium and Enteritidis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Negative Bacteria - Salmonella enterica. According to news reporting originating from Siena, Italy, by NewsRx correspondents, research stated, "Invasive nontyphoidal Salmonella (iNTS) disease is a neglected disease with high mortality in children and HIV-positive individuals in sub-Saharan Africa, caused primarily by Africa-specific strains of Salmonella enterica serovars Typhimurium and Enteritidis. A vaccine using GMMA (generalized modules for membrane antigens) from S. Typhimurium and S. Enteritidis containing lipid A modifications to reduce potential in vivo reactogenicity is under development."

Our news editors obtained a quote from the research from Novartis Animal Health, "GMMA with penta-acylated lipid A showed the greatest reduction in the level of cytokine release from human peripheral blood monocytes from that for GMMA with wild-type lipid A. Deletion of the lipid A modification genes msbB and pagP was required to achieve pure penta-acylation. Interestingly, DmsbBD pagP GMMA from S. enteritidis had a slightly higher stimulatory potential than those from S. typhimurium, a finding consistent with the higher lipopolysaccharide (LPS) content and Toll-like receptor 2 (TLR2) stimulatory potential of the former. Also, TLR5 ligand flagellin was found in Salmonella GMMA. No relevant contribution to the stimulatory potential of GMMA was detected even when the flagellin protein FliC from S. typhimurium was added at a concentration as high as 10% of total protein, suggesting that flagellin impurities are not a major factor for GMMA-mediated immune stimulation."

According to the news editors, the research concluded: "Overall, the stimulatory potential of S. typhimurium and S. enteritidis DmsbBD pagP GMMA was close to that of Shigella sonnei GMMA, which are currently in phase I clinical trials."

For more information on this research see: Toll-Like Receptor Activation by Generalized Modules for Membrane Antigens from Lipid A Mutants of Salmonella enterica Serovars Typhimurium and Enteritidis. Clinical and Vaccine Immunology, 2016;23(4):304-14. (American Society for Microbiology - www.asm.org; Clinical and Vaccine Immunology - cdli.asm.org)

**Oncology - Pancreatic Cancer**

**Reports from Ohio State University Advance Knowledge in Pancreatic Cancer (Treatment-related Hypertension as a Pharmacodynamic Biomarker for the Efficacy of Bevacizumab in Advanced Pancreas Cancer A Pooled Analysis of 4 Prospective Trials of ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Pancreatic Cancer is the subject of a report. According to news reporting originating from Columbus, Ohio, by NewsRx correspondents, research stated, "Phase III studies of bevacizumab in advanced pancreas cancer (APCA) demonstrated no improvement in outcome. No validated biomarkers for bevacizumab efficacy exist."

Our news editors obtained a quote from the research from Ohio State University, "We evaluated bevacizumab-related hypertension (B-HTN) as a biomarker in APCA patients in a pooled analysis from 4 prospective clinical trials of gemcitabine-based therapy combined with bevacizumab. Data were collected from individual databases from 4 prospective, single-arm phase II trials. Patients were grouped according to B-HTN or no hypertension (HTN), and patients with HTN were further grouped according to highest Common Terminology Criteria for Adverse Events grade of HTN: grade 1-2 or grade 3-4. Clinical outcomes of overall survival, time to progression, overall response rate (ORR), and disease control rate (ORR + SD > 16 wk) were compared. A total of 163 patients with stage IV APCA and Eastern Cooperative Oncology Group 0-1 were included. Median age was 59 years (range, 33 to 85 y). Thirty-four patients had B-HTN, and 129 patients had no HTN. Prognostic factors were balanced between groups. Patients with any grade B-HTN had a significantly improved median overall survival (13.1 vs. 8.1 mo, P=0.0006), median time to tumor progression (7.6 vs. 5.5 mo, P=0.0074), ORR (47% vs. 16%, P=0.0001), and disease control rate (85% vs. 59%, P=0.004). There were no differences in outcomes according to HTN grade (1-2 [N=16] vs. 3-4 [N=18]). APCA patients who develop any grade of B-HTN appear to derive benefit from bevacizumab."

According to the news editors, the research concluded: "Additional investigation is needed to identify subgroups of patients who develop B-HTN and are more likely to benefit from bevacizumab."

For more information on this research see: Treatment-related Hypertension as a Pharmacodynamic Biomarker for the Efficacy of Bevacizumab in Advanced Pancreas Cancer A Pooled Analysis of 4 Prospective Trials of Gemcitabine-based Therapy With Bevacizumab. *American Journal of Clinical Oncology-Cancer Clinical Trials*, 2016;39(6):614-618. *American Journal of Clinical Oncology-Cancer Clinical Trials* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

The news editors report that additional information may be obtained by contacting T.
Oncology - Esophageal Cancer

Reports from Oregon Health and Science University Add New Data to Findings in Esophageal Cancer (Preoperative carboplatin and paclitaxel-based chemoradiotherapy for esophageal carcinoma: results of a modified CROSS regimen utilizing radiation ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Esophageal Cancer are discussed in a new report. According to news reporting originating in Portland, Oregon, by NewsRx journalists, research stated, "Trimodality therapy for resectable esophageal and gastroesophageal junction cancers utilizing pre-operative radiotherapy with concurrent carboplatin and paclitaxel-based chemotherapy is being increasingly utilized secondary to the results of the phase III CROSS trial. However, there is a paucity of reports of this regimen as a component of chemoradiotherapy in North America."

The news reporters obtained a quote from the research from Oregon Health and Science University, "We aim to report on our clinical experience using a modified CROSS regimen with higher radiotherapy doses. Patients with advanced (cT2-cT4 or node positive) esophageal or gastroesophageal junction carcinoma who received preoperative carboplatin/paclitaxel-based chemoradiotherapy with radiation doses of greater than 41.4 Gray (Gy) followed by esophagectomy were identified from an institutional database. imaging, treatment, and tumor response characteristics were analyzed. Twenty-four patients were analyzed. All but one tumor had adenocarcinoma histology. The median radiation dose was 50.4 Gy. Pathologic complete response was achieved in 29% of patients, with all receiving 50.4 Gy. Three early postoperative deaths were seen, due in part to acute respiratory distress syndrome and all three patients received 50-50.4 Gy. With a median follow-up of 9.4 months (23 days-2 years), median survival was 24 months. Trimodality therapy utilizing concurrent carboplatin/paclitaxel with North American radiotherapy doses appeared to have similar pathologic complete response rates compared with the CROSS trial, but may be associated with higher toxicity."

According to the news reporters, the research concluded: "Although the sample size is small and further follow-up is necessary, radiation doses greater than 41.4 Gy may not be warranted secondary to a potentially increased risk of severe radiation-induced acute lung injury."

Our news correspondents report that additional information may be obtained by contacting N. Nabavizadeh, Oregon Health Sciences University, Dept. of Radiat Med, Portland, OR 97239, United States. Additional authors for this research include R. Shukla, D.A. Elliott, T. Mitin, G.M. Vaccaro, J.P. Dolan, R.J. Maggiore, P.H. Schipper, J.G. Hunter, C.R. Thomas and J.M. Holland.

Oncology - Thyroid Cancer

Reports from Osaka City University Highlight Recent Findings in Thyroid Cancer (The Safety and Efficacy of Weekly Paclitaxel Administration for Anaplastic Thyroid Cancer Patients: A Nationwide Prospective Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Thyroid Cancer is now available. According to news reporting out of Osaka, Japan, by NewsRx editors, research stated, "Anaplastic thyroid cancer (ATC) is a rare and extremely aggressive malignancy, with a median survival of less than 6 months due to rapid progression and resistance to multimodal therapies. Effective treatment strategies have not been identified."

Our news journalists obtained a quote from the research from Osaka City University, "A prospective clinical study was performed to objectively evaluate outcomes of treatment with paclitaxel. An investigator-initiated, multicenter, nonrandomized, open-label, single-arm study to evaluate the feasibility and efficacy of weekly paclitaxel (80 mg/m(2)) administration for patients with pathologically confirmed ATC was conducted in a nationwide organization. Feasibility was analyzed in 56 patients. More than one course of treatment was performed in 52 (93%) patients retaining sufficient dose intensity (>84%). No patient had to terminate the treatment because of an adverse event. The median overall survival was 6.7 months [confidence interval 4.4-9.0]. The 6-month survival was 54%. Among the 42 patients with an evaluable lesion, none demonstrated complete remission, 9 (21%) showed partial remission, 22 (52%) achieved stable disease, and 8 (19%) exhibited progressive disease; 3 did not complete the initial treatment course. The objective response rate was 21%, and the clinical benefit rate was 73%. The median time to progression was 1.6 months. Statistically, no additional effect of concomitant radiation was demonstrated in 6 patients receiving combined therapy. Eight
patients, in whom a complete post-treatment surgical removal of the tumor was feasible, survived significantly longer (median 7.6 months [CI 8.1-23.0]) than the other 34 patients in whom the tumor could not be completely removed after chemotherapy (5.4 months [CI 3.0-7.8], p = 0.018). The study demonstrates objective and accurate information concerning the feasibility and efficacy of a standardized treatment with weekly paclitaxel administration for ATC patients.

According to the news editors, the research concluded: "Weekly paclitaxel administration for ATC patients can be of clinical benefit in a neo-adjuvant setting."

For more information on this research see: The Safety and Efficacy of Weekly Paclitaxel Administration for Anaplastic Thyroid Cancer Patients: A Nationwide Prospective Study. *Thyroid*, 2016;26(9):1293-1299. *Thyroid* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. **Nursing - Evidence-Based Nursing**

**Reports from Ottawa Hospital Research Institute Describe Recent Advances in Evidence-Based Nursing (Implementation of Symptom Protocols for Nurses Providing Telephone-Based Cancer Symptom Management: A Comparative Case Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nursing - Evidence-Based Nursing have been published. According to news reporting out of Ottawa, Canada, by NewsRx editors, research stated, "The pan-Canadian Oncology Symptom Triage and Remote Support (COSTaRS) team developed 13 evidence-informed protocols for symptom management."

Our news journalists obtained a quote from the research from Ottawa Hospital Research Institute, "To build an effective and sustainable approach for implementing the COSTaRS protocols for nurses providing telephone-based symptom support to cancer patients. A comparative case study was guided by the Knowledge to Action Framework."

According to the news editors, the research concluded: "Three cases were created for three Canadian oncology programs that have nurses providing telephone support."

Our news journalists report that additional information may be obtained by contacting D. Stacey, Ottawa Hosp Res Inst, Ottawa, ON K1H 8M5, Canada. Additional authors for this research include E. Green, B. Ballantyne, J. Tarasuk, M. Skrutkowski, M. Carley, K. Chapman, C. Kuziemsky, E. Kolari, B. Sabo, A. Saucier, T. Shaw, L. Tardif, T. Truant, G.G. Cummings and D. Howell.

**Nephrology**

**Reports from Panjab University Advance Knowledge in Nephrology (Bergenin attenuates renal injury by reversing mitochondrial dysfunction in ethylene glycol induced hyperoxaluric rat model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nephrology. According to news originating from Chandigarh, India, by NewsRx correspondents, research stated, "Bergenin, isolated from Bergenia ligulata is a potent antioxidant and antilithiatic agent. Present work was designed to establish the biochemical role of bergenin on mitochondrial dysfunction in the ethylene glycol induced hyperoxaluric rat model."

Financial support for this research came from Indian Council of Medical Research.

Our news journalists obtained a quote from the research from Panjab University, "Bergenin was administrated at a dose of 10 mg/kg body wt i.p. from 14th day of establishing the 28 days hyperoxaluria rat model. a-Tocopherol was given as positive control at a dose of 100 mg/kg body wt i.p. Mitochondrial dysfunction was studied by evaluating the activities of respiratory chain complexes, mitochondrial membrane potential and reactive oxygen species. Histopathological analysis of the kidney tissue was done after Pizzolato staining. Also, expression of monocyte chemoattractant protein -1(MCP-1) and kidney injury marker protein (KIM-1) were studied and the levels of IL-1 beta were evaluated in kidney tissue homogenate. Mitochondrial dysfunction during stone crystallization was evident by decreased activities of electron transport chain complexes I, II and IV and augmented mitochondrial oxidative stress in hyperoxaluric rats. Bergenin treatment significantly (P < 0.05) restored the activities of these complexes. Moreover, it curtailed the lipid peroxidation and up regulated antioxidant levels, ameliorating the state of mitochondrial dysfunction. The protective role of bergenin was also reinforced by reducing IL-1 beta production and expression of KIM-1 and MCP-1 in the renal tissue. The findings of the present study provide evidence that bergenin exerted protective effects in hyperoxaluria through mitochondrial protection that involves attenuation of oxidative stress."
According to the news editors, the research concluded: "Hence, it presented itself as an effective remedy in combating urolithiasis."

For more information on this research see: Bergenin attenuates renal injury by reversing mitochondrial dysfunction in ethylene glycol induced hyperoxaluric rat model. European Journal of Pharmacology, 2016;791():611-621. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Heart Disorders and Diseases - Heart Attack

Reports from Paris-Descartes University Highlight Recent Findings in Heart Attack (Use of Neuromuscular Blockers During Therapeutic Hypothermia After Cardiac Arrest: A Nursing Protocol)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Attack. According to news reporting originating from Paris, France, by NewsRx correspondents, research stated, "Neuromuscular blockers used to prevent shivering during therapeutic hypothermia in comatose patients after out-of-hospital cardiac arrest are associated with adverse events. To assess the influence of a nurse-implemented protocol on use of neuromuscular blockers in patients treated with 24-hour therapeutic hypothermia after out-of-hospital cardiac arrest."

Our news editors obtained a quote from the research from Paris-Descartes University, "A before and after study was done in a 24-bed cardiac arrest center. During the before period, paralysis was maintained by continuous infusion of vecuronium during therapeutic hypothermia. During the after period, a nurse-implemented protocol was used to strictly control use of neuromuscular blockers. The primary outcome measure was duration of infusion of neuromuscular blockers; secondary end points included rates of ventilator-associated pneumonia and intensive care unit mortality. Among the 22 patients in the before group and the 23 patients in the after group, most were men (78%) with a median age of 66 years. Baseline characteristics were similar between the 2 groups. Median duration of sedation was 36 hours, shorter in the after group (34 hours) than in the before group (38 hours; P =.02). Median duration of infusion of neuromuscular blockers was significantly shorter in the after group (6 hours) than in the before group (33 hours; P<.001). Ventilator-associated pneumonia occurred more frequently in the before group (45%) than in the after group (13%; P =.02). Overall intensive care unit mortality rate was 58%, similar in both groups (P =.44)."
According to the news editors, the research concluded: "Use of a nurse-implemented protocol to reduce use of neuromuscular blockers is feasible."

For more information on this research see: Use of Neuromuscular Blockers During Therapeutic Hypothermia After Cardiac Arrest: A Nursing Protocol. *Critical Care Nurse*, 2016;36(6):33-40. *Critical Care Nurse* can be contacted at: Amer Assoc Critical Care Nurses, 101 Columbia, Aliso Viejo, CA 92656, USA.

The news editors report that additional information may be obtained by contacting A. Cariou, Paris Descartes Univ, Crit Care Med, Paris, France. Additional authors for this research include S. Ben Abdallah, A. Marincamp, V. Coic, R. Lauverjat, N. Ericher, W. Bougouin, J.P. Mira, A. Cariou and G. Geri.

**Nosocomial Infections**

**Reports from Pathology and Laboratory Medicine Describe Recent Advances in Nosocomial Infections (Investigation of a suspected nosocomial transmission of blaKPC3-mediated carbapenem-resistant Klebsiella pneumoniae by whole genome sequencing)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nosocomial Infections. According to news reporting originating from Los Angeles, California, by NewsRx correspondents, research stated, "Whole genome sequencing (WGS) was compared to pulse-field gel electrophoresis (PFGE) of XbaI-digested genomic DNA, as methods by which to evaluate a potential transmission of carbapenem-resistant *Klebsiella pneumoniae* between 2 hospital inpatients. PFGE result demonstrated only 1-band difference between the isolates, suggesting probable relatedness."

Our news editors obtained a quote from the research from Pathology and Laboratory Medicine, "In contrast, while WGS data demonstrated the same sequence type and very similar chromosomal sequences, over 20 single nucleotide variants were identified between the isolates, bringing into question whether there was a transmission event. WGS also identified an additional plasmid, with an XbaI restriction site in the isolates of the second patient that was not identified by PFGE."

According to the news editors, the research concluded: "While WGS provided additional information that was not available by PFGE, in this study, neither method could definitively conclude the relatedness between the isolates."

For more information on this research see: Investigation of a suspected nosocomial transmission of blaKPC3-mediated carbapenem-resistant Klebsiella pneumoniae by whole
The news editors report that additional information may be obtained by contacting S. Yang, Pathology & Laboratory Medicine, UCLA, Los Angeles, CA, United States. Oncology - Lymphoma

Reports from Peking Union Medical College Advance Knowledge in Lymphoma (Decreased Prognostic Value of International Prognostic Score in Chinese Advanced Hodgkin Lymphoma Patients Treated in the Contemporary Era)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lymphoma. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The International Prognostic Score (IPS) was developed based on the data of Western advanced Hodgkin lymphoma (HL) patients treated before 1992. Only a few studies ever evaluated the application value of IPS in Chinese population or in patients treated in the contemporary era whose outcomes has improved significantly than before."

Our news editors obtained a quote from the research from Peking Union Medical College, "We conducted a retrospective study involving 208 previously untreated Chinese advanced HL patients, who were admitted to Cancer Hospital Chinese Academy of Medical Sciences from January 1, 1999 to April 30, 2015 and received uniform first-line treatment. The prognostic value of both IPS and the seven IPS factors for freedom-from progression (FFP) and overall survival (OS) was assessed in this population. The statistical methods included Kaplan-Meier methodology, log-rank testing, and Cox proportional hazard regression analysis. With a median follow-up time of 79 months (range, 15-210 months), the 5-year FFP and OS were 78.8% and 86.0% respectively, which improved obviously compared with the original IPS study. The IPS remained prognostic for both FFP (P = 0.041) and OS (P = 0.013), but the range narrowed obviously, with 5-year FFP ranging from 87.2% to 61.5%, 5-year OS ranging from 94.1% to 69.2%, and the separation of survival curves was not as good as before. Only two of the seven IPS factors showed a significant independent prognostic value in the multivariate analysis: Stage IV (for FFP, hazard ratio [HR] = 2.219, 95% confidence interval [CI]: 1.148-3.948, P = 0.016; for OS, HR = 2.491, 95% CI: 1.159-5.355, P = 0.019) and hemoglobin < 105 g/L (for FFP, HR = 2.136, 95% CI: 1.123-4.060, P = 0.021; for OS, HR = 2.345, 95% CI: 1.099-
A simple prognostic score calculated by adding one point each for any of the two factors was prognostic both for FFP (P < 0.001) and OS (P < 0.001) with the survival curves separating very well, but the range still narrowed. The IPS has decreased the prognostic value in Chinese advanced HL patients treated in the contemporary era.

According to the news editors, the research concluded: "More prognostic factors are needed to supplement this original scoring system so as to identify different risk populations more accurately."

The news editors report that additional information may be obtained by contacting Y.K. Shi, Peking Union Med College, Beijing 100021, People's Republic of China. Additional authors for this research include Y. Qin, S.Y. Kang, X.H. He, P. Liu, S. Yang, S.Y. Zhou, C.G. Zhang, L. Gui, J.L. Yang, Y. Sun and Y.K. Shi.

HbA1c <7.0%, Bp <140/90 mmHg and LDL-C <2.6 mmol/L. Overall, 43.0% of type 2 diabetes patients were overweight and 16.7% were obese; 13.3% of overweight and and 10.1% of obese patients achieved all the 3B target goals. Overweight or obese patients were less likely to achieve 3B goals than those with normal BMIs. More than a half the overweight or obese patients (69.6%) were centrally obese. Patients with abdominal obesity were less likely to achieve cardiometabolic targets than those without abdominal obesity. In multivariate logistic regression analysis, female, higher BMI and waist circumference, smoking, drinking, sedentary lifestyle, and longer diabetes duration were significantly correlated with failure to achieve 3B control goals. Obesity is highly prevalent and associated with poor 3B control in Chinese type 2 diabetes patients.

According to the news editors, the research concluded: "In clinical practice, more attention and resources should focus on weight loss for such patients."

Our news journalists report that additional information may be obtained by contacting X. Zhou, Dept. of Endocrinology and Metabolism, Peking University People's Hospital, Beijing, People's Republic of China. Additional authors for this research include L. Ji, X. Ran, B. Su, Q. Ji, C. Pan, J. Weng, C. Ma, C. Hao, D. Zhang and D. Hu.

interval (CI) were calculated based on either a fixed-effects or a random-effects model. In addition, risk of bias was assessed with the use of the Newcastle-Ottawa scale. Sixteen studies were selected, involving almost 8,707 patients. According to the pooled estimates, compared with PLT, SLT was associated with a longer operative time (SMD, 0.28; 95% CI, 0.11-0.46), higher intraoperative blood loss (SMD, 0.41; 95% CI, 0.08-0.75), more postoperative bleeding (OR, 1.95; 95% CI, 1.10-3.45), an increased risk of recurrence (OR, 2.08; 95% CI, 1.24-3.50), and poorer 3-year (OR, 0.86; 95% CI, 0.76-0.98) and 5-year (OR, 0.86; 95% CI, 0.76-0.98) overall survival rates. However, no difference was detected between case and control groups in either rates of postoperative complications or such aspects as perioperative mortality, length of intensive care unit stay, length of hospital stay, and 1-year overall survival rate. The 3-year and 5-year overall survival rates were inferior in SLT, which shows that PLT is a better treatment strategy for transplantable hepatocellular carcinoma (HCC)."

According to the news reporters, the research concluded: "However, considering the severe organ limitation and the feasibility and safety of SLT, it provides a better option for patients with HCC recurrence after curative resection."

Our news journalists report that additional information may be obtained by contacting L. He, Peoples Hosp Deyang City, Dept. of Nursing, Deyang 618000, Sichuan, People's Republic of China. Additional authors for this research include T.T. Geng, L. He and H. Gao.

**Oncology - Skin Cancer**

**Reports from Pohang University of Science and Technology (POSTECH) Advance Knowledge in Skin Cancer (Hyaluronate-Gold Nanorod/DR5 Antibody Complex for Noninvasive Theralnosis of Skin Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Skin Cancer have been published. According to news originating from Gyeongbuk, South Korea, by NewsRx correspondents, research stated, "Noninvasive transdermal delivery is a promising method with distinct advantages including patient compliance over other delivery routes. Here, hyaluronate gold nanorod/death receptor 5 antibody (HA-AuNR/DR5 Ab) complex was developed for transdermal theranosis of skin cancer."

Our news journalists obtained a quote from the research from the Pohang University...
of Science and Technology (POSTECH), "The successful formation of the complex was corroborated by H-1 nuclear magnetic resonance, UV vis spectroscopy, dynamic light scattering, zeta potential, and transmission electron microscopy. In vitro biological activity of the complex was verified by ELISA and MTT assay using HCT116 cancer cells. In addition, in vivo photoacoustic imaging and two-photon microscopy clearly-visualized the transdermal delivery of HA-AuNR/DR5 Ab complex through the inevitable barrier of stratum corneum in the skin. Furthermore, in vivo antitumor effect on skin cancer model mice was confirmed from statistically significant decrease of tumor-reflecting luciferase expression levels and apoptotic signals in terminal deoxynucleotidyl transferase dUTP nick end labeling (TUNEL) assay."

According to the news editors, the research concluded: "Taken together, we could confirm the feasibility of HA-AuNR/DR5 Ab complex as a novel theranostic platform for noninvasive transdermal treatment of skin cancers."

For more information on this research see: Hyaluronate-Gold Nanorod/DR5 Antibody Complex for Noninvasive Theranosis of Skin Cancer. ACS Applied Materials & Interfaces, 2016;8(47):32202-32210. Surgery - Foot and Ankle Surgery

Reports from Pontifical Catholic University Highlight Recent Findings in Foot and Ankle Surgery (Gender-based violence and sexual and reproductive health among low-income youth in three Brazilian cities)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Surgery - Foot and Ankle Surgery. According to news originating from Belo Horizonte, Brazil, by NewsRx correspondents, research stated, "In this article, we investigate how gender-based violence (GBV) affects the sexual and reproductive health of impoverished adolescents and young adults. We analyse data from a 2011 survey of 450 young women and 300 young men aged 15-29, living in poor neighbourhoods of three middle-sized cities in Minas Gerais, Brazil."

Financial support for this research came from CNPq (National Counsel of Technological and Scientific Development) - Edictal CNPq.

Our news journalists obtained a quote from the research from Pontifical Catholic University, "In this survey we used a closed-ended questionnaire to collect data from 150 women and 100 men in each city. Our main goal was to explore the relationship between GBV and young women's autonomy in relation to their sexuality, using indicators appropriate to
Brazil. Our results showed a decreased prevalence of condom use at first intercourse and an increased prevalence of teenage pregnancies among young women who were in a relationship with a controlling and violent partner. Lower condom use was observed mostly among young men who acknowledged being violent and controlling towards a partner and they also were more likely to have made a partner pregnant as teenagers themselves.

According to the news editors, the research concluded: "We conclude that some variables utilized here as indicators of control and violence from a partner and of young women's autonomy can help us to understand how GBV inside relationships affects the reproductive and sexual health of young men and women, and how empowering them can reduce their susceptibility to unwanted pregnancies and HIV and other STI infections."

For more information on this research see: Gender-based violence and sexual and reproductive health among low-income youth in three Brazilian cities. Reproductive Health Matters, 2016;24(47):141-152. Reproductive Health Matters can be contacted at: Elsevier Science BV, PO Box 211, 1000 AE Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Reproductive Health Matters - www.journals.elsevier.com/reproductive-health-matters/)

The news correspondents report that additional information may be obtained from A.S. Chacham, Pontificia Univ Catolica Minas Gerais, Dept. of Social Sci, Belo Horizonte, MG, Brazil. Additional authors for this research include A.B. Simao and A.J. Caetano.

Science - Chromatography

Reports from Public Health Institute Add New Data to Findings in Chromatography (Analysis of 25 C NBOMe in Seized Blotters by HPTLC and GC-MS)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science - Chromatography. According to news reporting from Santiago, Chile, by NewsRx journalists, research stated, "Use of unauthorized synthetic drugs is a serious, forensic, regulatory and public health issue. In this scenario, consumption of drug-impregnated blotters is very frequent."

The news correspondents obtained a quote from the research from Public Health Institute, "For decades, blotters have been generally impregnated with the potent hallucinogen known as lysergic acid diethylamide (LSD); however, since 2013 blotter stamps with N-2 methoxybenzyl-substituted phenylethylamine hallucinogen designated as 'NBOMes' have been seized in Chile. To address this issue with readily accessible laboratory equipment, we have developed and validated a new HPTLC method for the identification and quantitation of 25-C-NBOMe in seized blotters and its confirmation by GC-MS. The proposed method was validated according to SWGTOX recommendations and is suitable for routine analysis of seized blotters containing 25-C-NBOMe. With the validated method, we analyzed 15 real samples, in all cases finding 25-C-NBOMe in a wide dosage range (701.0-1943.5 mu g per blotter)."
According to the news reporters, the research concluded: "In this situation, we can assume that NBOMes are replacing LSD as the main hallucinogenic drug consumed in blotters in Chile."

Our news journalists report that additional information may be obtained by contacting B. Duffau, Public Hlth Inst Chile, Drug Anal Sect, Santiago, Chile. Additional authors for this research include C. Camargo, M. Kogan, E. Fuentes and B.K. Cassels.

Keywords for this news article include: Santiago, Chile, South America, Chromatography, Science, Public Health Institute.

**Immune System Diseases and Conditions - HIV/AIDS**

**Reports from R. Coughlan and Co-Researchers Add New Data to Findings in HIV/AIDS (Key data from the 17th International Workshop on Co-morbidities and Adverse Drug Reactions in HIV)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - HIV/AIDS have been published. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Combination antiretroviral therapy (cART) has significantly reduced HIV-related morbidity and mortality; however, residual inflammation often persists in the absence of detectable viral load."

The news correspondents obtained a quote from the research, "In addition, chronic use of cART and an ageing HIV-positive population present new challenges to treating physicians who must balance the need for good virological control with risk of treatment-related toxicities. Discussions at the 17th International Workshop on Co-morbidities and Adverse Drug Reactions in HIV once again sought a better understanding of the complex relationship between HIV-, treatment- and age-related factors in the development of comorbidities in those infected with HIV."

According to the news reporters, the research concluded: "Key data from the meeting pertaining to inflammatory pathways in HIV, adipose tissue metabolism, cardiovascular disease, bone health, ageing and frailty, neurocognitive dysfunction, pulmonary disease and HCV coinfection are the focus of this report."

For more information on this research see: Key data from the 17th International Workshop on Co-morbidities and Adverse Drug Reactions in HIV. *Antiviral Therapy*, 2016;21 (1):75-89. *Antiviral Therapy* can be contacted at: Int Medical Press Ltd, 2-4 Idol Lane, London EC3R 5DD, England.

Oncology - Liver Cancer

Reports from Regional Hospital Highlight Recent Findings in Liver Cancer (Up-to-7 Criteria for Hepatocellular Carcinoma Liver Transplantation: A Retrospective Analysis of Experiences)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting out of Malaga, Spain, by NewsRx editors, research stated, "The expansion of criteria for hepatocellular carcinoma (HCC) liver transplantation should produce satisfactory outcomes in terms of survival and recurrence. To investigate if the up-to-7 criteria are applicable to liver transplantation for HCC."

Our news journalists obtained a quote from the research from Regional Hospital, "A review of all liver transplantations performed at our unit between January 2002 and December 2010 was conducted (645 patients). The 91 patients of the sample who had HCC were divided into 3 groups: in Milan criteria (MC; n = 74), in up-to-7 criteria (UTSC; n = 12), and outside of up-to-7 criteria (OUTSC; n = 5). A descriptive retrospective study was carried out to analyze the characteristics of liver tumors and recipients and to estimate recurrence and survival rates for this population of patients. The characteristics of transplant recipients of the 3 groups were comparable. Statistically significant differences were observed in the number of tumors (1 +/- 0.65 for MC, 3 +/- 1.05 for UTSC, 6 +/- 4.10 for OUTSC; P < .001), largest tumor size (2.47 +/- 1.12 cm for MC, 3.78 +/- 0.04 cm for UTSC, 4.04 +/- 1.73 cm for OUTSC; P < .001), and recurrence (5.4% for MC; 33.3% for UTSC; 20% for OUTSC; P = .008). Survival rates (MC, UTSC, and OUTSC) at 3 and 5 years were 71.6%, 66.7%, and 60%, and 58.1%, 58.3%, and 40%, respectively, whereas tumor-free survival rates were 70.3%, 58.3%, and 60%, and 58.1%, 50%, and 40%, respectively. Survival in patients with HCC transplanted under up-to-7 criteria is acceptable."

According to the news editors, the research concluded: "However, the expansion of criteria involves an increase in the number of patients included in the waiting list and a higher probability of relapse."

Our news journalists report that additional information may be obtained by contacting F.J.L. Diaz, Reg Hosp, Liver Transplant Unit, Malaga, Spain. Additional authors for this research include J.A.P. Daga, B.S. Perez, J.L.F. Aguilar, C.M. Casado, J.M.A. Narvaez,
Reports from Renmin Hospital of Wuhan University Add New Data to Findings in Gastric Cancer (Long Noncoding RNA H19-Derived miR-675 Enhances Proliferation and Invasion via RUNX1 in Gastric Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gastric Cancer. According to news reporting originating from Hubei, People's Republic of China, by NewsRx correspondents, research stated, "The lncRNA H19 and its mature product miR-675 have recently been shown to be upregulated and promote the progression of gastric cancer. However, the detailed function and underlying molecular mechanism of H19/miR-675 in the carcinogenesis of gastric cancer remains unclear."

Our news editors obtained a quote from the research from the Renmin Hospital of Wuhan University, "In this study, we found that H19 depended on miR-675 to enhance the proliferation and invasion of gastric cancer AGS cells, and the expression of miR-675 was positively correlated with H19 in patients with gastric cancer. Subsequently, the tumor-suppressor runt domain transcription factor 1 (RUNX1) was confirmed to be a downstream molecule of H19/miR-675 axis, since overexpression of H19 or miR-675 significantly decreased RUNX1 expression in AGS cells, and knockdown of H19 or miR-675 enhanced RUNX1 expression. More importantly, a series of assays further demonstrated that introduction of RUNX1 abrogated H19/miR-675-induced Akt/mTOR pathway activation and the following cellular proliferation and invasion of AGS cells. To our knowledge, this is the time to demonstrate that RUNX1 serves as a link between H19/miR-675 axis and Akt/mTOR signaling and is a pivotal mediator in gastric cancer progression induced by H19/miR-675."

According to the news editors, the research concluded: "Thus, our study provides important clues for understanding the key roles of lncRNA-miRNA functional network and identifying new therapeutic targets for gastric cancer."

For more information on this research see: Long Noncoding RNA H19-Derived miR-675 Enhances Proliferation and Invasion via RUNX1 in Gastric Cancer Cells. Oncology Research, 2016;23(3):99-107.

The news editors report that additional information may be obtained by contacting G. Liu, Dept. of Hepatobiliary and Laparoscopic Surgery, Renmin Hospital of Wuhan University, Wuhan, Hubei, People's Republic of China. Additional authors for this research include T. Xiang, Q.F. Wu and W.X Wang.

Pregnancy Complications - Spontaneous Abortion

Reports from Research Center Provide New Insights into Spontaneous Abortion (Success of smoking cessation interventions during pregnancy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pregnancy Complications - Spontaneous Abortion. According to news originating from Montreal, Canada, by NewsRx correspondents, research stated, "Smoking during pregnancy is a modifiable risk factor associated with adverse pregnancy outcomes. Smoking during pregnancy has been shown to increase the risk of spontaneous abortion, prematurity, low birthweight, congenital malformations, and sudden infant death syndrome."

Our news journalists obtained a quote from the research from Research Center, "Despite the fact that it is well known that smoking can lead to adverse pregnancy outcomes, 13-25% of pregnant women overall continue to smoke during this critical period. The objective of the study was to evaluate the effect of gestational use of bupropion and nicotine patch replacement therapy on the risk of the following: (1) smoking cessation, (2) prematurity, and (3) small for gestational age. Women included in the Quebec Pregnancy Cohort who filled the annual autoadministered questionnaire between Jan. 1, 1998, and June 30, 2009, were studied. Smokers before gestation with a pregnancy resulting in a live birth comprised the study population. Three mutually exclusive study groups were formed among those who smoked at the beginning of pregnancy: gestational users of nicotine patch replacement therapy, bupropion, and smokers who did not use nicotine patch replacement therapy or bupropion. Rate of smoking cessation during pregnancy as well as the risk of prematurity and small for gestational age were studied. Of the 1288 women who met inclusion criteria, 900 were smokers, 72 were bupropion users, and 316 were nicotine patch replacement therapy users. Bupropion and nicotine patch replacement therapy use during pregnancy were associated with higher rates of smoking cessation: 81% in the bupropion group; 79% for nicotine patch replacement therapy; and 0% in those not using bupropion or nicotine patch replacement therapy. After discontinuing smoking cessation medications, 60% of bupropion users and 68% of nicotine patch replacement therapy users did not smoke again during and after pregnancy. Adjusting for potential confounders, nicotine patch replacement therapy use was associated with a lower risk of prematurity (adjusted odds ratio, 0.21, 95% confidence interval, 0.13-0.34), and small-for-gestational-age (adjusted odds ratio, 0.61, 95% confidence interval, 0.41-0.90) compared to smoking. Bupropion was associated with a lower risk of prematurity only (adjusted odds ratio, 0.12, 95% confidence interval, 0.03-0.50). Bupropion and nicotine patch replacement therapy have an impact on smoking cessation during and after pregnancy."

According to the news editors, the research concluded: "Nicotine patch replacement therapy also decreased the risk of prematurity and small for gestational age."

For more information on this research see: Success of smoking cessation interventions during pregnancy. American Journal of Obstetrics and Gynecology, 2016;215 (5):170-177. American Journal of Obstetrics and Gynecology can be contacted at: Mosby-
Reports from Research Foundation Add New Data to Findings in Clinical Trials and Studies (Lung Volume Reduction with Vapor Ablation in the Presence of Incomplete Fissures: 12-Month Results from the STEP-UP Randomized Controlled Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting out of Heidelberg, Germany, by NewsRx editors, research stated, "Emphysema patients with collateral ventilation (CV) will not benefit from valve therapy, the most common endoscopic lung volume reduction procedure. A recent randomized controlled trial (STEP-UP) of the alternative bronchoscopic thermal vapor ablation (BTVA) included patients with (CV+) and without interlobar CV (CV-)."

Our news journalists obtained a quote from the research from Research Foundation, "This analysis evaluated the efficacy and safety of the CV+ population following BTVA. A post hoc fissure analysis of the baseline computed tomography of all treatment and control patients was performed with the VIDA Diagnostics Apollo software. A patient was considered to be CV+ if either of the treated upper lobes was adjacent to a fissure that was <90% complete. The primary endpoints, forced expiratory volume in 1 s (FEV 1) and St. George's Respiratory Questionnaire (SGRQ-C), were calculated for these CV+ patients following BTVA and safety results summarized. 78% (35/45) of the patients in the treatment arm and 79% (19/24) of the patients in the control arm were found to be CV+. At 12 months, the FEV 1 improvement of the treatment arm was 9.2%, as compared with a decrease of 5.4% in the control group, resulting in a mean between-group difference of 14.6% (p = 0.0137). The improvement in SGRQ-C of the treatment arm as compared to the control arm was 8.4 points (p = 0.0712). An increase in respiratory related serious adverse events was observed immediately following treatment, but most resolved with routine care. BTVA can achieve safe and clinically meaningful improvement in pulmonary function and quality of life in patients with CV."

According to the news editors, the research concluded: "These randomized controlled trial subgroup results offer proof of a viable solution for CV+ patients."

For more information on this research see: Lung Volume Reduction with Vapor Ablation in the Presence of Incomplete Fissures: 12-Month Results from the STEP-UP

Our news journalists report that additional information may be obtained by contacting D. Gompelmann, German Lung Res Fdn DZL, TLRCH, Heidelberg, Germany. Additional authors for this research include R. Eberhardt, M. Schuhmann, A. Valipour, P.L. Shah, F.J.F. Herth and K. Kontogianni.

Liver Diseases and Conditions - Fatty Liver

**Reports from Research Institute Add New Data to Findings in Fatty Liver (Increased Expression Profile and Functionality of TLR6 in Peripheral Blood Mononuclear Cells and Hepatocytes of Morbidly Obese Patients with Non-Alcoholic Fatty Liver ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Fatty Liver have been published. According to news reporting originating in Santander, Spain, by NewsRx journalists, research stated, "Current evidence suggests that gut dysbiosis drives obesity and non-alcoholic fatty liver disease (NAFLD) pathogenesis. Toll-like receptor 2 (TLR2) and TLR6 specifically recognize components of Gram-positive bacteria."

The news reporters obtained a quote from the research from Research Institute, "Despite the potential implications of TLR2 in NAFLD pathogenesis, the role of TLR6 has not been addressed. Our aim is to study a potential role of TLR6 in obesity-related NAFLD. Forty morbidly obese patients undergoing bariatric surgery were prospectively studied. Cell surface expression of TLR2 and TLR6 was assessed on peripheral blood mononuclear cells (PBMCs) by flow cytometry. Freshly isolated monocytes were cultured with specific TLR2/TLR6 agonists and intracellular production of cytokines was determined by flow-cytometry. In liver biopsies, the expression of TLR2 and TLR6 was analyzed by immunohistochemistry and cytokine gene expression using RT-qPCR. TLR6 expression in PBMCs from non-alcoholic steatohepatitis (NASH) patients was significantly higher when compared to those from simple steatosis. The production of pro-inflammatory cytokines in response to TLR2/TLR6 stimulation was also significantly higher in patients with lobular inflammation. Hepatocyte expression of TLR6 but not that of TLR2 was increased in NAFLD patients compared to normal liver histology. Deregulated expression and activity of peripheral TLR6 in morbidly obese patients can mirror the liver inflammatory events that are well known drivers of obesity-related NASH pathogenesis. Moreover, TLR6 is also significantly overexpressed in the hepatocytes of NAFLD patients compared to their normal counterparts."

According to the news reporters, the research concluded: "Thus, deregulated TLR6
expression may potentiate TLR2-mediated liver inflammation in NAFLD pathogenesis, and also
serve as a potential peripheral biomarker of obesity-related NASH.”

For more information on this research see: Increased Expression Profile and
Functionality of TLR6 in Peripheral Blood Mononuclear Cells and Hepatocytes of Morbidly
Obese Patients with Non-Alcoholic Fatty Liver Disease. *International Journal of Molecular
Sciences*, 2016;17(11):1761-1771. *International Journal of Molecular Sciences* can be

**Immunology - Immunoglobulins**

**Reports from Research Institute Highlight Recent Findings in Immunoglobulins [Substitution of Heavy Complementarity Determining Region 3 (CDR-H3) Residues Can Synergistically Enhance Functional Activity of Antibody and Its Binding Affinity to ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immunology - Immunoglobulins. According to news reporting originating from Yongin, South Korea, by NewsRx correspondents, research stated, "To generate a biobetter that has improved therapeutic activity, we constructed scFv libraries via random mutagenesis of several residues of CDR-H3 and -L3 of hu4D5. The scFv clones were isolated from the phage display libraries by stringent panning, and their anti-proliferative activity against HER2-positive cancer cells was evaluated as a primary selection criterion."

Our news editors obtained a quote from the research from Research Institute, "Consequently, we selected AH06 as a biobetter antibody that had a 7.2-fold increase in anti-proliferative activity (IC[50]: 0.81 nM) against the gastric cancer cell line NCI-N87 and a 7.4-fold increase in binding affinity (KD: 60 pM) to HER2 compared to hu4D5. The binding energy calculation and molecular modeling suggest that the substitution of residues of CDR-H3 to W98, F100c, A101 and L102 could stabilize binding of the antibody to HER2 and there could be direct hydrophobic interactions between the aromatic ring of W98 and the aliphatic group of I613 within HER2 domain IV as well as the heavy and light chain hydrophobic interactions by residues F100c, A101 and L102 of CDR-H3. Therefore, we speculate that two such interactions were exerted by the residues W98 and F100c. A101 and L102 may have a synergistic effect on the increase in the binding affinity to HER2. AH06 specifically binds to domain IV of HER2, and it decreased the phosphorylation level of HER2 and AKT."

"Consequently, we selected AH06 as a biobetter antibody that had a 7.2-fold increase in anti-proliferative activity (IC[50]: 0.81 nM) against the gastric cancer cell line NCI-N87 and a 7.4-fold increase in binding affinity (KD: 60 pM) to HER2 compared to hu4D5. The binding energy calculation and molecular modeling suggest that the substitution of residues of CDR-H3 to W98, F100c, A101 and L102 could stabilize binding of the antibody to HER2 and there could be direct hydrophobic interactions between the aromatic ring of W98 and the aliphatic group of I613 within HER2 domain IV as well as the heavy and light chain hydrophobic interactions by residues F100c, A101 and L102 of CDR-H3. Therefore, we speculate that two such interactions were exerted by the residues W98 and F100c. A101 and L102 may have a synergistic effect on the increase in the binding affinity to HER2. AH06 specifically binds to domain IV of HER2, and it decreased the phosphorylation level of HER2 and AKT."
According to the news editors, the research concluded: "Above all, it highly increased the overall level of p27 compared to hu4D5 in the gastric cancer cell line NCI-N82, suggesting that AH06 could potentially be a more efficient therapeutic agent than hu4D5."

The news editors report that additional information may be obtained by contacting S.K. Moon, Bio Medicine Lab, CKD Research Institute, ChongKunDang Pharm, Yongin 446-916, South Korea. **Reports from Royal Free Hospital Highlight Recent Findings in Hemophilia A (Congenital factor V and VIII deficiency in women: a systematic review of literature and report of two new cases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hematologic Diseases and Conditions - Hemophilia A are presented in a new report. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Factor V and factor VIII deficiency (F5F8D) is a rare congenital bleeding disorder. There is a paucity of data in the literature about obstetric and gynaecological problems in women affected by F5F8D."

Our news editors obtained a quote from the research from Royal Free Hospital, "The aim of this review was to examine obstetric complications and gynaecological problems in women with congenital F5F8D and present two new cases. An electronic search was performed to identify the published literature on PUBMED, MEDLINE and EMBASE databases using the following keywords 'congenital factor V and factor VIII deficiency' and 'women or pregnancy'. A total of 23 relevant articles were found and included in this systematic review: 15 case reports and 10 case series dating from 1976 to 2015. A total number of 86 women were identified. Heavy menstrual bleeding was the most common bleeding symptom in women (49%). Recurrent ovulation bleeding and haemorrhagic ovarian cyst were reported in three women. Nineteen pregnancies were reported (including our two case reports). There were no miscarriages. Postpartum bleeding occurred in six (32%) deliveries."

According to the news editors, the research concluded: "Data are very limited on gynaecological and obstetric problems in women with F5F8D. Heavy menstrual bleeding is a
common problem. There is also an increased risk of postpartum haemorrhage. Close collaboration between haemophilia, obstetric and gynaecological teams is important to prevent and manage obstetric and gynaecological bleeding complications."

