enhances adult DIO ARC signaling via an IL-6-dependent mechanism, we assessed ARC-PVN pathway competency in IL-6 knockout mice and found that the AgRP, but not the alpha-MSH, ARC-PVN pathway was reduced. These results suggest that both leptin and amylin are important neurotrophic factors for the postnatal development of the ARC-PVN pathway. Amylin might act as a direct neurotrophic factor in DIO rats to enhance both the number of POMC neurons and their alpha-MSH ARC-PVN pathway development."

According to the news editors, the research concluded: "This suggests important and selective roles for amylin during ARC hypothalamic development."

Our news journalists report that additional information may be obtained by contacting B.E. Levin, Rutgers New Jersey Med Sch, Dept. of Neurol, Newark, NJ, United States. Additional authors for this research include S.G. Bouret, A.A. Dunn-Meynell, C.N. Boyle, T.A. Lutz and B.E. Levin.

Investigators from University of North Carolina Zero in on Obesity (Child and youth participatory interventions for addressing lifestyle-related childhood obesity: a systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Obesity is now available. According to news originating from Chapel Hill, North Carolina, by NewsRx correspondents, research stated, "A growing number of childhood obesity interventions involve children and youth in participatory roles, but these types of interventions have not been systematically reviewed. We aimed to identify child and youth participatory interventions in the peer-reviewed literature in order to characterize the approaches and examine their impact on obesity and obesity-related lifestyle behaviours."

Our news journalists obtained a quote from the research from the University of North Carolina, "We searched PubMed/Medline, psychINFO and ERIC for quasi-experimental and randomized trials conducted from date of database initiation through May 2015 that engaged
children or youth in implementing healthy eating, physical activity or weight management strategies. Eighteen studies met our eligibility criteria. Most (n = 14) trained youth to implement pre-defined strategies targeting their peers. A few (n = 4) assisted youth to plan and implement interventions that addressed environmental changes. Thirteen studies reported at least one statistically significant weight, physical activity or dietary change outcome. Participatory approaches have potential, but variation in strategies and outcomes leave questions unanswered about the mechanisms through which child and youth engagement impact childhood obesity. Future research should compare child-delivered or youth-delivered to adult-delivered health promotion interventions and more rigorously evaluate natural experiments that engage youth to implement environmental changes."

According to the news editors, the research concluded: "With careful attention to theoretical frameworks, process and outcome measures, these studies could strengthen the effectiveness of child and youth participatory approaches."

The news correspondents report that additional information may be obtained from L. Frerichs, University of North Carolina, Center Hlth Equ Res, Chapel Hill, NC 27599, United States. Additional authors for this research include O. Ataga, G. Corbie-Smith and S.T. Lindau.

Keywords for this news article include: Chapel Hill, North Carolina, United States, North and Central America, Nutritional and Metabolic Diseases and Conditions, Nutrition Disorders, Diet and Nutrition, Overnutrition, Bariatrics, Obesity, University of North Carolina.

Nutritional and Metabolic Diseases and Conditions - …

Investigators from University of Queensland Release New Data on Obesity (The fractions of cancer attributable to modifiable factors: A global review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news reporting out of Herston, Australia, by NewsRx editors, research stated, "Worldwide, the burden of cancer is rising, stimulating efforts to develop strategies to control these diseases. Primary prevention, a key control strategy, aims to reduce cancer incidence through programs directed towards reducing population exposure to known causal factors."

Financial support for this research came from Cancer Council Australia.

Our news journalists obtained a quote from the research from the University of Queensland, "Before enacting such strategies, it is necessary to estimate the likely effect on cancer incidence if exposures to known causal factors were reduced or eliminated. The population attributable fraction (PAF) is the epidemiological measure which quantifies this potential reduction in incidence. We surveyed the literature to document and summarise the
proportions of cancers across the globe attributable to modifiable causes, specifically tobacco smoke, alcohol, overweight/obesity, insufficient physical activity, solar ultraviolet (UV) radiation and dietary factors (insufficient fruit, non-starchy vegetables and fibre; red/processed meat; salt). In total, we identified 55 articles that presented PAF estimates for one or more causes. Information coverage was not uniform, with many articles reporting cancer PAFs due to overweight/obesity, alcohol and tobacco, but fewer reporting PAFs for dietary factors or solar UV radiation. At all cancer sites attributable to tobacco and alcohol, median PAFs were markedly lower for women than men. Smoking contributed to very high median PAFs (>50%) for cancers of the lung and larynx. Median PAFs for men, attributable to alcohol, were high (25-50%) for cancers of the oesophagus, oral cavity/pharynx, larynx and liver. For cancers causally associated with overweight/obesity, high median PAFs were reported for oesophageal adenocarcinoma (men 29%, women 37%), gallbladder (men 11%, women 42%) and endometrium (36%). The cancer PAF literature is growing rapidly."

According to the news editors, the research concluded: "Repeating this survey in the future should lead to more precise estimates of the potentially preventable fractions of cancer."

For more information on this research see: The fractions of cancer attributable to modifiable factors: A global review. *Cancer Epidemiology*, 2016;44():203-221. *Cancer Epidemiology* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. **Johns Hopkins University Details Findings in Obesity (Microvascular Endothelial Dysfunction in Sedentary, Obese Humans Is Mediated by NADPH Oxidase Influence of Exercise Training)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Obesity are discussed in a new report. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "The objectives of this study were to determine the impact of in vivo reactive oxygen species (ROS) on microvascular endothelial function in obese human subjects and the efficacy of an aerobic exercise intervention on alleviating obesity-associated dysfunctionality. Approach and Results-Young, sedentary men and women were divided into lean (body mass index 18-25; n=14), intermediate (body mass index 28-32.5; n=
13), and obese (body mass index 33-40; n=15) groups."

The news correspondents obtained a quote from the research from Johns Hopkins University, "A novel microdialysis technique was utilized to detect elevated interstitial hydrogen peroxide (H2O2) and superoxide levels in the vastus lateralis of obese compared with both lean and intermediate subjects. Nutritive blood flow was monitored in the vastus lateralis via the microdialysis-ethanol technique. A decrement in acetylcholine-stimulated blood flow revealed impaired microvascular endothelial function in the obese subjects. Perfusion of apocynin, an NADPH oxidase inhibitor, lowered (normalized) H2O2 and superoxide levels, and reversed microvascular endothelial dysfunction in obese subjects. After 8 weeks of exercise, H2O2 levels were decreased in the obese subjects and microvascular endothelial function in these subjects was restored to levels similar to lean subjects. Skeletal muscle protein expression of the NADPH oxidase subunits p22(phox), p47(phox), and p67(phox) was increased in obese relative to lean subjects, where p22(phox) and p67(phox) expression was attenuated by exercise training in obese subjects. This study implicates NADPH oxidase as a source of excessive ROS production in skeletal muscle of obese individuals and links excessive NADPH oxidase-derived ROS to microvascular endothelial dysfunction in obesity."

According to the news reporters, the research concluded: "Furthermore, aerobic exercise training proved to be an effective strategy for alleviating these maladies."

For more information on this research see: Microvascular Endothelial Dysfunction in Sedentary, Obese Humans Is Mediated by NADPH Oxidase Influence of Exercise Training. *Arteriosclerosis Thrombosis and Vascular Biology*, 2016;36(12):2412-2420. *Arteriosclerosis Thrombosis and Vascular Biology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

Our news journalists report that additional information may be obtained by contacting J.D. La Favor, Johns Hopkins Sch Med, James Buchanan Brady Urol Inst, Dept. of Urol, Baltimore, MD, United States. Additional authors for this research include G.S. Dubis, H.M. Yan, J.D. White, M.A.M. Nelson, E.J. Anderson and R.C. Hickner.

**Nutritional and Metabolic Diseases and Conditions**

**New Findings Reported from University College Describe Advances in Obesity (Perceived Weight Discrimination and Chronic Biochemical Stress: A Population-Based Study Using Cortisol in Scalp Hair)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Obesity is the subject of a report. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "There is increasing evidence for weight-based discrimination against persons with obesity. This study aimed to examine the physiological impact of perceived weight discrimination on cortisol in hair, an indicator of chronic stress exposure."
Our news journalists obtained a quote from the research from University College, "Data were from 563 nonsmoking individuals with obesity (body mass index, BMI >= 30 kg/m^2) participating in the English Longitudinal Study of Ageing. Experiences of discrimination were reported via questionnaire, and hair cortisol concentrations were determined from the scalp-nearest 2-cm hair segment. Height and weight were objectively measured. ANCOVAs tested associations between perceived weight discrimination and hair cortisol concentration overall and by degree of obesity. All analyses were adjusted for age, sex, ethnicity, socioeconomic status, and BMI. Mean hair cortisol concentrations were 33% higher in those who had experienced weight discrimination than those who had not (mean log pg/mg 1.241 vs. 0.933, F = 12.01, P = 0.001). The association between weight discrimination and hair cortisol was particularly pronounced in individuals with severe (class II/III) obesity (1.402 vs. 0.972, F = 11.58, P = 0.001). Weight discrimination is associated with the experience of stress at a biological level."

According to the news editors, the research concluded: "Chronic exposure to elevated levels of cortisol may play a role in generating a vicious circle of weight gain and discrimination and contribute to obesity-associated health conditions."

The news correspondents report that additional information may be obtained from S.E. Jackson, UCL, Dept. of Epidemiol & Public Hlth, London, United Kingdom. Additional authors for this research include C. Kirschbaum and A. Steptoe.

Keywords for this news article include: London, United Kingdom, Europe, Nutritional and Metabolic Diseases and Conditions, Nutrition Disorders, Diet and Nutrition, Overnutrition, Biochemicals, Biochemistry, Bariatrics, Chemicals, Obesity, University College.

**New Findings from Bioprocessing Technology Institute Describe Advances in Obesity (Loss of Fas apoptosis inhibitory molecule leads to spontaneous obesity and hepatosteatosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting from Singapore, Singapore, by NewsRx journalists, research stated, "Altered hepatic lipogenesis is associated with metabolic diseases such as obesity and hepatosteatosis. Insulin resistance and compensatory hyperinsulinaemia are key drivers of these metabolic imbalances."

The news correspondents obtained a quote from the research from Bioprocessing Technology Institute, "Fas apoptosis inhibitory molecule (FAIM), a ubiquitously expressed antiapoptotic protein, functions as a mediator of Akt signalling. Since Akt acts at a nodal point in insulin signalling, we hypothesize that Faim may be involved in energy metabolism. In the current
study, C57BL/6 wild-type (WT) and FAIM-knockout (FAIM-KO) male mice were fed with normal chow diet and body weight changes were monitored. Energy expenditure, substrate utilization and physical activities were analysed using a metabolic cage. Liver, pancreas and adipose tissue were subjected to histological examination. Serum glucose and insulin levels and lipid profiles were determined by biochemical assays. Changes in components of the insulin signalling pathway in FAIM-KO mice were examined by immunoblots. We found that FAIM-KO mice developed spontaneous non-hyperphagic obesity accompanied by hepatosteatosis, adipocyte hypertrophy, dyslipidaemia, hyperglycaemia and hyperinsulinaemia. In FAIM-KO liver, lipogenesis was elevated as indicated by increased fatty acid synthesis and SREBP-1 and SREBP-2 activation. Notably, protein expression of insulin receptor beta was markedly reduced in insulin target organs of FAIM-KO mice. Akt phosphorylation was also lower in FAIM-KO liver and adipose tissue as compared with WT controls. In addition, phosphorylation of insulin receptor substrate-1 and Akt2 in response to insulin treatment in isolated FAIM-KO hepatocytes was also markedly attenuated. Altogether, our data indicate that Fis a novel regulator of insulin signalling and plays an essential role in energy homoeostasis."

According to the news reporters, the research concluded: "These findings may shed light on the pathogenesis of obesity and hepatosteatosis."

For more information on this research see: Loss of Fas apoptosis inhibitory molecule leads to spontaneous obesity and hepatosteatosis. Cell Death & Disease, 2016;7():e2091. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

Nutritional and Metabolic Diseases and Conditions -...

New Findings from Boston University Update Understanding of Obesity (WNT5A-JNK regulation of vascular insulin resistance in human obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Obesity is associated with the development of vascular insulin resistance; however, pathophysiological mechanisms are poorly understood. We sought to investigate the role of WNT5A-JNK in the regulation of insulin-mediated vasodilator responses in human adipose tissue arterioles prone to endothelial dysfunction."
The news reporters obtained a quote from the research from Boston University, "In 43 severely obese (BMI 44 +/- 11 kg/m(2)) and five metabolically normal non-obese (BMI 26 +/- 2 kg/m(2)) subjects, we isolated arterioles from subcutaneous and visceral fat during planned surgeries. Using videomicroscopy, we examined insulin-mediated, endothelium-dependent vasodilator responses and characterized adipose tissue gene and protein expression using real-time polymerase chain reaction and Western blot analyses. Immunofluorescence was used to quantify endothelial nitric oxide synthase (eNOS) phosphorylation. Insulin-mediated vasodilation was markedly impaired in visceral compared to subcutaneous vessels from obese subjects (p <0.001), but preserved in non-obese individuals. Visceral adiposity was associated with increased JNK activation and elevated expression of WNT5A and its non-canonical receptors, which correlated negatively with insulin signaling. Pharmacological JNK antagonism with SP600125 markedly improved insulin-mediated vasodilation by sixfold (p <0.001), while endothelial cells exposed to recombinant WNT5A developed insulin resistance and impaired eNOS phosphorylation (p <0.05). We observed profound vascular insulin resistance in the visceral adipose tissue arterioles of obese subjects that was associated with up-regulated WNT5A-JNK signaling and impaired endothelial eNOS activation."

According to the news reporters, the research concluded: "Pharmacological JNK antagonism markedly improved vascular endothelial function, and may represent a potential therapeutic target in obesity-related vascular disease."

For more information on this research see: WNT5A-JNK regulation of vascular insulin resistance in human obesity. Vascular Medicine, 2016;21(6):489-496. New Findings from Federal University in the Area of Obesity Described (Thyroid Function in Human Obesity: Underlying Mechanisms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Obesity are discussed in a new report. According to news reporting originating from Teresina,
Brazil, by NewsRx correspondents, research stated, "Obesity is associated with several metabolic and endocrine disorders; and changes in plasma concentrations, secretion patterns, and clearance of various hormones are observed in obese patients."

Our news editors obtained a quote from the research from Federal University, "In this context, recent research has shown that overweight can influence the function of the thyroid gland, usually leading to increased thyrotropin concentrations and changes in the ratio between the hormones triiodothyronine and thyroxine, though within the normal range. The etiology of these changes is still unclear; how-ever, several mechanisms have been proposed including the adaptive process to increase energy expenditure, hyperleptinemia, changes in the activity of deiodinases, the presence of thyroid hormones resistance, chronic low-grade inflammation, and insulin resistance."

According to the news editors, the research concluded: "Although the clinical implications have not been clarified, studies suggest that these changes in the thyroid function of obese individuals may contribute to the worsening of metabolic complications and the development of diseases in the thyroid gland."

For more information on this research see: Thyroid Function in Human Obesity: Underlying Mechanisms. *Hormone and Metabolic Research*, 2016;48(12):787-794. *Hormone and Metabolic Research* can be contacted at: Georg Thieme Verlag Kg, Ruderstr 14, D-70469 Stuttgart, Germany. (Thieme - www.thieme.com)

The news editors report that additional information may be obtained by contacting D.D.N. Marreiro, Univ Fed Piaui, Dept. of Nutr, Teresina, Piaui, Brazil. Additional authors for this research include M.M. Feitosa, J.S. Severo, T.E.C. Freitas, J.B.S. Morais, F.L. Torres-Leal, G.S. Henriques and D.D.N. Marreiro.

**Nutritional and Metabolic Diseases and Conditions -**

**New Findings from NHS Foundation Trust in the Area of Obesity Reported (Physical Activity to Reduce Systemic Inflammation Associated With Chronic Pain and Obesity: A Narrative Review)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting out of Leeds, United Kingdom, by NewsRx editors, research stated, "The increasing prevalence of chronic pain and obesity has significant health and cost implications for economies in the developed and developing world. Evidence suggests that there is a positive correlation between obesity and chronic pain and the link between them is thought to be systemic inflammation."

Our news journalists obtained a quote from the research from NHS Foundation Trust, "The aim of this narrative review was to explore the physiological links between chronic
musculoskeletal pain and obesity and to consider the potential role of regular physical activity in providing a means of managing obesity-related chronic pain. Systemic inflammation, mechanical overload, and autonomic dysfunction are associated with increased prevalence and severity of chronic pain in individuals with obesity. It has been proposed, therefore, that interventions that target systemic inflammation could help to reduce chronic pain in obese individuals. Reduction in abdominal fat has been shown to alleviate pain and reduce the systemic markers of inflammation that contribute to chronic pain. Interventions that include exercise prescription have been shown to reduce both abdominal fat and systemic inflammation. Furthermore, exercise is also known to reduce pain perception and improve mental health and quality of life that also improves pain outcomes."

According to the news editors, the research concluded: "However, adherence to formal exercise prescription is poor and therefore exercise programmes should be tailored to the interests, needs, and abilities of individuals to reduce attrition."

Our news journalists report that additional information may be obtained by contacting C.A. Paley, *Airedale NHS Foundation Trust, West Yorkshire †Faculty of Health and Social Sciences, Leeds Beckett University ‡Leeds Pallium Research Group, Leeds, UK. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1097/AJP.0000000000000258. ### Nutritional and Metabolic Diseases and Conditions –

### New Findings in Obesity Described from Nestle Research Center

**(Chrono-nutrition: a review of current evidence from observational studies on global trends in time-of-day of energy intake and its association with obesity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Obesity are discussed in a new report. According to news reporting from Lausanne, Switzerland, by NewsRx journalists, research stated, "The importance of the circadian rhythm in regulating human food intake behaviour and metabolism has long been recognised. However, little is known as to how energy intake is distributed over the day in existing populations, and its potential association with obesity."

The news correspondents obtained a quote from the research from Nestle Research Center, "The present review describes global trends in time-of-day of energy intake in the general population based on data from cross-sectional surveys and longitudinal cohorts. Evidence of the association between time-of-day of energy intake and obesity is also..."
summarised. Overall, there were a limited number of cross-sectional surveys and longitudinal cohorts that provided data on time-of-day of energy intake. In the identified studies, a wide variation in time-of-day of energy intake was observed, with patterns of energy distribution varying greatly by country and geographical area. In relation to obesity, eight cross-sectional surveys and two longitudinal cohorts were identified. The association between time-of-day of energy intake and obesity varied widely, with several studies reporting a positive link between evening energy intake and obesity."

According to the news reporters, the research concluded: "The current review summarises global trends in time-of-day of energy intake. The large variations across countries and global regions could have important implications to health, emphasising the need to understand the socio-environmental factors guiding such differences in eating patterns. Evidence of the association between time-of-day of energy intake and BMI also varied. Further larger scale collaborations between various countries and regions are needed to sum data from existing surveys and cohorts, and guide our understanding of the role of chrono-nutrition in health."

Our news journalists report that additional information may be obtained by contacting S. Almoosawi, Nestle Res Center, Dept. of Nutr & Hlth Res, CH-1000 Lausanne, Switzerland. Additional authors for this research include S. Vingeliene, L.G. Karagounis and G.K. Pot.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1017/S0029665116000306. This DOI is a link to an online electronic document that is either free or for purchase.

**Gram-Positive Bacteria - Clostridium difficile**

**New Findings on Clostridium difficile from Einstein Medical Center Summarized (Body mass index greater than 35 is associated with severe Clostridium difficile infection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Positive Bacteria - Clostridium difficile is now available. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Obesity has been implicated in the acquisition of Clostridium difficile infections (CDI), however, no study has investigated whether there is a correlation between body mass index (BMI) and CDI severity. To determine whether obesity, as measured by BMI
correlates with severe hospital-onset or community-onset CDI."

The news correspondents obtained a quote from the research from Einstein Medical Center, "Patients admitted with CDI at a tertiary-care center from January 2013 to June 2015 were identified. The cohort was stratified by onset of disease using the National Healthcare Safety Network criteria, and by severity using the 2013 American College of Gastroenterology guidelines. Multivariate logistic regression was used to determine independent predictors of severe CDI. A total of 196 met the inclusion criteria, of which 57.1% (112) met criteria for severe disease. Overall, BMI >35 kg/m² was 1.7-fold more likely to be associated with severe CDI compared to a BMI 20-35 kg/m² (P < 0.005), and was an independent predictor of severe CDI (P = 0.038). In patients with community-onset-CDI and hospital-onset-CDI, a BMI >35 kg/m² was associated with a 1.96-fold and 1.48 greater rate of severe CDI compared to a BMI 20-35 kg/m² (P = 0.004 and 0.048), and was an independent predictor of severe CDI in these cohorts (P = 0.039 and 0.027) respectively. This study has identified an association between body mass index and Clostridium difficile infection severity."

According to the news reporters, the research concluded: "A BMI >35 kg/m² is an independent risk factor for severe community-onset and hospital-onset Clostridium difficile infections."

For more information on this research see: Body mass index greater than 35 is associated with severe Clostridium difficile infection. Alimentary Pharmacology & Therapeutics, 2017;45(1):75-81. Alimentary Pharmacology & Therapeutics can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Mental Health Diseases and Conditions - Schizophrenia

New Findings on Schizophrenia from University of California Summarized (Weight change during long-term treatment with lurasidone: pooled analysis of studies in patients with schizophrenia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mental Health Diseases and Conditions - Schizophrenia have been published. According to news reporting from San Diego, California, by NewsRx journalists, research stated, "The objective of this analysis was to evaluate the effect
of 12 months of treatment with lurasidone on weight in patients with schizophrenia. Post-hoc, observed-case analysis included pooled data from six studies on 40-160 mg/day lurasidone; two studies included active comparators (2-6 mg/day risperidone or 200-800 mg/day quetiapine XR)."

The news correspondents obtained a quote from the research from the University of California, "Overall, 593 patients completed 12 months of treatment (N=471 lurasidone, N=89 risperidone, N=33 quetiapine XR). The mean baseline weight was 72.8, 80.8, and 72.4 kg in the lurasidone, risperidone, and quetiapine XR groups, respectively. The mean weight change at month 12 was -0.4 kg with lurasidone, +2.6 kg with risperidone, and +1.2 kg with quetiapine XR. Weight gain of at least 7% from study baseline was observed in 16.0, 25.8, and 15.2% of patients, and weight loss of at least 7% was seen in 18.5, 6.7, and 9.1% of patients treated with lurasidone, risperidone, and quetiapine XR, respectively. A shift from normal/underweight baseline BMI status to overweight/obese at month 12 occurred in 10.2, 27.6, and 15.0% of patients in the lurasidone, risperidone, and quetiapine XR groups, respectively. Conversely, 14.3, 1.7, and 7.7% of patients, respectively, shifted from overweight/obese to normal/underweight."

According to the news reporters, the research concluded: "In summary, a low potential for clinically significant weight gain was observed in patients with schizophrenia treated continuously with lurasidone for 12 months."

Our news journalists report that additional information may be obtained by contacting J.M. Meyer, aDept. of Psychiatry, University of California, San Diego, California bSunovion Pharmaceuticals Inc, Fort Lee, New Jersey, United States. Additional authors for this research include Y. Mao, A. Pikalov, J. Cucchiaro and A. Loebel.

Inflammation

New Inflammation Study Results Reported from University of Toronto
(Diet-induced cellular neuroinflammation in the hypothalamus: Mechanistic insights from investigation of neurons and microglia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Inflammation. According to news reporting from Toronto, Canada, by NewsRx journalists, research stated, "Diet-induced obesity can lead to detrimental chronic disorders. The severity of this global epidemic has encouraged ongoing research to characterize the mechanisms underlying obesity and its comorbidities."
Funders for this research include Natural Sciences and Engineering Research Council, Canadian Institutes for Health Research, Canada Foundation for Innovation and Canada Research Chairs Program.

The news correspondents obtained a quote from the research from the University of Toronto, "Recent evidence suggests that saturated fatty acids (SEA) in high-fat diets rapidly generate inflammation in the arcuate nucleus of the hypothalamus (ARC), which centrally regulates whole-body energy homeostasis. Herein, we will review the roles of hypothalamic neurons and resident microglia in the initiation of SFA-induced hypothalamic inflammation. Particularly, we focus on neuronal and microglial free fatty acid-sensing and capacity to produce inflammatory signaling. We also outline a potential role of peripherally-derived monocytes in this inflammation."

According to the news reporters, the research concluded: "And finally, we explore synaptic plasticity as a mechanism through which hypothalamic inflammation can modulate ARC circuitry, and thus disrupt energy homeostasis."

Our news journalists report that additional information may be obtained by contacting D.D. Belsham, University of Toronto, Dept. of Med, Toronto, ON, Canada. Additional authors for this research include E.K. Tse, M.H. Kim and D.D. Belsham.

New Obesity Findings Has Been Reported by Researchers at Garvan Institute of Medical Research (Skeletal muscle and plasma lipidomic signatures of insulin resistance and overweight/obesity in humans)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting from Sydney, Australia, by NewsRx journalists, research stated, "Alterations in lipids in muscle and plasma have been documented in insulin-resistant people with obesity. Whether these lipid alterations are a reflection of insulin resistance or obesity remains unclear."

The news correspondents obtained a quote from the research from the Garvan Institute of Medical Research, "Nondiabetic sedentary individuals not treated with lipid-lowering medications were studied (n=51). Subjects with body mass index (BMI) >25 kg/m(2) (n=28) were stratified based on median glucose infusion rate during a hyperinsulinemic-
euglycemic clamp into insulin-sensitive and insulin-resistant groups (above and below median, obesity/insulin-sensitive and obesity/insulin-resistant, respectively). Lean individuals (n=23) served as a reference group. Lipidomics was performed in muscle and plasma by liquid chromatography electrospray ionization-tandem mass spectrometry. Pathway analysis of gene array in muscle was performed in a subset (n=35). In muscle, insulin resistance was characterized by higher levels of C18:0 sphingolipids, while in plasma, higher levels of diacylglycerol and cholesterol ester, and lower levels of lysophosphatidylcholine and lysoalkylphosphatidylcholine, indicated insulin resistance, irrespective of overweight/obesity. The sphingolipid metabolism gene pathway was upregulated in muscle in insulin resistance independent of obesity. An overweight/obesity lipidomic signature was only apparent in plasma, predominated by higher triacylglycerol and lower plasmalogen species."

According to the news reporters, the research concluded: "Muscle C18:0 sphingolipids may play a role in insulin resistance independent of excess adiposity."

Our news journalists report that additional information may be obtained by contacting K.T. Tonks, Diabetes and Metabolism Division, Garvan Institute of Medical Research, Sydney, New South Wales, Australia. Additional authors for this research include A.C. Coster, M.J. Christopher, R. Chaudhuri, A. Xu, J. Gagnon-Bartsch, D.J. Chisholm, D.E. James, P.J. Meikle, J.R. Greenfield and D. Samocha-Bonet.

**New Obesity Findings from Hiroshima University Described (Serum Amyloid A3 Gene Expression in Adipocytes is an Indicator of the Interaction with Macrophages)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating from Higashi Hiroshima, Japan, by NewsRx correspondents, research stated, "The infiltration of macrophages into adipose tissue and their interaction with adipocytes are essential for the chronic low-grade inflammation of obese adipose tissue. In this study, we identified the serum amyloid A3 (Saa3) gene as a key adipocyte-derived factor that is affected by interaction with macrophages."

Our news editors obtained a quote from the research from Hiroshima University, "We showed that the Saa3 promoter in adipocytes actually responds to activated macrophages in a co-culture system. Decreasing C/EBP beta abundance in 3T3-L1 adipocytes or point mutation..."
of C/EBP beta elements suppressed the increased promoter activity in response to activated macrophages, suggesting an essential role of C/EBP beta in Saa3 promoter activation. Bioluminescence based on Saa3 promoter activity in Saa3-luc mice was promoted in obese adipose tissue, showing that Saa3 promoter activity is most likely related to macrophage infiltration.

According to the news editors, the research concluded: "This study suggests that the level of expression of the Saa3 gene could be utilized for the number of infiltrated macrophages in obese adipose tissue."

For more information on this research see: Serum Amyloid A3 Gene Expression in Adipocytes is an Indicator of the Interaction with Macrophages. Scientific Reports, 2016;6():1-15. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. AHR. The numbers of total and cytokine-expressing lung ILC2s and ILC3s further increased in HDM-challenged obese mice compared with those in HDM-challenged lean mice, and this was accompanied by high IL-33 and IL-1 beta levels and decreased ILC markers in visceral adipose tissue. Furthermore, depletion of ILCs with an anti-CD90 antibody, followed by T-cell reconstitution, led to a profound decrease in allergic airway inflammatory features in obese mice, including T(H)2 and T(H)17 infiltration.

According to the news reporters, the research concluded: "These results indicate that HFD-induced obesity might exacerbate allergic airway inflammation through mechanisms involving ILC2s and ILC3s."

For more information on this research see: Innate lymphoid cells contribute to allergic airway disease exacerbation by obesity. *Journal of Allergy and Clinical Immunology*, 2016;138(5):1309-1318.606-616. *Journal of Allergy and Clinical Immunology* can be contacted at: Mosby-Elsevier, 360 Park Avenue South, New York, NY 10010-1710, USA. **Nutritional and Metabolic Diseases and Conditions -...**

**New Obesity Findings from University of Picardie Described (Does sleeve gastrectomy improve the gait parameters of obese patients?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news originating from Amiens, France, by NewsRx correspondents, research stated, "Few studies have evaluated the effect of bariatric surgery on gait parameters, which constitute an important aspect of quality of life. Evaluate the effects of sleeve gastrectomy (SG) on kinematic gait parameters 6 months after surgery."

Our news journalists obtained a quote from the research from the University of Picardie, "University Hospital, France, public practice. This prospective, nonrandomized study was conducted in patients undergoing SG between January 2013 and December 2013. The primary endpoint was the difference in functional parameters of the patient's 6-minute walk test (6 MWT) before and 6 months after SG. Secondary outcomes were surgical data, weight loss, and quality of life score. Fifty-six patients were included. Mean preoperative body mass index was 46.3 +/- 7.1 kg/m(2) (35.2-71.0). On the preoperative 6 MWT, the mean distance traveled..."
was 467 m (267-606) at an average speed of 4.6 km/hr (2.67-6.06). Three patients were unable to complete the 6 MWT. At 6 months postoperatively, mean body mass index was 34.4 +/- 6.0 kg/m(2) (24.8-53.8). On the 6-month postoperative 6 MWT, the mean distance traveled was 515 m (280-652) at an average speed of 5 km/hr (2.82-6.50; P< .01). All patients completed the test. A decrease in muscle and joint pain and an increased range of motion of the joints were observed (P < .01). All domains of the Short Form 36 questionnaire were significantly improved (P < .01). SG significantly improves walking as well as range of motion of the joints. It also allows reduction of pain, facilitating the mobilization of obese patients that may be responsible for more marked weight loss after bariatric surgery."

According to the news editors, the research concluded: "Quality of life improves and weight loss occurs after the SG."

For more information on this research see: Does sleeve gastrectomy improve the gait parameters of obese patients? Surgery for Obesity and Related Diseases, 2016;12(8):1474-1481. **New Obesity Findings from Wayne State University Reported (Gender dimorphism in adipose tissue response to stress conditions: A plausible mechanism to explain the conflicting data regarding trauma and obesity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting out of Detroit, Michigan, by NewsRx editors, research stated, "Obesity is a chronic low-grade inflammatory condition associated with the elaboration of proinflammatory cytokines and adipokines from adipose tissue. Gender dimorphism (in part due to sex hormones) has been identified after injury and hemorrhagic shock."

Our news journalists obtained a quote from the research from Wayne State University, "We hypothesized that the sex hormones estrogen (E-2) and testosterone (DHT)
have disparate effects on inflammatory mediator production from adipose tissue under stress conditions. This was studied in an in vitro model. Mature adipocytes differentiated from adipose-derived stem cells were cocultured (2:1) with macrophages (RAW 264.7) and subjected to hypoxia/reoxygenation (H/R) and/or incubation with physiologic (10(-6) mu M) or stress (10(-3) mu M) concentrations of epinephrine (epi). Estrogen or DHT was added in a range of physiologic concentrations, and culture supernatants were obtained 12 hours after incubation, and tumor necrosis factor alpha (TNF-alpha), interleukin 6 (IL-6), and adiponectin levels were measured by enzyme-linked immunosorbent assay. Basal TNF-alpha and IL-6 release from cocultures was significantly increased in response to epi and/or H/R conditions. Estrogen decreased cytokine release to basal levels, whereas DHT had no effect. Of note, varying the concentration of epi had no effect on cytokine release. Basal levels of adiponectin release were significantly decreased in response to epi and/or H/R conditions. Estrogen exposure returned adiponectin levels to basal levels, whereas DHT had no effect. The inverse of this relationship was observed in regard to the sex hormones effect on leptin release. Estrogen returned leptin release to basal levels, whereas DHT had no effect. Stress levels of epi and H/R increased proinflammatory cytokine production and decreased adiponectin levels in adipocyte cocultures. Estrogen at physiologic concentrations decreased TNF-alpha, IL-6, and preserved adiponectin levels following epi and/or H/R conditions. There was no effect of DHT on mitigating the proinflammatory response.

According to the news editors, the research concluded: "Our results suggest a gender dimorphism in adipose tissue under stress conditions that may explain the conflicting data in the literature."

For more information on this research see: Gender dimorphism in adipose tissue response to stress conditions: A plausible mechanism to explain the conflicting data regarding trauma and obesity. *Journal of Trauma and Acute Care Surgery*, 2016;81(6):1028-1034. *Journal of Trauma and Acute Care Surgery* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Journal of Trauma and Acute Care Surgery - journals.lww.com/jtrauma/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting L.N. Diebel, Wayne State University, Marian & Michael Ilitch Dept. of Surg, Detroit, MI, United States. Additional authors for this research include L.N. Diebel and D.M. Liberati.

**New Obesity Study Findings Have Been Reported by Investigators at Children's Hospital (Family Factors that Characterize Adolescents with Severe Obesity and Their Role in Weight Loss Surgery Outcomes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Obesity is now available. According to news reporting from Cincinnati, Ohio, by NewsRx
journalists, research stated, "To comprehensively assess family characteristics of adolescents with severe obesity and whether family factors impact weight loss outcomes following weight loss surgery (WLS). Multisite prospective data from 138 adolescents undergoing WLS and primary caregivers (adolescent: M-age = 16.9; M-BMI = 51.5 kg/m(2); caregiver: M-age = 44.5; 93% female) and 83 nonsurgical comparators (NSComp: adolescent: M-age = 16.1; M-BMI = 46.9 kg/m(2); caregiver: M-age = 43.9; 94% female) were collected using standardized measures at presurgery/baseline and at 1 and 2 years."

The news correspondents obtained a quote from the research from Children's Hospital, "The majority (77.3%) of caregivers had obesity, with rates of caregiver WLS significantly higher in the WLS (23.8%) versus NSComp group (3.7%, P< 0.001). Family dysfunction was prevalent (approximate to 1 in every two to three families), with rates higher for NSComp than the WLS group. For the WLS group, preoperative family factors (i.e., caregiver BMI or WLS history, dysfunction, social support) were not significant predictors of adolescent weight loss at 1 and 2 years postoperatively, although change in family functioning over time emerged as a significant correlate of percent weight loss. Rates of severe obesity in caregivers as well as family dysfunction were clinically noteworthy, although not related to adolescent weight loss success following WLS."

According to the news reporters, the research concluded: "However, change in family communication and emotional climate over time emerged as potential targets to optimize weight loss outcomes."

For more information on this research see: Family Factors that Characterize Adolescents with Severe Obesity and Their Role in Weight Loss Surgery Outcomes. *Obesity*, 2016;24(12):2562-2569. *Obesity* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

Our news journalists report that additional information may be obtained by contacting M.H. Zeller, Cincinnati Children's Hospital, Behav Med & Clin Psychol, Cincinnati, OH 45229, United States. Additional authors for this research include S. Hunsaker, C. Mikhail, J. Reiter-Purtill, M.B. McCullough, B. Garland, H. Austin, G. Washington, A. Baughcum, D. Rofey and K. Smith.

**New Obesity Study Findings Recently Were Reported by Researchers at Albert Einstein College of Medicine (Hidden Obesity in Dialysis Patients: Clinical Implications)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating from Bronx, New York, by NewsRx correspondents, research stated, "While body-mass index (BMI) is used to diagnose obesity in the general population, its application in the end-stage renal disease (ESRD)
population is fraught with difficulty. A major limitation is its inability to distinguish muscle mass from fat mass, thereby leading to misclassification of individuals with poor muscle mass but excess adipose tissue as non-obese (i.e. BMI <30 kg/m(2))."

Financial support for this research came from National Institutes of Health.

Our news editors obtained a quote from the research from the Albert Einstein College of Medicine, "As muscle wasting is common among ESRD patients, this is an important problem. A substantial proportion of ESRD patients have levels of BMI in the normal range, yet excess adiposity based on other measures."

According to the news editors, the research concluded: "The importance of this 'hidden' obesity remains to be determined, but it must be recognized in order for obesity interventions to be appropriately targeted and tested in the ESRD population."

The news editors report that additional information may be obtained by contacting M.K. Abramowitz, Albert Einstein College of Medicine, Dept. of Epidemiol & Populat Hlth, Bronx, NY 10467, United States. Additional authors for this research include D. Sharma and V.W. Folkert.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/sdi.12516. This DOI is a link to an online electronic document that is either free or for purchase.

**Nutritional and Metabolic Diseases and Conditions -…**

**New Obesity Study Findings Recently Were Reported by Researchers at Autonomous University [4-Hydroxyisoleucine from Fenugreek (Trigonella foenum-graecum): Effects on Insulin Resistance Associated with Obesity]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting out of Queretaro, Mexico, by NewsRx editors, research stated, "Obesity and insulin resistance (IR) are interdependent multifactorial processes that cannot be understood separately. Obesity leads to systemic inflammation and increased levels of free fatty acids that provoke IR and lipotoxicity."

Our news journalists obtained a quote from the research from Autonomous University, "At the same time, IR exacerbates adipose cell dysfunction, resulting in chronic inflammation and major lipotoxic effects on nonadipose tissues. 4-Hydroxyisoleucine (4-
OHlle, a peculiar nonprotein amino acid isolated from fenugreek (Trigonella foenum-graecum) seeds, exhibits interesting effects on IR related to obesity. 4-OHlle increases glucose-induced insulin release, and the insulin response mediated by 4-OHlle depends on glucose concentration. The beneficial effects observed are related to the regulation of blood glucose, plasma triglycerides, total cholesterol, free fatty acid levels, and the improvement of liver function.

According to the news editors, the research concluded: "The mechanism of action is related to increased Akt phosphorylation and reduced activation of Jun N-terminal kinase (JNK) 1/2, extracellular signal-regulated kinase (ERK)1/2, p38 mitogen-activated protein kinase (MAPK), and nuclear factor (NF)-kappa B. Here, we present a review of the research regarding the insulinotropic and insulin-sensitising activity of 4-OHlle in in vitro and in vivo models."

For more information on this research see: 4-Hydroxyisoleucine from Fenugreek (Trigonella foenum-graecum): Effects on Insulin Resistance Associated with Obesity. *Molecules*, 2016;21(11):2626-2637. *Molecules* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. California, "Selectively bred DIO and DR female rats were fed chow (17% kcal fat) or Western diet (32%) for 54 days before mating and, thereafter, through weaning. As intended, despite chow-like caloric intake, Western diet increased prepregnancy weight gain and circulating leptin levels in DIO, but not DR, dams. Yet, in both genotypes, maternal Western diet increased the weight and adiposity of preweanlings, as early as in DR offspring, and increased plasma leptin, insulin, and adiponectin of weanlings. Although body weight normalized with chow feeding during adolescence, young adult Western diet offspring subsequently showed decreased energy expenditure and, in DR offspring, decreased lipid utilization as a fuel substrate. By mid-adulthood, maternal Western diet DR offspring ate more chow, weighed more, and were fatter than controls. Thus, maternal Western diet covertly programmed increased adiposity in childhood and adulthood, disrupted relations of energy regulatory hormones with body fat, and decreased energy expenditure in offspring of lean, genetically obesity-resistant mothers."

According to the news reporters, the research concluded: "Maternal Western diet exposure alone, without maternal obesity or overnutrition, can promote offspring weight gain."

Our news journalists report that additional information may be obtained by contacting E.P. Zorrilla, University of California, Grad Program Neurosci, La Jolla, CA 92093, United States. Additional authors for this research include E.M. Fekete, T.R. Nagy, B.E. Levin and E.P. Zorrilla.

The news reporters obtained a quote from the research from the University of Texas Southwestern Medical Center, "Baseline brain perfusion was measured with arterial spin labeling. Brain activity was measured via blood-oxygen-level-dependent functional magnetic resonance imaging in response to food cues, and appeal to cues was rated. Subjective hunger/fullness was reported pre- and post-imaging. After a standard meal, measures were repeated. When fasting, brain perfusion did not differ significantly between groups; and both groups showed significantly increased activity in the neo- and limbic cortices and midbrain compared with baseline (p <0.05, family-wise-error whole-brain corrected). Once fed, the lean group showed significantly decreased activation in these areas, especially the limbic cortex, whereas the group with severe obesity showed no such decreases (p <0.05, family-wise-error whole-brain corrected). After eating, appeal ratings of food decreased only in lean women. Within groups, hunger decreased (p <0.001) and fullness increased (p <0.001) fasted to fed. While fasting, brain response to food cues in women did not differ significantly despite BMI. After eating, brain activity quickly diminished in lean women but remained elevated in women with severe obesity."

According to the news reporters, the research concluded: "These brain activation findings confirm previous studies."

For more information on this research see: Brain imaging demonstrates a reduced neural impact of eating in obesity. *Obesity*, 2016;24(4):829-36. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

**Peptide Proteins - Proinsulin**

New Proinsulin Study Findings Recently Were Reported by Researchers at University of Helsinki Central Hospital (Mitochondria-related transcriptional signature is downregulated in adipocytes in obesity: a study of young healthy MZ twins)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Peptide Proteins - Proinsulin have been published. According to news originating from Helsinki, Finland, by NewsRx correspondents, research stated, "Low mitochondrial activity in adipose tissue is suggested to be an underlying factor in obesity and its metabolic complications. We aimed to find out whether mitochondrial measures are downregulated in obesity also in isolated adipocytes."
Financial supporters for this research include Biomedicum Helsinki Foundation, Finland, University of Helsinki, Helsinki, Finland, Diabetes Research Foundation Finland, Novo Nordisk Foundation, Helsinki University Hospital Research Funds, Finland, Finnish Foundation for Cardiovascular Research, Jalmari and Rauha Ahokas Foundation, Finland, Knut and Alice Wallenberg Foundation, Academy of Finland, CIBEROBN, Instituto de Salud Carlos III, Spain, Fondo de Investigacion Sanitaria-FEDER, Emil Aaltonen Foundation, Finland, Orion Foundation, Finland, Paulo Foundation, Finland, Maud Kuistila Foundation, Finland, Finnish Medical Foundation.

Our news journalists obtained a quote from the research from the University of Helsinki Central Hospital, "We studied young adult monozygotic (MZ) twin pairs discordant (n = 14, intrapair difference Delta BMI ae <yen > 3 kg/m(2)) and concordant (n = 5, Delta BMI < 3 kg/m(2)) for BMI, identified from ten birth cohorts of 22- to 36-year-old Finnish twins. Abdominal body fat distribution (MRI), liver fat content (magnetic resonance spectroscopy), insulin sensitivity (OGTT), high-sensitivity C-reactive protein, serum lipids and adipokines were measured. Subcutaneous abdominal adipose tissue biopsies were obtained to analyse the transcriptomics patterns of the isolated adipocytes as well as of the whole adipose tissue. Mitochondrial DNA transcript levels in adipocytes were measured by quantitative real-time PCR. Western blots of oxidative phosphorylation (OXPHOS) protein levels in adipocytes were performed in obese and lean unrelated individuals. The heavier (BMI 29.9 +/- 1.0 kg/m(2)) co-twins of the discordant twin pairs had more subcutaneous, intra-abdominal and liver fat and were more insulin resistant (p < 0.01 for all measures) than the lighter (24.1 +/- 0.9 kg/m(2)) co-twins. Altogether, 2538 genes in adipocytes and 2135 in adipose tissue were significantly differentially expressed (nominal p< 0.05) between the co-twins. Pathway analysis of these transcripts in both isolated adipocytes and adipose tissue revealed that the heavier co-twins displayed reduced expression of genes relating to mitochondrial pathways, a result that was replicated when analysing the pathways behind the most consistently downregulated genes in the heavier co-twins (in at least 12 out of 14 pairs). Consistently upregulated genes in adipocytes were related to inflammation. We confirmed that mitochondrial DNA transcript levels (12S RNA, 16S RNA, COX1, ND5, CYTB), expression of mitochondrial ribosomal protein transcripts and a major mitochondrial regulator PGC-1 alpha (also known as PPARGC1A) were reduced in the heavier co-twins' adipocytes (p < 0.05). OXPHOS protein levels of complexes I and III in adipocytes were lower in obese than in lean individuals. Subcutaneous abdominal adipocytes in obesity show global expressional downregulation of oxidative pathways, mitochondrial transcripts and OXPHOS protein levels and upregulation of inflammatory pathways."

According to the news editors, the research concluded: "The datasets analysed and generated during the current study are available in the figshare repository." For more information on this research see: Mitochondria-related transcriptional signature is downregulated in adipocytes in obesity: a study of young healthy MZ twins. New Wellness Study Findings Have Been Reported from University of Colorado (Health at hand: A systematic review of smart watch uses for health and wellness)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Wellness is the subject of a report. According to news originating from Aurora, Colorado, by NewsRx correspondents, research stated, "Smart watches have the potential to support health in everyday living by: enabling self-monitoring of personal activity; obtaining feedback based on activity measures; allowing for in-situ surveys to identify patterns of behavior; and supporting bi-directional communication with health care providers and family members. However, smart watches are an emerging technology and research with these devices is at a nascent stage."

Financial support for this research came from University of Colorado College of Nursing.

Our news journalists obtained a quote from the research from the University of Colorado, "We conducted a systematic review of smart watch studies that engaged people in their use by searching PubMed, Embase, IEEE XPlore and ACM Digital libraries. Participant demographics, device features, watch applications and methods, and technical challenges were abstracted from included studies. Seventy-three studies were returned in the search. Seventeen studies published were included. Included studies were published from 2014 to 2016, with the exception of one published in 2011. Most studies employed the use of consumer-grade smart watches (14/17, 82%), related studies focused on activity monitoring, heart rate monitoring, speech therapy adherence, diabetes self-management, and detection of seizures, tremors, scratching, eating, and medication-taking behaviors. Most patient-related studies enrolled participants with few exclusion criteria to validate smart watch function (10/17, 58%). Only studies that focused on Parkinson's disease, epilepsy, and diabetes management enrolled persons living with targeted conditions. One study focused on nursing work in the ICU and one focused on CPR training for laypeople. Consumer-grade smart watches have penetrated the health research space rapidly since 2014."

According to the news editors, the research concluded: "Smart watch technical function, acceptability, and effectiveness in supporting health must be validated in larger field studies that enroll actual participants living with the conditions these devices target."

For more information on this research see: Health at hand: A systematic review of smart watch uses for health and wellness. Journal of Biomedical Informatics, 2016;63():269-276. Oncology - Acute Myeloid Leukemia

Obesity-associated protein could be linked to leukemia development

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- CINCINNATI--Cancer researchers at the University of Cincinnati (UC) College of Medicine have found an obesity-associated protein's role in leukemia development and drug response which could lead to more effective therapies for the illness.

The study, which will be published in the Dec. 22 online edition of Cancer Cell and led by Jianjun Chen, PhD, associate professor in the Department of Cancer Biology, provided evidence that FTO--the protein associated with fat mass and obesity--plays a critical cancer-promoting role by regulating expression of a set of genes through a mechanism involving ribonucleic acid (RNA) modification and thereby increasing the reproduction of leukemia cells and prohibiting drug response.

"N6-methyladenosine (m6A) RNA methylation, the most prevalent internal modification in messenger RNAs (mRNAs, which translate DNA) in genes, was first identified in 1970s. In 2011, Dr. Chuan He, professor of chemistry at the University of Chicago, a co-senior author of this paper, discovered for the first time that FTO actually functions as an eraser of m6A methylation. This means that it can remove the modification from RNA transcripts, or RNA copies, thereby showing that m6A modification is a reversible process and is highly likely it is of biological importance. In 2012, two groups independently reported the development of novel sequencing technologies to profile all m6A modification areas in the entire genome and showed that roughly one-third of mRNAs in individual mammal cells are targets of m6A modification, highlighting the prevalence and potential functional importance of m6A modification.

"Recent studies have shown that m6A modification in mRNAs or non-coding RNAs plays critical roles in virtually all major normal biological processes such as tissue development and stem cell self-renewal and differentiation. However, little is known about the biological importance of m6A modification in the regulation of cancer-causing genes and/or tumor-suppressing genes in the development of tumors."

Researchers in the study analyzed a microarray dataset of 100 human acute myeloid leukemia (AML) samples from patients and nine normal control samples as well as other large-scale microarray datasets of AML samples. They found that FTO was highly expressed in various subtypes of leukemia samples such as those that contained chromosome crossover (genetic exchange between chromosomes) or mutations in certain genes. The high level of FTO expression contributed to cancer cells multiplying and surviving and also promoted the
development of leukemia in animal models and the non-response of cancer cells to therapeutic agents.

Additionally, researchers found that genes like ASB2 and RARA, which were reported to inhibit leukemia cell growth and/or mediate the response of leukemia cells to therapeutic agents, were suppressed in the AML samples with higher FTO expression. The suppression of these genes was attributed to FTO-controlled decreased stability of their mRNA and was connected to FTO's m6A demethylase activity.

"Our study shows, for the first time, the functional importance of the m6A modification machinery in leukemia," says Chen. "In addition, given the functional importance of FTO in the formation of leukemia and drug response, targeting FTO signaling may present a new therapeutic strategy to treat leukemia. As FTO may also play a cancer-promoting role in various types of solid tumors, besides leukemia, our discoveries may have a broad impact in cancer biology and cancer therapy. Further studies are needed to advance our understanding of the critical role of FTO in various types of cancers and to develop more effective novel therapeutic strategies based on such understanding to treat cancers."

**Recent Findings by W.T. Garvey and Colleagues in Obesity Provides New Insights (Patient-centered Care Of The Patient With Obesity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "As medical societies transition to a new perspective on obesity as a disease rather than primarily a behavioral concern, many are recommending treatment approaches that include a broader and more individualized disease-management framework. This overview of patient-centered care for patients who have overweight or obesity summarizes new perspectives and recommends treatment strategies with demonstrated efficacy for weight loss and weight-loss maintenance."

Our news journalists obtained a quote from the research, "The complex pathophysiology of obesity and its associated comorbidities illuminates the difficulties of weight management. However, even modest weight loss can result in improved obesity-related comorbidities and metabolic health. Health care practitioners and physicians can use effective communication and counseling skills to explore patients' feelings on weight management and determine their willingness to implement lifestyle interventions. Lifestyle management for overweight or obesity should include healthy meal planning, increased physical activity, and behavioral interventions comprising counseling and social support, all tailored to meet individual patient needs. Some patients who are unable to lose weight or maintain weight loss with lifestyle intervention alone may benefit from pharmacotherapy added to their obesity management strategy. There are now a variety of weight-loss medications available to prescribe; treatment decisions should take into account patient-related, biologic, and pharmacotherapeutic..."
factors, such as patient preference and treatment comorbidities, drug interactions, and side
effects."

According to the news editors, the research concluded: "Only when these strategies
are applied to treat obesity as a disease, rather than a behavioral problem, can we help improve
patient outcomes."

**Pregnancy Complications - Cephalopelvic Disproportion**

**Recent Findings from Hospital Center Has Provided New Information about Cephalopelvic Disproportion (Indications for primary cesarean delivery relative to body mass index)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Pregnancy Complications - Cephalopelvic Disproportion have been published. According to news reporting originating from Washington, District of Columbia, by NewsRx correspondents, research stated, "Obesity is a known risk factor for cesarean delivery. Limited data are available regarding the reasons for the increased rate of primary cesarean in obese women."

Our news editors obtained a quote from the research from Hospital Center, "It is important to identify the factors leading to an increased risk of cesarean to identify opportunities to reduce the primary cesarean rate. We evaluated indications for primary cesarean across body mass index (kg/m(2)) classes to identify the factors contributing to the increased rate of cesarean among obese women. In the Consortium of Safe Labor study from 2002 through 2008, we calculated indications for primary cesarean including failure to progress or cephalopelvic disproportion, non-reassuring fetal heart tracing, malpresentation, elective, hypertensive disease, multiple gestation, placenta previa or vasa previa, failed induction, HIV or active herpes simplex virus, history of uterine scar, fetal indication, placental abruption, chorioamnionitis, macrosomia, and failed operative delivery. For women with primary cesarean for failure to progress or cephalopelvic disproportion, dilation at the last recorded cervical examination was evaluated. Women were categorized according to body mass index on admission: normal weight (18.5-24.9), overweight (25.0-29.9), and obese classes I (30.0-34.9), II (35.0-39.9), and III (>= 40). Cochran-Armitage trend test and chi(2) tests were performed. Of 66,502 nulliparous and 76,961 multiparous women in the study population, 19,431 nulliparous (29.2%) and 7329 multiparous (9.5%) women underwent primary cesarean. Regardless of parity, malpresentation, failure to progress or cephalopelvic disproportion, and non-reassuring fetal heart tracing were
the common indications for primary cesarean. Regardless of parity, the rates of primary cesarean for failure to progress or cephalopelvic disproportion increased with increasing body mass index (normal weight, overweight, and classes I, II, and III obesity in nulliparous women: 33.2%, 41.6%, 46.4%, 47.4%, and 48.9% [P < .01] and multiparous women: 14.5%, 20.3%, 22.8%, 27.2%, and 25.3% [P < .01]), whereas the rates for malpresentation decreased (normal weight, overweight, and classes I, II, and III obesity in nulliparous women: 23.7%, 17.2%, 14.6%, 12.0%, and 9.1% [P < .01] and multiparous women: 35.6%, 30.6%, 26.5%, 24.3%, and 22.9% [P < .01]). Rates of primary cesarean for nonassuring fetal heart tracing were not statistically different for nulliparous (P > .05) or multiparous (P > .05) women. Among nulliparous women who had a primary cesarean for failure to progress or cephalopelvic disproportion, rates of cesarean prior to active labor (6 cm) increased as body mass index increased, accounting for 39.3% of women with class I, 47.1% of women with class II, and 56.8% of women with class III obesity compared to 35.2% for normal-weight women (P < .01). Similar to normal-weight women, the indication of cesarean for failure to progress or cephalopelvic disproportion was the major factor contributing to the increase in primary cesarean in obese women, but was even more prevalent with increasing obesity class."

According to the news editors, the research concluded: "The rates of intrapartum primary cesarean prior to achieving active labor increased with increasing obesity class in nulliparous women."

The news editors report that additional information may be obtained by contacting T. Kawakita, MedStar Washington Hosp Center, Obstet & Gynecol, Washington, DC, United States. Additional authors for this research include U.M. Reddy, H.J. Landy, S.N. Iqbal, C.C. Huang and K.L. Grantz.

Peptide Proteins - Proinsulin

Recent Findings from University of Oklahoma Provides New Insights into Proinsulin (Enhanced GLUT4-Dependent Glucose Transport Relieves Nutrient Stress in Obese Mice Through Changes in Lipid and Amino Acid Metabolism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptide Proteins - Proinsulin. According to news reporting from Oklahoma City, Oklahoma, by NewsRx journalists, research
stated, "Impaired GLUT4-dependent glucose uptake is a contributing factor in the development of whole-body insulin resistance in obese patients and obese animal models. Previously, we demonstrated that transgenic mice engineered to express the human GLUT4 gene under the control of the human GLUT4 promoter (i.e., transgenic [TG] mice) are resistant to obesity-induced insulin resistance."

Financial support for this research came from National Institute of Diabetes and Digestive and Kidney Diseases.

The news correspondents obtained a quote from the research from the University of Oklahoma, "A likely mechanism underlying increased insulin sensitivity is increased glucose uptake in skeletal muscle. The purpose of this study was to investigate the broader metabolic consequences of enhanced glucose uptake into muscle. We observed that the expression of several nuclear and mitochondrially encoded mitochondrial enzymes was decreased in TG mice but that mitochondrial number, size, and fatty acid respiration rates were unchanged. Interestingly, both pyruvate and glutamate respiration rates were decreased in TG mice. Metabolomics analyses of skeletal muscle samples revealed that increased GLUT4 transgene expression was associated with decreased levels of some tricarboxylic acid intermediates and amino acids, whereas the levels of several glucogenic amino acids were elevated."

According to the news reporters, the research concluded: "Furthermore, fasting acyl carnitines in obese TG mice were decreased, indicating that increased GLUT4-dependent glucose flux decreases nutrient stress by altering lipid and amino acid metabolism in skeletal muscle."

For more information on this research see: Enhanced GLUT4-Dependent Glucose Transport Relieves Nutrient Stress in Obese Mice Through Changes in Lipid and Amino Acid Metabolism. Diabetes, 2016;65(12):3585-3597. Diabetes can be contacted at: Amer Diabetes Assoc, 1701 N Beuregard St, Alexandria, VA 22311-1717, USA. Report Summarizes Obesity Study Findings from University of California (Effects of a mindfulness-based weight loss intervention in adults with obesity: A randomized clinical trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news originating from San Francisco, California, by NewsRx correspondents, research stated, "To determine whether adding mindfulness-based eating and stress management practices to a diet-exercise program improves weight loss and metabolic syndrome components. In this study 194 adults with obesity were randomized to a 5.5-month program with or without mindfulness training and identical diet-exercise guidelines."

Our news journalists obtained a quote from the research from the University of California, "Intention-to-treat analyses with multiple imputation were used for missing data. The primary outcome was 18-month weight change. Estimated effects comparing the mindfulness to control arm favored the mindfulness arm in (a) weight loss at 12 months, -1.9 kg (95% CI: -4.5, 0.8; p=0.17), and 18 months, -1.7 kg (95% CI: -4.7, 1.2; p=0.24), though not statistically significant; (b) changes in fasting glucose at 12 months, -3.1 mg/dl (95% CI: -6.3, 0.1; p=0.06), and 18 months, -4.1 mg/dl (95% CI: -7.3, -0.9; p=0.01); and © changes in triglyceride/HDL ratio at 12 months, -0.57 (95% CI: -0.95, -0.18; p=0.004), and 18 months, -0.36 (95% CI: -0.74, 0.03; p=0.07). Estimates for other metabolic risk factors were not statistically significant, including waist circumference, blood pressure, and C-reactive protein."

According to the news editors, the research concluded: "Mindfulness enhancements to a diet-exercise program did not show substantial weight loss benefit but may promote long-term improvement in some aspects of metabolic health in obesity that requires further study."

The news correspondents report that additional information may be obtained from J. Daubenmier, Osher Center for Integrative Medicine, University of California, San Francisco, California, United States. Additional authors for this research include P.J. Moran, J. Kristeller, M. Acree, P. Bacchetti, M.E. Kemeny, M. Dallman, R.H. Lustig, C. Grunfeld, D.F. Nixon, J.M. Milush, V. Goldman, B. Laraia, K.D. Laugero, L. Woodhouse, E.S. Epel and F.M Hecht.

Reports Outline Obesity Findings from University of Canberra (Obesity and emotional well-being in adolescents: Roles of body dissatisfaction, loss of control eating, and self-rated health)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting out of Canberra, Australia, by NewsRx editors, research stated, "Weak or inconsistent association between obesity and impairment in emotional well-being in population-based samples has led to efforts to identify mediating variables. This study examined the relative importance of body dissatisfaction (BD), loss of control (LOC) eating, and self-rated health (SRH) in mediating the association between obesity and impairment in emotional well-being in a school-based sample of adolescents (boys, n=437; girls, n=950)."

Our news journalists obtained a quote from the research from the University of Canberra, "Moderated mediation analysis was employed to assess the relative importance of the putative mediating variables and moderation of mediation effects by sex following the methods suggested by Hayes and coworkers. BD and SRH, but not LOC eating, were found to mediate the association between obesity and impairment in emotional well-being. Stronger mediation effects were observed for BD than for SRH. None of these results was moderated by sex."

According to the news editors, the research concluded: "The findings suggest that it may be important to target BD in obesity prevention and treatment programs in order to reduce the adverse impact of excess body weight on young people's emotional well-being."

For more information on this research see: Obesity and emotional well-being in adolescents: Roles of body dissatisfaction, loss of control eating, and self-rated health. Obesity, 2016;24(4):837-42. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

Our news journalists report that additional information may be obtained by contacting K. Gall, Dept. of Psychology, University of Canberra, Canberra, Australian Capital Territory, Australia. Reports Outline Obesity Study Findings from Research Hospital (The effects of sevoflurane and desflurane on the hemodynamics and respiratory functions in laparoscopic sleeve gastrectomy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating from Adana, Turkey, by NewsRx correspondents, research stated, "Sleeve gastrectomy has been one of the most commonly performed bariatric surgery methods. The study aimed to compare the effects of 2 most commonly used inhalation anesthetics, sevoflurane and desflurane, on the peroperative hemodynamic alterations and postoperative respiratory functions in morbidly obese patients undergoing sleeve gastrectomy. Nonrandomized cohort."

Our news editors obtained a quote from the research from Research Hospital, "Operating room, postoperative period. Eighty-four morbidly obese patients with a body mass index greater than 40 kg/m(2) who had scheduled to undergo sleeve gastrectomy operation were prospectively included in the study. Patients were divided into 2 groups. The maintenance of inhalation anesthesia was performed by sevoflurane in 1 group (sevoflurane group) and desflurane (desflurane group) in the other group. Demographic features, peroperative hemodynamic alterations, and the results of preoperative and postoperative 24th hour respiratory function tests were recorded. There was not any statistically significant difference between groups regarding age, sex, body mass index, anesthesia time, peroperative mean arterial pressure, arterial oxygen saturation, end-tidal carbon dioxide, and preoperative or postoperative forced expiratory volume 1/forced vital capacity ratios. We determined that both desflurane and sevoflurane provide similar intraoperative hemodynamic and early postoperative respiratory functions in morbidly obese patients in laparoscopic sleeve gastrectomy."

According to the news editors, the research concluded: "Both agents can be regarded as alternatives for inhalation anesthetics in maintenance of anesthesia."

The news editors report that additional information may be obtained by contacting H.K. Ozdogan, Adana Numune Training & Res Hosp, Dept. of Anesthesiol & Reanimat, Adana, Turkey. Additional authors for this research include S. Cetinkunar, F. Karateke, S. Cetinalp, M. Celik and S. Ozyazici.

Reports Outline Obesity Study Results from Arizona State University
(Prediction of Postpartum Weight in Low-Income Mexican-Origin Women From Childhood Experiences of Abuse and Family Conflict)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting out of Tempe, Arizona, by NewsRx editors, research stated, "The postpartum period represents a crucial transition period in which weight gain or loss can affect lifetime obesity risk. This study examined the prevalence of obesity and the influence of childhood abuse and family conflict on postpartum weight among low-income Mexican-origin women."

Our news journalists obtained a quote from the research from Arizona State University, "Depressive symptoms and partner support were evaluated as mediators. At a prenatal assessment, low-income Mexican-origin women (N = 322; mean [SD] age, 27.8 [6.5]) reported on childhood abuse and family conflict. Weight was measured 7 times between 6 weeks and 2 years postpartum and calculated as body mass index. Regression and growth models were used to estimate the impact of childhood abuse, childhood family conflict, partner support, and depressive symptoms on weight and weight change. Higher family conflict predicted higher weight across the first (beta = .12; p = .037) and second (beta = .16; p = .012) postpartum years. Family conflict (beta = .17; p = .018) and low partner support (beta = -.16; p = .028) also predicted increasing weight in the first year. Partner support partially mediated the effect of childhood abuse on weight change in the first year (p = .031). Depressive symptomatology mediated the effects of childhood abuse and family conflict on weight status in the second year (abuse: p = .005; conflict: p = .023)."

According to the news editors, the research concluded: "For low-income Mexican-origin women with a history of childhood abuse or high family conflict, depression and low partner support may be important targets for obesity prevention efforts in the postpartum period."

For more information on this research see: Prediction of Postpartum Weight in Low-Income Mexican-Origin Women From Childhood Experiences of Abuse and Family Conflict. *Psychosomatic Medicine*, 2016;78(9):1104-1113. Reports Summarize Obesity Findings from State University (Obesity Modifies Bone Marrow Microenvironment and Directs Bone Marrow Mesenchymal Cells to Adipogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting originating in Rio de Janeiro, Brazil, by NewsRx journalists, research stated, "To investigate the role of obesity on the bone marrow microenvironment and evaluate its possible impact on the adipogenic potential of mesenchymal stem cells (MSC). C57BL/6 male mice were fed with a high-fat diet (HFD) for 10 weeks."

The news reporters obtained a quote from the research from State University, "Femurs and tibiae were collected, and bone marrow mesenchymal stem cells (BM-MSC) were isolated and analyzed for proliferative potential, immunophenotype, and expression of adipogenesis markers. Their capacity to produce extracellular matrix proteins and proinflammatory cytokines in vitro was also evaluated. HFD mice presented a significant increase in bone marrow cellularity and higher tumor necrosis factor-alpha production in vitro. BM-MSC from HFD mice had higher proliferative capacity, produced more extracellular matrix proteins associated with adipogenesis, collagen I, and collagen IV, and showed increased constitutive expression of adipogenic markers, peroxisome proliferator-activated receptor-gamma, and CCAAT/enhanced binding protein family-alpha, without changes in preadipocyte factor-1 expression. Incubation with adipocyte-differentiation medium induced further increase in CCAAT/enhanced binding protein family-a and augmented adiponectin expression in obese BM-MSC. These alterations did not result in increased adipogenic differentiation within the bone marrow. Moreover, BM-HSC from HFD mice, co-cultivated with BM-MSCs from lean mice, exerted paracrine effects on these cells, inducing augmentation of peroxisome proliferator-activated receptor-gamma."

According to the news reporters, the research concluded: "The data suggest that obesity promotes an inflammatory microenvironment in bone marrow that commits BM-MSC to adipogenesis."

For more information on this research see: Obesity Modifies Bone Marrow Microenvironment and Directs Bone Marrow Mesenchymal Cells to Adipogenesis. Obesity, 2016;24(12):2522-2532. Obesity can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

Reports from Beijing Genomics Institute Describe Recent Advances in Insulin Resistance [FFAR4 (GPR120) Signaling Is Not Required for Anti-Inflammatory and Insulin-Sensitizing Effects of Omega-3 Fatty Acids]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Endocrine System Diseases and Conditions - Insulin Resistance is the subject of a report. According to news originating from Shenzhen, People's Republic of China, by NewsRx correspondents, research stated, "Free fatty acid receptor-4 (FFAR4), also known as GPR120, has been reported to mediate the beneficial effects of omega-3 polyunsaturated fatty acids (omega-3-PUFAs) by inducing an anti-inflammatory immune response. Thus, activation of FFAR4 has been reported to ameliorate chronic low-grade inflammation and insulin resistance accompanying obesity."

Financial support for this research came from Danish Council for Strategic Research. Our news journalists obtained a quote from the research from Beijing Genomics Institute, "However, conflicting reports on the role of FFAR4 in mediating the effects of omega-3-PUFAs are emerging, suggesting that FFAR4 may not be the sole effector. Hence analyses of the importance of this receptor in relation to other signaling pathways and prominent effects of omega-3-PUFAs remain to be elucidated. In the present study, we used Ffar4 knockouts (KO) and heterozygous (HET) mice fed either low fat, low sucrose reference diet; high fat, high sucrose omega 3-PUFA; or high fat, high sucrose omega 6-PUFA diet for 36 weeks. We demonstrate that both KO and HET mice fed omega 3-PUFAs were protected against obesity, hepatic triacylglycerol accumulation, and whole-body insulin resistance. Moreover, omega 3-PUFA fed mice had increased circulating protein levels of the anti-inflammatory adipokine, adiponectin, decreased fasting insulin levels, and decreased mRNA expression of several proinflammatory molecules within visceral adipose tissue."

According to the news editors, the research concluded: "We find that FFAR4 signaling is not required for the reported anti-inflammatory and insulin-sensitizing effects mediated by omega 3-PUFAs."

For more information on this research see: FFAR4 (GPR120) Signaling Is Not Required for Anti-Inflammatory and Insulin-Sensitizing Effects of Omega-3 Fatty Acids. Mediators of Inflammation, 2016();1-12. Mediators of Inflammation can be contacted at: Hindawi Publishing Corp, 315 Madison Ave 3RD Flr, Ste 3070, New York, NY 10017, USA. Kidney Diseases and Conditions - Chronic Kidney...

Reports on Chronic Kidney Disease from Department of Internal Medicine Provide New Insights (Chronic kidney disease and high eGFR according to body composition phenotype in adults with normal BMI)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Kidney Diseases and Conditions - Chronic Kidney Disease have been published. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Body composition contributes to the risk of chronic kidney disease (CKD) and glomerular hyperfiltration. In adults with normal body mass index (BMI), the relationships of body composition with CKD and high estimated glomerular filtration rate (eGFR) are largely unknown."

Our news editors obtained a quote from the research from the Department of Internal Medicine, "We analyzed 10,734 adults from the Korean National Health and Nutrition Examination Survey (KNHANES), whose body mass index (BMI) was within the normal range (18.5-24.9 kg/m(2)). Body composition was categorized into four phenotypes (normal, sarcopenia alone, obesity alone, and sarcopenic obesity) based on appendicular lean mass index (ALMI) and total body fat percentage (TBF%) measured by dual-energy X-ray absorptiometry (DXA). We examined the relationship of CKD and high eGFR (eGFR >= 120 ml/min per 1.73 m(2)) with body composition phenotypes. Sarcopenia alone (14.3%), obesity alone (16.0%), and sarcopenic obesity (10.7%) were prevalent. The association between sarcopenia alone and eGFR was J-shaped, while that between sarcopenic obesity and eGFR was U-shaped. In multivariate logistic regression analysis compared with the normal phenotype, sarcopenic obesity had an elevated odds ratio (OR) for CKD (OR: 1.59, 95% CI: 1.16-2.19). Sarcopenia alone (OR: 1.87; 95% CI: 1.41-2.47) and sarcopenic obesity (OR: 2.37, 95% CI: 1.68-3.36) had elevated OR for high eGFR. These findings suggest that decreased muscle mass and coexistence with excess adiposity show associations with CKD and high eGFR even in adults with normal BMI."

According to the news editors, the research concluded: "Body composition measured by DXA could provide information on the relationship of body composition with CKD and high eGFR."

For more information on this research see: Chronic kidney disease and high eGFR according to body composition phenotype in adults with normal BMI. Nutrition Metabolism and Cardiovascular Diseases, 2016;26(12):1088-1095. Nutrition Metabolism and Cardiovascular Diseases can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England.

The news editors report that additional information may be obtained by contacting K.B. Lee, Sungkyunkwan UniversityDiv Nephrol, Dept. of Internal Med, Kangbuk Samsung HospSch Med, Seoul 03181, South Korea. Additional authors for this research include K.B. Lee, E.J. Rhee, C.Y. Park, Y. Chang and S. Ryu.

Reports on Swiss 3T3 Cells from Kyoto University Provide New Insights
(13-Methylberberine, a berberine analogue with stronger anti-adipogenic effects on mouse 3T3-L1 cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Swiss 3T3 Cells. According to news originating from Kyoto, Japan, by NewsRx correspondents, research stated, "Lipid metabolism modulation is a main focus of metabolic syndrome research, an area in which many natural and synthetic chemicals are constantly being screened for in vitro and in vivo activity. Berberine, a benzylisoquinoline plant alkaloid, has been extensively investigated for its anti-obesity effects and as a potential cholesterol and triglyceride-lowering drug."

Our news journalists obtained a quote from the research from Kyoto University, "We screened 11 protoberberine and 2 benzophenanthridine alkaloids for their anti-adipogenic effects on 3T3-L1 adipocytes and found that 13-methylberberine exhibited the most potent activity. 13-Methylberberine down-regulated the expression of the main adipocyte differentiation transcription factors, peroxisome proliferator-activated receptor gamma (PPAR gamma) and CCAAT enhancer binding protein alpha (C/EBP alpha), as well as their target genes. PPAR gamma, C/EBP alpha, and sterol regulatory element binding protein 1 (SREBP-1) protein levels were reduced, and this lipid-reducing effect was attenuated by an AMP-activated protein kinase (AMPK) inhibitor, indicating that the effect of this compound requires the AMPK signaling pathway. Decreased Akt phosphorylation suggested reduced de novo lipid synthesis. C-13 methyl substitution of berberine increased its accumulation in treated cells, suggesting that 13-methylberberine has improved absorption and higher accumulation compared to berberine."

According to the news editors, the research concluded: "Our findings suggest that 13-methylberberine has potential as an anti-obesity drug."

For more information on this research see: 13-Methylberberine, a berberine analogue with stronger anti-adipogenic effects on mouse 3T3-L1 cells. Scientific Reports, 2016;6():1-10. Research Conducted at Laval University Has Updated Our Knowledge about Obesity (Association between nesfatin-1 levels and metabolic improvements in severely obese patients who underwent biliopancreatic derivation with duodenal switch)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news reporting originating from Quebec City, Canada, by NewsRx correspondents, research stated, "Nesfatin-1 is a neuroendocrine peptide with potent anorexigenic activity in rodents. The potential role of nesfatin-1 on the regulation of energy balance, metabolic functions and inflammation is currently debated in obese humans."

Our news editors obtained a quote from the research from Laval University, "In the present study, nesfatin-1 fluctuations and their associations with metabolic factors were investigated in severely obese patients who underwent biliopancreatic diversion with duodenal switch (BPD/DS) and severely obese controls (SOC). Basic procedures: Sixty severely obese patients who underwent BPD/DS and 15 SOC (matched for BMI and age) were included in the study. Associations between nesfatin-1 levels and body composition, glucose metabolism, lipid profile as well as inflammatory markers were evaluated at baseline and over a postsurgery 2-month (12 M) period. Body weight was reduced at 6 M and at 12 M in BPD/DS patients (P < 0.001). Nesfatin-1 levels were reduced at 6 M (women: P< 0.05) and at 12 M (men and women: 0.001) in BPD/DS patients. At baseline, nesfatin-1 levels negatively correlated with weight, fat (FM) and fat-free mass (FFM) in the whole population (combined BPD/DS and SOC patients). At 12 M, nesfatin-1 concentrations positively correlated with weight, FM, fasting insulin, insulin resistance, total cholesterol, LDL-cholesterol, triglyceride and apoB values. At 12 M, % changes in nesfatin-1 were positively associated with% changes in weight, FM, FFM, fasting insulin, insulin resistance, total cholesterol, LDL-cholesterol, apoB and C-reactive protein."

According to the news editors, the research concluded: "Nesfatin-1 levels decrease following BPD/DS-induced weight loss and are significantly associated with parameters of metabolic health."

For more information on this research see: Association between nesfatin-1 levels and metabolic improvements in severely obese patients who underwent biliopancreatic derivation with duodenal switch. Peptides, 2016:86():6-12. Peptides can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Research Data from University of Pennsylvania Update Understanding of Obesity (Future Therapies in Obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "Although diet and exercise have been the cornerstone of therapy for obesity, efficacy is suboptimal and short lived."

Our news journalists obtained a quote from the research from the University of Pennsylvania, "Surgical procedures are durable but invasive therapy for obesity. Supplemental therapies for obesity that are minimally invasive, low risk, and effective are needed."

According to the news editors, the research concluded: "Several therapeutic options are being developed that offer obese patients and their health care providers alternatives to what is currently available."

Our news journalists report that additional information may be obtained by contacting O. Pickett-Blakely, University of Pennsylvania, Perelman Sch Med, Div Gastroenterol, GI Nutr Obes & Celiac Dis Program, Philadelphia, PA 19104, United States.

Researchers at Austin Health Release New Data on Obesity (The effect of body mass and sex on the accuracy of respiratory magnetometers for measurement of end-expiratory lung volumes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases
and Conditions - Obesity. According to news reporting from Heidelberg, Australia, by NewsRx journalists, research stated, "Respiratory magnetometers are increasingly being used in sleep studies to measure changes in end-expiratory lung volume (EELV), including in obese obstructive sleep apnea patients. Despite this, the accuracy of magnetometers has not been confirmed in obese patients nor compared between sexes."

Financial supporters for this research include National Health and Medical Research Council (Australia), Australian Research Council.

The news correspondents obtained a quote from the research from Austin Health, "Thus we compared spirometer-measured and magnetometer-estimated lung volume and tidal volume changes during voluntary end-expiratory lung volume changes of 1.5, 1, and 0.5 l above and 0.5 l below functional respiratory capacity in supine normal-weight [body mass index (BMI) < 25 kg/m] and healthy obese (BMI > 30 kg/ m) men and women. Two different magnetometer calibration techniques proposed by Banzett et al. [Banzett RB, Mahan ST, Garner DM, Brughera A, Loring SH. J Appl Physiol (1985) 79: 2169-2176, 1995] and Sackner et al. [Sackner MA, Watson H, Belsito AS, Feinerman D, Suarez M, Gonzalez G, Bizousky F, Krieger B. J Appl Physiol (1985) 66: 410-420, 1989] were assessed. Across all groups and target volumes, magnetometers overestimated spirometer-measured EELV by similar to 65 ml (< 0.001) with no difference between techniques (0.07). The Banzett method overestimated the spirometer EELV change in normal-weight women for all target volumes except 0.5 l, whereas no differences between mass or sex groups were observed for the Sackner technique. The variability of breath-to-breath measures of EELV was significantly higher for obese compared with nonobese subjects and was higher for the Sackner than Banzett technique. On the other hand, for tidal volume, both calibration techniques underestimated spirometer measurements (< 0.001), with the underestimation being more marked for the Banzett than Sackner technique (0.03), in obese than normal weight (< 0.001) and in men than in women (0.003)."

According to the news reporters, the research concluded: "These results indicate that both body mass and sex affect the accuracy of respiratory magnetometers in measuring EELV and tidal volume."

Our news journalists report that additional information may be obtained by contacting A.S. Jordan, Austin Hlth, Inst Breathing & Sleep, Heidelberg, Vic, Australia. Additional authors for this research include R. Bourke, J. Trinder, C.L. Nicholas, D. Brazzale, F.J. O'Donoghue, P.D. Rochford and A.S. Jordan.

Researchers at University Hospital Target Obesity (Obesity services: how best to develop a coherent way forward)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Obesity is the subject of a report. According to news reporting originating from Leeds, United Kingdom, by NewsRx correspondents, research stated, "Obesity now affects 25% of the UK population. This volume of patients cannot be managed by current NHS services."

Our news editors obtained a quote from the research from University Hospital, "It really needs a public health approach which encourages an environment where it is easier for the public to take healthy rather than unhealthy actions. However, there remain substantial numbers of patients who will benefit from medical intervention. This needs a joined-up service which extends from a healthy environment, linking gyms, weight loss groups, community cooking lessons, etc. with pathways connecting primary and secondary healthcare. To date, the National Health Service has not managed to develop a coherent policy that addresses obesity as a major cause of health and social care expenditure. The most important step in primary care is probably to identify the presence of obesity. The medical steps should be in the identification and management of comorbidities. The purpose of treating obesity is not weight loss alone but improving health, so the narrative needs to change from weight to blood pressure, glucose tolerance, physical fitness, etc. Many physicians believe that weight loss is an unwinnable battle but there are several well conducted studies in which primary care, supported by specialists, can deliver successful clinical weight loss. Specialist medical and surgical care for obesity will be required for complex cases and is essential for overseeing long-term postsurgical follow-up to prevent and treat nutritional and metabolic complications. Obesity management suffers from a lack of coherent national public health policies, fragmentation of care and a lack of knowledge of what successful treatment entails."

According to the news editors, the research concluded: "Health benefits do not require a return to a healthy BMI."

The news editors report that additional information may be obtained by contacting J.H. Barth, Obesity Clinic, St James' University Hospital, Leeds, UK.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/cen.12992. This DOI is a link to an online electronic document that is either free or for purchase.

Researchers at University of Antwerp Target Obesity (CNV analysis and mutation screening indicate an important role for the NPY4R gene in human obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news reporting originating from Antwerp, Belgium, by NewsRx correspondents, research stated, "Genome-wide copy number variation (CNV) analyses have associated the 10q11.22 CNV with obesity. As the NPY4R gene is the most interesting candidate gene in this region, it was hypothesized that both genetic and structural variation in NPY4R might be implicated in the pathogenesis of obesity."

Our news editors obtained a quote from the research from the University of Antwerp, "In the first part of this study, 326 children and adolescents with obesity and 298 healthy lean individuals were screened for CNV in the NPY4R-containing chr.10q11.22 region. In the second part of this study, a mutation screen for variants in the NPY4R coding region was performed in 356 children and adolescents with obesity and 337 healthy lean adults. Our CNV analysis demonstrated a significantly higher frequency of NPY4R containing 10q11.22 CNV loss in the patient population (p=0.0003), while CNV gain in this region was more prevalent in the control population (p=0.031). Mutation analysis resulted in the identification of 15 rare non-synonymous heterozygous variants. For two variants that could only be identified in the patient population, receptor dysfunction and thus a pathogenic effect were demonstrated."

According to the news editors, the research concluded: "These data support an essential role for genetic and structural variation within the NPY4R gene in the pathogenesis of obesity."

For more information on this research see: CNV analysis and mutation screening indicate an important role for the NPY4R gene in human obesity. Obesity, 2016;24(4):970-6. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

The news editors report that additional information may be obtained by contacting E. Aerts, Centre of Medical Genetics, University of Antwerp, Antwerp, Belgium. Researchers at University of KwaZulu-Natal Release New Data on Obesity (microRNA-27a rs895819 is associated with obesity in HIV infected preeclamptic Black South African women on HAART)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting from Durban, South Africa, by NewsRx journalists, research stated, "Preeclampsia (PE) and HIV/AIDS present a major health challenge globally. South Africa has the highest disease burden of both HIV/AIDS and PE in the world."

The news correspondents obtained a quote from the research from the University of KwaZulu-Natal, "Despite extensive research, the pathophysiology of these conditions is not completely understood, however a genetic predisposition in women may affect susceptibility. MiRNA-27a regulates adipogenesis and glucose metabolism. A single nucleotide polymorphism (SNP) in miRNA-27a (rs895819T > C) has shown to have disparate effects in various populations. This study investigated the frequency of rs895819 in pregnant normotensive and preeclamptic Black South African (SA) women. Enrollment into the study included: normotensive (n = 95; 45 HIV+; 80 analysed for rs895819T > C, age range: 16-46 years) and PE patients (n = 98; 45 HIV+; 56 analysed for rs895819T > C), age range: 16-42 years). DNA was isolated from peripheral blood mononuclear cells (PBMC). Genotyping of miRNA-27a rs895819 was detected using a TaqMan ® SNP Genotyping assay. We did not find a significant association of miR-27a polymorphism with PE susceptibility in our data. However, in the subgroup analysis (based in HIV status), the variant genotypes (TC/CC) were associated with higher body mass index (BMI) among PE women (32.57 vs. 29.25, p = 0.064), significantly in the presence of HIV infection (33.47 vs. 27.8, p = 0.005)."

According to the news reporters, the research concluded: "The results of this study suggests that miR-27a rs895819 may not be associated with PE susceptibility; however, the miR-27a TC/CC genotype increases susceptibility to elevated BMI in PE, which may be significantly influenced by co-morbid HIV infection among pregnant women on HAART."

For more information on this research see: microRNA-27a rs895819 is associated with obesity in HIV infected preeclamptic Black South African women on HAART. *BMC Medical Genetics*, 2016;17():1-8. *BMC Medical Genetics* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. Researchers at University of Oulu Report New Data on Obesity (Fto-Deficiency Affects the Gene and MicroRNA Expression Involved in Brown Adipogenesis and Browning of White Adipose Tissue in Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting originating from Oulu, Finland, by NewsRx correspondents, research stated, "Genetic variants in the fat mass-and obesity-associated gene Fto are linked to the onset of obesity in humans. The causal role of the FTO protein in obesity is supported by evidence obtained from transgenic mice; however, the underlying molecular pathways pertaining to the role of FTO in obesity have yet to be established."

Our news editors obtained a quote from the research from the University of Oulu, "In this study, we investigate the Fto gene in mouse brown adipose tissue and in the browning process of white adipose tissue. We analyze distinct structural and molecular factors in brown and white fat depots of Fto-deficient mice under normal and obesogenic conditions. We report significant alterations in the morphology of adipose tissue depots and the expression of mRNA and microRNA related to brown adipogenesis and metabolism in Fto-deficient mice."

According to the news editors, the research concluded: "Furthermore, we show that high-fat feeding does not attenuate the browning process of Fto-deficient white adipose tissue as observed in wild-type tissue, suggesting a triggering effect of the FTO pathways by the dietary environment."

For more information on this research see: Fto-Deficiency Affects the Gene and MicroRNA Expression Involved in Brown Adipogenesis and Browning of White Adipose Tissue in Mice. *International Journal of Molecular Sciences*, 2016;17(11):1373-1384. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Obesity have been presented. According to news reporting originating in Mexico City, Mexico, by NewsRx journalists, research stated, "Depressive symptoms are often associated with obesity, and emotional eating may play a considerable role in weight gain. This study aimed to examine the association among depression symptoms, emotional eating, and body mass index (BMI) in Mexican college students; and to assess emotional eating as mediator between depressive symptoms and BMI."

The news reporters obtained a quote from the research from Autonomous University, "A total of 1453 students at a public university in Mexico City completed the scale Self-Efficacy in Emotion- and Stress-Related Eating of the Eating and Appraisal Due to Emotions and Stress Questionnaire (EADES) to assess emotional eating, and the scale created by the Center for Epidemiologic Studies (CES-D) to identify depressive symptoms. Weight and height were measured to calculate BMI. Structural equation models (SEM) were used to assess emotional eating as mediator between depressive symptoms and BMI by sex. Depressive symptoms were associated with emotional eating in both men (Beta = -0.33, p< 0.001) and women (Beta = -0.46, p< 0.001). Emotional eating, in turn, was associated with BMI in men (Beta = -0.08, p< 0.001) as well as in women (Beta = -0.09, p< 0.001). Emotional eating was a mediator between depression and BMI, adjusted for age in both sexes."

According to the news reporters, the research concluded: "This finding suggests that emotion management should be taken into consideration in obesity prevention and treatment strategies applied to young adults."