For more information on this research see: Congenital factor V and VIII deficiency in women: a systematic review of literature and report of two new cases. *Blood Coagulation & Fibrinolysis*, 2016;27(3):237-41. (Lippincott Williams and Wilkins - www.lww.com; Blood Coagulation & Fibrinolysis - journals.lww.com/bloodcoagulation/pages/default.aspx)

**Infectious Diseases**

**Reports from Royal Holloway-University of London Advance Knowledge in Infectious Diseases (The evolution of sex-specific virulence in infectious diseases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Infectious Diseases are presented in a new report. According to news reporting from Egham, United Kingdom, by NewsRx journalists, research stated, "Fatality rates of infectious diseases are often higher in men than women. Although this difference is often attributed to a stronger immune response in women, we show that differences in the transmission routes that the sexes provide can result in evolution favouring pathogens with sex-specific virulence."

The news correspondents obtained a quote from the research from the Royal Holloway-University of London, "Because women can transmit pathogens during pregnancy, birth or breast-feeding, pathogens adapt, evolving lower virulence in women. This can resolve the long-standing puzzle on progression from Human T-cell Lymphotropic Virus Type 1 (HTLV-1) infection to lethal Adult T-cell Leukaemia (ATL); a progression that is more likely in Japanese men than women, while it is equally likely in Caribbean women and men. We argue that breastfeeding, being more prolonged in Japan than in the Caribbean, may have driven the difference in virulence between the two populations."

According to the news reporters, the research concluded: "Our finding signifies the importance of investigating the differences in genetic expression profile of pathogens in males and females."

Reports from Ruhr University Describe Recent Advances in Atrial Fibrillation (Performance of an Implantable Cardiac Monitor to Detect Atrial Fibrillation: Results of the DETECT AF Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting out of Bad Oeynhausen, Germany, by NewsRx editors, research stated, "DETECTAF Study Results. Reliable detection and monitoring of atrial fibrillation (AF) is essential for accurate clinical decision making, which can now be done continuously with the introduction of implantable cardiac monitors (ICM) The DETECT AF study evaluated the performance of the Confirm DM2102 ICM (St. Jude Medical, St."

Our news journalists obtained a quote from the research from Ruhr University, "Paul, MN, USA) to accurately detect and monitor AF. Ninety patients previously implanted with the ICM and with either suspected or known paroxysmal AF were enrolled at 12 centers in Germany and The Netherlands. At least 2 weeks after ICM implant, patients wore a Holter monitor for 4 days, while the ICM monitored for AF episodes lasting at least 2 minutes. Holter monitor data was analyzed by a blinded, independent core laboratory and compared to the ICM AF detections. Patient and episode sensitivity (SE), specificity (SP), positive predictive value (PPV), and negative predictive (NPV) were calculated using standard analysis and a generalized estimation equation method where appropriate. A total of 79/90 subjects (61% male, 65.7 +/- 9.6 years old) were included in the analysis, totaling 6,894 hours of Holter monitoring. Using a per patient analysis SE was 100%, PPV was 64.0%, SP was 85.7%, and NPV was 100%. Using a per episode analysis, SE was 94.0% and PPV was 64.0%. With an AF duration analysis, the SE was 83.9%, PPV was 97.3%, SP was 99.4% with an NPV of 98.5%.”

According to the news editors, the research concluded: “The SJM Confirm DM2102 can accurately and repeatedly detect paroxysmal AF episodes of at least 2 minutes in length.”

Our news journalists report that additional information may be obtained by contacting G. Nolker, Ruhr University of Bochum, Herz & Diabet Zentrum Nordrhein Westfalen, Bad Oeynhausen, Germany. Additional authors for this research include J. Mayer,
Oncology - Prostate Cancer
Reports from Rutgers State University Provide New Insights into Prostate Cancer (delta-Tocopherol Inhibits Receptor Tyrosine Kinase-Induced AKT Activation in Prostate Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Prostate Cancer is now available. According to news reporting from Piscataway, New Jersey, by NewsRx journalists, research stated, "The cancer preventive activity of vitamin E is suggested by epidemiological studies and supported by animal studies with vitamin E forms, g-tocopherol and delta-tocopherol (delta-T). Several recent large-scale cancer prevention trials with high dose of a-tocopherol, however, yielded disappointing results."

The news correspondents obtained a quote from the research from Rutgers State University, "Whether vitamin E prevents or promotes cancer is a serious concern. A better understanding of the molecular mechanisms of action of the different forms of tocopherols would enhance our understanding of this topic. In this study, we demonstrated that delta-T was the most effective tocopherol form in inhibiting prostate cancer cell growth, by inducing cell cycle arrest and apoptosis. By profiling the effects of delta-T on the cell signaling using the phospho-kinase array, we found that the most inhibited target was the phosphorylation of AKT on T308. Further study on the activation of AKT by EGFR and IGFR revealed that delta-T attenuated the EGF/IGF-induced activation of AKT (via the phosphorylation of AKT on T308 induced by the activation of PIK3). Expression of dominant active PIK3 and AKT in prostate cancer cell line DU145 in which PIK3, AKT, and PTEN are wild type caused the cells to be refractory to the inhibition of delta-T, supporting that delta-T inhibits the PIK3-mediated activation of AKT. Our data also suggest that delta-T interferes with the EGF-induced EGFR internalization, which leads to the inhibition of the receptor tyrosine kinase-dependent activation of AKT."

According to the news reporters, the research concluded: "In summary, our results revealed a novel mechanism of delta-T in inhibiting prostate cancer cell growth, supporting the cancer preventive activity delta-T."

Our news journalists report that additional information may be obtained by contacting H. Wang, Rutgers State University, Ernest Mario Sch Pharm, Center Canc Prevent Res, Piscataway, NJ, United States. Additional authors for this research include J. Hong and
Reports from Salford Royal NHS Foundation Trust Provide New Insights into Atherosclerosis (Progress in the treatment of atherosclerotic renovascular disease: the conceptual journey and the unanswered questions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Atherosclerosis are discussed in a new report. According to news reporting originating in Salford, United Kingdom, by NewsRx journalists, research stated, "Over the past decades, management of atherosclerotic renovascular disease (ARVD) has undergone significant progress, in parallel with increased knowledge about the complex pathophysiology of this condition. Modern multi-targeted medical management of atherosclerosis has driven a change in both the natural history and the clinical outcomes of ARVD."

The news reporters obtained a quote from the research from Salford Royal NHS Foundation Trust, "Progression to total renal artery occlusion is a much less common occurrence and while early studies have reported that up to 41% of patients reached renal end-points over a mean follow-up of 44 months, the latest randomized controlled trials have shown that progressive renal impairment occurs in 16-22% of patients, with < 8% of patients reaching end-stage kidney disease (ESKD) over a similar time-frame. However, the results of the latest large ARVD trials investigating the effect of renal stenting upon clinical outcomes have been influenced by selection bias as high-risk patients with clinically significant renal artery stenosis (RAS) have largely been excluded from these studies. Although the neutral results of these trials have shown uncertainty about the role of revascularization in the management of patients with ARVD, there is evidence that revascularization can optimize outcomes in selected patients with a high-risk clinical phenotype."

According to the news reporters, the research concluded: "Future challenges lie in identifying important subgroups of patients with critical RAS and viable kidneys, while continuing to develop strategies to protect the renal parenchyma and hence improve clinical outcomes."

Our news correspondents report that additional information may be obtained by contacting D. Vassallo, Salford Royal NHS Fdn Trust, Dept. of Renal Med, Salford M6 8HD,
Biological Factors - Inflammation Mediators

Reports from San Raffaele Scientific Institute Add New Data to Findings in Inflammation Mediators (NF-kB oscillations translate into functionally related patterns of gene expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biological Factors - Inflammation Mediators have been published. According to news reporting from Milan, Italy, by NewsRx journalists, research stated, "Several transcription factors (TFs) oscillate, periodically relocating between the cytoplasm and the nucleus. NF-kB, which plays key roles in inflammation and cancer, displays oscillations whose biological advantage remains unclear."

The news correspondents obtained a quote from the research from San Raffaele Scientific Institute, "Recent work indicated that NF-kB displays sustained oscillations that can be entrained, that is, reach a persistent synchronized state through small periodic perturbations. We show here that for our GFP-p65 knock-in cells NF-kB behaves as a damped oscillator able to synchronize to a variety of periodic external perturbations with no memory. We imposed synchronous dynamics to prove that transcription of NF-kB-controlled genes also oscillates, but mature transcript levels follow three distinct patterns. Two sets of transcripts accumulate fast or slowly, respectively. Another set, comprising chemokine and chemokine receptor mRNAs, oscillates and resets at each new stimulus, with no memory of the past."

According to the news reporters, the research concluded: "We propose that TF oscillatory dynamics is a means of segmenting time to provide renewing opportunity windows for decision."

For more information on this research see: NF-kB oscillations translate into functionally related patterns of gene expression. Elife, 2016;5():e09100.

Our news journalists report that additional information may be obtained by contacting S. Zambrano, Division of Genetics and Cell Biology, San Raffaele Scientific Institute, Milan, Italy. Additional authors for this research include I. De Toma, A. Piffer, M.E. Bianchi and A. Agresti.

Reports from School of Medicine Advance Knowledge in Muscular Dystrophy (Identification and Function of Fibrocytes in Skeletal Muscle Injury Repair and Muscular Dystrophy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Muscular Dystrophy have been published. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "We identified and characterized the function of CD45(+)/collagen I+ fibrocytes in acutely injured skeletal muscle of wild-type (WT) and Ccr2(-/-) mice, and in quadriceps and diaphragm muscles of mdx(5cv) mice, a mouse model for Duchenne muscular dystrophy. Fibrocytes were not detected in peripheral blood of WT mice after acute muscle injury or mdx(5cv) mice."

Our news journalists obtained a quote from the research from the School of Medicine, "Fibrocytes were detected in acutely injured muscles and in mdx(5cv) quadriceps and diaphragm muscles. These cells expressed F4/80 and CCR2, and they were mostly Ly6C(lo). They expressed a low level of collagens but a high level of profibrotic growth factors as compared with i.m. fibroblasts. Fibrocyte expression of collagens and profibrotic growth factors was not increased in Ccr2(-/-) mice as compared with WT controls. Fibrocyte expression of both proinflammatory and profibrotic cytokines was significantly higher in mdx(5cv) diaphragm than in mdx(5cv) quadriceps. In cocultures, fibrocytes from the mdx(5cv) diaphragm stimulated a higher level of fibroblast expression of extracellular matrix genes than did those from the mdx (5cv) quadriceps. Our findings suggest that i.m. fibrocytes most likely originate from infiltrating monocytes/macrophages and differentiate within injured muscles. They likely contribute to the normal muscle injury repair by producing growth factors. They do not appear to contribute to the persistent muscle fibrosis associated with poor injury repair in Ccr2(-/-) mice."

According to the news editors, the research concluded: "However, they likely contribute to the persistent inflammation and progressive fibrosis in the mdx(5cv) diaphragm."

For more information on this research see: Identification and Function of Fibrocytes in Skeletal Muscle Injury Repair and Muscular Dystrophy. *Journal of Immunology*, 2016;197 (12):4750-4761. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Reports from School of Medicine Provide New Insights into Ethylamines (Dose-response and Cardiopulmonary Side Effects of the Novel Neuromuscular-blocking Drug CW002 in Man)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Ethylamines have been published. According to news reporting from New Haven, Connecticut, by NewsRx journalists, research stated, "CW002 is a benzylisoquinolinium nondepolarizing neuromuscular-blocking drug found to be inactivated by cysteine in preclinical studies. The current study represents a dose escalation clinical trial designed to describe CW002 potency, duration, cardiopulmonary side effects, and histamine release."

The news correspondents obtained a quote from the research from the School of Medicine, "Healthy subjects anesthetized with sevoflurane/nitrous oxide were divided into five groups (n = 6), each receiving a fixed CW002 dose (0.02, 0.04, 0.06, 0.08, or 0.10 mg/kg), and one group (n = 4) receiving 0.14 mg/kg. Blood pressure and heart rate were continuously recorded along with airway dynamic compliance. Neuromuscular blockade was assessed with mechanomyography at the adductor pollicis. Arterial blood was obtained before and after CW002 injection for analysis of plasma histamine concentration. Potency was estimated from a baseline sigmoid Emax model. ED50 was found to be 0.036 mg/kg (95% CI, 0.020 to 0.053 mg/kg) and ED95 0.077 mg/kg (95% CI, 0.044 to 0.114 mg/kg). At 0.14 mg/kg (1.8 x ED95), 80% twitch depression occurred in 94 +/- 18 s with complete block in 200 +/- 87 s. Clinical recovery (25% of maximum twitch) occurred in 34 +/- 3.4 min, with a 5 to 95% recovery interval of 35.0 +/- 2.7 min. The time to a train-of-four ratio greater than 0.9 ranged from 59 to 86 min. CW002 did not elicit histamine release or significant (greater than 10%) changes in blood pressure, heart rate, or dynamic airway compliance."

According to the news reporters, the research concluded: "In healthy subjects receiving sevoflurane/nitrous oxide, CW002 at 1.8 x estimated ED95 produces a clinical duration less than 40 min, elicits no histamine release, and has minimal cardiopulmonary side effects."

For more information on this research see: Dose-response and Cardiopulmonary Side Effects of the Novel Neuromuscular-blocking Drug CW002 in Man. Anesthesiology, 2016;125(6):1136-1143. Anesthesiology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Oncology - Liver Cancer

Reports from School of Pharmacy Add New Data to Findings in Liver Cancer (The Antitumor Effect of DYC-279 on Human Hepatocellular Carcinoma HepG2 Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news originating from Zhengzhou, People's Republic of China, by NewsRx correspondents, research stated, "DYC-279 is a newly synthesized compound. In this study, we revealed that DYC-279 could inhibit the proliferation of HepG2 cells in a dose-and time-dependent manner using the CCK-8 test."

Our news journalists obtained a quote from the research from the School of Pharmacy, "FACS showed that DYC-279 induced a G2/M arrest and apoptosis in a dose-dependent manner. Western blot demonstrated that DYC-279-induced G2/M arrest effect was correlated with the inhibition of cyclin-dependent kinase 1 activity, including a concomitant downregulation of cyclinD1 and cdc2 and upregulation of cyclinB1 in HepG2 cells. DYC-279 also significantly increased the ratio of Bax/Bcl-2, and stimulated the released of cytochrome c into cytosol and also activated caspase-9 and caspase-3, suggesting DYC-279 induced apoptosis via mitochondrial apoptotic pathway."

According to the news editors, the research concluded: "These data support that DYC-279 has anticancer properties in HepG2 cells and may be used as a novel effective reagent in the treatment of human liver cancer."

The news correspondents report that additional information may be obtained from P. Junyan, School of Pharmacy, University of Zhengzhou, Zhengzhou, People's Republic of China. Additional authors for this research include Y. Shujuan, G. Shulin, C. Yan and X. Xia.

Reports from School of Public Health Add New Data to Findings in Colon Cancer
(Systematic review with meta-analysis: the comparative effectiveness of aspirin vs. screening for colorectal cancer prevention)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Both aspirin use and screening with flexible sigmoidoscopy or guaiac faecal occult blood testing (FOBT) may reduce mortality from colorectal cancer, but comparative effectiveness of these interventions is unknown. To compare aspirin to guaiac FOBT screening with regard to incidence and mortality of colorectal cancer in a network meta-analysis."

Financial supporters for this research include Norges Forskningsrad, Stiftelsen Blanceflor Boncompagni Ludovisi, fodd Bildt, Kreftforeningen, National Institutes of Health. Our news journalists obtained a quote from the research from the School of Public Health, "We searched Medline, EMBASE and the COCHRANE central register (CENTRAL) for relevant randomised trials identified until 31 October 2015. Randomised trials in average-risk populations that reported colorectal cancer mortality, colorectal cancer incidence, or both, with a minimum follow-up of 2 years, and more than 100 randomised individuals were included. Three investigators independently extracted data. We calculated relative risks [RR with 95% predictive intervals (PrIs)] for the comparison of the interventions by frequentist network meta-analyses. The effect of aspirin on colorectal cancer mortality was similar to FOBT (RR 1.03; 95% PrI 0.76-1.39) and flexible sigmoidoscopy (RR 1.16; 95% PrI 0.84-1.60). Aspirin was more effective than FOBT (RR 0.36; 95% PrI 0.22-0.59) and flexible sigmoidoscopy (RR 0.37; 95% PrI 0.22-0.62) in preventing death from or cancer in the proximal colon. Aspirin was equally effective as screening in reducing colorectal cancer incidence, while flexible sigmoidoscopy was superior to FOBT (RR 0.84; 95% PrI 0.72-0.97). Low-dose aspirin seems to be equally effective as flexible sigmoidoscopy or guaiac FOBT screening to reduce colorectal cancer incidence and mortality, and more effective for cancers in the proximal colon."

According to the news editors, the research concluded: "A randomised comparative effectiveness trial of aspirin vs. screening is warranted."

Our news journalists report that additional information may be obtained by contacting L. Emilsson, Harvard TH Chan Sch Public Hlth, Dept. of Epidemiol, Boston, MA, United States. Reports from School of Public Health Highlight Recent Findings in School Health (School Health Promotion Policies and Adolescent Risk Behaviors in Israel: A Multilevel Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Education - School Health are discussed in a new report. According to news reporting originating from Haifa, Israel, by NewsRx correspondents, research stated, "Health promotion policies targeting risk-taking behaviors are being implemented across schools in Israel. This study identified the most effective components of these policies influencing cigarette smoking and alcohol consumption among adolescents."

Our news editors obtained a quote from the research from the School of Public Health, "Logistic hierarchical linear model (HLM) analysis of data for 5279 students in 95 Jewish public schools from the Health Behavior in School-Aged Children (HBSC) 2010-2011 survey in Israel enabled simultaneous estimation of the relationship between student-and school-level variables (health promotion policy) to alcohol consumption and smoking behavior. Principals of participating schools also were interviewed to ascertain their degree of adoption and implementation of a health promotion policy. Most of the variance in adolescent risk behaviors is explained by student-level variables: negative perceptions of school, lack of parental support for school issues, and more time spent with friends. Among the school-level policy measures, parental participation in health promotion intervention programs was repeatedly associated with lower rates of risk behaviors, over and above student characteristics. School health promotion policies should focus on parents' involvement in intervention programs and should seek to improve students' perceptions of school and their sense of well-being to promote resilience."

According to the news editors, the research concluded: "Further research is needed to identify additional factors that may increase the effectiveness of school health promotion policies."

The news editors report that additional information may be obtained by contacting R. Tesler, Fac Social Welf & Hlth Sci, Sch Public Hlth, IL-3498838 Haifa, Israel. Additional authors for this research include Y. Harel-Fisch and O. Baron-Epel.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/josh.12394. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiology

Reports from Science Institute Describe Recent Advances in Cardiology (Absolute Measurement of Cardiac Injury-Induced microRNAs in Biofluids across Multiple Test Sites)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiology is the subject of a report. According to news reporting out of Washington, District of Columbia, by NewsRx editors, research stated, "Extracellular microRNAs (miRNAs) represent a promising new source of toxicity biomarkers that are sensitive indicators of site of tissue injury. In order to establish reliable approaches for use in biomarker validation studies, the HESI technical committee on genomics initiated a multi-site study to assess sources of variance associated with quantitating levels of cardiac injury induced miRNAs in biofluids using RT-qPCR."

Our news journalists obtained a quote from the research from Science Institute, "Samples were generated at a central site using a model of acute cardiac injury induced in male Wistar rats by 0.5 mg/kg isoproterenol. Biofluid samples were sent to 11 sites for measurement of 3 cardiac enriched miRNAs (miR-1-3p, miR-208a-3p, and miR-499-5p) and 1 miRNA abundant in blood (miR-16-5p) or urine (miR-192-5p) by absolute quantification using calibration curves of synthetic miRNAs. The samples included serum and plasma prepared from blood collected at 4 h, urine collected from 6 to 24 h, and plasma prepared from blood collected at 24 h post subcutaneous injection. A 3 parameter logistic model was utilized to fit the calibration curve data and estimate levels of miRNAs in biofluid samples by inverse prediction. Most sites observed increased circulating levels of miR-1-3p and miR-208a-3p at 4 and 24 h after isoproterenol treatment, with no difference seen between serum and plasma. The biological differences in miRNA levels and sample type dominated as sources of variance, along with outlying performance by a few sites."

According to the news editors, the research concluded: "The standard protocol established in this study was successfully implemented across multiple sites and provides a benchmark method for further improvements in quantitative assays for circulating miRNAs."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/toxsci/kfw143. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Colon Cancer

Reports from Second Military Medical University Provide New Insights into Colon Cancer (gamma-Aminobutyric acid inhibits the proliferation and increases oxaliplatin sensitivity in human colon cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Gamma-Aminobutyric acid (GABA) is a natural nonprotein amino acid, which broadly exists in many plant parts and is widely used as an ingredient in the food industry. In mammals, it is widely distributed in central nervous system and non-neural tissues."

The news reporters obtained a quote from the research from Second Military Medical University, "In addition to a primary inhibitory neurotransmitter in the central nervous system, endogenous GABA content has been found to be elevated in neoplastic tissues in colon cancer. However, the effect of extraneous GABA on colon cancer has rarely been reported. In this study, we found the inhibitory effects of GABA on the proliferation of colon cancer cells (CCCs). The amino acid also suppressed metastasis of SW480 and SW620 cells. To further study the correlated mechanism, we analyzed the changes in cell cycle distribution and found that GABA suppressed cell cycle progression through G2/M or G1/S phase. Furthermore, RNA sequencing analysis revealed GABA-induced changes in the mRNA expression of 30 genes, including EGR1, MAPK4, NR4A1, Fos, and FosB, in all the three types of CCC. Importantly, GABA enhanced the anti-tumor efficacy of oxaliplatin (OXA) in subcutaneous xenograft tumor model in nude mice. The data suggest that GABA inhibits colon cancer cell proliferation perhaps by attenuating EGR1-NR4A1 axis, EGR1-Fos axis, and by disrupting MEK-EGR1 signaling pathway."

According to the news reporters, the research concluded: "This work reveals the pharmacological value of GABA derived from food and suggests that exogenous GABA might play an auxiliary role in polychemotherapy of colon cancer."

For more information on this research see: gamma-Aminobutyric acid inhibits the proliferation and increases oxaliplatin sensitivity in human colon cancer cells. Tumor Biology, 2016;37(11):14885-14894. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. Oncology - Acute Myeloid Leukemia

Reports from Shaheed Beheshti University of Medical Sciences
Advance Knowledge in Acute Myeloid Leukemia (Expression analysis of BECN1 in acute myeloid leukemia: association with distinct cytogenetic and molecular abnormalities)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Myeloid Leukemia. According to news reporting originating from Tehran, Iran, by NewsRx correspondents, research stated, "In acute myeloid leukemia (AML), it has been shown that AML-derived cells often remain sensitive to autophagy-inducing stimuli, leading to the idea that harnessing the autophagy can be pertinent to AML cytotoxic therapy. Despite this promising notion, to date, there is no comprehensive study addressing autophagy-related genes expression status in AML."

Financial supporters for this research include Shahid Beheshti University of Medical Sciences, Faculty of Medicine.

Our news editors obtained a quote from the research from the Shaheed Beheshti University of Medical Sciences, "As a critical mediator, BECN1 influences the onset and advance of autophagy and several studies have pointed to the BECN1 recurrent allelic deletion and expression variation in a broad range of tumors. To explore this caveat, we chose this alteration-prone gene to investigate in our study. We have analyzed the expression status of BECN1 in a series of 128 de novo AML patients using real-time quantitative polymerase chain reaction (qRT-PCR). In our favorable subgroup, BECN1 expression did not alter (p=0.301), but in intermediate and unfavorable patients, we have had BECN1 low expression compared to the normal controls (p=0.008 and p<0.001, respectively). We found evidence for the association of reduced expression of BECN1 with FLT3-ITD mutation (19 of 27 patients), monosomal karyotype (all of 11 patients), higher age, and WBC count."

According to the news editors, the research concluded: "Overall, remarkable association of reduced expression of BECN1 with FLT3-ITD mutation and monosomal karyotype and their functional relationship is interesting which should be addressed and verified in future studies."

The news editors report that additional information may be obtained by contacting D. Zare-Abdollahi, Dept. of Medical Genetics, Faculty of Medicine, Shahid Beheshti University of Medical Sciences, Tehran, Iran. Additional authors for this research include S. Safari, A. Movaflagh, M. Ghadiani, M. Tabarrae, S. Riazi-Isfahani, S. Gorji, L. Keyvan and L. Gachkar.

Reports from Shanghai Jiao-Tong University Add New Data to Findings in Colon Cancer (Overexpression of LARP1 predicts poor prognosis of colorectal cancer and is expected to be a potential therapeutic target)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "This study investigated the significance of Larelated protein 1 (LARP1) in the development and progression of colorectal cancer (CRC). Quantitative real-time polymerase chain reaction and Western blot analyses were carried out to determine the mRNA and protein expression of LARP1 in CRC tumor tissues and paired adjacent normal mucosa."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "The expression of LARP1 was upregulated in CRC. Immunohistochemical analysis using tissue microarray was performed. A positive correlation between LARP1 and proliferating cell nuclear antigen (PCNA) in the area of proliferation was observed using the Spearman's correlation coefficient test (r = 0.332, P< 0.01). The elevated expression of LARP1 significantly correlated with T stage (P = 0.02), N stage (P = 0.006), M stage (P < 0.001), American Joint Committee on Cancer (AJCC) stage (P = 0.04), differentiation rank (P < 0.001), and PCNA level (P < 0.001). In addition, the inhibitory effect of LARP1 knockdown on CRC cell proliferation was demonstrated using Cell Counting Kit-8 (CCK8) and colony-forming cell (CFC) assays. Multivariate analysis showed that LARP1 was an independent prognostic factor for overall survival (OS; hazard rate (HR) = 0.244; 95 % confidence interval (CI), 0.078-0.769; P = 0.016) and disease-free survival (DFS; HR = 0.281; 95% CI, 0.086-0.917; P = 0.035) in CRC patients."

According to the news editors, the research concluded: "LARP1 plays an important role in the proliferation of colorectal cancer and represents a new prognostic indicator."

For more information on this research see: Overexpression of LARP1 predicts poor prognosis of colorectal cancer and is expected to be a potential therapeutic target. Tumor Biology, 2016;37(11):14585-14594. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. Reports from Shanghai Jiao-Tong University Advance Knowledge in Neurodegenerative Diseases (Isoflurane neurotoxicity involves activation of hypoxia inducible factor-l alpha via intracellular calcium in neonatal rodents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Previously, we found that the inhaled anesthetic isoflurane up-regulated the transcriptional factor hypoxia inducible factor (HIF)-l alpha protein levels during induction of neurodegeneration in the brain of neonatal rats. Here, we investigated the role of HIF-l alpha and the underlying signaling pathway in the neurodegeneration induced by isoflurane in rodent developing brain."

The news reporters obtained a quote from the research from Shanghai Jiao-Tong University, "Primary hippocampal neurons were exposed to isoflurane (0.4 mM) for 12 h. Neuron injury was analyzed by 3-(4,5-dimethyithiazol-2-yl)-2,5-diphenyl-tetra-zolium bromide (MIT) test and quantification of lactate dehydrogenase release. HIF-l alpha gene expression and transcriptional activity, cleaved caspase-3 and phosphoinositide phospholipase C (PLC)-gamma gene expression were quantified. Cytosolic calcium concentration was measured by calcium imagining. The role of HIF-l alpha on juvenile learning and memory impairment induced by isoflurane was studied by fear conditioning and extinction test and Morris water maze test. Isoflurane induced HIF-l alpha gene expression and transcriptional activity in vitro. Furthermore, pharmacological inhibition of HIF-l alpha or knockdown of HIF-la by shRNA counteracted the neurotoxicity of isoflurane. Ca2+ signaling pathways involving PLC-gamma activation are required for isoflurane-evoked HIF-l alpha accumulation. Finally, partial deficiency of HIF-la attenuated isoflurane-induced neurodegeneration in developing brain, and alleviated juvenile learning and memory impairment induced by isoflurane."

According to the news reporters, the research concluded: "HIF-l alpha activation via cytosolic Ca2+ signaling pathway play a role in the mechanism of isoflurane-induced neurodegeneration in neonatal rodents, suggesting HIF-l alpha as a potential therapeutic target for the prevention of the deleterious effects of prolonged exposures to anesthetics."

For more information on this research see: Isoflurane neurotoxicity involves activation of hypoxia inducible factor-l alpha via intracellular calcium in neonatal rodents. Brain Research, 2016;1653():39-50. Brain Research can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Heart Disorders and Diseases - Cardiomyopathies

Reports from Shinshu University Add New Data to Findings in Cardiomyopathies (Regression of left ventricular hypertrabeculation is associated with improvement in systolic function and favorable prognosis in adult patients with non-ischemic ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Cardiomyopathies have been presented. According to news originating from Matsumoto, Japan, by NewsRx correspondents, research stated, "We sometimes experience regression of left ventricular hypertrabeculation (LVHT), which is compatible with the diagnosis of LV non-compaction cardiomyopathy (LVNC) in adult patients. However, little is known about the association between LVHT regression and LV systolic function in adult patients."

Our news journalists obtained a quote from the research from Shinshu University, "We prospectively examined 23 consecutive adult patients who fulfilled the echocardiographic criteria for LVNC. LV reverse remodeling (RR) was defined as an absolute increase in LV ejection fraction of >10% at 6 months follow-up. LVHT area was calculated by subtraction from the outer edge to the inner edge of the LVHT at end-systole. The mean follow-up period was 61 months. LVRR was observed in 9 patients (39%). The changes in the mean LVHT area showed significant correlation with the changes in LV ejection fraction (r = -0.78, p< 0.0001). Cardiac death occurred in 7 patients (50%) without LVRR, but no patients with LVRR died (log-rank, p = 0.003). Furthermore, composite of cardiac death and hospitalization for heart failure occurred in 10 patients (71%) without LVRR, whereas there was one patient with LVRR (log-rank, p< 0.001). Regression of LVHT is associated with improvement in LV systolic function."

According to the news editors, the research concluded: "LVRR might be associated with a favorable prognosis in patients with LVHT."

For more information on this research see: Regression of left ventricular hypertrabeculation is associated with improvement in systolic function and favorable prognosis in adult patients with non-ischemic cardiomyopathy. Journal of Cardiology, 2016;68(5-6):431-438. Journal of Cardiology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Gastroenterology

Reports from Showa University Advance Knowledge in
Gastroenterology (Oxygenated Static Preservation of Donation after
Cardiac Death Liver Grafts Improves Hepatocyte Viability and Function)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Gastroenterology. According to news
reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "Cell therapy,
such as hepatocyte transplantation (HTx), is promising for the treatment of metabolic liver
diseases or as a bridge to orthotopic liver transplantation in patients with fulminant liver failure.
However, one of the limitations of this therapy is the shortage of donors."

The news reporters obtained a quote from the research from Showa University, "The
present study aims to investigate whether the two-layer method (TLM) of cold preservation with
oxygenation improves the viability and activity of hepatocytes from rat donation after cardiac
death (DCD) donors compared with results obtained with the University of Wisconsin (UW)
solution. Moreover, we evaluated the hepatocyte function after culture or transplantation into
the spleen. We used male Sprague-Dawley rats for this study. The DCD model was induced by
phrenotomy after injecting heparin. We assigned rats based on warm ischemia times of 15 and
30 min to groups S and L, respectively. Each group (n=5) was then subdivided as follows: (1)
group S: not preserved (S/N), preserved by TLM for 3 h (S/TLM3) and 12 h (S/TLM12), and in
the UW solution for 3 h (S/UW3) and 12 h (S/UW12), and (2) group L: not preserved (L/N),
preserved by TLM for 3 h (L/TLM3) and 12 h (L/TLM12), and in the UW solution for 3 h
(L/UW3) and 12 h (L/UW12). The cell viability and function of isolated DCD hepatocytes were
analyzed for culture or HTx into the spleen. The viability and ATP levels of DCD hepatocytes
significantly improved after TLM compared with the values after preservation in cold UW
solution in group S/N (p <0.059). The levels of albumin production and urea synthesis by
hepatocytes after culture were significantly higher in groups S/TLM3 and S/TLM12 than in
groups S/UW3 and S/UW12 (p <0.05), respectively. Further, serum albumin levels after HTx
were also markedly higher in groups S/TLM3 and S/TLM12 than in groups S/UW3 and
S/UW12. The morphological features revealed that cultured and transplanted hepatocytes
remained clearly viable and maintained an expression for specific hepatic function, such as the
production of albumin and glycogen."

According to the news reporters, the research concluded: "This novel method of
oxygenated cold preservation of DCD livers can expand the hepatocyte donor pool for HTx and
establish a wider application of this developing technique."

For more information on this research see: Oxygenated Static Preservation of
Donation after Cardiac Death Liver Grafts Improves Hepatocyte Viability and Function.
Reports from Sibley Heart Center Advance Knowledge in Cardiology (Echocardiographic Predictors of Left Ventricular Outflow Tract Obstruction following Repair of Atrioventricular Septal Defect)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "Left ventricular outflow tract obstruction (LVOTO) is a common complication following surgical repair of atrioventricular septal defect (AVSD). We sought to determine predictors of LVOTO based on echocardiograms performed prior to initial repair of AVSD."

Our news journalists obtained a quote from the research from Sibley Heart Center, "Of the 415 children that had repair of AVSD from 2003 to 2012, 17 children were identified with LVOTO that required surgical intervention. Thirty-four patients with repaired AVSD and no LVOTO served as controls. Patient demographics, cardiac surgery type, and echocardiogram results at last follow-up were collected. Off-line analysis of the echocardiogram prior to AVSD repair was done to obtain: left ventricular outflow tract (LVOT) and interventricular septal diameter, chordae across LVOT, aortoseptal angle, left ventricular (LV) inflow/outflow length ratio, inferior displacement of the atrioventricular (AV) valve, atrioventricular valve index (AVVI) and presence of coarctation of the aorta. The LVOTO group had significantly smaller indexed LVOT diameters (P <.001), increased likelihood of chordae crossing the LVOT (P=.010), decreased LV inflow/outflow length ratio (P <.001), decreased AVVI (P5.014) and increased presence of coarctation of the aorta (P=.003) compared to control patients. A multiple logistic regression model including presence of chordae in the LVOT [OR 5.32, 95% CI: (1.24-22.78, P=.024] and an indexed LVOT diameter <= 2.5 cm/m(2) [OR 5.41, 95% CI: (1.15-25.39) P5.032] demonstrated each to be independently associated with the development of LVOT obstruction (area under the receiving operating curve=0.77). Chordae across the LVOT and an indexed LVOT diameter of <= 2.5 cm/m(2) are associated with a higher risk of development of LVOTO following repair of AVSD."

According to the news editors, the research concluded: "Identification of these risk factors on echocardiogram prior to initial AVSD repair can be useful in evaluating for future
risk of LVOTO and the need for closer clinical follow-up."

For more information on this research see: Echocardiographic Predictors of Left Ventricular Outflow Tract Obstruction following Repair of Atrioventricular Septal Defect. *Congenital Heart Disease*, 2016;11(6):554-561. *Congenital Heart Disease* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. **Oncology - Esophageal Cancer**

**Reports from Sichuan University Advance Knowledge in Esophageal Cancer (Early enteral nutrition compared with parenteral nutrition for esophageal cancer patients after esophagectomy: a meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Esophageal Cancer. According to news reporting out of Chengdu, People's Republic of China, by NewsRx editors, research stated, "Early postoperative enteral nutrition (EN) after esophagectomy in esophageal cancer patient has been reported to be correlated with a better rehabilitation than parenteral nutrition (PN). However, a robust conclusion has not been achieved."

Our news journalists obtained a quote from the research from Sichuan University, "Therefore, we performed a meta-analysis to compare the postoperative EN and PN in patients with esophageal cancer undergoing esophagectomy. Three electronic databases were searched for eligible studies to be included in the meta-analysis. The summary relative risk/weighted mean difference (RR/ WMD) estimates and corresponding 95% confidence interval (CI) were calculated using fixed-and random-effects models. Ten studies met the inclusion criteria. The analysis demonstrated that the early postoperative EN could significantly decrease the pulmonary complications (RR = 0.37, 95% CI = 0.22-0.62, P = 0.00, test for heterogeneity: I-2 = 0.0%, P = 0.89) and anastomotic leakage (RR = 0.46, 95% CI = 0.22-0.96, P = 0.04, test for heterogeneity: I-2 = 0.0%, P = 0.66) compared with PN. On the eighth postoperative day, the EN group had a higher levels of albumin (WMD = 1.84, 95% CI = 0.47-3.21, P = 0.01, test for heterogeneity: I-2 = 84.5%, P = 0.00) and prealbumin (WMD = 12.96, 95% CI = 3.63-22.29, P = 0.01, test for heterogeneity: I-2 = 0.0%, P = 0.63) compared with the PN group. However, there was no difference in digestive complications between these two approaches (RR = 1.30, 95% CI = 0.79-2.13, P = 0.30, test for heterogeneity: I-2 = 0.0%, P = 0.97)."

According to the news editors, the research concluded: "For patients with esophageal cancer following esophagectomy, the early postoperative EN support could decrease the morbidity of severe complications, such as pulmonary complications and anastomotic leakage,
and maintain patients at a better nutritional status than parenteral nutrition support."

Our news journalists report that additional information may be obtained by contacting L.Q. Chen, Sichuan University, West China Hosp, Dept. of Thorac Surg, Chengdu 610041, Sichuan, People's Republic of China. Additional authors for this research include J. Cai, Z.X. Niu and L.Q. Chen.

Keywords for this news article include: Chengdu, People's Republic of China, Asia, Parenteral Nutrition, Nutritional Support, Diet and Nutrition, Enteral Nutrition, Esophageal Cancer, Gastroenterology, Feeding Methods, Esophagectomy, Oncology, Surgery, Sichuan University.

**Viral RNA**

**Reports from Singapore National University Provide New Insights into Viral RNA (RNA-binding protein CPEB1 remolds host and viral RNA landscapes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Viral RNA is the subject of a report. According to news originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Host and virus interactions occurring at the post-transcriptional level are critical for infection but remain poorly understood. Here, we performed comprehensive transcriptome-wide analyses revealing that human cytomegalovirus (HCMV) infection results in widespread alternative splicing (AS), shortening of 3' untranslated regions (3' UTRs) and lengthening of poly(A)-tails in host gene transcripts."

Our news journalists obtained a quote from the research from Singapore National University, "We found that the host RNA-binding protein CPEB1 was highly induced after infection, and ectopic expression of CPEB1 in noninfected cells recapitulated infection-related post-transcriptional changes. CPEB1 was also required for poly(A)-tail lengthening of viral RNAs important for productive infection. Strikingly, depletion of CPEB1 reversed infection related cytopathology and post-transcriptional changes, and decreased productive HCMV titers. Host RNA processing was also altered in herpes simplex virus-2 (HSV-2)-infected cells, thereby indicating that this phenomenon might be a common occurrence during herpesvirus infections."

According to the news editors, the research concluded: "We anticipate that our work may serve as a starting point for therapeutic targeting of host RNA-binding proteins in herpesvirus infections."

For more information on this research see: RNA-binding protein CPEB1 remolds host and viral RNA landscapes. *Nature Structural & Molecular Biology*, 2016;23(12):1101-1110. *Nature Structural & Molecular Biology* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Nature Publishing Group -
Reports from Soochow University Provide New Insights into Type 2 Diabetes (Increased angiopoietin-like protein 8 levels in patients with type 2 diabetes and cardiovascular disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "In the present study, we recruited 124 patients with type 2 diabetes, among which 22 had a history of cardiovascular disease (CVD)."

Our news journalists obtained a quote from the research from Soochow University, "The study demonstrated that compared with type 2 diabetes without CVD, those with CVD had remarkably higher levels of angiopoietin-like protein 8 (ANGPTL8)."

According to the news editors, the research concluded: "Moreover, the close relationship between ANGPTL8 and CVD was independent of conventional CVD risk factors."

The news correspondents report that additional information may be obtained from J. Hu, Soochow Univ, Affiliated Hosp 2, Dept. of Endocrinol, Suzhou, Jiangsu, People's Republic of China. Additional authors for this research include C. Fang, H.M. Guo and J. Hu.

**Mycobacterium Infections - Tuberculosis**

**Reports from Southern Medical University Advance Knowledge in Tuberculosis (Microarray analysis of long noncoding RNA and mRNA expression profiles in human macrophages infected with Mycobacterium tuberculosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Mycobacterium Infections - Tuberculosis are discussed in a new report. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Macrophages play a crucial role in the control and elimination of invading Mycobacterium tuberculosis (Mt), and also serve as the major residence for Mt. However, the interaction between macrophages and Mt remains to be clearly determined."

Our news editors obtained a quote from the research from Southern Medical University, "Although long noncoding RNAs (lncRNAs) have emerged as key regulators in many biological processes, their roles in anti-mycobacterial responses of macrophages remain to be elucidated. Here, we applied microarray analysis to examine lncRNA and mRNA expression profiles in human primary macrophages after 72 h of infection with H37Ra or H37Rv. Our results revealed that many lncRNAs were differentially expressed in macrophages after H37Ra or H37Rv infection, indicating a possible role for lncRNAs in immune responses induced by Mt infection and providing important cues for further functional studies. Furthermore, gene ontology (GO) and Kyoto Encyclopedia of Genes and Genomes (KEGG) biological pathway analysis of the differentially expressed mRNAs showed the potential functions and pathways related to the pathogenesis of Mt infection. Finally, two lncRNAs, MIR3945HG V1 and MIR3945HG V2, were identified as novel candidate diagnostic markers for tuberculosis."

According to the news editors, the research concluded: "Our results provide novel insight into the mechanisms of the pivotal Mt-macrophage interactions, and reveal potential targets for diagnostics and the treatment of tuberculosis."

Reports from Southern Medical University Highlight Recent Findings in Crohn's Disease (Involvement of Activated Cdc42 Kinase1 in Colitis and Colorectal Neoplasms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Crohn's Disease have been published. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Activated Cdc42 kinase1 (ACK1) is a non-receptor tyrosine kinase which is critical for cell survival, proliferation, and migration. Genomic amplification of ACK1 has been reported in multiple human cancers."

Our news editors obtained a quote from the research from Southern Medical University, "We aimed to investigate ACK1 protein expression in colorectal mucosa with inflammation and neoplasm, and to evaluate its correlation with disease activity and severity. A total of 250 individuals who underwent total colonoscopy were collected randomly from January 2007 to May 2013 in Nanfang Hospital, Guangzhou, China. Colorectal mucosal biopsy specimens were obtained by endoscopy from 78 patients with ulcerative colitis (UC), 22 with Crohn's disease (CD), 20 with infectious colitis, 26 with non-IBD and noninfectious colitis, 16 with sporadic adenomas, 4 with dysplasia-associated lesions or masses, 10 with sporadic colorectal cancer (CRC), 4 with UC-related CRC, 10 with hyperplastic polyps, and 60 without colonic abnormalities. ACK1 protein levels were determined immunohistochemically. The correlations of ACK1 expression with disease activity and severity were also evaluated. Significantly increased ACK1 expression was observed in epithelial cells of colorectal mucosa with inflammation and dysplasia compared to controls (P <0.05). ACK1 expression correlated with clinical activity in IBD (chi(2)=4.57, P=0.033 for UC; chi(2)=5.68, P=0.017 for CD), as well as grade of dysplasia in preneoplastic lesions (P <0.05). No significant differences in ACK1 expression were found between UC and CD, or between IBD and non-IBD conditions (P >0.05). ACK1 protein is increased extensively in colitis and colorectal dysplasia."

According to the news editors, the research concluded: "ACK1 overexpression may play a role in colorectal inflammation and neoplasms."

For more information on this research see: Involvement of Activated Cdc42 Kinase1 in Colitis and Colorectal Neoplasms. Medical Science Monitor, 2016;22():9-17. Medical Science Monitor can be contacted at: Int Scientific Literature, Inc, 361 Forest Lane, Smithtown, NY 11787, USA.

The news editors report that additional information may be obtained by contacting F.C. Zhi, Southern Med Univ, Nanfang Hosp, Dept. of Gastroenterol, Guangdong Prov Key Lab Gastroenterol, Guangzhou, Guangdong, People's Republic of China. Additional authors for this research include H.X. Gu, X.M. Zhao, L.Y. Huang, S.X. Zhou and F.C. Zhi.

Oncology - Small Cell Lung Cancer

Reports from Southern Medical University Provide New Insights into Small Cell Lung Cancer (New application of an old drug: Antitumor activity and mechanisms of doxycycline in small cell lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Small Cell Lung Cancer. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Small cell lung cancer (SCLC) remains one of the most aggressive tumors with a poor prognosis. The clinical outcome of SCLC patients has reached its plateau with the existing standard treatment and thus new therapies are urgently required."

Our news editors obtained a quote from the research from Southern Medical University, "Accumulating evidences have indicated that doxycycline, a commonly used antibiotic, has antitumor activity against several malignancies. However, whether doxycycline has antitumor activity in SCLC and its underlying mechanisms remain unclear. Our investigation demonstrated that doxycycline could significantly inhibit the proliferation and colony formulation of SCLC cells (p<0.05). Furthermore, both Hoechst 33258 dye staining and TUNEL assays indicated that doxycycline could induce remarkable apoptosis of H446 cells in a concentration-dependent manner. RT-PCR and western blot assays proved that apoptosis induction effect of doxycycline was achieved via inducing the expression of caspase-3 and bax, as well as attenuating the expression of survivin and bcl-2. Moreover, the wound healing assay and Transwell assay indicated that doxycycline could significantly suppress the migration and invasion of H446 cells in a concentration-dependent manner (p<0.05). ELISA assay proved that the inhibitory effect of doxycycline on the migration and invasion of H446 cells was achieved via decreasing the secretion of MMP-2, MMP-9 and VEGF, as well as increasing the secretion of TIMP-2. Taken together, doxycycline dose-dependently suppressed the proliferation, colony formulation, migration and invasion of SCLC cells, as well as induced apoptosis."