Our news correspondents report that additional information may be obtained by contacting M.E.I. Camacho, Metropolitan Autonomous Univ, Hlth Care Department, Mexico City 04960, DF, Mexico. Additional authors for this research include M.E.I. Camacho, M.D. Velazquez-Alva and M.Z. Zepeda.

Researchers from Children's Hospital Describe Findings in Obesity (Increased plasminogen activator inhibitor results in a hypofibrinolytic state in adolescents with obesity: invivo and exvivo evidence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting out of Edmonton, Canada, by NewsRx
editors, research stated, "Obesity in adolescents increases their risk for deep vein thrombosis. The objectives of this study were to determine potential mechanisms for thrombotic risk by investigating the fibrinolytic pathway in a sample of adolescents with and without obesity."

Our news journalists obtained a quote from the research from Children's Hospital, "Thirty-seven adolescents with obesity and 16 normal weight age-matched controls were recruited. Plasma levels of components of the fibrinolytic system were measured in addition to a Global Haemostasis Potential assay (GHP), which assesses plasma capacity to generate and lyse a fibrin clot. Levels of plasminogen activator inhibitor (PAI) and tissue plasminogen activator (tPA)/PAI complexes were increased in adolescents with obesity when compared to normal weight controls. There was a significant inverse association of increasing PAI with a decrease in plasmin-antiplasmin complexes. The GHP in obese adolescents displayed a hypofibrinolytic response with a markedly increased t(1/2) clot lysis time, as well as an increase in fibrin clot density as indicated by increased absorbance at maximum peak height. In the obese group, immunodepletion of PAI decreased both t(1/2) lysis time and absorbance at maximum peak height."

According to the news editors, the research concluded: "We have shown invivo and exvivo there is a hypofibrinolytic state in obese adolescents and have established the hypofibrinolytic state is due to increased PAI levels."

Our news journalists report that additional information may be obtained by contacting L.G. Mitchell, Stollery Childrens Hosp, Edmonton, AB, Canada. Additional authors for this research include G.D.C. Ball and L.G. Mitchell.

Y gastric bypass (LRYGB) procedures classifying patients into low risk (class A), intermediate risk (class B), and high risk (class C). The primary aim of this study was to evaluate the accuracy of the OS-MRS in predicting postoperative complications after LRYGB.

The news correspondents obtained a quote from the research from the Department of Surgery, "Secondarily, the postoperative complication rate between primary and revisional LRYGB was systematically analyzed. The Obesity Center Amsterdam, located in a large teaching hospital, in Amsterdam, The Netherlands. The OS-MRS was applied to a consecutive database of patients who underwent LRYGB from November 2007 onwards. Postoperative complications were scored according to the Clavien-Dindo classification. Revisional LRYGB was separately analyzed. LRYGB was performed in 1667 patients either as a primary (81.5%) or revisional (18.5%) procedure. The majority (n = 1371, 82.2%) were female, mean age 44.6 (standard deviation 14.4) years and mean body mass index 44.2 (6.5) kg/m(2). Nine hundred and four (54.2%) were OS-MRS class A, 642 class B (38.5%), and 121 (7.3%) class C. Complications occurred in 143 (10.5%) and 44 (14.2%) patients after primary and revisional surgery, respectively. In both primary and revisional LRYGB, there was no association between complications and the OS-MRS classification. Subanalysis comparing primary with revisional LRYGB found a significant association between revisional surgery and the development of severe complications (Clavien-Dindo >= 3) (P = .003) and mortality (P = .017). The OS-MRS was not an accurate predictor for postoperative complications in patients who underwent primary or revisional LRYGB.

According to the news reporters, the research concluded: "As in other studies, revisional surgery is an independent risk factor for the development of severe complications."

Our news journalists report that additional information may be obtained by contacting U.K. Coblijn, Sint Lucas Andreas Ziekenhuis, Dept. of Surg, Amsterdam, Netherlands. Additional authors for this research include S.M. Lagarde, C.A.L. de Raaff, S.M. de Castro, W.F. van Tets, H.J. Bonjer and B.A. van Wagensveld.

Researchers from Mt. Sinai Hospital Report Recent Findings in Wellness (Healthy and productive workers: using intervention mapping to design a workplace health promotion and wellness program to improve presenteeism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Wellness have been published. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "Presenteeism is a growing problem in developed countries mostly due to an aging workforce. The economic costs related to presenteeism exceed those of absenteeism and employer health costs."

Our news journalists obtained a quote from the research from Mt. Sinai Hospital, "Employers are implementing workplace health promotion and wellness programs to improve health among workers and reduce presenteeism. How best to design, integrate and deliver these programs are unknown. The main purpose of this study was to use an intervention mapping approach to develop a workplace health promotion and wellness program aimed at reducing presenteeism. We partnered with a large international financial services company and used a qualitative synthesis based on an intervention mapping methodology. Evidence from systematic reviews and key articles on reducing presenteeism and implementing health promotion programs was combined with theoretical models for changing behavior and stakeholder experience. This was then systematically operationalized into a program using discussion groups and consensus among experts and stakeholders. The top health problem impacting our workplace partner was mental health. Depression and stress were the first and second highest cause of productivity loss respectively. A multi-pronged program with detailed action steps was developed and directed at key stakeholders and health conditions. For mental health, regular sharing focus groups, social networking, monthly personal stories from leadership using webinars and multi-media communications, expert-led workshops, lunch and learn sessions and manager and employee training were part of a comprehensive program. Comprehensive, specific and multi-pronged strategies were developed and aimed at encouraging healthy behaviours that impact presenteeism such as regular exercise, proper nutrition, adequate sleep, smoking cessation, socialization and work-life balance. Limitations of the intervention mapping process included high resource and time requirements, the lack of external input and viewpoints skewed towards middle and upper management, and using secondary workplace data of unknown validity and reliability. In general, intervention mapping was a useful method to develop a workplace health promotion and wellness program aimed at reducing presenteeism. The methodology provided a step-by-step process to unravel a complex problem."

According to the news editors, the research concluded: "The process compelled participants to think critically, collaboratively and in nontraditional ways."

For more information on this research see: Healthy and productive workers: using intervention mapping to design a workplace health promotion and wellness program to improve presenteeism. Researchers from Nanjing Agricultural University Report Details of New Studies and Findings in the Area of Obesity (Both diet and gene mutation induced obesity affect oocyte quality in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting out of Nanjing, People's Republic of China, by NewsRx editors, research stated, "Obesity was shown to cause reproductive dysfunctions such as reduced conception, infertility and early pregnancy loss. However, the possible effects of obesity on oocyte quality are still not fully understood."

Our news journalists obtained a quote from the research from Nanjing Agricultural University, "In this study we investigated the effects of both diet and gene mutation induced obesity on impairments in mouse oocyte polarization, oxidative stress, and epigenetic modifications. Our results showed that high-fat diet induced obesity (HFD) and gene mutation induced obesity (ob/ob) could both impair oocyte meiotic maturation, disrupt spindle morphology, and reduce oocyte polarity. Oocytes from obese mice underwent oxidative stress, as shown by high DHE and ROS levels. Abnormal mitochondrial distributions and structures were observed in oocytes from obese groups of mice and early apoptosis signals were detected, which suggesting that oxidative stress had impaired mitochondrial function and resulted in oocyte apoptosis. Our results also showed that 5 mC levels and H3K9 and H3K27 methylation levels were altered in oocytes from obese mice, which indicated that DNA methylation and histone methylation had been affected."

According to the news editors, the research concluded: "Our results showed that both HFD and ob/ob induced obesity affected oocyte maturation and that oxidative stress-induced early apoptosis and altered epigenetic modifications may be the reasons for reduced oocyte quality in obese mice."

For more information on this research see: Both diet and gene mutation induced obesity affect oocyte quality in mice. Scientific Reports, 2016;6():18858. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Researchers from State University of New York Report Findings in Obesity (Do environmental pollutants increase obesity risk in humans?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting out of Buffalo, New York, by NewsRx editors, research stated, "Obesity has become a global epidemic and threat to public health. A good understanding of the causes can help attenuate the risk and spread."

Our news journalists obtained a quote from the research from the State University of New York, "Environmental pollutants may have contributed to the rising global obesity rates. Some research reported associations between chemical pollutants and obesity, but findings are mixed. This study systematically examined associations between chemical pollutants and obesity in human subjects. Systematic review of relevant studies published between 1 January 1995 and 1 June 2016 by searching PubMed and MEDLINE®. Thirty-five cross-sectional (n = 17) and cohort studies (n = 18) were identified that reported on associations between pollutants and obesity measures. Of them, 16 studies (45.71%) reported a positive association; none reported a sole inverse association; three (8.57%) reported a null association only; six (17.14%) reported both a positive and null association; seven (20.00%) reported a positive and inverse association; and three studies (8.57%) reported all associations (positive, inverse and null). Most studies examined the association between multiple different pollutants, different levels of concentration and in subsamples, which results in mixed results. Thirty-three studies reported at least one positive association between obesity and chemicals, such as polychlorinated biphenyls, biphenyl A, dichlorodiphenyltrichloroethane, dichlorodiphenyldichloroethylene and more. Certain chemicals, such as biphenyl A, were more likely to have high ORs ranging from 1.0 to 3.0, whereas highly chlorinated polychlorinated biphenyls were more likely to have negative ORs. Effects of chemicals on the endocrine system and obesity might vary by substance, exposure level, measure of adiposity and subject characteristics (e.g. sex and age). Accumulated evidences show positive associations between pollutants and obesity in humans."

According to the news editors, the research concluded: "Future large, long-term, follow-up studies are needed to assess impact of chemical pollutants on obesity risk and related mechanisms."

Our news journalists report that additional information may be obtained by contacting Y. Wang, SUNY Buffalo, Dept. of Community Hlth & Hlth Behav, Buffalo, NY, United States. Additional authors for this research include K. Hollis-Hansen, X. Ren, Y. Qiu and W. Qu.

Researchers from Texas Technical University Discuss Findings in Obesity (Physical activity and obesity: what we know and what we need to know)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting from Lubbock, Texas, by NewsRx journalists, research stated, "Creating a negative energy balance by decreasing caloric consumption and increasing physical activity is a common strategy used to treat obesity. A large number of review and original research papers have considered the role of physical activity in weight loss and maintenance."

The news correspondents obtained a quote from the research from Texas Technical University, "However, their conclusions are at times conflicting. In this review, we have critically evaluated the findings of systematic reviews and meta-analyses and supplemented their conclusions with recently published, high-quality clinical trials. We have eliminated studies that were methodologically flawed in an attempt to reduce the ambiguity in the literature. We further sought, through selective review of these publications, to isolate the effects of various types of exercise, independent of dietary interventions, to further clarify their independent contributions. Thus, our review describes (i) combined calorie restriction with physical activity interventions, (ii) physical activity interventions without calorie restriction and (iii) the role of physical activity on maintenance of weight loss. Through this critical examination of the literature, we have provided conclusions to address certain ambiguities regarding the role of physical activity in obesity treatment that will inform clinical practice."

According to the news reporters, the research concluded: "We have also identified several long-standing gaps in knowledge that will inform future research."

Our news journalists report that additional information may be obtained by contacting M. Binks, Texas Technical University, Behav Med & Translat Res Lab, Dept. of Nutr Sci, Lubbock, TX 79409, United States. Additional authors for this research include C.N. Kahathuduwa and M. Binks.

Studies Conducted at University of Chile on Obesity Recently Reported

[Impact of a school-based intervention on nutritional education and physical activity in primary public schools in Chile (KIND) programme study protocol: cluster randomised ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting originating in Santiago, Chile, by NewsRx journalists, research stated, "Chile has suffered a fast increase in childhood obesity in the last 10 years. As a result, several school programmes have been implemented, however the effectiveness of these needs to be evaluated to identify and prioritize strategies to curve this trend."

The news reporters obtained a quote from the research from the University of Chile, 'Cluster randomized controlled trial. Twelve primary public schools chosen at random over three regions of the country will take part in this study. The sample size consisted of a total of 1,655 children. For each region one school will be selected for each of the three nutritional intervention modes and one school will be selected as the control group. The intervention modes consist of the following: Healthy Kiosk and nutritional education (KSEAN); Optimized physical activity (AFSO); Healthy Kiosk and nutritional education (KSEAN) + optimized physical activity (AFSO); Control group. The effectiveness of each intervention will be evaluated by determining the nutritional condition of each child by measuring percentage of body fat, BMI and the z-score of the BMI. This study will also identify the eating behaviours, nutritional knowledge and fitness of each child, along with the effective time of moderate activity during physical education classes. A protocol to evaluate the effectiveness of a school based intervention to control and/or reduce the rates of childhood obesity for children between 6 and 10 years of age was developed. The protocol was developed in line with the Declaration of Helsinki, the Nuremberg Code and the University of Chile Guidelines for ethical committees, and was approved by the INTA, Universidad de Chile ethical committee on Wednesday 12 March 2014. There is consensus among researchers and health and education personnel that schools are a favourable environment for actions to prevent and/or control childhood obesity. However a lack of evidence on the effectiveness of interventions to date has led some to question the wisdom of allocating resources to programmes."

According to the news reporters, the research concluded: "This is the first study of this kind in Chile and could be an important first step to provide guidance to political authorities in relation to which food and nutrition strategies to prioritize to curve this alarming trend."

For more information on this research see: Impact of a school-based intervention on nutritional education and physical activity in primary public schools in Chile (KIND) programme study protocol: cluster randomised controlled trial. BMC Public Health, 2016;16 ():30-40. BMC Public Health can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. Studies from Chungbuk National University Describe New Findings in Obesity [Effect of the Capsicoside G-rich Fraction from Pepper (Capsicum annuum L.) Seeds on High-fat Diet-induced Obesity in Mice]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting from Cheongju, South Korea, by NewsRx journalists, research stated, "Obesity is one of the most common metabolic syndromes and is a major threat to human health worldwide. Given the size of this problem, there is growing interest in natural agents that may decrease obesity."

The news correspondents obtained a quote from the research from Chungbuk National University, "In this study, we investigated the anti-obesity effect of a capsicoside G-rich fraction (CRF; 13.35% capsicoside G) isolated from pepper seeds in diet-induced obese mice. C57BL/6J mice were fed either a normal diet or a high-fat diet (HFD), with or without CRF (HFD + CRF; 10 and 100 mg/kg body weight). The body weight and food efficiency ratio of mice fed HFD+ CRF were lower in comparison to that of mice fed only an HFD. Epididymal adipose tissue weight and adipocyte hypertrophy were significantly lower in HFD+ CRF mice than in HFD mice. The fat deposition in the liver of mice fed HFD+ CRF was lower compared to that of mice fed only an HFD. CRF significantly reversed the HFD-induced elevation of the expression of key adipocyte differentiation regulators, including peroxisome proliferator-activated receptor., CCAAT/enhancer-binding protein a, sterol regulatory element binding protein 1c, and their target genes."

According to the news reporters, the research concluded: "These results suggest that CRF could be used as dietary therapy for the prevention of obesity and obesity-related metabolic diseases."

For more information on this research see: Effect of the Capsicoside G-rich Fraction from Pepper (Capsicum annuum L.) Seeds on High-fat Diet-induced Obesity in Mice. 

Our news journalists report that additional information may be obtained by contacting J. Lee, Chungbuk National University, Div Food & Anim Sci, Cheongju 28644, Chungbuk, South Korea. Studies from Harvard School of Medicine in the Area of Obesity Reported (Respiratory Management of Perioperative Obese Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "With a rising incidence of obesity in the United States, anesthesiologists are faced with a larger volume of obese patients coming to the operating room as well as obese patients with ever-larger body mass indices (BMIs). While there are many cardiovascular and endocrine issues that clinicians must take into account when caring for the obese patient, one of the most prominent concerns of the anesthesiologist in the perioperative setting should be the status of the lung."

The news reporters obtained a quote from the research from the Harvard School of Medicine, "Because the pathophysiology of reduced lung volumes in the obese patient differs from that of the ARDS patient, the best approach to keeping the obese patient's lung open and adequately ventilated during mechanical ventilation is unique. Although strong evidence and research are lacking regarding how to best ventilate the obese surgical patient, we aim with this review to provide an assessment of the small amount of research that has been conducted and the pathophysiology we believe influences the apparent results. We will provide a basic overview of the anatomy and pathophysiology of the obese respiratory system and review studies concerning pre-, intra-, and postoperative respiratory care. Our focus in this review centers on the best approach to keeping the lung recruited through the prevention of compression atelectasis and the maintaining of physiological lung volumes. We recommend the use of PEEP via noninvasive ventilation (NIV) before induction and endotracheal intubation, the use of both PEEP and periodic recruitment maneuvers during mechanical ventilation, and the use of PEEP via NIV after extubation."

According to the news reporters, the research concluded: "It is our hope that by studying the underlying mechanisms that make ventilating obese patients so difficult, future research can be better tailored to address this increasingly important challenge to the field of anesthesia."

For more information on this research see: Respiratory Management of Perioperative Obese Patients. *Respiratory Care*, 2016;61(12):1681-1692. *Respiratory Care* can be contacted at: Daedalus Enterprises Inc, 9425 N Mac Arthur Blvd, Ste 100, Irving, TX 75063-4706, USA.

Our news correspondents report that additional information may be obtained by contacting L. Berra, Harvard Med Sch, Boston, MA, United States. Additional authors for this research include M. Pirrone, C.S. Zhang, D.F. Fisher, R.M. Kacmarek and L. Berra.

Propiophenones

Studies from University of Arizona Add New Findings in the Area of Propiophenones (BMI changes in adolescents treated with bupropion SR for smoking cessation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Propiophenones have been presented. According to news reporting out of Tucson, Arizona, by NewsRx editors, research stated, "Adolescent overweight and obesity and smoking continue to be very important health challenges because of their lasting effects on overall health. Weight gain after smoking cessation is a barrier to quitting as well as a negative consequence to health."

Financial support for this research came from National Cancer Institute.

Our news journalists obtained a quote from the research from the University of Arizona, "This study reports changes in the body mass index (BMI) z-scores of adolescent smokers participating in a dose-ranging clinical trial of bupropion SR (150 mg/day and 300 mg/day) for smoking cessation. A total of N=296 adolescent smokers (placebo n=100, 150 mg/day n=101, 300 mg/day n=95) with a BMI z-score of 0.5 (sd: 1.4), 0.5 (sd: 1.3), and 0.5 (sd: 1.2) in the placebo, 150 mg/day, and 300 mg/day groups, respectively, were followed for 6 months. Adolescents in the 300 mg/day group had a significant reduction in BMI z-score 6 weeks after quitting (b=-0.16, CI=(-0.29, -0.04), P-value=0.01). This result was not sustained at the 6-month follow-up. A reduction in BMI z-score during smoking cessation with bupropion has important implications for the future of adolescent smoking cessation."

According to the news editors, the research concluded: "These results are particularly relevant for adolescents who have either overweight or obesity or who have reservations about quitting for fear of gaining weight or BMI."

For more information on this research see: BMI changes in adolescents treated with bupropion SR for smoking cessation. Obesity, 2016;24(1):26-9. (Nature Publishing Group - www.nature.com; Obesity - www.nature.com/oby/)

Study Findings from Chapman University Provide New Insights into Obesity (Cortisol in Human Milk Predicts Child BMI)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Obesity is now available. According to news originating from Orange, California, by NewsRx correspondents, research stated, "Breastfeeding has been linked to lower rates of childhood obesity. Human milk contains cortisol, known to regulate glucose storage and metabolism."

Our news journalists obtained a quote from the research from Chapman University, "The aim of this study was to test the hypothesis that early exposure to cortisol in human breast milk helps to modulate infant body mass index (BMI) trajectories over the first 2 years of life. Growth curve modeling was used to examine whether infant exposure to cortisol in human milk at 3 months predicted changes in child body mass index percentile (BMIP) at 6, 12, and 24 months of age in 51 breastfeeding mother-child pairs. Infants exposed to higher milk cortisol levels at 3 months were less likely to exhibit BMIP gains over the first 2 years of life, compared with infants exposed to lower milk cortisol. By age 2, infants exposed to higher milk cortisol levels had lower BMIPs than infants exposed to lower milk cortisol. Milk cortisol was a stronger predictor of BMIP change in girls than boys. Cortisol exposure through human milk may help to program metabolic functioning and childhood obesity risk."

According to the news editors, the research concluded: "Further, because infant formula contains only trace amounts of glucocorticoids, these findings suggest that cortisol in milk is a novel biological pathway through which breastfeeding may protect against later obesity."

For more information on this research see: Cortisol in Human Milk Predicts Child BMI. *Obesity*, 2016;24(12):2471-2474. *Obesity* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating from Cordoba, Spain, by NewsRx correspondents, research stated, "Somatostatin (SST) and cortistatin (CORT) regulate numerous endocrine secretions and their absence [knockout (KO)-models] causes important endocrine-metabolic alterations, including pituitary dysregulations. We have demonstrated that the metabolic phenotype of single or combined SST/CORT KO-models is not drastically altered under normal conditions."

Our news editors obtained a quote from the research, "However, the biological actions of SST/CORT are conditioned by the metabolic-status (e.g. obesity). Therefore, we used male/female SST- and CORT-KO mice fed low-fat (LF) or high-fat (HF) diet to explore the interplay between SST/CORT and obesity in the control of relevant pituitary-axes and whole-body metabolism. Our results showed that the SST/CORT role in the control of GH/prolactin secretions is maintained under LF- and HF-diet conditions as SST-KOs presented higher GH/prolactin-levels, while CORT-KOs displayed higher GH- and lower prolactin-levels than controls under both diets. Moreover, the impact of lack of SST/CORT on the metabolic-function was gender-and diet-dependent. Particularly, SST-KOs were more sensitive to HF-diet, exhibiting altered growth and body-composition (fat/lean percentage) and impaired glucose/insulin-metabolism, especially in males. Conversely, only males CORT-KO under LF-diet conditions exhibited significant alterations, displaying higher glucose-levels and insulin-resistance."

According to the news editors, the research concluded: "Altogether, these data demonstrate a tight interplay between SST/CORT-axis and the metabolic status in the control of endocrine/metabolic functions and unveil a clear dissociation of SST/CORT roles."

For more information on this research see: Obesity- and gender-dependent role of endogenous somatostatin and cortistatin in the regulation of endocrine and metabolic homeostasis in mice. Scientific Reports, 2016;6():1-12. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Study Findings on Obesity Are Outlined in Reports from Sheffield Hallam University (‘I just don’t want to get bullied anymore, then I can lead a normal life’; Insights into life as an obese adolescent and their views on obesity treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news reporting out of Sheffield, United Kingdom, by NewsRx editors, research stated, "Adolescent obesity is a complex condition involving social, emotional, behavioural and cultural issues. One-to-one interviews and small focus groups with overweight and obese young people were conducted."

Our news journalists obtained a quote from the research from Sheffield Hallam University, "Qualitative research is an appropriate method to explore the complexity of this issue. Overweight and obese adolescent’s attending a community weight management intervention in South Yorkshire. Main variables studied Interviews aimed to explore the experiences of obese adolescents and their perspectives towards obesity treatment. Adolescent's provided detailed accounts of their perspectives on weight gain, alluding to disordered patterns of eating and overeating, reported as being triggered by social and emotional factors, and in particular, bullying. Avoidance of bullying and a desire to integrate socially with peers were key drivers to seek treatment. Young people reported what they should do to lose weight, yet responsibility for successful weight loss and lifestyle change was repeatedly attributed to the treatment received, as opposed to viewing this as a combination of self-motivation coupled with support provided by friends and family."

According to the news editors, the research concluded: "Weight loss programmes need to consider the complex experience of obese young people in their design, focusing on how to implement long-term lifestyle changes."

Our news journalists report that additional information may be obtained by contacting L.J. Reece, Sheffield Hallam University, Center Sport & Exercise Sci, Sheffield, S Yorkshire, United Kingdom. Additional authors for this research include P. Bissell and R.J. Copeland.

Keywords for this news article include: Sheffield, United Kingdom, Europe, Nutritional and Metabolic Diseases and Conditions, Nutrition Disorders, Diet and Nutrition, Overnutrition, Bariatrics, Obesity, Sheffield Hallam University.

Study Findings on Obesity Are Outlined in Reports from University of Washington (Safety of Outpatient Surgical Abortion for Obese Patients in the First and Second Trimesters)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting originating in Seattle, Washington, by NewsRx journalists, research stated, "To evaluate the relationship between obesity and surgical abortion complications in the outpatient setting. We conducted a retrospective cohort study of 4,968 women undergoing surgical abortion at a large outpatient clinic network from September 2012 to July 2014."

The news reporters obtained a quote from the research from the University of Washington, "We used log-binomial regression to evaluate body mass index (BMI) as an independent risk factor for first- and second-trimester abortion complications. Body mass index was analyzed as both a continuous and categorical predictor. We assessed complications including need for uterine reaspiration (including same-day reaspiration), uterine perforation, cervical laceration, infection, emergency department visit or hospitalization, and excessive blood loss defined as estimated blood loss greater than or equal to 100 mL. The majority (77%) of procedures was performed in the first trimester. Forty-seven percent of women were normal weight or underweight, 28% were overweight, and 25% were obese, including 4% with BMI greater than or equal to 40. The overall complication rate was 1.7%; the most common complications were need for uterine reaspiration (1.0%) and excessive blood loss (0.6%). Obesity was not associated with increased risk of surgical complications, including when adjusting for age, gestational age, and history of prior cesarean delivery. In a high-volume outpatient abortion clinic with experienced health care providers, abortion is very safe."

According to the news reporters, the research concluded: "Obesity does not appear to be an independent predictor for abortion complications and should not be used in isolation to refer women to hospital-based facilities for abortion care in the first or second trimester."

For more information on this research see: Safety of Outpatient Surgical Abortion for Obese Patients in the First and Second Trimesters. Obstetrics and Gynecology, 2016;128(5):1065-1070. Obstetrics and Gynecology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Study Results from National Autonomous University Update Understanding of Obesity (Hepatic miR-33a/miR-144 and their target gene ABCA1 are associated with steatohepatitis in morbidly obese subjects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Obesity is now available. According to news reporting from Mexico City, Mexico, by NewsRx journalists, research stated, "Abnormal cholesterol metabolism may contribute to the pathogenesis of non-alcoholic steatohepatitis (NASH) and fibrosis. miR-33 and miR-144 regulate adenosine triphosphate binding cassette transporter (ABCA1) and other target genes involved in cholesterol efflux, fatty acid oxidation and inflammation. We explored relationships between non-alcoholic fatty liver disease (NAFLD) and the hepatic expression of ABCA1/ABCG1, as well as other target genes regulated by miR-33 (carnitine O-octanoyltransferase, CROT and hydroxyacyl-CoA-dehydrogenase beta-subunit, HADHB) and miR-144 (toll-like receptor-2, TLR2)."

Financial supporters for this research include Consejo Nacional de Ciencia y Tecnologia, Direcccion General Asuntos del Personal Academico, Universidad Nacional Autonoma de Mexico, PAPIIT-UNAM, Fundacion Miguel Aleman.

The news correspondents obtained a quote from the research from National Autonomous University, "Moreover, we evaluated whether the expression of these genes is correlated with miR-33a/b and miR-144 expression in Mexican individuals with morbid obesity. Eighty-four morbidly obese subjects undergoing bariatric surgery were included in this study. Liver biopsies were obtained to measure hepatic triglyceride and free cholesterol contents, as well as ABCA1, ABCG1, CROT, HADHB, TLR2, miR-33a/b and miR-144 expression. Hepatic free cholesterol content was significantly increased in NASH as compared to non-NASH subjects, while ABCA1 and ABCG1 protein levels significantly decreased with NASH and fibrosis progression. The relative expression of miR-33a and miR-144 correlated inversely with ABCA1 but not with ABCG1 protein levels. Moreover, both miRNAs increased significantly in NASH individuals. miR-33 target genes CROT and HADHB correlated inversely with miR-33a. However, the expression of these genes was not associated with NASH."

According to the news reporters, the research concluded: "MiR-33a/144 and their target gene ABCA1 may contribute to the pathogenesis of NASH in morbidly obese subjects."

Our news journalists report that additional information may be obtained by contacting S. Canizales-Quinteros, National Autonomous University of Mexico, Fac Quim, Unidad Genom Poblac Aplicada Salud, Inst Nacl Med Genom INMEGEN, Mexico City, DF, Mexico. Study Results from Pennsylvania State University Update
Understanding of Obesity (Application of the multiphase optimization strategy to a pilot study: an empirical example targeting obesity among children of low-income mothers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting out of University Park, Pennsylvania, by NewsRx editors, research stated, "Emerging approaches to building more efficient and effective behavioral interventions are becoming more widely available. The current paper provides an empirical example of the use of the engineering-inspired multiphase optimization strategy (MOST) to build a remotely delivered responsive parenting intervention to prevent obesity among children of low-income mothers with and without depressive symptoms."

Our news journalists obtained a quote from the research from Pennsylvania State University, "Participants were 107 mothers with (n = 45) and without (n = 62) depressive symptoms who had a child aged 12 to 42 months participating in the Women, Infants and Children program. Participants were randomized to one of sixteen experimental conditions using a factorial design that included a combination of the following eight remotely delivered intervention components: responsive feeding curriculum (given to all participants), parenting curriculum, portion size guidance, obesogenic risk assessment, personalized feedback on mealtime routines, feeding curriculum counseling, goal setting, mobile messaging, and social support. This design enabled efficient identification of components with low feasibility and acceptability. Completion rates were high (85%) and did not statistically differ by depressive symptoms. However, mothers with depressive symptoms who received obesogenic risk assessment and personalized feedback on mealtime routines components had lower completion rates than mothers without depressive symptoms. All intervention components were feasible to implement except the social support component. Regardless of experimental condition, most participants reported that the program increased their awareness of what, when, and how to feed their children. MOST provided an efficient way to assess the feasibility of components prior to testing them with a fully powered experiment. This framework helped identify potentially challenging combinations of remotely delivered intervention components."

According to the news editors, the research concluded: "Consideration of how these results can inform future studies focused on the optimization phase of MOST is discussed."

For more information on this research see: Application of the multiphase optimization strategy to a pilot study: an empirical example targeting obesity among children of...

*Study Results from Sapienza-University Update Understanding of Obesity (Circulating SIRT1 inversely correlates with epicardial fat thickness in patients with obesity)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Obesity have been presented. According to news originating from Rome, Italy, by NewsRx correspondents, research stated, "Obesity is increasing worldwide and is related to undesirable cardiovascular outcomes. Epicardial fat (EF), the heart visceral fat depot, increases with obesity and correlates with cardiovascular risk."

Financial support for this research came from Sapienza University of Rome, Italy.

Our news journalists obtained a quote from the research from Sapienza-University, "SIRT1, an enzyme regulating metabolic circuits linked with obesity, has a cardioprotective effect and is a predictor of cardiovascular events. We aimed to assess the relationship of EF thickness (EFT) with circulating SIRT1 in patients with obesity. Sixty-two patients affected by obesity and 23 lean controls were studied. Plasma SIRT1 concentration was determined by enzyme-linked immunosorbent assay (ELISA). EFT was measured by echocardiography. Body mass index (BMI), waist circumference, heart rate (HR), blood pressure, and laboratory findings (fasting glucose, insulin, HbA1c, cholesterol, and triglycerides) were assessed. SIRT1 was significantly lower (P = 0.002) and EFT was higher (P < 0.0001) in patients with obesity compared with lean controls. SIRT1 showed a negative correlation with EFT and HR in the obesity group (rho = -0.350, P = 0.005; rho = -0.303, P = 0.008, respectively). After adjustment for obesity-correlated variables, multiple linear regression analysis showed that EFT remained the best correlate of SIRT1 (beta = -0.352, P = 0.016). Circulating SIRT1 correlates with the visceral fat content of the heart."

According to the news editors, the research concluded: "Serum SIRT1 levels might provide additional information for risk assessment of coronary artery disease in patients with obesity."

For more information on this research see: Circulating SIRT1 inversely correlates with epicardial fat thickness in patients with obesity. *Nutrition Metabolism and*

Peptide Proteins - Proglucagon

Study Results from Swedish Neuroscience Institute Provide New Insights into Proglucagon (American Association Of Clinical Endocrinologists And American College Of Endocrinology Disease State Clinical Review: Update On Growth Hormone Stimulation ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptide Proteins - Proglucagon. According to news reporting out of Seattle, Washington, by NewsRx editors, research stated, "The clinical features of adult GH deficiency (GHD) are nonspecific, and GH stimulation testing is often required to confirm the diagnosis. However, diagnosing adult GHD can be challenging due to the episodic and pulsatile GH secretion, concurrently modified by age, gender, and body mass index (BMI)."

Our news journalists obtained a quote from the research from Swedish Neuroscience Institute, "PubMed searches were conducted to identify published data since 2009 on GH stimulation tests used to diagnose adult GHD. Relevant articles in English language were identified and considered for inclusion in the present document. Testing for confirmation of adult GHD should only be considered if there is a high pretest probability, and the intent to treat if the diagnosis is confirmed. The insulin tolerance test (ITT) and glucagon stimulation test (GST) are the two main tests used in the United States. While the ITT has been accepted as the gold-standard test, its safety concerns hamper wider use. Previously, the GH-releasing hormone-arginine test, and more recently the GST, are accepted alternatives to the ITT. However, several recent studies have questioned the diagnostic accuracy of the GST when the GH cut-point of 3 mg/L is used and have suggested that a lower GH cut-point of 1 mg/L improved the sensitivity and specificity of this test in overweight/obese patients and in those with glucose intolerance. Until a potent, safe, and reliable test becomes available, the GST should remain as the alternative to the ITT in the United States. In order to reduce over-diagnosing adult GHD in overweight/obese patients with the GST, we propose utilizing a lower GH cut-point of 1 mg/L in these subjects."
According to the news editors, the research concluded: "However, this lower GH cut-point still needs further evaluation for diagnostic accuracy in larger patient populations with varying BMIs and degrees of glucose tolerance."

For more information on this research see: American Association Of Clinical Endocrinologists And American College Of Endocrinology Disease State Clinical Review: Update On Growth Hormone Stimulation Testing And Proposed Revised Cut-point For The Glucagon Stimulation Test In The Diagnosis Of A. Endocrine Practice, 2016;22(10):1235-1244. Endocrine Practice can be contacted at: Amer Assoc Clinical Endocrinologists, 245 Riverside Avenue, Ste 200, Jacksonville, FL 32202, USA.

Our news journalists report that additional information may be obtained by contacting K.C.J. Yuen, Swedish Neurosci Inst, Dept. of Neurosurg, Seattle, WA 98122, United States. Additional authors for this research include N.A. Tritos, S.L. Samson, A.R. Hoffman and L. Katznelson.

Study Results from University Medical Center Provide New Insights into Obesity (Macrosomia, Obesity, and Macrocephaly as First Clinical Presentation of PHP1b Caused by STX16 Deletion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting out of Utrecht, Netherlands, by NewsRx editors, research stated, "Pseudohypoparathyroidism (PHP) is a genetic disorder with resistance to parathyroid hormone (PTH) as most important feature. Main subtypes of the disease are pseudohypoparathyroidism 1b (PHP1b) and pseudohypoparathyroidism 1a (PHP1a)."

Our news journalists obtained a quote from the research from University Medical Center, "PHP1b is characterized by PTH resistance of the renal cortex due to reduced activity of the stimulatory G protein a subunit (Gs alpha) of the PTH receptor. In addition to resistance to PTH, PHP1a patients also lack sensitivity for other hormones that signal their actions through G protein-coupled receptors and display physical features of Albright hereditary osteodystrophy (AHO), which is not classically seen in PHP1b patients. PHP1a is caused by heterozygous loss-of-function mutations in maternally inherited GNAS exons 1-13, which encode Gsa. PHP1b is often caused by deletion of the STX16 gene, which is thought to have an important role in controlling the methylation and thus imprinting at part of the GNAS locus. Here we present a patient with PHP1b caused by the previously described recurrent 3-kb STX16 deletion. The patient's first symptoms were macrosomia, early onset obesity, and macrocephaly."

According to the news editors, the research concluded: "Since this is an atypical but previously described rare presentation of PHP1b, we reemphasize STX16 deletions and PHP1b as a rare cause for early onset obesity and macrosomia."

For more information on this research see: Macrosomia, Obesity, and Macrocephaly

Our news journalists report that additional information may be obtained by contacting I.M. de Lange, Univ Med Center Utrecht, Dept. of Med Genet, NL-3584 CX Utrecht, Netherlands. Additional authors for this research include A.A.V. Stuart, R.B. van der Luijt, H.K.P. van Amstel and M.M. van Haelst.

Peptide Proteins - Proinsulin

Study Results from University of Missouri Update Understanding of Proinsulin (Transcriptomic differences in intra-abdominal adipose tissue in extremely obese adolescents with different stages of NAFLD)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Peptide Proteins - Proinsulin have been published. According to news reporting originating from Columbia, Missouri, by NewsRx correspondents, research stated, "Mechanisms responsible for progression of nonalcoholic fatty liver disease (NAFLD) to steatohepatitis (NASH) remain poorly defined. To examine the potential contribution of adipose tissue to NAFLD progression, we performed a complete transcriptomic analysis using RNA sequencing (RNA-Seq) on intra-abdominal adipose tissue (IAT) from severely obese adolescents [M-age 16.9 +/- 0.4 yr, body mass index (BMI) z-score 2.7 +/- 0.1] undergoing bariatric surgery and liver biopsy categorized into three groups: no steatosis (normal, n = 8), steatosis only (n = 13), or NASH (n = 10) by liver histology."

Funders for this research include University of Missouri Life Sciences Pre-Doctoral Fellowship, JR Albert Foundation, U.S. Department of Veterans Affairs (VA), Center for Bariatric Research and Innovation at Cincinnati Children's Hospital, HHS | National Institutes of Health (NIH).

Our news editors obtained a quote from the research from the University of Missouri, "Age, body weight, and BMI did not differ among groups, but subjects with NASH were more insulin resistant (increased homeostatic model assessment/insulin resistance, P< 0.05 vs. other groups). RNA-Seq revealed 175 up-and 492 downregulated mRNA transcripts (>= +/- 1.5-fold, false discovery rate <0.10) in IAT between NASH vs. Normal, with 'mitochondrial dysfunction, P = 4.19E-7' being the top regulated canonical pathway identified by Ingenuity Pathway Analysis; only 19 mRNA transcripts were up-and 148 downregulated when comparing Steatosis
vs. Normal, with suppression of 'EIF2 signaling, P = 1.79E-27' being the top regulated pathway indicating increased cellular stress. A comparison of IAT between NASH vs. Steatosis found 515 up-and 175 downregulated genes, with 'antigen presentation, P = 6.03E-18' being the top regulated canonical pathway and 'inflammatory response' the top diseases and disorders function."

According to the news editors, the research concluded: "Unique transcriptomic differences exist in IAT from severely obese adolescents with distinct stages of NAFLD, providing an important resource for identifying potential novel therapeutic targets for childhood NASH."

For more information on this research see: Transcriptomic differences in intra-abdominal adipose tissue in extremely obese adolescents with different stages of NAFLD. *Physiological Genomics*, 2016;48(12):897-911. *Physiological Genomics* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

The news editors report that additional information may be obtained by contacting R.S. Rector, University of Missouri, Dept. of Nutr & Exercise Physiol, Columbia, MO, United States. Study Results from University of Salento Update Understanding of Obesity [Socio-Economic and Environmental Factors Associated with Overweight and Obesity in Children Aged 6-8 Years Living in Five Italian Cities (the MAPEC_LIFE Cohort)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news originating from Lecce, Italy, by NewsRx correspondents, research stated, "The prevalence of obesity among Italian children has reached such alarming levels as to require detailed studies of the causes of the phenomenon. A cross-sectional study was carried out in order to assess the weight status of 1164 Italian children aged 6-8 years (the Monitoring Air Pollution Effects on Children for Supporting Public Health Policy (MAPEC_LIFE) cohort) and to identify any associations between selected socio-economic and environmental factors and overweight/obesity."

Our news journalists obtained a quote from the research from the University of Salento, "The data were obtained by means of a questionnaire given to parents, and any associations were examined by binomial logistic regression analyses. Overweight was found to be positively associated with male gender, parents of non-Italian origin, and parents who smoke,
and negatively associated with the parents' level of education and employment. In addition, the frequency of overweight varied in relation to the geographical area of residence, with a greater prevalence of overweight children in the cities of central-southern Italy."

According to the news editors, the research concluded: "This study highlights the need to implement appropriate obesity prevention programs in Italy, which should include educational measures concerning lifestyle for parents from the earliest stages of their child's life."

For more information on this research see: Socio-Economic and Environmental Factors Associated with Overweight and Obesity in Children Aged 6-8 Years Living in Five Italian Cities (the MAPEC_LIFE Cohort). International Journal of Environmental Research and Public Health, 2016;13(10):918-928. International Journal of Environmental Research and Public Health can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Musculoskeletal Diseases and Conditions -…

Findings from French National Institute of Health and Medical Research (INSERM) Has Provided New Data on Osteoarthritis [Ceftriaxone-Resistant Neisseria gonorrhoeae Isolates (2010 to 2014) in France Characterized by Using Whole-Genome Sequencing]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Neisseria gonorrhoeae have been presented. According to news originating from Paris, France, by NewsRx correspondents, research stated, "Two extended-spectrum cephalosporin-resistant Neisseria gonorrhoeae isolates were discovered among 6,340 (0.03%) French isolates between 2010 and 2014."

Our news journalists obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "One isolate corresponded to the F89 multidrug-resistant N. gonorrhoeae isolate harboring a penA mosaic; whole-genome sequencing highlighted an additional R251H substitution in the ftsX gene recently involved in cephalosporin resistance."

According to the news editors, the research concluded: "The other, ceftriaxone-resistant isolate ( MIC, 0.25 mg/liter) harbored the PBP2 pattern XXXVI plus a P551S substitution and belonged to sequence type ST1579 (multilocus sequence typing [MLST])."

New Findings from University of California Describe Advances in HIV/AIDS (Client-perpetrated and husband-perpetrated violence among female sex workers in Andhra Pradesh, India: HIV/STI risk across personal and work contexts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immune System Diseases and Conditions - HIV/AIDS is now available. According to news reporting out of La Jolla, California, by NewsRx editors, research stated, "This study examines violence experienced in work and personal contexts and relation to HIV risk factors in these contexts among female sex workers (FSW) in Andhra Pradesh, India. FSW at least 18 years of age (n=2335) were recruited through three rounds of respondent-driven sampling between 2006 and 2010 for a survey on HIV risk."

Our news journalists obtained a quote from the research from the University of California, "Using crude and adjusted logistic regression models, any sexual/physical violence (last 6 months) perpetrated by clients and husbands were separately assessed in association with accepting more money for sex without a condom (last 30 days), consistent condom use with clients and husbands (last 30 days), and sexually transmitted infection (STI) symptoms (last 6 months). The mean age among participants was 32, 22% reported being currently married, and 22% and 21% reported physical/sexual violence by clients and husbands, respectively. In adjusted logistic regression models, FSW who experienced client violence were more likely to report accepting more money for unprotected sex trades (adjusted OR (AOR)=1.7; 95% CI 1.4 to 2.2), less likely to report consistent condom use with clients (AOR=0.6; 95% CI 0.5 to 0.7) and more likely to report STI symptoms (AOR=3.5; 95% CI 2.6 to 4.6). Women who reported husband violence were more likely to report accepting more money for unprotected sex trades (AOR=2.1; 95% CI 1.2 to 3.7), less likely to report consistent condom use with clients (AOR=0.5; 95% CI 0.3 to 0.8) and more likely to report STI symptoms (AOR=2.6; 95% CI 1.6 to 4.1)."
According to the news editors, the research concluded: "Among FSW, experiences of violence in work and personal contexts are associated with sexual HIV risk behaviours with clients as well as STI symptoms."

Our news journalists report that additional information may be obtained by contacting E. Reed, University of California, Sch Med La Jolla, Div Global Public Hlth, La Jolla, CA 90037, United States. Additional authors for this research include J.T. Erausquin, A.K. Groves, M. Salazar, M. Biradavolu and K.M. Blankenship.

**Nanotechnology - Molecular Imaging**

**Researchers from Harvard School of Medicine Provide Details of New Studies and Findings in the Area of Molecular Imaging (Sites With Small Impedance Decrease During Catheter Ablation for Atrial Fibrillation Are Associated With Recovery of ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Impedance Decrease During AF Ablation. To correlate impedance decrease during atrial fibrillation (AF) ablation with lesion durability and PV conduction recovery demonstrated during redo procedures."

The news correspondents obtained a quote from the research from the Harvard School of Medicine, "Markers of successful ablation beyond acute conduction block are needed to improve durability of pulmonary vein (PV) isolation (PVI). Local impedance decrease resulting from ablation is a real-time marker of tissue heating and is correlated with lesion creation. Impedance changes associated with point-by-point radiofrequency ablation in the PV antra were recorded during 167 consecutive first-time AF ablations. During clinically indicated redo procedures, sites of recovered PV conduction were identified, and were correlated with the impedance change achieved during ablation at these locations during the initial procedure. Redo procedures were performed in 28 patients, in whom 19 sites of recovered PV conduction were documented. Most sites of PV reconnection (58%) occurred along the posterior PV antra."
Ablation resulting in impedance decrease < 10 ohms during the initial procedure was present in 89% (17/19) of sites with conduction recovery. Regions with adjacent ablation resulting in impedance decrease < 10 ohms were associated with a higher rate of conduction recovery (37% vs. 1.5%, P< 0.001). Likewise, patients with PV conduction recovery demonstrated during redo procedure (Group 1) had larger regions where ablation resulted in < 10 ohm impedance decrease than patients without PV conduction recovery (Group 2) (21.9 +/- 15.5 mm vs. 11.5 +/- 2.1 mm, P< 0.01). Recovered PV conduction occurs predominantly in regions where adjacent ablation applications result in impedance decreases < 10 ohms."

According to the news reporters, the research concluded: "Impedance-guided ablation strategies may improve durability of PVI."

For more information on this research see: Sites With Small Impedance Decrease During Catheter Ablation for Atrial Fibrillation Are Associated With Recovery of Pulmonary Vein Conduction. *Journal of Cardiovascular Electrophysiology*, 2016;27(12):1390-1398.

Our news journalists report that additional information may be obtained by contacting J.S. Chinitz, Harvard Med Sch, Brigham & Women's Hospital, Dept. of Med, Cardiac Arrhythmia ServDiv Cardiol, Boston, MA, United States. Additional authors for this research include S. Kapur, C. Barbhaiya, S. Kumar, R. John, L.M. Epstein, U. Tedrow, W.G. Stevenson and G.F. Michaud.

**Digestive System Diseases and Conditions - Colonic...**

**Researchers from University of Barcelona Report Details of New Studies and Findings in the Area of Colonic Polyps (Prognostic Value of Left Atrial Strain in Outpatients with De Novo Heart Failure)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Failure. According to news reporting out of Barcelona, Spain, by NewsRx editors, research stated, "Left atrial (LA) dysfunction has been related to symptom onset in patients with heart failure (HF). However, the potential prognostic role of LA function has been scarcely studied in outpatients with new-onset HF symptoms."

Our news journalists obtained a quote from the research from the University of Barcelona, "Consecutive outpatients with suspected HF onset evaluated at a one-stop clinic were screened. HF diagnosis was performed according to current guidelines. LA function was analyzed in patients in sinus rhythm by speckle-tracking echocardiography, determining LA peak strain rate after atrial contraction (LASRa) as a surrogate of atrial contractile function. Yearly prospective follow-up was conducted to report cardiovascular hospital admission or death. Patients without HF in sinus rhythm were followed as a control group. Survival curves
were estimated using the Kaplan-Meier method. One hundred fifty-four outpatients were included (mean age, 74 +/- 10 years; 67% women) with a median follow-up duration of 44.4 months (interquartile range, 31-58 months). Final diagnosis was 29.9% non-HF and 70.1% HF. More than two in five patients with HF (44.4%) had AF (n = 48), and 55.6% (n = 60) were in sinus rhythm. The latter were divided according to LASRa tertile: highest, -1.93 +/- 0.39 sec(-1); middle, -1.08 +/- 0.21 sec(-1); and lowest, -0.47 +/- 0.18 sec(-1). At the end of follow-up, patients with atrial fibrillation had a low event-free survival rate (56.3%), similar to those in the lower LASRa tertile (55.0%). The non-HF group had the best prognosis, and the higher and middle LASRa tertiles had intermediate prognoses (event-free survival, 85%, 75%, and 70%, respectively). The study of contractile LA function in outpatients with new-onset HF provides prognostic stratification."

According to the news editors, the research concluded: "The early identification of patients at higher risk on the basis of their atrial function would allow focusing on them independently of their final diagnoses."

Our news journalists report that additional information may be obtained by contacting L. Sanchis, University of Barcelona, Cardiovasc Inst, Barcelona Hospital Clinic, IDIBAPS, Barcelona, Spain. Additional authors for this research include R. Andrea, C. Falces, T. Lopez-Sobrino, S. Montserrat, F. Perez-Villa, B. Bijnens and M. Sitges.

**Statistical Mechanics**

**Researchers from University of Cagliari Provide Details of New Studies and Findings in the Area of Statistical Mechanics (Altered Aortic Upper Wall TDI Velocity Is Inversely Related with Left Ventricular Diastolic Function in Operated Tetralogy ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Tetralogy of Fallot is now available. According to news reporting originating from Cagliari, Italy, by NewsRx correspondents, research stated, "Postoperative tetralogy of Fallot (TOF) patients often develop progressive aortic root dilatation due to an impairment in aortic elastic properties. (1) to assess aortic elasticity at the level of the aortic upper wall by tissue Doppler imaging (TDI); (2) to
evaluate the influence of aortic elasticity on left ventricular (LV) diastolic function in TOF patients."

Our news editors obtained a quote from the research from the University of Cagliari, "Twenty-eight postoperative TOF patients (14 males, 14 females. Mean age: 25.7 +/- 1.6 years) and 28 age- and sex-matched normal subjects were examined. Aortic distensibility and stiffness index were calculated. Aortic wall systolic and diastolic velocities, LV systolic and diastolic parameters were assessed by TDI. Aortic distensibility was significantly lower (P = .024), and aortic stiffness index significantly higher (P = .036) in TOF patients compared to controls. E/E' was significantly higher in TOF than in control group (P < .001). Aortic upper wall early diastolic velocity (AWEDV) was significantly correlated with aortic stiffness index (r: -0.42; P < .03), aortic distensibility (r=0.54; P< .004), left atrial volume (r=0.62; P = .0004), and E/E' ratio (r = -0.87; P< .0001). The latter relationship remained significant even when excluding the influence of age at surgery (r = 0.60; P< .0007) and of previous palliative surgery (r = -0.53; P< .02). Aortic elastic properties can be directly assessed using TDI to measure AWEDV."

According to the news editors, the research concluded: "Aortic elasticity is significantly lower in postoperative TOF patients, exerting a negative effect also on LV diastolic function, with a potential long-term influence on clinical status."

For more information on this research see: Altered Aortic Upper Wall TDI Velocity Is Inversely Related with Left Ventricular Diastolic Function in Operated Tetralogy of Fallot. Congenital Heart Disease, 2016;11(6):598-605. Congenital Heart Disease can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com; Congenital Heart Disease - onlinelibrary.wiley.com/journal/10.1111/(ISSN) 1747-0803)

The news editors report that additional information may be obtained by contacting P.P. Bassareo, University of Cagliari, Dept. of Med Sci M Aresu, Cagliari, Italy. Additional authors for this research include L. Saba, A.R. Marras and G. Mercuro.

Aromatic Amino Acids

Researchers from University of North Carolina Report Details of New Studies and Findings in the Area of Aromatic Amino Acids (Co-delivery of polymeric metformin and cisplatin by self-assembled core-membrane nanoparticles to treat non-small cell ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news reporting from Chapel Hill, North Carolina, by NewsRx journalists, research stated, "Clinically, combined therapy of cisplatin (CDDP) and metformin is an effective treatment for non-small cell lung cancer (NSCLC). The success is attributed to synergistic effects between the two drugs."

Funders for this research include NIH, National Natural Science Foundation of China.
The news correspondents obtained a quote from the research from the University of North Carolina, "Therefore, we hypothesize that co-encapsulation of CDDP and metformin will avoid the prominent toxicity of CDDP while maintaining the synergy between the regimens. CDDP was first conjugated to polyglutamic acid (PGA) to form anionic PGA-CDDP which was electrostatically complexed with the cationic polymeric metformin (polymet). The nano-sized complex was then stabilized with cationic liposomes composed of DOTAP (2, 3-Dioleoyloxypropyl)trimethylammonium/Cholesterol/DSPE-PEG-anisamide aminoethyl. Both in vitro and in vivo experiments confirmed the synergy between polymet and CDDP. CDDP delivered with nanoparticles (NPs) exhibited significantly increased tumor accumulation over free CDDP and suppressed tumor growth through apoptosis in NSCLC H460 tumor-bearing mice without nephrotoxicity. The synergistic effect of polymet alongside CDDP demonstrates that polymet-CDDP NPs can activate the AMP-activated protein kinase alpha (AMPK alpha) pathway and inhibit mammalian target rapamycin (mTOR) activity to enhance growth suppression."

According to the news reporters, the research concluded: "In all, this platform is the first to successfully co-load polymet, a polymeric metformin, and CDDP into the same nanoparticle for successful treatment of NSCLC."

For more information on this research see: Co-delivery of polymeric metformin and cisplatin by self-assembled core-membrane nanoparticles to treat non-small cell lung cancer. *Journal of Controlled Release*, 2016;244():63-73. *Journal of Controlled Release* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Biomedical Engineering - Tissue Engineering**

**Researchers from University of Pittsburgh Provide Details of New Studies and Findings in the Area of Tissue Engineering (Early Whole Blood Transcriptional Signatures Are Associated with Severity of Lung Inflammation in Cynomolgus Macaques with ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections -
Tuberculosis. According to news reporting originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "Whole blood transcriptional profiling offers great diagnostic and prognostic potential. Although studies identified signatures for pulmonary tuberculosis (TB) and transcripts that predict the risk for developing active TB in humans, the early transcriptional changes immediately following Mycobacterium tuberculosis infection have not been evaluated."

Our news editors obtained a quote from the research from the University of Pittsburgh, "We evaluated the gene expression changes in the cynomolgus macaque model of TB, which recapitulates all clinical aspects of human M. tuberculosis infection, using a human microarray and analytics platform. We performed genome-wide blood transcriptional analysis on 38 macaques at 11 postinfection time points during the first 6 mo of M. tuberculosis infection. Of 6371 differentially expressed transcripts between preinfection and postinfection, the greatest change in transcriptional activity occurred 20-56 d postinfection, during which fluctuation of innate and adaptive immune response-related transcripts was observed. Modest transcriptional differences between active TB and latent infection were observed over the time course with substantial overlap. The pattern of module activity previously published for human active TB was similar in macaques with active disease. Blood transcript activity was highly correlated with lung inflammation (lung [F-18]fluorodeoxyglucose [FDG] avidity) measured by positron emission tomography and computed tomography at early time points postinfection. The differential signatures between animals with high and low lung FDG were stronger than between clinical outcomes. Analysis of preinfection signatures of macaques revealed that IFN signatures could influence eventual clinical outcomes and lung FDG avidity, even before infection."

According to the news editors, the research concluded: "Our data support that transcriptional changes in the macaque model are translatable to human M. tuberculosis infection and offer important insights into early events of M. tuberculosis infection."

For more information on this research see: Early Whole Blood Transcriptional Signatures Are Associated with Severity of Lung Inflammation in Cynomolgus Macaques with Mycobacterium tuberculosis Infection. *Journal of Immunology*, 2016;197(12):4817-4828. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Researchers from University of Wisconsin Report Details of New Studies and Findings in the Area of South Asia (BMP1-like proteinases are essential to the structure and wound healing of skin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Matrix Biology. According to news reporting out of Madison, Wisconsin, by NewsRx editors, research stated, "Closerly related extracellular metalloproteinases bone morphogenetic protein 1 (BMP1) and mammalian Tolloid-like 1 (mTLL1) are co-expressed in various tissues and have been suggested to have overlapping roles in the biosynthetic processing of extracellular matrix components. Early lethality of mice null for the BMP1 gene Bmp1 or the mTLL1 gene Till has impaired in vivo studies of these proteinases."

Funders for this research include Department of Veterans Affairs, Debra International Epidermolysis Bullosa Medical Research Foundation, Palo Alto VA Office of Research and Development, National Institutes of Health.

Our news journalists obtained a quote from the research from the University of Wisconsin, "To overcome issues of early lethality and functional redundancy we developed the novel BTKO mouse strain, with floxed Bmp1 and Till1 alleles, for induction of postnatal, simultaneous ablation of the two genes. We previously showed these mice to have a skeletal phenotype that includes elements of osteogenesis imperfecta (OI), osteomalacia, and deficient osteocyte maturation, observations validated by the finding of BMP1 mutations in a subset of human patients with OI-like phenotypes. However, the roles of BMP1-like proteinase in non-skeletal tissues have yet to be explored, despite the supposed importance of putative substrates of these proteinases in such tissues. Here, we employ BTKO mice to investigate potential roles for these proteinases in skin. Loss of BMP1-like proteinase activity is shown to result in markedly thinned and fragile skin with unusually densely packed collagen fibrils and delayed wound healing. We demonstrate deficits in the processing of collagens I and III, decorin, biglycan, and laminin 332 in skin, which indicate mechanisms whereby BMP1-like proteinases affect the biology of this tissue."

According to the news editors, the research concluded: "In contrast, lack of effects on collagen VII processing or deposition indicates this putative substrate to be biosynthetically processed by non-BMP1-like proteinases."

For more information on this research see: BMP1-like proteinases are essential to the structure and wound healing of skin. Matrix Biology, 2016;56():114-131. Matrix Biology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Matrix Biology - www.journals.elsevier.com/matrix-biology/)

Study Data from Johns Hopkins University Provide New Insights into Cardiology (Cardiac Index Declines During Long-Term Left Ventricular Device Support)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiology are discussed in a new report. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "To investigate longitudinal trends in valvular and ventricular function with long-term left ventricular assist device (LVAD) therapy, we analyzed hemodynamic and echocardiographic data of patients with at least 2 years of continuous LVAD support. All 130 patients who underwent HeartMate II implantation at our institution between 2005 and 2012 were reviewed."

The news correspondents obtained a quote from the research from Johns Hopkins University, "Twenty patients had hemodynamic and echocardiographic evaluations in both the early (0-6 months) and late (2-3 years) postoperative period. Patients on inotropic therapy or temporary mechanical support were excluded. The average times of early and late hemodynamic evaluations were 59,641 days and 88,961 days, respectively. Cardiac index (CI) declined by an average of 0.4 L/min/m² (P=0.04) with concomitant increase in pulmonary capillary wedge pressure (PCWP; P=0.02). The right atrial pressure to PCWP (RAP: PCWP) ratio decreased during LVAD support suggesting improvement in right ventricular function. While there was an increase in degree of aortic insufficiency (AI) at the late follow-up period (P=0.008), dichotomization by median decline in CI (20.4 L/min/m²) indicated no difference in prevalence of AI among the groups. CI declined in patients with HeartMate II after 2 years of continuous support."

According to the news reporters, the research concluded: "An increase in preload and afterload was observed in those with the greatest decline in CI."

Our news journalists report that additional information may be obtained by contacting R.J. Tedford, Johns Hopkins University, Dept. of Med, Div Cardiol, Baltimore, MD 21287, United States. Additional authors for this research include B.A. Houston, J.M. Chaisson, J.C. Grimm, G.R. Stevens, C.M. Sciortino, A.S. Shah, G.J.R. Whitman, S.D. Russell and R.J. Tedford.

ALEXION ALXN ALERT: Johnson & Weaver, LLP Announces Filing of Class Action Complaint Against Alexion Pharmaceuticals, Inc.; Encourages all Investors to Contact the Firm for Information

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Johnson & Weaver, LLP announces that a class action complaint was filed on behalf of purchasers of Alexion Pharmaceuticals, Inc. (NASDAQ: ALXN) securities during the period between February 10, 2014 and November 9, 2016 (the "Class Period"). Alexion is a biopharmaceutical company that develops and commercializes therapeutic products. The lawsuit will seek to recover damages for shareholders.

According to the complaint, throughout the Class Period defendants issued materially false and misleading statements to investors and failed to disclose that: Alexion employed improper sales practices with respect to Soliris; as a result, Alexion's revenues from Soliris sales were unlikely to be sustainable; and therefore, Alexion's public statements were materially false and misleading at all relevant times.

If you have any questions concerning this notice, or if you purchased stock before the February 10, 2014, class period, please contact lead analyst Jim Baker (mailto:jimb@johnsonandweaver.com) at 619-814-4471. If you email, please include your phone number.

Any member of the putative class may move the Court to serve as lead plaintiff through counsel of their choice or may choose to do nothing and remain an absent class member.

Keywords for this news article include: Alexion Pharmaceuticals, Pharmaceutical Companies, Legal Issues, Johnson & Weaver Llp.

Neurodegenerative Diseases and Conditions - Motor…

ALS and Alzheimer's Disease Bioinformatics Reports Confirm GM6's Role as Regulator of Disease-Relevant Pathways

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Genervon Biopharmaceuticals LLC ("Genervon") reported that in advance of the upcoming JP Morgan Healthcare Conference in San Francisco in January it will publish the confidential list of genes associated with Amyotrophic Lateral Sclerosis (ALS) (89 genes) and Alzheimer's disease (84 genes) that are modulated by GM6 to potentially bring homeostasis to these progressive, incurable and fatal neurodegenerative diseases.

GM6 is modeled upon an endogenous embryonic-stage motoneuronotrophic factor regulator that controls differentiation and development of the human nervous system while further potentially monitoring distress signals and coordinating responses to restore homeostasis. GM6 binds specifically to the beta sub-unit of the tyrosine kinase of the Insulin Receptors, IGF1 Receptors and IGF2 Receptors, to activate the monitoring and repair mechanism in the brain. GM6 has been demonstrated to be safe in phase 1 and three phase 2 trials (ALS, PD and Ischemic Stroke).
Most, if not all, ALS and Alzheimer's disease clinical trials have failed because conventional drug design has narrowly focused only on single targets believed to be associated with ALS or AD pathogenesis. Genervon has now shown that GM6 modulates 89 ALS-associated genes by at least twofold along with 84 AD-associated genes. These genes were associated with a diverse set of pathways and disease-associated processes that are consistent with our unique multi-target drug design strategy based upon an endogenous regulator.

Genervon's ALS poster is now available online showing the 89 ALS-associated genes that are modulated by GM6: https://f1000research.com/posters/5-2836.

Genervon's AD poster is now available online showing the 84 AD-associated genes that are modulated by GM6: https://f1000research.com/posters/5-2915 Genervon discovered and developed GM6 for a range of neurological disorders with a primary focus on neurodegenerative diseases including Amyotrophic Lateral Sclerosis (ALS), Parkinson's disease (PD), Muscular Dystrophy (MS), Huntington Disease (HD) and Alzheimer's disease (AD). Genervon is planning a phase 3 clinical trial for ALS in 2017.

Genervon welcomes inquiries regarding partnership opportunities, licensing, and clinical trial cooperation inquiries. For further information, click the following links: rnd@genervon.com, licensing@genervon.com, investment@genervon.com View source version on businesswire.com: http://www.businesswire.com/news/home/20161227005093/en/

Abortion care in the UK is 'heading towards a crisis,' warns expert

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Abortion care in the UK is "heading towards a crisis" and reform of the law is just one of the many obstacles that needs to be overcome, argues an expert in the Journal of Family Planning and Reproductive Health Care.

Among the challenges women seeking abortion face include inequitable access, a lack of trained staff, stigmatisation, and a culture of exceptionalism, explains Dr Sandy Goldbeck-Wood, editor in chief of the journal, and clinical lead for abortion services at Cambridge University Hospitals.

She argues that "problems of access and stigma, familiar worldwide, are compounded in the UK by an abortion law that is now widely seen as not fit for purpose" which is considered to be "out of step with technical advances in safe medical abortion and current UK social values."

Most women believe they have a right to make their own decision about abortion, but British law still requires the identification of serious physical or mental health risk by two doctors not necessarily qualified, and who may not know the woman personally.

The law is, therefore, widely seen by clinicians as "hypocritical and anachronistic," explains Dr Goldbeck-Wood.
Another problem is that abortion care has become artificially separated from the rest of reproductive health care, she adds. In the UK, a high proportion of abortion care is provided in specialist organisations outside the NHS.

Trainees in obstetrics and gynaecology - among them the potential service providers of the future - have too little opportunity to benefit from the learning environment that abortion care offers.

"As well as reinforcing stigma, this deprives trainees of valuable learning opportunities," she says

Organisations calling for the law to be reformed include the British Pregnancy Advisory Service, the Royal College of Nursing, the Royal College of Midwives and other women's health organisations.

And if the law is to be reformed, says Dr Goldbeck-Wood, there will be a strong need for debate which is respectful and acknowledges the ethical complexity in this sensitive area of health care.

"Abortion care remains a high-volume, under-researched and under-integrated area of women's healthcare," she writes. "2017 is an excellent time for practitioners to be challenging hypocrisy and exceptionalism in UK abortion care, and leading respectful debate centred on women's needs, with complexity acknowledged."

A study led by Dr Louise Keogh, from the University of Melbourne, assessed the decriminalisation of abortion in the Victoria state of Australia in 2008.

It found that a change in the law has empowered women, and increased clarity and safety for clinicians, but has failed to address stigma, access to services and workforce sustainability.

Commenting on the study, Sally Sheldon, professor of law at Kent University, says that the abortion law reform in Victoria has vital lessons for the UK.

She says that removal of specific criminal prohibitions against abortion "should not be seen as a panacea", even though it is important to remove criminal law prohibitions and to establish abortion care as a health issue.

Much more work is needed to remove stigma, encourage doctors to provide terminations, and improve "equitable access to excellent, modern abortion services," she concludes.

**Lung Diseases and Conditions - Cystic Fibrosis**

**Alder Hey Children's NHS Foundation Trust Details Findings in Cystic Fibrosis (Pneumococcal vaccines for cystic fibrosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Cystic Fibrosis. According to news reporting originating in Merseyside, United Kingdom, by NewsRx journalists, research stated, "Invasive pneumococcal disease is associated with significant mortality and many countries have introduced routine pneumococcal vaccination into their childhood immunisation programmes. Whilst pneumococcal disease in cystic fibrosis is
uncommon, pneumococcal immunisation may offer some protection against pulmonary exacerbations caused by this pathogen."

The news reporters obtained a quote from the research from Alder Hey Children's NHS Foundation Trust, "In the USA and UK pneumococcal vaccination is currently recommended for all children and adults with cystic fibrosis. This is an update of a previously published review. To assess the efficacy of pneumococcal vaccines in reducing morbidity in people with cystic fibrosis. Search methods We searched the Cochrane Cystic Fibrosis and Genetic Disorders Group Cystic Fibrosis Trials Register, which comprises references identified from comprehensive electronic database searches and handsearches of relevant journals and abstract books of conference proceedings. In addition, the pharmaceutical manufacturers of the polysaccharide and conjugate pneumococcal vaccines were approached. Date of the most recent search: 27 June 2016. Selection criteria Randomised and quasi-randomised controlled trials comparing pneumococcal vaccination (with either a polysaccharide or conjugate pneumococcal vaccine) with non-vaccination or placebo in children or adults with cystic fibrosis were eligible for inclusion. Data collection and analysis No relevant trials were identified. There are no trials included in this review. Authors' conclusions As no trials were identified we cannot draw conclusions on the efficacy of routine pneumococcal immunisation in people with cystic fibrosis in reducing their morbidity or mortality. As many countries now include pneumococcal immunisation in their routine childhood vaccination schedule it is unlikely that future randomised controlled trials will be initiated."

According to the news reporters, the research concluded: "Rigorously conducted epidemiological studies may offer the opportunity to evaluate the efficacy of pneumococcal vaccination in reducing morbidity and mortality in people with cystic fibrosis."

For more information on this research see: Pneumococcal vaccines for cystic fibrosis. Cochrane Database of Systematic Reviews, 2016;(9):2585-2597. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

**Drugs and Therapies - Behavioural Pharmacology**

**American University Reports Findings in Behavioural Pharmacology (Cocaine cues retain silent traces of an excitatory history after conversion into conditioned inhibitors: 'the ghost in the addict')**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness Week
& Wellness Week -- Researchers detail new data in Drugs and Therapies - Behavioural Pharmacology. According to news originating from Washington, District of Columbia, by NewsRx correspondents, research stated, "The present experiment investigated the extent to which the A+/AB-conditioned inhibition procedure could counteract an excitatory drug-related conditioning history. In two groups of rats, a light stimulus was established as a signal for the absence of cocaine."

Our news journalists obtained a quote from the research from American University, "For the History group, the light had previously been a discriminative stimulus (S) that occasioned cocaine self-administration and could thus be classified as a cocaine excitor. In comparison, the No-History group first encountered the light during conditioned inhibition training. During conditioned inhibition training, both groups self-administered cocaine during tone as well as during click Ss, whereas drug seeking was eliminated in click-plus-light, wherein cocaine was not available (A+/AB-). Drug seeking was essentially eliminated in both groups. Nevertheless, on a summation test the light reduced cocaine seeking occasioned by the tone S by 95% in the No-History group, but by less than 50% in the History group. This summation test result showed that the effects of a drug-related history persisted even after the light was converted into an effective conditioned inhibitor on the training baseline through the powerful A+/AB-procedure."

According to the news editors, the research concluded: "Future research should seek procedures that produce even stronger conditioned inhibition that eliminates such residual 'silent' drug excitation, the 'ghost in the addict'."

For more information on this research see: Cocaine cues retain silent traces of an excitatory history after conversion into conditioned inhibitors: 'the ghost in the addict'. EurekAlert!

Animal biology, human health dominate 2016 EurekAlert! trending news list

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- News releases about the fight against Zika, a happy sex life, and dogs were among 2016's most popular on EurekAlert!, a science news service operated by the American Association for the Advancement of Science (AAAS). For the first time, an infographic made its way to the top five most-shared list.
O, Canada

The most popular news release of 2016, titled "Canadian innovation for killing mosquito eggs could help Zika fight," received 414,825 page views between 16 December 2015 and 15 December 2016. It describes a low-cost and environmentally friendly approach to killing eggs of mosquitoes that spread diseases like dengue and Zika.

A second Canadian release, "University of Toronto study reveals secret to a happy sex life" took the 4th spot with 205,989 views. It describes how "sexpectations" -- the belief that sexual satisfaction either takes hard work or comes from being true soulmates with a partner -- can make or break a relationship.

Dog videos

For the first time, news releases about animal biology outnumbered those about human health with the most spots -- five -- in the top 10.

Our fascination with man's best friend catapulted two releases into 2nd and 7th places. A press summary from the journal Science about dogs' ability to understand vocabulary and intonation in human speech received 194,013 views.

A Cell Press news release, entitled "Your dog remembers what you did," earned 299,194 views for reminding dog owners that "your dogs are paying attention, and they'll remember." This news release was also the second-most shared release in 2016 via AddThis, with 1,600 shares and more than 1,000 social clicks on multiple platforms including Twitter, e-mail, and Facebook.

Imagine having to rip your own skin apart just to open your mouth to eat. Hydra, a tiny freshwater animal, does just that. A second Cell Press news release illustrating this process for the first time -- complete with video -- was the 3rd most popular release in 2016 with 286,475 views. (This is also the second year in a row that Cell Press occupied two spots on the annual Trending News List).

Most popular

The most popular news release in 2016 received 62% more views than its 2015 predecessor, a release about the "missing link" between the brain and the immune system (256,289). Overall, the top 10 trending news releases of 2016 received 47% more views over those from 2015 (1,545,066).

Bucking the trend from previous years, where health-related news dominated the EurekAlert! Trending News List, this year saw five releases about animal biology and four about human health occupying the top nine spots. A WiFi-related release was the lone entry from the tech arena.

Other entries in the 2016 Trending News List include releases about the relationship between wheat and chronic conditions like multiple sclerosis, asthma and rheumatoid arthritis, how coffee may help ward off dementia in some women, salmon hatcheries causing rapid genetic changes, and advances in WiFi technology.

The 10 most popular news releases on EurekAlert! in 2016 are:

Most shared

Three of the five most-shared news releases in 2016 are also among the most-read. The top spot went to the release suggesting a link between a protein in wheat and chronic conditions such as asthma, rheumatoid arthritis, and multiple sclerosis, with upwards of 1,700 shares and 6,100 social clicks. The 5th most-shared release, from The Lancet, describes a new stem cell transplantation method that may halt MS symptoms.

The two dog-related news releases on the Trending List also made it to the most-shared list, occupying the 2nd and 4th spots.
For the first time, an infographic from the multimedia archive emerged as one of the most-shared items of the year. A 2015 map showing that lice in 25 U.S. states are resistant to common treatments earned 3rd place with more than 1,100 shares and 1,000 social clicks. The related study had been presented at the 250th National Meeting & Exposition of the American Chemical Society.

The five most-shared items on EurekAlert! in 2016 are:

1. Social media sharing via AddThis in 2016 continued an upward trend with a total of 344,400 news-release shares over 2015's 340,233. Facebook, Twitter, and e-mail remained the preferred sharing platforms, while LinkedIn and Reddit made up a smaller but significant presence.

2. EurekAlert! recently surpassed 30,000 followers on Twitter and nearly 18,000 Facebook fans.

3. More than 29,500 news releases were eligible for inclusion on EurekAlert! in 2016, up from 27,859 in 2015. All news releases were submitted by accredited research institutions, peer-reviewed journals, or their press agents and made available to registered science reporters and the public. The annual EurekAlert! trending news release list was compiled based on the number of public and reporter visits to news releases between 16 December 2015 and 15 December 2016.

Related:

In late 2014 EurekAlert! introduced a fully responsive design, which better supports mobile use, multimedia, and social sharing. A staff-curated homepage feature highlighting trending news releases was also rolled out as part of the new design.

Drugs and Therapies - Antibiotics

Antibiotic resistance just became more complex

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Bacteria that are susceptible to antibiotics can survive when enough resistant cells around them are expressing an antibiotic-deactivating factor. This new take on how the microbial context can compromise antibiotic therapy was published by a team of microbiologists from the University of Groningen microbiologists, together with colleagues from San Diego, in the journal PLOS Biology on 27 December.

The entire paper is summed up nicely in a short video clip of a crucial experiment in the study. We see Staphylococci bacteria, which have been labelled with a green fluorescent protein, expressing a resistance gene for the antibiotic chloramphenicol. Next to them are black Streptococcus pneumoniae bacteria that do not have the resistance gene. In a medium containing the antibiotic, the green cells begin to grow and divide whereas the non-resistant black cells don't. After a time, individual black cells begin to divide and they even outgrow their green companions.

What is going on here? Microbiologist Robin Sorg, first author of the paper, explains: 'The resistant cells take up the chloramphenicol and deactivate it. At a certain point, the concentration in the growth medium drops below a critical level and the non-resistant cells start growing.' Something like this has been seen before. 'Cells with resistance to penicillin can
secrete beta-lactamase enzymes which break down the antibiotic. But in our case, the antibiotic is deactivated inside the resistant cells.'

Time lapse

The discovery was made using time-lapse microscopy, and confirmed with computational modelling and a mouse pneumonia model. 'In the mice, we observed that susceptible Streptococcus pneumoniae bacteria survive the chloramphenicol treatment when the animals are co-infected with resistant bacteria.' Furthermore, the results ruled out a transfer of the resistance gene. The data is in line with anecdotal evidence from the clinic, where antibiotic-susceptible bacteria are sometimes cultured from patients who were unsuccessfully treated with antibiotics. Sorg: 'This always puzzled physicians. Our work might provide one possible explanation.'

So susceptible bacteria can survive longer when resistant bacteria are present, and in the end even outcompete them. What does this mean for the spread of antibiotic resistance? 'It is complicated', Sorg says. 'We know that antibiotic usage results in selection for resistance. However, we do not fully understand the processes, nor why antibiotic resistance can develop so fast. Single cell studies like ours help to fill in some of these details.'

Metabolism

One thing that should be noted is that the susceptible cells in the experiment stop growing, but don't die. 'Many antibiotic-induced killing mechanisms rely on dividing cells, or at least on cells with an active metabolism.' What doesn't kill the cells will perhaps not make them stronger, but certainly gives them time to pick up resistance genes from their environment.

This knowledge can inform doctors when treating a patient with antibiotics. 'We know that we should use these drugs with discretion, but we may need to be even more careful than we thought.' Sorg sketches a personalized-medicine approach, in which the non-pathogenic microbes present in a patient are checked for resistance genes. 'That would increase the risk of a transfer to pathogens.'

To prevent the occurrence of resistance in non-pathogenic microorganisms, it is of course important to use antibiotics as sparingly as possible. And perhaps one day, when our understanding of the mechanisms responsible for the spread of antibiotic resistance is more complete, we may find a way to stop it.

**Oncology - Breast Cancer**

**Aromatase inhibitors for breast cancer: Advantages over tamoxifen in early-stage disease**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- The German Institute for Quality and Efficiency in Health Care (IQWiG) investigated whether and what advantages drugs from the drug class of aromatase inhibitors offer compared with other breast cancer treatments or with each other. The final report was published on 15 November.
According to the findings, the data available show advantages over tamoxifen for the early, but not for the late stage of disease: Patients survive longer and recurrences occur later. Overall, the evidence for advanced breast cancer is much poorer.

The Federal Joint Committee (G-BA) commissioned IQWiG to perform several comparisons: On the one hand, IQWiG was to compare aromatase inhibitors with other treatment options, in particular the anti-oestrogen tamoxifen. On the other, the Institute was to assess whether the 3 approved drugs from the drug class of aromatase inhibitors (anastrozole, exemestane, letrozole) differ with regard to benefit or harm.

As the IQWiG researchers determined, the evidence for early breast cancer is clearly better than for advanced disease: 12 of the overall 19 studies that IQWiG included in the assessment refer to early breast cancer. In July 2015 the results were published of a study that enrolled more than 4000 participants and compared 2 aromatase inhibitors (letrozole, anastrozole).

In contrast, the evidence is much poorer for advanced breast cancer. For instance, some questions were not investigated at all and the number of participants was much lower (approx. 3000 versus approx. 39,000). It is also remarkable that none of the studies considered the aspect "health-related quality of life".

The assessment is not only based on published studies. After a request by IQWiG, the drug manufacturers provided additional data or information on the studies conducted, so that the assessment was possible on the basis of a complete pool of data.

Aromatase inhibitors are approved for 5 different treatment regimens in early breast cancer. The data show an added benefit over tamoxifen for 2 of these regimens: In upfront therapy the patients start drug treatment with an aromatase inhibitor, while in switch therapy, after 2 to 3 years of pretreatment with an anti-oestrogen, patients switch to an aromatase inhibitor.

The results are favourable for aromatase inhibitors for 3 outcomes: overall survival, freedom of recurrence, and certain side effects (e.g. serious adverse events). Depending on the drug taken, other side effects, in particular specific adverse events, occur in part more often or less often than with tamoxifen.

For extended therapy, where the only aromatase inhibitor approved here (letrozole) is given after completion of 5 years of treatment with tamoxifen, the data show an advantage only for freedom of recurrence. However, this is accompanied by more discontinuations due to adverse events.

No data are available for neoadjuvant therapy, where aromatase inhibitors are given prior to surgery. Likewise, data are lacking for the comparison of aromatase inhibitors with each other. The only such study, which compared letrozole with anastrozole, showed no relevant differences.

In advanced breast cancer, none of the drugs offers an advantage for any of the 3 possible treatment regimens with aromatase inhibitors: Data are available for first-line therapy; however, no added benefit over tamoxifen can be inferred from them. Relevant studies are lacking for second-line therapy (i.e. after pretreatment with anti-oestrogens) and for third-line therapy.

The G-BA commissioned IQWiG to assess aromatase inhibitors as early as 2010, that is, before the introduction of the Act on the Reform of the Market for Medicinal Products (AMNOG). Since the beginning of 2011 all newly approved drugs have to be assessed. Since then, the timely completion of these assessments is of the highest priority for G-BA and IQWiG. This is also the reason why the final report on aromatase inhibitors is only available now. But of course the report considers the current state of knowledge.
Within AMNOG it was originally planned that the G-BA could request a dossier from a drug manufacturer not only for newly approved drugs, but also for selected older ones. This "call-up" for the established drug market was abolished in the first AMNOG reform at the beginning of 2014, primarily due to legal concerns that legal action could be taken against later resolutions of the G-BA. Up until then, only one drug class from the established market (gliptins) had been evaluated according to AMNOG.

The Institute Director, Jurgen Windeler, commented on the final report as follows: "The report on the aromatase inhibitors once again shows that comparative assessments are also feasible and meaningful for drugs that have been on the market for a longer period of time. This is because they can provide important information on benefit and harm and in this way help improve the quality of patient care."

IQWiG published the preliminary results in the form of the preliminary report in April 2016 and interested parties were invited to submit comments. At the end of the commenting procedure, the preliminary report was revised and sent as a final report to the commissioning agency in September 2016. The written comments submitted, which did not lead to a change in the assessment result, were published in a separate document together with the final report. The report was produced in collaboration with external experts.

Base Pair Biotechnologies, Inc.

Base Pair Biotechnologies, Inc. and Nexmos, Inc. Create the First DNA Aptamers that Inhibit Vitamin C Oxidation

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Base Pair Biotechnologies, Inc., The Aptamer Discovery Company, and Nexmos, Inc., the Aptamer Application R&D Company, announce the creation of a new class of DNA-aptamer based oxidation inhibitors. These molecules stabilize vitamin C, enabling development of new cosmetics, nutraceuticals, beverages and therapeutic agents with longer shelf life and potentially greater efficacy. Nexmos plans to launch the first product containing these molecules in the second half of 2017, as a component of an antioxidant beverage formulation, in collaboration with a major health beverage company.

Aptamers are small DNA or RNA molecules that are selected in vitro to bind specifically to a target because they fold into a shape that fits their target. Targets can be cells, viruses, proteins, small molecules or metabolites. Manufacture uses well-established synthetic chemistry methods, providing high purity and minimal batch to batch variability. At scale, aptamer manufacture can cost significantly less than more commonly used affinity agents such as antibodies. Aptamers are also relatively stable, non-toxic, and biodegradable. While aptamers with enzymatic activity are well known, these are the first aptamers known to inhibit oxidative damage.

"Base Pair addressed a significant need with this project," said Bill Jackson, Ph.D., Founder and Chief Scientist at Base Pair. "Creating a new aptamer that's selective for its target
is like throwing a bucket of keys at a lock and hoping one sticks in the keyhole. Finding an aptamer that not only binds vitamin C but also inhibits its oxidation is like throwing a bucket of keys at a locked door and having one not only fit, but turn, unlock and open the door."

"We are tremendously excited about the potential for this new class of molecules," said Nelson Son, CEO, Founder of Nexmos. Nexmos will market the aptamer-vitamin complexes under the trade name, APTAMIN™. APTAMIN™ C, the first Aptamin product, solves the fundamental stability problem of vitamin C which has limited its applications.

DNA synthesis has in the past been used to generate tools for research use, therapeutic use, forensics, and diagnostics. In most cases DNA and RNA aptamers are used as capture or detection reagents. This is the first time a synthetically manufactured DNA aptamer has been shown to be useful for general consumer products.

"We are pleased Base Pair agreed to work with us to develop aptamers to additional targets, including vitamins, food supplements, and human diagnostic biomarkers," said Mr. Son. The approach used by Base Pair to stabilize vitamin C can be used to identify and create molecules that stabilize other targets, including small molecule drugs. Base Pair and Nexmos are in the process of initiating the next series of development projects to create aptamers that stabilize other commercially important molecules.

**Virus Integration**

**Baylor University College of Medicine Reports Findings in Virus Integration (Clonal Dynamics In Vivo of Virus Integration Sites of T Cells Expressing a Safety Switch)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Virus Integration. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Safety switches are becoming relevant for the clinical translation of T-cell-based immunotherapies. In patients receiving an allogeneic hematopoietic stem cell transplant, the inducible caspase-9 gene (iC9) safety switch expressed by donor-derived T lymphocytes efficiently controls acute graft versus host disease (GvHD)."

Our news editors obtained a quote from the research from the Baylor University College of Medicine, "However, in vivo elimination of iC9-T cells by the chemical inducer of dimerization (CID) that activates the iC9 protein is incomplete. To study this effect, we characterized the clonal diversity and dynamics of vector insertion sites (VIS) in iC9-T cells pre-and post-CID administration in four patients who developed GvHD. We identified 3,203 VIS among four patients and followed their in vivo clonal dynamics up to 161 days post-CID. VIS were categorized by their proximity to host genome elements, gene associations, and cis-modulatory relationship to mapped promoters. We found that VIS are preferentially located near open chromatin and promoter regions; furthermore, there was no evidence for selection bias among VIS surviving the CID treatment. The majority of iC9-T cells with high normalized VIS copy number at the time of GvHD onset were eliminated by CID, while iC9-T cells detectable post-CID generally have low normalized VIS copy number."
According to the news editors, the research concluded: "We propose that suboptimal iC9 transgene expression is responsible for the incomplete elimination of iC9-T cells and illustrate here by simple model how cis-modulatory influences of local genome context and T-cell receptor activation status at time of CID treatment contribute to stochastic sparing of iC9-T cells."

For more information on this research see: Clonal Dynamics In Vivo of Virus Integration Sites of T Cells Expressing a Safety Switch. *Molecular Therapy*, 2015;24(4):736-45. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

**Biophysical Society announces winners of 2017 CPOW Travel Awards**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- The Biophysical Society has announced the winners of its annual CPOW Travel Awards to attend the Biophysical Society's 61st Annual Meeting in New Orleans, Louisiana, February 11-15, 2017. CPOW, the Society's Committee for Professional Opportunities for Women, has initiated these travel fellowships to increase the number of women biophysicists and encourage their participation at the Meeting. The recipients of this competitive award must be female postdoctoral fellows or mid-career scientists presenting a poster or oral presentation at the conference. Each awardee receives a travel grant and will be recognized at a reception on Saturday, February 11, at the Ernest N. Morial Convention Center.

BlueCross BlueShield of Tennessee, Inc.

BlueCross Online Wellness Portal Adds Capabilities

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- BlueCross BlueShield of Tennessee members with Apple Watches may now sync their devices to the company's member wellness portal with the AlwaysOn™ mobile app, thanks to newly-established integration with Apple Health.

Connection to the BlueCross wellness portal can have significant perks - the platform offers members access to health news, self-directed wellness courses, online health and lifestyle coaching, and other tools.

This integration is part of wider efforts to ensure members who use a smartphone or a wearable device can easily connect their favorite fitness or health tracker with the BlueCross
Our online wellness program is designed to be as user-friendly as possible, and a big part of that involves making sure our systems work with the devices members use,” explains Lauren LaFontaine, BlueHealth Solutions product manager at BlueCross BlueShield of Tennessee. "We want our BlueCross members to fully utilize the wellness benefits we offer, in ways that work for them."