According to the news editors, the research concluded: "These findings encourage further investigations on the potential of doxycycline as a candidate drug for the treatment of SCLC."

The news editors report that additional information may be obtained by contacting S.Q. Wang, Dept. of Pharmacy, Nanfang Hospital, Southern Medical University, Guangzhou, Guangdong 510515, People's Republic of China. Additional authors for this research include B.X. Zhao, Y. Liu, Y.T. Wang, Q.Y. Liang, Y. Cai, Y.Q. Zhang, J.H. Yang, Z.H. Song and G.F
Reports from Spine Institute Provide New Insights into Aneurysm
(Separating the wheat from the chaff: region of interest combined with metal artifact reduction for completion angiography following cerebral aneurysm treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Aneurysm are discussed in a new report. According to news originating from Memphis, Tennessee, by NewsRx correspondents, research stated, "Following complicated endovascular or microsurgical treatments, assessment of radiographic outcome can be challenging due to device resolution and metallic artifact. Two-dimensional and three-dimensional angiography can reveal information about flow and aneurysm obliteration, but may be limited by beam hardening, overlapping vessels, and image degradation in the region of metallic implants."

Our news journalists obtained a quote from the research from Spine Institute, "In this study, we investigated the combination of a collimated volumetric imaging (volume of interest, VOI) protocol followed by metal artifact reduction (MAR) post processing to evaluate the correct positioning of stents, flow diveters, coils, and clips while limiting the radiation dose to the patient. Methods 9 patients undergoing 10 procedures were included in our study. All patients underwent endovascular or surgical treatment of a cerebral aneurysm involving stents, flow diverting stents, coils, and/or clips followed by either immediate or early postoperative evaluation of our protocol. Image datasets corrected for metallic artifacts (VOI-MAR) were judged to be better a statistically significant finding than image datasets only corrected for field of view truncation (VOI alone). Qualitatively, images were more interpretable and informative with regards to device position and apposition to the vessel wall for those cases involving a pipeline, and with regards to encroachment on the parent artery and possible residual aneurysm, in all cases."

According to the news editors, the research concluded: "VOI acquisition combined with MAR post-processing provides for accurate and informative evaluation of cerebral aneurysm treatment while limiting the radiation dose to patients."

The news correspondents report that additional information may be obtained from A.S. Arthur, Semmes Murphey Neurol & Spine Inst, Memphis, TN, United States. Additional authors for this research include C. Nickele, S. Schafer, S. Bauer, B. Scholz, L. Elijovich, D. Hoit, V.T. Doss and A.S. Arthur.

Proteins - DNA-Binding Proteins

Reports from St. James Hospital Describe Recent Advances in DNA-Binding Proteins (Molecular Mechanisms of Natural Honey Against H. pylori Infection Via Suppression of NF-kappa B and AP-1 Activation in Gastric Epithelial Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - DNA-Binding Proteins have been published. According to news reporting out of Dublin, Ireland, by NewsRx editors, research stated, "Natural honey has been used as a medicine since ancient times. Honey is widely known for its antibacterial properties against H. pylori; however, the mechanisms of its antibacterial activity are not fully known."

Our news journalists obtained a quote from the research from St. James Hospital, "The present study was performed to examine the molecular mechanisms by which natural honey can inhibit H. pylori infection in gastric epithelial cells. Electrophoretic mobility shift assay was used to measure NF-kappa B- and AP-1-DNA binding activity. Western blotting was used to detect I kappa B-alpha and COX-2 expression. H. pylori induced NF-kappa B and AP-1 DNA-binding activity in gastric epithelial cells. Manuka honey inhibited H. pylori-induced NF-kappa B and AP-1 in a time-and dose dependent manner. Maximum inhibition of H. pylori-induced NF-kappa B and AP-1 by manuka honey was observed at concentrations of 20% at 1-2 h. Pre-treatment of AGS cells with other commercial natural honeys also inhibited H. pylori-induced NF-kappa B and AP-1 DNA-binding activity. Honey prevented H. pylori-induced degradation of IKB-alpha protein and downregulated COX-2 protein levels. Our findings suggest that natural honey exerts its inhibitory effects against H. pylori by inhibiting NF-kappa B and AP-1 activation and downregulation of COX-2 expression."

According to the news editors, the research concluded: "These results provide new mechanistic insights into honey effects in the suppression of H. pylori infection."

For more information on this research see: Molecular Mechanisms of Natural Honey Against H. pylori Infection Via Suppression of NF-kappa B and AP-1 Activation in Gastric Epithelial Cells. Archives of Medical Research. 2016;47(5):340-348. Archives of Medical Research can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Reports from St. John's University Add New Data to Findings in Biguanides (Activation of AMP-activated Protein Kinase by Metformin Induces Protein Acetylation in Prostate and Ovarian Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Biguanides. According to news reporting from Queens, New York, by NewsRx journalists, research stated, "AMP-activated protein kinase (AMPK) is an energy sensor and master regulator of metabolism. AMPK functions as a fuel gauge monitoring systemic and cellular energy status."

Financial support for this research came from National Institute of General Medical Sciences.

The news correspondents obtained a quote from the research from St. John's University, "Activation of AMPK occurs when the intracellular AMP/ATP ratio increases and leads to a metabolic switch from anabolism to catabolism. AMPK phosphorylates and inhibits acetyl-CoA carboxylase (ACC), which catalyzes carboxylation of acetyl-CoA to malonyl-CoA, the first and rate-limiting reaction in de novo synthesis of fatty acids. AMPK thus regulates homeostasis of acetylCoA, a key metabolite at the crossroads of metabolism, signaling, chromatin structure, and transcription. Nucleocytosolic concentration of acetyl-CoA affects histone acetylation and links metabolism and chromatin structure. Here we show that activation of AMPK with the widely used antidiabetic drug metformin or with the AMP mimic 5-aminoimidazole-4-carboxamide ribonucleotide increases the inhibitory phosphorylation of ACC and decreases the conversion of acetyl-CoA to malonyl-CoA, leading to increased protein acetylation and altered gene expression in prostate and ovarian cancer cells. Direct inhibition of ACC with allosteric inhibitor 5-(tetradecyloxy)-2-furoic acid also increases acetylation of histones and non-histone proteins. Because AMPK activation requires liver kinase B1, metformin does not induce protein acetylation in liver kinase B1-deficient cells."

According to the news reporters, the research concluded: "Together, our data indicate that AMPK regulates the availability of nucleocytosolic acetyl-CoA for protein acetylation and that AMPK activators, such as metformin, have the capacity to increase protein acetylation and alter patterns of gene expression, further expanding the plethora of metformin's physiological effects."

For more information on this research see: Activation of AMP-activated Protein Kinase by Metformin Induces Protein Acetylation in Prostate and Ovarian Cancer Cells. Journal of Biological Chemistry, 2016;291(48):25154-25166. Journal of Biological Chemistry can be contacted at: Amer Soc Biochemistry Molecular Biology Inc, 9650 Rockville Pike,

Cardiovascular Diseases and Conditions -...

Reports from Stanford University Describe Recent Advances in Arteriosclerosis (Protective Effects of Statins in Cancer: Should They Be Prescribed for High-Risk Patients?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Arteriosclerosis are presented in a new report. According to news reporting originating in Stanford, California, by NewsRx journalists, research stated, "Purpose of Review Statins are one of the most widely prescribed drug classes in the USA. This review aims to summarize recent research on the relationship between statin use and cancer outcomes, in the context of clinical guidelines for statin use in patients with cancer or who are at high risk for cancer."

The news reporters obtained a quote from the research from Stanford University, "A growing body of research has investigated the relationship between statins and cancer with mixed results. Cancer incidence has been more extensively studied than cancer survival, though results are inconsistent as some large meta-analyses have not found an association, while other studies have reported improved cancer outcomes with the use of statins. Additionally, two large studies reported increased all-cancer survival with statin use. Studies on specific cancer types in relation to cancer use have also been mixed, though the most promising results appear to be found in gastrointestinal cancers. Few studies have reported an increased risk of cancer incidence or decreased survival with statin use, though this type of association has been more commonly reported for cutaneous cancers. The overall literature on statins in relation to cancer incidence and survival is mixed, and additional research is warranted before any changes in clinical guidelines can be recommended. Future research areas include randomized controlled trials, studies on specific cancer types in relation to statin use, studies on populations without clinical indication for statins, elucidation of underlying biological mechanisms, and investigation of different statin types."

According to the news reporters, the research concluded: "However, studies seem to suggest that statins may be protective and are not likely to be harmful in the setting of cancer,"
suggesting that cancer patients who already take statins should not have this medication discontinued."

For more information on this research see: Protective Effects of Statins in Cancer: Should They Be Prescribed for High-Risk Patients? *Current Atherosclerosis Reports, 2016;18* (12):28-34. *Current Atherosclerosis Reports* can be contacted at: Current Medicine Group, 400 Market Street, Ste 700, Philadelphia, PA 19106, USA. **Drugs and Therapies - Antifungals**

**Reports from Statens Serum Institute Add New Data to Findings in Antifungals (Resistance in human pathogenic yeasts and filamentous fungi: prevalence, underlying molecular mechanisms and link to the use of antifungals in humans and the ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antifungals have been published. According to news reporting originating in Copenhagen, Denmark, by NewsRx editors, the research stated, "Antifungal drug resistance is a multifaceted clinical challenge, and when present, a primary cause of treatment failure in patients with severe fungal infections. Changing epidemiology, increasing resistance rates and a narrow antifungal armamentarium may further underline the required attention on resistance particularly within the most prevalent invasive fungal infections caused by Candida yeasts and Aspergillus moulds."

The news reporters obtained a quote from the research from Statens Serum Institute, "In Denmark, the resistance epidemiology remains to be fully elucidated. This thesis sought to address this demand as well as provide insight into the landscape of underlying molecular resistance mechanisms. Paper I and II both contributed to the understanding of FKS (beta-glucan synthase) mediated echinocandin resistance in Candida species. Paper I covered a unique stepwise acquisition of a homozygous mutation in FKS1 of Candida tropicalis leading to an amino acid change corresponding to a well-known S645P in Candida albicans. Paper II presented a failure case due to Candida krusei displaying high-level echinocandin resistance likely attributable to an acquired D662Y amino acid substitution in FKS1. Intrinsic differences in FKS1 among Candida species may explain why the level of resistance both depends on the mutation as well as the species and cannot be easily translated to the level of clinical resistance. Intrinsic fluconazole resistance in C. krusei further substantiated the clinical implications of acquired echinocandin resistance. Paper III presented a rare multidrug resistance case in a series of isogenic C. albicans isolates, almost covering the entire spectrum of known resistance mechanisms in Candida and involved the proposal of novel resistance mutations. An A61E
change in ERG11 was potentially involved in reduced susceptibility to long-structured azoles. Increased expression levels of azole efflux pumps were probably accredited to novel gain-of-function variants in the transcription factor TAC1 (R688Q and R673L). Echinocandin resistance was induced by the well-known S645P variant of FKS1 and polyene resistance was likely inflicted by a frameshift mutation in ERG2 leading to loss of function of the encoded protein and subsequent ergosterol depletion. The number of acquired resistance cases is increasing in our settings and Paper IV sought to illuminate whether antifungal resistance is overlooked in the current fungaemia programme. This involved the acquisition of post-treatment oral isolates from 193 Candidaemia patients among which 114 received azoles (primarily fluconazole) and 85 received an echinocandin (and some both). Azole exposed patients carried a significantly higher proportion of species less susceptible to fluconazole (primarily Candida glabrata) among colonising Candida compared to baseline blood isolates (P <0.001). A similar trend was seen for echinocandin treated patients although not statistically significant. Interestingly, there was a high frequency of acquired resistance, 29.4% to fluconazole and 21.6% to echinocandins, among colonising C. glabrata isolates post treatment. These figures were both significantly higher compared to baseline blood isolates as well as oral isolates from patients with no or minimal exposure to either drug class. In contrast, acquired resistance among C. albicans oral isolates was rare (<5%). Thus, the oral cavity may be an unrecognized reservoir of resistant Candida species, especially C. glabrata following azole or echinocandin treatment. This underlines the care of which therapeutic stewardship must be taken both for antifungal naive patients, to avoid resistance development, as well as for patients previously exposed to antifungals. Paper VI was a retrospective laboratory based study and aimed to elucidate the prevalence of azole resistance in A. fumigatus isolates from 2010-2014 in Denmark. This study also sought to uncover the underlying resistance mechanisms, primarily attributable to CYP51A mutations, and finally to assess the accumulated genotyping data. Among 1162 A. fumigatus isolates, 94.5% were screened for azole resistance and a significant increasing trend was observed for the number of azole resistant isolates to approximately 6% in 2014 (P <0.001) and 4% in corresponding patients (P <0.05). The underlying resistance mutations were diverse but still dominated by the TR34/L98H resistance mechanism responsible for >50% of all our azole resistant isolates. The genotyping data of resistant and a selection of susceptible A. fumigatus showed high identity to foreign isolates (>15%). This could argue for the hypothesis on clonal expansion, which has previously been suggested for TR34/L98H clones in the Netherlands and India, but could also indicate an insufficient discriminatory power of such analysis. Still, a proposed A. fumigatus outbreak in a haematology ward was unresolved since no genetically identical isolates were recovered from patients and air samples, illustrating the ubiquitous nature of this organism. Overall, the main concerns are a changing Candida epidemiology towards species less susceptible to fluconazole combined with the rapid acquisition of echinocandin resistance, especially among C. glabrata isolates. For A. fumigatus, the concern is the emergence of azole resistant strains in the environment, displaying cross-resistance to clinical azoles, and thus posing unforeseen clinical challenges in the management of invasive aspergillosis. Collectively, these findings call for an increased awareness especially at clinical microbiology laboratories, which ideally would lead to susceptibility testing of all clinically relevant isolates by reference or validated methods."

According to the news reporters, the research concluded: "Moreover, novel diagnostic approaches for non-culturable pathogens are warranted and especially DNA based detection by PCR may serve as a solid complimentary tool for improved diagnostics of invasive fungal infections."

**Cardiovascular Diseases**

**Reports from Sultan Qaboos University Hospital Highlight Recent Findings in Cardiovascular Diseases (Dyslipidaemia in the Middle East: Current status and a call for action)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases have been published. According to news reporting from Muscat, Oman, by NewsRx journalists, research stated, "The increase in the cardiovascular disease (CVD)-associated mortality rate in the Middle East (ME) is among the highest in the world. The aim of this article is to review the current prevalence of dyslipidaemia and known gaps in its management in the ME region, and to propose initiatives to address the burden of dyslipidaemia."

Financial support for this research came from Sanofi.

The news correspondents obtained a quote from the research from Sultan Qaboos University Hospital, "Published literature on the epidemiology of dyslipidaemia in the ME region was presented and discussed at an expert meeting that provided the basis of this review article. The high prevalence of metabolic syndrome, diabetes, familial hypercholesterolaemia (FH) and consanguineous marriages, in the ME region, results in a pattern of dyslipidaemia (low high-density lipoprotein cholesterol and high triglycerides) that is different from many other regions of the world. Early prevention and control of dyslipidaemia is of paramount importance to reduce the risk of developing CVD."

According to the news reporters, the research concluded: "Education of the public and healthcare professionals and developing preventive programs, FH registries and regional guidelines on dyslipidaemia are the keys to dyslipidaemia management in the ME region."

Oncology - Lung Cancer
Reports from Sun Yat Sen University Describe Recent Advances in Lung Cancer (PTEN expression is associated with the outcome of lung cancer: evidence from a meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Lung Cancer have been presented. According to news originating from Guangdong, People’s Republic of China, by NewsRx correspondents, research stated, "Various studies examined the relationship between the expression of phosphatase and tensin homolog (PTEN) with the clinical outcome in patients with lung cancer, but yielded conflicting results. EVIDENCE ACQUISITION: Electronic databases updated to January 2016 were searched to find relevant studies."

Our news journalists obtained a quote from the research from Sun Yat Sen University, "A meta-analysis was conducted with eligible studies which quantitatively evaluated the relationship between the expression of PTEN and clinical outcomes of patients with lung cancer. Subgroup and sensitivity analysis were conducted. EVIDENCE SYNTHESIS: A total of 13 studies were included. When compared with high PTEN expression group, the lung cancer patients with reduced PTEN expression exhibited shorter overall survival (hazard ratio=0.40, 95%CI=0.32 similar to 0.52, P<0.001) and shorter progression-free survival (hazard ratio=0.53, 95%CI=0.38 similar to 0.74, P<0.001). In subgroup analysis, among lung cancer patients whose treatments including EGFR TKIs, we observed significant benefits of OS in high PTEN expression group. Reduced PTEN expression may be an indicator for poor prognosis in patients with lung cancer. It could have the same influence for patients whose treatments include EGFR-TKIs."

According to the news editors, the research concluded: "The presence of PTEN expression may define a subset of patients with lung cancer appropriate for investigational therapeutic strategies."

For more information on this research see: PTEN expression is associated with the outcome of lung cancer: evidence from a meta-analysis. Minerva Medica, 2016;107(5):342-351. Minerva Medica can be contacted at: Edizioni Minerva Medica, Corso Bramante 83-85 Int Journals Dept., 10126 Turin, Italy.

Heart Disorders and Diseases - Ventricular Fibrillation

Reports from Sun Yat Sen University Describe Recent Advances in Ventricular Fibrillation (Long-term treatment of spontaneously hypertensive rats with PD123319 and electrophysiological remodeling of left ventricular myocardium)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Ventricular Fibrillation. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "To investigate the effects of PD123319, an antagonist of angiotensin II subtype-2 receptor (AT2R), on the electrophysiological characteristics of the left ventricular hypertrophic myocardium in spontaneously hypertensive rats (SHR). A total of twenty-four 10-week-old male SHR were divided into two groups: PD123319 and non-PD123319 groups (n = 12 in each)."

Financial support for this research came from Science and Technology Department of Guangdong Province.

The news correspondents obtained a quote from the research from Sun Yat Sen University, "Twelve 10-week-old Wistar-Kyoto rats served as the control group. Systolic blood pressure, left ventricular mass index (LVMI), ventricular effective refractory period, and ventricular fibrillation threshold were also measured after 8 weeks. I (Na), I (CaL), I (to), and membrane capacitance were measured in the left ventricular myocytes after 8 weeks by whole-cell patch clamp. PD123319 increased LVMI compared with the non-PD123319 group (PD123319 vs. non-PD123319, 3.83 +/- 0.11 vs. 3.60 +/- 0.19 mg/g; P< 0.01). PD123319 also decreased the ventricular fibrillation threshold compared with the non-PD123319 group (PD123319 vs. non-PD123319, 14.75 +/- 0.65 vs. 16.0 +/- 0.86 mA; P< 0.01). PD123319 enhanced membrane capacitance compared with the non-PD123319 group (PD123319 vs. non-PD123319, 283.63 +/- 5.80 vs. 276.50 +/- 4.28 pF; P< 0.05). PD123319 increased the density of I (CaL) compared with the non-PD123319 group (PD123319 vs. non-PD123319, -6.76 +/- 0.48 vs. -6.13 +/- 0.30 pA/pF; P< 0.05). PD123319 decreased the density of I (to) compared with the non-PD123319 group (PD123319 vs. non-PD123319, 11.49 +/- 0.50 vs. 12.23 +/- 0.36 pA/pF; P< 0.05)."

According to the news reporters, the research concluded: "Long-term treatment with PD123319 worsened the development of myocyte hypertrophy and associated electrophysiological alterations in spontaneously hypertensive rat."

For more information on this research see: Long-term treatment of spontaneously hypertensive rats with PD123319 and electrophysiological remodeling of left ventricular myocardium. Naunyn-Schmiedebergs Archives of Pharmacology, 2016;389(12):1333-1340. Naunyn-Schmiedebergs Archives of Pharmacology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.

Oncology - Breast Cancer

Reports from Sun Yat Sen University Highlight Recent Findings in
Breast Cancer (Clinical features of brain metastases in breast cancer: an
implication for hippocampal-sparing whole-brain radiation therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According
to news originating from Guangdong, People's Republic of China, by NewsRx correspondents,
research stated, "The objectives of this study were to describe the distribution of brain
metastases (BM) in breast cancer patients and investigate the risk factors for perihippocampal
metastases (PHM). Retrospective analysis of the clinicopathological characteristics and patterns
of BM was performed."

Our news journalists obtained a quote from the research from Sun Yat Sen
University, "Associations between clinicopathological characteristics and PHM (the
hippocampus plus 5 mm margin) were evaluated using logistic regression analyses. A total of
1,356 brain metastatic lesions were identified in 192 patients. Patients with 1-3 BM, 4-9 BM,
and >10 BM accounted for 63.0%, 18.8%, and 18.2%, respectively. There were only 7 (3.6%)
patients with hippocampal metastases (HM) and 14 (7.3%) patients with PHM. On logistic
regression, the number of BM was an independent risk factor for PHM. Patients with > 10 BM
had a significantly higher risk of PHM compared with those with,10 BM. Breast cancer subtype
(BCS) was not associated with PHM. The number of BM was significantly correlated with
various BCSs. Patients with hormone receptor (HR)+/human epidermal growth factor receptor 2
(HER2)+, HR-/HER2+, and HR-/HER2-subtypes had a higher probability of >= 10 BM, relative
to patients with an HR+/HER2-subtype. Our study suggests that a low incidence of PHM may
be acceptable to perform hippocampal-sparing whole-brain radiation therapy for breast cancer
patients."

According to the news editors, the research concluded: "Patients with extensive
diffuse metastases (>= 10 BM) were associated with higher odds of PHM."

For more information on this research see: Clinical features of brain metastases in
breast cancer: an implication for hippocampal-sparing whole-brain radiation therapy.

Reports from Sun Yat-Sen University Advance Knowledge in Cancer Therapy (Discovering new mTOR inhibitors for cancer treatment through virtual screening methods and in vitro assays)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cancer Therapy have been published. According to news reporting out of Guangzhou, People's Republic of China, by NewsRx editors, research stated, "Mammalian target of rapamycin (mTOR) is an attractive target for new anticancer drug development. We recently developed in silico models to distinguish mTOR inhibitors and non-inhibitors."

Our news journalists obtained a quote from the research from Sun Yat-Sen University, "In this study, we developed an integrated strategy for identifying new mTOR inhibitors using cascaded in silico screening models. With this strategy, fifteen new mTOR kinase inhibitors including four compounds with IC50 values below 10 mM were discovered. In particular, compound 17 exhibited potent anticancer activities against four tumor cell lines, including MCF-7, HeLa, MGC-803, and C6, with IC50 values of 1.90, 2.74, 3.50 and 11.05 mM. Furthermore, cellular studies and western blot analyses revealed that 17 induces cell death via apoptosis by targeting both mTORC1 and mTORC2 within cells and arrests the cell cycle of HeLa at the G1/G0-phase. Finally, multi-nanosecond explicit solvent simulations and MM/GBSA analyses were carried out to study the inhibitory mechanisms of 13, 17, and 40 for mTOR."

According to the news editors, the research concluded: "The potent compounds presented here are worthy of further investigation."

For more information on this research see: Discovering new mTOR inhibitors for cancer treatment through virtual screening methods and in vitro assays. Scientific Reports, 2016;6():18987. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Reports from Sungkyunkwan University Provide New Insights into Histone Deacetylase Inhibitors (Compound 9a, a novel synthetic histone deacetylase inhibitor, protects against septic injury in mice by suppressing MAPK signalling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Histone Deacetylase Inhibitors is the subject of a report. According to news reporting out of Suwon, South Korea, by NewsRx editors, research stated, "Sepsis is a life-threatening clinical condition characterized by uncontrolled inflammatory responses and is a major cause of death in intensive care units. Histone deacetylase (HDAC) inhibitors have recently exhibited anti-inflammatory properties."

Financial supporters for this research include So-Jin Kim, Korean government.

Our news journalists obtained a quote from the research from Sungkyunkwan University, "MAPK phosphatase (MKP) suppresses MAPK signalling, which plays an important role in inflammatory responses. The purpose of this study was to investigate the protective mechanisms of Compound 9a, a newly synthetized HDAC inhibitor, against septic injury. The anti-inflammatory properties of Compound 9a were assayed in LPS-stimulated RAW264.7 cells. In vivo, polymicrobial sepsis was induced in C57BL/6 mice by caecal ligation and puncture (CLP). The mice were treated with Compound 9a (i.p., 10?mg/kg) 2h before and immediately after CLP. Compound 9a inhibited the increased production of TNF-a, IL-6 and NO in LPS-stimulated RAW264.7 cells. In mice with CLP, Compound 9a improved survival rate, attenuated organ injuries and decreased serum TNF-a and IL-6 levels. CLP increased expression of toll-like receptor 4, phosphorylated (p)-p38, p-JNK and p-ERK proteins, which was attenuated by Compound 9a. Compound 9a decreased MKP-1 association with HDAC1 and enhanced MKP-1 acetylation and enhanced MKP-1 association with p-p38 and p-ERK. Moreover, the inhibitory effects of Compound 9a on serum cytokine levels and phosphorylation of MAPK were abolished by MKP-1 siRNA."

According to the news editors, the research concluded: "Our findings suggest that Compound 9a protected against septic injury by suppressing MAPK-mediated inflammatory signalling."

Our news journalists report that additional information may be obtained by contacting S.J. Kim, School of Pharmacy, Sungkyunkwan University, Suwon, 440-746, South Korea. Additional authors for this research include K.S. Baek, H.J. Park, Y.H. Jung and S.M Lee.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bph.13414. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Lymphoma

Reports from Sungkyunkwan University School of Medicine Describe Recent Advances in Lymphoma (Successful Management of Primary Cardiac Lymphoma with Minimal Debulking Surgery Combined with Adjuvant Chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Lymphoma are discussed in a new report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Primary cardiac lymphoma (PCL) is a rare cardiac tumor with poor prognosis. Palliative chemotherapy is still considered to be the standard management tool for PCL."

Our news editors obtained a quote from the research from the Sungkyunkwan University School of Medicine, "A case of a 58-year-old man with a large right-heart tumor is presented. Echocardiography showed no abnormal findings except mild tricuspid stenosis with dynamic obstruction. To prevent sudden right heart failure, we pursued on-pump beating resection. After resection of the tumor near the tricuspid valve and confirmation of normalized hemodynamics by intraoperative transesophageal echocardiography, we decided not to perform a further debulking procedure, such as resection or reconstruction of the atrial/ventricular wall. The postoperative course was uneventful and the patient tolerated six cycles of adjuvant chemotherapy well. Currently, the patient visits the outpatient clinic regularly without definite evidence of lymphoma involvement on follow-up imaging studies. In cases where a rare malignant cardiac tumor is suspected, surgical resection should be considered a diagnostic tool for tissue confirmation, a therapeutic tool for hemodynamic correction, and a preventive strategy for sudden cardiac death."

According to the news editors, the research concluded: "Additionally, a minimal debulking procedure focusing on the area of hemodynamic disturbance appears to be sufficient in PCL cases."

For more information on this research see: Successful Management of Primary Cardiac Lymphoma with Minimal Debulking Surgery Combined with Adjuvant Chemotherapy. The Heart Surgery Forum, 2015;18(6):E242-4.

The news editors report that additional information may be obtained by contacting T.H. Hong, Dept. of Thoracic and Cardiovascular Surgery, Samsung Medical Center, Sungkyunkwan University School of Medicine, Seoul, South Korea.

Cardiology

Reports from Technical University Provide New Insights into Cardiology (Relation between detection rate and inappropriate shocks in single versus dual chamber cardioverter-defibrillator--an analysis from the OPTION trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting originating in Munich, Germany, by NewsRx journalists, research stated, "The programming of implantable cardioverter-defibrillators (ICDs) influences inappropriate shock rates. The aim of the study is to analyse rates of patients with appropriate and inappropriate shocks according to detection zones in the OPTION trial."

The news reporters obtained a quote from the research from Technical University, "All patients received dual chamber (DC) ICDs randomly assigned to be programmed either to single chamber (SC) or to DC settings including PARAD+ algorithm. In a post-hoc analysis, rates of patients with inappropriate and appropriate shocks were calculated for shocks triggered at heart rates (≥170 bpm (ventricular tachycardia zone) and at rates (≥200 bpm (ventricular fibrillation zone). In the SC group, higher rates of patients with total and inappropriate shocks were delivered at heart rates (≥170 bpm than at rates (≥200 bpm (total shocks: 21.1% vs. 16.6%; p=0.002; inappropriate shocks: 7.6% vs. 4.5%, p=0.016; appropriate shocks: 15.2% vs. 13.5%; p=n.s.). No such differences were observed in the DC group (total shocks: 14.3% vs. 12.6%; p=n.s.; inappropriate shocks: 3.9% vs. 3.6%; p=n.s.; appropriate shocks: 12.2% vs. 10.4%; p=n.s.)."

According to the news reporters, the research concluded: "The higher frequency of patients with total shocks with SC settings than with DC settings that benefit from PARAD+ was driven by a higher percentage of patients with inappropriate shocks in the VT zone (170-200 bpm) in the SC population."

For more information on this research see: Relation between detection rate and inappropriate shocks in single versus dual chamber cardioverter-defibrillator--an analysis from the OPTION trial. Scientific Reports, 2016;6():21748. (Nature Publishing Group - www.nature.com/srep/)

Oncoogy - Melanoma

Reports from Technical University Provide New Insights into Melanoma
(Tumour stage distribution and survival of malignant melanoma in Germany 2002-2011)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Melanoma have been published. According to news reporting originating from Munich, Germany, by NewsRx correspondents, research stated, "Over the past two decades, there has been a rising trend in malignant melanoma incidence worldwide. In 2008, Germany introduced a nationwide skin cancer screening program starting at age 35."

Our news editors obtained a quote from the research from Technical University, "The aims of this study were to analyse the distribution of malignant melanoma tumour stages over time, as well as demographic and regional differences in stage distribution and survival of melanoma patients. Pooled data from 61 895 malignant melanoma patients diagnosed between 2002 and 2011 and documented in 28 German population-based and hospital-based clinical cancer registries were analysed using descriptive methods, joinpoint regression, logistic regression and relative survival. The number of annually documented cases increased by 53.2% between 2002 (N = 4 779) and 2011 (N = 7 320). There was a statistically significant continuous positive trend in the proportion of stage UICC I cases diagnosed between 2002 and 2011, compared to a negative trend for stage UICC II. No trends were found for stages UICC III and IV respectively. Age (OR 0.97, 95% CI 0.97-0.97), sex (OR 1.18, 95% CI 1.11-1.25), date of diagnosis (OR 1.05, 95% CI 1.04-1.06), 'diagnosis during screening' (OR 3.24, 95% CI 2.50-4.19) and place of residence (OR 1.23, 95% CI 1.16-1.30) had a statistically significant influence on the tumour stage at diagnosis. The overall 5-year relative survival for invasive cases was 83.4% (95% CI 82.8-83.9%)." "

According to the news editors, the research concluded: "No distinct changes in the distribution of malignant melanoma tumour stages among those aged 35 and older were seen that could be directly attributed to the introduction of skin cancer screening in 2008."

The news editors report that additional information may be obtained by contacting O. Schoffer, Technical University of Munich, Dept. of Sport & Hlth Sci, Epidemiol, D-80992 Munich, Germany. Additional authors for this research include S. Schuulein, G. Arand, H. Arnholdt, D. Baaske, R.C. Bargou, N. Becker, M.W. Beckmann, Y. Bodack, B. Bohme, T. Bozkurt, R. Breitsprecher, A. Buchali, E. Burger, U. Burger, K. Dommisch, G. Elsner, K.
Fernschild and U. Flintzer.

Digestive System Diseases and Conditions - Colitis

Reports from Texas A&M University Add New Data to Findings in Colitis (Mango polyphenolics reduce inflammation in intestinal colitis involvement of the miR-126/PI3K/AKT/mTOR axis in vitro and in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Digestive System Diseases and Conditions - Colitis have been presented. According to news reporting from College Station, Texas, by NewsRx journalists, research stated, "This study sought to elucidate the mechanisms underlying the anti-inflammatory effect of mango (Mangifera indica L.) polyphenolics containing gallic acid and gallotannins, and the role of the miR-126/PI3K/AKT/mTOR signaling axis in vitro and in vivo. Polyphenolics extracted from mango (var."

The news correspondents obtained a quote from the research from Texas A&M University, "Keitt) were investigated in lipopolysaccharide (LPS)-treated CCD-18Co cells. Rats received either a beverage with mango polyphenolics or a control beverage, and were exposed to three cycles of 3% dextran sodium sulfate (DSS) followed by a 2-wk recovery period. The mango extract (10mg GAE/L) suppressed the protein expression of NF-B, p-NF-B, PI3K (p85), HIF-1, p70S6K1, and RPS6 in LPS-treated CCD-18Co cells. LPS reduced miR-126 expression, whereas, the mango extract induced miR-126 expression in a dose-dependent manner. The relationship between miR-126 and its target, PI3K (p85), was confirmed by treating cells with miR-126 antagonomiR where mango polyphenols reversed the effects of the antagonomiR. In vivo, mango beverage protected against DSS-induced colonic inflammation (47%, P=0.05) and decreased the Ki-67 labeling index in the central and basal regions compared to the control. Mango beverage significantly attenuated the expression of pro-inflammatory cytokines such as TNF-, IL-1, and iNOS at the mRNA and protein level. Moreover, the expression of PI3K, AKT, and mTOR was reduced, whereas, miR-126 was upregulated by the mango treatment."

According to the news reporters, the research concluded: "These results suggest that mango polyphenols attenuated inflammatory response by modulating the PI3K/AKT/mTOR pathway at least in part through upregulation of miRNA-126 expression both in vitro and in vivo; thus, mango polyphenolics might be relevant as preventive agents in ulcerative colitis."

Our news journalists report that additional information may be obtained by contacting S.U. Mertens-Talcott, Texas A&M University, Dept. of Vet Physiol & Pharmacol, College Stn, TX, United States. Additional authors for this research include N. Banerjee, R.C.
Cardiovascular Diseases and Conditions -…

Reports from Third Military Medical University Add New Data to Findings in Atherosclerosis (Elevated Type II Secretory Phospholipase A2 Increases the Risk of Early Atherosclerosis in Patients with Newly Diagnosed Metabolic Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "A critical association between type II secretory phospholipase A2 (sPLA2-IIa) and established atherosclerotic cardiovascular disease has been demonstrated. However, the contribution of sPLA2-IIa to early atherosclerosis remains unknown."

Our news editors obtained a quote from the research from Third Military Medical University, "This study investigated the association between early-stage atherosclerosis and sPLA2-IIa in metabolic syndrome (MetS) patients. One hundred and thirty-six MetS patients and 120 age-and gender-matched subjects without MetS were included. Serum sPLA2-IIa protein levels and activity were measured using commercial kits. Circulating endothelial activation molecules (vascular cell adhesion molecule-1 (VCAM-1), intercellular adhesion molecule-1 (ICAM-1), E-selectin, and P-selectin), and carotid intima-media thickness (cIMT), were measured as parameters of vascular endothelial dysfunction and early atherosclerosis. MetS patients exhibited significantly higher sPLA2-IIa protein and activity levels than the controls. Both correlated positively with fasting blood glucose and waist circumference in MetS patients. Additionally, MetS patients exhibited strikingly higher levels of endothelial activation molecules and increased cIMT than controls. These levels correlated positively with serum sPLA2-IIa protein levels and activity. Moreover, multivariate analysis showed that high sPLA2-IIa protein and activity levels were independent risk factors of early atherosclerosis in MetS patients."

According to the news editors, the research concluded: "This study demonstrates an independent association between early-stage atherosclerosis and increased levels of sPLA2-IIa, implying that increased sPLA2-IIa may predict early-stage atherosclerosis in MetS patients."

For more information on this research see: Elevated Type II Secretory Phospholipase A2 Increases the Risk of Early Atherosclerosis in Patients with Newly Diagnosed Metabolic Syndrome. Scientific Reports, 2016;6():1-8. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting Z.Y. Song, Third Military Medical University, Southwest Hosp, Dept. of Cardiol, Chongqing 400038, People's Republic of China. Additional authors for this research include C.Y. Zhong,
Oncology - Melanoma

Reports from Thomas Jefferson University Describe Recent Advances in Melanoma [Autologous melanoma cell vaccine using monocyte-derived dendritic cells (NBS20/eltrapulden cel-T)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Melanoma are discussed in a new report. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Targeted therapy and immunotherapy have revolutionized the treatment of advanced melanoma. Despite recent advances, lack of long-term efficacy from targeted therapy and serious immune-related toxicity are major concerns."

The news correspondents obtained a quote from the research from Thomas Jefferson University, "There is unmet need for 'durable' and 'safe' treatment options for advanced melanoma. Cancer vaccine therapy in melanoma has been investigated for many years with modest clinical efficacy. More recently, dendritic cell-based vaccine products have become available for clinical use and have been the focus of investigation. CLBS20 (NBS20/eltrapulden cel-T) is a novel dendritic cell-based vaccine product that has shown promising results in early phase trials in advanced melanoma."

According to the news reporters, the research concluded: "This cancer vaccine approach could play an important role in providing a sustainable survival benefit, targeting cancer cells themselves and avoiding off-target immune-related toxicity."

Our news journalists report that additional information may be obtained by contacting A. Javed, Dept. of Medical Oncology, Thomas Jefferson University, 925 Chestnut street, Philadelphia, PA 19107, United States. Additional authors for this research include S. Sato and T. Sato.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2217/fon.16.13. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from Thomas Jefferson University Highlight Recent Findings in Febrile Seizures (Mesial temporal lobe epilepsy with childhood febrile seizure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Diseases and Conditions - Febrile Seizures. According to news reporting originating in Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "To evaluate the demographic and clinical manifestations of patients with mesial temporal sclerosis and temporal lobe epilepsy (MTS-TLE) with childhood febrile seizure (FS) and establishing the potential differences as compared to those without FS. We also investigated the surgery outcome in these two groups of patients."

The news reporters obtained a quote from the research from Thomas Jefferson University, "In this retrospective study, all patients with a clinical diagnosis of drug-resistant TLE due to mesial temporal sclerosis, who underwent epilepsy surgery at Jefferson Comprehensive Epilepsy Center, were recruited. Patients were prospectively registered in a database from 1986 through 2014. Postsurgical outcome was classified into two groups; seizure-free or relapsed. Clinical manifestations and outcome were compared between patients with MTS-TLE with FS and those without FS. Two hundred and sixty-two patients were eligible for this study. One hundred and seventy patients (64.9%) did not have FS in their childhood, while 92 patients (35.1%) reported experiencing FS in their childhood. Demographic and clinical characteristics of these two groups of patients were not different. Postoperative seizure outcome was not statistically different between these two groups of patients (P = 0.19). When MTS is the pathological substrate of TLE, clinical manifestations and response to surgical treatment of patients are very similar in patients with history of febrile seizure in their childhood compared to those without such an experience."

According to the news reporters, the research concluded: "In other words, when the subgroup of patients with MTS-TLE and drug-resistant seizures is examined history of childhood febrile seizure loses its value as a distinguishing factor in characteristics or predictive factor for surgery outcome."

Our news correspondents report that additional information may be obtained by contacting A.A. Asadi-Pooya, Thomas Jefferson University, Dept. of Neurol, Jefferson Comprehensive Epilepsy Center, Philadelphia, PA 19107, United States. Additional authors for this research include M. Nei, C. Rostami and M.R. Sperling.

Lung Diseases and Conditions - Hemoptysis

Reports from Thomas Jefferson University Hospital Add New Data to Findings in Hemoptysis (Management considerations of massive hemoptysis while on extracorporeal membrane oxygenation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lung Diseases and Conditions - Hemoptysis are presented in a new report. According to news originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Veno-arterial extracorporeal membrane oxygenation (V-A ECMO) is a life-saving procedure in patients with both respiratory and cardiac failure. Bleeding complications are common since patients must be maintained on anticoagulation."

Our news journalists obtained a quote from the research from Thomas Jefferson University Hospital, "Massive hemoptysis is a rare complication of ECMO; however, it may result in death if not managed thoughtfully and expeditiously. A retrospective chart review was performed of consecutive ECMO patients from 7/2010-8/2014 to identify episodes of massive hemoptysis. The management of and the outcomes in these patients were studied. Massive hemoptysis was defined as an inability to control bleeding (>300 mL/day) from the endotracheal tube with conventional maneuvers, such as bronchoscopy with cold saline lavage, diluted epinephrine lavage and selective lung isolation. All of these episodes necessitated disconnecting the ventilator tubing and clamping the endotracheal tube, causing full airway tamponade. During the period of review, we identified 118 patients on ECMO and 3 (2.5%) patients had the complication of massive hemoptysis. One case was directly related to pulmonary catheter migration and the other two were spontaneous bleeding events that were propagated by antiplatelet agents. All three patients underwent bronchial artery embolization in the interventional radiology suite. Anticoagulation was held during the period of massive hemoptysis without any embolic complications. There was no recurrent bleed after appropriate intervention. All three patients were successfully separated from ECMO. Bleeding complications remain a major issue in patients on ECMO. Disconnection of the ventilator and clamping the endotracheal tube with full respiratory and cardiac support by V-A ECMO is safe."

According to the news editors, the research concluded: "Early involvement of interventional radiology to embolize any potential sources of the bleed can prevent re-hemoptysis and enable continued cardiac and respiratory recovery."

For more information on this research see: Management considerations of massive hemoptysis while on extracorporeal membrane oxygenation. Perfusion-Uk, 2016;31(8):653-658. Perfusion-Uk can be contacted at: Sage Publications Ltd, 1 Olivers Yard, 55 City Road, London EC1Y 1SP, England.

Leiomyosarcomas

Reports from Tianjin Medical University Add New Data to Findings in Leiomyosarcomas (Myxoid leiomyosarcoma of the uterus: a case report and review of the literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Leiomyosarcomas have been published. According to news reporting originating in Tianjin, People's Republic of China, by NewsRx journalists, research stated, "A para 1, 52-year-old female was admitted with complaints of irregular vaginal bleeding for the previous six months. Ultrasonography revealed a 4x6-cm tumor extending into the uterine cavity and cervical canal."

The news reporters obtained a quote from the research from Tianjin Medical University, "On vaginal examination, a 2x2-cm tumor protruding from the cervical os was found, and an enlarged uterus was palpated. Vaginal intrauterine tumor resection was performed, and the patient was diagnosed with uterine myxoid leiomyosarcoma. A total abdominal hysterectomy with bilateral salpingo-oophorectomy was performed, followed by postoperative chemotherapy. Twenty-one months after surgery, the patient died of tumor recurrence."

According to the news reporters, the research concluded: "Uterine myxoid leiomyosarcoma is an extremely rare variant of uterine sarcoma with a poor prognosis and malignant biological behavior."

Our news correspondents report that additional information may be obtained by contacting K. Wen, Tianjin Med Univ, Dept. of Pharmacol, Tianjin 300070, People's Republic of China. Additional authors for this research include Y. Li, Q. Qu and K. Wen.

Reports from Tianjin Medical University Describe Recent Advances in Anatomy [Detachment-Based Equilibrium of Anoikic Cell Death and Autophagic Cell Survival Through Adaptor Protein p66(Shc)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Life Science Research - Anatomy is the subject of a report. According to news reporting from Tianjin, People's Republic of China, by NewsRx journalists, research stated, "Anoikis (detachment-induced cell death) confers a tumor-suppressive function in metastatic cancer cells. Autophagy, a conserved self-degradative process, enhances the anoikis resistance of detached cancer cells by maintaining cellular homeostasis."

Financial supporters for this research include National Natural Science Foundation of China, Tianjin University of Science and Technology, Science Foundation of Tianjin Medical University, High Technology Research and Development Program of China ("863" Program).

The news correspondents obtained a quote from the research from Tianjin Medical University, "However, the mechanism of regulating cell fate-decision by balancing anoikis and autophagy has been poorly understood. Our previous studies have shown that the adaptor protein p66(Shc) mediates anoikis through RhoA activation and inhibits tumor metastasis in vivo. We also found that p66(Shc) depletion mitigates nutrient-deprivation-induced autophagy. These findings suggest p66(Shc) may coordinate these two processes. To verify this hypothesis, we investigated the effect of p66(Shc) on the cell death of detached lung cancer cells, and measured autophagy markers and autophagic flux. Results showed that p66(Shc) depletion significantly inhibited anoikis, and reduced the formation of LC3B-II and the degradation of Sequestosome 1 (SQSTM1, p62) in detachment-induced cells. Using monodansylcadaverine (MDC)-LysoTracker double staining and monomeric Cherry (mCherry)-GFP-LC3 assay, we found that the autophagic flux was also mitigated by p66(Shc) depletion. In addition, p66(Shc) knockdown increased the formation of full-length X-linked inhibitor of apoptosis (XIAP)-associated factor 1 (XAF1), which enhances anoikis sensitivity."

According to the news reporters, the research concluded: "P66(Shc) plays an essential role in detachment-equilibrium of anoikic cell death and autophagic cell survival."

Our news journalists report that additional information may be obtained by contacting Z. Cai, Dept. of Biochemistry and Molecular Biology, School of Basic Medical Sciences, Tianjin Medical University, Tianjin, 300070, People's Republic of China. Oncology - Breast Cancer

Reports from Tianjin Medical University Highlight Recent Findings in Breast Cancer (Advancement of Wnt signal pathway and the target of breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting out of Tianjin, People's Republic of China, by NewsRx editors, research stated, "Wnt/beta-catenin signaling has been proved to play an important role in the development and promotion of cancer metastasis. The activation of Wnt signals can lead to duplicating, updating, metastasizing and relapsing."