More than 80 devices are now compatible with the BlueCross online portal. Access is available either via computer or the company's AlwaysOn™ mobile app. Members can find more information on how to sync a device or download the AlwaysOn app at http://www.bcbst.com/device-sync/index.page?. About BlueCross® BlueCross BlueShield of Tennessee's mission is peace of mind through better health. Founded in 1945, the Chattanooga-based company is focused on serving more than 3.4 million members in Tennessee and across the country. BlueCross BlueShield of Tennessee Inc. is an independent licensee of the BlueCross BlueShield Association. For more information, visit the company's website at bcbst.com. Biotechnology - Genomics
CHA University Reports Findings in Genomics (Next generation sequencing identifies abnormal Y chromosome and candidate causal variants in premature ovarian failure patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Biotechnology - Genomics are discussed in a new report. According to news reporting out of Gyeonggi Do, South Korea, by NewsRx editors, research stated, "Premature ovarian failure (POF) is characterized by heterogeneous genetic causes such as chromosomal abnormalities and variants in causal genes. Recently, development of techniques made next generation sequencing (NGS) possible to detect genome wide variants including chromosomal abnormalities."

Financial support for this research came from Ministry of Education.

Our news journalists obtained a quote from the research from CHA University, "Among 37 Korean POF patients, XY karyotype with distal part deletions of Y chromosome, Yp11.32-31 and Yp12 end part, was observed in two patients through NGS. Six deleterious variants in POF genes were also detected which might explain the pathogenesis of POF with abnormalities in the sex chromosomes. Additionally, the two POF patients had no mutation in SRY but three non-synonymous variants were detected in genes regarding sex reversal."

According to the news editors, the research concluded: "These findings suggest candidate causes of POF and sex reversal and show the propriety of NGS to approach the heterogeneous pathogenesis of POF."

For more information on this research see: Next generation sequencing identifies abnormal Y chromosome and candidate causal variants in premature ovarian failure patients. Genomics, 2016;108(5-6):209-215. Genomics can be contacted at: Academic Press Inc
Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Genomics - www.journals.elsevier.com/genomics/)

Our news journalists report that additional information may be obtained by contacting K. Kwack, CHA Univ, Coll Life Sci, Dept. of Biomed Sci, Seongnam Si 13488, Gyeonggi Do, South Korea. Additional authors for this research include C. Kim, Y. Park, J.A. Pyun and K. Kwack.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ygeno.2016.10.006. This DOI is a link to an online electronic document that is either free or for purchase.

Inflammation

Capital Medical University Reports Findings in Inflammation (14,15-Epoyxyicosatrienoic acid suppresses cigarette smoke condensate-induced inflammation in lung epithelial cells by inhibiting autophagy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Inflammation have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Epoxyeicosatrienoic acids (EETs) are metabolic products of free arachidonic acid, which are produced through cytochrome P-450 (CYP) epoxygenases. EETs have anti-inflammatory, antiapoptotic, and antioxidative activities."

Financial supporters for this research include Beijing Municipal Natural Science Foundation, Shou Fa from Beijing Municipal Health Bureau.

The news reporters obtained a quote from the research from Capital Medical University, "However, the effect of EETs on cigarette smoke-induced lung inflammation is not clear. Autophagy is believed to be involved in the pathogenesis of chronic obstructive pulmonary disease. In addition, nuclear erythroid-related factor 2 (Nrf2), a transcription factor that regulates many antioxidant genes, is thought to regulate antioxidant defenses in several lung diseases. In addition, interaction between EETs, autophagy, and Nrf2 has been reported. The aim of this study was to explore the effect of 14,15-EET on cigarette smoke condensate (CSC)-induced inflammation in a human bronchial epithelial cell line (Beas-2B), and to determine whether the underlying mechanisms involved in the regulation of Nrf2 through inhibition of autophagy. Autophagy and expression of autophagy signaling pathway proteins (LC3B, p62, PI3K, Akt, p-Akt, and p-mTOR) and anti-inflammatory proteins (Nrf2 and HO-1) were assessed via Western blot analysis. Autophagosomes and autolysosomes were detected by adenoviral mRFP-GFP-LC3 transfection. Inflammatory factors (IL-6, IL-8, and MCP-1) were detected by ELISA. Lentiviral vectors carrying p62 short hairpin RNA were used to interfere with p62 expression to evaluate the effect of p62 on Nrf2 expression. Nrf2 expression was determined through immunocytochemistry. 14,15-EET treatment resulted in a significant reduction in IL-6, IL-8, and MCP-1 secretion, and increased accumulation of Nrf2 and expression of HO-1. In addition, 14,15-EET inhibited CSC-induced autophagy in Beas-2B cells."

According to the news reporters, the research concluded: "The mechanism of the
anti-inflammatory effect of 14,15-EET involved inhibition of autophagy and an increase in p62 levels, followed by translocation of Nrf2 into the nucleus, which then upregulated expression of the antioxidant enzyme HO-1. 14,15-EET protects against CSC-induced lung inflammation by promoting accumulation of Nrf2 via inhibition of autophagy.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1152/ajplung.00161.2016. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Liver Cancer

Capital Medical University Reports Findings in Liver Cancer (Worse or better?-Cirrhosis with hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Hepatocellular carcinoma (HCC) accounts for about 90% of all malignant tumors of liver, ranking fifth in the worldwide incidence of malignant tumors and the third in fatality. More and more evidences suggest that cancer is a metabolic-related disease."

The news reporters obtained a quote from the research from Capital Medical University, "From the analysis of recent clinical research data, we found that as the severity of the cirrhosis aggravated, patients with HCC and end-stage liver cirrhosis had a flat energy metabolism which was better than it in patients with simple end-stage liver cirrhosis. Based on these clinical phenomenon, the major aim of this study is to present a new hypothesis: 'compensated liver function mechanism' for patients with HCC and liver cirrhosis, cancer cells may play a role to compensate liver function."

According to the news reporters, the research concluded: "In this study, we elaborated relevant content about this novel standpoint combined with tumor energy metabolism reprogramming mechanism and tumor cell origin as well as cell exchange mechanism."

For more information on this research see: Worse or better?-Cirrhosis with hepatocellular carcinoma. Medical Hypotheses, 2016;97():85-87. Medical Hypotheses can be
Central South University Details Findings in Non-Small Cell Lung Cancer (Resveratrol inhibits Hexokinases II mediated glycolysis in non-small cell lung cancer via targeting Akt signaling pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Non-Small Cell Lung Cancer is now available. According to news reporting originating from Changsha, People's Republic of China, by NewsRx correspondents, research stated, "Deregulation of glycolysis was often observed in human cancer cells. In the present study, we reported resveratrol, a small polyphenol, which has been intensively studied in various tumor models, has a profound anti-tumor effect on human non-small cell lung cancer (NSCLC) via regulation of glycolysis."

Our news editors obtained a quote from the research from Central South University, "Resveratrol impaired hexokinase II (HK2)-mediated glycolysis, and markedly inhibited anchorage-dependent and independent growth of NSCLC cells. Exposure to resveratrol decreased EGFR and downstream kinases Akt and ERK1/2 activation. Moreover, we revealed that resveratrol impaired glucose metabolism by mainly inhibiting expression of HK2 mediated by the Akt signaling pathway, and exogenous overexpression of constitutively activated Akt1 in NSCLC cells substantially rescued resveratrol-induced glycolysis suppression. The in vivo data indicated that resveratrol obviously suppressed tumor growth in a xenograft mouse model."

According to the news editors, the research concluded: "Our results suggest targeting HK2 or metabolic enzymes appears to be a new approach for clinical NSCLC prevention or treatment."

The news editors report that additional information may be obtained by contacting W. Wang, Central South University, Xiangya Hosp 3, Cell Transplantat & Gene Therapy Inst, Changsha 410000, Hunan, People's Republic of China. Additional authors for this research...
include X.Q. Ma, N. Li, H.S. Liu, Q. Dong, J. Zhang, C.J. Yang, Y. Liu, Q. Liang, S.W. Zhang, C. Xu, W. Song, S.M. Tan, P.F. Rong and W. Wang.

Immunology - Antigens

China Three Gorges University Reports Findings in Antigens (Tumor-associated antigens: Tn antigen, sTn antigen, and T antigen)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Antigens have been published. According to news reporting originating in Yichang, People's Republic of China, by NewsRx journalists, research stated, "Glycosylation is one of the major posttranslational modifications of proteins. N-glycosylation (Asn-linked) and O-glycosylation (Ser/Thr-linked) are the two main forms."

The news reporters obtained a quote from the research from China Three Gorges University, "Abnormal O-glycosylation is frequently observed on the surface of tumor cells, and is associated with an adverse outcome and poor prognosis in patients with cancer. O-glycans (Tn, sTn, and T antigen) can be synthesized in the Golgi apparatus with the aid of several glycosyltransferases (such as T-synthase and ST6GalNAc-I) in a suitable environment. The unique molecular chaperone of T-synthase is Cosmc, which helps T-synthase to fold correctly in the endoplasmic reticulum. Dysregulation of these glycosyltransferases, molecular chaperones, or the environment is involved in the dysregulation of O-glycans. Tn, sTn, and T antigen neo-or over-expression occurs in many types of cancer including gastric, colon, breast, lung, esophageal, prostate, and endometrial cancer."

According to the news reporters, the research concluded: "This review discusses the major synthetic pathway of O-glycans and the mechanism by which Tn, sTn, and T antigens promote tumor metastasis."

For more information on this research see: Tumor-associated antigens: Tn antigen, sTn antigen, and T antigen. HLA, 2016;88(6):275-286. HLA can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Chosun University Reports Findings in Platinum Compounds (Protective Effect of Tempol against Cisplatin-Induced Ototoxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Platinum Compounds are discussed in a new report. According to news reporting originating in Gwangju, South Korea, by NewsRx journalists, research stated, "One of the major adverse effects of cisplatin chemotherapy is hearing loss. Cisplatin-induced ototoxicity hampers treatment because it often necessitates dose reduction, which decreases cisplatin efficacy."

The news reporters obtained a quote from the research from Chosun University, "This study was performed to investigate the effect of Tempol on cisplatin-induced ototoxicity in an auditory cell line, House Ear Institute-Organ of Corti 1 (HEI-OC1). Cultured HEI-OC1 cells were exposed to 30 μM cisplatin for 24 h with or without a 2 h pre-treatment with Tempol. Cell viability was determined using 3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide (MTT) assay and apoptotic cells were identified using terminal deoxynucleotidyl transferase dUTP nick end labeling of nuclei (TUNEL) assay and flow cytometry. The effects of Tempol on cisplatin-induced cleaved poly(ADP-ribose) polymerase, cleaved caspase, and mitochondrial inducible nitric oxide synthase expression were evaluated using western blot analysis. Levels of intracellular reactive oxygen species (ROS) were measured to assess the effects of Tempol on cisplatin-induced ROS accumulation. Mitochondria were evaluated by confocal microscopy, and the mitochondrial membrane potential was measured to investigate whether Tempol protected against cisplatin-induced mitochondrial dysfunction. Cisplatin treatment decreased cell viability, and increased apoptotic features and markers, ROS accumulation, and mitochondrial dysfunction. Tempol pre-treatment before cisplatin exposure significantly inhibited all these cisplatin-induced effects."

According to the news reporters, the research concluded: "These results demonstrate that Tempol inhibits cisplatin-induced cytotoxicity in HEI-OC1, and could play a preventive role against cisplatin-induced ototoxicity."

For more information on this research see: Protective Effect of Tempol against Cisplatin-Induced Ototoxicity. International Journal of Molecular Sciences, 2016;17(11):2361-2373. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Our news correspondents report that additional information may be obtained by contacting C.K. Youn, Chosun Univ, Sch Med, Div Nat Med Sci, Gwangju 61452, South Korea. Additional authors for this research include J. Kim, E.R. Jo, J. Oh, N.Y. Do and S.I. Cho.

Keywords for this news article include: Gwangju, South Korea, Asia, Chlorine Compounds, Nitrogen Compounds, Platinum Compounds, Cisplatin, Chosun University.

College of Pharmacy Details Findings in Pharmacy Practice (Valued characteristics of community pharmacy residency applicants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Pharmacy Practice is the subject of a report. According to news reporting out of Springfield, Massachusetts, by NewsRx editors, research stated, "To determine the attributes of postgraduate year 1 (PGY1) community pharmacy residency applicants and candidates that are most appealing to community residency program directors (CRPDs). A 22-question online survey, designed to collect residency demographics, desirable characteristics for consideration for interview invitation (applicants), and characteristics that should be displayed during an interview (candidates)."

Our news journalists obtained a quote from the research from the College of Pharmacy, "American Society of Health-System Pharmacists (ASHP)-recognized community pharmacy residency programs (CPRPs). The CRPDs of 109 ASHP-recognized CPRPs throughout the United States. Not applicable. Minimum applicant requirements; rank order of valued characteristics at application and interview stage of hiring process. The response rate was 71/109 (65.1%). Applicant work experience in chain pharmacy (90.1%) and independent pharmacy (77.5%) was most highly valued by CRPDs, with 85.9% preferring applicants with a minimum of 1 year or more of community pharmacy experience. A large majority of CPRPs (91.4%) indicated a preference for applicants who have been an officer of a student organization. Among CPRPs that required minimum grade point averages (GPAs), a mean GPA of 2.88 +/- 0.34 was reported (range 2.0 to 3.5; mode 3.0). Pharmacy work experience (68.1%) and letters of recommendation (59.4%) were most frequently cited as top factors in the decision-making process for selecting candidates to interview. At the interview stage, CRPDs rated interest and knowledge about the residency (62.3%), time management and prioritization (50.7%), and self-awareness and commitment to improvement (43.5%) as the most important skills for candidates to demonstrate. Community pharmacy work experience, organizational leadership experience, and positive letters of recommendation appear to be the most valued attributes of a community pharmacy residency applicant."

According to the news editors, the research concluded: "Applicants should consider aligning themselves with these characteristics to successfully match to a community pharmacy residency."

Our news journalists report that additional information may be obtained by contacting D.R. Kennedy, Western New England Univ, Coll Pharm, Pharmacol, Springfield, MA, United States. Additional authors for this research include G.S. Lezaja, E.C. Nemec, J.J. Spooner and D.R. Kennedy.

Columbia University Medical Center Sponsors Clinical Study Using Biocept's Liquid Biopsy Platform to Evaluate Cerebrospinal Fluid of Breast Cancer Patients for Metastatic Biomarkers

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Hyperlink "http://www.biocept.com/" \n
Biocept, Inc. (NASDAQ: BIOC), a leading commercial provider of clinically actionable liquid biopsy tests designed to improve the outcomes of cancer patients, announces that Columbia University Medical Center will conduct a study to evaluate the clinical utility of the Company's Target Selector™ platform to diagnose leptomeningeal metastases (LM) in patients with breast cancer. LM occurs when tumor cells gain access to cerebrospinal fluid (CSF) pathways and regrow in distant sites within the spinal cord and brain leading to neurological complications. Biocept's liquid biopsy platform will be used to test the CSF of breast cancer patients and will be compared to standard methods for confirming the diagnosis of LM.

"Diagnosing LM in patients with breast cancer can be challenging given the low diagnostic sensitivity of traditional methods such as cytologic analysis," stated Kevin Kalinsky, MD, MS, Assistant Professor of Medicine, Columbia University Medical Center and the study's principal investigator. "We will be using Biocept's Target Selector™ technology to evaluate oncologic biomarkers in the CSF of breast cancer patients, with the potential to provide a rapid and accurate solution to confirm diagnosis and enable patients to begin treatment for LM earlier. This clinical study addresses a significant medical need, given the devastating nature of LM involvement in breast cancer patients."

Complete Nutrition(TM) Unveils New Weight Management Product, Meal Plan & 21-Day Challenge

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- With the top New Year's resolution being losing weight and becoming fit, Complete Nutrition stores nationwide will introduce a new product, Citrine, designed to give individuals the energy and focus they need to eat better, feel better and stay on track with their weight management goals. After months of research and development, the product will hit the shelves on Jan. 9, 2017.

The Citrine supplement includes several clinically-tested ingredients, including Sensoril™ Trim (to support weight loss), Advantra Z® (to support weight loss), Teacrine® (to boost focus and energy), CapsiMax® (to support weight loss and increase BMR) and Huperzine A (to increase focus).

Taking a consultative approach to health and fitness, the 150+-store nutritional supplement retailer will also introduce a comprehensive Fitness Journal designed to help individuals break bad habits, track their progress and reach their fitness goals. Included in the
Journal are tips for a healthy, nutrition-conscious diet, an exercise guide and additional information to support being fit. The Fitness Journal also includes a step-by-step Fast Track 21-Day Meal Plan designed specifically for Complete Nutrition by Sarah Berndt, MS, RD.

While the new product and Fitness Journal aren't available until Jan. 9, 2017, Complete Nutrition is helping customers get a jump start on their fitness goals with a one-day 20 percent-off sale on Dec. 28, 2016 on all in-store products.

"There's a lot of noise in the industry right now about changing strategies and offering new lower prices. At Complete Nutrition, we believe in our model and always have. We are about empowering people to get results. Through our consultation approach and great products we help customers reach their goals," said Jim Heidenreich, CEO of Complete Nutrition. "When we developed the formula for Citrine and the 21-Day Fast Track Meal Plan I knew we had something amazing to deliver our customers that built on our DNA of helping everyone achieve results. I can't wait to hear their success stories."

Heidenreich, who committed to complete the 21-day challenge himself, said to show how confident the company is in the product and program, customers who buy Citrine, complete an in-store BodyComp Analysis and come back in after 21 days will receive one-dollar for every pound lost. "Our goal is to give $100,000 back to our customers, which also means we helped people lose over 100,000 pounds of weight. Now that's impressive," said Heidenreich. Heidenreich will share his journey, along with other Complete Nutrition customers, on the brand's FUEL Blog. About Complete Nutrition Complete Nutrition is a national retail franchise offering a wide variety of high-quality weight management, fitness and wellness supplements. Since 2005, Complete Nutrition has been helping people achieve their fitness and wellness goals through a consultative approach that applies insights gained through a body composition (BodyComp™) analysis and pairing those results with exclusive supplements. For more information about Complete Nutrition, call 866-366-5766 or visit CompleteNutrition.com. Follow Complete Nutrition on Facebook at facebook.com/completenutrition and Instagram at Instagram.com/completenutrition. Gram-Positive Bacteria – Staphylococcus aureus

Connolly Hospital Details Findings in Staphylococcus aureus (Eradication of Staphylococcus aureus Catheter-Related Biofilm Infections Using ML:8 and Citrox)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Positive Bacteria - Staphylococcus aureus are presented in a new report. According to news reporting out of Dublin, Ireland, by NewsRx editors, research stated, "Staphylococci are a leading cause of catheter-related infections (CRI)s due to biofilm formation. CRI:s are typically managed by either device removal or systemic antibiotics, often in combination with catheter lock solutions (CLS:s)."

Our news journalists obtained a quote from the research from Connolly Hospital, "CLS:s provide high concentrations of the antimicrobial agent at the site of infection. However, the most effective CLS:s against staphylococcal biofilm-associated infections have yet to be
The purpose of this study was to evaluate the efficacy and suitability of two newly described antimicrobial agents, ML: 8 and Citrox, as CLSs against Staphylococcus aureus biofilms. ML: 8 (1% [vol/vol]) and Citrox (1% [vol/vol]), containing caprylic acid and flavonoids, respectively, were used to treat S. aureus biofilms grown in vitro using newly described static and flow biofilm assays. Both agents reduced biofilm viability > 97% after 24 h of treatment. Using a rat model of CRI, ML: 8 was shown to inactivate early-stage S. aureus biofilms in vivo, while Citrox inactivated established, mature in vivo biofilms. Cytotoxicity and hemolytic activity of ML: 8 and Citrox were equivalent to those of other commercially available CLSs. Neither ML: 8 nor Citrox induced a cytokine response in human whole blood, and exposure of S. aureus to either agent for 90 days was not associated with any increase in resistance.

According to the news editors, the research concluded: "Taken together, these data reveal the therapeutic potential of these agents for the treatment of S. aureus catheter-related biofilm infections."

Our news journalists report that additional information may be obtained by contacting E. O'Neill, Connolly Hosp, Dept. of Microbiol, Dublin, Ireland. Additional authors for this research include M. Zapotoczna, N.T. Stevens, H. Humphreys, J.P. O'Gara and E. O'Neill.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AAC.00910-16. This DOI is a link to an online electronic document that is either free or for purchase.

Corporate Whistleblower Center

Corporate Whistleblower Now Urges Physicians to Call About Potential Huge Rewards If They Can Prove a Medical Device or Drug Company Is Involved in Selling Non-FDA Approved Products

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- The HYPERLINK "http://corporatewhistleblower.com/" \nCorporate Whistleblower says, "We are urging a physician or a medical device/pharmaceutical representative to call us anytime at 866-714-6466 if they have well documented proof a company is selling non-FDA approved products to their patients-especially Medicare patients."

"Recently a whistleblower received $5 million dollars for this type of information. In the instance of off labeled drugs-drugs not approved for new uses-what could possibly go
wrong? In recent years, over $13 billion in fines have been paid by major drug companies to settle lawsuits against them for their fraudulent marketing practices, including off-label promotion of their drugs/devices not approved by the FDA. "http://corporatewhistleblower.com/"/n\http://CorporateWhistleblower.Com

In November 2016, the Department of Justice announced it had come to terms with a medical device company for selling their non-FDA approved product. In this instance the medical device was to be used as a drug-delivery device in combination with chemotherapy drugs, despite the lack of FDA approval as a drug-device combination product. In December 2009, the medical device maker filed an application with FDA for approval of their device as a drug-eluting bead combination product. However, FDA informed the company that it was not accepting the application because clinical studies did not provide adequate evidence of a therapeutic benefit.

Nonetheless, the device company routinely advised healthcare providers that their product provided "better" or "superior" therapy for certain types of cancer when, in fact, there was insufficient clinical evidence to support these claims. The medical device company will pay more than $36 million to resolve criminal and civil liability. HYPERLINK "http://corporatewhistleblower.com/"/n\http://CorporateWhistleblower.Com

The Corporate Whistleblower is saying, "Why sit on a winning lotto ticket if you are a medical doctor or a medical device/pharmaceutical company rep with proof a company is aggressively marketing medical products or drugs that are not approved by the FDA? If you have this type of information we would like to talk to you anytime at 866-714-6466. One of the unique features we offer is assisting a potential whistleblower expand their reward potential by expanding the size and scope of the wrong doing. Give us a call anytime and we will explain how it works." HYPERLINK "http://corporatewhistleblower.com/"/n\http://CorporateWhistleblower.Com

Simple rules for a whistleblower from the HYPERLINK "http://corporatewhistleblower.com/"/nCorporate Whistleblower: Do not go to the government first if you want to become a whistleblower: The Corporate Whistleblower Center says, "Major whistleblowers frequently go to the government thinking they will help. It's a huge mistake. Do not go to the news media with your whistleblower information either. Any type of public revelation of a whistleblower's information could destroy the prospect for a reward. Do not try to force a medical device or pharmaceutical company or individual to come clean on off labeling their products."

The Corporate Whistleblower is the premier advocate for whistleblowers in the United States. Unlike any group in the US, they assist potential whistleblowers with packaging their information and providing the whistleblower with access to the most accomplished whistleblower attorneys in the nation. For more information a potential whistleblowers in any state can contact the Corporate Whistleblower anytime at HYPERLINK "tel:(866)%20714-6466"/n866-714-6466 or visit HYPERLINK "http://corporatewhistleblower.com/"/n\http://CorporateWhistleblower.Com

Mycobacterium Infections - Tuberculosis

Data from All India Institute of Medical Sciences Advance Knowledge in Tuberculosis (DevS/DosS sensor is bifunctional and its phosphatase activity precludes aerobic DevR/DosR regulon expression in Mycobacterium tuberculosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Mycobacterium Infections - Tuberculosis have been presented. According to news reporting originating in New Delhi, India, by NewsRx journalists, research stated, "Two-component systems, comprising histidine kinases and response regulators, empower bacteria to sense and adapt to diverse environmental stresses. Some histidine kinases are bifunctional; their phosphorylation (kinase) and dephosphorylation (phosphatase) activities toward their cognate response regulators permit the rapid reversal of genetic responses to an environmental stimulus."

Financial supporters for this research include Department of Science and Technology, Govt. of India for the JC Bose National Fellowship, Department of Biotechnology, Ministry of Science and Technology, Council for Scientific and Industrial Research.

The news reporters obtained a quote from the research from the All India Institute of Medical Sciences, "DevR-DevS/DosR-DosS is one of the best-characterized two-component systems of Mycobacterium tuberculosis. The kinase function of DevS is activated by gaseous stress signals, including hypoxia, resulting in the induction of similar to 48-genes DevR dormancy regulon. Regulon expression is tightly controlled and lack of expression in aerobic Mtb cultures is ascribed to the absence of phosphorylated DevR. Here we show that DevS is a bifunctional sensor and possesses a robust phosphatase activity toward DevR. We used site-specific mutagenesis to generate substitutions in conserved residues in the dimerization and histidine phosphotransfer domain of DevS and determined their role in kinase/phosphatase functions. In vitro and in vivo experiments, including a novel in vivo phosphatase assay, collectively establish that these conserved residues are critical for regulating kinase/phosphatase functions. Our findings establish DevS phosphatase function as an effective control mechanism to block aerobic expression of the DevR dormancy regulon. Asp-396 is essential for both kinase and phosphatase functions, whereas Gln-400 is critical for phosphatase function. The positive and negative functions perform opposing roles in DevS: the kinase function triggers regulon induction under hypoxia, whereas its phosphatase function prevents expression under aerobic conditions."

According to the news reporters, the research concluded: "A finely tuned balance in these opposing activities calibrates the dormancy regulon response output."

Liver Diseases and Conditions - Chronic Hepatitis B…

Data from Anhui Medical University Provide New Insights into Chronic Hepatitis B Virus (Prediction model for sustained hepatitis B e antigen seroconversion to peginterferon alfa-2a in chronic hepatitis B)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Chronic Hepatitis B Virus. According to news reporting originating from Hefei, People's Republic of China, by NewsRx correspondents, research stated, "Clinically applicable models to predict hepatitis B e antigen (HBeAg)-positive chronic hepatitis B (CHB) response to peginterferon (PEG-IFN) are scarce. This study aimed to develop simple scoring systems, based on multiple parameters, for predicting sustained HBeAg seroconversion to PEG-IFN."

Our news editors obtained a quote from the research from Anhui Medical University, "Eighty-five treatment-naive patients with HBeAg-positive CHB underwent 52-week PEG-IFN treatment and 24-week follow-up. Logistic regression analysis assessed parameters at baseline and weeks 12, 24, and 52 to predict HBeAg seroconversion at week 24 off-treatment. The best three predictors at each time point were included in prediction models of PEG-IFN therapy efficacy. The three most meaningful predictors were alanine aminotransferase (ALT) > 5 x ULN, HBeAg <= 500 S/CO, and antibody to hepatitis B core antigen (anti-HBc) > 10.7 S/CO at baseline; HBeAg <= 20 S/CO, anti-HBc > 11.7 S/CO, and HBeAg decline > 1 log(10) S/CO at week 12; ALT > 2 x ULN, HBeAg <= 15 S/CO, and anti-HBc > 10.4 S/CO at week 24; HBeAg <= 5 S/CO, anti-HBc > 11.1 S/CO, and hepatitis B virus DNA decline > 2 log(10) copies/mL at week 52. Parameters meeting optimal cutoff thresholds were scored 1 or otherwise scored 0. For total scores of 0 versus 3 at baseline and weeks 12, 24, and 52, response rates were 6.3%, 12.5%, 0%, and 0% versus 90.0%, 83.3%, 76.9%, and 86.4%, respectively."

According to the news editors, the research concluded: "We successfully established prediction models for PEG-IFN response in HBeAg-positive CHB."

The news editors report that additional information may be obtained by contacting X.
Data from Anhui Medical University Provide New Insights into Esophageal Cancer (Insights into the potential use of microRNAs as a novel class of biomarkers in esophageal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Esophageal Cancer have been published. According to news originating from Hefei, People's Republic of China, by NewsRx correspondents, research stated, "MicroRNAs (abbreviated miRNAs) have been demonstrated to be involved in tumorigenesis and cancer development and proposed as promising biomarkers in cancer diagnosis. Numerous studies have observed the aberrant expression of miRNAs in esophageal cancer."

Our news journalists obtained a quote from the research from Anhui Medical University, "However, there are some discrepant results. Thus, we conducted this meta-analysis to identify the overall accuracy of miRNAs in the diagnosis of esophageal cancer. A comprehensive literature search was conducted in PubMed and other databases using combinations of key words. The summary receiver operator characteristic curves were plotted to assess the overall diagnostic performance of miRNAs. Chi-squared and I-2 tests were used to assess the heterogeneity between studies. Additionally, we conducted subgroup and sensitivity analyses to analyze the potential sources of heterogeneity. In total, 33 studies from 12 articles were available in this meta-analysis. The pooled sensitivity, specificity, positive and negative likelihood ratio (PLR, NLR) diagnostic odds ratio, and area under the curve were 0.80, 0.80, 4.0, 0.25, 16, and 0.87, respectively. Subgroup analyses based on the sample types (saliva-, serum-and plasma-based) showed no differences in the diagnostic accuracy of each subgroup. An independent meta-analysis of eight articles was conducted to evaluate the diagnostic accuracy of miRNAs in patients with esophageal squamous cell carcinoma, with a pooled sensitivity of 0.77, specificity of 0.83, PLR of 4.4, NLR of 0.27, diagnostic odds ratio of 16, and area under the curve of 0.87."

According to the news editors, the research concluded: "This meta-analysis demonstrates the feasibility of using miRNAs as non-invasive biomarkers to discriminate esophageal cancer from healthy controls. However, further high-quality studies on more clearly defined esophageal cancer patient are needed to confirm our conclusion."

For more information on this research see: Insights into the potential use of microRNAs as a novel class of biomarkers in esophageal cancer. Diseases of the Esophagus, 2016;29(5):412-420. Diseases of the Esophagus can be contacted at: Wiley-Blackwell, 111
Data from Assaf Harofe Medical Center Provide New Insights into Drug Resistance (Multidrug-Resistant Gram-Negative Bacilli: Infection Control Implications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Drug Resistance are discussed in a new report. According to news reporting originating from Zerifin, Israel, by NewsRx correspondents, research stated, "Antimicrobial resistance is a common iatrogenic complication of both modern life and medical care."

Our news editors obtained a quote from the research from Assaf Harofe Medical Center, "Certain multidrug resistant and extensively drug resistant Gram-negative organisms pose the biggest challenges to health care today, predominantly owing to a lack of therapeutic options. Containing the spread of these organisms is challenging, and in reality, the application of multiple control measures during an evolving outbreak makes it difficult to measure the relative impact of each measure."

According to the news editors, the research concluded: "This article reviews the usefulness of various infection control measures in containing the spread of multidrug-resistant Gram-negative bacilli."

The news editors report that additional information may be obtained by contacting D. Marchaim, Assaf Harofeh Med Center, Div Infect Dis, IL-70300 Zerifin, Israel. Additional authors for this research include N.D. Friedman and D. Marchaim.

Keywords for this news article include: Zerifin, Israel, Asia, Drugs and Therapies, Drug Resistance, Assaf Harofe Medical Center.

**Drugs and Therapies - Antifungals**

**Data from Astellas Pharma Global Development Inc. Provide New Insights into Antifungals [Population Pharmacokinetics of Isavuconazole from Phase 1 and Phase 3 (SECURE) Trials in Adults and Target Attainment in Patients with Invasive Infections ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antifungals is the subject of a report. According to news reporting out of Northbrook, Illinois, by NewsRx editors, research stated, "Isavuconazole, the active moiety of the water-soluble prodrug isavuconazonium sulfate, is a triazole antifungal agent used for the treatment of invasive fungal infections. The objective of this analysis was to develop a population pharmacokinetic (PPK) model to identify covariates that affect isavuconazole pharmacokinetics and to determine the probability of target attainment (PTA) for invasive aspergillosis patients."

Financial support for this research came from Astellas Pharma Global Development, Inc.

Our news journalists obtained a quote from the research from Astellas Pharma Global Development Inc., "Data from nine phase 1 studies and one phase 3 clinical trial (SECURE) were pooled to develop the PPK model (NONMEM, version 7.2). Stepwise covariate modeling was performed in Perl-speaks-NONMEM, version 3.7.6. The area under the curve (AUC) at steady state was calculated for 5,000 patients by using Monte Carlo simulations. The PTA using the estimated pharmacodynamic (PD) target value (total AUC/MIC ratio) estimated from in vivo PD studies of invasive aspergillosis over a range of MIC values was calculated using simulated patient AUC values. A two-compartment model with a Weibull absorption function and a first-order elimination process adequately described plasma isavuconazole concentrations. The mean estimate for isavuconazole clearance was 2.360 liters/h (percent coefficient of variation [% CV], 34%), and the mean AUC from 0 to 24 h (AUC(0-24)) was similar to 100 mg center dot h/liter. Clearance was approximately 36% lower in Asians than in Caucasians. The PTA calculated over a range of MIC values by use of the nonneutropenic murine efficacy index corresponding to 90% survival indicated that adequate isavuconazole exposures were achieved in > 90% of simulated patients to treat infections with MICs up to and including 1 mg/liter according to European Committee on Antimicrobial Susceptibility Testing methodology and in > 90% of simulated patients for infections with MICs up to and including 0.5 mg/liter according to Clinical and Laboratory Standards Institute methodology."

According to the news editors, the research concluded: "The highest MIC result for PTA was the same for Caucasian and Asian patients."

For more information on this research see: Population Pharmacokinetics of Isavuconazole from Phase 1 and Phase 3 (SECURE) Trials in Adults and Target Attainment in Patients with Invasive Infections Due to Aspergillus and Other Filamentous Fungi. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5483-5491. Drugs and Therapies - Antiinfectives

Data from B. VanScoy et al Provide New Insights into Antiinfectives (Relationship between Fosfomycin Exposure and Amplification of Escherichia coli Subpopulations with Reduced Susceptibility in a Hollow-Fiber Infection Model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antiinfectives is now available. According to news reporting from Schenectady, New York, by NewsRx journalists, research stated, "Understanding the relationship between antibiotic exposure and amplification of bacterial subpopulations with reduced drug susceptibility over time is important for evaluating the adequacy of dosing regimens. We utilized a hollow-fiber infection model to identify the fosfomycin intravenous dosing regimens that prevented the amplification of Escherichia coli bacterial subpopulations with reduced fosfomycin susceptibility."

The news correspondents obtained a quote from the research, "The challenge isolate was E. coli ATCC 25922 (agar MIC with glucose-6-phosphate, 1 mg/liter; agar MIC without glucose-6-phosphate, 32 mg/liter). The fosfomycin dosing regimens studied were 1 to 12 g every 8 h for 10 days to approximate that planned for clinical use. The studies included a no-treatment control regimen. Two bacterial subpopulations were identified, one with reduced susceptibility with agar MIC values ranging from 32 to 128 mg/liter and the other resistant with agar MIC values of 256 to > 1,024 mg/liter on plates containing 5 x and 256 x the baseline MIC value, respectively. An inverted-U-shaped function best described the relationship between the amplification of the two bacterial subpopulations and drug exposure."

According to the news reporters, the research concluded: "The lowest fosfomycin dosing regimen that did not amplify a bacterial subpopulation with reduced susceptibility was 4 g administered every 8 h. Nearly immediate amplification of bacterial subpopulations with reduced susceptibility was observed with fosfomycin dosing regimens consisting of 1 to 2 g every 8 h. These data will be useful to support the selection of fosfomycin dosing regimens that minimize the potential for on-therapy amplification of bacterial subpopulations with reduced susceptibility."

For more information on this research see: Relationship between Fosfomycin Exposure and Amplification of Escherichia coli Subpopulations with Reduced Susceptibility in a Hollow-Fiber Infection Model. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5141-5145. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Surgery - Cardiovascular and Thoracic Surgery

Data from Baylor University College of Medicine Advance Knowledge in Cardiovascular and Thoracic Surgery (Decision analysis to define the optimal management of athletes with anomalous aortic origin of a coronary artery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Surgery - Cardiovascular and Thoracic Surgery have been published. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "The goal of this study was to use decision analysis to evaluate the impact of varying uncertainties on the outcomes of patients with anomalous aortic origin of a coronary artery. Two separate decision analysis models were created: one for anomalous left coronary artery (ALCA) and one for anomalous right coronary artery (ARCA)."

The news reporters obtained a quote from the research from the Baylor University College of Medicine, "Three strategies were compared: observation, exercise restriction, and surgery. Probabilities and health utilities were estimated on the basis of existing literature. Deterministic and probabilistic sensitivity analyses were performed. Surgery was the optimal management strategy for patients <30 years of age with ALCA. As age increased, observation became an equivalent strategy and eventually surpassed surgery as the treatment of choice. The advantage on life expectancy for surgery over observation ranged from 2.6 +/- 1.7 years for a 10-year-old patient to -0.03 +/- 0.1 for a 65-year old patient. In patients with ARCA, observation was the optimal strategy for most patients with a life expectancy advantage over surgery of 0.1 +/- 0.1 years to 0.2 +/- 0.4 years, depending on age. Surgery was the preferred strategy only for patients <25 years of age when the perceived risk of sudden cardiac death was high and the perioperative mortality was low. Exercise restriction was a suboptimal strategy for both ALCA and ARCA in all scenarios. The optimal management in anomalous aortic origin of a coronary artery depends on multiple factors, including individual patient characteristics."

According to the news reporters, the research concluded: "Decision analysis provides a tool to understand how these characteristics affect the outcomes with each management strategy and thus may aid in the decision making process for a particular patient."

For more information on this research see: Decision analysis to define the optimal management of athletes with anomalous aortic origin of a coronary artery. Journal of Thoracic

Clinical Research - Clinical Trials and Studies

Data from Beijing Hospital Advance Knowledge in Clinical Trials and Studies (Efficacy and safety of the Chaihuguizhiganjiang-suanzaoren granule on primary insomnia: study protocol for a randomised controlled trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Clinical Research - Clinical Trials and Studies have been presented. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Insomnia is a highly prevalent, often debilitating and economically burdensome sleep disorder with limited effective therapies. Few data are available to understand which of the therapeutic alternatives is the most effective for patients with insomnia, especially for Traditional Chinese Medicine (TCM)."

The news correspondents obtained a quote from the research from Beijing Hospital, "Chinese herbal medicine, as a typical TCM, is one of the most popular complementary and alternative therapies for insomnia. We aim to evaluate the efficacy and safety of the Chaihuguizhiganjiang-suanzaoren granule (CSG), a Chinese herbal medicine treatment, in patients with primary insomnia. This is a multicentre, placebo-controlled, double-blinded, randomised controlled clinical trial. A total of 258 participants are randomly allocated to two groups: the intervention group or the placebo group. The intervention group receives CSG and the placebo group receives a placebo granule. The patients receive either CSG or placebo two times daily for 8 weeks. The primary outcome is the Pittsburgh sleep quality index (PSQI). Secondary outcomes include the Insomnia Severity Index (ISI), Total Sleep Time (TST) and the Short-Form Health Survey (SF-36). The assessment is performed at baseline (before randomisation), 4, 8 and 12 weeks after randomisation. The protocol has been approved by the Research Ethical Committee of Beijing Hospital of Traditional Chinese Medicine Affiliated to Capital Medical University (reference: 2014BL-003-01)."
According to the news reporters, the research concluded: "The trial will be helpful in identifying the efficacy and safety of CSG in patients with primary insomnia."

For more information on this research see: Efficacy and safety of the Chaihuguizhiganjiang-suansaozen granule on primary insomnia: study protocol for a randomised controlled trial. *Bmj Open*, 2016;6(2):e008459. (BMJ Publishing Group - group.bmj.com/; Bmj Open - bmjopen.bmj.com/)

**Data from Ben-Gurion University of the Negev Provide New Insights into Type 1 Diabetes Mellitus (Exploration of alpha 1-Antitrypsin Treatment Protocol for Islet Transplantation: Dosing Plan and Route of Administration)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus is now available. According to news reporting out of Beer Sheva, Israel, by NewsRx editors, research stated, "Lifelong weekly infusions of human alpha 1-antitrypsin (hAAT) are currently administered as augmentation therapy for patients with genetic AAT deficiency (AATD). Several recent clinical trials attempt to extend hAAT therapy to conditions outside AATD, including type 1 diabetes."

Our news journalists obtained a quote from the research from the Ben-Gurion University of the Negev, "Because the endpoint for AATD is primarily the reduction of risk for pulmonary emphysema, the present study explores hAAT dose protocols and routes of administration in attempt to optimize hAAT therapy for islet-related injury. Islet-grafted mice were treated with hAAT (Glassia; intraperitoneally or subcutaneously) under an array of clinically relevant dosing plans. Serum hAAT and immunocyte cell membrane association were examined, as well as parameters of islet survival. Results indicate that dividing the commonly prescribed 60 mg/kg i.p. dose to three 20 mg/kg injections is superior in affording islet graft survival; in addition, a short dynamic descending dose protocol (240 -> 120 -> 60 -> 60 mg/kg i.p.) is comparable in outcomes to indefinite 60 mg/kg injections. Although pharmacokinetics after intraperitoneal administration in mice resembles exogenous hAAT treatment in humans, subcutaneous administration better imitated the physiologic progressive rise of hAAT during acute phase responses; nonetheless, only the 60 mg/kg dose depicted an advantage using the subcutaneous route. Taken together, this study provides a platform for extrapolating an
islet-relevant clinical protocol from animal models that use hAAT to protect islets."

According to the news editors, the research concluded: "In addition, the study places emphasis on outcome-oriented analyses of drug efficacy, particularly important when considering that hAAT is presently at an era of drug-repurposing toward an extended list of clinical indications outside genetic AATD."

Our news journalists report that additional information may be obtained by contacting E.C. Lewis, Ben Gurion University of the Negev, Fac Hlth Sci, Dept. of Clin Biochem & Pharmacol, IL-84101 Beer Sheva, Israel. Additional authors for this research include E. Ozeri, G. Shahaf, D.E. Ochayon, R. Schuster, N. Bahar, N. Kalay, P. Cal, M.I. Mizrahi, O. Nisim, P. Strauss, E. Schenker and E.C. Lewis.

**Cardiovascular Diseases and Conditions**

**Data from Bezmialem Vakif University Provide New Insights into Hypertension (Adropin levels and target organ damage secondary to high blood pressure in the ED)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Hypertension are presented in a new report. According to news reporting originating in Istanbul, Turkey, by NewsRx journalists, research stated, "High blood pressure is still a challenge for emergency physicians to discern the patients that require further analysis to establish the existence of acute hypertensive target organ damage (TOD). The present study aimed to reveal that adropin levels are useful for detecting TOD in patients presenting with high blood pressure."

The news reporters obtained a quote from the research from Bezmialem Vakif University, "Patients presenting with a blood pressure of more than 180/110 mm Hg were enrolled into the study. After a resting period of 15 minutes, patients' blood pressures were measured thrice at 5-minute intervals while the patients were sitting on a chair, and the average of these measurements was accepted as the baseline value. Blood samples were obtained for either adropin levels or possible TOD during the emergency department admission. A total of 119 patients were included in the study. The mean systolic and diastolic blood pressures of study patients were 204.8 +/- 23.2 and 108.3 +/- 10.3, respectively, and 42% (n = 50) of the patients had TOD. Although the adropin levels were similar between the patients with or without TOD (TOD group = 195 pg/mL, interquartile range [IQR]: 178-201; no-TOD group = 196 pg/mL, IQR: 176-204 [P = .982]), it is significantly higher in normotensive patients.
(normotensive group = 289 pg/mL, IQR: 193-403) compared with the hypertensive ones (P < .001)."