Our news journalists obtained a quote from the research from Tianjin Medical University, "The Wnt signaling pathway is mainly divided into the Wnt/beta-catenin pathway and the Wnt/calcium pathway. A better understanding of all the diverse functions of Wnt and their molecular mechanisms has evoked prevailing interest in identifying additional targets related to the Wnt/beta-catenin pathways in breast cancer. A number of new target, related to Wnt/beta-catenin pathways have been identified in recent years, including NOP14, BKCa channels, Emilin2, WISP, MicroRNAs, NRBP1, TRAF4, and Wntless."

According to the news editors, the research concluded: "In this review, we will introduce the new targets related to the Wnt/beta-catenin pathways in breast cancer."

For more information on this research see: Advancement of Wnt signal pathway and the target of breast cancer. Open Life Sciences, 2016;11(1):98-104. Open Life Sciences can be contacted at: De Gruyter Open Ltd, Bogumila Zuga 32A St, 01-811 Warsaw, Poland.

Our news journalists report that additional information may be obtained by contacting Q. Fu, Tianjin Med Univ, General Hospital, Dept. of Gen Surg, Tianjin 300052, People's Republic of China. Additional authors for this research include W. Li, Z.C. Zhao and Q. Fu.

Heart Disorders and Diseases - Heart Failure

Reports from Tokyo Women's Medical University Add New Data to Findings in Heart Failure (Effect of Taurine on Hemodiafiltration in Patients With Chronic Heart Failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Failure are presented in a new report. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Taurine, an important factor in the living body, is essential for cardiovascular function..."
and development and function of skeletal muscle, retina and central nervous system. In the present study, its effect on cardiovascular function was specifically taken into consideration."

Our news journalists obtained a quote from the research from Tokyo Women's Medical University, "In hemodiafiltration (HDF) patients, the effect of taurine on patients with chronic heart failure (CHF), in whom dry weight was difficult to control, was evaluated. All patients who were subjected to regular HDF for 4 h three times per week at Joban hospital were included in this study. Patients with chronic heart failure, in whom dry weight was difficult to control (N=4), were included in the evaluation of clinical status. X-ray and echocardiography were determined before and after taurine treatment. Almost all patients were taking nitric acid, warfarin, anti-platelet agents and vasopressors. Because vital signs were unstable in chronic heart failure, all cases withheld antihypertensive drugs during HDF. For unstable vital signs during HDF, pulmonary congestion was chronically recognized. After taurine was started, vital signs stabilized and lowering of dry weight was possible. In addition, X-ray and cardiac diastolic failure on echocardiography improved."

According to the news editors, the research concluded: "Taurine was effective for CHF patients on HDF in whom dry weight was difficult to control in spite of various medications."

Our news journalists report that additional information may be obtained by contacting S. Shiohira, Dept. of Medicine IV, Tokyo Women's Medical University, Tokyo, Japan. Additional authors for this research include M. Komatsu, M. Okazaki, T. Naganuma, H. Kawaguchi, K. Nitta and K. Tsuchiya.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1744-9987.12330. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions - …

Reports from Tufts Medical Center Add New Data to Findings in Atherosclerosis (Effects of Race and Sex on Measured GFR: The Multi-Ethnic Study of Atherosclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Kidney failure disproportionately affects older blacks versus whites. The reasons are unknown and may be related to lower measured glomerular
filtration rate (GFR) and higher levels of albuminuria in community-based population samples."

Financial supporters for this research include National Institutes of Health, Advancing Translational Sciences, NIH, National Heart, Lung and Blood Institute, National Center for Research Resources.

The news correspondents obtained a quote from the research from Tufts Medical Center, "Cross-sectional analysis of a substudy of a prospective cohort. Ancillary study following Multi-Ethnic Study of Atherosclerosis (MESA) visit 5. Predictor: Age, sex, and race. Measured GFR using plasma clearance of iohexol and urine albumin-creatinine ratio (ACR). GFR was measured in 294 participants. Mean age was 71 +/- 9 (SD) years, 47% were black, 48% were women, mean GFR was 73 +/- 19 mL/min/1.73 m(2), and median ACR was 10.0 (IQR, 5.8-20.9) mg/g. Measured GFR was on average 1.02 (95% CI, 0.79-1.24) mL/min/1.73 m (2) lower per year older. Mean GFR indexed for body surface area was not different between blacks versus whites (mean difference, 2.94 [95% CI, -1.37 to 7.26] mL/min/1.73 m(2)), but was lower in women than men (mean difference, -9.34 [95% CI, -13.53 to -5.15] mL/min/1.73 m(2)); this difference persisted and remained significant after adjustment for demographics, clinical characteristics, and measures of body size. The difference between men and women, but not between blacks and whites, was substantially greater when GFR was not indexed for body surface area. ACR was higher in older versus younger participants (mean difference, 3.2% [95% CI, 1.5%-4.8%] per year), but geometric mean ratio of ACR did not differ between blacks versus whites (mean difference, 19.7%; 95% CI, -39.1% to 6.1%) or between men versus women (mean difference, -4.4%; 95% CI, -27.7% to 26.3%). Limitations: This is a study of survivors. People who agreed to participate were younger than those who refused."

According to the news reporters, the research concluded: "In this first community-based study that included blacks and whites, no differences in measured GFR between races were found, suggesting that other factors must account for the disproportionately higher burden of kidney failure in older blacks versus whites."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1053/j.ajkd.2016.06.021. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from Tulane University Provide New Insights into Angiology (Serum 25-hydroxyvitamin D deficiency predicts poor outcome amongst acute ischaemic stroke patients with low high density lipoprotein cholesterol)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Angiology is the subject of a report. According to news reporting out of New Orleans, Louisiana, by NewsRx editors, research stated, "Background and purposeCurrent observational studies indicate that a lower vitamin D level is associated with a higher risk of poor ischaemic stroke prognosis. Whether this association is affected by lipid levels is unclear."

Financial supporters for this research include Soochow University, National Natural Science Foundation of China, Tulane University, Diboll Private Foundation.

Our news journalists obtained a quote from the research from Tulane University, "Our aim was to examine the effect of serum vitamin D especially its deficiency on the global outcome of ischaemic stroke stratified by individual lipid component level. MethodsA total of 3181 ischaemic patients from China Antihypertensive Trial in Acute Ischaemic Stroke were included in this study and their baseline serum 25-hydroxyvitamin D levels were tested. They were prospectively followed up for death, major disability and vascular events for 3 months after acute ischaemic stroke. A multivariable logistic model was used to evaluate the association between serum 25-hydroxyvitamin D levels and clinical outcomes of ischaemic stroke in the 3-month period of follow-up in all patients and in different lipid-level subgroups. ResultsVitamin D deficiency was associated with poor clinical outcomes only in ischaemic stroke patients with high density lipoprotein cholesterol (HDLC) <1.04 mmol/l rather than all patients. The multivariable adjusted odds ratios (95% confidence intervals) of major disability and composite adverse events were 1.98 (1.08-3.63) and 2.24 (1.22-4.12), respectively. There was a significant interaction effect between vitamin D and HDLC levels on major disability and the composite outcome (P for interaction < 0.05 for both). A significant linear trend existed between 25-hydroxyvitamin D and risk of poor prognosis (P = 0.03)."

According to the news editors, the research concluded: "ConclusionsVitamin D deficiency may be merely an independent risk factor of poor prognosis in ischaemic stroke patients with low HDLC level."

Our news journalists report that additional information may be obtained by contacting T. Xu, Tulane University, Sch Public Hlth & Trop Med, Dept. of Epidemiol, New Orleans, LA 70118, United States. Additional authors for this research include C. Zhong, Y. Peng, C.S. Chen, J. Wang, Z. Ju, Q. Li, D. Geng, Y. Sun, D. Zhang, Y. Zhang, J. Chen, T. Xu, Y. Zhang and J. He.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ene.13121. This DOI is a link to an online electronic document that is
either free or for purchase.

Immunology - Lymphoid Tissue

Reports from University Clinic Highlight Recent Findings in Lymphoid Tissue (Endobronchial ultrasound elastography strain ratio for mediastinal lymph node diagnosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Lymphoid Tissue. According to news originating from Golnik, Slovenia, by NewsRx correspondents, research stated, "Ultrasound elastography is an imaging procedure that can assess the biomechanical characteristics of different tissues. The aim of this study was to define the diagnostic value of the endobronchial ultrasound (EBUS) elastography strain ratio of mediastinal lymph nodes in patients with a suspicion of lung cancer."

Our news journalists obtained a quote from the research from University Clinic, "The diagnostic values of the strain ratios were compared with the EBUS brightness mode (B-mode) features of selected mediastinal lymph nodes and with their cytological diagnoses. This prospective, single-centre study enrolled patients with an indication for biopsy and mediastinal staging after a non-invasive diagnostic workup of a lung tumour. EBUS with standard B-mode evaluation and elastography with strain ratio measurement were performed before endobronchial ultrasound-guided transbronchial needle aspiration (EBUS-TBNA). Thirty-three patients with 80 suspicious mediastinal lymph nodes were included. Malignant infiltration was confirmed in 34 (42.5%) lymph nodes. The area under the receiver operating characteristic curve for the strain ratio was 0.87 (p <0.0001). At a strain ratio (≥) 8, the accuracy for malignancy prediction was 86.25% (sensitivity 88.24%, specificity 84.78%, positive predictive value [PPV] 81.08%, negative predictive value [NPV] 90.70%). The strain ratio is more accurate than conventional B-mode EBUS modalities for differentiating between malignant and benign lymph nodes. EBUS-guided elastography with strain ratio assessment can distinguish malignant from benign mediastinal lymph nodes with greater accuracy than conventional EBUS modalities."

According to the news editors, the research concluded: "This new method may reduce the number of mediastinal EBUS-TBNAs and thus reduce the invasiveness and expense of mediastinal staging in patients with non-small lung cancer (NSCLC)."

For more information on this research see: Endobronchial ultrasound elastography strain ratio for mediastinal lymph node diagnosis. Radiology and Oncology, 2015;49(4):334-40.

The news correspondents report that additional information may be obtained from A. Rozman, University Clinic of Pulmonary and Allergic Diseases Golnik, Golnik, Slovenia. Additional authors for this research include M.M. Malovrh, K. Adamic, T. Subic, V. Kovac and M. Flezar.

Reports from University College Highlight Recent Findings in Tuberous Sclerosis (Variants Within TSC2 Exons 25 and 31 Are Very Unlikely to Cause Clinically Diagnosable Tuberous Sclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nervous System Diseases and Conditions - Tuberous Sclerosis have been published. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Inactivating mutations in TSC1 and TSC2 cause tuberous sclerosis complex (TSC). The 2012 international consensus meeting on TSC diagnosis and management agreed that the identification of a pathogenic TSC1 or TSC2 variant establishes a diagnosis of TSC, even in the absence of clinical signs."

Financial supporters for this research include Tuberous Sclerosis Association (UK), TS Alliance (USA), British Heart Foundation, National Institute for Health Research, University College London Hospitals Biomedical Research Centre, Associazione Emma & Ernesto Rulfo per la Genetica Medica, Wellcome Trust.

Our news journalists obtained a quote from the research from University College, "However, exons 25 and 31 of TSC2 are subject to alternative splicing. No variants causing clinically diagnosed TSC have been reported in these exons, raising the possibility that such variants would not cause TSC. We present truncating and in-frame variants in exons 25 and 31 in three individuals unlikely to fulfil TSC diagnostic criteria and examine the importance of these exons in TSC using different approaches. Amino acid conservation analysis suggests significantly less conservation in these exons compared with the majority of TSC2 exons, and TSC2 expression data demonstrates that the majority of TSC2 transcripts lack exons 25 and/or 31 in many human adult tissues. In vitro assay of both exons shows that neither exon is essential for TSC complex function."

According to the news editors, the research concluded: "Our evidence suggests that variants in TSC2 exons 25 or 31 are very unlikely to cause classical TSC, although a role for these exons in tissue/stage specific development cannot be excluded."

Nutritional and Metabolic Diseases and Conditions - …

Reports from University Hospital Add New Data to Findings in Diabetes Insipidus (Copeptin in the diagnosis of vasopressin-dependent disorders of fluid homeostasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Diabetes Insipidus is now available. According to news reporting originating in Basel, Switzerland, by NewsRx journalists, research stated, "Copeptin and arginine vasopressin (AVP) are derived from a common precursor molecule and have equimolar secretion and response to osmotic, haemodynamic and stress-related stimuli. Plasma concentrations of copeptin and AVP in relation to serum osmolality are highly correlated."

The news reporters obtained a quote from the research from University Hospital, "The physiological functions of AVP with respect to homeostasis of fluid balance, vascular tonus and regulation of the endocrine stress response are well known, but the exact function of copeptin is undetermined. Quantification of AVP can be difficult, but copeptin is stable in plasma and can be easily measured with a sandwich immunoassay. For this reason, copeptin has emerged as a promising marker for the diagnosis of AVP-dependent fluid disorders. Copeptin measurements can enable differentiation between various conditions within the polyuria-polydipsia syndrome. In the absence of prior fluid deprivation, baseline copeptin levels >20 pmol/l identify patients with nephrogenic diabetes insipidus. Conversely, copeptin levels measured upon osmotic stimulation differentiate primary polydipsia from partial central diabetes insipidus."

According to the news reporters, the research concluded: "In patients with hyponatraemia, low levels of copeptin together with low urine osmolality identify patients with primary polydipsia, and the ratio of copeptin to urinary sodium can distinguish the syndrome of inappropriate antidiuretic hormone secretion from other AVP-dependent forms of hyponatraemia."

Our news correspondents report that additional information may be obtained by contacting M. Christ-Crain, Dept. of Endocrinology, University Hospital Basel, University of Basel, Petersgraben 4, Basel CH-4031, Switzerland.

The direct object identifier (DOI) for that additional information is:
Autoimmune Diseases and Conditions - Rheumatoid...

Reports from University Hospital Add New Data to Findings in Rheumatoid Arthritis (Methotrexate selectively targets human proinflammatory macrophages through a thymidylate synthase/p53 axis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Autoimmune Diseases and Conditions - Rheumatoid Arthritis. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "Methotrexate (MTX) functions as an antiproliferative agent in cancer and an anti-inflammatory drug in rheumatoid arthritis (RA). Although macrophages critically contribute to RA pathology, their response to MTX remains unknown."

The news reporters obtained a quote from the research from University Hospital, "As a means to identify MTX response markers, we have explored its transcriptional effect on macrophages polarised by GM-CSF (GM-Mempty set) or M-CSF (M-Mempty set), which resemble proinflammatory and anti-inflammatory macrophages found in RA and normal joints, respectively. The transcriptomic profile of both human macrophage subtypes exposed to 50 nM of MTX under long-term and short-term schedules were determined using gene expression microarrays, and validated through quantitative real time PCR and ELISA. The molecular pathway involved in macrophage MTX-responsiveness was determined through pharmacological, siRNA-mediated knockdown approaches, metabolomics for polyglutamylated-MTX detection, western blot, and immunofluorescence on RA and normal joints. MTX exclusively modulated gene expression in proinflammatory GM-Mempty set, where it influenced the expression of 757 genes and induced CCL20 and LIF at the mRNA and protein levels. Pharmacological and siRNA-mediated approaches indicated that macrophage subset-specific MTX responsiveness correlates with thymidylate synthase (TS) expression, as proinflammatory TS+ GM-Mempty set are susceptible to MTX, whereas anti-inflammatory TSlow/- M-Mempty set and monocytes are refractory to MTX. Furthermore, p53 activity was found to mediate the TS-dependent MTX-responsiveness of proinflammatory TS+ GM-Mempty set. Importantly, TS and p53 were found to be expressed by CD163(+/+)TNF alpha(+) GM-CSF-polarised macrophages from RA joints but not from normal synovium. Macrophage response to MTX is polarisation-dependent and determined by the TS-p53 axis."

According to the news reporters, the research concluded: "CCL20 and LIF constitute novel macrophage markers for MTX responsiveness in vitro."

For more information on this research see: Methotrexate selectively targets human proinflammatory macrophages through a thymidylate synthase/p53 axis. *Annals of the Rheumatic Diseases*, 2016;75(12):2157-2165. *Annals of the Rheumatic Diseases* can be...

Oncology - Head and Neck Cancer

Reports from University Hospital Advance Knowledge in Head and Neck Cancer (CT-based follow-up following radiotherapy or radiochemotherapy for locally advanced head and neck cancer; outcome and development of a prognostic model for regional ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Head and Neck Cancer. According to news reporting out of Leuven, Belgium, by NewsRx editors, research stated, "The purpose of this study was to make a prognostic model for regional relapse in head and neck cancer using clinical and CT parameters. 183 patients with lymph node-positive head and neck cancer were treated between 2002 and 2012 with radiotherapy or concurrent chemoradiotherapy."

Our news journalists obtained a quote from the research from University Hospital, "CT studies pre- and post-treatment were reviewed for lymph node size and the presence of necrosis, extracapsular spread (ECS) and calcifications. For every patient, correlations with 3-year regional control (RC), metastasis-free survival (MFS), disease-free survival (DFS) and overall survival (OS) were made. 3-year outcome rates were as follows: local control of 84%, RC of 80%, MFS of 74%, DFS of 61% and OS of 63%. Pre-treatment nodal size and the presence of necrosis were associated with a poorer outcome. This was also the case for post-treatment lymph node size, the presence of necrosis and ECS. We developed a CT-based prognostic model for RC with an area under the curve of 0.78 (95% confidence interval 0.63; 0.85). We reached a good outcome in our patient cohort using a CT-based follow-up approach. A CT-based model was developed, which can aid in predicting RC. Advances in knowledge: A prognostic model is proposed, which can aid in predicting RC and the necessity for post-radiotherapy neck dissection using clinical parameters and parameters derived from the post-
treatment CT study."

According to the news editors, the research concluded: "This is the first article to propose a prognostic model for regional relapse in head and neck cancer based on these parameters."

Our news journalists report that additional information may be obtained by contacting S. Nuyts, KU Leuven Univ Leuven, University Hospital Leuven, Dept. of Radiat Oncol, Leuven, Belgium. Additional authors for this research include O. Vantomme, A. Laenen, R. Hermans and S. Nuyts.

**Heart Disorders and Diseases - Atrial Fibrillation**

**Reports from University Medical Center Advance Knowledge in Atrial Fibrillation (Long-Term Success for the Convergent Atrial Fibrillation Procedure: 4-Year Outcomes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Atrial Fibrillation are discussed in a new report. According to news reporting out of Ljubljana, Slovenia, by NewsRx editors, research stated, "The objective of this single-center study was to report long-term efficacy outcomes of the convergent procedure for the treatment of atrial fibrillation. Outcomes for the convergent procedure were determined by clinical presentation and interrogating implanted loop recorders."

Our news journalists obtained a quote from the research from University Medical Center, "Rhythm status and required interventions for atrial fibrillation recurrence (antiarrhythmic drugs, cardioversions, and repeat ablations) were quantified 1 to 4 years after the procedure. Long-term outcomes, atrial fibrillation burden quantified with continuous monitoring, and patient baseline characteristics were analyzed and reported. Seventy-six consecutive patients with paroxysmal (5%), persistent (16%), or longstanding atrial fibrillation (79%) underwent the convergent procedure between January 2009 and July 2013. Clinical presentation in sinus rhythm at isolated timepoints was 88% at 6 months, 85% at 1 year, 85% at 2 years, 84% at 3 years, and 81% at 4 years of follow-up. Total patients requiring repeat catheter ablation was 18% through 4 years. Single procedure 1-year success (freedom from atrial fibrillation/atrial flutter/atrial tachycardia through 1 year and off antiarrhythmic drugs) was 56%; and long-term success (freedom from atrial fibrillation/atrial flutter/atrial tachycardia through at least 36 months and off antiarrhythmic drugs) was 45%. Four-year outcomes for the convergent procedure are promising and demonstrate the ability to maintain sinus rhythm in a predominantly persistent and longstanding atrial fibrillation population."
According to the news editors, the research concluded: "Increasing the extent of posterior ablation should be evaluated for patients with enlarged atria to account for the potential increase in fibrosis distribution and other atrial remodeling markers that produce arrhythmogenic substrates."

Our news journalists report that additional information may be obtained by contacting B. Gersak, Univ Med Center Ljubljana, Dept. of Cardiovasc Surg, Ljubljana 1000, Slovenia.

**DNA Research**

**Reports from University of Alabama Advance Knowledge in DNA Research (Poxvirus uracil-DNA glycosylase-An unusual member of the family I uracil-DNA glycosylases)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on DNA Research are presented in a new report. According to news reporting originating in Birmingham, Alabama, by NewsRx journalists, research stated, "Uracil-DNA glycosylases are ubiquitous enzymes, which play a key role repairing damages in DNA and in maintaining genomic integrity by catalyzing the first step in the base excision repair pathway. Within the superfamily of uracil-DNA glycosylases family I enzymes or UNGs are specific for recognizing and removing uracil from DNA."

The news reporters obtained a quote from the research from the University of Alabama, "These enzymes feature conserved structural folds, active site residues and use common motifs for DNA binding, uracil recognition and catalysis. Within this family the enzymes of poxviruses are unique and most remarkable in terms of amino acid sequences, characteristic motifs and more importantly for their novel non-enzymatic function in DNA replication. UNG of vaccinia virus, also known as D4, is the most extensively characterized UNG of the poxvirus family. D4 forms an unusual heterodimeric processivity factor by attaching to a poxvirus-specific protein A20, which also binds to the DNA polymerase E9 and recruits other proteins necessary for replication. D4 is thus integrated in the DNA polymerase complex, and its DNA-binding and DNA scanning abilities couple DNA processivity and DNA base excision repair at the replication fork. The adaptations necessary for taking on the new function are reflected in the amino acid sequence and the three-dimensional structure of D4."

According to the news reporters, the research concluded: "An overview of the current state of the knowledge on the structure-function relationship of D4 is provided here."

For more information on this research see: Poxvirus uracil-DNA glycosylase-An

Our news correspondents report that additional information may be obtained by contacting D. Chattopadhyay, Univ Alabama Birmingham, Dept. of Med, Birmingham, AL 35294, United States. Additional authors for this research include N. Zhukovskaya, G. Bedwell, M. Nuth, R. Gillilan, P.E. Prevelige, R.P. Ricciardi, S. Banerjee and D. Chattopadhyay.

**Reports from University of Ataturk Add New Data to Findings in Paracetamol Therapy (Mitigation of paracetamol-induced reproductive damage by chrysin in male rats via reducing oxidative stress)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Paracetamol Therapy have been published. According to news reporting originating in Erzurum, Turkey, by NewsRx journalists, research stated, "Paracetamol (PRC) is a nonsteroidal anti-inflammatory drug used widely as a painkiller for various diseases and as the symptomatic flu cure in several countries worldwide. PRC toxicity may occur under conditions of the overdose usage."

The news reporters obtained a quote from the research from the University of Ataturk, "Chrysin (CR) is a flavonoid that is naturally present in several plants, honey and propolis. The aim of this study was to investigate the effects of CR (at the doses of 25 mg kg(-1) and 50 mg kg(-1)) pre-treatment over seven consecutive days against PRC-induced reproductive toxicity in male rats. Our results showed that PRC toxicity decreased the sperm motility, and increased dead sperm rate, abnormal sperm cell rate, apoptosis and MDA levels in testicular tissues. Pre-treatment with CR at the dose of 25 and 50 mg kg(-1) for 7 days mitigated side effects of acute PRC toxicity in male reproductive system proportionally in a dose-dependent manner. This possible protection mechanism might be dependent on the antioxidant activity of CR."

According to the news reporters, the research concluded: "Pre-treatment with CR at the dose of 25 and 50 mg kg(-1) for 7 days can be the beneficial against PRC-induced reproductive toxicity proportionally in a dose-dependent manner."

Our news correspondents report that additional information may be obtained by contacting E.H. Aksu, Ataturk University, Fac Vet Med, Dept. of Reprod & Artificial Inseminat,
TR-25240 Erzurum, Turkey. Additional authors for this research include M. Ozkaraca, F.M. Kandemir, A.D. Omur, E. Eldutar, S. Kucukler and S. Comakli.

Reports from University of Auckland Highlight Recent Findings in Proinsulin (A Critical Role for beta-Catenin in Modulating Levels of Insulin Secretion from beta-Cells by Regulating Actin Cytoskeleton and Insulin Vesicle Localization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Peptide Proteins - Proinsulin are discussed in a new report. According to news reporting originating in Auckland, New Zealand, by NewsRx journalists, research stated, "The processes regulating glucose-stimulated insulin secretion (GSIS) and its modulation by incretins in pancreatic beta-cells are only partly understood. Here we investigate the involvement of beta-catenin in these processes."

The news reporters obtained a quote from the research from the University of Auckland, "Reducing beta-catenin levels using siRNA knockdown attenuated GSIS in a range of beta-cell models and blocked the ability of GLP-1 agonists and the depolarizing agent KCl to potentiate this. This could be mimicked in both beta-cell models and isolated islets by short-term exposure to the beta-catenin inhibitory drug pyrvinium. In addition, short-term treatment with a drug that increases beta-catenin levels results in an increase in insulin secretion. The timing of these effects suggests that beta-catenin is required for the processes regulating trafficking and/or release of pre-existing insulin granules rather than for those regulated by gene expression. This was supported by the finding that the overexpression of the transcriptional coactivator of beta-catenin, transcription factor 7-like 2 (TCF7L2), attenuated insulin secretion, consistent with the extra TCF7L2 translocating beta-catenin from the plasma membrane pool to the nucleus. We show that beta-catenin depletion disrupts the intracellular actin cytoskeleton, and by using total internal reflectance fluorescence (TIRF) microscopy, we found that beta-catenin is required for the glucose-and incretin-induced depletion of insulin vesicles from near the plasma membrane."

According to the news reporters, the research concluded: "We find that beta-catenin levels modulate Ca2+-dependent insulin exocytosis under conditions of glucose, GLP-1, or KCl stimulation through a role in modulating insulin secretory vesicle localization and/or fusion via actin remodeling. These findings also provide insights as to how the overexpression of TCF7L2 may attenuate insulin secretion."

For more information on this research see: A Critical Role for beta-Catenin in Modulating Levels of Insulin Secretion from beta-Cells by Regulating Actin Cytoskeleton and Insulin Vesicle Localization. Heart Disorders and Diseases - Heart Disease

Reports from University of Bergen Add New Data to Findings in Heart Disease (Prevention and treatment of cardiovascular disease in Ethiopia: a cost-effectiveness analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Disease. According to news reporting from Bergen, Norway, by NewsRx journalists, research stated, "The coverage of prevention and treatment strategies for ischemic heart disease and stroke is very low in Ethiopia. In view of Ethiopia's meager healthcare budget, it is important to identify the most cost-effective interventions for further scale-up."

The news correspondents obtained a quote from the research from the University of Bergen, "This paper's objective is to assess cost-effectiveness of prevention and treatment of ischemic heart disease (IHD) and stroke in an Ethiopian setting. Fifteen single interventions and sixteen intervention packages were assessed from a healthcare provider perspective. The World Health Organization's Choosing Interventions that are Cost-Effective model for cardiovascular disease was updated with available country-specific inputs, including demography, mortality and price of traded and non-traded goods. Costs and health benefits were discounted at 3% per year. Incremental cost-effectiveness ratios are reported in US$per disability adjusted life year (DALY) averted. Sensitivity analysis was undertaken to assess robustness of our results.

Combination drug treatment for individuals having > 35% absolute risk of a CVD event in the next 10 years is the most cost-effective intervention. This intervention costs US$67 per DALY averted and about US$7 million annually. Treatment of acute myocardial infarction (AMI) (costing US$1000-US$7530 per DALY averted) and secondary prevention of IHD and stroke (costing US$1060-US$10,340 per DALY averted) become more efficient when delivered in integrated packages. At an annual willingness-to-pay (WTP) level of about US$3 million, a package consisting of aspirin, streptokinase, ACE-inhibitor and beta-blocker for AMI has the highest probability of being most cost-effective, whereas as WTP increases to > US$7 million, combination drug treatment to individuals having > 35% absolute risk stands out as the most cost-effective strategy. Cost-effectiveness ratios were relatively more sensitive to halving the effectiveness estimates as compared with doubling the price of drugs and laboratory tests. In Ethiopia, the escalating burden of CVD and its risk factors warrants timely action. We have demonstrated that selected CVD intervention packages could be scaled up at a modest budget..."
increase. The level of willingness-to-pay has important implications for interventions' probability of being cost-effective."

According to the news reporters, the research concluded: "The study provides valuable evidence for setting priorities in an essential healthcare package for CVD in Ethiopia."

Our news journalists report that additional information may be obtained by contacting M.T. Tolla, University of Bergen, Dept. of Global Public Hlth & Primary Hlth Care, Bergen, Norway. Cardiology

Reports from University of British Columbia Describe Recent Advances in Cardiology (Sequential Right and Left Ventricular Assessment in Posttetralogy of Fallot Patients with Significant Pulmonary Regurgitation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiology. According to news originating from Vancouver, Canada, by NewsRx correspondents, research stated, "The natural history of right ventricular (RV) and left ventricular (LV) size and function among adults with tetralogy of Fallot (TOF) repair and hemodynamically significant pulmonary regurgitation (PR) is not known. The main aim of this study was to determine changes in RV and LV size and function over time in an adult population with TOF repair and hemodynamically significant pulmonary regurgitation."

Our news journalists obtained a quote from the research from the University of British Columbia, "Forty patients with repaired TOF and hemodynamically significant PR were included. These patients were identified on the basis of having more than one CMR between January 2008 and 2015. Patients with a prosthetic pulmonary valve or any cardiac intervention between CMR studies were excluded. Rate of progression (ROP) of RV dilation was determined for both indexed right ventricular end-systolic volume (RVESVi) and indexed right ventricular end-diastolic volume (RVEDVi), and calculated as the difference between the last and first volumes divided by the number of years between CMR#1 and CMR#2. Subjects were also divided into two groups based on the distribution of the ROP of RV dilation: Group I-rapid ROP (> 50th percentile) and Group II-slower ROP (<= 50th percentile). The interval between CMR#1 and CMR#2 was 3.961.7 years (range 1-8 years). We did find a significant change in RVEDVi and RVESVi over this time period, although the magnitude of change was small. Nine patients
(23%) had a reduction in right ventricular ejection fraction (RVEF) by greater than 5%, 13 patients (33%) had an increase in RVEDVi by greater than 10 mL/m² and seven patients (18%) had an increase in RVESVi by greater than 10 mL/m². Median ROP for RVEDVi was 1.8 (range 210.4 to 21.8) mL/(m² year); RVESVi 1.1 (range 25.8 to 24.5) mL/(m² year) and RVEF 20.5 (range 28 to 4)/% per year. Patients with a rapid ROP had significantly larger RV volumes at the time of CMR#1 and lower RVEF as compared to the slow ROP group. There was no overall significant change in LVEDVi, LVESVi, or LVEF over this time period. We have demonstrated, in a small population of patients with hemodynamically significant PR, that there is a small increase in RV volumes and decrease in RVEF over a mean 4-year period. We believe it to be reasonable practice to perform CMR at least every 4 years in asymptomatic patients with repaired TOF and hemodynamically significant PR. We found that LV volumes and function remained stable during the study period, suggesting that significant progressive LV changes are less likely to occur over a shorter time period.

According to the news editors, the research concluded: "Our results inform a safe standardized approach to monitoring adults with hemodynamically significant PR post TOF repair and assist in planning allocation of this expensive and limited resource."

Enzymes and Coenzymes - ADP Ribose Transferases
Reports from University of Calabria Provide New Insights into ADP Ribose Transferases [Poly(ADP-ribose) polymerase is not involved in the neuroprotection exerted by azithromycin against ischemic stroke in mice]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - ADP Ribose Transferases. According to news reporting originating in Arcavacata di Rende, Italy, by NewsRx journalists, research stated, "Repurposing azithromycin has recently emerged as a promising strategy for the acute treatment of ischemic stroke. The mechanism of neuroprotection depends on the ability of this macrolide to promote polarization of microglia/macrophages towards beneficial M2 phenotypes."

Funders for this research include Fondazione Italiana Sclerosi Multipla, FISM, Ente Cassa di Risparmio di Firenze.
The news reporters obtained a quote from the research from the University of Calabria, "The immunomodulatory and anti-inflammatory effects of azithromycin, well documented in chronic inflammatory airway diseases, have been ascribed to the inhibition of the transcription factors nuclear factor (NF)-kappa B and activator protein (AP) -1. Since these inflammatory transcription factors are positively regulated by poly(ADP-ribose) polymerase (PARP) -1, an enzyme actively involved in ischemic brain injury, we have investigated whether the neuroprotective properties of azithromycin in ischemic stroke involve upstream modulation of PARP-1. Administration of a single dose of this macrolide antibiotic upon reperfusion reduced, to a similar extent in wild type and PARP-1 knockout mice, infarct brain damage produced by transient occlusion of the middle cerebral artery. Moreover, we demonstrated the lack of effects of azithromycin on PARP-dependent death of HeLa cells, as well as on activity of purified PARP-1 and PARP-2."

According to the news reporters, the research concluded: "Thus, azithromycin protects mice against ischemic stroke injury through a mechanism independent of PARP activation."

For more information on this research see: Poly(ADP-ribose) polymerase is not involved in the neuroprotection exerted by azithromycin against ischemic stroke in mice. European Journal of Pharmacology, 2016;791():518-522. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Atrial Fibrillation
Reports from University of Calgary Provide New Insights into Atrial Fibrillation (Enhanced Cytosolic Ca2+ Activation Underlies a Common Defect of Central Domain Cardiac Ryanodine Receptor Mutations Linked to Arrhythmias)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Atrial Fibrillation. According to news reporting originating from Calgary, Canada, by NewsRx correspondents, research stated, "Recent three-dimensional structural studies reveal that the central domain of ryanodine receptor (RyR) serves as a transducer that converts long-range conformational changes into the gating of the channel pore. Interestingly, the central domain encompasses one of the mutation hotspots
(corresponding to amino acid residues 3778-4201) that contains a number of cardiac RyR (RyR2) mutations associated with catecholaminergic polymorphic ventricular tachycardia (CPVT) and atrial fibrillation (AF)."

Our news editors obtained a quote from the research from the University of Calgary, "However, the functional consequences of these central domain RyR2 mutations are not well understood. To gain insights into the impact of the mutation and the role of the central domain in channel function, we generated and characterized eight disease-associated RyR2 mutations in the central domain. We found that all eight central domain RyR2 mutations enhanced the Ca2+-dependent activation of [H-3]ryanodine binding, increased cytosolic Ca2+-induced fractional Ca2+ release, and reduced the activation and termination thresholds for spontaneous Ca2+ release in HEK293 cells. We also showed that racemic carvedilol and the non-beta-blocking carvedilol enantiomer, ®-carvedilol, suppressed spontaneous Ca2+ oscillations in HEK293 cells expressing the central domain RyR2 mutations associated with CPVT and AF. These data indicate that the central domain is an important determinant of cytosolic Ca2+ activation of RyR2."

According to the news editors, the research concluded: "These results also suggest that altered cytosolic Ca2+ activation of RyR2 represents a common defect of RyR2 mutations associated with CPVT and AF, which could potentially be suppressed by carvedilol or ®-carvedilol."

The news editors report that additional information may be obtained by contacting S.R.W. Chen, University of Calgary, Dept. of Physiol & Pharmacol, Libin Cardiovasc Inst Alberta, Calgary, AB T2N 4N1, Canada. Additional authors for this research include W.T. Guo, B. Sun, D.J. Hunt, J.H. Wei, Y.J. Liu, Y.D. Wang, R.W. Wang, P.P. Jones, T.G. Back and S.R.W. Chen.

research stated, "Staphylococcus aureus bacteremia (SAB) is a tremendous health burden. Previous studies examining the association of vancomycin MIC and outcomes in patients with SAB have been inconclusive."

Financial support for this research came from HHS | National Institutes of Health (NIH).

The news correspondents obtained a quote from the research from the University of California, "This study evaluated the association between vancomycin MICs and 30- or 90-day mortality in individuals with SAB. This was a prospective cohort study of adults presenting from 2008 to 2013 with a first episode of SAB. Subjects were identified by an infection surveillance system. The main predictor was vancomycin MIC by MicroScan. The primary outcomes were death at 30 and 90 days, and secondary outcomes included recurrence, readmission, or a composite of death, recurrence, and readmission at 30 and 90 days. Covariates included methicillin susceptibility, demographics, illness severity, comorbidities, infectious source, and antibiotic use. Cox proportional-hazards models with propensity score adjustment were used to estimate 30- and 90-day outcomes. Of 429 unique first episodes of SAB, 11 were excluded, leaving 418 individuals for analysis. Eighty-three (19.9%) participants had a vancomycin MIC of 2 µg/ml. In the propensity-adjusted Cox model, a vancomycin MIC of 2 µg/ml compared to < 2 µg/ml was not associated with a greater hazard of mortality or composite outcome of mortality, readmission, and recurrence at either 30 days (hazard ratios [HRs] of 0.86 [95% confidence interval CI, 0.41, 1.80] [P = 0.70] and 0.94 [95% CI, 0.55, 1.58] [P = 0.80], respectively) or 90 days (HRs of 0.91 [95% CI, 0.49, 1.69] [P = 0.77] and 0.69 [95% CI, 0.46, 1.04] [P = 0.08], respectively) after SAB diagnosis."

According to the news reporters, the research concluded: "In a prospective cohort of patients with SAB, vancomycin MIC was not associated with 30- or 90-day mortality or a composite of mortality, disease recurrence, or hospital readmission."

For more information on this research see: Vancomycin MIC Does Not Predict 90-Day Mortality, Readmission, or Recurrence in a Prospective Cohort of Adults with Staphylococcus aureus Bacteremia. Antimicrobial Agents and Chemotherapy, 2016;60(9):5276-5284. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Polyomavirus

Reports from University of California Add New Data to Findings in Polyomavirus (Intragraft Antiviral-Specific Gene Expression as a Distinctive Transcriptional Signature for Studies in Polyomavirus-Associated Nephropathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Polyomavirus is the subject of a report. According to news reporting from San Francisco, California, by NewsRx journalists, research stated, "Polyomavirus nephropathy (PVAN) is a common cause of kidney allograft dysfunction and loss. To identify PVAN-specific gene expression and underlying molecular mechanisms, we analyzed kidney biopsies with and without PVAN."

The news correspondents obtained a quote from the research from the University of California, "The study included 168 posttransplant renal allograft biopsies (T cell-mediated rejection [TCMR] = 26, PVAN = 10, normal functioning graft = 73, and interstitial fibrosis/tubular atrophy = 59) from 168 unique kidney allograft recipients. We performed gene expression assays and bioinformatics analysis to identify a set of PVAN-specific genes. Validity and relevance of a subset of these genes are validated by quantitative polymerase chain reaction and immunohistochemistry. Unsupervised hierarchical clustering analysis of all the biopsies revealed high similarity between PVAN and TCMR gene expression. Increased statistical stringency identified 158 and 252 unique PVAN and TCMR injury-specific gene transcripts respectively. Although TCMR-specific genes were overwhelmingly involved in immune response costimulation and TCR signaling, PVAN-specific genes were mainly related to DNA replication process, RNA polymerase assembly, and pathogen recognition receptors. A principal component analysis (PCA) using these genes further confirmed the most optimal separation between the 3 different clinical phenotypes. Validation of 4 PVAN-specific genes (RPS15, complement factor D, lactotransferrin, and nitric oxide synthase interacting protein) by quantitative polymerase chain reaction and confirmation by immunohistochemistry of 2 PVAN-specific proteins with antiviral function (lactotransferrin and IFN-inducible transmembrane 1) was done."

According to the news reporters, the research concluded: "Even though PVAN and TCMR kidney allografts share great similarities on gene perturbation, PVAN-specific genes were identified with well-known antiviral properties that provide tools for discerning PVAN and AR as well as attractive targets for rational drug design."

For more information on this research see: Intragraft Antiviral-Specific Gene Expression as a Distinctive Transcriptional Signature for Studies in Polyomavirus-Associated Nephropathy. Transplantation, 2016;100(10):2062-2070. Transplantation can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Transplantation - journals.lww.com/transplantjournal/pages/default.aspx)

Reports from University of California Describe Recent Advances in Prostate Cancer (Cell type-specific abundance of 4EBP1 primes prostate cancer sensitivity or resistance to PI3K pathway inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Prostate Cancer have been presented. According to news reporting originating in San Francisco, California, by NewsRx journalists, research stated, "Pharmacological inhibitors against the PI3K-AKT-mTOR (phosphatidylinositol 3-kinase-AKT-mammalian target of rapamycin) pathway, a frequently deregulated signaling pathway in cancer, are clinically promising, but the development of drug resistance is a major limitation. We found that 4EBP1, the central inhibitor of cap-dependent translation, was a critical regulator of both prostate cancer initiation and maintenance downstream of mTOR signaling in a genetic mouse model. 4EBP1 abundance was distinctly different between the epithelial cell types of the normal prostate."

The news reporters obtained a quote from the research from the University of California, "Of tumor-prone prostate epithelial cell types, luminal epithelial cells exhibited the highest transcript and protein abundance of 4EBP1 and the lowest protein synthesis rates, which mediated resistance to both pharmacologic and genetic inhibition of the PI3K-AKT-mTOR signaling pathway. Decreasing total 4EBP1 abundance reversed resistance in drug-insensitive cells. Increased 4EBP1 abundance was a common feature in prostate cancer patients who had been treated with the PI3K pathway inhibitor BKM120; thus, 4EBP1 may be associated with drug resistance in human tumors."

According to the news reporters, the research concluded: "Our findings reveal a molecular program controlling cell type-specific 4EBP1 abundance coupled to the regulation of global protein synthesis rates that renders each epithelial cell type of the prostate uniquely sensitive or resistant to inhibitors of the PI3K-AKT-mTOR signaling pathway."

For more information on this research see: Cell type-specific abundance of 4EBP1 primes prostate cancer sensitivity or resistance to PI3K pathway inhibitors. *Science Signaling*, 2015;8(403):ra116.

Reports from University of California Highlight Recent Findings in Chemical Biology (Engineering Soluble Human Paraoxonase 2 for Quorum Quenching)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Chemical Research - Chemical Biology. According to news reporting originating in Riverside, California, by NewsRx journalists, research stated, "Many pathogenic bacteria utilize quorum sensing (QS) systems to regulate the expression of their virulence genes and promote the formation of biofilm, which renders pathogens with extreme resistance to conventional antibiotic treatments. As a novel approach for attenuating antibiotic resistance and in turn fighting chronic infections, enzymatic inactivation of QS signaling molecules, such as N-acyl homoserine lactones (AHLs), holds great promises."

Financial support for this research came from University of California, Riverside. The news reporters obtained a quote from the research from the University of California, "Instead of using bacterial lactonases that can evoke immune response when administered, we focus on the human paraoxonase 2 (huPON2). However, insolubility when heterologously overexpressed hinders its application as anti-infection therapeutics. In this study, huPON2 was engineered for soluble expression with minimal introoduction of foreign sequences. On the basis of structure modeling, degenerate linkers were exploited for the removal of hydrophobic helices of huPON2 without disrupting its folding structure and thus retaining its enzymatic function. High soluble expression levels were achieved with a yield of 76 mg of fully human PON2 variants per liter of culture media. Particularly, two clones, D2 and E3, showed significant quorum quenching (QQ) bioactivities and effectively impeded Pseudomonas aeruginosa swimming and swarming motilities, signs of an early stage of biofilm formation."

According to the news reporters, the research concluded: "In addition, by correlating QQ with luminescence signal readouts, quantitative analysis of QQ toward natural or non-natural AHL-regulator combinations suggested that D2 and E3 exhibited strong lactone hydrolysis activities toward five AHLs of different side chain lengths and modifications widely utilized by a variety of biomedically important pathogens."

For more information on this research see: Engineering Soluble Human Paraoxonase 2 for Quorum Quenching. ACS Chemical Biology, 2016;11(11):3122-3131. Reports from University of California Highlight Recent Findings in Gliomas (Hyperpolarized C-13 MR imaging detects no lactate production in mutant IDH1 gliomas: Implications for diagnosis and response monitoring)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gliomas have been published. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "Metabolic imaging of brain tumors using C-13 Magnetic Resonance Spectroscopy (MRS) of hyperpolarized [1-C-13] pyruvate is a promising neuroimaging strategy which, after a decade of preclinical success in glioblastoma (GBM) models, is now entering clinical trials in multiple centers. Typically, the presence of GBM has been associated with elevated hyperpolarized [1-C-13] lactate produced from [1-C-13] pyruvate, and response to therapy has been associated with a drop in hyperpolarized [1-C-13] lactate."

Our news editors obtained a quote from the research from the University of California, "However, to date, lower grade gliomas had not been investigated using this approach. The most prevalent mutation in lower grade gliomas is the isocitrate dehydrogenase 1 (IDH1) mutation, which, in addition to initiating tumor development, also induces metabolic reprogramming. In particular, mutant IDH1 gliomas are associated with low levels of lactate dehydrogenase A (LDHA) and mono-carboxylate transporters 1 and 4 (MCT1, MCT4), three proteins involved in pyruvate metabolism to lactate. We therefore investigated the potential of 13C MRS of hyperpolarized [1-C-13] pyruvate for detection of mutant IDH1 gliomas and for monitoring of their therapeutic response. We studied patient-derived mutant IDH1 glioma cells that underexpress LDHA, MCT1 and MCT4, and wild-type IDH1 GBM cells that express high levels of these proteins. Mutant IDH1 cells and tumors produced significantly less hyperpolarized [1-C-13] lactate compared to GBM, consistent with their metabolic reprogramming. Furthermore, hyperpolarized [1-C-13] lactate production was not affected by chemotherapeutic treatment with temozolomide (TMZ) in mutant IDH1 tumors, in contrast to previous reports in GBM."