According to the news reporters, the research concluded: "Despite the significantly higher levels of adropin in normotensive patients compared with hypertensive ones, adropin could not be used as a decision tool for detecting TOD in patients presenting with high blood pressure to the emergency department."

Our news correspondents report that additional information may be obtained by contacting B. Gulen, Bezmialem Vakif Univ, Dept. of Emergency Med, Istanbul, Turkey. Additional authors for this research include C. Eken, O.T. Kucukdagli, M. Serinken, A. Kocyigit, E. Kilic and H. Uyarel.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajem.2016.04.014. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Heart Attack

Data from Brigham and Women's Hospital Provide New Insights into Heart Attack (Continuous EEG monitoring enhances multimodal outcome prediction in hypoxic-ischemic brain injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Attack is the subject of a report. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Hypoxic brain injury is the largest contributor to disability and mortality after cardiac arrest. We aim to identify electroencephalogram (EEG) characteristics that can predict outcome on cardiac arrest patients treated with targeted temperature management (TTM)."

The news correspondents obtained a quote from the research from Brigham and Women's Hospital, "We retrospectively examined clinical, EEG, functional outcome at discharge, and in-hospital mortality for 373 adult subjects with return of spontaneous circulation after cardiac arrest. Poor outcome was defined as a Cerebral Performance Category score of 3-5. Pure suppression-burst (SB) was defined as SB not associated with status epilepticus (SE), seizures, or generalized periodic discharges. In-hospital mortality was 68.6% (N = 256). Presence of both unreactive EEG background and SE was associated with a positive predictive value (PPV) of 100% (95% confidence interval: 0.96-1) and a false-positive rate (FPR) of 0% (95% CI: 0-0.11) for poor functional outcome. A prediction model including demographics data, admission exam, presence of status epilepticus, pure SB, and lack of EEG reactivity had an area under the curve of 0.92 (95% CI: 0.87-0.95) for poor functional outcome prediction, and 0.96
(95% CI: 0.94-0.98) for in-hospital mortality. Presence of pure SB (N = 87) was confounded by anesthetics use in 83.9% of the cases, and was not an independent predictor of poor functional outcome, having a FPR of 23% (95% CI: 0.19-0.28). An unreactive EEG background and SE predicted poor functional outcome and in-hospital mortality in cardiac arrest patients undergoing TTM."

According to the news reporters, the research concluded: "Prognostic value of pure SB is confounded by use of sedative agents, and its use on prognostication decisions should be made with caution."

For more information on this research see: Continuous EEG monitoring enhances multimodal outcome prediction in hypoxic-ischemic brain injury. Resuscitation, 2016;109 ():121-126. **Stem Cell Research - Hematopoietic Stem Cells**

**Data from British Heart Foundation Provide New Insights into Hematopoietic Stem Cells (DNA Methylation Dynamics of Human Hematopoietic Stem Cell Differentiation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Stem Cell Research - Hematopoietic Stem Cells are presented in a new report. According to news reporting originating in Cambridge, United Kingdom, by NewsRx journalists, research stated, "Hematopoietic stem cells give rise to all blood cells in a differentiation process that involves widespread epigenome remodeling. Here we present genome-wide reference maps of the associated DNA methylation dynamics."

Financial supporters for this research include BLUEPRINT project, European Union’s Seventh Framework Programme, NIHR Cambridge Biomedical Research Centre, Austrian Academy of Sciences, Medical Research Council Clinical Training Fellowship, German Research Council, DOC Fellowship of the Austrian Academy of Sciences, NIHR, BHF, NHS Blood and Transplant, Wellcome Trust Sir Henry Dale Fellowship, Wellcome Trust, MRC, BHF Cambridge Centre of Excellence, New Frontiers Group, European Research Council (ERC) Starting Grant, European Union’s Horizon 2020.

The news reporters obtained a quote from the research from British Heart Foundation, "We used a meta-epigenomic approach that combines DNA methylation profiles across many small pools of cells and performed single-cell methylene sequencing to assess cell-to-cell heterogeneity. The resulting dataset identified characteristic differences between HSCs
derived from fetal liver, cord blood, bone marrow, and peripheral blood. We also observed lineage-specific DNA methylation between myeloid and lymphoid progenitors, characterized immature multi-lymphoid progenitors, and detected progressive DNA methylation differences in maturing megakaryocytes. We linked these patterns to gene expression, histone modifications, and chromatin accessibility, and we used machine learning to derive a model of human hematopoietic differentiation directly from DNA methylation data."

According to the news reporters, the research concluded: "Our results contribute to a better understanding of human hematopoietic stem cell differentiation and provide a framework for studying blood-linked diseases."

Our news correspondents report that additional information may be obtained by contacting M. Frontini, British Heart Fdn Center Excellence, Cambridge CB2 0QQ, United Kingdom. Oncology - Rectal Cancer

Data from C. Hardie et al Provide New Insights into Rectal Cancer
(Effect of statin and aspirin use on toxicity and pathological complete response rate of neo-adjuvant chemoradiation for rectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Rectal Cancer. According to news reporting originating from Palmerston North, New Zealand, by NewsRx correspondents, research stated, "To retrospectively evaluate the potential impact of statin and aspirin use on acute toxicity and pathological complete response (pCR) rate in rectal cancer patients receiving neo-adjuvant long-course radiation therapy (LCRT) with concurrent chemotherapy. A retrospective review was performed of all patients undergoing neo-adjuvant LCRT for rectal adenocarcinoma at the Regional Cancer Treatment Service between 1 September 2007 and 1 June 2011."

Our news editors obtained a quote from the research, "Data obtained include demographic details; date and radiological TNM stage at diagnosis; medication taken at time of RT; toxicity during LCRT; and surgical histology to determine if a pCR was obtained following LCRT. Neo-adjuvant LCRT was administered to 142 patients for rectal cancer during this
period; concurrent chemotherapy was omitted in 13 due to significant comorbidities. TNM stage was 2 or 3 radiologically at diagnosis in 127 (89.4%) of patients. At the time of LCRT, 23% were taking a statin and 25% were taking aspirin. Of 135 assessable patients, 34 (13%) achieved a pCR at surgery. On logistic regression, pCR was not significantly associated with the use of chemotherapy, statins, aspirin, other NSAIDs, T-stage or N-stage. There was no significant correlation between statin or aspirin use with bladder or rectal toxicity. Actuarial time to maximum rectal toxicity was not different in statin users or nonusers. In contrast to other larger retrospective series, this study did not find improvements in toxicity or pCR rate through statin or aspirin use in rectal cancer patients undergoing LCRT."

According to the news editors, the research concluded: "Their potential benefits in this setting would be best studied prospectively in a large randomized trial."

The news editors report that additional information may be obtained by contacting C. Hardie, Regional Cancer Treatment Service, Palmerston North Hospital, Palmerston North, New Zealand. Additional authors for this research include Y. Jung and M. Jameson.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ajco.12468. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Colon Cancer

Data from Cancer Institute Advance Knowledge in Colon Cancer [Subgroup analysis in RAISE: a randomized, double-blind phase III study of irinotecan, folinic acid, and 5-fluorouracil (FOLFIRI) plus ramucirumab or placebo in patients with ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news reporting out of Brno, Czech Republic, by NewsRx editors, research stated, "The RAISE phase III trial demonstrated ramucirumab + FOLFIRI improved survival compared with placebo + FOLFIRI for second-line metastatic colorectal carcinoma patients previously treated with first-line bevacizumab, oxaliplatin, and a fluoropyrimidine. Analyses reported here found similar efficacy and safety in patients regardless of KRAS mutational status, time to first-line progression, and age. The RAISE phase III clinical trial demonstrated that
ramucirumab + FOLFIRI improved overall survival (OS) [hazard ratio (HR) = 0.844, \( P = 0.0219 \)] and progression-free survival (PFS) (HR = 0.793, \( P < 0.0005 \)) compared with placebo + FOLFIRI for second-line metastatic colorectal carcinoma (mCRC) patients previously treated with first-line bevacizumab, oxaliplatin, and a fluoropyrimidine.

Our news journalists obtained a quote from the research from Cancer Institute, "Since some patient or disease characteristics could be associated with differential efficacy or safety, prespecified subgroup analyses were undertaken. This report focuses on three of the most relevant ones: KRAS status (wild-type versus mutant), age (< 65 versus \( \geq 65 \) years), and time to progression (TTP) on first-line therapy (< 6 versus \( \geq 6 \) months). OS and PFS were evaluated by the Kaplan-Meier analysis, with HR determined by the Cox proportional hazards model. Treatment-by-subgroup interaction was tested to determine whether treatment effect was consistent between subgroup pairs. Patients with both wild-type and mutant KRAS benefited from ramucirumab + FOLFIRI treatment over placebo + FOLFIRI (interaction \( P = 0.526 \)); although numerically, wild-type KRAS patients benefited more (wild-type KRAS: median OS = 14.4 versus 11.9 months, HR = 0.82, \( P = 0.049 \); mutant KRAS: median OS = 12.7 versus 11.3 months, HR = 0.89, \( P = 0.263 \)). Patients with both longer and shorter first-line TTP benefited from ramucirumab (interaction \( P = 0.9434 \)), although TTP < 6 months was associated with poorer OS (TTP \( \geq 6 \) months: median OS = 14.3 versus 12.5 months, HR = 0.86, \( P = 0.061 \); TTP < 6 months: median OS = 10.4 versus 8.0 months, HR = 0.86, \( P = 0.276 \)). The subgroups of patients \( \geq 65 \) versus < 65 years also derived a similar ramucirumab survival benefit (interaction \( P = 0.9521 \)) (\( \geq 65 \) years: median OS = 13.8 versus 11.7 months, HR = 0.85, \( P = 0.156 \); < 65 years: median OS = 13.1 versus 11.9 months, HR = 0.86, \( P = 0.098 \)). The safety profile of ramucirumab + FOLFIRI was similar across subgroups. These analyses revealed similar efficacy and safety among patient subgroups with differing KRAS mutation status, longer or shorter first-line TTP, and age."

According to the news editors, the research concluded: "Ramucirumab is a beneficial addition to second-line FOLFIRI treatment for a wide range of patients with mCRC. ClinicalTrials.gov, NCT01183780."

**Cerebrovascular Diseases and Conditions - Vascular...**

**Data from Capital Medical University Provide New Insights into Vascular Dementia (Efficacy of Cholinesterase Inhibitors in Vascular Dementia: An Updated Meta-Analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cerebrovascular Diseases and Conditions - Vascular Dementia are discussed in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "The objective of this study was to determine whether treatment with acetylcholinesterase inhibitors would provide cognitive benefit for patients with vascular dementia. Studies in patients with vascular dementia, who had not taken acetylcholinesterase inhibitors or memantine for at least 6 weeks, were included."

The news correspondents obtained a quote from the research from Capital Medical University, "Twelve studies were included in the final analysis. Donepezil showed significant improvement in Alzheimer's Disease Assessment Scale-cognitive subscale (ADAS-cog) as compared to placebo, at the doses tested, that is, 5 and 10 mg/day (difference in means -1.389 and -1.680, respectively, p (<=) 0.008), but not on the Mini Mental State Examination (MMSE) (p (>) 0.259). Galantamine also improved the ADAS-cog in comparison to the placebo (difference in means -2.191, p<0.001), whereas, rivastigmine did not show any benefit on ADAS-cog. However, the findings with rivastigmine are difficult to interpret, given there were only 2 studies. Treatment with cholinesterase inhibitors was associated with a twofold increase in the odds of discontinuation, due to adverse events (pooled OR 1.966, 95% CI 1.630-2.371, p <0.001). The present results reveal the therapeutic benefits of donepezil and galantamine in patients with vascular dementia."

According to the news reporters, the research concluded: "Interestingly, the ADAS-cog and MMSE varied considerably in detecting cognitive improvement."

Our news journalists report that additional information may be obtained by contacting Y.D. Chen, Dept. of Neurology, Beijing Chaoyang Hospital, Capital Medical University, Beijing, People's Republic of China. Additional authors for this research include J. Zhang, Y. Wang, J.L. Yuan and W.L Hu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000444253. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Atrial Fibrillation

Data from Central South University Advance Knowledge in Atrial Fibrillation (Association Between the Left Atrial and Left Atrial Appendages Systole Strain Rate in Patients with Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting out of Changsha, People's Republic of China, by NewsRx editors, research stated, "The aim of this research was to explore the association between the left atrial (LA) and left atrial appendages (LAA) systole strain rate (SSR) in patients with atrial fibrillation (AF), and to provide evidence to aid in the assessment of disease progression. A total of 180 patients with AF were selected for the study (130 patients with paroxysmal AF (Par AF) and 50 patients with persistence AF (PerAF))."

Our news journalists obtained a quote from the research from Central South University, "In addition, 60 healthy individuals were selected as a control group. The total and side wall SSRs were calculated. The total SSR in the control group was higher than in the ParAF and PerAF groups (2.87 +/- 0.45 vs. 2.15 +/- 0.56 vs. 1.92 +/- 0.62 and 6.24 +/- 1.61 vs. 4.45 +/- 1.42 vs. 3.66 +/- 1.55). The total SSR of LAA was correlated with that of LA in the AF patient groups and the control group; the correlation coefficients were 0.720, 0.563, and 0.421. However, the ratio of total SSR of LAA to that of LA was not significant statistically different among the three groups (2.24 +/- 0.41 vs. 2.35 +/- 0.58 vs. 2.03 +/- 0.56). The posterior wall had the lowest SSRs in the control group and ParAF group. The SSRs of AF patients were lower than that of healthy individuals, and the degree was associated with disease progression."

According to the news editors, the research concluded: "The SSR was different in different side walls, and gradually shorten with disease progression."

For more information on this research see: Association Between the Left Atrial and Left Atrial Appendages Systole Strain Rate in Patients with Atrial Fibrillation. Medical Science Monitor, 2016;22():4974-4977. Medical Science Monitor can be contacted at: Int Scientific Literature, Inc, 361 Forest Lane, Smithtown, NY 11787, USA.

Our news journalists report that additional information may be obtained by contacting X.M. Zhou, Central South University, Xiang Ya Hosp 2, Dept. of Cardiac Surg, Changsha, Hunan, People's Republic of China. Additional authors for this research include M.Z. OuYang, D.M. Kong and X.M. Zhou.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gastroenterology - Kidney Function. According to news reporting out of Durham, North Carolina, by NewsRx editors, research stated, "Brincidofovir (BCV) is an orally bioavailable lipid conjugate of cidofovir (CDV) with increased in vitro potency relative to CDV against all 5 families of double-stranded DNA viruses that cause human disease. After intravenous (IV) administration of CDV, the organic anion transporter 1 (OAT1) transports CDV from the blood into the renal proximal tubule epithelial cells with resulting dose-limiting nephrotoxicity."

Our news journalists obtained a quote from the research from Chimerix, "To study whether OAT1 transports BCV and to evaluate the pharmacokinetic and renal safety profile of oral BCV compared with IV CDV. The cellular uptake of BCV and its major metabolites was assessed in vitro. Renal function at baseline and during and after treatment in subjects in BCV clinical studies was examined. In OAT1-expressing cells, uptake of BCV and its 2 major metabolites (CMX103 and CMX064) was the same as in mock-transfected control cells and was not inhibited by the OAT inhibitor probenecid. In human pharmacokinetic studies, BCV administration at therapeutic doses resulted in detection of CDV as a circulating metabolite; peak CDV plasma concentrations after oral BCV administration in humans were,1% of those observed after IV CDV administration at therapeutic doses. Analysis of renal function and adverse events from 3 BCV clinical studies in immunocompromised adult and pediatric subjects indicated little to no evidence of associated nephrotoxicity. Over 80% of subjects who switched from CDV or foscarnet to BCV experienced an improvement in renal function as measured by maximum on-treatment estimated glomerular filtration rate."

According to the news editors, the research concluded: "The lack of BCV uptake through OAT1, together with lower CDV concentrations after oral BCV compared with IV CDV administration, likely explains the superior renal safety profile observed in immunocompromised subjects receiving BCV compared with CDV."

For more information on this research see: Brincidofovir Is Not a Substrate for the Human Organic Anion Transporter 1: A Mechanistic Explanation for the Lack of Nephrotoxicity Observed in Clinical Studies. Therapeutic Drug Monitoring, 2016;38(6):777-786. Therapeutic Drug Monitoring can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Therapeutic Drug Monitoring - journals.lww.com/drug-monitoring/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting T.K. Tippin, Chimerix, Durham, NC 27713, United States. Additional authors for this research include M.E. Morrison, T.M. Brundage and H. Mommeja-Marin.

Blood Pressure

Data from China University of Science and Technology Advance Knowledge in Blood Pressure [Protective role of ACE2-Ang-(1-7)-Mas in myocardial fibrosis by downregulating K(Ca)3.1 channel via ERK1/2 pathway]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Pressure have been published. According to news reporting originating from Tangshan, People's Republic of China, by NewsRx correspondents, research stated, "The intermediate-conductance Ca^{2+}-activated K+ (K(Ca)3.1) channel plays a vital role in myocardial fibrosis induced by angiotensin (Ang) II. However, as the antagonists of Ang II, the effect of angiotensin-converting enzyme 2 (ACE2)-angiotensin-(1-7)-Mas axis on K(Ca)3.1 channel during myocardial fibrosis remains unknown."

Our news editors obtained a quote from the research from the China University of Science and Technology, "This study was designed to explore the function of K(Ca)3.1 channel in the cardioprotective role of ACE2-Ang-(1-7)-Mas. Wild-type (WT) mice, hACE2 transgenic mice (Tg), and ACE2 deficiency mice (ACE2(-/-)) were administrated with Ang II by osmotic mini-pumps. As the activator of ACE2, diminazene aceturate (DIZE) inhibited increase of blood pressure, collagen deposition, and K(Ca)3.1 protein expression in myocardium of WT mice induced by Ang II. In Tg and ACE2(-/-) mice, besides the elevation of blood pressure, Ang II induced transformation of cardiac fibroblast into myofibroblast and resulted in augmentation of hydroxyproline concentration and collagen deposition, as well as K(Ca)3.1 protein expression, but the changes in ACE2(-/-) mice were more obvious than those in Tg mice. Mas antagonist A779 reduced blood pressure, myocardium fibrosis, and myocardium K(Ca)3.1 protein expression by Ang II in Tg mice, but activation of K(Ca)3.1 with SKA-31 in Tg mice promoted the pro-fibrogenic effects of Ang II. Respectively, in ACE2(-/-) mice, TRAM-34, the K(Ca)3.1 blocker, and Ang-(1-7) inhibited increase of blood pressure, collagen deposition, and K(Ca)3.1 protein expression by Ang II. Moreover, DIZE and Ang-(1-7) depressed p-ERK1/2/ERK increases by Ang II in WT mice, and after blockage of ERK1/2 pathway with PD98059, the K(Ca)3.1 protein expression was reduced in WT mice."

According to the news editors, the research concluded: "The present study demonstrates that ACE2-Ang-(1-7)-Mas protects the myocardium from hypertension-induced injury, which is related to its inhibiting effect on K(Ca)3.1 channels through ERK1/2 pathway. Our results reveal that K(Ca)3.1 channel is likely to be a critical target on the ACE2-Ang-(1-7)-Mas axis for its protective role in myocardial fibrosis and changes of K(Ca)3.1 induced by homeostasis of ACE-Ang II-AT1 axis and ACE2-Ang-(1-7)-Mas axis may be a new therapeutic target in myocardial fibrosis."

For more information on this research see: Protective role of ACE2-Ang-(1-7)-Mas in myocardial fibrosis by downregulating K(Ca)3.1 channel via ERK1/2 pathway. Pflugers Archiv-European Journal of Physiology, 2016;468(11-12):2041-2051. Pflugers Archiv-European Journal of Physiology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA.
Apoptosis

Data from Chungnam National University Advance Knowledge in Apoptosis (Mutational analysis of metacaspase CaMca1 and decapping activator Edc3 in the pathogenicity of Candida albicans)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Apoptosis are presented in a new report. According to news reporting originating in Daejeon, South Korea, by NewsRx journalists, research stated, "Candida albicans, an opportunistic fungal pathogen, displays apoptotic cell death in response to various stresses and a wide range of antifungal treatments. CaMca1, which is the only metacaspase in C. albicans, has been described as a key player in apoptotic cell death."

The news reporters obtained a quote from the research from Chungnam National University, "Edc3 is an mRNA decapping activator and a scaffold protein of processing bodies. Edc3 was previously shown to regulate CaMCA1 expression and oxidative stress-induced apoptosis. In this study, we analyzed the contribution of the catalytic residues of the CaMca1 to the oxidative stress-induced apoptosis and pathogenicity of C. albicans. The CaMCA1(C292A) mutation decreased caspase activity to a level similar to that observed in the Camca1/Camca1 deletion strain and over-expression of CaMCA1(C292A) failed to suppress the oxidative-stress phenotypes of the edc3/edc3 mutant strain. The edc3/edc3, Camca1/Camca1, and CaMCA1 (C292A) mutant strains were not virulent in a murine candidiasis model. Filamentation defects were observed in the Camca1/Camca1 mutant cells, whereas this defect was only partial in CaMCA1(C292A) mutant cells."

According to the news reporters, the research concluded: "These results suggest that CaMca1 and Edc3 play essential roles in the oxidative stress-induced apoptosis and virulence of C albicans, and also support the notion that Edc3 is a key regulator of CaMca1 expression."

For more information on this research see: Mutational analysis of metacaspase CaMca1 and decapping activator Edc3 in the pathogenicity of Candida albicans. *Fungal Genetics and Biology*, 2016;97():18-23. *Fungal Genetics and Biology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Fungal Genetics and Biology - www.journals.elsevier.com/fungal-genetics-and-biology/)

**Arrhythmia**

**Data from Columbia University Advance Knowledge in Arrhythmia (Validation of electromechanical wave imaging in a canine model during pacing and sinus rhythm)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Arrhythmia have been presented. According to news reporting originating in New York City, New York, by NewsRx journalists, research stated, "Accurate determination of regional areas of arrhythmic triggers is of key interest to diagnose arrhythmias and optimize their treatment. Electromechanical wave imaging (EWI) is an ultrasound technique that can image the transient deformation in the myocardium after electrical activation and therefore has the potential to detect and characterize location of triggers of arrhythmias."

The news reporters obtained a quote from the research from Columbia University, "The objectives of this study were to investigate the relationship between the electromechanical and the electrical activation of the left ventricular (LV) endocardial surface during epicardial and endocardial pacing and during sinus rhythm as well as to map the distribution of electromechanical delays. In this study, 6 canines were investigated. Two external electrodes were sutured onto the epicardial surface of the LV. A 64-electrode basket catheter was inserted through the apex of the LV. Ultrasound channel data were acquired at 2000 frames/s during epicardial and endocardial pacing and during sinus rhythm. Electromechanical and electrical activation maps were synchronously obtained from the ultrasound data and the basket catheter, respectively. The mean correlation coefficient between electromechanical and electrical activation was 0.81 for epicardial anterior pacing, 0.79 for epicardial lateral pacing, 0.69 for endocardial pacing, and 0.56 for sinus rhythm. The electromechanical activation sequence determined by EWI follows the electrical activation sequence and more specifically in the case of pacing."

According to the news reporters, the research concluded: "This finding is of key interest in the role that EWI can play in the detection of the anatomical source of arrhythmias and the planning of pacing therapies such as cardiovascular resynchronization therapy."

For more information on this research see: Validation of electromechanical wave imaging in a canine model during pacing and sinus rhythm. *Heart Rhythm*, 2016;13(11):2221-2227. Heart Rhythm can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Heart Rhythm - www.journals.elsevier.com/heart-rhythm/)

Drugs and Therapies - Diclofenac Therapy

Data from D. Mladsi and Colleagues Advance Knowledge in Diclofenac Therapy (Cost-effectiveness of Low-dose Submicron Diclofenac Compared With Generic Diclofenac)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Diclofenac Therapy have been presented. According to news reporting from Research Triangle Park, North Carolina, by NewsRx journalists, research stated, "NSAIDs are commonly prescribed for the treatment of pain and inflammation. Despite the effectiveness of NSAIDs, concerns exist regarding their tolerability."

The news correspondents obtained a quote from the research, "Worldwide health authorities, including the European Medicines Agency, Health Canada, and the US Food and Drug Administration, have advised that NSAIDs be prescribed at the lowest effective dosage and for the shortest duration. Effective lowering of NSAID dosage without compromising pain relief has been demonstrated in randomized, controlled trials of the recently approved NSAID lower-dose submicron diclofenac. Building on previously published work from an independently published systematic review and meta-analysis, a linear dose toxicity relationship between diclofenac dose and serious gastrointestinal (GI) events was recently demonstrated, indicating that reductions in adverse events (AEs) may be seen even with modest dose reductions in many patients. The objective of the present study was to estimate the potential reduction in risk for NSAID dose related AEs, corresponding savings in health care costs, and the incremental cost-effectiveness of submicron diclofenac compared with generic diclofenac in the United States. Our decision-analytic cost-effectiveness model considered a subset of potential AEs that may be avoided by lowering NSAID dosage. To estimate the expected reductions in upper GI bleeding/perforation and major cardiovascular events with submicron diclofenac, our model used prediction equations estimated by meta-regressions using data from systematic literature reviews. Utilities, lifetime costs, and health outcomes associated with AEs were estimated using data from the literature. The face validity of the model structure and inputs was confirmed by clinical experts in the United States. Results were evaluated in 1-way and probabilistic sensitivity analyses. The model predicted that submicron diclofenac versus generic diclofenac could reduce the occurrence of modeled GI events (by 18.0%), cardiovascular events (by 6.9%), and acute renal failure (by 18.8%), leading to a 9.8% reduction in costs of treating AEs. Submicron diclofenac was predicted to be cost-saving, with results relatively insensitive to parameter uncertainty. Submicron diclofenac has the potential to provide clinical and economic value to patients using NSAIDs in the United States."

According to the news reporters, the research concluded: "Further investigation
regarding the potential effects of submicron diclofenac on the risks for additional NSAID dose related toxicities should be explored.”

Our news journalists report that additional information may be obtained by contacting D. Mladsi, RTI Hlth Solut, Res Triangle Pk, NC 27709, United States. Additional authors for this research include N. Ronquest, D. Odom, L. Miles and K. Saag.

**Digestive System Diseases and Conditions** --...

**Data from Department of Internal Medicine Provide New Insights into Colorectal Neoplasms (Associations between amount of smoking and alcohol intake and risk of colorectal neoplasm)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Colorectal Neoplasms have been published. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Although smoking and alcohol has been linked to an increased risk of colorectal neoplasm (CRN), large-scale studies to identify dose-dependent relationship between amount of smoking and alcohol consumption and risk of CRN are rare. We aimed to investigate the risk for CRN according to the amount of smoking and alcohol intake in a large sample of Korean adults."

The news correspondents obtained a quote from the research from the Department of Internal Medicine, "A cross-sectional study was performed on 31,714 examinees aged (>=)30 years undergoing their first colonoscopy as part of routine preventive health care between 2010 and 2011. Never smokers were compared with six groups of smokers according to smoking amount, and individuals with alcohol intake of (<=) 6.25 g ethanol per day were compared with three groups according to alcohol amount. In adjusted models, the risk of overall CRN increased with increasing amount of smoking (P for trend <0.001). The adjusted odds ratios for overall CRN comparing never smokers with six smoker groups according to smoking amount ( (<=) 2.50, 2.51-5.60, 5.61-9.00, 9.01-13.00, 13.01-19.50, and (>=)19.51 pack-years) were 1.02, 1.19, 1.35, 1.53, 1.63, and 2.03, respectively. In addition, the risk of both non-advanced and advanced CRN increased with increasing amount of smoking (both P for trend <0.001). However, the amount of alcohol consumption was not correlated with the risk of CRN. The prevalence of
CRN was associated with increasing amount of smoking in a dose-response manner, whereas it was not associated with the amount of alcohol consumption."

According to the news reporters, the research concluded: "Our study suggests that smoking amount as well as smoking status should be considered for CRN risk stratification."

Drugs and Therapies - Chemotherapy

Data from Department of Research Provide New Insights into Chemotherapy [Reference data of the European Organisation for Research and Treatment of Cancer (EORTC) QLQ-CIPN20 Questionnaire in the general Dutch population]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Chemotherapy have been presented. According to news reporting out of Utrecht, Netherlands, by NewsRx editors, research stated, "Chemotherapy-induced peripheral neuropathy (CIPN) is a debilitating side-effect of chemotherapy. However, CIPN symptoms are also reported by patients not receiving chemotherapy."

Our news journalists obtained a quote from the research from the Department of Research, "Normative data could help interpret CIPN among cancer patients. Our aim was to generate normative data for the European Organisation for Research and Treatment of Cancer (EORTC) QLQ-CIPN20 Questionnaire designed to assess CIPN from the patients' perspective. The normative CIPN data have also been generated for stratified subgroups formed on the basis of sex, age and comorbidity. The QLQ-CIPN20 and the Self-administered Comorbidity Questionnaire were administered to a representative panel of the Dutch-speaking population in the Netherlands. Two thousand one hundred and two (78%) of those invited completed the questionnaires. The majority reported no CIPN symptoms (83-97%). Cronbach's alpha coefficients for the sum score, and sensory, motor and autonomic subscales were 0.87, 0.76, 0.82 and 0.49, respectively. Compared with men, women scored significantly worse on the sum score (men, 3.0 versus women, 4.3; p< 0.001), motor scale (2.7 versus 5.1; p< 0.001) and
autonomic scale (3.8 versus 5.2; p< 0.01), but this difference was not clinically relevant. CIPN symptoms increased significantly with age among both men (for the sum score and all scales) and women (for the sum score, sensory and motor scale). Those with self-reported comorbidities reported significantly more CIPN symptoms, both statistically and clinically, than those without. For instance, they had a lower mean sum score (1.5) compared to those with asthma/chronic obstructive pulmonary disease (COPD; 6.9), diabetes (5.9), heart disease (8.0), hypertension (6.2), osteoarthritis (9.6) and rheumatoid arthritis (13.8). A low prevalence of neuropathy was observed in the normative population without cancer, although neuropathy did increase with age and the presence of comorbidities."

According to the news editors, the research concluded: "These data (which is freely available) can aid in the interpretation of QLQ-CIPN20 scores and can help increase our understanding of the influence of age, sex and comorbid conditions on CIPN among cancer patients."

Our news journalists report that additional information may be obtained by contacting F. Mols, Netherlands Comprehens Canc Organization IKNL, Dept. of Res, Utrecht, Netherlands. **Nutritional and Metabolic Diseases and Conditions - …**

**Data from Drexel University Advance Knowledge in Obesity (From last supper to self-initiated weight loss: Pretreatment weight change may be more important than previously thought)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting originating in Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Evaluate the association between pretreatment and during-treatment weight change, as well as differences in self-regulation between those who gain weight, remain weight stable, and lose weight pretreatment. Data from the first 6 months of a behavioral weight loss study were used."

The news reporters obtained a quote from the research from Drexel University, "Participants (n=283) were weighed at two assessment points (screening visit and baseline) prior to the start of treatment and at every treatment session. Participants were divided into those who
gained weight, remained weight stable, or lost weight between the screening visit and the first treatment session. Pretreatment weight change was not significantly associated with during-treatment change. Weight change from the screening visit to month 6 was significantly different by category, with losses of 11% and 7% for those who lost and gained weight pretreatment, respectively. Weight change from first treatment session to month 6 was not different by category. Poorer self-regulation was associated with pretreatment weight gain and better self-regulation with pretreatment weight loss. Pretreatment weight change may not relate to success during behavioral weight loss treatment. Researchers should carefully consider when the 'baseline' assessment takes place to reduce bias introduced by pretreatment weight change."

According to the news reporters, the research concluded: "Poorer self-regulation may place individuals at risk for weight gain prior to treatment."

For more information on this research see: From last supper to self-initiated weight loss: Pretreatment weight change may be more important than previously thought. *Obesity*, 2016;24(4):843-9. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

**Data from E.E. Caamal-Fuentes and Colleagues Advance Knowledge in Alcohols (Anti-giardia activity and acute toxicity of a methanol extract of Senna racemosa bark)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Alcohols have been published. According to news originating from Yucatan, Mexico, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: *Senna racemosa* (Mill.) H.S. Irwin & Barneby (syn."

Financial support for this research came from Fundacion Instituto Mexicano del Seguro Social.

Our news journalists obtained a quote from the research, "*Cassia racemosa* Mill.) is a plant used in traditional Mayan medicinal practices to treat diarrhea. A methanol extract of *S. racemosa* bark has been shown to have in vitro activity against *Giardia intestinalis*. No studies of its efficacy and toxicity in in vivo models have been done. The present study objective was to analyze the activity of this methanol extract of *S. racemosa* bark against *Giardia intestinalis* trophozoites in experimentally infected mice, and evaluate its toxicological effects in rats. *S. racemosa* was collected in Merida, Yucatan, Mexico (21 degrees 58'N, 89 degrees 36'W) in June
2005. The bark methanol extract was obtained and high performance liquid chromatography (HPLC-DAD) was used to generate a constituent profile. In vivo anti-giardia activity was assayed with an experimental model of G. intestinalis infection in neonatal CD-1 mice. Nine doses ranging from 0.25-15 mg extract/kg body weight were tested to determine the dose required to kill 50% of the trophozoites (ED50). An acute toxicity assay was run in which one of four single doses (200, 1000, 2000 and 3000 mg/kg body weight) was orally administered to adult Wistar rats. Animal weight, death rates, toxic effects and behavioral parameters were observed over a 14-d period. They were then euthanized and a necropsy performed. The S. racemosa bark extract inhibited growth of G. intestinalis (ED50=1.14 mg/Kg) in neonatal CD-1 mice. No toxic or lethal effects were observed even at the highest dosage (3000 mg/Kg), and neither were signs of toxicity observed in internal organs. The active compounds chrysophanol and physcion were present in the extract at a 1.76 ratio."

According to the news editors, the research concluded: "The results strongly support traditional use of S. racemosa bark for treatment of diarrhea caused by Giardia intestinalis infection."

The news correspondents report that additional information may be obtained from R.E. Moo-Puc, Inst Mex Icano Seguro Social, Center Med Ignacio Garcia Tellez, Unidad Med Alta Especialidad, Unidad Invest Med Yucatan, Merida 97150, Yucatan, Mexico. Additional authors for this research include M. Graniel-Sabido, G.J. Mena-Rejon and R.E. Moo-Puc.

**Oncology - Multiple Myeloma**

**Data from Eberhard-Karls University Advance Knowledge in Multiple Myeloma (Simplified response monitoring criteria for multiple myeloma in patients undergoing therapy with novel agents using computed tomography)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Multiple Myeloma are discussed in a new report. According to news originating from Tubingen, Germany, by NewsRx correspondents, research stated, "Multiple myeloma is a malignant hematological disorder of the mature B-cell lymphocytes originating in the bone marrow. While therapy monitoring is still mainly based on laboratory biomarkers, the additional use of imaging has been advocated due to inaccuracies of serological biomarkers or in a-secretory myelomas."

Our news journalists obtained a quote from the research from Eberhard-Karls
University, "Non-enhanced CT and MRI have similar sensitivities for lesions in yellow marrow rich bone marrow cavities with a favourable risk and cost-effectiveness profile of CT. Nevertheless, these methods are still limited by frequently high numbers of medullary lesions and its time consumption for proper evaluation. To establish simplified response criteria by correlating size and CT attenuation changes of medullary multiple myeloma lesions in the appendicular skeleton with the course of lytic bone lesions in the entire skeleton. Furthermore to evaluate these criteria with respect to established hematological myeloma-specific parameters for the prediction of treatment response to bortezomib or lenalidomide. Non-enhanced reduced-dose whole-body CT examinations of 78 consecutive patients (43 male, 35 female, mean age 63.69 +/- 9.2 years) with stage III multiple myeloma were retrospectively re-evaluated. On per patient basis, size and mean CT attenuation of 2-4 representative lesions in the limbs were measured at baseline and at a follow-up after a mean of 8 months. Results were compared with the course of lytic bone lesions as well with that of specific hematological biomarkers. Myeloma response was assessed according to the International Myeloma Working Group (IMWG) uniform response criteria. Testing for correlation between response of medullary lesions (Resp(med)) and response of all myeloma manifestations including osteolyses total (Resp(total)) was performed using the corrected contingency, coefficient (C-corr). The correlation between Respmad based on length diameter and transverse diameter and Resp(total) was perfect (C-corr = 1.0; p< 0.0001) whereas the correlation based on density was moderate (C-corr = 0.54; p< 0.0001). The evaluation of simplified response criteria with a measurement of only 2 medullary lesions yielded the best sensitivity and specificity valued for treatment-induced changes for the length diameter evaluation with 94.4%/195.7% for prediction of progressive disease and 78.6%/93.3% for prediction of therapy response. There were no significant differences between patients treated with bortezomib and lenalidomide (p > 0.05)."

According to the news editors, the research concluded: "Measurements of size of a minimum of two medullary lesions is sufficient for response assessment and correlates very well with the course of lytic bone lesions and that of hematologic parameters."

The news correspondents report that additional information may be obtained from G. Bier, Eberhard Karls Univ Tuebingen, Dept. of Neuroradiol, D-72076 Tubingen, Germany. Additional authors for this research include M. Horger, S. Kum, K. Weisel, J. Fritz, S.D. Ioanoviciu and G. Bier.

Nutritional and Metabolic Diseases and Conditions - …

Data from Ehime University Graduate School of Medicine Provide New Insights into Anorexia (Association between high serum carcinoembryonic antigen and clinical state of male anorexia nervosa: A case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Anorexia are presented in a new report. According to news reporting out of Ehime, Japan, by NewsRx editors, research stated, "Anorexia nervosa (AN) is a complex psychiatric disorder, which is not yet fully understood. Several studies reported that AN was associated with disruption of cytokine network."

Our news journalists obtained a quote from the research from the Ehime University Graduate School of Medicine, "Carcinoembryonic antigen (CEA) is a glycoprotein related to its network, used as a tumor marker of adenocarcinoma, and suggested to stimulate monocytes and macrophages to release proinflammatory cytokines. Here, we report a 41-year-old male suffering from AN who was suspected of having a malignant tumor due to markedly elevated serum CEA levels. However, on further examinations, he was discovered to have no malignant tumors, and, interestingly, his CEA levels actually decreased as his clinical state of AN improved. Furthermore, it was found that his CEA levels were elevated proportionally to his clinical state of AN and that his body mass index was significantly correlated with serum CEA levels."

According to the news editors, the research concluded: "Therefore, it is suggested that inflammatory responses may be associated with the clinical state of AN."

Our news journalists report that additional information may be obtained by contacting S. Ochi, Dept. of Neuropsychiatry, Ehime University Graduate School of Medicine, Toon, Ehime, Japan. Additional authors for this research include H. Shimizu and S. Ueno.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/eat.22474. This DOI is a link to an online electronic document that is either free or for purchase.

Data from Erasmus University Medical Center Advance Knowledge in Antineoplastics (Fasting protects against the side effects of irinotecan treatment but does not affect anti-tumour activity in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antineoplastics is now available. According to news reporting out of Rotterdam, Netherlands, by NewsRx editors, research stated, "The main limitation to the use of irinotecan in the treatment of colorectal cancer is the severity of side effects, including neutropaenia and diarrhoea. Here, we explored the effects of 3 days of fasting on irinotecan-induced toxicities, on plasma, liver and tumor pharmacokinetics and on anti-tumour activity in mice."

Financial support for this research came from KWF Kankerbestrijding.

Our news journalists obtained a quote from the research from Erasmus University Medical Center, "Male BALB/c mice received C26 colon carcinoma cells subcutaneously. They were randomized 1:1 into equally sized ad libitum fed and fasted groups after which they were treated with irinotecan. Weight and adverse side effects were recorded daily. At the end of the experiment, tumours were resected and weighed, and concentrations of irinotecan and its active metabolite SN-38 were determined in plasma and tumour. Fasting prevented the diarrhoea and visible signs of discomfort induced by irinotecan. Ad libitum fed animals developed leucopenia compared with untreated controls, whereas fasted mice did not. Irinotecan suppressed tumor growth equally in both treated groups, compared with untreated controls. Levels of the active irinotecan metabolite SN-38 9 (calculated as AUC values) were significantly lower in fasted mice in both plasma and liver, but not in tumor tissue. Fasting protected against irinotecan-induced side effects without interfering with its anti-tumour efficacy. Fasting induced a lower systemic exposure to SN-38, which may explain the absence of adverse side effects, while tumor levels of SN-38 remained unchanged."

According to the news editors, the research concluded: "These data offer important new approaches to improve treatment with irinotecan in patients."

Our news journalists report that additional information may be obtained by contacting S.A. Huisman, Dept. of Surgery, Erasmus University Medical Center, Rotterdam, Netherlands. Additional authors for this research include P. de Bruijn, I.M. Ghibadi Moghaddam-Helmantel, J.N. Ijzermans, E.A. Wiemer, R.H. Mathijssen and R.W de Bruin.

Oncology - Cancer Genetics

Data from Federal University Advance Knowledge in Cancer Genetics (Prevalence of Hispanic BRCA1 and BRCA2 mutations among hereditary breast and ovarian cancer patients from Brazil reveals differences among Latin American populations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Cancer Genetics are presented in a new report. According to news reporting originating in Porto Alegre, Brazil, by NewsRx journalists, research stated, "Germline mutations in BRCA1 or BRCA2 (BRCA) are responsible for 5-15% of breast (BC) and ovarian cancers (OC), predisposing to the development of early onset and often multiple primary tumors. Since mutation carriers can benefit from risk-reducing interventions, the identification of individuals with hereditary breast and ovarian cancer (HBOC) syndrome has a significant clinical impact."

Funders for this research include Breast Cancer Research Foundation, Avon, NIH/NCI, Fundo de Incentivo a Pesquisa e Eventos, Coordenacao de Aperfeicoamento de Pessoal de Nivel Superior.

The news reporters obtained a quote from the research from Federal University, "We assessed whether a panel assay for recurrent Hispanic BRCA mutations (HISPANEL) has an adequate breadth of coverage to be suitable as a cost effective screening tool for HBOC in a cohort of patients from Southern Brazil. A multiplex, PCR-based panel was used to genotype 232 unrelated patients for 114 germline BRCA mutations, finding deleterious mutations in 3.5% of them. This mutation prevalence is within the range detected by the HISPANEL among BC patients unselected for family history in other Latin American settings. The HISPANEL would have accounted for 27% of the BRCA mutations detected by complete sequencing in a comparison cohort (n = 193). This prevalence may be region-specific since significant differences in population structure exist in Brazil."

According to the news reporters, the research concluded: "Comprehensive analysis of BRCA in a larger set of HBOC patients from different Brazilian regions is warranted, and the results could inform customization of the HISPANEL as an affordable mutation screening tool."

For more information on this research see: Prevalence of Hispanic BRCA1 and BRCA2 mutations among hereditary breast and ovarian cancer patients from Brazil reveals differences among Latin American populations. Cancer Genetics, 2016;209(9):417-422. Cancer Genetics can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Cancer Genetics - www.journals.elsevier.com/cancer-genetics/)

Our news correspondents report that additional information may be obtained by contacting P. Ashton-Prolla, Univ Fed Rio Grande do Sul, Dept. of Genet, BR-91501970 Porto Alegre, RS, Brazil. Additional authors for this research include J. Herzog, C.B.O. Netto, O. Artigalas, I.V.D. Schwartz, C.M. Bittar, P. Ashton-Prolla and J.N. Weitzel.