According to the news editors, the research concluded: "Our results demonstrate the unusual metabolic imaging profile of mutant IDH1 gliomas, which, when combined with other clinically available imaging methods, could be used to detect the presence of the IDH1 mutation in vivo."

For more information on this research see: Hyperpolarized C-13 MR imaging detects no lactate production in mutant IDH1 gliomas: Implications for diagnosis and response monitoring. *Neuroimage-Clinical*, 2016;12():180-189. *Neuroimage-Clinical* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon,

Science

Reports from University of Cambridge Describe Recent Advances in Science (CCT complex restricts neuropathogenic protein aggregation via autophagy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Science are presented in a new report. According to news reporting from Cambridge, United Kingdom, by NewsRx journalists, research stated, "Aberrant protein aggregation is controlled by various chaperones, including CCT (chaperonin containingTCP-1)/TCP-1/TRiC. Mutated CCT4/5 subunits cause sensory neuropathy and CCT5 expression is decreased in Alzheimer's disease."

The news correspondents obtained a quote from the research from the University of Cambridge, "Here, we show that CCT integrity is essential for autophagosome degradation in cells or Drosophila and this phenomenon is orchestrated by the actin cytoskeleton. When autophagic flux is reduced by compromise of individual CCT subunits, various disease-relevant autophagy substrates accumulate and aggregate. The aggregation of proteins like mutant huntingtin, ATXN3 or p62 after CCT2/5/7 depletion is predominantly autophagy dependent, and does not further increase with CCT knockdown in autophagy-defective cells/organisms, implying surprisingly that the effect of loss-of-CCT activity on mutant ATXN3 or huntingtin oligomerization/aggregation is primarily a consequence of autophagy inhibition rather than loss of physiological anti-aggregation activity for these proteins."

According to the news reporters, the research concluded: "Thus, our findings reveal an essential partnership between two key components of the proteostasis network and implicate autophagy defects in diseases with compromised CCT complex activity."

Our news journalists report that additional information may be obtained by contacting D.C. Rubinsztein, University of Cambridge, Cambridge Inst Med Res, Dept. of Med Genet, Addenbrookes Hospital, Cambridge CB2 2XY, United Kingdom. Additional authors for this research include S. Imarisio, F.M. Menzies, M. Jimenez-Sanchez, F.H. Siddiqi, X.T. Wu, M. Renna, C.J. O’Kane, D.C. Crowther and D.C. Rubinsztein.
Reports from University of Central Lancashire Highlight Recent Findings in Health and Medicine (Repetitive task training for improving functional ability after stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Health and Medicine is the subject of a report. According to news reporting from Preston, United Kingdom, by NewsRx journalists, research stated, "Repetitive task training (RTT) involves the active practice of task-specific motor activities and is a component of current therapy approaches in stroke rehabilitation. Primary objective: To determine if RTT improves upper limb function/reach and lower limb function/balance in adults after stroke."

The news correspondents obtained a quote from the research from the University of Central Lancashire, "Secondary objectives: 1) To determine the effect of RTT on secondary outcome measures including activities of daily living, global motor function, quality of life/health status and adverse events. 2) To determine the factors that could influence primary and secondary outcome measures, including the effect of 'dose' of task practice; type of task (whole therapy, mixed or single task); timing of the intervention and type of intervention.

Search methods We searched the Cochrane Stroke Group Trials Register (4 March 2016); the Cochrane Central Register of Controlled Trials (CENTRAL) (the Cochrane Library 2016, Issue 5:1 October 2006 to 24 June 2016); MEDLINE (1 October 2006 to 8 March 2016); Embase (1 October 2006 to 8 March 2016); CINAHL (2006 to 23 June 2016); AMED (2006 to 21 June 2016) and SPORTSDiscus (2006 to 21 June 2016). Selection criteria Randomised/quasi-randomised trials in adults after stroke, where the intervention was an active motor sequence performed repetitively within a single training session, aimed towards a clear functional goal.

Data collection and analysis Two review authors independently screened abstracts, extracted data and appraised trials. We determined the quality of evidence within each study and outcome group using the Cochrane 'Risk of bias' tool and GRADE (Grades of Recommendation, Assessment, Development and Evaluation) criteria. We did not assess follow-up outcome data using GRADE. We contacted trial authors for additional information. We included 33 trials with 36 intervention-control pairs and 1853 participants. The risk of bias present in many studies was unclear due to poor reporting; the evidence has therefore been rated 'moderate' or 'low' when using the GRADE system. There is low-quality evidence that RTT improves arm function (standardised mean difference (SMD) 0.25, 95% confidence interval (CI) 0.01 to 0.49; 11 studies, number of participants analysed = 749), hand function (SMD 0.25, 95% CI 0.00 to 0.51; eight studies, number of participants analysed = 619), and lower limb functional measures (SMD 0.29, 95% CI 0.10 to 0.48; five trials, number of participants analysed = 419). There is moderate-quality evidence that RTT improves walking distance (mean difference (MD) 34.80, 95% CI 18.19 to 51.41; nine studies, number of participants analysed = 610) and functional ambulation (SMD 0.35, 95% CI 0.04 to 0.66; eight studies, number of participants analysed = 525). We found significant differences between groups for both upper-limb (SMD 0.92, 95% CI 0.58 to 1.26; three studies, number of participants analysed = 153) and lower-limb (SMD 0.34,
95% CI 0.16 to 0.52; eight studies, number of participants analysed = 471) outcomes up to six months post treatment but not after six months. Effects were not modified by intervention type, dosage of task practice or time since stroke for upper or lower limb. There was insufficient evidence to be certain about the risk of adverse events. Authors' conclusions There is low-to moderate-quality evidence that RTT improves upper and lower limb function; improvements were sustained up to six months post treatment. Further research should focus on the type and amount of training, including ways of measuring the number of repetitions actually performed by participants.

According to the news reporters, the research concluded: "The definition of RTT will need revisiting prior to further updates of this review in order to ensure it remains clinically meaningful and distinguishable from other interventions."

**Oncology - Urothelial Cancer**

**Reports from University of Chicago Highlight Recent Findings in Urothelial Cancer (Clinical Evaluation of Cisplatin Sensitivity of Germline Polymorphisms in Neoadjuvant Chemotherapy for Urothelial Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Urothelial Cancer. According to news reporting originating from Chicago, Illinois, by NewsRx correspondents, research stated, "To identify patients with urothelial cancer most likely to benefit from neoadjuvant chemotherapy, we evaluated germline pharmacogenomic markers for an association with response in 205 patients across 3 institutions. Stage pT0 (26%) and < pT2 (50%) rates were consistent across the respective discovery and replication cohorts."

Financial support for this research came from NIH.

Our news editors obtained a quote from the research from the University of Chicago, "Despite the large effects for 3 polymorphisms in the discovery set, none were associated with achievement of pT0 or < pT2 on replication. Multi-institutional efforts are feasible and will be necessary to achieve advances in urothelial cancer precision medicine. Level 1 evidence has demonstrated increased overall survival with cisplatin-based neoadjuvant chemotherapy for patients with muscle-invasive urothelial cancer. Usage remains low, however, in part because neoadjuvant chemotherapy will not be effective for every patient. To identify the patients most likely to benefit, we evaluated germline pharmacogenomic markers for association with
neoadjuvant chemotherapy sensitivity in 2 large cohorts of patients with urothelial cancer. Patients receiving neoadjuvant cisplatin-based chemotherapy for muscle-invasive urothelial cancer were eligible. Nine germline single nucleotide polymorphisms (SNPs) potentially conferring platinum sensitivity were tested for an association with a complete pathologic response to neoadjuvant chemotherapy (pT0) or elimination of muscle-invasive cancer (<pT2). The data from 205 patients were analyzed-59 patients were included in the discovery set and 146 in an independent replication cohort from 3 institutions. The stage pT0 (26%) and < pT2 (50%) rates were consistent across the discovery and replication populations. Using a multivariate recessive genetic model, rs244898 in RARS (odds ratio, 6.8; 95% confidence interval, 1.8-28.9; P = .006) and rs7937567 in GALNTL4 (odds ratio, 4.8; 95% confidence interval, 1.1-22.6; P = .04) were associated with pT0 in the discovery set. Despite these large effects, neither were associated with achievement of pT0 in the replication set. A third SNP, rs10964552, was associated with stage < pT2 in the discovery set but also failed to replicate. Germline SNPs previously associated with platinum sensitivity were not associated with the neoadjuvant chemotherapy response in a large replication cohort of patients with urothelial cancer."

According to the news editors, the research concluded: "These results emphasize the need for replication when evaluating pharmacogenomic markers and demonstrate that multi-institutional efforts are feasible and will be necessary to achieve advances in urothelial cancer pharmacogenomics."

For more information on this research see: Clinical Evaluation of Cisplatin Sensitivity of Germline Polymorphisms in Neoadjuvant Chemotherapy for Urothelial Cancer. Clinical Genitourinary Cancer, 2016;14(6):511-517. Clinical Genitourinary Cancer can be contacted at: Cig Media Group, Lp, 3500 Maple Avenue, Ste 750, Dallas, TX 75219-3931, USA. Reports from University of Cincinnati Highlight Recent Findings in Aneurysm (Aneurysm growth and de novo aneurysms during aneurysm surveillance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Aneurysm. According to news reporting out of Cincinnati, Ohio, by NewsRx editors, research stated, "Many low-risk unruptured intracranial aneurysms (UIAs) are followed for growth with surveillance imaging. Growth of UTAs likely increases the risk of rupture."

Our news journalists obtained a quote from the research from the University of Cincinnati, "The incidence and risk factors of UIA growth or de novo aneurysm formation require further research. The authors retrospectively identify risk factors and annual risk for UIA growth or de novo aneurysm formation in an aneurysm surveillance protocol. Over an 11.5-year period, the authors recommended surveillance imaging to 192 patients with 234 UTAs. The incidence of UIA growth and de novo aneurysm formation was assessed. With logistic regression, risk factors for UIA growth or de novo aneurysm formation and patient compliance with the surveillance protocol was assessed. During 621 patient-years of follow-up, the incidence of aneurysm growth or de novo aneurysm formation was 5.0%/patient-year. At the 6-month examination, 5.2% of patients had aneurysm growth and 4.3% of aneurysms had grown. Four de novo aneurysms formed (0.64%/patient-year). Over 793 aneurysm-years of follow-up, the annual risk of aneurysm growth was 3.7%. Only initial aneurysm size predicted aneurysm growth (UIA < 5 mm = 1.6% vs UIA >= 5 mm = 8.7%, p = 0.002). Patients with growing UIAs were more likely to also have de novo aneurysms (p = 0.01). Patient compliance with this protocol was 65%, with younger age predictive of better compliance (p = 0.01). Observation of low-risk UTAs with surveillance imaging can be implemented safely with good adherence. Aneurysm size is the only predictor of future growth."

According to the news editors, the research concluded: "More frequent (semiannual) surveillance imaging for newly diagnosed UTAs and UTAs 5 mm is warranted."

For more information on this research see: Aneurysm growth and de novo aneurysms during aneurysm surveillance. Journal of Neurosurgery. 2016;125(6):1374-1382. Journal of Neurosurgery can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

Pharmacokinetics

Reports from University of Cincinnati Highlight Recent Findings in Pharmacokinetics (ABCC3 genetic variants are associated with postoperative morphine-induced respiratory depression and morphine pharmacokinetics in children)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacokinetics have been presented. According to news originating from Cincinnati, Ohio, by NewsRx correspondents, research stated, "Respiratory depression (RD) is a serious side effect of morphine and detrimental to effective analgesia. We reported that variants of the ATP binding cassette gene ABCC3 (facilitates hepatic morphine metabolite efflux) affect morphine metabolite clearance."

Our news journalists obtained a quote from the research from the University of Cincinnati, "In this study of 316 children undergoing tonsillectomy, we found significant association between ABCC3 variants and RD leading to prolonged postoperative care unit stay (prolonged RD). Allele A at rs4148412 and allele G at rs729923 caused a 2.36 (95% CI=1.28-4.37, p=0.0061) and 3.7 (95% CI 1.47-9.09, p=0.0050) times increase in odds of prolonged RD, respectively. These clinical associations were supported by increased formation clearance of morphine glucuronides in children with rs4148412 AA and rs4973665 CC genotypes in this cohort, as well as an independent spine surgical cohort of 67 adolescents."

According to the news editors, the research concluded: "This is the first study to report association of ABCC3 variants with opioid-related RD, and morphine metabolite formation (in two independent surgical cohorts). The Pharmacogenomics Journal advance online publication, 26 January."

For more information on this research see: ABCC3 genetic variants are associated with postoperative morphine-induced respiratory depression and morphine pharmacokinetics in children. The Pharmacogenomics Journal, 2016();.

Drugs and Therapies - Antibiotics

Reports from University of Claude Bernard Provide New Insights into Antibiotics (Delivery system for berberine chloride based on the nanocarrier ZnAl-layered double hydroxide: Physicochemical
characterization, release behavior and evaluation of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antibiotics. According to news reporting out of Villeurbanne, France, by NewsRx editors, research stated, "Layered double hydroxide (LDH) has attracted major interest as one of the most versatile drug delivery systems especially for adsorption capacity and/or controlled delivery property of bioactive agents owing to their combining features of biohybrid. ZnAl synthesized layered double hydroxide can offer a platform to immobilize various types of bioactive compounds, particularly berberine chloride (BBC)."

Our news journalists obtained a quote from the research from the University of Claude Bernard, "However, the immobilization reaction of berberine chloride into ZnAl-LDH was performed by direct co-precipitation method at different ratios of BBC/LDH. BBC-ZnAl-LDH biohybrids were characterized in terms of structure, surface morphology, in vitro drug release profile and antibacterial assay against various bacterial cells. The BBC biomolecules were attached by coordinate bond. Structural and microstructural characterization confirms that interaction of BBC with ZnAl-LDH occurs by adsorption rather than intercalation of BBC within LDH layers. The BBC release profiles from BBC-ZnAl-LDH had a longer release duration compared to the physical mixture, and the drug release seemed faster with the low ratio of BBC/LDH. BBC-ZnAl-LDH can be internalized into bacterial cells. In vitro experiments in PBS medium showed that BBC-ZnAl-LDH biohybrid had higher cytotoxicity and inhibitory effects against three pathogenic bacteria; Staphylococcus aureus CIP 543154, Pseudomonas aeruginosa A22 and Bacillus subtilus ILP 1428B upon the drug release profiles and its destructive potential depends on the loading BBC on the LDH layers."

According to the news editors, the research concluded: "Nonetheless these results prove that the prepared BBC-ZnAl-LDH biohybrids retain the anti-bacterial character of the BBC molecules and are therefore potential modified drug delivery system (DDS)."

Our news journalists report that additional information may be obtained by contacting M.A. Djebbi, Univ Claude Bernard Lyon 1, UMR CNRS 5280, Inst Sci Analyt, F-69100 Villeurbanne, France. Additional authors for this research include A. Elabed, Z. Bouaziz, M. Sadiki, S. Elabed, P. Namour, N. Jaffrezic-Renault and A.B. Amara.

Nutritional and Metabolic Diseases and Conditions -…

Reports from University of Colorado Advance Knowledge in Obesity (Pharmacokinetic and Pharmacodynamic Evaluation of a Weight-Based Dosing Regimen of Cefoxitin for Perioperative Surgical Prophylaxis in Obese and Morbidly Obese Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting from Aurora, Colorado, by NewsRx journalists, research stated, "The objective of this study was to determine the pharmacokinetics and pharmacodynamics (PK/PD) of a weight-based cefoxitin dosing regimen for surgical prophylaxis in obese patients. Patients received a single dose of cefoxitin at 40 mg/kg based on total body weight."

The news correspondents obtained a quote from the research from the University of Colorado, ‘Cefoxitin samples were obtained over 3 h from serum and adipose tissue, and concentrations were determined by validated high-performance liquid chromatography. Noncompartmental pharmacokinetic analysis was performed, followed by Monte Carlo simulations to estimate probability of target attainment (PTA) for Staphylococcus aureus, Escherichia coli, and Bacteroides fragilis over 4-h periods postdose. Thirty patients undergoing bariatric procedures were enrolled. The body mass index (mean +/- standard deviation [SD]) was 45.9 +/- 8.0 kg/m(2) (range, 35.0 to 76.7 kg/m2); the median cefoxitin dose was 5 g (range, 4.0 to 7.5 g). The mean maximum concentrations were 216.15 +/- 41.80 mu g/ml in serum and 12.62 +/- 5.89 in tissue; the mean tissue/serum ratio was 8% +/- 3%. In serum, weight-based regimens achieved > 90% PTA (goal time during which free [unbound] drug concentrations exceed pathogen MICs [fT > MIC] of 100%) for E. coli and S. aureus over 2 h and for B. fragilis over 1 h; in tissue this regimen failed to achieve goal PTA at any time point. The 40-mg/kg regimens achieved higher PTAs over longer periods in both serum and tissue than did the standard 2-g doses. However, although weight-based cefoxitin regimens were better than fixed doses, achievement of desired pharmacodynamic targets was suboptimal in both serum and tissue."

According to the news reporters, the research concluded: "Alternative dosing regimens and agents should be explored in order to achieve more favorable antibiotic performance during surgical prophylaxis in obese patients."

For more information on this research see: Pharmacokinetic and Pharmacodynamic Evaluation of a Weight-Based Dosing Regimen of Cefoxitin for Perioperative Surgical Prophylaxis in Obese and Morbidly Obese Patients. Antimicrobial Agents and Chemotherapy, 2016;60(10):5885-5893.抗微生物剂和化疗期刊可以联系：American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org

Our news journalists report that additional information may be obtained by contacting P. Moine, Univ Colorado Denver, Sch Med, Dept. of Anesthesiol, Aurora, CO 80204, United States. Additional authors for this research include S.W. Mueller, J.A. Schoen, K.B. Rothchild and D.N. Fish.

Immunology - Immunoproteins

Reports from University of Connecticut Advance Knowledge in Immunoproteins (Effect of Excipients on Liquid-Liquid Phase Separation and Aggregation in Dual Variable Domain Immunoglobulin Protein Solutions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immunoproteins have been published. According to news originating from Storrs, Connecticut, by NewsRx correspondents, research stated, "Liquid-liquid phase separation (LLPS) and aggregation can reduce the physical stability of therapeutic protein formulations. On undergoing LLPS, the protein-rich phase can promote aggregation during storage due to high concentration of the protein."

Financial support for this research came from AbbVie.

Our news journalists obtained a quote from the research from the University of Connecticut, "Effect of different excipients on aggregation in protein solution is well documented; however data on the effect of excipients on LLPS is scarce in the literature. In this study, the effect of four excipients (PEG 400, Tween 80, sucrose, and hydroxypropyl beta-cyclodextrin (HPbCD)) on liquid-liquid phase separation and aggregation in a dual variable domain immunoglobulin protein solution was investigated. Sucrose suppressed both LLPS and aggregation, Tween 80 had no effect on either, and PEG 400 increased LLPS and aggregation. Attractive protein-protein interactions and liquid-liquid phase separation decreased with increasing concentration of HPbCD, indicating its specific binding to the protein. However, HPbCD had no effect on the formation of soluble aggregates and fragments in this study."

According to the news editors, the research concluded: "LLPS and aggregation are highly temperature dependent; at low temperature protein exhibits LLPS, at high temperature protein exhibits aggregation, and at an intermediate temperature both phenomena occur simultaneously depending on the solution conditions."

For more information on this research see: Effect of Excipients on Liquid-Liquid Phase Separation and Aggregation in Dual Variable Domain Immunoglobulin Protein Solutions. Molecular Pharmaceutics, 2016;13(3):774-83. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

The news correspondents report that additional information may be obtained from A.S. Raut, Dept. of Pharmaceutical Sciences, University of Connecticut, 69 North Eagleville Road, Unit 3092, Storrs, Connecticut 06269, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.molpharmaceut.5b00668. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Heart Attack

Reports from University of Copenhagen Describe Recent Advances in Heart Attack (Association between prehospital physician involvement and survival after out-of-hospital cardiac arrest: A Danish nationwide observational study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Attack. According to news reporting originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "Sudden out-of-hospital cardiac arrest (OHCA) is an important public health problem. While several interventions are known to improve survival, the impact of physician-delivered advanced cardiac life support for OHCA is unclear."

Our news editors obtained a quote from the research from the University of Copenhagen, "We aimed to assess the association between prehospital physician involvement and 30-day survival. Observational study including persons registered with first-time OHCA of any cause in the Danish Cardiac Arrest Registry during 2005-2012. We used logistic regression analysis to assess the association between 30-day survival and involvement of a physician at any time before arrival at the hospital. Secondary outcomes were 1-year survival and return of spontaneous circulation (ROSC) before arrival at the hospital. The associations were explored in three multivariable models: a model with simple adjustment, a model with multiple imputation of missing variables, and a propensity score model where exposed subjects were matched 1:1 with unexposed subjects on a propensity score reflecting the probability of being assigned to the exposure group. 21,165 persons with OHCA during 2005-2012 were included. Overall, 10.8% of OHCA patients with physician involvement and 8.1% of OHCA patients without physician involvement before arrival at hospital were alive after 30 days, crude odds ratio (OR) = 1.37 (95% CI = 1.24-1.51), adjusted OR = 1.18 (95% CI = 1.04-1.34). Physician involvement was also positively associated with ROSC, OR = 1.09 (95% CI = 1.00-1.19); and with 1-year survival, OR = 1.13 (95% CI = 0.99-1.29). In this large population-based observational study, we found prehospital physician involvement after OHCA associated with better 30-day survival."

According to the news editors, the research concluded: "This association was also found for ROSC, but with less certainty for 1-year survival."

The news editors report that additional information may be obtained by contacting A. Hamilton, University of Copenhagen, Hvidovre Hosp, Dept. of Anaesthesiol & Intens Care, Copenhagen, Denmark. Additional authors for this research include J. Steinmetz, M. Wissenberg, C. Torp-Pedersen, F.K. Lippert, L. Hove and N. Lohse.

Reports from University of Debrecen Highlight Recent Findings in Obesity (Paraoxonase-1 and adipokines: Potential links between obesity and atherosclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating in Debrecen, Hungary, by NewsRx journalists, research stated, "Oxidative stress and chronic low-grade inflammation are major characteristics of obesity-related disorders. The dominance of pro-oxidant and pro-inflammatory mechanisms triggers insulin resistance and enhances the progression of atherosclerosis."

Financial support for this research came from National Research, Development and Innovation.

The news reporters obtained a quote from the research from the University of Debrecen, "Discovered first as an esterase that hydrolyze organophosphates, human paraoxonase-1 is bound to high-density lipoprotein and inhibits the oxidation of lipoproteins and reduces the degree of inflammation, hence it is considered to act against atherosclerosis. In contrast, the majority of the adipokines secreted from the enlarged white adipose tissue promote the atherosclerotic process; and altered adipokine secretion is now regarded as one of the major contributors of increased cardiovascular morbidity and mortality in obesity. In this review, we detail the correlations between paraoxonase-1 and some selected adipokines, namely leptin, adiponectin and chemerin. Adipokine imbalance leads to decreased paraoxonase-1 activity that results in enhanced atherosclerosis; therefore, altered adipokine secretion may be predictive of cardiovascular complications in obesity. As an active organ secreting biological active substances, white adipose tissue may also act as a 'fine-tuner' of immune and endocrine actions attenuating or enhancing reactions triggered by pathogens, inflammation and metabolic stimuli; and obesity, as a chronic noxious state may perturb the proper functioning of this fine-tuning process."

According to the news reporters, the research concluded: "Further investigations are of major importance to elucidate the associations between adipokines and paraoxonase-1 and to establish accurate interventions against obesity-related disorders."

For more information on this research see: Paraoxonase-1 and adipokines: Potential links between obesity and atherosclerosis. Chemico-Biological Interactions, 2016;259():388-393. Drugs and Therapies - Antineoplastics

Reports from University of Dundee Describe Recent Advances in Antineoplastics (The Role of Folate Transport in Antifolate Drug Action in Trypanosoma brucei)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antineoplastics have been presented. According to news originating from Dundee, United Kingdom, by NewsRx correspondents, research stated, "The aim of this study was to identify and characterize mechanisms of resistance to antifolate drugs in African trypanosomes. Genome-wide RNAi library screens were undertaken in bloodstream form Trypanosoma brucei exposed to the antifolates methotrexate and raltitrexed."

Our news journalists obtained a quote from the research from the University of Dundee, "In conjunction with drug susceptibility and folate transport studies, RNAi knockdown was used to validate the functions of the putative folate transporters. The transport kinetics of folate and methotrexate were further characterized in whole cells. RNA interference target sequencing experiments identified a tandem array of genes encoding a folate transporter family, TbFT1-3, as major contributors to antifolate drug uptake. RNAi knockdown of TbFT1-3 substantially reduced folate transport into trypanosomes and reduced the parasite's susceptibility to the classical antifolates methotrexate and raltitrexed. In contrast, knockdown of TKFT1-3 increased susceptibility to the non-classical antifolates pyrimethamine and nolatrexed. Both folate and methotrexate transport were inhibited by classical antifolates but not by non-classical antifolates or biopterin."

According to the news editors, the research concluded: "Thus, TbFT1-3 mediates the uptake of folate and classical antifolates in trypanosomes, and TbFT1-3 loss-of-function is a mechanism of antifolate drug resistance."

Enzymes and Coenzymes - Carboxylic Ester...

Reports from University of Eastern Finland Describe Recent Advances in Carboxylic Ester Hydrolases [In Vivo Characterization of the Ultrapotent Monoacylglycerol Lipase Inhibitor ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - Carboxylic Ester Hydrolases. According to news reporting from Kuopio, Finland, by NewsRx journalists, research stated, "Monoacylglycerol lipase (MAGL) is a serine hydrolase that acts as a principal degradative enzyme for the endocannabinoid 2-arachidonoylglycerol (2-AG). In addition to terminating the signaling function of 2-AG, MAGL liberates arachidonic acid to be used as a primary source for neuroinflammatory prostaglandin synthesis in the brain."

The news correspondents obtained a quote from the research from the University of Eastern Finland, "MAGL activity also contributes to cancer pathogenicity by producing precursors for tumor-promoting bioactive lipids. Pharmacological inhibitors of MAGL provide valuable tools for characterization of MAGL and 2-AG signaling pathways. They also hold great therapeutic potential to treat several pathophysiological conditions, such as pain, neurodegenerative disorders, and cancer. We have previously reported piperidine triazole urea, 4-[bis-(benzo[d][1,3]dioxol-5-yl)methyl]-piperidin-1-yl(1H-1,2,4-triazol-1-yl)methanone (JJKK-048), to be an ultra-potent and highly selective inhibitor of MAGL in vitro. Here, we characterize in vivo effects of JJKK-048. Acute in vivo administration of JJKK-048 induced a massive increase in mouse brain 2-AG levels without affecting brain anandamide levels. JJKK-048 appeared to be extremely potent in vivo. Activity-based protein profiling revealed that JJKK-048 maintains good selectivity toward MAGL over other serine hydrolases. Our results are also the first to show that JJKK-048 promoted significant analgesia in a writhing test with a low dose that did not cause cannabimimetic side effects."

According to the news reporters, the research concluded: "At a high dose, JJKK-048 induced analgesia both in the writhing test and in the tail-immersion test, as well as hypomotility and hyperthermia, but not catalepsy."

For more information on this research see: In Vivo Characterization of the Ultrapotent Monoacylglycerol Lipase Inhibitor 4-[bis-(benzo[d][1,3]dioxol-5-yl)methyl]-piperidin-1-yl(1H-1,2,4-triazol-1-yl)methanone (JJKK-048). Journal of Pharmacology and Experimental Therapeutics, 2016;359(1):62-72. Journal of Pharmacology and Experimental Therapeutics
Reports from University of Exeter Add New Data to Findings in Type 2 Diabetes (beta-cell differentiation status in type 2 diabetes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting from Exeter, United Kingdom, by NewsRx journalists, research stated, "Type 2 diabetes (T2D) affects 415 million people worldwide and is characterized by chronic hyperglycaemia and insulin resistance, progressing to insufficient insulin production, as a result of -cell failure. Over time, chronic hyperglycaemia can ultimately lead to loss of -cell function, leaving patients insulin-dependent."

The news correspondents obtained a quote from the research from the University of Exeter, "Until recently the loss of -cell mass seen in T2D was considered to be the result of increased rates of apoptosis; however, it has been proposed that apoptosis alone cannot account for the extent of -cell mass loss seen in the disease, and that a loss of function may also occur as a result of changes in -cell differentiation status. In the present review, we consider current knowledge of determinants of -cell fate in the context of understanding its relevance to disease process in T2D, and also the impact of a diabeticogenic environment (hyperglycaemia, hypoxia, inflammation and dyslipidaemia) on the expression of genes involved in maintenance of -cell identity. We describe current knowledge of the impact of the diabetic microenvironment on gene regulatory processes such alternative splicing, the expression of disallowed genes and epigenetic modifications."

According to the news reporters, the research concluded: "Elucidating the molecular mechanisms that underpin changes to -cell differentiation status and the concomitant -cell failure offers potential treatment targets for the future management of patients with T2D."

For more information on this research see: beta-cell differentiation status in type 2 diabetes. *Diabetes Obesity & Metabolism*, 2016;18(12):1167-1175. *Diabetes Obesity & Metabolism* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news journalists report that additional information may be obtained by contacting L.W. Harries, University of Exeter, Sch Med, Inst Biomed & Clin Sci, Dept. of Mol Genet, Exeter, Devon, United Kingdom.

Cyclohexanes

Reports from University of Florida College of Medicine Advance Knowledge in Cyclohexanes (Ketamine suppresses hypoxia-induced inflammatory responses in the late-gestation ovine fetal kidney cortex)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cyclohexanes. According to news originating from Gainesville, Florida, by NewsRx correspondents, research stated, "Acute fetal hypoxia is a form of fetal stress that stimulates renal vasoconstriction and ischaemia as a consequence of the physiological redistribution of combined ventricular output. Because of the potential ischaemia-reperfusion injury to the kidney, we hypothesized that it would respond to hypoxia with an increase in the expression of inflammatory genes, and that ketamine (an N-methyl-D-aspartate receptor antagonist) would reduce or block this response."

Our news journalists obtained a quote from the research from the University of Florida College of Medicine, "Hypoxia was induced for 30 min in chronically catheterized fetal sheep (125 ? 3 days), with or without ketamine (3 mg kg(-1)) administered intravenously to the fetus 10 min prior to hypoxia. Gene expression in fetal kidney cortex collected 24 h after the onset of hypoxia was analysed using ovine Agilent 15.5k array and validated with qPCR and immunohistochemistry in four groups of ewes: normoxic control, normoxia + ketamine, hypoxic control and hypoxia + ketamine (n=3-4 per group). Significant differences in gene expression between groups were determined with t-statistics using the limma package for R (P (<=) 0.05). Enriched biological processes for the 427 upregulated genes were immune and inflammatory responses and for the 946 downregulated genes were metabolic processes. Ketamine countered the effects of hypoxia on upregulated immune/inflammatory responses as well as the downregulated metabolic responses. We conclude that our transcriptomics modelling predicts that hypoxia activates inflammatory pathways and reduces metabolism in the fetal kidney cortex, and ketamine blocks or ameliorates this response."

According to the news editors, the research concluded: "The results suggest that ketamine may have therapeutic potential for protection from ischaemic renal damage."

The news correspondents report that additional information may be obtained from E.I. Chang, Dept. of Physiology and Functional Genomics, University of Florida College of Medicine, Gainesville, FL, 32610-0274, United States. Additional authors for this research include M.A. Zarate, M.B. Rabaglino, E.M. Richards, M. Keller-Wood and C.E. Wood.

Skin Diseases and Conditions - Cholesteatoma

Reports from University of Florida Highlight Recent Findings in Cholesteatoma (Efficacy of Antibiotic Prophylaxis Prior to Tympanoplasty for Contaminated Cholesteatoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Skin Diseases and Conditions - Cholesteatoma. According to news reporting out of Gainesville, Florida, by NewsRx editors, research stated, "To evaluate the efficacy of combined antistaphylococcal and antipseudomonal preoperative antibiotics for preventing surgical site infections following tympanoplasty and mastoidectomy with contaminated cholesteatoma. Retrospective chart review."

Our news journalists obtained a quote from the research from the University of Florida, "Medical records of patients who underwent tympanoplasty +/- mastoidectomy for cholesteatoma were reviewed. Only cases considered to have contaminated or dirty surgical fields were included. The primary outcome measure was occurrence of postoperative surgical site infections, perichondritis, pinna abscess, periotic cellulitis, or periotic abscess requiring systemic antibiotic therapy or surgical intervention. The charts of 326 patients who underwent tympanoplasty +/- mastoidectomy were reviewed. Of those, 195 met inclusion criteria. Preoperative antibiotics included clindamycin and ceftazidime or gentamicin. Patients treated with no per-operative antibiotics had a surgical site infection rate of 11%, and those treated with perioperative antibiotics had a rate of 1% (P = 0.02)."

According to the news editors, the research concluded: "Administration of preoperative antibiotics to cover staphylococcal and pseudomonal species may prevent surgical site infections with tympanoplasty mastoidectomy for contaminated cholesteatoma."

Our news journalists report that additional information may be obtained by contacting P.J. Antonelli, University of Florida, Dept. of Otolaryngol Head & Neck Surg, Gainesville, FL, United States.

Reports from University of Freiburg Highlight Recent Findings in Antimicrobials (Nonwoven Carboxylated Agarose-Based Fiber Meshes with Antimicrobial Properties)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antimicrobials are discussed in a new report. According to news reporting from Freiburg, Germany, by NewsRx journalists, research stated, "Hydrogel forming polysaccharides, such as the seaweed derived agarose, are well suited for wound dressing applications as they have excellent cell and soft tissue compatibility. For wound dressings, fibrous structure is desirable as the high surface area can favor adsorption of wound exudate and promote drug delivery."

Financial supporters for this research include Albert-Ludwigs-Universitat Freiburg, Deutsche Forschungsgemeinschaft.

The news correspondents obtained a quote from the research from the University of Freiburg, "Although electro-spinning offers a straightforward means to produce nonwoven fibrous polymeric structures, processing agarose and its derivatives into fibers through electrospinning is challenging as it has limited solubility in solvents other than water. In this study we describe the processing of carboxylated agarose (CA) fibers with antibacterial properties by electrospinning from a solution of the ionic liquid (IL) 1-butyl-3-methylimidazolium chloride ([Bmim][Cl--(+)]) possessing antimicrobial properties. The extent of carboxylation was found to impact fiber diameter, mesh elastic modulus, fiber swelling, and the loading and release of IL. IL-bearing CA fibers inhibited the growth of Staphylococcus aureus and Pseudomonas aeruginosa, bacteria commonly found in wound exudate."

According to the news reporters, the research concluded: "In sum, nonwoven CA fibers processed from IL are promising as biomaterials for wound dressing applications."

For more information on this research see: Nonwoven Carboxylated Agarose-Based Fiber Meshes with Antimicrobial Properties. Biomacromolecules, 2016;17(12):4021-4026. Biomacromolecules can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; Biomacromolecules - www.pubs.acs.org/journal/bomaf6)

Reports from University of Glasgow Advance Knowledge in Heart Failure (Loop diuretics, renal function and clinical outcome in patients with heart failure and reduced ejection fraction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Failure are presented in a new report. According to news reporting out of Glasgow, United Kingdom, by NewsRx editors, research stated, "We aimed to study the relationships of loop diuretic dose with renal function and clinical outcomes in patients with chronic heart failure (HF). Loop diuretic dose at baseline was recorded in patients included in the Controlled Rosuvastatin Multinational Trial in Heart Failure (CORONA)."

Our news journalists obtained a quote from the research from the University of Glasgow, "The relationship to change in estimated glomerular filtration rate (eGFR) over time and to the first occurrence of the composite outcome of cardiovascular (CV) death or hospitalization owing to HF was examined in propensity score matched cohorts. Of the 5011 patients, 2550, 745, and 449 were receiving >80 mg (high), 41-80 mg (medium) and (<=)40 mg (low) of loop diuretics in furosemide equivalent daily dosages, respectively, which were used to assemble 229, 385, and 1045 pairs of propensity-matched high, medium, and low dose cohorts. Compared with matched no loop diuretic groups, eGFR declined 0.3 ? 0.2, 0.3 ? 0.3 and 1.2 ? 0.5 mL/min/1.73 m(2) /year in the low-, medium-, and high-dose groups, respectively. Compared with matched no loop diuretic groups, hazard ratios (HR) (95% confidence intervals) for outcome associated with low-, medium-and high-dose groups were 1.71 (1.41-2.06), 1.99 (1.50-2.64), and 2.94 (1.95-4.41), respectively. Higher loop diuretic dose was particularly associated with increased risk for hospitalization owing to HF: HR 4.80 (2.75-8.37), p<0.001."

According to the news editors, the research concluded: "The use of loop diuretics was associated with a slightly greater rate of decline in eGFR, which did not vary significantly by diuretic dose. Loop diuretic dose was associated with higher risks of (CV) mortality and predominantly hospitalization owing to HF, which appeared to be higher among those receiving higher daily doses."

Our news journalists report that additional information may be obtained by contacting K. Damman, British Heart Foundation Cardiovascular Research Centre, University of Glasgow, Glasgow, UK. Additional authors for this research include J. Kjekshus, J. Wikstrand, J.G. Cleland, M. Komajda, H. Wedel, F. Waagstein and J.J McMurtry.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/ejhf.462. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from University of Gothenburg Highlight Recent Findings in Colon Cancer (Development and validation of the preparedness for Colorectal Cancer Surgery Questionnaire: PCSQ-pre 24)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting originating in Gothenburg, Sweden, by NewsRx journalists, research stated, "The aims of the study were to develop and psychometrically evaluate a patient-reported outcome instrument for the measurement of preoperative preparedness in patients undergoing surgery for colorectal cancer. This study was conducted in two stages: a) instrument development (item generation, construction of items and domains), empirical verification and b) instrument evaluation."

The news reporters obtained a quote from the research from the University of Gothenburg, "A questionnaire with 28 items measuring preparedness for surgery was developed covering four domains and was tested for content validity with an expert panel and with patients. Psychometric testing of the questionnaire was conducted on 240 patients undergoing elective surgery for colorectal cancer. The scale content validity index of the preparedness items was 0.97. The final version consisted of 24 items measuring 4 subscales: Searching for and making use of information, Understanding and involvement in the care process, Making sense of the recovery process and Support and access to medical care. Confirmatory factor analysis revealed good model fit with standardized factor loadings ranging from 0.58 to 0.97. A well-fitting second-order factor model provided support for a total preparedness score with second-order factor loadings ranging from 0.75 to 0.93. The ordinal alpha values of the four latent factors ranged from 0.92 to 0.96, indicating good internal consistency. The polyserial correlations with the total score were 0.64 (p < 0.01) for the overall preparedness question and 0.37 (p < 0.01) for overall well-being."

According to the news reporters, the research concluded: "The Swedish Preparedness for Colorectal Cancer Surgery Questionnaire for use in the preoperative phase demonstrated good psychometric properties based on a sound conceptualization of preparedness."

Our news correspondents report that additional information may be obtained by contacting E. Carlsson, University of Gothenburg, Center Person Center Care GPCC, Gothenburg, Sweden. Additional authors for this research include M. Pettersson, J. Ohlen, R. Sawatzky, F. Smith and F. Friberg.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejon.2016.09.002. This DOI is a link to an online electronic document that is either free or for purchase.

Reports from University of Hong Kong Highlight Recent Findings in Leukemia (Nanomechanical measurement of adhesion and migration of leukemia cells with phorbol 12-myristate 13-acetate treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Leukemia. According to news reporting originating from Hong Kong, People's Republic of China, by NewsRx correspondents, research stated, "The adhesion and traction behavior of leukemia cells in their microenvironment is directly linked to their migration, which is a prime issue affecting the release of cancer cells from the bone marrow and hence metastasis. In assessing the effectiveness of phorbol 12-myristate 13-acetate (PMA) treatment, the conventional batch-cell transwell-migration assay may not indicate the intrinsic effect of the treatment on migration, since the treatment may also affect other cellular behavior, such as proliferation or death."

Our news editors obtained a quote from the research from the University of Hong Kong, "In this study, the pN-level adhesion and traction forces between single leukemia cells and their microenvironment were directly measured using optical tweezers and traction-force microscopy. The effects of PMA on K562 and THP1 leukemia cells were studied, and the results showed that PMA treatment significantly increased cell adhesion with extracellular matrix proteins, bone marrow stromal cells, and human fibroblasts. PMA treatment also significantly increased the traction of THP1 cells on bovine serum albumin proteins, although the effect on K562 cells was insignificant. Western blots showed an increased expression of E-cadherin and vimentin proteins after the leukemia cells were treated with PMA. The study suggests that PMA upregulates adhesion and thus suppresses the migration of both K562 and THP1 cells in their microenvironment."

According to the news editors, the research concluded: "The ability of optical tweezers and traction-force microscopy to measure directly pN-level cell-protein or cell-cell contact was also demonstrated."

For more information on this research see: Nanomechanical measurement of adhesion and migration of leukemia cells with phorbol 12-myristate 13-acetate treatment. *International Journal of Nanomedicine*, 2016;11():6533-6545. *International Journal of Nanomedicine* can be contacted at: Dove Medical Press Ltd, PO Box 300-008, Albany, Auckland 0752, New Zealand.

Reports from University of Illinois Advance Knowledge in Charcot-Marie-Tooth Disease (Bicyclic-Capped Histone Deacetylase 6 Inhibitors with Improved Activity in a Model of Axonal Charcot-Marie-Tooth Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nervous System Diseases and Conditions - Charcot-Marie-Tooth Disease are discussed in a new report. According to news reporting originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Charcot-Marie-Tooth (CMT) disease is a disorder of the peripheral nervous system where progressive degeneration of motor and sensory nerves leads to motor problems and sensory loss and for which no pharmacological treatment is available. Recently, it has been shown in a model for the axonal form of CMT that histone deacetylase 6 (HDAC6) can serve as a target for the development of a pharmacological therapy."

Our news editors obtained a quote from the research from the University of Illinois, "Therefore, we aimed at developing new selective and activity-specific HDAC6 inhibitors with improved biochemical properties. By utilizing a bicyclic cap as the structural scaffold from which to build upon, we developed several analogues that showed improved potency compared to tubastatin A while maintaining excellent selectivity compared to HDAC1. Further screening in N2a cells examining both the acetylation of α-tubulin and histones narrowed down the library of compounds to three potent and selective HDAC6 inhibitors. In mutant HSPB1-expressing DRG neurons, serving as an in vitro model for CMT2, these inhibitors were able to restore the mitochondrial axonal transport deficits."

According to the news editors, the research concluded: "Combining structure-based development of HDAC6 inhibitors, screening in N2a cells and in a neuronal model for CMT2F, and preliminary ADMET and pharmacokinetic profiles, resulted in the selection of compound 23d that possesses improved biochemical, functional, and druglike properties compared to tubastatin A."

For more information on this research see: Bicyclic-Capped Histone Deacetylase 6 Inhibitors with Improved Activity in a Model of Axonal Charcot-Marie-Tooth Disease. AcS Chemical Neuroscience, 2015;7(2):240-58. (American Chemical Society - www.acs.org; Acs Chemical Neuroscience - www.pubs.acs.org/journal/acnedm)

Enzymes and Coenzymes - Ligases

Reports from University of Illinois Advance Knowledge in Ligases (The mitochondrial ubiquitin ligase plays an anti-apoptotic role in cardiomyocytes by regulating mitochondrial fission)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Ligases have been published. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "Apoptosis plays a critical role in the development of myocardial infarction. Cardiomyocytes are enriched with mitochondria and excessive mitochondrial fission can trigger cellular apoptosis."

Financial supporters for this research include National Institutes of Health, American Cancer Society.

Our news journalists obtained a quote from the research from the University of Illinois, "Recently, the mitochondrial ubiquitin ligase (MITOL), localized in the mitochondrial outer membrane, was reported to play an important role in the regulation of mitochondrial dynamics and apoptosis. However, the underlying mechanism of its action remains uncertain. The present study was aimed at uncovering the role of MITOL in the regulation of cardiomyocyte apoptosis. Our results showed that MITOL expression was up-regulated in cardiomyocytes in response to apoptotic stimulation. Mitochondrial ubiquitin ligase overexpression blocked dynamin-related protein 1 accumulation in the mitochondria, and attenuated the mitochondrial fission induced by hydrogen peroxide. Conversely, MITOL knockdown sensitized cardiomyocytes to undergo mitochondrial fission, resulting in subsequent apoptosis."

According to the news editors, the research concluded: "These findings suggest that MITOL plays a protective role against apoptosis in cardiomyocytes, and may serve as a potential therapeutic target for apoptosis-related cardiac diseases."

Our news journalists report that additional information may be obtained by contacting P.F. Li, University of Illinois, Coll Med, Dept. of Microbiol & Immunol, Chicago, IL 60612, United States. Additional authors for this research include L.H.H. Aung, B.S. Prabhakar and P.F. Li.