Central Nervous System Diseases and Conditions –…

Data from Federal University Provide New Insights into Epilepsy (Effects of different physical exercise programs on susceptibility to pilocarpine-induced seizures in female rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting out of Sao Paulo, Brazil, by NewsRx editors, research stated, "In epilepsy, the most common serious neurological disorder worldwide, several investigations in both humans and animals have shown the effectiveness of physical exercise programs as a complementary therapy. Among the benefits demonstrated, regular exercise can decrease the number of seizures as well as improve cardiovascular and psychological health in people with epilepsy."

Financial supporters for this research include CAPES, FAPESP, CNPq.

Our news journalists obtained a quote from the research from Federal University, "While many studies in animals have been performed to show the beneficial effects of exercise, they exclusively used male animals. However, females are also worthy of investigation because of their cyclical hormonal fluctuations and possible pregnancy. Considering the few animal studies concerning seizure susceptibility and exercise programs in females, this study aimed to verify whether exercise programs can interfere with seizure susceptibility induced by pilocarpine in adult female Wistar rats. Animals were randomly divided into three groups: control, forced, and voluntary (animals kept in a cage with a wheel). After the final exercise session, animals received a pilocarpine hydrochloride (350 mg/kg i.p.; Sigma) injection to induce seizures. To measure the intensity of pilocarpine-induced motor signs, we used a scale similar to that developed by Racine (1972) in the kindling model. During a 4-h period of observation, we recorded latency for first motor signs, latency for reaching SE, number of animals that developed SE, and intensity of pilocarpine-induced motor signs. No difference was observed among groups in latency for first motor signs and in the number of animals that developed SE. Although the voluntary group presented more intense motor signs, an increased latency for developing SE was observed compared with that in forced and control groups. Our behavioral results are not enough to explain physiological and molecular pathways, but there are mechanisms described in literature which may allow us to propose possible explanations. Voluntary exercise increased latency to SE development."

According to the news editors, the research concluded: "Further investigation is necessary to elucidate the pathways involved in these results, while more studies should be performed regarding gender specific differences."

For more information on this research see: Effects of different physical exercise programs on susceptibility to pilocarpine-induced seizures in female rats. *Epilepsy & Behavior*, 2016;64():262-267. *Epilepsy & Behavior* can be contacted at: Academic Press Inc Elsevier
Proteins - Extracellular Matrix Proteins

Data from Fourth Military Medical University Provide New Insights into Extracellular Matrix Proteins (Mutations in COL1A1 Gene Change Dentin Nanostructure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Proteins - Extracellular Matrix Proteins have been presented. According to news reporting originating in Shaanxi, People's Republic of China, by NewsRx journalists, research stated, "Although many studies have attempted to associate specific gene mutations with dentin phenotypic severity, it remains unknown how the mutations in COL1A1 gene influence the mechanical behavior of dentin collagen and matrix. Here, we reported one osteogenesis imperfecta (OI) pedigree caused by two new inserting mutations in exon 5 of COL1A1 (NM_000088.3:c.440_441insT;c.441_442insA), which resulted in the unstable expression of COL1A1 mRNA and half quantity of procollagen production."

Financial support for this research came from National Natural Science Foundation of China.

The news reporters obtained a quote from the research from Fourth Military Medical University, "We investigated the morphological and mechanical features of proband's dentin using atomic force microscope (AFM), scanning electron microscope, and transmission electron microscope. Increased D-periodic spacing, variably enlarged collagen fibrils coating with fewer minerals were found in the mutated collagen. AFM analysis demonstrated rougher dentin surface and sparsely decreased Young's modulus in proband's dentin."

According to the news reporters, the research concluded: "We believe that our findings provide new insights into the genetic-/nano-mechanisms of dentin diseases, and may well explain OI dentin features with reduced mechanical strength and a lower crosslinked density."

Our news correspondents report that additional information may be obtained by contacting X. Duan, State Key Laboratory of Military Stomatology, Dept. of Oral Biology Clinic of Oral Rare Diseases and Genetic Diseases, The Fourth Military Medical University, Xi'an, Shaanxi, People's Republic of China. Additional authors for this research include Z. Liu, Y. Gan, D. Xia, Q. Li, Y. Li, J. Yang, S. Gao and M. Dong.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/ar.23308. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Asia, Shaanxi, Collagen, Genetics, People's Republic of China, Extracellular Matrix Proteins.

Our news editors obtained a quote from the research from Fudan University, "We reviewed the medical records of 47 patients with GC with local peritoneal metastasis, which was found by laparotomy or laparoscopy. The patients were divided into 2 groups: those who underwent gastric resection (n=29), and a non-resection group who did not (n=18). The clinical characteristics, postoperative complications, mortality, palliative intervention, and long-term outcomes of the 2 groups were compared. Complications occurred more frequently in the resection group than in non-resection group (P=0.017). There was no postoperative mortality or reoperation in either group. Palliative intervention was performed in 9 (31%) patients in resection group and 16 (88.9%) patients in non-resection group (P <0.001). The intervention interval and hospital-free time were significant longer in resection group than in non-resection group (P <0.001, P< 0.001). The Kaplan-Meier survival curves revealed that resection group had longer survival than non-resection group (P < 0.001)."

According to the news editors, the research concluded: "Non-curative resectional surgery helps prolong survival time and improve the quality of life for patients with GC with local peritoneal metastasis."

For more information on this research see: Non-curative surgery for patients with gastric cancer with local peritoneal metastasis A retrospective cohort study. Medicine, 2016;95 (49):568-571. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Oncology - Gastric Cancer

Data from Fujian Normal University Provide New Insights into Gastric Cancer (Real-time optical diagnosis of gastric cancer with serosal invasion using multiphoton imaging)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gastric Cancer is the subject of a report. According to news reporting out of Fuzhou, People's Republic of China, by NewsRx editors, research stated, "A real-time optical biopsy, which could determine tissue histopathology, would be of extraordinary benefit to staging laparoscopy for gastric cancer with serosal invasion (T4) that requires downstage treatment. We investigated the feasibility of using multiphoton imaging to perform a real-time optical diagnosis of gastric cancer with or without serosal invasion."

Our news journalists obtained a quote from the research from Fujian Normal University, "First, a pilot study was performed to establish the optical diagnostic features of gastric cancer with or without serosal invasion using multiphoton imaging compared with hematoxylin-eosin staining and Masson's trichrome staining. Second, a blinded study was performed to compare the diagnostic sensitivity, specificity, and accuracy of multiphoton imaging and endoscopic ultrasonography (EUS) for T4 gastric cancer. In the pilot study, multiphoton imaging revealed collagen loss and degradation and cellular and nuclear pleomorphism in gastric cancer with serosal invasion. The collagen content in gastric cancer with or without serosal invasion was 0.36 +/- 0.18 and 0.79 +/- 0.16 (p < 0.001), respectively. In the blinded study, the sensitivity, specificity, and accuracy of EUS and multiphoton imaging for T4 gastric cancer were 70% and 90% (p = 0.029), 66.67% and 96.67% (p = 0.003), and 68.33% and 93.33% (p = 0.001), respectively."

According to the news editors, the research concluded: "It is feasible to use multiphoton imaging to make a real-time optical diagnosis of gastric cancer with or without serosal invasion."

Aortic Dissection

Data from Fujita Health University Provide New Insights into Aortic Dissection (Early and Late Outcomes of Surgical Repair for Stanford A Acute Aortic Dissection in Octogenarians)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Aortic Dissection. According to news originating from Aichi, Japan, by NewsRx correspondents, research stated, "Because increased age is a strong independent predictor of mortality and morbidity, surgery for octogenarians with Stanford type A aortic dissection (AAD) may be avoided. From 2005 to 2015, 158 patients underwent surgical repair for AAD via a median sternotomy."

Our news journalists obtained a quote from the research from Fujita Health University, "We compared 24 (15.2%) octogenarians (83 +/- 3 years) with 134 (84.8%) patients aged <= 79 years (62 +/- 13 years), based on retrospectively collected clinical data. Octogenarians were predominantly female (79.2% vs. 44.8%, P=0.0033). Ascending aortic replacement was more frequently performed in the octogenarians (95.8% vs. 65.7%, P=0.0015) and total arch replacement in the younger patients (4.2% vs. 26.9%, P=0.0165). There were 14 hospital deaths among the younger patients, none among the octogenarians (0% vs. 10.4%, P=0.1303), and major morbidity rates were comparable. There were 3 late deaths among the octogenarians and 9 deaths among the younger patients. The respective 1-, 3-, and 5-year survival rates were 94.4%, 81.5%, and 81.5% in the octogenarians and 86.9%, 85.6%, and 83.9% in the younger patients, with no significant differences. Surgical repair for AAD in octogenarians showed favorable results when compared with a younger patient cohort, with low hospital mortality rate and excellent late outcomes."

According to the news editors, the research concluded: "Therefore, this technique should not be disregarded just because the patient is an octogenarian."

The news correspondents report that additional information may be obtained from M. Tochii, Fujita Hlth Univ, Dept. of Cardiovasc Surg, Toyoake, Aichi 4701192, Japan. Additional authors for this research include Y. Takami, K. Hattori, H. Ishikawa, M. Ishida, Y. Higuchi and Y. Takagi.

Data from Gradient Advance Knowledge in Toxicology and Pharmacology (Weight-of-evidence evaluation of associations between particulate matter exposure and biomarkers of lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Toxicology and Pharmacology. According to news reporting out of Cambridge, Massachusetts, by NewsRx editors, research stated, "Research suggests that exposure to ambient particulate matter (PM) may be associated with lung cancer; however, no mode of action (MoA) for this has been established. We applied a weight-of-evidence (WoE) approach to evaluate recent evidence from four realms of research (controlled human exposure, epidemiology, animal, and in vitro) to determine whether the overall evidence supports one or more MoAs by which PM could cause lung cancer."

Financial support for this research came from Exxon Mobil Biomedical Sciences, Inc.

Our news journalists obtained a quote from the research from Gradient, "We evaluated three general MoAs: DNA damage and repair; other genotoxic effects, including mutagenicity and clastogenicity; and gene expression, protein expression, and DNA methylation. After assessing individual study quality, we evaluated the strength of the evidence within as well as across disciplines using a modified set of Bradford Hill considerations. We conclude that the overall WoE indicates it is plausible that PM of various size fractions may cause direct DNA damage, but the evidence is insufficient regarding the alternative MoAs we evaluated."

According to the news editors, the research concluded: "More research is needed to determine whether DNA damage can lead to downstream events and, ultimately, lung cancer."

For more information on this research see: Weight-of-evidence evaluation of associations between particulate matter exposure and biomarkers of lung cancer. Regulatory Toxicology and Pharmacology, 2016;82():53-93. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Regulatory Toxicology and Pharmacology - www.journals.elsevier.com/regulatory-toxicology-and-pharmacology/)

Lymphadenopathy

Data from H.L. Gaddey et al Provide New Insights into Lymphadenopathy (Unexplained Lymphadenopathy: Evaluation and Differential Diagnosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lymphadenopathy. According to news reporting originating from Offutt AFB, Nebraska, by NewsRx correspondents, research stated, "Lymphadenopathy is benign and self-limited in most patients. Etiologies include malignancy, infection, and autoimmune disorders, as well as medications and iatrogenic causes."

Our news editors obtained a quote from the research, "The history and physical examination alone usually identify the cause of lymphadenopathy. When the cause is unknown, lymphadenopathy should be classified as localized or generalized. Patients with localized lymphadenopathy should be evaluated for etiologies typically associated with the region involved according to lymphatic drainage patterns. Generalized lymphadenopathy, defined as two or more involved regions, often indicates underlying systemic disease. Risk factors for malignancy include age older than 40 years, male sex, white race, supraclavicular location of the nodes, and presence of systemic symptoms such as fever, night sweats, and unexplained weight loss. Palpable supraclavicular, popliteal, and iliac nodes are abnormal, as are epitrochlear nodes greater than 5 mm in diameter. The workup may include blood tests, imaging, and biopsy depending on clinical presentation, location of the lymphadenopathy, and underlying risk factors. Biopsy options include fine-needle aspiration, core needle biopsy, or open excisional biopsy. Antibiotics may be used to treat acute unilateral cervical lymphadenitis, especially in children with systemic symptoms."

According to the news editors, the research concluded: "Corticosteroids have limited usefulness in the management of unexplained lymphadenopathy and should not be used without an appropriate diagnosis."

The news editors report that additional information may be obtained by contacting H.L. Gaddey, Ehrling Bergquist Family Med Residency Program, Offutt AFB, NE, United States.

Keywords for this news article include: Offutt AFB, Nebraska, United States, North and Central America, Risk and Prevention, Lymphadenopathy, Hematology.

Lung Diseases and Conditions - Interstitial Lung...

Data from Hannover School of Medicine Provide New Insights into Interstitial Lung Disease (Pulmonary Hypertension in Patients with Chronic Fibrosing Idiopathic Interstitial Pneumonias)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lung Diseases and Conditions - Interstitial Lung Disease are presented in a new report. According to news reporting originating in Hannover, Germany, by NewsRx journalists, research stated, "Pulmonary hypertension (PH) is a common finding in patients with chronic fibrosing idiopathic interstitial pneumonias (IIP). Little is known about the response to pulmonary vasodilator therapy in this patient population."

The news reporters obtained a quote from the research from the Hannover School of Medicine, "COMPERA is an international registry that prospectively captures data from patients with various forms of PH receiving pulmonary vasodilator therapies. We retrieved data from COMPERA to compare patient characteristics, treatment patterns, response to therapy and survival in newly diagnosed patients with idiopathic pulmonary arterial hypertension (IPAH) and PH associated with IIP (PH-IIP). Compared to patients with IPAH (n=798), patients with PH-IIP (n=151) were older and predominantly males. Patients with PH-IIP were treated predominantly with phosphodiesterase-5 inhibitors (88% at entry, 87% after 1 year). From baseline to the first follow-up visit, the median improvement in 6MWD was 30 m in patients with IPAH and 24.5 m in patients with PH-IIP (p=0.457 for the difference between both groups). Improvements in NYHA functional class were observed in 22.4% and 29.5% of these patients, respectively (p=0.179 for the difference between both groups). Survival rates were significantly worse in PH-IIP than in IPAH (3-year survival 34.0 versus 68.6%; p<0.001). Total lung capacity, NYHA class IV, and mixed-venous oxygen saturation were independent predictors of survival in patients with PH-IIP. Patients with PH-IIP have a dismal prognosis."

According to the news reporters, the research concluded: "Our results suggest that pulmonary vasodilator therapy may be associated with short-term functional improvement in some of these patients but it is unclear whether this treatment affects survival."

For more information on this research see: Pulmonary Hypertension in Patients with Chronic Fibrosing Idiopathic Interstitial Pneumonias. Plos One, 2015;10(12):e0141911. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news correspondents report that additional information may be obtained by contacting M.M. Hoeper, Dept. of Respiratory Medicine and German Center of Lung Research (DZL), Hannover Medical School, Hannover, Germany. Additional authors for this research include J. Behr, M. Held, E. Grunig, C.D. Vizza, A. Vonk-Noordegraaf, T.J. Lange, M. Claussen, C. Grohe, H. Klose, K.M. Olsson, T. Zelniker, C. Neurohr, O. Distler, H. Wirtz, C. Opitz, D. Huscher, D. Pittrow and J Gibbs.

Data from Harvard School of Medicine Provide New Insights into Cardiovascular Research (The association of lean and fat mass with all-cause mortality in older adults: The Cardiovascular Health Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Research. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Understanding contributions of lean and fat tissue to cardiovascular and non-cardiovascular mortality may help clarify areas of prevention in older adults. We aimed to define distributions of lean and fat tissue in older adults and their contributions to cause-specific mortality."

Funders for this research include National Heart, Lung, and Blood Institute (NHLBI), National Institute of Neurological Disorders and Stroke (NINDS), National Institute on Aging (NIA).

Our news editors obtained a quote from the research from the Harvard School of Medicine, "A total of 1335 participants of the Cardiovascular Health Study (CHS) who underwent dual-energy x-ray absorptiometry (DEXA) scans were included. We used principal components analysis (PCA) to define two independent sources of variation in DEXA-derived body composition, corresponding to principal components composed of lean ('lean PC') and fat ('fat PC') tissue. We used Cox proportional hazards regression using these PCs to investigate the relationship between body composition with cardiovascular and non-cardiovascular mortality. Mean age was 76.2 ± 4.8 years (56% women) with mean body mass index 27.1 ± 4.4 kg/m². A greater lean PC was associated with lower all-cause (HR = 0.91, 95% CI 0.84-0.98, P = 0.01) and cardiovascular mortality (HR = 0.84, 95% CI 0.74-0.95, P = 0.005). The lowest quartile of the fat PC (least adiposity) was associated with a greater hazard of all-cause mortality (HR = 1.24, 95% CI 1.04-1.48, P = 0.02) relative to fat PCs between the 25th-75th percentile, but the highest quartile did not have a significantly greater hazard (P = 0.70). Greater lean tissue mass is associated with improved cardiovascular and overall mortality in the elderly. The lowest levels of fat tissue mass are linked with adverse prognosis, but the highest levels show no significant mortality protection."

According to the news editors, the research concluded: "Prevention efforts in the elderly frail may be best targeted toward improvements in lean muscle mass."

The news editors report that additional information may be obtained by contacting A. Spahillari, Harvard Med Sch, Beth Israel Deaconess Med Center, Div Cardiol, Boston, MA 02114, United States. Additional authors for this research include K.J. Mukamal, C. DeFilippi, J.R. Kizer, J.S. Gottdiener, L. Djousse, M.F. Lyles, T.M. Bartz, V.L. Murthy and R.V. Shah.

Cardiovascular Diseases and Conditions -...

Data from Heart of England Foundation Trust Provide New Insights into Hypertension (The use of carbon dioxide angiography for renal sympathetic denervation: a technical report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Hypertension. According to news reporting out of Birmingham, United Kingdom, by NewsRx editors, research stated, "Hypertension is the leading attributable cause of cardiovascular mortality worldwide. Patients with hypertension have multiple comorbidities including high rates of concomitant renal disease."

Our news journalists obtained a quote from the research from the Heart of England Foundation Trust, "Current pharmacological approaches are inadequate in the treatment of resistant hypertension. Renal sympathetic denervation (RDN) has been shown to effectively treat resistant hypertension. The traditional use of iodinated contrast in RDN is contraindicated in patients with significant renal insufficiency. In patients with renal impairment, carbon dioxide (CO2) can be used as an alternative contrast material for RDN. This article describes the technical aspects of RDN using CO2 angiography. Our centre is experienced in the innovative RDN procedure using CO2 angiography. We describe the protocol for CO2 angiography for RDN using a home-made CO2 delivery system and the Symplicity ™ (Minneapolis MN 55432 USA) catheter (Medtronic) device. CO2 angiography is an excellent alternative to iodinated contrast for RDN procedures. CO2 angiography for RDN is a safe and effective alternative to iodinated contrast. RDN using CO2 angiography is an easy and feasible procedure that can be used in patients with renal insufficiency or iodinated contrast allergies. Advances in knowledge: There is a paucity of descriptive reports for CO2 angiography for RDN and we provide details of the optimal protocol for the procedure."

According to the news editors, the research concluded: "In particular, we describe the use of a Symplicity Spyral ™ catheter (Medtronic), which has not been reported to date for use in this procedure."

Our news journalists report that additional information may be obtained by contacting A. Ganeshan, Heart England Fdn Trust, Dept. of Radiol, Birmingham, W Midlands, United Kingdom. Additional authors for this research include M.A. Hameed, I. Dasgupta, E.T.D. Hoey, J. Freedman and A. Ganeshan.

Adenocarcinomas

Data from Hebei Medical University Provide New Insights into Adenocarcinomas (Decreased Expression and Frequent Promoter Hypermethylation of RASSF2 and RASSF6 Correlate With Malignant Progression and Poor Prognosis of Gastric Cardia ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Adenocarcinomas. According to news reporting out of Shijiazhuang, People's Republic of China, by NewsRx editors, research stated, "The RAS-association domain family (RASSF) consists of 10 members, and several members act as tumor suppressor genes and epigenetically inactivated in different tumor types. The present study investigated the role and methylation status of RASSF2, RASSF3, RASSF4, and RASSF6 in the pathogenesis and prognosis of GCA."

Our news journalists obtained a quote from the research from Hebei Medical University, "Quantitative real-time RTPCR, Western blot, and immunohistochemistry (IHC) methods were used respectively to detect the expression of RASSF2, RASSF3, RASSF4, and RASSF6 in 135 GCA cases and BS-MSP method was used to clarify the methylation status of these four genes. Decreased mRNA and protein expression of RASSF2, RASSF3, RASSF4, and RASSF6 were detected in GCA tumor tissues. Aberrant CpG island methylation of RASSF2, RASSF4, and RASSF6 were detected in GCA tumor tissues and were inversely correlated with the expression levels of these genes. Both of RASSF2 and RASSF6 expression and methylation were associated with TNM stage, depth of invasion, LN metastasis, distant metastasis or recurrence, and UGIC family history. GCA patients with simultaneous negative protein expression of RASSF2 and RASSF6 or with simultaneous methylation of both genes demonstrated poor patient survival. These results suggest that down-regulation of RASSF2, RASSF3, RASSF4, and RASSF6 is a tumor-specific phenomenon and the inactivation of RASSF2 and RASSF6 may be associated with tumor progression. Inactivation of RASSF2, RASSF4, and RASSF6 through CpG island methylation may play important roles in GCA carcinogenesis."

According to the news editors, the research concluded: "A combination of RASSF2 and RASSF6 expression or hypermethylation may serve as useful prognostic biomarker for GCA."

Our news journalists report that additional information may be obtained by contacting Z.M. Dong, Hebei Medical University, Hosp 4, Hebei Canc Inst, Pathol Lab, Shijiazhuang 050011, Hebei, People's Republic of China. Additional authors for this research include Z.M. Dong, Y.L. Guo, S.P. Shen, X. Guo, G. Kuang and Z.B. Yang. Keywords for this news article include: Shijiazhuang, People's Republic of China,
Data from Hebei Medical University Provide New Insights into Carcinomas (Enhancement of Drug Sensitivity by Knockdown of HIF-1a in Gastric Carcinoma Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Carcinomas have been presented. According to news reporting from Shijiazhuang, People's Republic of China, by NewsRx journalists, research stated, "In this study, the effects of hypoxia-inducible factor-1a (HIF-1a) on gastric carcinoma (GC) drug resistance through apoptosis-related genes are investigated. First, HIF-1a-specific siRNA was synthetized and transfected into drug-resistant GC cell line OCUM-2MD3/L-OHP."

The news correspondents obtained a quote from the research from Hebei Medical University, "Then MTT assay was applied to test the inhibition rate of GC cells by 5-fluourouracil (5-FU) and oxaliplatin (L-OHP). After that, flow cytometry (FCM) was applied to measure apoptosis rate. qPCR and Western blot assay were employed to detect HIF-1a and apoptosis-related genes. HIF-1a in OCUM-2MD3/L-OHP cells was higher than that in OCUM-2MD3 and gastric epithelial cells. After HIF-1a-siRNA transfection, inhibition rates of 5-FU and L-OHP to tumor cells increased significantly. FCM results showed that apoptosis rate of OCUM-2MD3/L-OHP cells increased significantly. After HIF-1a-siRNA transfection, survivin and Bcl-2 decreased, whereas Bax, caspase 3, and caspase 8 increased significantly. Results from this study seem to confirm that HIF-1a getting involved in GC drug resistance is possibly due to its regulation of some apoptosis-related genes."

According to the news reporters, the research concluded: "HIF-1a may be a potential target to reverse drug resistance of GC."

For more information on this research see: Enhancement of Drug Sensitivity by Knockdown of HIF-1a in Gastric Carcinoma Cells. Oncology Research, 2016;23(3):129-36.

Our news journalists report that additional information may be obtained by contacting Q. Zhao, Dept. of General Surgery, the Fourth Affiliated Hospital, Hebei Medical University, Shijiazhuang, People's Republic of China. Additional authors for this research include B.B. Tan, Y. Li, L.Q. Fan, P.G. Yang and Y. Tian.

Data from Helen Hayes Hospital Provide New Insights into Osteoporosis (A Longitudinal Study of Skeletal Histomorphometry at 6 and 24 Months Across Four Bone Envelopes in Postmenopausal Women With Osteoporosis Receiving Teriparatide or ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Osteoporosis. According to news originating from West Haverstraw, New York, by NewsRx correspondents, research stated, "Previously, we reported the effects of teriparatide (TPTD) and zoledronic acid (ZOL) on bone formation based on biochemical markers and bone histomorphometry of the cancellous envelope at month 6 in postmenopausal women with osteoporosis who participated in the 12-month primary Skeletal Histomorphometry in Subjects on Teriparatide or Zoledronic Acid Therapy (SHOTZ) study. Patients were eligible to enter a 12-month extension on their original treatment regimen: TPTD 20mg/day (s.c. injection) or ZOL 5mg/year (i.v. infusion)."

Our news journalists obtained a quote from the research from Helen Hayes Hospital, "A second biopsy was performed at month 24. Here we report longitudinal changes between and within each treatment group in the cancellous, endocortical, intracortical, and periosteal bone envelopes in patients with evaluable biopsies at months 6 and 24 (paired data set: TPTD, n = 10; ZOL, n = 9). Between-group differences are also reported in the larger set of patients with evaluable biopsies at month 6 (TPTD, n = 28; ZOL, n = 30). Data from the cancellous envelope at month 6 or month 24 provided a reference to compare differences across envelopes within each treatment group. The 24-month results extend our earlier report that TPTD and ZOL possess different tissue-level mechanisms of action. Moreover, these differences persisted for at least 2 years in all four bone envelopes. Few longitudinal differences were observed within or across bone envelopes in ZOL-treated patients, suggesting that the low bone formation indices at month 6 persisted to month 24. Conversely, the magnitude of the effect of TPTD on bone formation varied across individual envelopes: median values for mineralizing surface (MS/BS) and bone formation rate (BFR/BS) at month 6 were approximately 3-fold to 5-fold higher in the endocortical and intracortical envelopes compared to the cancellous envelope. Although MS/BS and BFR/BS declined in these envelopes at month 24, median values continued to exceed, or were not significantly different from, those in the cancellous envelope. This study demonstrates for the first time that bone formation indices are higher with TPTD treatment than with ZOL in all four bone envelopes and the difference persists for at least 2 years."

According to the news editors, the research concluded: "Moreover, the magnitude of the effect of TPTD in cortical bone remains robust at 24 months."

The news correspondents report that additional information may be obtained from D.W. Dempster, Helen Hayes Hosp, Reg Bone Center, West Haverstraw, NY 10993, United

Nephrology

Data from Huazhong University of Science and Technology Advance Knowledge in Nephrology (Blocking protein phosphatase 2A signaling prevents endothelial-to-mesenchymal transition and renal fibrosis: a peptide-based drug therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nephrology. According to news reporting originating in Hubei, People's Republic of China, by NewsRx journalists, research stated, "Endothelial-to-mesenchymal transition (EndMT) contributes to the emergence of fibroblasts and plays a significant role in renal interstitial fibrosis. Protein phosphatase 2A (PP2A) is a major serine/threonine protein phosphatase in eukaryotic cells and regulates many signaling pathways."

The news reporters obtained a quote from the research from the Huazhong University of Science and Technology, "However, the significance of PP2A in EndMT is poorly understood. In present study, the role of PP2A in EndMT was evaluated. We demonstrated that PP2A activated in endothelial cells (EC) during their EndMT phenotype acquisition and in the mouse model of obstructive nephropathy (i.e., UUO). Inhibition of PP2A activity by its specific inhibitor prevented EC undergoing EndMT. Importantly, PP2A activation was dependent on tyrosine nitration at 127 in the catalytic subunit of PP2A (PP2Ac). Our renal-protective strategy was to block tyrosine127 nitration to inhibit PP2A activation by using a mimic peptide derived from PP2Ac conjugating a cell penetrating peptide (CPP: TAT), termed TAT-Y127WT. Pretreatment with TAT-Y127WT was able to prevent TGF-b1-induced EndMT. Administration of the peptide to UUO mice significantly ameliorated renal EndMT level, with preserved density of peritubular capillaries and reduction in extracellular matrix deposition."

According to the news reporters, the research concluded: "Taken together, these results suggest that inhibiting PP2Ac nitration using a mimic peptide is a potential preventive strategy for EndMT in renal fibrosis."

For more information on this research see: Blocking protein phosphatase 2A signaling prevents endothelial-to-mesenchymal transition and renal fibrosis: a peptide-based drug therapy. Scientific Reports, 2016;6():19821. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Cardiology

Data from Institute of Anesthesiology Advance Knowledge in Cardiology (Evaluation of a New Sonoclot Device for Heparin Management in Cardiac Surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiology are presented in a new report. According to news reporting originating in Zurich, Switzerland, by NewsRx journalists, research stated, "Sonoclot is used to measure kaolin-based activated clotting time (kACT) for heparin management. Apart from measuring kACT, the device assesses the patient's coagulation status by glass bead-activated tests (gbACTs; measuring also clot rate [CR] and platelet function [PF])."

The news reporters obtained a quote from the research from the Institute of Anesthesiology, "Recently, a new version of the Sonoclot has been released, and the redesign may result in performance changes. The aim of this study was to evaluate and compare the performance of the new (S2) and the previous (S1) Sonoclot. The S1 was used in the routine management of 30 patients undergoing elective cardiac surgery. Blood samples were taken at baseline (T1), after heparin administration (200 U/kg, 100 U/kg; T2 and T3), during cardiopulmonary bypass (T4), after protamine infusion (T5), and before intensive care unit transfer (T6). Kaolin-based activated clotting time and gbACTs were measured in duplicate by both the old and the new device and performance compared by Bland-Altman analysis and percentage error calculation. A total of 300 kACT and 180 gbACTs were available. Bland-Altman analysis for kACT revealed that S2 consistently reported results in shorter time compared to S1 (overall = -14.7%). Comparing S2 and S1, the glass bead-activated tests showed mean percentage differences of -18.9% (gbACTs), +37.4% (CR), and -3.7% (PF). Since clotting is faster in the new S2 compared to S1, shorter clotting times have to be considered in clinical practice."

According to the news reporters, the research concluded: "The use of S2 kACT in heparin management will result in higher heparin and protamine dosing unless heparin kACT target values are adjusted to correct for the differences in results between S1 and S2."

Our news correspondents report that additional information may be obtained by contacting C.K. Hofer, Triemli City Hosp, Inst Anaesthesiol & Intens Care Med, CH-8063 Zurich, Switzerland. Additional authors for this research include M.T. Ganter, A. Zientara, K.
Graves, R. Behr, M. Genoni and C.K. Hofer.

Heart Disorders and Diseases - Heart Failure

Data from Institute of Environmental Medicine Advance Knowledge in Heart Failure (Adherence to a Mediterranean diet is associated with reduced risk of heart failure in men)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Failure are presented in a new report. According to news reporting from Stockholm, Sweden, by NewsRx journalists, research stated, "We examined the hypothesis that high adherence to a Mediterranean diet reduces the risk of developing heart failure (HF) as well as the risk of death from HF. The study population comprised 37 308 men from the Cohort of Swedish Men who were free from cardiovascular disease at baseline."

Financial supporters for this research include Vetenskapsradet, Karolinska Institutet.

The news correspondents obtained a quote from the research from the Institute of Environmental Medicine, "The modified Mediterranean diet (mMED) score was created from a self-administered food frequency questionnaire, based on consumption of presumed beneficial/detrimental foods, on a 0-8 scale. Incident HF events were ascertained by linkage to the Swedish National Patient and the Cause of Death Registers. Relative risks (RR) with 95% confidence intervals (CI), adjusted for potential confounders, were estimated by Cox proportional hazards regression models. We identified 146 deaths from HF and 1269 incident HF events over a median follow-up of 10.9 years (1998-2008). The mMED score was inversely associated with risk of HF (multivariable RR for the highest vs. lowest quartile 0.69, 95% CI 0.57, 0.83); the corresponding RR of HF mortality was 0.55 (95% CI 0.31, 0.98). The multivariable RR for every two-point increment in the mMED score was 0.85 (95% CI 0.78, 0.91) for incidence of HF and 0.78 (95% CI 0.62, 0.98) for mortality from HF, respectively. High adherence to a Mediterranean diet was associated with a lower risk of HF and mortality from HF in men."

According to the news reporters, the research concluded: "Further studies are needed to replicate these findings in other populations."

Our news journalists report that additional information may be obtained by contacting T.G. Tektonidis, Unit of Nutritional Epidemiology, Institute of Environmental Medicine (IMM), Karolinska Institutet, Nobels vag 13, Box 210, SE-171 77, Stockholm, Sweden. Additional authors for this research include A. Akesson, B. Gigante, A. Wolk and S.C
Larsson.

Heart Disorders and Diseases - Atrial Fibrillation
Data from Jagiellonian University Provide New Insights into Atrial Fibrillation (A comparison of minimally invasive and standard aortic valve replacement)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Fibrillation have been presented. According to news reporting from Krakow, Poland, by NewsRx journalists, research stated, "The study objective was to compare aortic valve replacement through a right anterior minithoracotomy with aortic valve replacement through a median sternotomy. With propensity score matching, we selected 211 patients after aortic valve replacement through a right anterior minithoracotomy and 211 patients after aortic valve replacement who underwent operation between January 2010 and December 2013."

The news correspondents obtained a quote from the research from Jagiellonian University, "Perioperative outcomes were analyzed, and multivariable logistic regression analysis of risk factors of postoperative morbidity was performed. For propensity score-matched patients, hospital mortality was 1.0% in the aortic valve replacement through a right anterior minithoracotomy group and 1.4% in the aortic valve replacement group (P = 1.000). Stroke occurred in 0.5% versus 1.4% (P = .615), myocardial infarction occurred in 1.4% versus 1.9% (P = 1.000), and new onset of atrial fibrillation occurred in 12.8% versus 24.2% (P = .003) of patients in the aortic valve replacement through a right anterior minithoracotomy and aortic valve replacement groups, respectively. Postoperative drainage was 353.5 +/- 248.6 mL versus 544.3 +/- 324.5 mL (P< .001) and blood transfusion was required for 48.8% versus 67.3%(P< .001) of patients in the aortic valve replacement through a right anterior minithoracotomy and aortic valve replacement groups, respectively. Mediastinitis occurred in 2.8% of patients after aortic valve replacement and in 0.0% of patients after aortic valve replacement through a right anterior minithoracotomy surgery (P = .040). Intensive care unit stay (1.3 +/- 1.2 days vs 2.6 +/- 2.6 days) and hospital stay (5.7 +/- 1.6 days vs 8.7 +/- 4.4 days) were statistically significantly shorter in the aortic valve replacement through a right anterior minithoracotomy group. Aortic valve replacement through a right anterior minithoracotomy surgery resulted in reduced postoperative morbidity (odds ratio, 0.4; P< .001) and postoperative bleeding and blood transfusion requirements (odds ratio, 0.4; P<. 001)."

According to the news reporters, the research concluded: "Aortic valve replacement through a right anterior minithoracotomy surgery resulted in a reduced infection rate, diminished postoperative bleeding and blood transfusion requirements, reduced occurrence of new onset of atrial fibrillation, and shorter intensive care unit and hospital stays."

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Fibrillation have been presented. According to news reporting from Krakow, Poland, by NewsRx journalists, research stated, "The study objective was to compare aortic valve replacement through a right anterior minithoracotomy with aortic valve replacement through a median sternotomy. Oncology - Gastric Cancer

Data from Jilin University Advance Knowledge in Gastric Cancer

[MicroRNA-520f suppresses growth of gastric carcinoma cells by target ATPase family AAA domain-containing protein 2 (ATAD2)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Gastric Cancer are discussed in a new report. According to news originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) are small, non-coding RNAs that can serve as tumor suppressor genes or oncogenes in tumorigenesis. More and more evidence demonstrate that abnormal expression of miRNAs lead to the gastric carcinoma occurrence."

Our news journalists obtained a quote from the research from Jilin University, "In the present study, we revealed that the expression levels of miR-520f were significantly down-regulated in gastric carcinoma cells and clinical gastric carcinoma samples. Next, we demonstrated that introduction of miR-520f inhibited the growth of gastric carcinoma cells in vitro. However, down-regulate the expression levels of miR-520f by anti-miR-520f lead to an enhanced cell proliferation, implying that miR-520f maybe serve as a novel tumor suppressor. Moreover, we found that ATPase family AAA domain-containing protein 2 (ATAD2) was one target genes of miR-520f downstream regulator, which caused the decreased expression of ATAD2. Meanwhile, the overexpression of ATAD2 reversed the inhibited proliferation ability caused by miR-520f."

According to the news editors, the research concluded: "Therefore, our find that miR-520f involves in gastric carcinoma proliferation, pointing a therapeutic probability of miR-520f in the therapy of gastric carcinoma."

For more information on this research see: MicroRNA-520f suppresses growth of gastric carcinoma cells by target ATPase family AAA domain-containing protein 2 (ATAD2).
Pharmacokinetics

Data from Jilin University Advance Knowledge in Pharmacokinetics (Simultaneous Determination of Formononetin, Calycosin and Rhamnocitrin from Astragalus Complanatus by UHPLC-MS-MS in Rat Plasma: Application to a Pharmacokinetic Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacokinetics. According to news reporting originating from Changchun, People's Republic of China, by NewsRx correspondents, research stated, "This assay provided a novel and generally applicable method to simultaneously determine formononetin, calycosin and rhamnocitrin in rat plasma based on ultra-high performance liquid chromatography with tandem mass spectrometry. A single step of protein precipitation procedure with methanol was utilized, and luteolin was chosen as an internal standard."

Our news editors obtained a quote from the research from Jilin University, "Chromatographic separation was achieved using a Waters Symmetry-C-18 column, and the applied isocratic elution program allowed for the simultaneous determination of the three flavones in a one-step chromatographic separation with a total run time of 3.5 min. The fully validated methodology for the analytes demonstrated high sensitivity, good accuracy and precision. The average recoveries of the analytes and internal standard were all above 91.0% and no obvious matrix effect was observed. This method was successfully applied to the preclinical pharmacokinetic studies of formononetin, calycosin and rhamnocitrin in rats."

According to the news editors, the research concluded: "The results would be helpful to provide some references to clinical application of this herb."

The news editors report that additional information may be obtained by contacting L.
Data from Johns Hopkins University Advance Knowledge in Small Molecule Inhibitors (Small Molecule Inhibitor of NRF2 Selectively Intervenes Therapeutic Resistance in KEAP1-Deficient NSCLC Tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Small Molecule Inhibitors have been presented. According to news reporting from Baltimore, Maryland, by NewsRx journalists, research stated, "Loss of function mutations in Kelch-like ECH Associated Protein 1 (KEAP1), or gain-of-function mutations in nuclear factor erythroid 2-related factor 2 (NRF2), are common in non-small cell lung cancer (NSCLC) and associated with therapeutic resistance. To discover novel NRF2 inhibitors for targeted therapy, we conducted a quantitative high-throughput screen using a diverse set of 400,000 small molecules (Molecular Libraries Small Molecule Repository Library, MLSMR) at the National Center for Advancing Translational Sciences."

Funders for this research include U.S. Department of Health and Human Services, Flight Attendant Medical Research Institute.

The news correspondents obtained a quote from the research from Johns Hopkins University, "We identified ML385 as a probe molecule that binds to NRF2 and inhibits its downstream target gene expression. Specifically, ML385 binds to Nehl, the Cap 'N' Collar Basic Leucine Zipper (CNC-bZIP) domain of NRF2, and interferes with the binding of the V-Maf Avian Musculoaponeurotic Fibrosarcoma Oncogene Homologue G (MAFG)-NRF2 protein complex to regulatory DNA binding sequences. In clonogenic assays, when used in combination with platinum-based drugs, doxorubicin or taxol, ML385 substantially enhances cytotoxicity in NSCLC cells, as compared to single agents. ML385 shows specificity and selectivity for NSCLC cells with KEAP1 mutation, leading to gain of NRF2 function. In preclinical models of NSCLC with gain of NRF2 function, ML385 in combination with carboplatin showed significant antitumor activity."

According to the news reporters, the research concluded: "We demonstrate the discovery and validation of ML385 as a novel and specific NRF2 inhibitor and conclude that targeting NRF2 may represent a promising strategy for the treatment of advanced NSCLC."

For more information on this research see: Small Molecule Inhibitor of NRF2 Selectively Intervenes Therapeutic Resistance in KEAP1-Deficient NSCLC Tumors. ACS Chemical Biology, 2016;11(11):3214-3225. Biogenic Amines

Data from Kameda Medical Center Provide New Insights into Biogenic Amines (Moderate vasomotor response to acetylcholine provocation test as an indicator of long-term prognosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biogenic Amines. According to news reporting from Chiba, Japan, by NewsRx journalists, research stated, "The acetylcholine (ACh) provocation test (ACh-test) is used for the diagnosis of vasospastic angina (VSA). However, subjects often show a moderate spasm (MS) response for which diagnosis of VSA is not definitive, and the clinical significance of this response is unknown."

The news correspondents obtained a quote from the research from Kameda Medical Center, "We assessed moderate coronary vasomotor response to the ACh test as an indicator of long-term prognosis. A total of 298 consecutive patients who underwent the ACh test for suspected VSA were retrospectively investigated. Coronary spasm severity after intracoronary administration of isosorbide dinitrate was evaluated by measuring epicardial coronary artery diameter reduction after ACh injection. Patients were divided into three groups according to the diameter reduction during the ACh test: severe spasm (SS) showing <yen >75 % diameter reduction, MS showing <yen >50 % diameter reduction, and others (N). In Kaplan-Meier analysis, the major adverse cardiac event (MACE) rates with a median follow-up of 4.6 years were significantly worse in SS (11.1 %) and MS (8.5 %) than N (1.9 %), (SS vs N; P = 0.009, MS vs N; P = 0.029). Significant difference in MACE rates was not observed between SS and MS (P = 0.534). Cox regression analysis revealed that MS remained an independent predictor of MACE after adjustment for other confounders (HR: 7.18, 95 % CI 1.42-36.4, P = 0.017)."

According to the news reporters, the research concluded: "Patients with MS by ACh test had a cardiac event rate comparable with that of patients with SS and significantly worse than that of patients with normal vasomotor responses."

For more information on this research see: Moderate vasomotor response to acetylcholine provocation test as an indicator of long-term prognosis. Heart and Vessels, 2016;31(12):1943-1949. **Hematologic Diseases and Conditions - Anemia**

**Data from Kaohsiung Medical University Advance Knowledge in Anemia (Protective effects of the roots of Angelica sinensis on strenuous exercise-induced sports anemia in rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Hematologic Diseases and Conditions - Anemia is now available. According to news originating from Kaohsiung, Taiwan, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: Sports anemia is a persistent and severe problem in athletes owing to strenuous exercise-induced oxidative stress and hepcidin upregulation. The roots of Angelica sinensis (AS), a familiar traditional Chinese medicine, has been used for replenishing blood since antiquity."

Financial support for this research came from Ministry of Science and Technology, Taiwan.