Clinical Research - Clinical Trials and Studies

Reports from University of Illinois Describe Recent Advances in Clinical Trials and Studies (A Meta-Intervention to Increase Completion of an HIV-Prevention Intervention: Results From a Randomized Controlled Trial in the State of Florida)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news originating from Champaign, Illinois, by NewsRx correspondents, research stated, "A randomized control trial with 722 eligible clients from a health department in the State of Florida was conducted to identify a simple, effective meta-intervention to increase completion of an HIV-prevention counseling program. The overall design involved 2 factors representing an empowering and instrumental message, as well as an additional factor indicating presence or absence of expectations about the counseling."

Our news journalists obtained a quote from the research from the University of Illinois, "Completion of the 3-session counseling was determined by recording attendance. A logistic regression analysis with the 3 factors of empowering message, instrumental message, and presence of mediator measures, as well as all interactions, revealed significant interactions between instrumental and empowering messages and between instrumental messages and presence of mediator measures. Results indicated that (a) the instrumental message alone produced most completion than any other message, and (b) when mediators were not measured, including the instrumental message led to greater completion. The overall gains in completion as a result of the instrumental message were 16%, implying success in the intended facilitation of counseling completion."

According to the news editors, the research concluded: "The measures of mediators did not detect any experimental effects, probably because the effects were happening without much conscious awareness."

The news correspondents report that additional information may be obtained from D. Albarracin, University of Illinois, Dept. of Psychol & Mkt, Champaign, IL 61820, United States. Additional authors for this research include K. Wilson, M.R. Durantini, A. Sunderrajan and W.
Oncology - Colon Cancer

Reports from University of Kansas Provide New Insights into Colon Cancer (Prevalence and survival benefit of adjuvant chemotherapy in stage III colon cancer patients: Comparison of overall and age-stratified results by multivariable modeling ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting from Kansas City, Kansas, by NewsRx journalists, research stated, "Few population-based studies have assessed the effectiveness of adjuvant chemotherapy (ACT) in stage III colon cancer patients according to age. We sought to quantify the prevalence of ACT use and the absolute and relative survival benefit of ACT overall and by age in a population-based cohort."

The news correspondents obtained a quote from the research from the University of Kansas, "Stage III patients with adenocarcinoma of the colon identified by the Georgia Comprehensive Cancer Registry for the years 2000-07 were eligible (final N = 3057). We utilized Poisson regression to obtain adjusted mortality rates (MR) and Cox proportional hazards models to obtain adjusted hazard ratios (HRs) for 5-year overall survival. We evaluated control of confounding by comparing HRs obtained via multivariable modeling (MM), propensity score weighting (PSW), and propensity score matching (PSM). Just over one-third of colon cancer patients did not receive ACT, and the proportion increased with age. Overall, receipt of ACT conferred an absolute (MR difference [No ACT rate-ACT rate] 25.4 deaths/1000 person-years [py], 95% confidence interval [CI]: 19.1-32.7 deaths/1000 py) and relative (MM HR = 0.67, 95% CI: 0.59-0.76) survival benefit. The survival benefit was demonstrated across age groups. MM and propensity score methods yielded highly similar HRs."

According to the news reporters, the research concluded: "Unless contraindicated, efforts to ensure receipt of ACT for stage III colon cancer patients up to 84 years of age are needed to improve the prognosis of patients with node-positive disease."

For more information on this research see: Prevalence and survival benefit of adjuvant chemotherapy in stage III colon cancer patients: Comparison of overall and age-stratified results by multivariable modeling and propensity score methodology in a population-based cohort. Cancer Epidemiology, 2016;44():77-83. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Angiology - Blood Coagulation and Fibrinolysis

Reports from University of Karachi Highlight Recent Findings in Blood Coagulation and Fibrinolysis [Anticoagulant, antiplatelet and antianemic effects of Punica granatum (pomegranate) juice in rabbits]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Angiology - Blood Coagulation and Fibrinolysis. According to news reporting originating in Karachi, Pakistan, by NewsRx journalists, research stated, "Pomegranate (Punica granatum L., Punicaceae) is a good source of minerals and phytochemicals with diverse pharmacological activities such as anxiolytic, antidepressant, hypoglycemic, hypolipidemic, and anti-inflammatory activities. Effects of P. granatum on blood parameters and coagulation have, however, been little studied. The aim of the study was to assess the outcome of P. granatum on coagulation and anticoagulation factors at different doses on blood samples of healthy white rabbits."

The news reporters obtained a quote from the research from the University of Karachi, "Blood samples of the animals were collected twice during the study and biochemical assays were performed to assess the effect on hematological, coagulation, anticoagulation, and platelet aggregation. Significant changes were observed in erythrocytes, hemoglobin, and mean corpuscular hemoglobin concentration, while bleeding and thrombin time were also prolonged significantly. There was significant increase in protein C, thrombin antithrombin complex levels, and decrease in platelet aggregation and fibrinogen concentration, in a dose-dependent manner."

According to the news reporters, the research concluded: "The results of hematological and coagulation assays lead to the speculation about a possible antianemic and cardioprotective effect of P."

For more information on this research see: Anticoagulant, antiplatelet and antianemic effects of Punica granatum (pomegranate) juice in rabbits. Blood Coagulation & Fibrinolysis, 2016;27(3):287-93. (Lippincott Williams and Wilkins - www.lww.com; Blood Coagulation & Fibrinolysis - journals.lww.com/bloodcoagulation/pages/default.aspx)

Neurodegenerative Diseases and Conditions - Motor...

Reports from University of Kebangsaan Advance Knowledge in Motor Neuron Disease (Cell-based therapies for amyotrophic lateral sclerosis/motor neuron disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Neurodegenerative Diseases and Conditions - Motor Neuron Disease are discussed in a new report. According to news reporting from Kuala Lumpur, Malaysia, by NewsRx journalists, research stated, "Amyotrophic lateral sclerosis (ALS), which is also known as motor neuron disease (MND) is a fatal disease associated with rapidly progressive disability, for which no definitive treatment as yet exists. Current treatment regimens largely focus on relieving symptoms to improve the quality of life of those affected."

The news correspondents obtained a quote from the research from the University of Kebangsaan, "Based on data from preclinical studies, cell-based therapy is a promising treatment for ALS/MND. To assess the effects of cell-based therapy for people with ALS/MND, compared with placebo or no additional treatment. Search methods On 21 June 2016, we searched the Cochrane Neuromuscular Specialised Register, CENTRAL, MEDLINE, and Embase. We also searched two clinical trials' registries for ongoing or unpublished studies. Selection criteria We planned to include randomised controlled trials (RCTs), quasi-RCTs and cluster RCTs that assigned people with ALS/MND to receive cell-based therapy versus a placebo or no additional treatment. Co-interventions were allowable, provided that they were given to each group equally. Data collection and analysis We followed standard Cochrane methodology. No studies were eligible for inclusion in the review. We identified four ongoing trials. Authors' conclusions Currently, there is a lack of high-quality evidence to guide practice on the use of cell-based therapy to treat ALS/MND. We need large, prospective RCTs to establish the efficacy of cellular therapy and to determine patient-, disease-and cell treatment-related factors that may influence the outcome of cell-based therapy. The major goals of future research should be to determine the appropriate cell source, phenotype, dose, and route of delivery, as these will be key elements in designing an optimal cell-based therapy programme for people with ALS/MND."

According to the news reporters, the research concluded: "Future research should also explore novel treatment strategies, including combinations of cellular therapy and standard or novel neuroprotective agents, to find the best possible approach to prevent or reverse the neurological deficit in ALS/MND, and to prolong survival in this debilitating and fatal condition."

For more information on this research see: Cell-based therapies for amyotrophic lateral sclerosis/motor neuron disease. Cochrane Database of Systematic Reviews, 2016; (11):2203-2236. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Reports from University of Kerala Provide New Insights into Atherosclerosis (Quercetin attenuates atherosclerotic inflammation and adhesion molecule expression by modulating TLR-NF-kappa B signaling pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Atherosclerosis are discussed in a new report. According to news originating from Thiruvananthapuram, India, by NewsRx correspondents, research stated, "Adhesion molecules expressed by activated endothelial cells play key role in regulating leukocyte trafficking to sites of inflammation. The present study attempted to explore whether the polyphenolic flavonoid quercetin influence leukocyte endothelial attraction and the involvement of TLR-NF-kappa B signaling pathway in the expression of adhesion molecules involved in the early development of atherosclerosis."

Our news journalists obtained a quote from the research from the University of Kerala, "Quercetin at 25 mu M concentration significantly reduced the HUVEC expression of VCAM-1 and ICAM-1 evidently enhanced by oxLDL. In addition, quercetin significantly downregulated the mRNA expression of MCP-1 and alleviated the nuclear translocation of NF-kappa B p65 subunit in oxLDL induced HUVECs. Western blot and PCR analyses revealed that quercetin significantly attenuated the expression of both protein and mRNA expression of TLR2 and TLR4. Quercetin supplementation significantly decreased the inflammatory mediators like COX, 5-LOX, MPO, NOS, CRP and the mRNA expression of the cytokine; IL-6 in hypercholesterolemic diet (HCD) fed atherosclerotic rats. The results demonstrate that quercetin is effective to regulate the atherosclerotic inflammatory process by inhibiting oxLDL induced endothelial leukocyte adhesion by attenuating the TLR-NF-kappa B signaling pathway in endothelial cells and decrease the inflammatory process induced by HCD in rats."

According to the news editors, the research concluded: "Therefore, quercetin acts as anti-inflammatory and anti-atherogenic agent, which may have implications for strategies attenuating endothelial dysfunction-related atherosclerosis."

For more information on this research see: Quercetin attenuates atherosclerotic inflammation and adhesion molecule expression by modulating TLR-NF-kappa B signaling pathway. Cellular Immunology, 2016;310():131-140. Cellular Immunology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Heart Disorders and Diseases - Heart Attack

Reports from University of Ljubljana Advance Knowledge in Heart Attack (Cross-talk between the dipeptidyl peptidase-4 and stromal cell-derived factor-1 in stem cell homing and myocardial repair: Potential impact of dipeptidyl peptidase-4 ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting from Ljubljana, Slovenia, by NewsRx journalists, research stated, "Dipeptidyl peptidase-4 (DPP-4), glycyl-prolyl-naphthylamidase, is a serine protease that catalyzes the hydrolysis of various proline-containing polypeptides. It is involved in the inactivation of glucagon-like peptide-1 (GLP-1) and glucose-dependent insulinotropic polypeptide (GIP), having in this way a profound influence on glucose metabolism."

Funders for this research include Ministry of Education, Science and Technological Development of the Republic of Serbia, Slovenian Research Agency.

The news correspondents obtained a quote from the research from the University of Ljubljana, "During organ damage, stromal and endothelial cells produce a chemokine known as stromal cell-derived factor-1 (SDF-1), a powerful chemoattractant of stem/progenitor cells. SDF-1 binds to a specific α-chemokine receptor (CXCR4) and can be degraded by proteases, including matrix DPP-4/CD26, presented in the circulation, or activated in injured tissues. DPP-4 inhibition has received considerable attention because of its significant therapeutic benefits in the regulation of insulin secretion and tissue insulin sensitivity, the regulation of tumor growth and metastasis, angiogenesis, tissue repair, especially after myocardial infarction, and regulation of endocrine function. Inhibition of circulating proteases appears to maintain the optimal endogenous SDF-1 concentration and may enhance homing of endothelial progenitor cells. In the present article, we present an overview of some basic facts about the role of DPP-4 in glucose homeostasis, the mechanism of its inhibition, and a brief summary of available DPP-4 inhibitors."

According to the news reporters, the research concluded: "Furthermore, since protection against the overactivity of proteases is important for restoring cardiac function and repair after myocardial damage, necrosis and apoptosis, we propose that administration of a DPP-4 inhibitor may also be beneficial following myocardial infarction by the prevention of cleavage of stem cell chemoattractant cytokine SDF-1."

For more information on this research see: Cross-talk between the dipeptidyl peptidase-4 and stromal cell-derived factor-1 in stem cell homing and myocardial repair:

Our news journalists report that additional information may be obtained by contacting M. Anderluh, Univ Ljubljana, Fac Pharm, Dept. of Pharmaceut Chem, SI-1000 Ljubljana, Slovenia. Additional authors for this research include G. Kocic, K. Tomovic, R. Kocic, M. Deljanin-Ilic and A. Smelcetovic.

**Oncology - Breast Cancer**

**Reports from University of Macau Add New Data to Findings in Breast Cancer (A Novel Danshensu Derivative Prevents Cardiac Dysfunction and Improves the Chemotherapeutic Efficacy of Doxorubicin in Breast Cancer Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting out of Macao, People's Republic of China, by NewsRx editors, research stated, "Doxorubicin (Dox) is an anthracycline antibiotic widely used in clinics as an anticancer agent. However, the use of Dox is limited by its cardiotoxicity."

Funders for this research include Research Committee of University of Macau, The Hong Kong Polytechnic University.

Our news journalists obtained a quote from the research from the University of Macau, "We have previously shown that a Danshensu (DSS) derivative, ADTM, displayed strong cardioprotective effects. With improved chemical stability and activity, a novel DSS derivative, D006, based on the structure of ADTM, was synthesized. In the present study, the protective effects of D006, indexed by attenuation of the cardiotoxicity induced by Dox as well as chemosensitizing effects that increase the antitumor activity of Dox, were investigated. Our results showed that D006 was more potent than either parental compound, or their use in combination, in ameliorating Dox-induced toxicity in H9c2 cells. In our zebrafish model, D006, but not DSS, alone significantly preserved the ventricular function of zebrafish after Dox treatment. Moreover, D006 upregulated mitochondrial biogenesis and increased mtDNA copy number after Dox treatment of H9c2 cells. D006 promoted the expression of HO-1 protein in a time-dependent manner while the HO-1 inhibitor, Znpp, reversed the protective effects of D006."
In human breast tumor MCF-7 cells, D006 enhanced Dox-induced cytotoxicity by increasing apoptosis."

According to the news editors, the research concluded: "Our results indicate that a new DSS derivative exhibits promising protective effects against Dox-induced cardiotoxicity both in vivo and in vitro, an effect at least partially mediated by induction of HO-1 expression and the activation of mitochondrial biogenesis. Meanwhile, D006 also potentiated the anti-cancer effects of Dox in breast tumor cells."

Our news journalists report that additional information may be obtained by contacting L. Wang, State Key Laboratory of Quality Research in Chinese Institute of Chinese Medical Sciences, University of Macau, Macao, People's Republic of China. **Immunology - Granulocytes**

**Reports from University of Manchester Add New Data to Findings in Granulocytes (The Associations of Blood Kidney Injury Molecule-1 and Neutrophil Gelatinase-Associated Lipocalin with Progression from CKD to ESRD)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - Granulocytes have been presented. According to news reporting from Salford, United Kingdom, by NewsRx journalists, research stated, "Elevated levels of urinary kidney injury molecule-1 and neutrophil gelatinase-associated lipocalin are associated with negative outcomes in CKD. Our study aimed to explore the prognostic accuracy of blood levels of kidney injury molecule-1 and neutrophil gelatinase-associated lipocalin for progression to ESRD, major adverse cardiovascular events, and death in a large cohort of adult patients with all cause nondialysis-dependent CKD stages 3-5."

The news correspondents obtained a quote from the research from the University of Manchester, "We considered whether these factors improve prediction in relation to traditional biomarkers and clinical parameters. & measurements Kidney injury molecule-1 and neutrophil gelatinase-associated lipocalin were measured on baseline plasma samples from 1982 patients who were recruited to the Chronic Renal Insufficiency Standards Implementation Study between the start of June of 2002 and the start of June of 2013. Associations with study end points were assessed using Cox regression models, receiver operator characteristic curve analyses, and
reclassification statistics. Over a median follow-up of 29.5 months (interquartile range, 14.9-53.5), 21.6% of patients progressed to ESRD, 27% died, and 6.6% suffered a major adverse cardiovascular event. Higher blood levels of kidney injury molecule-1 and neutrophil gelatinase-associated lipocalin were independently associated with a greater risk for ESRD (hazard ratio, 1.25; 95% confidence interval, 1.10 to 1.43; P<0.001 and hazard ratio, 1.35; 95% confidence interval, 1.14 to 1.59; P<= 0.001, respectively, per 1 SD higher biomarker concentration). There was no association with risk for cardiovascular events or death. The addition of biomarkers to our baseline risk model of traditional clinical characteristics and laboratory parameters did not significantly improve model discrimination or risk reclassification. In patients with moderate to severe CKD, kidney injury molecule-1 and neutrophil gelatinase, associated lipocalin blood levels are independent risk factors for progression to ESRD."

According to the news reporters, the research concluded: "Additional studies are needed to establish the utility and cost-effectiveness of these novel biomarkers in the clinical setting."

For more information on this research see: The Associations of Blood Kidney Injury Molecule-1 and Neutrophil Gelatinase-Associated Lipocalin with Progression from CKD to ESRD. Clinical Journal of the American Society of Nephrology, 2016;11(12):2141-2149. Clinical Journal of the American Society of Nephrology can be contacted at: Amer Soc Nephrology, 1725 I St, Nw Ste 510, Washington, DC 20006, USA.

and transgenic mice overexpressing the human A53T mutation to α-synuclein to examine the influence of increased Fe (days 10-17 postpartum) on the parkinsonian development phenotype of these animals (including abnormal nigral Fe levels and deficits in both cell numbers and locomotor activity), and to explore the impact of the Fe chelator clioquinol in the model."

Financial supporters for this research include National Health and Medical Research Council, Australian Research Council.

Our news journalists obtained a quote from the research from the University of Melbourne, "Both untreated and Fe-loaded A53T mice showed similar levels of nigral cell loss, though 5 months of clioquinol treatment was only able to prevent the loss in the non-Fe-loaded A53T group. Iron levels in the Fe-loaded A53T mice returned to normal at 8 months, though effects of dopamine denervation remained, demonstrated by limited locomotor activity and sustained neuron loss."

According to the news editors, the research concluded: "These data suggest that Fe exposure during a critical developmental window, combined with the overexpression mutant α-synuclein, presents a disease phenotype resistant to intervention using clioquinol later in life."

Our news journalists report that additional information may be obtained by contacting J.L. Billings, The Florey Institute of Neuroscience and Mental Health, The University of Melbourne, Parkville, Victoria 3052, Australia. Additional authors for this research include D.J. Hare, M. Nurjono, I. Volitakis, R.A. Cherny, A.I. Bush, P.A. Adlard and D.I. Finkelstein.

Michigan, "Clonogenic survival assays were used to quantitate the radiosensitivity of cell lines at baseline and after MELK inhibition. The effect of MELK knockdown on DNA damage repair kinetics was determined using gamma H2AX staining. The in vivo effect of MELK knockdown on radiosensitivity was performed using mouse xenograft models. Kaplan-Meier analysis was used to estimate local control and survival information, and a Cox proportional hazards model was constructed to identify potential factors impacting local recurrence-free survival. MELK expression is significantly elevated in breast cancer tissues compared with normal tissue as well as in TNBC compared with non-TNBC. MELK RNA and protein expression is significantly correlated with radioresistance in breast cancer cell lines. Inhibition of MELK (genetically and pharmacologically) induces radiation sensitivity in vitro and significantly delayed tumor growth in vivo in multiple models. Kaplan-Meier survival and multivariable analyses identify increasing MELK expression as being the strongest predictor of radioresistance and increased local recurrence in multiple independent datasets. Here, we identify MELK as a potential biomarker of radioresistance and target for radiosensitization in TNBC."

According to the news editors, the research concluded: "Our results support the rationale for developing clinical strategies to inhibit MELK as a novel target in TNBC."

For more information on this research see: Maternal Embryonic Leucine Zipper Kinase (MELK) as a Novel Mediator and Biomarker of Radioresistance in Human Breast Cancer. Clinical Cancer Research, 2016;22(23):5864-5875. Clinical Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. Bone Research

Reports from University of Michigan Describe Recent Advances in Bone Research (FAK Promotes Osteoblast Progenitor Cell Proliferation and Differentiation by Enhancing Wnt Signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Bone Research are presented in a new report. According to news originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "Decreased bone formation is often associated with increased bone marrow adiposity. The
molecular mechanisms that are accountable for the negative correlation between bone mass and bone marrow adiposity are incompletely understood.

Our news journalists obtained a quote from the research from the University of Michigan, "Focal adhesion kinase (FAK) has critical functions in proliferation and differentiation of many cell types; however, its roles in osteoblast lineage cells are largely unknown. We show herein that mice lacking FAK in Osterix-expressing cells exhibited decreased osteoblast number and low bone mass as well as increased bone marrow adiposity. The decreased bone mass in FAK-deficient mice was accounted for by decreased proliferation, compromised osteogenic differentiation, and increased adipogenic differentiation of bone marrow Osterix-expressing cells resulting from downregulation of Wnt/-catenin signaling due to the reduced expression of canonical Wnt ligands."

According to the news editors, the research concluded: "In contrast, FAK loss in calvarial preosteoblasts had no adverse effect on their proliferation and osteogenic differentiation and these cells had intact Wnt/-catenin signaling."

The news correspondents report that additional information may be obtained from F. Liu, University of Michigan, Sch Dental, Div Prosthodont, Ann Arbor, MI 48109, United States. Additional authors for this research include H.B. Yuan, L. Wang, X.X. Wei, L. Williams, P.H. Krebsbach, J.L. Guan and F. Liu.

Drugs and Therapies - Antiretrovirals

Reports from University of Missouri Highlight Recent Findings in Antiretrovirals (Tenofovir Containing Thiolated Chitosan Core/Shell Nanofibers: In Vitro and in Vivo Evaluations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antiretrovirals have been presented. According to news reporting originating from Kansas City, Missouri, by NewsRx correspondents, research stated, "It is hypothesized that thiolated chitosan (TCS) core/shell nanofibers (NFs) can enhance the drug loading of tenofovir, a model low molecular weight and highly water-soluble drug molecule, and improve its mucoadhesivity and in vivo safety. To test this hypothesis, poly(ethylene oxide) (PEO) core with TCS and polylactic acid (PLA) shell NFs are fabricated by a coaxial electrospinning technique."

Financial support for this research came from National Institute of Allergy and Infectious Diseases.
Our news editors obtained a quote from the research from the University of Missouri, "The morphology, drug loading, drug release profiles, cytotoxicity and mucoadhesion of the NFs are analyzed using scanning and transmission electron microscopies, liquid chromatography, cytotoxicity assays on VK2/E6E7 and End1/E6E7 cell lines and Lactobacilli crispatus, fluorescence imaging and periodic acid colorimetric method, respectively. In vivo safety studies are performed in C57BL/6 mice followed by H&E and immunohistochemical (CD45) staining analysis of genital tract. The mean diameters of PEO, PEO/TCS, and PEO/TCS-PLA NFs are 118.56, 9.95, and 99.53 nm, respectively. The NFs exhibit smooth surface. The drug loading (13%-25%, w/w) increased by 10-fold compared to a nanoparticle formulation due to the application of the electrospinning technique. The NFs are noncytotoxic at the concentration of 1 mg/mL. The PEO/TCS-PLA core/shell NFs mostly exhibit a release kinetic following Weibull model (r(2) = 0.9914), indicating the drug release from a matrix system. The core/shell NFs are 40-60-fold more bioadhesive than the pure PEO based NFs. The NFs are nontoxic and noninflammatory in vivo after daily treatment for up to 7 days."

According to the news editors, the research concluded: "Owing to their enhanced drug loading and preliminary safety profile, the TCS core/shell NFs are promising candidates for the topical delivery of HIV/AIDS microbicides such as tenofovir."

For more information on this research see: Tenofovir Containing Thiolated Chitosan Core/Shell Nanofibers: In Vitro and in Vivo Evaluations. *Molecular Pharmaceutics*, 2016;13 (12):4129-4140. *Molecular Pharmaceutics* can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. **Cardiology**

**Reports from University of Montpellier Describe Recent Advances in Cardiology (Inter-individual variability and modeling of electrical activity: a possible new approach to explore cardiac safety?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiology are presented in a new report. According to news reporting originating in Montpellier, France, by NewsRx journalists, research stated, "Safety pharmacology aims to predict rare side effects of new drugs. We explored whether rare pro-
arrhythmic effects could be linked to the variability of the effects of these drugs on ion currents and whether taking into consideration this variability in computational models could help to better detect and predict cardiac side effects."

The news reporters obtained a quote from the research from the University of Montpellier, "For this purpose, we evaluated how intra-and inter-individual variability influences the effect of hERG inhibition on both the action potential duration and the occurrence of arrhythmias. Using two computer simulation models of human action potentials (endocardial and Purkinje cells), we analyzed the contribution of two biological parameters on the pro-arrhythmic effects of several hERG channel blockers: (i) spermine concentration, which varies with metabolic status, and (ii) L-type calcium conductance, which varies due to single nucleotide polymorphisms or mutations. By varying these parameters, we were able to induce arrhythmias in 1 out of 16 simulations although conventional modeling methods to detect pro-arrhythmic molecules failed."

According to the news reporters, the research concluded: "On the basis of our results, taking into consideration only 2 parameters subjected to intra-and inter-individual variability, we propose that in silico computer modeling may help to better define the risks of new drug candidates at early stages of pre-clinical development."

Science

Reports from University of North Carolina Describe Recent Advances in Science (Nicotinamide benefits both mothers and pups in two contrasting mouse models of preeclampsia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Science is now available. According to news reporting originating in Chapel Hill, North Carolina, by NewsRx journalists, research stated, "Preeclampsia (PE) complicates similar to 5% of human pregnancies and is one of the leading causes of pregnancy-related maternal deaths. The only definitive treatment, induced delivery, invariably results in prematurity, and in severe early-onset cases may lead to fetal death."

Financial support for this research came from HHS | National Institutes of Health (NIH).

The news reporters obtained a quote from the research from the University of North Carolina, "Many currently available antihypertensive drugs are teratogenic and therefore
precluded from use. Nonteratogenic antihypertensives help control maternal blood pressure in PE, but results in preventing preterm delivery and correcting fetal growth restriction (FGR) that also occurs in PE have been disappointing. Here we show that dietary nicotinamide, a nonteratogenic amide of vitamin B-3, improves the maternal condition, prolongs pregnancies, and prevents FGR in two contrasting mouse models of PE. The first is caused by endotheliosis due to excess levels in the mothers of a soluble form of the receptor for vascular endothelial growth factor (VEGF), which binds to and inactivates VEGF. The second is caused by genetic absence of Ankiryn-repeat-and-SOCS-box-containing-protein 4, a factor that contributes to the differentiation of trophoblast stem cells into the giant trophoblast cells necessary for embryo implantation in mice; its absence leads to impaired placental development. In both models, fetal production of ATP is impaired and FGR is observed. We show here that nicotinamide decreases blood pressure and endotheliosis in the mothers, probably by inhibiting ADP ribosyl cyclase (ADPRC), and prevents FGR, probably by normalizing fetal ATP synthesis via the nucleotide salvage pathway."

According to the news reporters, the research concluded: "Because nicotinamide benefits both dams and pups, it merits evaluation for preventing or treating PE in humans."

**Cardiovascular Diseases**

**Reports from University of Oxford Describe Recent Advances in Cardiovascular Diseases (Sympathetic neurons are a powerful driver of myocyte function in cardiovascular disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases. According to news reporting from Oxford, United Kingdom, by NewsRx journalists, research stated, "Many therapeutic interventions in disease states of heightened cardiac sympathetic activity are targeted
to the myocytes. However, emerging clinical data highlights a dominant role in disease progression by the neurons themselves."

The news correspondents obtained a quote from the research from the University of Oxford, "Here we describe a novel experimental model of the peripheral neuro-cardiac axis to study the neuron's ability to drive a myocyte cAMP phenotype. We employed a co-culture of neonatal ventricular myocytes and sympathetic stellate neurons from normal (WKY) and pro-hypertensive (SHR) rats that are sympathetically hyper-responsive and measured nicotine evoked cAMP responses in the myocytes using a fourth generation FRET cAMP sensor. We demonstrated the dominant role of neurons in driving the myocyte ss-adrenergic phenotype, where SHR cultures elicited heightened myocyte cAMP responses during neural activation. Moreover, cross-culturing healthy neurons onto diseased myocytes rescued the diseased cAMP response of the myocyte. Conversely, healthy myocytes developed a diseased cAMP response if diseased neurons were introduced. Our results provide evidence for a dominant role played by the neuron in driving the adrenergic phenotype seen in cardiovascular disease."

According to the news reporters, the research concluded: "We also highlight the potential of using healthy neurons to turn down the gain of neurotransmission, akin to a smart pre-synaptic ss-blocker."

For more information on this research see: Sympathetic neurons are a powerful driver of myocyte function in cardiovascular disease. *Scientific Reports*, 2016;6():1-11. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Heart Disorders and Diseases – Atrial Fibrillation

**Reports from University of Oxford Highlight Recent Findings in Atrial Fibrillation (Recent time trends in incidence, outcome and premorbid treatment of atrial fibrillation-related stroke and other embolic vascular events: a population-based ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Atrial Fibrillation are discussed in a new report. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "Prevalence of atrial fibrillation (AF) is increasing, due partly to the ageing population. The Birmingham Atrial Fibrillation Treatment of the Aged (BAFTA) Trial, published in 2007, provided strong evidence of the effectiveness of warfarin at age (≥)80 years, but the impact on incidence of AF-related stroke and peripheral embolic vascular events is uncertain."

Our news journalists obtained a quote from the research from the University of
Oxford, "We studied age-specific incidence and outcome of all AF-related incident strokes and systemic emboli from 2002 to 2012 in the Oxford Vascular Study. Of 3096 acute cerebral or peripheral vascular events, 748 (24.2%) were AF-related. Of the 597 disabling/fatal incident ischaemic strokes, 369 occurred at age (≥)80 years, of which 124 (33.6%) were in non-anticoagulated patients with known prior AF. There was no reduction in incident AF-related events after 2007 at all ages (n=231 vs 211; adjusted RR=1.11, 0.91 to 1.36, p=0.29) or at age (≥)80 (137 vs 135, RR=1.15, 0.94 to 1.40, p=0.17). Scope for improved prevention at older ages was considerable. Among 208 patients with incident AF-related events at age (≥)80 and known prior AF, only 19 (9.1%) were anticoagulated. Of the 189 patients not anticoagulated, 166 (87.8%) had no major disability prior to the event and 167 (88.4%) had a high embolism risk score, of whom 139 (83.2%) were also at low risk of complications. Yet, 125/167 (74.9%) were dead or institutionalised after the event. Potentially preventable embolic events outnumbered warfarin-related intracerebral haemorrhages by about 15-fold (280 vs 19), rising to 50-fold (189 vs 4) at age (≥)80 years. We found no reduction in incidence of AF-related vascular events since publication of the BAFTA trial."

According to the news editors, the research concluded: "A third of all disabling/fatal strokes occur in non-anticoagulated patients with known prior AF."

The news correspondents report that additional information may be obtained from G.S. Yiin, Stroke Prevention Research Unit, Nuffield Dept. of Clinical Neurosciences, University of Oxford, Oxford, Oxfordshire, UK. Additional authors for this research include D.P. Howard, N.L. Paul, L. Li, Z. Mehta and P.M. Rothwell.

### Proteins - Cell Cycle Proteins

**Reports from University of Paris Provide New Insights into Cell Cycle Proteins (IMP-3 protects the mRNAs of cyclins D1 and D3 from GW182/AGO2-dependent translational repression)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Proteins - Cell Cycle Proteins is the subject of a report. According to news reporting out of Palaiseau, France, by NewsRx editors, research stated, "IGF-2 mRNA binding protein 3 (IGF2BP3, IMP-3) is a well-known post-transcriptional regulatory factor of gene expression, mainly involved in embryonic development and oncogenesis."

Our news journalists obtained a quote from the research from the University of Paris, "We have previously demonstrated that a subset of IMP-3 targets, such as the mRNAs of cyclins..."
D1, D3 and G1, are positively regulated by IMP-3, and that this regulation depends on nuclear localization of IMP-3. In the present study, we show that as a first step following a knock-down of IMP-3, the protein levels of the cyclins rapidly decrease, while their mRNAs remain stable and associated with the polyribosomes, though not translated.

According to the news editors, the research concluded: "We have elucidated the molecular mechanisms of this regulation, demonstrating that IMP-3 and its protein partners ILF3/NF90 and PTBP1 bind to the 3'UTRs of the cyclin mRNAs and protect them from the translational repression induced by miRNA-dependent recruitment of AGO2/GW182 complex in human cancer cells."

For more information on this research see: IMP-3 protects the mRNAs of cyclins D1 and D3 from GW182/AGO2-dependent translational repression. International Journal of Oncology, 2016;49(6):2578-2588. International Journal of Oncology can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

Our news journalists report that additional information may be obtained by contacting A. Polesskaya, Univ Paris Saclay, CNRS, Ecole Polytechnic, BIOC, F-91128 Palaiseau, France. Additional authors for this research include T.R. Vargas, J. Kropp, M. Vandamme, G. Pinna and A. Polesskaya.

Keywords for this news article include: Palaiseau, France, Europe, Intracellular Signaling Peptides and Proteins, Cell Cycle Proteins, Genetics, Cyclins, University of Paris.

Cardiovascular Diseases and Conditions - Aneurysm

Reports from University of Pennsylvania Provide New Insights into Aneurysm (At the Root of the Repair Debate: Outcomes After Elective Aortic Root Replacements for Aortic Insufficiency With Aneurysm)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurysm. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "There is growing interest in aortic valve-sparing and valve repair operations, but the ideal operation and timing of intervention in these generally younger patients undergoing operations for aortic insufficiency (AI) and dilated ascending aorta remains controversial. Root replacements at a single institution from 2002 to 2014 were reviewed."

Our news journalists obtained a quote from the research from the University of Pennsylvania, "Inclusion criteria were age younger than 70 and presence of moderate or greater aortic insufficiency (AI), with or without aortic aneurysm. Of 1,425 root replacements, 220 patients were considered in the final analysis. Moderate AI was present in 87 patients and severe AI in 133 patients. The 30-day mortality was 0% in moderate AI patients and 2% (n = 3) in severe AI patients (p = 0.3). Freedom from reoperation was 95% at 10 years. Severe preoperative AI was associated with worse long-term survival compared with moderate AI (hazard ratio, 2.6; p = 0.04). Patients undergoing root replacement with moderate AI had similar survival compared with the age-and gender-matched United States population (log-rank p = 0.93), whereas patients with severe AI had significantly worse survival (log-rank p = 0.02).

Other multi-variable predictors of decreased long-term survival were age (hazard ratio, 1.1; p = 0.01) and preoperative renal failure (hazard ratio, 6.9; p< 0.01). Elective root replacement
operations in patients younger than 70 are associated with low rates of mortality and reoperation, which should be considered the benchmark operation for aortic valve-sparing or repair operations in similar patients."

According to the news editors, the research concluded: "Worse survival was associated with severe AI and older age, suggesting earlier intervention may be an appropriate therapeutic strategy in selected patients."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.03.071. This DOI is a link to an online electronic document that is either free or for purchase.

Pharmacology

Reports from University of Picardie Highlight Recent Findings in Pharmacology (Recent Advances in Oncogenic Roles of the TRPM7 Chanzyme)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacology have been presented. According to news reporting from Amiens, France, by NewsRx journalists, research stated, "Transient Receptor Potential Melastatin-related 7 (TRPM7) is a non-selective cation channel fused with a functional kinase domain. Physiologically, TRPM7 channel is involved in magnesium homeostasis, cell survival and gastrulation."

The news correspondents obtained a quote from the research from the University of Picardie, "The channel part is responsible for calcium, magnesium, and metal trace entries. Cation current through TRPM7 channel is inhibited by both intracellular magnesium and magnesium complexed with nucleotides. In parallel, the kinase is able to phosphorylate cytoskeleton proteins like myosin chain regulating cell tension and motility. Moreover, TRPM7 kinase domain can be cleaved by caspase and participates to apoptosis signaling. Importantly, TRPM7 channel expression is aberrant in numerous cancers including breast, glioblastoma, nasopharynx, ovarian, and pancreatic. Moreover, TRPM7 high expression is an independent biomarker of poor outcome in breast cancer. Pharmacological modulation or silencing of
TRPM7 strongly affects proliferation, adhesion, migration or invasion in cancer cell lines. Nevertheless, it is still not clear by which mechanism TRPM7 channels may disturb cancer cell hallmarks. In the present review, we will discuss the role of TRPM7 channels in malignancies. In particular, we will distinguish the role of cation signaling from kinase function in order to better understand how TRPM7 channels may play a central role in cancer progression."

According to the news reporters, the research concluded: "We will also discuss the recent advances in pharmacological blockers of TRPM7 and their potential use for cancer therapy."

For more information on this research see: Recent Advances in Oncogenic Roles of the TRPM7 Chanzyme. *Current Medicinal Chemistry*, 2016;23(36):4092-4107. *Current Medicinal Chemistry* can be contacted at: Bentham Science Publ Ltd, Executive Ste Y-2, PO Box 7917, Saif Zone, 1200 Br Sharjah, U Arab Emirates. **Catecholamines**

**Reports from University of Pittsburgh Provide New Insights into Catecholamines (Antiferroptotic activity of non-oxidative dopamine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Catecholamines. According to news reporting originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "Dopamine is a neurotransmitter that has many functions in the nervous and immune systems. Ferroptosis is a non-apoptotic form of regulated cell death that is involved in cancer and neurodegenerative diseases."

Funders for this research include US National Institutes of Health, Natural Science Foundation of Guangdong Province, National Natural Science Funds of China, American Cancer Society Research Scholar Grant.

Our news editors obtained a quote from the research from the University of Pittsburgh, "However, the role of dopamine in ferroptosis remains unidentified. Here, we show that the non oxidative form of dopamine is a strong inhibitor of ferroptotic cell death. Dopamine dose-dependently blocked ferroptosis in cancer (PANC1 and HEY) and non-cancer (MEF and HEK293) cells following treatment with erastin, a small molecule ferroptosis inducer. Notably,
dopamine reduced erastin-induced ferrous iron accumulation, glutathione depletion, and malondialdehyde production. Mechanically, dopamine increased the protein stability of glutathione peroxidase 4, a phospholipid hydroperoxidase that protects cells against membrane lipid peroxidation. Moreover, dopamine suppressed dopamine receptor D4 protein degradation and promoted dopamine receptor D5 gene expression."

According to the news editors, the research concluded: "Thus, our findings uncover a novel function of dopamine in cell death and provide new insight into the regulation of iron metabolism and lipid peroxidation by neurotransmitters."

For more information on this research see: Antiferroptotic activity of non-oxidative dopamine. *Biochemical and Biophysical Research Communications*, 2016;480(4):602-607. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. **Antithrombotics**

**Reports from University of Queensland Describe Recent Advances in Antithrombotics (The role of cGMP and its signaling pathways in kidney disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Antithrombotics have been published. According to news originating from Brisbane, Australia, by NewsRx correspondents, research stated, "Cyclic nucleotide signal transduction pathways are an emerging research field in kidney disease. Activated cell surface receptors transduce their signals via intracellular second messengers such as cAMP and cGMP."

Our news journalists obtained a quote from the research from the University of Queensland, "There is increasing evidence that regulation of the cGMP-cGMP-dependent protein kinase 1-phosphodiesterase (cGMP-cGK1PDE) signaling pathway may be renoprotective. Selective PDE5 inhibitors have shown potential in treating kidney fibrosis in patients with chronic kidney disease (CKD), via their downstream signaling, and these inhibitors also have known activity as antithrombotic and anticancer agents. This review gives an outline of the cGMP-cGK1-PDE signaling pathways and details the downstream signaling and regulatory functions that are modulated by cGK1 and PDE inhibitors with regard to antifibrotic,
antithrombotic, and antitumor activity. Current evidence that supports the renoprotective effects of regulating cGMP-cGK1-PDE signaling is also summarized. Finally, the effects of icariin, a natural plant extract with PDE5 inhibitory function, are discussed."

According to the news editors, the research concluded: "We conclude that regulation of cGMP-cGK1-PDE signaling might provide novel, therapeutic strategies for the worsening global public health problem of CKD."

The news correspondents report that additional information may be obtained from G.C. Gobe, University of Queensland, Sch Med, Translat Res Inst, Center Kidney Dis Res, Brisbane, Qld 4102, Australia. Additional authors for this research include D.W. Johnson and G.C. Gobe.

Cardiovascular Diseases and Conditions - ...

Reports from University of Reading Add New Data to Findings in Hypertension (Whey protein lowers blood pressure and improves endothelial function and lipid biomarkers in adults with prehypertension and mild hypertension: results from the ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news reporting from Reading, United Kingdom, by NewsRx journalists, research stated, "Cardiovascular diseases (CVDs) are the greatest cause of death globally, and their reduction is a key public-health target. High blood pressure (BP) affects 1 in 3 people in the United Kingdom, and previous studies have shown that milk consumption is associated with lower BP."

The news correspondents obtained a quote from the research from the University of Reading, "We investigated whether intact milk proteins lower 24-h ambulatory blood pressure (AMBP) and other risk markers of CVD. The trial was a double-blinded, randomized, 3-way-crossover, controlled intervention study. Forty-two participants were randomly assigned to consume 2 X 28 g whey protein/d, 2 X 28 g Ca caseinate/d, or 2 X 27 g maltodextrin (control)/d for 8 wk separated by a 4-wk washout. The effects of these interventions were examined with the use of a linear mixed-model ANOVA. Thirty-eight participants completed the study. Significant reductions in 24-h BP [for systolic blood pressure (SBP): -3.9 mm Hg; for diastolic blood pressure (DBP): -2.5 mm Hg; P = 0.050 for both] were observed after whey-protein consumption compared with control intake. After whey-protein supplementation compared with control intake, peripheral and central systolic pressures [-5.7 mm Hg (P = 0.007) and -5.4 mm Hg (P = 0.012), respectively] and mean pressures [-3.7 mm Hg (P = 0.025) and -4.0 mm Hg (P = 0.019), respectively] were also lowered. Flow mediated dilation (FMD) increased significantly
after both whey protein and calcium-caseinate intakes compared with control intake [1.31% (P < 0.001) and 0.83% (P = 0.003), respectively]. Although both whey protein and calcium caseinate significantly lowered total cholesterol [-0.26 mmol/L (P = 0.013) and -0.20 mmol/L (P = 0.042), respectively], only whey protein decreased triacylglycerol (-0.23 mmol/L; P = 0.025) compared with the effect of the control. Soluble intercellular adhesion molecule 1 and soluble vascular cell adhesion molecule 1 were reduced after whey protein consumption (P = 0.011) and after calcium-caseinate consumption (P = 0.039), respectively, compared with after control intake. The consumption of unhydrolyzed milk proteins (56 g/d) for 8 wk improved vascular reactivity, biomarkers of endothelial function, and lipid risk factors. Whey-protein supplementation also lowered 24-h ambulatory SBP and DBP. These results may have important implications for public health."

According to the news reporters, the research concluded: "This trial was registered at clinicaltrials.gov as NCT02090842."

Our news journalists report that additional information may be obtained by contacting J.A. Lovegrove, University of Reading, Fac Life Sci, Sch Chem Food & Pharm, Inst Cardiovasc & Metab Res, Reading, Berks, United Kingdom. Additional authors for this research include C. Giromini, Y. Chatzidiakou, D.I. Givens and J.A. Lovegrove.

Oncology - Liver Cancer

Reports from University of Sherbrooke Advance Knowledge in Liver Cancer [An Unbiased Mass Spectrometry Approach Identifies Glypican-3 as an Interactor of Proprotein Convertase Subtilisin/Kexin Type 9 (PCSK9) and Low Density Lipoprotein Receptor ...]  

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting out of Sherbrooke, Canada, by NewsRx editors, research stated, "The mechanism of LDL receptor (LDLR) degradation mediated by the proprotein convertase subtilisin/kexin type 9 (PCSK9) has been extensively studied; however, many steps within this process remain unclear and still require characterization. Recent studies have shown that PCSK9 lacking its Cys/His-rich domain can still promote LDLR internalization, but the complex does
not reach the lysosome suggesting the presence of an additional interaction partner(s)."

Our news journalists obtained a quote from the research from the University of Sherbrooke, "In this study we carried out an unbiased screening approach to identify PCSK9-interacting proteins in the HepG2 cells' secretome using co-immunoprecipitation combined with mass spectrometry analyses. Several interacting proteins were identified, including glypican-3 (GPC3), phospholipid transfer protein, matrilin-3, tissue factor pathway inhibitor, fibrinogen-like 1, and plasminogen activator inhibitor-1. We then validated these interactions by co-immunoprecipitation and Western blotting. Furthermore, functional validation was examined by silencing each candidate protein in HepG2 cells using short hairpin RNAs to determine their effect on LDL uptake and LDLR levels. Only GPC3 and phospholipid transfer protein silencing in HepG2 cells significantly increased LDL uptake in these cells and displayed higher total LDLR protein levels compared with control cells."

According to the news editors, the research concluded: "Moreover, our study provides the first evidence that GPC3 can modulate the PCSK9 extracellular activity as a competitive binding partner to the LDLR in HepG2 cells."

Our news journalists report that additional information may be obtained by contacting R. Day, University of Sherbrooke, Inst Pharmacol Sherbrooke, Fac Med & Sci Sante, Dept. of SurgUrol Div, Sherbrooke, PQ J1H 5N4, Canada. Additional authors for this research include R. Essalmani, R. Desjardins, N.G. Seidah and R. Day.

2 Diabetes have been presented. According to news reporting out of Shizuoka, Japan, by NewsRx editors, research stated, "A high-throughput RapidFire mass spectrometry assay is described for elongation of very long-chain fatty acids family 6 (ElovL6). ElovL6 is a microsomal enzyme that regulates the elongation of C12-16 saturated and monounsaturated fatty acids."

Our news journalists obtained a quote from the research from the University of Shizuoka, "ElovL6 may be a new therapeutic target for fat metabolism disorders such as obesity, type 2 diabetes, and nonalcoholic steatohepatitis. To identify new ElovL6 inhibitors, we developed a high-throughput fluorescence screening assay in 1536-well format. However, a number of false positives caused by fluorescent interference have been identified. To pick up the real active compounds among the primary hits from the fluorescence assay, we developed a RapidFire mass spectrometry assay and a conventional radioisotope assay. These assays have the advantage of detecting the main products directly without using fluorescent-labeled substrates. As a result, 276 compounds (30%) of the primary hits (921 compounds) in a fluorescence ultra-high-throughput screening method were identified as common active compounds in these two assays. It is concluded that both methods are very effective to eliminate false positives. Compared with the radioisotope method using an expensive 14C-labeled substrate, the RapidFire mass spectrometry method using unlabeled substrates is a high accuracy, high-throughput method. In addition, some of the hit compounds selected from the screening inhibited cellular fatty acid elongation in HEK293 cells expressing ElovL6 transiently. This result suggests that these compounds may be promising lead candidates for therapeutic drugs."

According to the news editors, the research concluded: "Ultrahigh-throughput fluorescence screening followed by a RapidFire mass spectrometry assay was a suitable strategy for lead discovery against ElovL6."

For more information on this research see: Lead discovery for mammalian elongation of long chain fatty acids family 6 using a combination of high-throughput fluorescent-based assay and RapidFire mass spectrometry assay. Autoimmune Diseases and Conditions - Experimental...

Reports from University of Strathclyde Provide New Insights into Experimental Autoimmune Encephalomyelitis (MAP kinase phosphatase 2 deficient mice develop attenuated experimental autoimmune encephalomyelitis through regulating dendritic cells ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Experimental Autoimmune Encephalomyelitis. According to news originating from Glasgow, United Kingdom, by NewsRx correspondents, research stated, "Mitogen-activated protein kinase phosphatases (MKPs) play key roles in inflammation and immune mediated diseases. Here we investigated the mechanisms by which MKP-2 modulates central nervous system (CNS) inflammation in experimental autoimmune encephalomyelitis (EAE)."

Our news journalists obtained a quote from the research from the University of Strathclyde, "Our results show that MKP-2 mRNA levels in the spinal cord and lymphoid organs of EAE mice were increased compared with naive controls, indicating an important role for MKP-2 in EAE development. Indeed, MKP-2(-/-) mice developed reduced EAE severity, associated with diminished CNS immune cell infiltration, decreased proinflammatory cytokine production and reduced frequency of CD4(+) and CD8(+) T cells in spleens and lymph nodes. In addition, MKP-2(-/-)-CD11c(+) dendritic cells (DCs) had reduced expression of MHC-II and CD40 compared with MKP-2(+/+) mice. Subsequent experiments revealed that CD4(+) T cells from naive MKP-2(-/-)-mice had decreased cell proliferation and IL-2 and IL-17 production relative to wild type controls. Furthermore, co-culture experiments showed that bone marrow derived DCs of MKP-2(-/-) mice had impaired capability in antigen presentation and T cell activation."

According to the news editors, the research concluded: "While MKP-2 also modulates macrophage activation, our study suggests that MKP-2 is essential to the pathogenic response of EAE, and it acts mainly via regulating the important antigen presenting DC function and T cell activation."

For more information on this research see: MAP kinase phosphatase 2 deficient mice develop attenuated experimental autoimmune encephalomyelitis through regulating dendritic cells and T cells. Scientific Reports, 2016;6():13-25. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Reports from University of Sydney Advance Knowledge in Hypertension

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Hypertension is now available. According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "The objective of this periodic review was to identify, summarize, and appraise studies relating to the implementation of salt reduction strategies that were retrieved between November 2015 and February 2016. From the established MEDLINE search, 56 studies were identified as relevant to the implementation of salt reduction initiatives."

The news reporters obtained a quote from the research from the University of Sydney, "Detailed appraisal was performed on seven studies that evaluated the impact of salt reduction interventions. While study quality varied, all had one or more risks related to bias. There was consistent evidence, from three studies, demonstrating that setting-based structural interventions to improve the nutritional composition of foods were effective in reducing salt but mixed evidence in relation to the effectiveness of behavioral interventions."

According to the news reporters, the research concluded: "The development of an evaluation guidance framework that supports scientific rigor and external validity would aid future design and interpretation of studies evaluating salt reduction interventions, particularly for low-resource countries."

Our news correspondents report that additional information may be obtained by contacting K. Trieu, University of Sydney, George Inst Global Hlth, Sydney, NSW 2050, Australia. Additional authors for this research include R. McLean, C. Johnson, J.A. Santos, T.S. Raj, N.R.C. Campbell and J. Webster.

Reports from University of Tehran Advance Knowledge in Hepatitis B Virus (HBsAg mutations related to occult hepatitis B virus infection in HIV-positive patients result in a reduced secretion and conformational changes of HBsAg)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Hepatitis B Virus. According to news reporting from Tehran, Iran, by NewsRx journalists, research stated, "Occult hepatitis B infection (OBI) is a frequent finding in human immunodeficiency virus (HIV)-infected patients. While several related mutations in the hepatitis B virus (HBV) genome have been reported, their distinct impact on HBsAg synthesis is largely obscure."

The news correspondents obtained a quote from the research from the University of Tehran, "Thirty-one (18%) out of 172 HIV-infected patients, who were selected from HBsAg-negative patients, were positive for HBV-DNA assigned as being OBI-positive. We generated a series of expression constructs of variant HBsAg with a determinant amino acid substitutions including P127L, P127T, S136Y, and P127T+S136Y using site-directed mutagenesis. The expression of variant HBsAg was examined by transient transfection in hepatoma cells, followed by HBsAg immunoassay and immunofluorescence stained with specific anti-HBs antibodies. The potential impact of amino acid substitutions at different positions for conformational changes in the HBsAg was investigated using bioinformatics. All variants comprising either single or combined mutations resulted in significantly reduced HBsAg detection in supernatants and in cell lysates of hepatoma cells transfected with the constructs. Moreover, intracellular immunofluorescence staining of cytoblocks showed perinuclear and cytoplasmic fluorescence of HBsAg constructs with significantly diminished fluorescent intensity in comparison to the wild type. Altered protein conformations by predictive models, indicating an impaired detection by the host's immune response as well as by commercial antibody-based test assays."

According to the news reporters, the research concluded: "Mutations in the a determinant region of HBV as often found in OBI remarkably impair the detection of HBsAg from serum and infected cells, emphasizing the relevance of alternative methods such as HBV-DNA quantification for high-risk groups like HIV-infected individuals. J. Med. Virol. 89:246-256, 2017."

For more information on this research see: HBsAg mutations related to occult hepatitis B virus infection in HIV-positive patients result in a reduced secretion and conformational changes of HBsAg. Journal of Medical Virology, 2017;89(2):246-256. Journal of Medical Virology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Oncology - Acute Lymphoblastic Leukemia

Reports from University of Texas Add New Data to Findings in Acute Lymphoblastic Leukemia (Adult Acute Lymphoblastic Leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Acute Lymphoblastic Leukemia have been published. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Conventional cytotoxic chemotherapy used to treat acute lymphoblastic leukemia (ALL) results in high cure rates in pediatric patients but is suboptimal in the treatment of adult patients. The 5-year overall survival is approximately 90% in children and 30% to 40% in adults and elderly patients."

The news correspondents obtained a quote from the research from the University of Texas, "Adults with ALL tend to have higher risk factors at diagnosis, more comorbidities, and increasing age that often requires dose reductions. Major advancements have been made in redefining the pathologic classification of ALL, identifying new cytogenetic-molecular abnormalities, and developing novel targeted agents in order to improve survival. The addition of new monoclonal antibodies and tyrosine kinase inhibitors to conventional chemotherapy in the frontline setting has resulted in increased rates of complete remission and overall survival."

According to the news reporters, the research concluded: "These new developments are changing the treatment of adult ALL from a 'one therapy fits all' approach to individualized treatment based on patient's cytogenetic and molecular profile."

Our news journalists report that additional information may be obtained by contacting E.J. Jabbour, Univ Texas MD Anderson Canc Center, Dept. of Leukemia, Houston, TX 77030, United States. Additional authors for this research include H. Kantarjian and E.J. Jabbour.

Drugs and Therapies - Pharmaceutical Research

Reports from University of Texas Add New Data to Findings in Pharmaceutical Research (Influence of process parameters on the preparation of pharmaceutical films by electrostatic powder deposition)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Pharmaceutical Research is the subject of a report. According to news originating from Austin, Texas, by NewsRx correspondents, research stated, "Electrostatic powder deposition (ESPD) has been developed as a solvent-free method to prepare pharmaceutical films. The aim of this work was to investigate the influence of process parameters during (1) electrostatic powder deposition, (2) curing, and (3) removal of the film from the substrate on the properties of the film."

Financial supporters for this research include American Foundation for Pharmaceutical Education Grant Fellowship, National Science Foundation.

Our news journalists obtained a quote from the research from the University of Texas, "Polyethylene oxide (PEO) was used as the model polymer and stainless steel 316 as the substrate. Deposition efficiency (i.e. deposited weight) was measured with varying charging voltage, gun tip to substrate distance, and environmental humidity. Scanning electron microscopy was utilized to assess film formation, and adhesive and mechanical strength of films were measured with varying cure temperature and time. Adhesive strength was measured for films prepared on substrates of varying surface roughness. When deposition was performed at low humidity conditions, 25% RH, process parameters did not significantly affect deposition behavior. At 40% RH, increasing deposition efficiency with decreasing gun tip to substrate distance and increasing voltage (up to 60 kV) was observed. Complete film formation was seen by 30 min at 80 degrees C, compared to lower curing temperatures and times. All films were readily removed from the substrates."

According to the news editors, the research concluded: "The results show the ESPD process can be modified to produce films with good mechanical properties (e.g. tensile strength > 0.06 MPa), suggesting it is a promising dry powder process for preparing pharmaceutical films."

The news correspondents report that additional information may be obtained from L.K. Prasad, Univ Texas Austin, Coll Pharm, Austin, TX 78712, United States. Additional authors for this research include J.S. LaFountaine, J.M. Keen, R.O. Williams and J.W. McGinity.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.014. This DOI is a link to an online electronic
Reports from University of Texas Advance Knowledge in Immunosuppressive Agents (Stability of tacrolimus injection diluted in 0.9% sodium chloride injection and stored in Excel bags)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Immunosuppressive Agents are discussed in a new report. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "The chemical stability and physical compatibility of tacrolimus i.v. infusion solutions prepared in Excel bags and stored at 23 or 4 degrees C for up to nine days were studied. Tacrolimus admixtures (2, 4, and 8 mu g/mL) were prepared in Excel bags using 0.9% sodium chloride injection and stored at 23 degrees C without protection from light or at 4 degrees C in the dark."

Our news editors obtained a quote from the research from the University of Texas, "Test samples were withdrawn from triplicate bag solutions immediately after preparation and at predetermined time intervals (1, 3, 5, 7, and 9 days). Chemical stability was assessed by measuring tacrolimus concentrations using a validated stability indicating high-performance liquid chromatography assay. The physical stability of the admixtures was assessed by visual examination and by measuring turbidity, particle size, and drug content. All test solutions stored at 23 or 4 degrees C had a no greater than 6% loss of the initial tacrolimus concentration throughout the nine-day study period. All test samples of tacrolimus admixtures, under both storage conditions, were without precipitation and remained clear initially and throughout the nine-day observation period. Changes in turbidities were minor; measured particulates remained few in number in all samples throughout the study."

According to the news editors, the research concluded: "Extemporaneously prepared infusion solutions of tacrolimus 2, 4, and 8 mu g/mL in 0.9% sodium chloride injection in Excel bags were chemically and physically stable for at least nine days when stored at room temperature (23 degrees C) without protection from light and when stored in a refrigerator (4 degrees C) in the dark."

For more information on this research see: Stability of tacrolimus injection diluted in 0.9% sodium chloride injection and stored in Excel bags. American Journal of Health-System Pharmacy, 2016;73(24):2083-2088. American Journal of Health-System Pharmacy can be contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD 20814, USA.

The news editors report that additional information may be obtained by contacting A.L. Myers, Univ Texas MD Anderson Canc Center, Div Pharm, Houston, TX 77030, United States. Additional authors for this research include Y.P. Zhang, J.D. Kawedia, B.R. Shank, M.A. Deaver and M.A. Kramer.

Drugs and Therapies - Pharmacology and...

Reports from University of Texas Advance Knowledge in Pharmacology and Experimental Therapeutics (Discriminative Stimulus Effects of Binary Drug Mixtures: Studies with Cocaine, MDPV, and Caffeine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Pharmacology and Experimental Therapeutics is the subject of a report. According to news originating from San Antonio, Texas, by NewsRx correspondents, research stated, "Illicit drug preparations often include more than one pharmacologically active compound. For example, cocaine and synthetic cathinones [e.g., 3,4-methylenedioxypyrovalerone (MDPV)] are often mixed with caffeine before sale."

Our news journalists obtained a quote from the research from the University of Texas, "Caffeine is likely added to these preparations because it is inexpensive and legal; however, caffeine might also mimic or enhance some of the effects of cocaine or MDPV. In these studies, male Sprague-Dawley rats were trained to discriminate 10 mg/kg cocaine from saline, and the discriminative stimulus effects of cocaine, caffeine, and MDPV were evaluated alone and as binary mixtures (cocaine and caffeine, MDPV and caffeine, and cocaine and MDPV) at fixed-dose ratios of 3:1, 1:1, and 1:3 relative to the dose of each drug that produced 50% cocaine-appropriate responding. Dose-addition analyses were used to determine the nature of the drug-drug interactions for each mixture (e.g., additive, supra-additive, or subadditive). Although additive interactions were observed for most mixtures, supra-additive interactions were observed at the 50% effect level for the 1:1 mixture of cocaine and caffeine and at the 80% effect level for all three mixtures of cocaine and caffeine, as well as for the 3:1 and 1:3 mixtures of cocaine and MDPV. These results demonstrate that with respect to cocaine-like discriminative stimulus effects, caffeine can function as a substitute in drug preparations containing either cocaine or MDPV, with enhancements of cocaine-like effects possible under certain conditions."

According to the news editors, the research concluded: "Further research is needed to determine whether similar interactions exist for other abuse-related or toxic effects of drug preparations, including cocaine, synthetic cathinones, and caffeine."

The news correspondents report that additional information may be obtained from G.T. Collins, Univ Texas Hlth Sci Center San Antonio, South Texas Vet Hlth Care Sys, San
Antonio, TX, United States. Additional authors for this research include M. Abbott, K. Galindo, E.L. Rush, K.C. Rice and C.P. France.

Cardiovascular Diseases

Reports from University of Texas Southwestern Highlight Recent Findings in Cardiovascular Diseases [A Test in Context Hemoglobin A (1c) and Cardiovascular Disease]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases. According to news reporting originating from Dallas, Texas, by NewsRx correspondents, research stated, "Measurement of glycated hemoglobin (HbA(1c)), the most widely accepted indicator of long-term glycemic exposure, is central for the diagnosis and management of diabetes mellitus. Levels of HbA(1c) track epidemiologically with diabetic complications, and glycemic control, as reflected by HbA(1c) reduction, results in decreased risk of microvascular complications, including diabetic kidney disease, neuropathy, and retinopathy."

Our news editors obtained a quote from the research from the University of Texas Southwestern, "The relationship between HbA(1c) reduction and cardiovascular disease prevention in patients with diabetes is more complex, with data from large randomized trials published over the past decade providing clear evidence that lowering of HbA(1c) per se is an inadequate marker for a therapeutic regimen's impact on cardiovascular outcomes and patient survival. Recent revisions in professional society guidelines moved away from uniform recommendations and toward a more nuanced, patient-centered approach to HbA(1c) therapeutic targets."

According to the news editors, the research concluded: "The context and key evidence underpinning these recent changes are discussed in this paper, alongside a brief overview of HbA(1c) contemporary assays and their limitations."

For more information on this research see: A Test in Context Hemoglobin A(1c) and Cardiovascular Disease. *Journal of the American College of Cardiology*, 2016;68(22):2479-2486. *Journal of the American College of Cardiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA.

The news editors report that additional information may be obtained by contacting M.O. Gore, Univ Texas Southwestern Med Center Dallas, Dept. of Internal Med, Dallas, TX 75390, United States.

Reports from University of Tokyo Advance Knowledge in Mononuclear Phagocyte System (Pim-1L Protects Cell Surface-Resident ABCA1 From Lysosomal Degradation in Hepatocytes and Thereby Regulates Plasma High-Density Lipoprotein Level)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Mononuclear Phagocyte System have been published. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "ATP-binding cassette transporter A1 (ABCA1) exerts an atheroprotective action through the biogenesis of high-density lipoprotein in hepatocytes and prevents the formation of foam cells from macrophages. Controlling ABCA1 is a rational approach to improving atherosclerotic cardiovascular disease."

Our news journalists obtained a quote from the research from the University of Tokyo, "Although much is known about the regulatory mechanism of ABCA1 synthesis, the molecular mechanism underpinning its degradation remains to be clearly described. Approach and Results-ABCA1 possesses potential sites of phosphorylation by serine/threonine-protein kinase Pim-1 (Pim-1). Pim-1 depletion decreased the expression of cell surface-resident ABCA1 (csABCA1) and apolipoprotein A-I-mediated [H-3] cholesterol efflux in the human hepatoma cell line HepG2, but not in peritoneal macrophages from mice. In vitro kinase assay, immunoprecipitation, and immunocytochemistry suggested phosphorylation of csABCA1 by the long form of Pim-1 (Pim-1L). Cell surface biotinylation indicated that Pim-1L inhibited lysosomal degradation of csABCA1 involving the liver X receptor beta, which interacts with csABCA1 and thereby protects it from ubiquitination and subsequent lysosomal degradation. Cell surface coimmunoprecipitation with COS-1 cells expressing extracellularly hemagglutinin-tagged ABCA1 showed that Pim-1L-mediated phosphorylation of csABCA1 facilitated the interaction between csABCA1 and liver X receptor beta and thereby stabilized the csABCA1-Pim-1L complex. Mice deficient in Pim-1 kinase activity showed lower expression of ABCA1 in liver plasma membranes and lower plasma high-density lipoprotein levels than control mice. Pim-1L protects hepatic csABCA1 from lysosomal degradation by facilitating the physical interaction between csABCA1 and liver X receptor beta and subsequent stabilization of the csABCA1-Pim-1L complex and thereby regulates the circulating level of high-density lipoprotein."

According to the news editors, the research concluded: "Our findings may aid the development of high-density lipoprotein-targeted therapy."

For more information on this research see: Pim-1L Protects Cell Surface-Resident ABCA1 From Lysosomal Degradation in Hepatocytes and Thereby Regulates Plasma High-Density Lipoprotein Level. *Arteriosclerosis Thrombosis and Vascular Biology*, 2016;36 (12):2304-2314. *Arteriosclerosis Thrombosis and Vascular Biology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Reports from University of Toronto Describe Recent Advances in DNA Research (Controlling DNA-nanoparticle serum interactions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on DNA Research have been presented. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "Understanding the interaction of molecularly assembled nanoparticles with physiological fluids is critical to their use for in vivo delivery of drugs and contrast agents. Here, we systematically investigated the factors and mechanisms that govern the degradation of DNA on the nanoparticle surface in serum."

Our news journalists obtained a quote from the research from the University of Toronto, "We discovered that a higher DNA density, shorter oligonucleotides, and thicker PEG layer increased protection of DNA against serum degradation. Oligonucleotides on the surface of nanoparticles were highly resistant to DNase I endonucleases, and degradation was carried out exclusively by protein-mediated exonuclease cleavage and full-strand desorption. These results enabled the programming of the degradation rates of the DNA-assembled nanoparticle system from 0.1 to 0.7 h(-1) and the engineering of superstructures that can release two different preloaded dye molecules with distinct kinetics and half-lives ranging from 3.3 to 9.8 h. This study provides a general framework for investigating the serum stability of DNA-containing nanostructures."

According to the news editors, the research concluded: "The results advance our understanding of engineering principles for designing nanoparticle assemblies with controlled in vivo behavior and present a strategy for storage and multistage release of drugs and contrast agents that can facilitate the diagnosis and treatment of cancer and other diseases."

Our news journalists report that additional information may be obtained by contacting W.C.W. Chan, University of Toronto, Dept. of Chem Engn, Toronto, ON M5S 3E5, Canada. Additional authors for this research include L.Y.T. Chou and W.C.W. Chan.

Heart Disorders and Diseases - Heart Attack

Reports from University of Toronto Provide New Insights into Heart Attack (Association of Pre-hospital ECG Administration With Clinical Outcomes in ST-Segment Myocardial Infarction: A Systematic Review and Meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Attack have been published. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "Delays in reperfusion for patients with myocardial ischemia leads to increased morbidity and mortality. The objective of this review was to identify, evaluate, and critically appraise the evidence on whether pre-hospital electrocardiography (ECG) reduces patient mortality and improves post-ST-segment myocardial infarction patient-oriented outcomes."

Our news journalists obtained a quote from the research from the University of Toronto, "We searched PubMed/MEDLINE, EMBASE, and Cochrane Library (1990-2015) for controlled clinical studies. We also searched conference proceedings, trial registries, and reference lists of narrative and systematic reviews. Two reviewers independently identified and extracted data from studies that compared pre-hospital ECG with standard of care in patients with suspected myocardial infarction who underwent primary percutaneous coronary intervention. Internal validity was assessed using the Newcastle-Ottawa scale. We screened 21,197 citations and included 63 unique studies (plus 22 companion publications). Most studies were of moderate quality. Pre-hospital ECG was associated with significantly fewer deaths (relative risk, 0.68; 95% confidence interval [CI], 0.63-0.74; 45 studies; 71,315 patients; I-2, 0%), reduced time to reperfusion (mean difference, -35.32 minutes; 95% CI, -44.02 to -26.61; 26 studies; 27,524 patients; I-2, 97%), shorter hospital stays (mean difference, -0.63 days; 95% CI, -1.05 to -0.20; 10 studies; 39,275 patients; I-2, 39%), and more patients had first medical contact to device time < 90 minutes than standard of care (relative risk, 1.77; 95% CI, 1.52-2.07; 11 studies; 20,991 patients; I-2, 93%)."

According to the news editors, the research concluded: "Use of pre-hospital ECG is associated with decreased mortality and overall better patient outcomes."

Our news journalists report that additional information may be obtained by contacting R.A. Ducas, University of Toronto, Peter Munk Cardiac Center, Toronto, ON, Canada. Additional authors for this research include C. Labos, D. Allen, M. Golian, M. Jeyaraman, J. Lys, A. Mann, L. Copstein, S. Vokey, R. Rabbani, R. Zarychanski, A.M. Abou-Setta and A.H. Menkis.

Nanotechnology - Nanoparticles

Reports from University of Turin Highlight Recent Findings in Nanoparticles (Enhanced selective sonosensitizing efficacy of ultrasound-based anticancer treatment by targeted gold nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nanotechnology - Nanoparticles is now available. According to news originating from Turin, Italy, by NewsRx correspondents, research stated, "This study investigates cancer targeted gold nanoparticles as ultrasound sensitizers for the treatment of cancer."

Our news journalists obtained a quote from the research from the University of Turin, "The ultrasound sensitizer activity of folate-PEG decorated gold nanoparticles (FA-PEG-GNP) has been studied on human cancer cell lines that overexpress folate receptors (KB and HCT-116) and another that does not (MCF7), at two ultrasound energy densities (8 x 10(-6) J cm(-2) and 8 x 10(-5) J cm(2), for 5 min at 1.866 MHz). FA-PEG-GNP selectively targeted KB and HCT-116 cells and a remarkable reduction in cancer cell growth was observed upon ultrasound exposure, along with significant reactive oxygen species generation and increase in necrotic cells."

According to the news editors, the research concluded: "The combined use of targeting capacity and the ultrasound sensitizing effect, make FA-PEG-GNP promising candidates for the site-specific cancer treatment."

Reports from University of Utrecht Highlight Recent Findings in Pharmacoepidemiology (The effect of exposure misclassification in spontaneous ADR reports on the time to detection of product-specific risks for biologicals: a simulation study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Pharmacoepidemiology are discussed in a new report. According to news reporting originating in Utrecht, Netherlands, by NewsRx journalists, research stated, "The availability of accurate product-specific exposure information is essential in the pharmacovigilance of biologicals, because differences in the safety profile may emerge between products containing the same active substance. In spontaneous adverse drug reaction (ADR) reports, drug exposure may, however, be misclassified, that is, attributed to the incorrect product."

Financial support for this research came from College ter Beoordeling van Geneesmiddelen.

The news reporters obtained a quote from the research from the University of Utrecht, "The aim of this study was to explore the effect of exposure misclassification on the time to detection of product-specific risks in spontaneous reporting systems. We used data simulations to explore the effect of exposure misclassification. We simulated an active substance-specific subset of a spontaneous reporting system and used the proportional reporting ratio for signal detection. The effect of exposure misclassification was evaluated in three test cases representing product-specific ADRs that may occur for biologicals and studied in relative terms by varying the model parameters (market share and relative risk). We found that exposure misclassification results in the largest delay in identification of risks that have a weak association (relative risk <2 or 3) with the product of interest and in situations where the product associated with the unique risk has a large (>50%) market share. The absolute public health impact of exposure misclassification, in terms of cases/time to detection, varied considerably across the test cases. Exposure misclassification in ADR reports may result in a delayed detection of product-specific risks, particularly in the detection of weak drug-event associations."

According to the news reporters, the research concluded: "Our findings can help inform the future implementation and refinement of product-specific and batch-specific signal detection procedures."

Our news correspondents report that additional information may be obtained by contacting N.S. Vermeer, Utrecht Institute for Pharmaceutical Sciences (UIPS), Division of Pharmacoepidemiology and Clinical Pharmacology, Utrecht University, Utrecht, Netherlands. Additional authors for this research include H.C. Ebbers, S.M. Straus, H.G. Leufkens, T.C. Egberts and M.L De Bruin.

Oncology - Prostate Cancer

Reports from University of Verona Describe Recent Advances in Prostate Cancer (p16 Expression in Prostate Cancer and Nonmalignant Lesions: Novel Findings and Review of the Literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting from Benevento, Italy, by NewsRx journalists, research stated, "Prostatic specimens occasionally may contain proliferative foci of the small atypical acini that display some but not all features of prostate carcinoma. p504s is the only prostatic cancer (PC)-specific marker that, in combination with basal cell markers, help in the diagnosis of malignant lesions. Very little is known about the diagnostic importance of p16 in primary prostate carcinoma and nonmalignant elements."

The news correspondents obtained a quote from the research from the University of Verona, "We recruited 137 of routinely diagnostic prostatic specimens (between 2009 and 2013), which consisted of 21 prostatectomy, 15 transurethral prostatic resection, and 101 needle biopsy. We evaluated p16, in comparison with p504s, in prostatic carcinoma and benign glands. In this study, both nuclear and cytoplasmatic p16 expression were considered positive. We observed p16 expression in 86% of PC specimens and 16% of benign elements (p=0.001). Interestingly, p16 alone retained a high diagnostic potential in prostatectomy (95%) and in needle biopsy (84%), exhibiting a close association with PC. p504s had a high sensitivity (97%) and predictive negative value (98%) but a low specificity (71%) and predictive positive value (63%). In contrast, p16-positive expression showed a higher specificity (84%) and predictive positive value (74%) than p504s. Two prostatic carcinoma negative for p504s were positive for p16, whereas 7 cases negative for p16 were positive for p504s, and notably none was negative for both markers. In prostatectomy, p16 showed a higher diagnostic accuracy but not on transurethral prostatic resection. In needle biopsies, both markers were complementary, indicating that their combined detection may help in performing an accurate diagnosis."

According to the news reporters, the research concluded: "Our data suggest that p16 expression is significantly enhanced in prostate carcinoma as compared with nonmalignant elements. Our results provide evidence that p16 and p504s together could improve the diagnosis of PC in prostatectomy and needle biopsies."

For more information on this research see: p16 Expression in Prostate Cancer and Nonmalignant Lesions: Novel Findings and Review of the Literature. Applied Immunohistochemistry & Molecular Morphology, 2016;24(3):201-6. Heart Disorders and Diseases - Heart Failure

Reports from University of Washington Provide New Insights into Heart Failure (Different components of blood pressure are associated with increased risk of atherosclerotic cardiovascular disease versus heart failure in advanced chronic kidney ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Failure are discussed in a new report. According to news originating from Seattle, Washington, by NewsRx correspondents, research stated, "Blood pressure is a modifiable risk for cardiovascular disease (CVD). Among hemodialysis patients, there is a U-shaped association between blood pressure and risk of death."

Our news journalists obtained a quote from the research from the University of Washington, "However, few studies have examined the association between blood pressure and CVD in patients with stage 4 and 5 chronic kidney disease. Here we studied 1795 Chronic Renal Insufficiency Cohort (CRIC) Study participants with estimated glomerular filtration rate <30 ml/min per 1.73 m(2) and not on dialysis. The association of systolic (SBP), diastolic (DBP), and pulse pressure with the risk of physician-adjudicated atherosclerotic CVD (stroke, myocardial infarction, or peripheral arterial disease) and heart failure was tested using Cox regression adjusted for demographics, comorbidity and medications. There was a significant association with higher SBP (adjusted hazard ratio 2.04 [95% confidence interval: 1.46-2.84]) for SBP over 140 vs under 120 mmHg, higher DBP (2.52 [1.54-4.11]) for DBP >90 mm Hg versus <80 mm Hg and higher pulse pressure (2.67 [1.82-3.92]) for pulse pressure >68 mm Hg versus <51 mm Hg with atherosclerotic CVD. For heart failure, there was a significant association with higher pulse pressure only (1.42 [1.05-1.92]) for pulse pressure >68 mm Hg versus <51 mmHg, but not for SBP or DBP. Thus, among participants with stage 4 and 5 chronic kidney disease, there was an independent association between higher SBP, DBP, and pulse pressure with the risk of atherosclerotic CVD, whereas only higher pulse pressure was independently associated with a greater risk of heart failure."

According to the news editors, the research concluded: "Further trials are needed to determine whether aggressive reduction of blood pressure decreases the risk of CVD events in patients with stage 4 and 5 chronic kidney disease."

For more information on this research see: Different components of blood pressure are associated with increased risk of atherosclerotic cardiovascular disease versus heart failure in advanced chronic kidney disease. *Kidney International*, 2016;90(6):1348-1356. *Kidney*
The news reporters obtained a quote from the research from the University of the Basque Country, "From December 2003 to February 2016, 777 liver transplantations were performed at our institution, 33 of them (4.2%) with donors 80 years old and above. Our policy for the acceptance of these donors is based on preoperative liver function tests, donor hemodynamic stability, and intraoperative normal gross aspect. Octogenarian grafts were deliberately not assigned to retransplantations or to recipients with multiple previous surgical procedures or extensive portal thrombosis. Mean donor age was 82.7 +/- 2.1 years, with a range between 80 and 88. Only 12.1% suffered hemodynamic instability during the intensive care unit stay. Three donors (9.1%) had a history of diabetes mellitus. The mean Model for End-Stage Liver Disease score among recipients was 14.7 +/- 5.6. Mean cold ischemia time was 302 +/- 61 minutes. After a median follow-up of 18.5 months (range 7.5 to 47.5), no graft developed primary nonfunction. We observed hepatic artery thrombosis in 1 patient (3%) and biliary complications in 4 patients (12.5%). There was 1 case of ischemic-type biliary lesion, although it was related to hepatic artery thrombosis. Patient survival at 1 and 3 years was 90.3%, whereas graft survival was 92.6% and 86.4%, respectively."

According to the news reporters, the research concluded: "Excellent mid-term results can be obtained after liver transplantation with octogenarian donors with strict donor selection and adequate graft allocation."

Our news correspondents report that additional information may be obtained by contacting M. Gastaca, University of the Basque Country, Hepatobiliary Surg & Liver Transplantat Unit, Bilbao, Spain. Additional authors for this research include M. Guerra, L.A. Martinez, P. Ruiz, A. Ventoso, I. Palomares, M. Prieto, A. Matarranz, A. Valdivieso and J.O. de Urbina.

**Glycoconjugates**

**Reports from Uppsala University Advance Knowledge in Glycoconjugates (Kinetic Models for Measuring P-glycoprotein Function at the Blood-Brain Barrier with Positron Emission Tomography)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Glycoconjugates have been published. According to news reporting originating in Uppsala, Sweden, by NewsRx editors, the research stated, "P-glycoprotein function is associated with a number of neurodegenerative and psychiatric diseases as well as with pharmacoresistance to for example antiepileptic drugs. The ability to measure P-gp function in vivo would allow for an increased understanding of the mechanisms of disease and treatment."

The news reporters obtained a quote from the research from Uppsala University, "This review assesses the various approaches to in vivo quantification of P-gp function using currently available P-gp tracers and PET in humans. First, the use of compartment models, and their interpretation in terms of P-gp function at the blood-brain barrier, is discussed. Then, the methods that have been used to quantify PET data of the P-gp tracers [C-11] verapamil, [C-11] N-desmethyl-loperamide (dLop), [C-11] laniquidar, [C-11] phenytoin, [C-11] tariquidar and [C-11] elacridar are reviewed."

According to the news reporters, the research concluded: "In summary, the extraction of P-gp substrate PET tracers, which is their plasma to tissue rate constant K-1 corrected for variations in regional cerebral blood flow, is generally considered to be the preferred measure of P-gp function."

For more information on this research see: Kinetic Models for Measuring P-

**Cardiovascular Diseases and Conditions - Thrombosis**

**Reports from Vancouver General Hospital Advance Knowledge in Thrombosis (Test Characteristics Of Emergency Physician-performed Limited Compression Ultrasound For Lower-extremity Deep Vein Thrombosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Thrombosis. According to news reporting from Vancouver, Canada, by NewsRx journalists, research stated, "The current literature suggests that emergency physician (EP)-performed limited compression ultrasound (LCUS) is a rapid and accurate test for deep vein thrombosis (DVT). Our primary objective was to determine the sensitivity and specificity of LCUS for the diagnosis of DVT when performed by a large heterogeneous group of EPs."

The news correspondents obtained a quote from the research from Vancouver General Hospital, "This was a prospective diagnostic test assessment of LCUS conducted at two urban academic emergency departments. The scanning protocol involved compression at the common femoral, superficial femoral, and popliteal veins. Patients were eligible if undergoing radiology department ultrasound of the lower extremity with moderate or high pretest probability for DVT, or low pretest probability for DVT with a positive D-dimer. The enrolling EP performed LCUS before radiology department ultrasound of the same lower extremity. Sensitivity, specificity, and associated 95% confidence intervals (CIs) were calculated with the radiologist interpretation of the radiology department ultrasound as the criterion standard. A total of 56 EPs enrolled 296 patients for LCUS, with a median age of 50 years and 50% female. Fifty (17%) DVTs were identified by radiology department ultrasound, and another five (2%) cases were deemed indeterminate. The sensitivity and specificity of EP-performed LCUS was 86% (95% CI 73-94%) and 93% (95% CI 89-96%), respectively. A large heterogeneous group of EPs with limited training can perform LCUS with intermediate diagnostic accuracy."
According to the news reporters, the research concluded: "Unfortunately, LCUS performed by EPs with limited ultrasound training is not sufficiently sensitive or specific to rule out or diagnose DVT as a single testing modality."

Our news journalists report that additional information may be obtained by contacting D.J. Kim, Vancouver Gen Hosp, Dept. of Emergency Med, Vancouver, BC V5Z 1M9, Canada. Additional authors for this research include R.L. Byyny, C.A. Rice, J.P. Faragher, K.E. Nordenholz, J.S. Haukoos, M.M. Liao and J.L. Kendall.

**Oncology - Multiple Myeloma**

**Reports from Vanderbilt University School of Medicine Add New Data to Findings in Multiple Myeloma (Evolving paradigms in the treatment of relapsed/refractory multiple myeloma: increased options and increased complexity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Multiple Myeloma. According to news reporting from Nashville, Tennessee, by NewsRx journalists, research stated, "The use of modern therapies such as thalidomide, bortezomib and lenalidomide coupled with upfront high-dose therapy and autologous stem cell transplant (ASCT) has resulted in improved survival in patients with newly diagnosed multiple myeloma (MM). However, patients with relapsed/refractory multiple myeloma (RRMM) often have poorer clinical outcomes and might benefit from novel therapeutic strategies."

The news correspondents obtained a quote from the research from the Vanderbilt University School of Medicine, "Emerging therapies, such as deacetylase inhibitors, monoclonal antibodies and new proteasome inhibitors, appear promising and may change the therapeutic landscape in RRMM. A limited number of studies has shown a benefit with salvage ASCT in patients with RRMM, although there remains ongoing debate about its timing and effectiveness. Improvement in transplant outcomes has re-ignited a debate on the timing and possible role for salvage ASCT and allogeneic stem cell transplant in RRMM."

According to the news reporters, the research concluded: "As the treatment options for management of patients with RRMM become increasingly complex, physicians must consider both disease-and patient-related factors in choosing the appropriate therapeutic approach, with the goal of improving efficacy while minimizing toxicity."

For more information on this research see: Evolving paradigms in the treatment of
relapsed/refractory multiple myeloma: increased options and increased complexity. *Bone Marrow Transplantation*, 2016;51(4):479-91. *Bone Marrow Transplantation* can be contacted at: Nature Publishing Group, 345 Park Avenue South, New York, NY 10010-1707, USA. **Surgery - Embolectomy**

**Reports from W.B. Keeling and Co-Researchers Add New Data to Findings in Embolectomy (Outcomes After Surgical Pulmonary Embolectomy for Acute Pulmonary Embolus: A Multi-Institutional Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Surgery - Embolectomy. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Surgical pulmonary embolectomy (SPE) has been sparingly used for the successful treatment of massive and submassive pulmonary emboli. To date, all data regarding SPE have been limited to single-center experiences."

The news correspondents obtained a quote from the research, "The purpose of this study was to document short-term outcomes after SPE for acute pulmonary emboli (PE) at four high-volume institutions. A retrospective review of multiple local Society of Thoracic Surgeons databases of adults undergoing SPE from 1998 to 2014 for acute PE was performed (n = 214). Demographic, operative, and outcomes data were collected and analyzed. Patients were summarily categorized as having either massive or submassive PEs based on the presence or absence of preoperative vasopressors. A total of 214 patients with acute PE were treated by SPE. The mean age was 56.0 +/- 14.5 years, and 92 (43.6%) patients were female. Of those, 176 (82.2%) PEs were submassive and 38 (17.8%) were massive. Fifteen (7.0%) patients underwent concomitant cardiac procedures, with 10 (4.7%) having simultaneous valvular interventions and 5 (2.4%) undergoing concomitant bypass grafting. Cardiopulmonary bypass (CPB) was used for all cases. Cardioplegic arrest was used for 80 (37.4%) patients. The median CPB and aortic cross clamp times were 71.5 (interquartile range [IQR], 47.0-109.5) and 46.0 (IQR, 26.0-74.5), respectively. Notably, only 25 (11.7%) patients died in the hospital. Mortality was highest
among the 28 patients who experienced preoperative cardiac arrest (9, 32.1%). Conclusions. These data represent the first multicenter experience with SPE for acute pulmonary emboli."

According to the news reporters, the research concluded: "Surgical pulmonary embolectomy for acute massive and submassive PE is safe and can be performed with acceptable in-hospital outcomes; the procedure should be included in the multimodality treatment of life-threatening pulmonary emboli."

Our news journalists report that additional information may be obtained by contacting W.B. Keeling, Pavil Holdings Grp, New York, NY, United States. Additional authors for this research include T. Sundt, M. Leacche, Y. Okita, J. Binongo, Y. Lasajanak, L. Aklog and O.M. Lattouf.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.05.004. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Small Cell Lung Cancer

Reports from Weill Cornell Medical College Describe Recent Advances in Small Cell Lung Cancer (Anatomical Segmentectomy and Wedge Resections Are Associated with Comparable Outcomes for Patients with Small cT1N0 Non-Small Cell Lung Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Small Cell Lung Cancer are presented in a new report. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Sublobar resection is advocated for patients with NSCLC and compromised cardiopulmonary reserve, and for selected patients with early stage disease. Anatomic segmentectomy (AS) has traditionally been considered superior to wedge resection (WR), but well-balanced comparative studies are lacking."

The news reporters obtained a quote from the research from Weill Cornell Medical College, "We hypothesize that WR and AS are associated with comparable oncologic outcomes for patients with cT1N0 NSCLC. A retrospective review of a prospective database was performed (2000-2014) for cT1N0 patients, excluding patients with multiple primary tumors, carcinoid tumors, adenocarcinoma in situ, and minimally invasive adenocarcinoma. Demographic, clinical, and pathological data were reviewed. Overall survival (OS) and disease-free survival (DFS) were estimated using the Kaplan-Meier method and differences compared using log-rank test. Multivariable analysis (MVA) of factors affecting DFS was performed by
Cox regression analysis. For further comparison of the effect of resection type on survival, propensity score matching (i.e., by age, sex, Charlson comorbidity index, percent forced expiratory volume in 1 second (FEV1%), clinical tumor size, and tumor maximum standardized uptake value) was performed to obtain balanced cohorts of patients undergoing WR and AS (n = 76 per group). Two hundred eighty-nine patients met our selection criteria, including WR in 160 and AS in 129. Poor performance status and limited cardiopulmonary reserve were the primary indications for sublobar resection in 76% of WR patients and in 62% of AS patients (p = 0.011). Thirteen patients (4.5%) had pN1/2 disease. Patients undergoing AS were more likely to have nodal sampling/dissection [123 (95%) versus 112 (70%); p<0.001], more stations sampled (3 versus 2; p< 0.001), and more total nodes resected (7 versus 4; p = 0.001). However, there was no difference between patients undergoing WR versus AS in local recurrence [15 versus 14; p = 0.68] or 5-year DFS (51% versus 53%; p = 0.7; median follow-up 34 months). Univariate analysis showed no effect of extent of resection on DFS [hazard ratio 1.07 (95% confidence interval 0.74-1.56); p = 0.696]. MVA showed that only tumor maximum standardized uptake value was associated with worse DFS [hazard ratio 1.07 (95% confidence interval 1.01-1.13); p = 0.016]. In the propensity matched analysis of balanced subgroups, there was also no difference (p = 0.950) in 3- or 5-year DFS in cT1N0 patients undergoing WR (65% and 49%) or AS (68% and 49%). Our data show that WR and AS are comparable oncologic procedures for carefully staged cT1N0 NSCLC patients."

According to the news reporters, the research concluded: "Although AS is associated with a more thorough lymph node dissection, this did not translate to a survival benefit in this patient population with a low rate of nodal metastases."

Keywords for this news article include: New York City, New York, United States, North and Central America, Small Cell Lung Cancer, Cancer, Epidemiology, Lung Neoplasms, Segmentectomy, Oncology, Surgery, Weill Cornell Medical College.

**Animal Diseases and Conditions - Avian Influenza**

**Reports from Wroclaw University of Technology Add New Data to Findings in Avian Influenza (Bird Flu) [Rapid detection of highly pathogenic A(H7N7) avian influenza virus genetic markers in heterogenic samples utilizing on-chip SSCP-CE method]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Current study results on Animal Diseases and Conditions - Avian Influenza (Bird Flu) have been published. According to news reporting out of Wroclaw, Poland, by NewsRx editors, research stated, "A highly pathogenic avian influenza (HPAI) poses serial threat to humans and animals. Low pathogenic variant of the virus is relatively harmless, but it could evolve into potentially lethal highly pathogenic strain."

Financial support for this research came from National Centre of Research and Development.

Our news journalists obtained a quote from the research from the Wroclaw University of Technology, "In the last decade, the latter was responsible for death of 212 humans and culling over 30 million chickens. Commonly used methods of HPAI variant identification are based on genetic analysis, mainly polymerase chain reaction (PCR) technique. The main drawback of PCR is relatively low detection selectivity of minor HPAI variants in heterogenic samples, as well as its limited application in environmental conditions. Any diagnostic method which could differentiate pathogenicity at the subclinical infection level in mixed samples at the spot of outbreak, will provide significant progress in effective countermeasures development. For this purpose, detection of characteristic genetic mutations of HPAI variant seems to be the most accurate solution. Herein, we present a microchip device for rapid mutation-based detection of low and highly pathogenic strains of avian influenza virus in heterogenic samples utilizing ultrasensitive Single Strand Conformation Polymorphism (SSCP) method combined with Capillary Electrophoresis (CE) and lab-on-a-chip technique. Construction and properties of microdevice are presented in details. Emphasis is placed on simplifying microdevice preparation protocol and reduction of the time of analysis, towards real application in laboratory, as well as outdoor analyses, performed with recently developed lab-in-a-suitcase instrument."

According to the news editors, the research concluded: "Results of detection and differentiation of low and highly pathogenic A(H7N7) avian influenza virus genetic markers are described and discussed."

For more information on this research see: Rapid detection of highly pathogenic A (H7N7) avian influenza virus genetic markers in heterogenic samples utilizing on-chip SSCP-CE method. Sensors and Actuators B-Chemical, 2016;236():926-936. Sensors and Actuators B-Chemical can be contacted at: Elsevier Science Sa, PO Box 564, 1001 Lausanne, Switzerland.