Our news journalists obtained a quote from the research from Kaohsiung Medical University, "Aim of the study: To evaluate the effects of ethanolic AS extract in a 4-week study on sports anemia in female Wistar rats. To induce anemia, a strenuous exercise protocol consisting of running and swimming was employed with increasing intensity. Animals were randomly assigned to the following groups: control group; strenuous exercise group; and strenuous exercise and AS extract-treated group (300 mg kg(-1) d(-1)). After 4 weeks, rats underwent exhaustive swimming and forelimb grip strength test. The blood biochemical markers and hepatic antioxidant activities were determined. Hepatic interleukin-6 and muscle glycogen were observed through immunohistochemical and Periodic acid-Schiff staining, respectively. AS extract (consisting of ferulic acid, Z-ligustilide, and n-butylenephthalide) treatment improved forelimb grip strength and rescued exercise-induced anemia by significantly elevating the red blood cell counts and hemoglobin concentrations as well as hematocrit levels (p < 0.05). AS modulated the iron metabolism through decreasing serum hepcidin-25 concentrations by 33.0% (p < 0.05) and increasing serum iron levels by 343% (p < 0.01). The hepatic injury marker serum alanine aminotransferase concentrations were also reduced, followed by increased antioxidant enzyme catalase expression in the liver (p < 0.05). Furthermore, substantial attenuation of hepatic interleukin-6 expression and preservation of muscle glycogen content suggested the additional roles of AS acting on sports anemia and physical performance."

According to the news editors, the research concluded: "Our findings evidenced a novel and promising therapeutic approach for AS treatment for rescuing the anemic condition.
induced following 4 weeks of strenuous exercise."

For more information on this research see: Protective effects of the roots of Angelica
sinensis on strenuous exercise-induced sports anemia in rats. Journal of Ethnopharmacology,

**Nephrology**

**Data from Keimyung University Provide New Insights into Nephrology**
**(Fyn deficiency attenuates renal fibrosis by inhibition of phospho-STAT3)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness &
Wellness Week -- Current study results on Nephrology have been published. According to
news reporting originating in Daegu, South Korea, by NewsRx journalists, research stated, "The
hallmark of renal tubulointerstitial fibrosis is the accumulation of myofibroblasts and
extracellular matrix proteins. Fyn, a member of the Src family of kinases, has diverse biological
functions including regulation of mitogenic signaling and proliferation and integrin-mediated
interaction."

The news reporters obtained a quote from the research from Keimyung University,
"Src family proteins promote pulmonary fibrosis by augmenting transforming growth factor-beta
signaling, but their role in renal fibrosis is less understood. We observed upregulation of Fyn in
a renal fibrosis model induced by unilateral ureteral obstruction. Upon ureteral obstruction, Fyn-
deficient mice exhibited attenuated renal fibrosis relative to wild-type mice. Furthermore,
obstruction-induced renal expression of type I collagen, fibronectin, alpha-smooth muscle actin,
and plasminogen activator inhibitor-1 was suppressed. Pharmacologic inhibition of Fyn blocked
induction of extracellular matrix proteins in kidney cell lines. Importantly, the attenuation of
renal fibrosis by Fyn deficiency was not accompanied by changes in the Smad pathway. Rather,
the antifibrotic effect of Fyn deficiency was associated with downregulation of signal transducer
and activator of transcription 3 (STAT3). Small, interfering RNA targeting STAT3 in Fyn-
deficient cells further suppressed alpha-smooth muscle actin expression, whereas a STAT3
activator partially restored plasminogen activator inhibitor-1 expression, indicating that STAT3
signaling is critically involved in this process. Thus, Fyn plays an important role in renal
fibrosis."
According to the news reporters, the research concluded: "Hence, Fyn kinase inhibitors may be therapeutically useful against renal fibrosis."

The direct object identifier (DOI) for that additional information is:

**Data from King Abdul-Aziz University Provide New Insights into Intellectual Disability (A novel mutation in PGAP2 gene causes developmental delay, intellectual disability, epilepsy and microcephaly in consanguineous Saudi family)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Developmental Diseases and Conditions - Intellectual Disability. According to news reporting out of Jeddah, Saudi Arabia, by NewsRx editors, research stated, "PGAP2 (Post-GPI Attachment to Proteins 2) gene is involved in lipid remodeling steps of Glycosylphosphatidylinositol (GPI)-anchor maturation. At the surface of the cell this gene is required for proper expression of GPI-anchored proteins."

Financial support for this research came from King Abdulaziz University.

Our news journalists obtained a quote from the research from King Abdul-Aziz University, "Hyperphosphatasia with mental retardation syndrome-3 is an autosomal recessive disorder usually characterized by severe mental retardation. Mutations in the PGAP2 gene cause hyperphosphatasia mental retardation syndrome-3. We have identified a large consanguineous family from Saudi origin segregating developmental delay, intellectual disability, epilepsy and microcephaly. Whole exome sequencing with 100x coverage was performed on two affected siblings of the family. Data analysis in the patient revealed a novel missense mutation c.191C>T in PGAP2 gene resulting in Alanine to Valine substitution (Ala64Val). The mutation was reconfirmed and validated by subsequent Sanger sequencing method. The mutation was ruled out in 100 unrelated healthy controls."

According to the news editors, the research concluded: "We suggest that this pathogenic mutation disrupts the proper function of the gene proteins resulting in the disease
state."

For more information on this research see: A novel mutation in PGAP2 gene causes developmental delay, intellectual disability, epilepsy and microcephaly in consanguineous Saudi family. *Journal of the Neurological Sciences*, 2016;371():121-125. *Journal of the Neurological Sciences* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Life Science Research**

**Data from King's College Provide New Insights into Life Science Research (The Association between Chronic Widespread Musculoskeletal Pain, Depression and Fatigue Is Genetically Mediated)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Life Science Research is the subject of a report. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Chronic widespread musculoskeletal pain (CWP) is prevalent in the general population and associated with high health care costs, so understanding the risk factors for chronic pain is important for both those affected and for society. In the present study we investigated the underlying etiological structure of CWP to understand better the association between the major clinical features of fatigue, depression and dihydroepiandrosterone sulphate (DHEAS) using a multivariate twin design."

The news correspondents obtained a quote from the research from King’s College, "Data were available in 463 UK female twin pairs including CWP status and information on depression, chronic fatigue and serum DHEAS levels. High to moderate heritabilities for all phenotypes were obtained (42.58% to 74.24%). The highest phenotypic correlation was observed between fatigue and CWP (r=0.45), and the highest genetic correlation between CWP and fatigue (rg=0.78). Structural equation modeling revealed the AE Cholesky model to provide the best model of the observed data. In this model, two additive genetic factors could be detected loading heavily on CWP-A2 explaining 40% of the variance and A3 20%. The factor
loading heaviest on DHEAS showed only a small loading on the other phenotypes and none on fatigue at all. Furthermore, one distinct non-shared environmental factor loading specifically on CWP—but not on any of the other phenotypes—could be detected suggesting that the association between CWP and the other phenotypes is due only to genetic factors.”

According to the news reporters, the research concluded: "Our results suggest that CWP and its associated features share a genetic predisposition but that they are relatively distinct in their environmental determinants."

Our news journalists report that additional information may be obtained by contacting A. Burri, Dept. of Twin Research and Genetic Epidemiology, King's College London, St Thomas’ Hospital, London, UK. Additional authors for this research include S. Ogata, G. Livshits and F. Williams.

**Heart Disorders and Diseases - Heart Failure**

**Data from Kyushu University Provide New Insights into Heart Failure (Deep and future insights into neuromodulation therapies for heart failure)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week — Investigators publish new report on Heart Disorders and Diseases - Heart Failure. According to news originating from Fukuoka, Japan, by NewsRx editors, the research stated, "Major pathophysiology of heart failure is an autonomic nervous system dysfunction as a result of excess sympathoexcitation and/or withdrawal of vagal nerve activity. Although we already have various pharmacological and non-pharmacological therapies for heart failure, survival of heart failure patients remains around 50%.”

Our news journalists obtained a quote from the research from Kyushu University, "To achieve further reductions in morbidity and mortality of heart failure, neuromodulations with devices, such as baroreflex activating therapy, vagal nerve stimulation, renal sympathetic denervation, spinal cord stimulation, and left cardiac sympathetic denervation, have been expected. Although all of these neuromodulations have benefits on heart failure, efficacy, and safety in preclinical and small-sized clinical studies, the benefits on heart failure have been insufficient and controversial compared to our expectations in large-sized randomized trials."

According to the news editors, the research concluded: "However, we should develop and apply these novel therapies for the patients with heart failure in the near future."

For more information on this research see: Deep and future insights into neuromodulation therapies for heart failure. *Journal of Cardiology*, 2016;68(5-6):368-372.
Connective Tissue Diseases and Conditions - Ehlers-…

Data from L. Mackenroth and Colleagues Advance Knowledge in Ehlers-Danlos Syndrome (An overlapping phenotype of Osteogenesis imperfecta and Ehlers-Danlos syndrome due to a heterozygous mutation in COL1A1 and biallelic missense variants in TNXB ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Connective Tissue Diseases and Conditions - Ehlers-Danlos Syndrome. According to news reporting out of Berlin, Germany, by NewsRx editors, research stated, "Osteogenesis imperfecta (OI) and Ehlers-Danlos syndrome (EDS) are variable genetic disorders that overlap in different ways [Cole 1993; Grahame 1999]. Here, we describe a boy presenting with severe muscular hypotonia, multiple fractures, and joint hypermobility, features that are compatible with mild OI and hypermobility type EDS, respectively."

Our news journalists obtained a quote from the research, "By whole exome sequencing, we identified both a COL1A1 mutation (c.4006-1G > A) inherited from the patient's mildly affected mother and biallelic missense variants in TNXB (p.Val1213Ile, p.Gly2592Ser). Analysis of cDNA showed that the COL1A1 splice site mutation led to intron retention causing a frameshift (p.Phe1336Valfs*72). Type 1 collagen secretion by the patient's skin fibroblasts was reduced. Immunostaining of a muscle biopsy obtained from the patient revealed a clear reduction of tenascin-X in the extracellular matrix compared to a healthy control."

According to the news editors, the research concluded: "These findings imply that the combination of the COL1A1 mutation with the TNXB variants might cause the patient's unique phenotype."

Our news journalists report that additional information may be obtained by

Drugs and Therapies - Beta-Adrenergic Blocking...

Data from LUNAM University Provide New Insights into Beta-Adrenergic Blocking Agents (Effect of nebivolol treatment during pregnancy on the intrauterine fetal growth, mortality and pup postnatal development in the L-NAME-induced hypertensive ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Beta-Adrenergic Blocking Agents are presented in a new report. According to news reporting originating in Nantes, France, by NewsRx journalists, research stated, “The present study was carried out to evaluate the effect of nebivolol vs. bisoprolol treatment on the intrauterine fetal growth, mortality and postnatal development in N-omega-Nitro-t-arginine methyl ester hydrochloride (L-NAME)-induced hypertensive rats. Hypertension was induced in normotensive pregnant Wistar rats by daily administration of L-NAME (100 mg/kg/day, in the drinking water) for the period of pregnancy.”

The news reporters obtained a quote from the research from LUNAM University, "After 9 days of L-NAME treatment, rats with systolic and diastolic blood pressure (SBP and DBP) more than 140/90 mmHg were considered hypertensive. Then, some of them were treated from day 11 to day 18 of pregnancy with nebivolol (8 mg/kg/day) or bisoprolol (10 mg/kg/day) via oral gavage. SBP, DBP and heart rate (HR) were re-evaluated by tail cuff method on day 19 of pregnancy and morphometrical or histological studies were performed on day 20. In addition, the mortality and postnatal development of newborn pups were assessed in all groups. The L-NAME administration during pregnancy induced an increase in SBP and DBP while HR did not change. Nebivolol or bisoprolol treatment completely prevented the elevation of SBP and DBP induced by L-NAME with a reduction in HR in pregnant and non-pregnant rats. The intrauterine fetal growth and the postnatal development of newborn rats in nebivolol-treated hypertensive group were significantly lower vs. control and higher vs. bisoprolol-treated group with a higher mortality in the both types of treatments vs. control rats.”

According to the news reporters, the research concluded: "The nebivolol and bisoprolol administration produce adverse effects on fetal growth and postnatal development, that limits their therapeutic use in females during pregnancy."

For more information on this research see: Effect of nebivolol treatment during

Gram-Negative Bacteria - Citrobacter freundii

Data from Laval University Advance Knowledge in Citrobacter freundii [Genome and Plasmid Analysis of bla(IMP-4)-Carrying Citrobacter freundii B38]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Negative Bacteria - Citrobacter freundii. According to news reporting originating from Quebec City, Canada, by NewsRx correspondents, research stated, "Sequencing of the blaIMP-4-carrying C. freundii B38 using the PacBio SMRT technique revealed that the genome contained a chromosome of 5,134,500 bp and three plasmids, pOZ172 (127,005 bp), pOZ181 (277,592 bp), and pOZ182 (18,467 bp). Plasmid pOZ172 was identified as IncFIHY, like pP10164-NDM and pNDM-EcGN174."

Our news editors obtained a quote from the research from Laval University, "It carries a class 1 integron with four cassettes (bla(IMP-4)-qacG2-aacA4-aphA15) and a complete hybrid tni module (tniR-tniQ-tniB-tniA). The recombination of tniR from Tn402 (identical) with tniQBA from Tn5053 (99%) occurred within the res site of Tn402/5053. The Tn402/5053-like integron, named Tn6017, was inserted into Tn1722 at the res II site. The replication, partitioning, and transfer systems of pOZ181 were similar to those of IncHI2 plasmids (e.g., R478) and contained a sulI-type class 1 integron with the cassette array orf-dfrA1-orfgcu37-aadA5 linked to an upstream Tn1696 mpA-tnpR and to a downstream 3' conserved sequence (3'-CS) and ISCR1. A Tn2 transposon encoding a bla(TEM-1) beta-lactamase was identified on pOZ182. Other interesting resistance determinants encoded on the B38 chromosome included multidrug resistance (MDR) efflux pumps, an AmpC beta-lactamase, and resistances to Cu, Ag, As, and Zn. This is the first report of a complete tni module linked to a blat(IMP-4)-carrying class 1 integron, which, together with other recently reported non-sulI integrases, represents the emergence of a distinct evolutionary lineage of class 1 integrions lacking a 3-CS (qacE Delta 1-sulI)."
According to the news editors, the research concluded: "The unique cassette array, complete tni module of Tn6017, and incompatibility group of pOZ172 suggest a blaIMP-4 evolutionary pathway in C. freundii B38 different from that for other blaIMP-4 genes found in Gram-negative bacteria in the Western Pacific region."

For more information on this research see: Genome and Plasmid Analysis of bla (IMP-4)-Carrying Citrobacter freundii B38. Antimicrobial Agents and Chemotherapy, 2016;60 (11):6719-6725. Drugs and Therapies - Imidazole Therapy

**Data from Loma Linda University School of Medicine Provide New Insights into Imidazole Therapy (Flavonol and imidazole derivatives block HPV16 E6 activities and reactivate apoptotic pathways in HPV8314; cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Imidazole Therapy have been published. According to news reporting from Loma Linda, California, by NewsRx journalists, research stated, "High-risk human papillomaviruses (HR-HPVs) cause nearly all cases of cervical cancer, as well as approximately 30% of head and neck cancers. HPV 16 E6, one of two major viral oncogenes, protects cells from apoptosis by binding to and accelerating the degradation of several proteins important in apoptotic signaling, including caspase 8 and p53."

The news correspondents obtained a quote from the research from the Loma Linda University School of Medicine, "We proposed that blocking the interactions between HPV E6 and its partners using small molecules had the potential to re-sensitize HPV(+) cells to apoptosis. To test this idea, we screened libraries of small molecules for candidates that could block E6/caspase 8 binding and identified several candidates from different chemical classes. We tested hits for dose-dependency and specificity in vitro and for toxicity in a cell-based assay and then used this information to select the two best candidates for further testing: myricetin, a flavonol, and spinacine, an imidazole amino-acid derivative of histidine. Both compounds clearly inhibited the ability of E6 to bind in vitro to both caspase 8 and E6AP, the protein that mediates p53 degradation. In addition, both compounds were able to increase the level of caspase 8 and p53 in SiHa cervical cancer cells, resulting in an increase of caspase 3/7 activity. Finally, both myricetin and spinacine sensitized HPV(+) cervical and oral cancer cells, but not.
HPV(-) cervical and oral cancer cells, to apoptosis induced by the cancer-specific ligand TRAIL, as well as the chemotherapeutic agents doxorubicin and cisplatin.

According to the news reporters, the research concluded: "New therapies based on this work may improve treatment for HPV(+) cancer patients."

For more information on this research see: Flavonol and imidazole derivatives block HPV16 E6 activities and reactivate apoptotic pathways in HPV+ cells. Cell Death & Disease, 2016;7():2060. (Nature Publishing Group - www.nature.com/; Cell Death & Disease - www.nature.com/cddis/)

Non-Steroidal Anti-Inflammatory Agents

Data from M. Mezzelani and Colleagues Advance Knowledge in Non-Steroidal Anti-Inflammatory Agents [Transcriptional and cellular effects of Non-Steroidal Anti-Inflammatory Drugs (NSAIDs) in experimentally exposed mussels, Mytilus ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Non-Steroidal Anti-Inflammatory Agents have been published. According to news reporting originating from Rome, Italy, by NewsRx correspondents, research stated, "The aim of the present investigation was to provide new insights on accumulation and possible adverse effects of various non-steroidal anti-inflammatory drugs (NSAIDs) in mussels, Mytilus gallo-provincialis, exposed to an environmentally realistic concentration (0.5 μg/L) of individual compounds, Acetaminophen (AMP), Diclofenac (DIC), Ibuprofen (IBU), Ketoprofen (KET) or Nimesulide (NIM). The measurement of drugs in mussel tissues was integrated with both functional alterations at cellular level and transcriptomic responses."

Financial support for this research came from EU Project REPROSEED.

Our news editors obtained a quote from the research, "Results indicated the capability of mussels to accumulate DIC and NIM, while AMP, IBU and KET were always below detection limit. A large panel of ecotoxicological biomarkers revealed the early onset of alterations induced by tested NSAIDs on immunological responses, lipid metabolism and DNA integrity. The gene transcription analysis through DNA microarrays, supported cellular biomarker results, with clear modulation of a large number of genes involved in the arachidonic acid and lipid metabolism, immune responses, cell cycle and DNA repair. The overall results
indicated an ecotoxicological concern for pharmaceuticals in M. galloprovincialis, with transcriptional responses appearing as sensitive exposure biomarkers at low levels of exposure: such changes, however, are not always paralleled by corresponding functional effects, suggesting caution when interpreting observed effects in terms of perturbed cellular pathways."

According to the news editors, the research concluded: "Fascinating similarities can also be proposed in the mode of action of NSAIDs between bivalves and vertebrate species."

For more information on this research see: Transcriptional and cellular effects of Non-Steroidal Anti-Inflammatory Drugs (NSAIDs) in experimentally exposed mussels, Mytilus galloprovincialis. Aquatic Toxicology, 2016;180():306-319. Aquatic Toxicology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Aquatic Toxicology - www.journals.elsevier.com/aquatic-toxicology/)

**Oncology - Colon Cancer**

**Data from Masaryk University Provide New Insights into Colon Cancer**

*(Activation of autophagy and PPAR gamma protect colon cancer cells against apoptosis induced by interactive effects of butyrate and DHA in a cell type-dependent manner: The ...)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news originating from Brno, Czech Republic, by NewsRx correspondents, research stated, "The short-chain and n-3 polyunsaturated fatty acids exhibit anticancer properties, and they may mutually interact within the colon. However, the molecular mechanisms of their action in colon cancer cells are still not fully understood."

Our news journalists obtained a quote from the research from Masaryk University, "Our study focused on the mechanisms responsible for the diverse effects of sodium butyrate (NaBt), in particular when interacting with docosahexaenoic acid (DHA), in distinct colon cancer cell types, in which NaBt either induces cell differentiation or activates programmed cell death involving mitochondrial pathway. NaBt activated autophagy both in HT-29 cells, which are sensitive to induction of differentiation, and in nondifferentiating HCT-116 cells. However, autophagy supported cell survival only in HT-29 cells. Combination of NaBt with DHA-promoted cell death, especially in HCT-116 cells and after longer time intervals. The inhibition of autophagy both attenuated differentiation and enhanced apoptosis in HT-29 cells treated with NaBt and DHA, but it had no effect in HCT-116 cells. NaBt, especially in combination with DHA, activated PPAR gamma in both cell types. PPAR gamma silencing decreased
differentiation and increased apoptosis only in HT-29 cells, therefore we verified the role of caspases in apoptosis, differentiation and also PPAR gamma activity using a pan-caspase inhibitor. In summary, our data suggest that diverse responses of colon cancer cells to fatty acids may rely on their sensitivity to differentiation, which may in turn depend on distinct engagement of autophagy, caspases and PPAR gamma."

According to the news editors, the research concluded: "These results contribute to understanding of mechanisms underlying differential effects of NaBt, when interacting with other dietary fatty acids, in colon cancer cells."

The news correspondents report that additional information may be obtained from J. Hofmanova, Masaryk University, Dept. of Expt Biol, Fac Sci, Brno, Czech Republic. Additional authors for this research include N. Strakova, J. Vondracek, A.H. Vaculova, A. Kozubik and J. Hofmanova.

**Data from Medical College of Wisconsin Provide New Insights into Congenital Heart Disease (Impact of MYH6 variants in hypoplastic left heart syndrome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Congenital Diseases and Conditions - Congenital Heart Disease is now available. According to news reporting originating in Milwaukee, Wisconsin, by NewsRx journalists, research stated, "Hypoplastic left heart syndrome (HLHS) is a clinically and anatomically severe form of congenital heart disease (CHD). Although prior studies suggest that HLHS has a complex genetic inheritance, its etiology remains largely unknown."

Funders for this research include A Healthier Wisconsin CVC Pilot Award, Wanek Consortium for HLHS, Wolfe Family Foundation, Little Hearts for Life.

The news reporters obtained a quote from the research from the Medical College of Wisconsin, "The goal of this study was to characterize a risk gene in HLHS and its effect on HLHS etiology and outcome. We performed next-generation sequencing on a multigenerational family with a high prevalence of CHD/HLHS, identifying a rare variant in the alpha-myosin heavy chain (MYH6) gene. A case-control study of 190 unrelated HLHS subjects was then performed and compared with the 1000 Genomes Project. Damaging MYH6 variants, including novel, missense, in-frame deletion, premature stop, de novo, and compound heterozygous
variants, were significantly enriched in HLHS cases (P < 1 x 10(-5)). Clinical outcomes analysis showed reduced transplant-free survival in HLHS subjects with damaging MYH6 variants (P < 1 x 10(-2)). Transcriptome and protein expression analyses with cardiac tissue revealed differential expression of cardiac contractility genes, notably upregulation of the beta-myosin heavy chain (MYH7) gene in subjects with MYH6 variants (P < 1 x 10(-3)). We subsequently used patient-specific induced pluripotent stem cells (iPSCs) to model HLHS in vitro. Early stages of in vitro cardiomyogenesis in iPSCs derived from two unrelated HLHS families mimicked the increased expression of MYH7 observed in vivo (P < 1 x 10(-2)), while revealing defective cardiomyogenic differentiation. Rare, damaging variants in MYH6 are enriched in HLHS, affect molecular expression of contractility genes, and are predictive of poor outcome."

According to the news reporters, the research concluded: "These findings indicate that the etiology of MYH6-associated HLHS can be informed using iPSCs and suggest utility in future clinical applications."

For more information on this research see: Impact of MYH6 variants in hypoplastic left heart syndrome. *Physiological Genomics*, 2016;48(12):912-921. *Physiological Genomics* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Data from Mexican Institute of Social Security Advance Knowledge in Type 2 Diabetes (Adaptation and validation of the Distress Scale for Mexican patients with type 2 diabetes and hypertension: a cross-sectional survey)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes are discussed in a new report. According to news reporting originating from Mexico City, Mexico, by NewsRx correspondents, research stated, "The aim of this study was to adapt and validate the Distress Scale for Mexican patients with type 2 diabetes and hypertension (DSDH17M). Two family medicine clinics affiliated with the Mexican Institute of Social Security."

Our news editors obtained a quote from the research from the Mexican Institute of
Social Security, "722 patients with type 2 diabetes and/or hypertension (235 patients with diabetes, 233 patients with hypertension and 254 patients with both diseases). A cross-sectional survey. The validation procedures included: (1) content validity using a group of experts, (2) construct validity from exploratory factor analysis, (3) internal consistency using Cronbach's a, (4) convergent validity between DSDH17M and anxiety and depression using the Spearman correlation coefficient, (5) discriminative validity through the Wilcoxon rank-sum test and (6) test-retest reliability using intraclass correlation coefficient. The DSDH17M has 17 items and three factors explaining 67% of the total variance. Cronbach a ranged from 0.83 to 0.91 among factors. The first factor of 'Regime-related Distress and Emotional Burden' moderately correlated with anxiety and depression scores. Discriminative validity revealed that patients with obesity, those with stressful events and those who did not adhere to pharmacological treatment had significantly higher distress scores in all DSDH17M domains. Test-retest intraclass correlation coefficient for DSDH17M ranged from 0.92 to 0.97 among factors."

According to the news editors, the research concluded: "DSDH17M is a valid and reliable tool to identify distress of patients with type 2 diabetes and hypertension."

For more information on this research see: Adaptation and validation of the Distress Scale for Mexican patients with type 2 diabetes and hypertension: a cross-sectional survey. Bmj Open, 2016;6(3):e009723. (BMJ Publishing Group - group.bmj.com/; Bmj Open - bmjopen.bmj.com/)

**Drugs and Therapies - Cancer Therapy**

**Data from NN Blokhin Russian Cancer Research Center Advance Knowledge in Cancer Therapy (Discovery of Compound A--a selective activator of the glucocorticoid receptor with anti-inflammatory and anti-cancer activity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Cancer Therapy. According to news reporting originating in Moscow, Russia, by NewsRx journalists, research stated, "Glucocorticoids are among the most effective anti-inflammatory drugs, and are widely used for cancer therapy. Unfortunately, chronic treatment with glucocorticoids results in multiple side effects."

The news reporters obtained a quote from the research from NN Blokhin Russian Cancer Research Center, "Thus, there was an intensive search for selective glucocorticoid
receptor (GR) activators (SEGRA), which retain therapeutic potential of glucocorticoids, but with fewer adverse effects. GR regulates gene expression by transactivation (TA), by binding as homodimer to gene promoters, or transrepression (TR), via diverse mechanisms including negative interaction between monomeric GR and other transcription factors. It is well accepted that metabolic and atrophogenic effects of glucocorticoids are mediated by GR TA. Here we summarized the results of extensive international collaboration that led to discovery and characterization of Compound A (CpdA), a unique SEGRA with a proven 'dissociating' GR ligand profile, preventing GR dimerization and shifting GR activity towards TR both in vitro and in vivo. We outlined here the unusual story of compound's discovery, and presented a comprehensive overview of CpdA ligand properties, its anti-inflammatory effects in numerous animal models of inflammation and autoimmune diseases, as well as its anti-cancer effects. Finally, we presented mechanistic analysis of CpdA and glucocorticoid effects in skin, muscle, bone, and regulation of glucose and fat metabolism to explain decreased CpdA side effects compared to glucocorticoids."

According to the news reporters, the research concluded: "Overall, the results obtained by our and other laboratories underline translational potential of CpdA and its derivatives for treatment of inflammation, autoimmune diseases and cancer."

For more information on this research see: Discovery of Compound A— a selective activator of the glucocorticoid receptor with anti-inflammatory and anti-cancer activity. *Oncotarget*, 2015;6(31):30730-44.

Our news correspondents report that additional information may be obtained by contacting E. Lesovaya, Dept. of Chemical Carcinogenesis, NN Blokhin Russian Cancer Research Center, Moscow, Russia. **Drugs and Therapies - Genitourinary Tract Agents**

**Data from National Autonomous University Advance Knowledge in Genitourinary Tract Agents (The potential role of serotonergic mechanisms in the spinal oxytocin-induced antinociception)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Genitourinary Tract Agents. According to news reporting from Queretaro, Mexico, by NewsRx journalists, research stated, "The role of oxytocin (OXT) in pain modulation has been suggested. Indeed, hypothalamic paraventricular nuclei (PVN) electrical stimuli, reduce the nociceptive neuronal activity (i.e., neuronal discharge associated with activation of A delta- and C-fibers) of the spinal dorsal horn wide dynamic range (WDR) cells and nociceptive behavior."
Funders for this research include Consejo Nacional de Ciencia y Tecnología, PAPIIT.

The news correspondents obtained a quote from the research from National Autonomous University, "Furthermore, raphe magnus nuclei lesion reduces the PVN-induced antinociception, suggesting a functional interaction between the OXT and the serotoninergic system. The present study investigated in Wistar rats the potential role of spinal serotoninergic mechanisms in the OXT- and PVN-induced antinociception. In long-term secondary mechanical allodynia and hyperalgesia induced by formalin or extracellular unitary recordings of the WDR cells we evaluated the role of 5-hydroxytryptamine (5-HT) effect on the OXT-induced antinociception. All drugs were given intrathecally (i.t.). OXT (1 x 10(-5)-1 x 10(-4) nmol) or 5-HT (1 x 10(-3)-1 x 10(-1) nmol) prevented the formalin-induced sensitization, an effect mimicked by PVN stimulation. Moreover, administration of OXT (1 x 10(-5) nmol) plus 5-HT (1 x 10(-3) nmol) at ineffective doses, produced antinociception. This effect was antagonized by: (i) d(CH2)(5)[Tyr(Me)(2),Thr(4),Tyr-NH29]OVT (oxytocin receptor antagonist; 2 x 10(-2) nmol); or (ii) methiothepin (a non-specific 5-H-1/2/5/6/7 receptor antagonist; 80 nmol). Similar results were obtained with PVN stimulation plus 5-HT (5 x 10(-5) nmol). In WDR cell recordings, the PVN-induced antinociception was enhanced by i.t. 5-HT and partly blocked when the spinal cord was pre-treated with methiothepin (80 nmol)."

According to the news reporters, the research concluded: "Taken together, these results suggest that serotoninergic mechanisms at the spinal cord level are partly involved in the OXT-induced antinociception."

For more information on this research see: Neuropeptides, 2016:60():51-60. 2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Hepatitis. According to news reporting out of Hsinchu, Taiwan, by NewsRx editors, research stated, "Hepatitis B viral (HBV) infection is strongly associated with an increased risk of liver diseases like cirrhosis or hepatocellular carcinoma (HCC). Many lines of evidence suggest that deletions occurring in HBV genomic DNA are highly associated with the activity of HBV via the interplay between aberrant viral proteins release and human immune system."

Financial support for this research came from Ministry of Science and Technology, Taiwan.

Our news journalists obtained a quote from the research from National Chiao Tung University, "Deletions finding on the HBV whole genome sequences is thus a very important issue though there exist underlying the challenges in mining such big and complex biological data. Although some next generation sequencing (NGS) tools are recently designed for identifying structural variations such as insertions or deletions, their validity is generally committed to human sequences study. This design may not be suitable for viruses due to different species. We propose a graphics processing unit (GPU)-based data mining method called DeF-GPU to efficiently and precisely identify HBV deletions from large NGS data, which generally contain millions of reads. To fit the single instruction multiple data instructions, sequencing reads are referred to as multiple data and the deletion finding procedure is referred to as a single instruction. We use Compute Unified Device Architecture (CUDA) to parallelize the procedures, and further validate DeF-GPU on 5 synthetic and 1 real datasets. Our results suggest that DeF-GPU outperforms the existing commonly-used method Pindel and is able to exactly identify the deletions of our ground truth in few seconds."

According to the news editors, the research concluded: "The source code and other related materials are available at https://sourceforge.net/projectsdefgpu."

For more information on this research see: DeF-GPU: Efficient and effective deletions finding in hepatitis B viral genomic DNA using a GPU architecture. Methods, 2016;111():56-63. Methods can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Methods - www.journals.elsevier.com/methods/)

Our news journalists report that additional information may be obtained by contacting V.S. Tseng, National Chiao Tung University, Dept. of Comp Sci, Hsinchu 308, Taiwan. Additional authors for this research include K.L. Lan, W.C. Liu, T.T. Chang and V.S. Tseng.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ymeth.2016.07.020. This DOI is a link to an online electronic document that is either free or for purchase.

Data from National Institutes of Health Advance Knowledge in Ebola Virus (FAM134B, the Selective Autophagy Receptor for Endoplasmic Reticulum Turnover, Inhibits Replication of Ebola Virus Strains Makona and Mayinga)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Ebola Virus. According to news reporting from Hamilton, Montana, by NewsRx journalists, research stated, "Selective autophagy of the endoplasmic reticulum (termed ER-phagy) is controlled by members of the FAM134 reticulon protein family. Here we used mouse embryonic fibroblasts from mice deficient in FAM134B to examine the role of the ER in replication of historic (Mayinga) or contemporary (Makona GCO7) strains of Ebola virus (EBOV)."

Financial supporters for this research include Division of Intramural Research, National Institute of Allergy and Infectious Diseases, National Institutes of Health.

The news correspondents obtained a quote from the research from the National Institutes of Health, "Loss of FAM134B resulted in 1-2 log(10) higher production of infectious EBOV, which was associated with increased production of viral proteins GP and VP40 and greater accumulation of nucleocapsid lattices. In addition, only 10% of wild-type cells contained detectable nucleoprotein, whereas knockout of FAM134B resulted in 80% of cells positive for nucleoprotein."

According to the news reporters, the research concluded: "Together, these data suggest that FAM134B-dependent ER-phagy is an important limiting event in EBOV replication in mouse cells and may have implications for further development of antiviral therapeutics and murine models of infection."

Our news journalists report that additional information may be obtained by contacting A.I. Chiramel, NIAID, Lab Virol, National Institutes of Health, Rocky Mt Labs, Hamilton, MT, United States. Additional authors for this research include J.D. Dougherty, V. Nair, S.J. Robertson and S.M. Best.

Penile Diseases and Conditions - Priapism

Data from Near East University Advance Knowledge in Priapism (Autologous blood clot embolisation in posttraumatic high-flow priapism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Penile Diseases and Conditions - Priapism are presented in a new report. According to news reporting originating in Mersin, Turkey, by NewsRx journalists, research stated, "Non-ischemic, high-flow priapism is defined as the state of painless and permanent erection of the penis which generally develops by perineal trauma. Selective transarterial embolisation is one of the treatment options."

The news reporters obtained a quote from the research from Near East University, "We present an 18-year-old men who had complaints of painless and permanent erection after a blunt perineal trauma. Colour Doppler ultrasound revealed a pseudoaneurysm and fistula at the left cavernosal artery. Hence autologous blood clot injection was performed to embolise the pseudoaneurysm. Due to the recanalization on the postprocedural seventh day, second embolisation was performed. One month after the second procedure, colour Doppler ultrasound revealed a 50% shrink but mild refilling in the pseudoaneurysm, whereas complete thrombus formation was observed on follow-up imaging. His priapism had fully recovered and erectile functions were totally normal at the six months and one year follow up."

According to the news reporters, the research concluded: "Autologous blood clot embolisation seems as a safe and successful treatment."

Our news correspondents report that additional information may be obtained by contacting G. Yilmaz, Near East Univ, Fac Med, Dept. of Radiol, Writing & Design, Lefkosa, Mersin, Turkey.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/0036933015619295. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Colon Cancer

Data from Northwestern University Advance Knowledge in Colon Cancer (New Developments in Interventional Oncology Liver Metastases From Colorectal Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- New research on Oncology - Colon Cancer is the subject of a report. According to news originating from Chicago, Illinois, by NewsRx correspondents, research stated, "Colorectal cancer is the third leading cause of cancer death in the United States. Although hepatic excision is the first-line treatment for colorectal liver metastasis (CRLM), few patients are candidates."

Our news journalists obtained a quote from the research from Northwestern University, "Locoregional therapy (LRT) encompasses minimally invasive techniques practiced by interventional radiology. These include ablative treatments (radiofrequency ablation, microwave ablation, and cryosurgical ablation) and transcatheter intra-arterial therapy (hepatic arterial infusion chemotherapy, transarterial 'bland' embolization, transarterial chemoembolization, and radioembolization with yttrium 90). The National Comprehensive Cancer Network recommends LRT for unresectable CRLM refractory to chemotherapy."

According to the news editors, the research concluded: "The following is a review of LRT in CRLM, including salient features, advantages, limitations, current roles, and future considerations."

For more information on this research see: New Developments in Interventional Oncology Liver Metastases From Colorectal Cancer. Cancer Journal, 2016;22(6):373-380. Cancer Journal can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

The news correspondents report that additional information may be obtained from R. Salem, Northwestern University, Robert H Lurie Comprehensive Cancer Center, Dept. of Med, Div Hematol & Oncol, Chicago, IL 60611, United States. Additional authors for this research include A. Gabr, N. Abouchaleh, R. Ali, A. Riaz, R.J. Lewandowski and R. Salem.

Keywords for this news article include: Chicago, Illinois, United States, North and Central America, Cancer, Article Review, Colorectal Research, Gastroenterology, Colon Cancer, Oncology, Northwestern University.

Oncology - Bladder Cancer

Data from Nottingham University Hospital NHS Trust Provide New Insights into Bladder Cancer (Closing the Gender Gap: Can We Improve Bladder Cancer Survival in Women? - A Systematic Review of Diagnosis, Treatment and Outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Bladder Cancer are discussed in a new report. According to news reporting out of Nottingham, United Kingdom, by NewsRx editors, research stated, "Despite recent attention, there are no gender specific guidelines to address the disparity in bladder cancer survival between the sexes. The focus of this review was to identify areas of clinical practice that may influence bladder cancer outcomes and to provide evidence-based recommendations to improve bladder cancer survival in women."

Our news journalists obtained a quote from the research from Nottingham University Hospital NHS Trust, "A systematic search of MEDLINE was conducted to identify studies related to referral, diagnosis, treatment and outcomes of patients with bladder cancer with particular reference to gender differences. Patients' knowledge of key signs and symptoms of
bladder cancer is poor. There is evidence that there is a gender difference in referral patterns both at patient and primary care level. The presence of cystitis, in particular, delays referral. Treatment and surveillance of high-risk non-muscle invasive cancers is variable and non-urothelial bladder cancer, which has higher incidence in women is more likely to be treated non-operatively than urothelial bladder cancer."

According to the news editors, the research concluded: "We have offered recommendations to improve patient education and streamline referrals and suggested considerations for treatment of high-risk cancers to help improve survival in female bladder cancer patients."

Our news journalists report that additional information may be obtained by contacting F. Burge, Nottingham Univ Hosp NHS Trust, Dept. of Urol, Nottingham NG5 1PB, United Kingdom.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000449256. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Non-Small Cell Lung Cancer**

**Data from Okayama University Hospital Provide New Insights into Non-Small Cell Lung Cancer (Induction S-1+Concurrent Radiotherapy Followed by Surgical Resection of Locally Advanced Non-small-cell Lung Cancer in an Elderly Patient)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Non-Small Cell Lung Cancer. According to news reporting originating in Okayama, Japan, by NewsRx journalists, research stated, "We present the case of a 77-year-old Japanese man diagnosed with lung squamous cell carcinoma with mediastinal lymph node metastasis. He was treated with induction chemoradiotherapy for T1bN2M0 stage IIIA disease."

The news reporters obtained a quote from the research from Okayama University Hospital, "Considering his age, we selected S-1 as the chemotherapeutic drug. Observing an objective response with no severe adverse events, we performed a left upper lobectomy with sleeve resection of the pulmonary artery. No residual tumor cells were found in the resected specimens, and no critical complication was observed in the clinical course."

According to the news reporters, the research concluded: “This case suggests that induction chemoradiotherapy using S-1 combined with concurrent radiation followed by surgery
can be a therapeutic option for elderly patients with locally advanced non-small-cell lung cancer."

Our news correspondents report that additional information may be obtained by contacting H. Torigoe, Dept. of Thoracic Surgery, Okayama University Hospital, Okayama 700-8558, Japan. Additional authors for this research include S. Toyooka, K. Katsui, J. Soh, Y. Maki, K. Kiura and S. Miyoshi.

The publisher of the journal *Acta Medica Okayama* can be contacted at: Okayama Univ Med School, Dept Pharmacology, Okayama, 700, Japan.

Keywords for this news article include: Asia, Japan, Okayama, Oncology, Radiotherapy, Lung Neoplasms, Non Small Cell Lung Cancer, Non-Small Cell Lung Cancer.

**Oncology**

**Data from P.J. Pitts et al Provide New Insights into Oncology (21st century pharmacovigilance: efforts, roles, and responsibilities)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology have been published. According to news reporting originating in Singapore, Singapore, by NewsRx journalists, research stated, "In an era when the number of expedited and conditional review pathways for newly available brand-name drugs and biosimilar medicines to treat serious and life-threatening diseases is increasing, defining pharmacovigilance has never been more crucial. 21st century pharmacovigilance is not merely about uncovering, reporting, and addressing adverse events associated with already approved and marketed agents, but can be described as the systematic monitoring of the process of pre-market review and post-market surveillance, which includes the use of medicines in everyday practice."

The news reporters obtained a quote from the research, "Pharmacovigilance identifies previously unrecognised adverse events or changes in the patterns of these effects, the quality and adequacy of drug supply, and should ensure effective communication with the public, health-care professionals, and patients about the optimum safety and effective use of medicines."

According to the news reporters, the research concluded: "In this paper, the first in a Series of three about drug safety in oncology, we discuss evolving challenges in the purview, roles, and responsibilities of the US Food and Drug Administration and the European Medicines Agency with respect to pharmacovigilance efforts, with a special emphasis on oncology treatment."

Our news correspondents report that additional information may be obtained by
contacting P.J. Pitts, Ecole Super Sci Econ & Commerciales, Singapore, Singapore. Additional authors for this research include H. Le Louet, Y. Moride and R.M. Conti.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/S1470-2045(16)30312-6. This DOI is a link to an online electronic document that is either free or for purchase.

Transplant Medicine - Liver Transplants

Data from Porto Hospital Center Provide New Insights into Liver Transplts (Survival Predictors in Liver Transplantation: Time-Varying Effect of Red Blood Cell Transfusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Liver Transplants have been published. According to news reporting out of Oporto, Portugal, by NewsRx editors, research stated, "Many attempts have been undertaken to better predict outcome after liver transplantation. The aim of this study was to identify the pre- and intraoperative variables that may influence the survival after liver transplantation, at a single institution."

Our news journalists obtained a quote from the research from Porto Hospital Center, "Anesthetic records from 543 consecutive patients who underwent liver transplantation from June 2006 to June 2014 were reviewed in this retrospective study. Patients undergoing retransplantation were excluded from the analysis, as were patients with familial amyloid polyneuropathy. Preoperative variables studied were age, sex, Model for End-Stage Liver Disease score, primary diagnosis, cold ischemia time, preoperative international normalized ratio, serum albumin, and and hemoglobin levels. Intraoperative variables included were norepinephrine consumption, blood loss, red blood cell transfusion, and surgical time. Variables significant in the univariate analysis with a P value of <.2 were included in a multivariate Cox regression model. Only red blood cell transfusion (hazard ratio [HR], 1.16; 95% confidence interval [CI], 1.04-1.29) and female sex (HR, 1.71; 95% CI, 1.10-2.65) were identified as significant independent predictors for survival after liver transplantation. Because of proportionality assumption violation, the multivariate Cox regression model was subsequently upgraded by adding a time-varying interaction between red blood cell transfusion and time since liver transplantation. As a result, we found that at 3 months after liver transplantation, the rate of dying increased 14% (95% CI, 2%-26%) for each unit transfused, and at 6 months it increased 12% (95% CI, 0.3%-24%)."

According to the news editors, the research concluded: "