Muscle Cells
Reports from Xi'an Jiao Tong University Add New Data to Findings in Muscle Cells (Activation of AMPK alpha 2 inhibits airway smooth muscle cells proliferation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Muscle Cells is the subject of a report. According to news reporting originating in Shaanxi, People's Republic of China, by NewsRx journalists, research stated, "The aims of the present study were to examine the effect of adenosine monophosphate-activated protein kinase (AMPK) activation on airway smooth muscle cells (ASMCs) proliferation and to address its potential mechanisms. Platelet derived growth factor (PDGF) activated phosphatidylinositol 3-kinase (P13K)/protein kinase B (Alt)/mammalian target of rapamycin (mTOR) signaling pathway, and this in turn up-regulated S-phase kinase-associated protein 2 (Skp2) and consequently reduced cyclin dependent kinase inhibitor 1B (p27) leading to ASMCs proliferation."

The news reporters obtained a quote from the research from Xi'an Jiao Tong University, "Pre-incubation of cells with metformin, an AMPK activator, blocked PDGF-induced activation of mTOR and its downstream targets changes of Skp2 and p27 without changing Alt phosphorylation and inhibited ASMCs proliferation. Transfection of ASMCs with AMPK alpha 2-specific small interfering RNA (siRNA) reversed the effect of metformin on mTOR phosphorylation, Skp2 and p27 protein expression and cell proliferation."

According to the news reporters, the research concluded: "Our study suggests that activation of AMPK, particularly AMPK alpha 2, negatively regulates mTOR activity to suppress ASMCs proliferation and therefore has a potential value in the prevention and treatment of asthma by negatively modulating airway remodeling."

Our news correspondents report that additional information may be obtained by contacting L. Liu, Xi An Jiao Tong Univ, Affiliated Hosp 1, Dept. of Resp & Crit Care Med, Xian 710061, Shaanxi, People's Republic of China. Additional authors for this research include Y.L. Pan, Y. Song, X.F. Su, R. Ke, L. Yang, L. Gao and M.X. Li.

Genetics
Reports from Xuzhou Medical College Provide New Insights into Genetics (p53 coordinates DNA repair with nucleotide synthesis by suppressing PFKFB3 expression and promoting the pentose phosphate pathway)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics is now available. According to news reporting originating in Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Activation of p53 in response to DNA damage is essential for tumor suppression. Although previous studies have emphasized the importance of p53-dependent cell cycle arrest and apoptosis for tumor suppression, recent studies have suggested that other areas of p53 regulation, such as metabolism and DNA damage repair (DDR), are also essential for p53-dependent tumor suppression."

The news reporters obtained a quote from the research from Xuzhou Medical College, "However, the intrinsic connections between p53-mediated DDR and metabolic regulation remain incompletely understood. Here, we present data suggesting that p53 promotes nucleotide biosynthesis in response to DNA damage by repressing the expression of the phosphofructokinase-2 (PFK2) isoform 6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 3 (PFKFB3), a rate-limiting enzyme that promotes glycolysis. PFKFB3 suppression increases the flux of glucose through the pentose phosphate pathway (PPP) to increase nucleotide production, which results in more efficient DNA damage repair and increased cell survival. Interestingly, although p53-mediated suppression of PFKFB3 could increase the two major PPP products, NADPH and nucleotides, only nucleotide production was essential to promote DDR."

According to the news reporters, the research concluded: "By identifying the novel p53 target PFKFB3, we report an important mechanistic connection between p53-regulated metabolism and DDR, both of which play crucial roles in tumor suppression."

For more information on this research see: p53 coordinates DNA repair with nucleotide synthesis by suppressing PFKFB3 expression and promoting the pentose phosphate pathway. Scientific Reports, 2016;6():1-13. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Oncology - Endometrial Cancer

Reports from Y.L. Wan et al Highlight Recent Findings in Endometrial Cancer (Working together to shape the endometrial cancer research agenda: The top ten unanswered research questions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Endometrial Cancer is the subject of a report. According to news reporting from Southampton, United Kingdom, by NewsRx journalists,
research stated, "Endometrial cancer (EC) is the most common gynaecological cancer in developed nations and its incidence is rising. As a direct consequence, more women are dying from EC despite advances in care and improved survivorship."

Funders for this research include Central Manchester University Hospitals NHS Foundation Trust, Manchester Academic Health Science Centre, The Christie NHS Foundation Trust, British Gynaecological Cancer Society, Macmillan Cancer Support, National Forum of Gynaecological Oncology Nurses, James Lind Alliance, Womb Cancer Support UK, Womb Cancer Voice, Eve Appeal, Wellbeing of Women, Cochrane, National Institute of Health Research, Pelvic Obstetric and Gynaecological Physiotherapists, College of Radiographers, Allied Health Professionals Network.

The news correspondents obtained a quote from the research, "There is a lack of research activity and funding, as well as public awareness about EC. We sought to engage patients, carers and healthcare professionals to identify the most important unanswered research questions in EC. The priority setting methodology was developed by the James Lind Alliance and involved four key stages: gathering research questions; checking these against existing evidence; interim prioritisation; and a final consensus meeting during which the top ten unanswered research questions were agreed using modified nominal group methodology. Our first online survey yielded 786 individual submissions from 413 respondents, of whom 211 were EC survivors or carers, and from which 202 unique unanswered research questions were generated. 253 individuals, including 108 EC survivors and carers, completed an online interim prioritisation survey. The resulting top 30 questions were ranked in a final consensus meeting. Our top ten spanned the breadth of patient experience of this disease and included developing personalised risk scoring, refining criteria for specialist referral, understanding the underlying biology of different types of EC, developing novel personalised treatment and prevention strategies, prognostic and predictive biomarkers, increasing public awareness and interventions for psychological issues."

According to the news reporters, the research concluded: "Having established the top ten unanswered research questions in EC, we hope this galvanises researchers, healthcare professionals and the public to collaborate, coordinate and invest in research to improve the lives of women affected by EC."

For more information on this research see: Working together to shape the endometrial cancer research agenda: The top ten unanswered research questions. Gynecologic Oncology, 2016;143(2):287-293. Reports from Yildirim Beyazit University Add New Data to Findings in Cardiology (Autonomic Cardiac Activity in Patients with Smoking and Alcohol Addiction by Heart Rate Variability Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting out of Ankara, Turkey, by NewsRx editors, research stated, "Smoking and alcohol addictions are common and worldwide. In the present study, we aimed to investigate the effects of these addictions on cardiac rhythm using heart rate variability (HRV) analysis."

Our news journalists obtained a quote from the research from Yildirim Beyazit University. "Addicts (n=42 men: 22 cigarette; 20 cigarette and alcohol) and age-matched controls (n=34 men) were included in the study. All patients fulfill the criteria for dependence according to DSM-IV-TR. Electrocardiography (ECG) recordings were obtained for a total of 30 minutes. Fagerstrom Nicotine Addiction Test (FNAT) and CAGE questionnaire (Cut down, Annoy, Guilt, Eye opener) was applied to all patients. Almost all HRV parameters were significantly decreased in cigarette and cigarette and alcohol addicts compared with controls (p <0.05). The mean heart rate (bpm) increased in both addict groups compared with control group, and this increase was particularly significant in cigarette and alcohol addicts. The cardiac autonomic balance shifted in favor of sympathetic activity by suppressing the parasympathetic activity in addicts; therefore, the present study shows that smoking and/or alcohol addiction leads to sympathetic activation and parasympathetic inhibition. Reduced vagal activity also predisposes to cardiac arrhythmias."

According to the news editors, the research concluded: "This suggests an increased risk of cardiovascular mortality in subjects with smoking and alcohol addiction."

For more information on this research see: Autonomic Cardiac Activity in Patients with Smoking and Alcohol Addiction by Heart Rate Variability Analysis. Clinical and Investigative Medicine, 2016;39(6):S147-S152. Clinical and Investigative Medicine can be contacted at: Canadian Soc Clinical Investigation, Csci Head Office, 774 Echo Drive, Ottawa, On K1S 5N8, Canada.

Our news journalists report that additional information may be obtained by contacting R. Yuksel, Yildirim Beyazit Univ, Fac Med, Dept. of Physiol, Ankara, Turkey. Additional authors for this research include R.N. Yuksel, T. Sengezer and S. Dane.

Keywords for this news article include: Ankara, Turkey, Eurasia, Heart Rate, Risk and Prevention, Hemodynamics, Cardiology, Yildirim Beyazit University.

Reports from Yonsei University Advance Knowledge in Cardiovascular Research (Low Dentin Matrix Protein 1 Is Associated With Incident Cardiovascular Events in Peritoneal Dialysis Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Research is now available. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Recent reports demonstrated that dentin matrix protein 1 (DMP1) acts as an inhibitor of vascular calcification and might be a potential biomarker for chronic kidney disease-mineral and bone disorder; however, no clinical investigations regarding DMP1 have been performed in dialysis patients. We investigated the prognostic value of DMP1 on cardiovascular outcomes in prevalent peritoneal dialysis patients."

Our news editors obtained a quote from the research from Yonsei University, "We recruited 223 prevalent peritoneal dialysis patients and divided them into high and low DMP1 groups according to log-transformed plasma DMP1 levels. Lateral lumbar spine radiographs were used for measurement of vascular calcification. Major cardiovascular events were compared between the two groups. A Cox proportional hazards analysis determined DMP1 was independently associated with cardiovascular outcomes. In vitro mouse osteocytes were cultured in media containing indoxyl sulfate (IS), and the expressions of DMP1 were examined. The mean age was 52.1 +/- 11.8 years, and 116 (52.0%) patients were male. The median value of log DMP1 was 0.91 (0.32-2.81ng/mL). The multiple logistic regression analysis indicated that DMP1 levels were independently associated with the presence of vascular calcification after adjustment for multiple confounding factors (odds ratio=0.719; 95% confidence interval [CI] 0.522-0.989; p=0.043). During a mean follow-up duration of 34.6 months, incident cardiovascular events were observed in 41 (18.4%) patients. A Kaplan-Meier plot showed that the low DMP1 group had a significantly higher rate of incident cardiovascular events compared with the high DMP1 group (log-rank test, p=0.026). In addition, multiple Cox analysis showed that low DMP1 was significantly associated with incident cardiovascular events (log 1 increase: hazard ratio=0.855; 95% CI 0.743-0.984; p=0.029) after adjustment for multiple confounding factors. In IS-stimulated osteocytes, mRNA and protein expression levels of DMP1 were significantly decreased compared with control osteocytes. We showed that low DMP1 levels were significantly associated with presence of vascular calcification and were independently associated with the incident cardiovascular events in prevalent peritoneal dialysis patients."

According to the news editors, the research concluded: "DMP1 might be a potential factor contributing to cardiovascular complications in dialysis patients."

Reports from Zagazig University Advance Knowledge in Iron-Deficiency Anemia (Impact of iron deficiency anemia on the function of the immune system in children)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Iron-Deficiency Anemia are discussed in a new report. According to news reporting out of Zagazig, Egypt, by NewsRx editors, research stated, "The importance of iron deficiency as a public health problem is based ultimately on the seriousness of its consequences on health. The most extensively investigated consequences of iron deficiency involve work performance and immune function."

Our news journalists obtained a quote from the research from Zagazig University, "The significance of the effects on work performance is generally accepted. In contrast, data on the influence of iron deficiency on immune function are often perceived as being confusing and contradictory. We aimed to evaluate the effect of iron deficiency anemia on humoral, cellular, nonspecific immunity, and also the effect on the cytokines that are the key factors of many immunologic steps. Forty children with iron deficiency anemia and 20 age and sex-matched healthy children were included. All children were subjected to full medical history, thorough clinical examination, complete blood count, iron indices (serum iron, serum total iron-binding capacity, serum ferritin, and transferrin saturation), immunoglobulin assay (IgA, IgG, and IgM), interleukin (IL)-6 serum level, study of T-lymphocyte subsets, and evaluation of phagocytic function of macrophages and oxidative burst activity of neutrophils. Patients had significantly lower IgG levels, IL-6, phagocytic activity, and oxidative burst of neutrophils than controls, although there was no significant difference between patients and controls with regard to other immunoglobulins and CD4/CD8 ratio. There was significantly positive correlation between serum iron and IL-6 serum level. We concluded that humoral, nonspecific immunity (phagocytic activity and oxidative burst), and the IL-6 are influenced in patients with iron deficiency anemia."

According to the news editors, the research concluded: "Study of these abnormalities after correction of iron deficiency is strongly needed."

For more information on this research see: Impact of iron deficiency anemia on the function of the immune system in children. Medicine, 2016;95(47):161-165. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Cardiovascular Diseases and Conditions - Thrombosis

Reports from Zagazig University Highlight Recent Findings in Thrombosis (Cu-blood flow model through a catheterized mild stenotic artery with a thrombosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Thrombosis is now available. According to news reporting from Zagazig, Egypt, by NewsRx journalists, research stated, "Copper nanoparticles blood flow analysis through a catheterized mild stenotic artery with a thrombosis is presented. The system of coupled governing equations are prescribed and then simplified under mild stenosis assumptions."

The news correspondents obtained a quote from the research from Zagazig University, "The governing equations are solved exactly, and then expressions for temperature, axial velocity, stream function, wall shear stress and resistance impedance are obtained generally for metallic nanoparticles blood flow. Due to the importance of copper nanoparticles in biomedicine, the results for Cu-blood flow model are introduced. The effect of various pertinent flow and geometric parameters on copper-blood flow features in the stenotic region are illustrated and discussed through graphs for catheter and tube models."

According to the news reporters, the research concluded: "Blood trapping is introduced graphically for numerous flow parameters."

For more information on this research see: Cu-blood flow model through a catheterized mild stenotic artery with a thrombosis. Mathematical Biosciences, 2016;282():135-146. Mathematical Biosciences can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Mathematical Biosciences - www.journals.elsevier.com/mathematical-biosciences/)

Reports from Zhengzhou University Describe Recent Advances in Gliomas (Lentivirus-mediated silencing of HSDL2 suppresses cell proliferation in human gliomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Gliomas. According to news originating from Zhengzhou, People's Republic of China, by NewsRx correspondents, research stated, "Gliomas are the most common type of malignant brain tumors, and the related prognosis is poor. Though many genes have been identified as factors in the development and progression of gliomas, underlying mechanisms remained unclear."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Zhengzhou University, "It was clear that abnormal lipid metabolism was one of the major hallmarks of cancers. However, few factors associated with lipid metabolism have been reported to be involved in cancer pathogenesis. Hydroxysteroid dehydrogenase-like 2 (HSDL2) is a protein containing sterol carrier protein 2 (SCP2) domain localized in peroxisomes, which indicated that HSDL2 might be a fatty acid regulatory factor. Here, we revealed that HSDL2 was significantly upregulated in gliomas and its expression was positively correlated with glioma grades. Furthermore, lentiviral-mediated HSDL2 knockdown showed that HSDL2 downregulation inhibited the proliferation in two human glioblastoma cell lines U-251 cells and U87 MG cells, induced cell cycle arrest, and promoted cell apoptosis. Our study provided multiple lines of evidence for the causal relationship between HSDL2 overexpression and glioma progression and provided possible mechanisms underlying HSDL2-mediated glioma growth."

According to the news editors, the research concluded: "Taken together, these results indicated that HSDL2 might serve as a potential target for glioma treatment in the future."

For more information on this research see: Lentivirus-mediated silencing of HSDL2 suppresses cell proliferation in human gliomas. Tumor Biology, 2016;37(11):15065-15077. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

The news correspondents report that additional information may be obtained from R.K. Chen, Zhengzhou Univ, Affiliated Hosp 1, Dept. of Neurosurg, Zhengzhou, Henan, People's Republic of China. Additional authors for this research include Y. Xue, F.D. Yang, X.T. Wei, L.J. Song and X.Z. Liu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13277-016-5402-6. This DOI is a link to an online electronic document that is either free or for purchase.

**Reports on Acute Coronary Syndrome Findings from Department of Public Health Provide New Insights (Ventricular fibrillation waveform measures and the etiology of cardiac arrest)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Acute Coronary Syndrome. According to news reporting originating in Seattle, Washington, by NewsRx journalists, research stated, "Early determination of the acute etiology of cardiac arrest could help guide resuscitation or post-resuscitation care. In experimental studies, quantitative measures of the ventricular fibrillation waveform distinguish ischemic from non-ischemic etiology."

The news reporters obtained a quote from the research from the Department of Public Health, "We investigated whether waveform measures distinguished arrest etiology among adults treated by EMS for out-of-hospital ventricular fibrillation between January 1, 2006-December 31, 2014. Etiology was classified using hospital information into three exclusive groups: acute coronary syndrome (ACS) with ST elevation myocardial infarction (STEMI), ACS without ST elevation (non-STEMI), or nonischemic arrest. Waveform measures included amplitude spectrum area (AMSA), centroid frequency (CF), mean frequency (MF), and median slope (MS) assessed during CPR-free epochs immediately prior to the initial and second shock. Waveform measures prior to the initial shock and the changes between first and second shock were compared by etiology group. We a priori chose a significance level of 0.01 due to multiple comparisons. Of the 430 patients, 35% (n = 150) were classified as STEMI, 29% (n = 123) as non-STEMI, and 37% (n = 157) with non-ischemic arrest. We did not observe differences by etiology in any of the waveform measures prior to shock 1 (Kruskal-Wallis Test) (p = 0.28 for AMSA, p = 0.07 for CF, p = 0.63 for MF, and p = 0.39 for MS). We also did not observe differences for change in waveform between shock 1 and 2, or when the two acute ischemia groups (STEMI and non-STEMI) were combined and compared to the non-ischemic group."

According to the news reporters, the research concluded: "This clinical investigation suggests that waveform measures may not be useful in distinguishing cardiac arrest etiology."

Our news correspondents report that additional information may be obtained by contacting T. Rea, Dept. of Public Hlth, Emergency Med Serv, Div Public Hlth Seattle & King Cty, Seattle, WA, United States. Additional authors for this research include J. Coult, J. Blackwood, C. Fahrenbruch, H. Kwok, P. Kudenchuk and T. Rea.

Reports on Acute Coronary Syndrome from Medical University Provide New Insights (Endothelial lipase plasma levels are increased in both sexes in stable coronary artery disease and only in women with acute coronary syndrome but not associated ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Acute Coronary Syndrome have been published. According to news originating from Graz, Austria, by NewsRx correspondents, research stated, "To investigate whether endothelial lipase (EL) plasma levels are increased in stable coronary artery disease (sCAD) and acute coronary syndrome (ACS) patients, as well as to test the association of EL plasma levels and the severity of CAD and sex. The study was performed as a single-center, cross-sectional, observational research on 72 sCAD and 187 ACS patients in the Sisters of Charity University Hospital Centre, Zagreb, Croatia, between December 1, 2011 and December 1, 2012."

Our news journalists obtained a quote from the research from Medical University, "EL plasma levels were measured using ELISA. EL plasma levels were significantly higher in sCAD patients (median 311.3 pg/mL, interquartile range [IQR] 250.4-422.6 pg/mL) than in ACS patients (median =258.7 pg/mL, IQR = 162.1-356.0 pg/mL; P<0.001). EL levels in female ACS patients were significantly higher (median 314.5 pg/mL, IQR 218.3-420.8 pg/mL) than in male ACS patients (median 225.4 pg/mL, IQR 148.7320 .1 pg/mL; P<0.001) and similar to the EL levels in the sCAD patients. There was no significant correlation between EL plasma levels and the GENSINI score and between EL plasma levels and the number of atherosclerotic coronary artery segments in either the ACS (rho =-0.09, P=0.247; rho =0.12, P=0.106, respectively) or sCAD group (rho = 0.04, P=0.771; rho =0.06, P=0.643, respectively). Our results suggest that EL plasma levels discriminate male but not female patients with different clinical presentations of CAD, as well as female and male ACS patients."

According to the news editors, the research concluded: "EL plasma levels are not significantly correlated with CAD severity."

For more information on this research see: Endothelial lipase plasma levels are increased in both sexes in stable coronary artery disease and only in women with acute coronary syndrome but not associated with the severity of coronary artery disease. Croatian Medical Journal, 2016;57(5):482-492. Croatian Medical Journal can be contacted at: Medicinska Naklada, Vlaska 69, Hr-10000 Zagreb, Croatia.

**Eye Diseases and Conditions - Age-Related Macular...**

**Reports on Age-Related Macular Degeneration from University of Southampton Provide New Insights** *(A rare penetrant TIMP3 mutation confers relatively late onset choroidal neovascularisation which can mimic age-related macular degeneration)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Eye Diseases and Conditions - Age-Related Macular Degeneration. According to news originating from Southampton, United Kingdom, by NewsRx correspondents, research stated, "To perform a genotype-phenotype correlation for three patients heterozygous for a missense mutation in the tissue inhibitor of metalloproteinase 3 (TIMP3) gene. Retrospective, observational case series."

Our news journalists obtained a quote from the research from the University of Southampton, "The medical records and photographs were reviewed for three patients diagnosed at the time with neovascular age-related macular degeneration (AMD). All were later found to carry a predicted C113G mutation in the TIMP3 gene, other known mutations in which are associated with Sorsby's fundus dystrophy. All three patients developed drusen and bilateral choroidal neovascularisation with subsequent disciform scarring and atrophy. Visual acuity rapidly deteriorated to <6/60 in both eyes. The age of onset varied from 56 to 64 years and the interval to contralateral eye involvement varied from 4 to 6 years. Two of the three patients had a family history of AMD. All three patients were heterozygous for the C113G nucleotide change, resulting in a Ser38Cys change at the N terminus of the TIMP3 protein."

According to the news editors, the research concluded: "This case series suggests the C113G TIMP3 variant may represent a novel highly penetrant mutation causing choroidal neovascularisation of relatively late onset for Sorsby's fundus dystrophy, mimicking early onset AMD."

For more information on this research see: A rare penetrant TIMP3 mutation confers relatively late onset choroidal neovascularisation which can mimic age-related macular degeneration. *Eye*, 2015;30(3):488-91. *Eye* can be contacted at: Nature Publishing Group, 345 Park Avenue South, New York, NY 10010-1707, USA. Reports on Amniotic Fluid Embolism from Baylor University College of Medicine Provide New Insights (Amniotic Fluid Embolism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Pregnancy Complications - Amniotic Fluid Embolism. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Amniotic fluid embolism remains one of the most devastating conditions in obstetric practice with an incidence of approximately 1 in 40,000 deliveries and a reported mortality rate ranging from 20% to 60%." 

The news correspondents obtained a quote from the research from the Baylor University College of Medicine, "The pathophysiology involves an abnormal maternal response to fetal tissue exposure associated with breaches of the maternal-fetal physiologic barrier during parturition. This response and its subsequent injury involve activation of proinflammatory mediators similar to that seen with the classic systemic inflammatory response syndrome."

According to the news reporters, the research concluded: "Maternal treatment is primarily supportive, whereas prompt delivery in the mother who has sustained cardiopulmonary arrest is critical for improved newborn outcome."

Our news journalists report that additional information may be obtained by contacting S.L. Clark, Texas Childrens Hosp, Baylor College of Medicine, Dept. of Obstet & Gynecol, Houston, TX 77030, United States.

Reports on Antibiotics Findings from Sichuan Normal University Provide New Insights (Staurosporine as an agonist for induction of GLUT4 translocation, identified by a pH-sensitive fluorescent IRAP-mOrange2 probe)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news reporting originating from Chengdu, People's Republic of China, by NewsRx correspondents, research stated, "Insulin-stimulated GLUT4 translocation from GLUT4 storage vesicles (GSVs) to the plasma membrane (PM) constitutes a key process for blood glucose control. Therefore, compounds that could promote GLUT4 translocation into the PM represent potential drugs for the treatment of diabetes."

Financial supporters for this research include National Natural Science Foundation of China, Chinese Academy of Sciences, National Key Laboratory of Biomacromolecules. Our news editors obtained a quote from the research from Sichuan Normal University, "In this research, we screened for agonists that induce GLUT4 translocation by using a novel pH-sensitive fluorescent probe, insulin-regulated aminopeptidase (IRAP)-mOrange2. We identified as well as validated one agonist, staurosporine, from a 64,000 compound library. Staurosporine promotes GSVs translocation into the PM and increases glucose uptake through the AMP-activated protein kinase (AMPK) pathway, serving as an effective insulin additive analogue in L6 cells."

According to the news editors, the research concluded: "Our work highlights the convenience and efficiency of this novel pH-sensitive fluorescent probe and reveals the new biological activity of staurosporine as an agonist for GLUT4 translocation and as an effective insulin additive analogue."

For more information on this research see: Staurosporine as an agonist for induction of GLUT4 translocation, identified by a pH-sensitive fluorescent IRAP-mOrange2 probe. Drugs and Therapies - Antibiotics

Reports on Antibiotics from University of Toyama Provide New Insights (Antibiotic Therapy Increases the Risk of Preterm Birth in Preterm Labor without Intra-Amniotic Microbes, but may Prolong the Gestation Period in Preterm Labor with Microbes, ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antibiotics.

According to news reporting originating from Toyama, Japan, by NewsRx correspondents, research stated, "To examine the efficacy of the use of antibiotics in preterm labor (PTL) with intact membranes, after evaluating intra-amniotic microbes by our rapid and bacteria-free polymerase chain reaction (PCR) system. One hundred and four PTL patients before 32 weeks of gestation were recruited."

Our news editors obtained a quote from the research from the University of Toyama, "Until 2012, antibiotics were empirically prescribed based on the clinical severity of PTL. Intra-amniotic microbes in stored samples were evaluated later by our newly established PCR system, and the efficacy of the use of antibiotics in PTL was evaluated. In the amniotic fluid (AF) microbe-negative patients (n=67), antibiotic therapy significantly shortened the gestation period (p <0.0001), whereas in the microbe-positive patients (n=37), appropriate antibiotic therapy (proper antibiotic selection against identified AF microbes) was significantly associated with an increase in gestation period (p <0.0001)."

According to the news editors, the research concluded: "Appropriate antibiotic therapy in PTL with intact membranes prolonged the gestation period."

The news editors report that additional information may be obtained by contacting S. Yoneda, Dept. of Obstetrics and Gynecology, University of Toyama, Toyama, Japan. Additional authors for this research include A. Shiozaki, N. Yoneda, M. Ito, T. Shima, K. Fukuda, T. Ueno, H. Niimi, I. Kitajima, M. Kigawa and S. Saito.

Reports on Antigens from Johns Hopkins University Provide New Insights (Systematic autoantigen analysis identifies a distinct subtype of scleroderma with coincident cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Antigens have been published. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "Scleroderma is a chronic autoimmune rheumatic disease associated with widespread tissue fibrosis and vasculopathy. Approximately two-thirds of all patients with scleroderma present with three dominant autoantibody subsets."

Financial support for this research came from HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID).

The news reporters obtained a quote from the research from Johns Hopkins University, "Here, we used a pair of complementary high-throughput methods for antibody epitope discovery to examine patients with scleroderma with or without known autoantibody specificities. We identified a specificity for the minor spliceosome complex containing RNA Binding Region (RNP1, RNA recognition motif) Containing 3 (RNPC3) that is found in patients with scleroderma without known specificities and is absent in unrelated autoimmune diseases. We found strong evidence for both intra- and intermolecular epitope spreading in patients with RNA polymerase III (POLR3) and the minor spliceosome specificities."

According to the news reporters, the research concluded: "Our results demonstrate the utility of these technologies in rapidly identifying antibodies that can serve as biomarkers of disease subsets in the evolving precision medicine era."

Our news correspondents report that additional information may be obtained by contacting L. Casciola-Rosen, Johns Hopkins University, Sch Med, Div Rheumatol, Baltimore, MD 21224, United States. Additional authors for this research include A.A. Shah, M.Z. Li, Q.K. Xu, A. Rosen, L. Casciola-Rosen and S.J. Elledge.

Reports on Antineoplastics from Central Hospital Provide New Insights (A Simple High-Performance Liquid Chromatography for Determining Lapatinib and Erlotinib in Human Plasma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antineoplastics. According to news originating from Ibaraki, Japan, by NewsRx correspondents, research stated, "Lapatinib and erlotinib are used for cancer treatment, showing large interindividual variability. Therapeutic drug monitoring may be useful for assessing the clinical outcomes and adverse events."

Our news journalists obtained a quote from the research from Central Hospital, "A simple high-performance liquid chromatography UV method was developed for the determination of lapatinib and erlotinib in human plasma. An aliquot of plasma sample spiked with internal standard was treated with acetonitrile to precipitate the proteins. Lapatinib and erlotinib were separated on an octadecylsilyl silica gel column using a mobile phase consisting of acetonitrile, methanol, water, and trifluoroacetic acid (26:26:48:0.1) pumped at a flow rate of 1.0 mL/min. The detection wavelength was set at 316 nm. The calibration curves for lapatinib and erlotinib were linear (r = 0.9999) in the range of 0.125-8.00 mcg/mL. The extraction recoveries for both lapatinib and erlotinib at the plasma concentration of 0.125-8.00 mcg/mL were higher than 89.9% with coefficients of variation less than 3.5%. The coefficients of variation for intraday and interday assays of lapatinib and erlotinib were less than 5.1% and 6.1%, respectively."

According to the news editors, the research concluded: "The present method can be used for blood concentration monitoring for lapatinib or erlotinib in exactly the same conditions."

For more information on this research see: A Simple High-Performance Liquid Chromatography for Determining Lapatinib and Erlotinib in Human Plasma. Therapeutic Drug Monitoring, 2016;38(6):657-662. Therapeutic Drug Monitoring can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Antioxidants

Reports on Antioxidants Findings from Daegu Haany University Provide New Insights (Isoliquiritigenin in licorice functions as a hepatic protectant by induction of antioxidant genes through extracellular signal-regulated kinase-mediated ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Antioxidants have been published. According to news originating from Gyongsan, South Korea, by NewsRx correspondents, research stated, "Liver is the major site of biotransformation for exogenous toxins, in having a defense system against oxidative stress as well as cytochrome P450 system. Isoliquiritigenin (isoLQ) is an active component present in Glycyrrhizae radix and has been shown to have various biological activities."

Financial support for this research came from The NRF grant funded by the Korea government [MSIP].

Our news journalists obtained a quote from the research from Daegu Haany University, "This study investigated the effect of isoLQ as a liver protectant against oxidative stress, both in vivo and in vitro, and also its molecular mechanisms. We used tert-butylhydroperoxide-induced hepatocyte damage model and cadmium (Cd)-stimulated liver toxicity animal model, which are assessed by immunoblot and flow cytometry as well as plasma and histopathological parameters. In HepG2 cells, pretreatment of 10 and 30 A mu M isoLQ significantly inhibited the induction of apoptosis and mitochondrial damage, and production of reactive oxygen species. Moreover, isoLQ induced the activation of nuclear factor erythroid 2-related factor-2 (Nrf2), as indicated by an increase in its nuclear translocation and antioxidant response element-luciferase activity. IsoLQ also induced the expression of Nrf2 target phase II enzymes, such as heme oxygenase-1, glutamate-cysteine ligase catalytic subunit and NAD(P) H:quinone oxidoreductase 1. IsoLQ also induced phosphorylation of extracellular stimulus-regulated kinase (ERK), and its activation of Nrf2 was mediated with ERK-dependent phosphorylation of Nrf2, as determined by its chemical inhibitor. In rats, oral treatment of 5 and 20 mg/kg isoLQ prevented Cd-induced acute hepatic damage, as assessed by plasma parameters and semiquantitative histology, such as the modified HAI grading scores and the degenerative regions in hepatic parenchyma."

According to the news editors, the research concluded: "These findings are considered as scientific evidence that isoLQ in licorice has the function of being a hepatic protectant against oxidative damages through ERK-mediated Nrf2 activation."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s00394-015-1051-6. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antiretrovirals

Reports on Antiretrovirals from Purdue University Provide New Insights (Nanoscale Infrared, Thermal, and Mechanical Characterization of Telaprevir-Polymer Miscibility in Amorphous Solid Dispersions Prepared by Solvent Evaporation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiretrovirals have been published. According to news reporting originating from West Lafayette, Indiana, by NewsRx correspondents, research stated, "Miscibility is of great interest for pharmaceutical systems, in particular, for amorphous solid dispersions, as phase separation can lead to a higher tendency to crystallize, resulting in a loss in solubility, decreased dissolution rate, and compromised bioavailability. The purpose of this study was to investigate the miscibility behavior of a model poorly water-soluble drug, telaprevir (TPV), with three different polymers using atomic force microscopy-based infrared, thermal, and mechanical analysis."

Funders for this research include Division of Industrial Innovation and Partnerships, U.S. Food and Drug Administration, National Institute of General Medical Sciences.

Our news editors obtained a quote from the research from Purdue University, "Standard atomic force microscopy (AFM) imaging together with nanoscale infrared spectroscopy (AFM-IR), nanoscale thermal analysis (nanoTA), and Lorentz contact resonance (LCR) measurements were used to evaluate the miscibility behavior of TPV with three polymers, hydroxypropyl methylcellulose (HPMC), HPMC acetate succinate (HPMCAS), and poly(vinylpyrrolidone-co-vinyl acetate) (PVPVA), at different drug to polymer ratios. Phase separation was observed with HPMC and PVPVA at drug loadings above 10%. For HPMCAS, a smaller miscibility gap was observed, with phase separation being observed at drug loadings higher than &sim;30-40%. The domain size of phase-separated regions varied from below 50 nm to a few hundred nanometers. Localized infrared spectra, nano-TA measurements, images from AFM-based IR, and LCR measurements showed clear contrast between the continuous and discrete domains for these phase-separated systems, whereby the discrete domains were drug-rich. Fluorescence microscopy provided additional evidence for phase separation. These methods appear to be promising to evaluate miscibility in drug-polymer systems with similar Tgs and submicron domain sizes."

According to the news editors, the research concluded: "Furthermore, such findings are of obvious importance in the context of contributing to a mechanistic understanding of amorphous solid dispersion phase behavior."

For more information on this research see: Nanoscale Infrared, Thermal, and Mechanical Characterization of Telaprevir-Polymer Miscibility in Amorphous Solid Dispersions Prepared by Solvent Evaporation. Molecular Pharmaceutics, 2016;13(3):1123-36. (American

Reports on Apoptosis Findings from Sabanci University Provide New Insights (AMP-Activated Protein Kinase Couples 3-Bromopyruvate-Induced Energy Depletion to Apoptosis via Activation of FoxO3a and Upregulation of Proapoptotic Bcl-2 Proteins)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Apoptosis is now available. According to news originating from Istanbul, Turkey, by NewsRx correspondents, research stated, "Most tumors primarily rely on glycolysis rather than mitochondrial respiration for ATP production. This phenomenon, also known as Warburg effect, renders tumors more sensitive to glycolytic disturbances compared to normal cells. 3-bromopyruvate is a potent inhibitor of glycolysis that shows promise as an anticancer drug candidate."

Our news journalists obtained a quote from the research from Sabanci University, "Although investigations revealed that 3-BP triggers apoptosis through ATP depletion and subsequent AMPK activation, the underlying molecular mechanisms coupling AMPK to apoptosis are poorly understood. We showed that 3-BP leads to a rapid ATP depletion which was followed by growth inhibition and Bax-dependent apoptosis in HCT116 cells. Apoptosis was accompanied with activation of caspase-9 and -3 while pretreatment with a general caspase inhibitor attenuated cell death. AMPK, p38, JNK, and Akt were phosphorylated immediately upon treatment. Pharmacological inhibition and silencing of AMPK largely inhibited 3-BP-induced apoptosis and reversed phosphorylation of JNK. Transcriptional activity of FoxO3a was dramatically increased subsequent to AMPK-mediated phosphorylation of FoxO3a at Ser413. Cell death analysis of cells transiently transfected with wt or AMPK-phosphorylation-deficient FoxO3 expression plasmids verified the contributory role of AMPK-FoxO3a axis in 3-BP-induced apoptosis. In addition, expression of proapoptotic Bcl-2 proteins Bim and Bax were upregulated in an AMPK-dependent manner. Bim was transcriptionally activated in association with FoxO3a activity, while Bax upregulation was abolished in p53-null cells."

According to the news editors, the research concluded: "Together, these data suggest that AMPK couples 3-BP-induced metabolic disruption to intrinsic apoptosis via modulation of FoxO3a-Bim axis and Bax expression."

For more information on this research see: AMP-Activated Protein Kinase Couples

The news correspondents report that additional information may be obtained from C. Bodur, Sabanci Univ, Mol Biol Genet & Bioengn Program, Istanbul 34956, Turkey. Additional authors for this research include B. Karakas, A.C. Timucin, T. Tezil and H. Basaga.

Keywords for this news article include: Istanbul, Turkey, Eurasia, Intracellular Signaling Peptides and Proteins, AMP-Activated Protein Kinases, Enzymes and Coenzymes, Apoptosis, Caspase, Sabanci University.

**Lung Diseases and Conditions - Asthma**

**Reports on Asthma from University of California Provide New Insights (GSDMB induces an asthma phenotype characterized by increased airway responsiveness and remodeling without lung inflammation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Asthma have been published. According to news originating from La Jolla, California, by NewsRx correspondents, research stated, "Gasdermin B (GSDMB) on chromosome 17q21 demonstrates a strong genetic linkage to asthma, but its function in asthma is unknown. Here we identified that GSDMB is highly expressed in lung bronchial epithelium in human asthma."

Our news journalists obtained a quote from the research from the University of California, "Overexpression of GSDMB in primary human bronchial epithelium increased expression of genes important to both airway remodeling [TGF-beta 1, 5-lipoxygenase (5-LO)] and airway-hyperresponsiveness (AHR) (5-LO). Interestingly, hGSDMB(Zp3-Cre) mice expressing increased levels of the human GSDMB transgene showed a significant spontaneous increase in AHR and a significant spontaneous increase in airway remodeling, with increased smooth muscle mass and increased fibrosis in the absence of airway inflammation. In addition, hGSDMB(Zp3-Cre) mice showed increases in the same remodeling and AHR mediators (TGF-beta 1, 5-LO) observed in vitro in GSDMB-overexpressing epithelial cells. GSDMB induces TGF-beta 1 expression via induction of 5-LO, because knockdown of 5-LO in epithelial cells over-expressing GSDMB inhibited TGF-beta 1 expression."

According to the news editors, the research concluded: "These studies demonstrate that GSDMB, a gene highly linked to asthma but whose function in asthma is previously unknown, regulates AHR and airway remodeling without airway inflammation through a previously unrecognized pathway in which GSDMB induces 5-LO to induce TGF-beta 1 in bronchial epithelium."

For more information on this research see: GSDMB induces an asthma phenotype characterized by increased airway responsiveness and remodeling without lung inflammation. *Proceedings of the National Academy of Sciences of the United States of America*, 2016;113 (46):13132-13137. *Proceedings of the National Academy of Sciences of the United States of America* can be contacted at: Natl Acad Sciences, 2101 Constitution Ave NW, Washington, DC

Cardiovascular Diseases and Conditions -

Reports on Atherosclerosis Findings from Southern Medical University Provide New Insights (Identification of novel genes and pathways in carotid atheroma using integrated bioinformatic methods)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Atherosclerosis are discussed in a new report. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Atherosclerosis is the primary cause of cardiovascular events and its molecular mechanism urgently needs to be clarified. In our study, atheromatous plaques (ATH) and macroscopically intact tissue (MIT) sampled from 32 patients were compared and an integrated series of bioinformatic microarray analyses were used to identify altered genes and pathways."

Our news journalists obtained a quote from the research from Southern Medical University, "Our work showed 816 genes were differentially expressed between ATH and MIT, including 443 that were up-regulated and 373 that were down-regulated in ATH tissues. GO functional-enrichment analysis for differentially expressed genes (DEGs) indicated that genes related to the 'immune response' and 'muscle contraction' were altered in ATHs. KEGG pathway-enrichment analysis showed that up-regulated DEGs were significantly enriched in the 'FceRI-mediated signaling pathway', while down-regulated genes were significantly enriched in the 'transforming growth factor-b signaling pathway'. Protein-protein interaction network and module analysis demonstrated that VAV1, SYK, LYN and PTPN6 may play critical roles in the network. Additionally, similar observations were seen in a validation study where SYK, LYN and PTPN6 were markedly elevated in ATH."

According to the news editors, the research concluded: "All in all, identification of these genes and pathways not only provides new insights into the pathogenesis of atherosclerosis, but may also aid in the development of prognostic and therapeutic biomarkers for advanced atheroma."

Cardiovascular Diseases and Conditions -

Reports on Atherosclerosis Findings from University of Washington Provide New Insights (Cutting Edge: BAFF Overexpression Reduces Atherosclerosis via TACI-Dependent B Cell Activation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news reporting out of Seattle, Washington, by NewsRx editors, research stated, "Patients with systemic lupus erythematosus exhibit accelerated atherosclerosis, a chronic inflammatory disease of the arterial wall. The impact of B cells in atherosclerosis is controversial, with both protective and pathogenic roles described."

Our news journalists obtained a quote from the research from the University of Washington, "For example, natural IgM binding conserved oxidized lipid epitopes protect against atherosclerosis, whereas anti-oxidized lowdensity lipoprotein ( oxLDL) IgG likely promotes disease. Because BAFF promotes B cell class-switch recombination and humoral autoimmunity, we hypothesized that excess BAFF would accelerate atherosclerosis. In contrast, BAFF overexpression markedly reduced hypercholesterolemia and atherosclerosis in hyperlipidemic mice. BAFF-mediated atheroprotection required B cells and was associated with increased protective anti-oxLDL IgM. Surprisingly, high-titer anti-oxLDL IgM production and reduced atherosclerosis was dependent on the BAFF family receptor transmembrane activator and CAML interactor."

According to the news editors, the research concluded: "In summary, we identified a novel role for B cell-specific, BAFF-dependent transmembrane activator and CAML interactor signals in atherosclerosis pathogenesis, of particular relevance to the use of BAFF-targeted therapies in systemic lupus erythematosus."

For more information on this research see: Cutting Edge: BAFF Overexpression Reduces Atherosclerosis via TACI-Dependent B Cell Activation. Journal of Immunology, 2016;197(12):4529-4534. Journal of Immunology can be contacted at: Amer Assoc

Heart Disorders and Diseases - Atrial Fibrillation

Reports on Atrial Fibrillation from Tokyo Medical and Dental University Provide New Insights (The impact of B-type natriuretic peptide levels on the suppression of accompanying atrial fibrillation in Wolff-Parkinson-White syndrome patients ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Atrial Fibrillation have been published. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Atrial fibrillation (AF) often coexists with Wolff-Parkinson-White (WPW) syndrome. We compared the efficacy of Kent bundle ablation alone and additional AF ablation on accompanying AF, and examined which patients would still have a risk of AF after successful Kent bundle ablation."

Our news journalists obtained a quote from the research from Tokyo Medical and Dental University, "This retrospective multicenter study included 96 patients (56 15 years, 72 male) with WPW syndrome and AF undergoing Kent bundle ablation. Some patients underwent simultaneous pulmonary vein isolation (PVI) for AF. The incidence of post-procedural AF was examined. Sixty-four patients underwent only Kent bundle ablation (Kent-only group) and 32 also underwent PVI (+PVI group). There was no significant difference in the basic patient characteristics between the groups. Additional PVI did not improve the freedom from residual AF compared to Kent bundle ablation alone (p = 0.53). In the Kent-only group, AF episodes remained in 25.0% during the follow-up (709 days). A univariate analysis showed that age >= 60 years, left atrial dimension >= 38 mm, B-type natriuretic peptide (BNP) >= 40 pg/ml, and concomitant hypertension were predictive factors for residual AF. However, in the multivariate analysis, only BNP >= 40 pg/ml remained as an independent predictive factor (HR = 17.1 and CI: 2.3-128.2; p = 0.006). Among patients with WPW syndrome and AF, Kent bundle ablation alone may have a sufficient clinical impact of preventing recurrence of AF in select patients."

According to the news editors, the research concluded: "Screening the BNP level would help decide the strategy to manage those patients."

For more information on this research see: The impact of B-type natriuretic peptide levels on the suppression of accompanying atrial fibrillation in Wolff-Parkinson-White

**Urogenital Diseases and Conditions - Azoospermia**

**Reports on Azoospermia Findings from Al-Azhar University Provide New Insights (Oestrogen receptors beta genotype in infertile Egyptian men with nonobstructive azoospermia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Urogenital Diseases and Conditions - Azoospermia have been published. According to news reporting originating in Assiut, Egypt, by NewsRx journalists, research stated, "In a prospective study, the polymorphism of oestrogen receptor beta gene was investigated in nonobstructive azoospermia patients. Ninety infertile patients with nonobstructive azoospermia diagnosed after two semen analysis, 2 weeks apart and negative testicular sperm extraction during intracytoplasmic sperm injection, and 60 fertile men as controls were enrolled in the study."

The news reporters obtained a quote from the research from Al-Azhar University, "Semen analysis, hormonal profile and allele-specific PCR reaction were performed to detect variants of the RsaI polymorphism of the oestrogen receptor beta gene for all patients and controls. The mean patient's age was significantly lower than the mean age of the controls (P < 0.05). There was a significant increase in the mean serum levels of FSH, LH, free testosterone and E2 and significant decrease in total testosterone in patients than controls (P < 0.05). In the patients, the frequency of the homozygous GG, heterozygous AG and homozygous AA genotype was 83.3%, 14.3% and 3.3% respectively, whereas their frequencies in the controls were 95%, 5% and 0% respectively (odds ratio 3.8). There is no significant correlation between ER beta polymorphisms and patient's age or pituitar y and sex hormones (P > 0.05)."

According to the news reporters, the research concluded: "Our findings suggested that in Egyptian population, genetic mutation in ER beta is associated with the risk of nonobstructive azoospermia."

For more information on this research see: Oestrogen receptors beta genotype in infertile Egyptian men with nonobstructive azoospermia. *Andrologia*, 2016;48(10):1289-1293.
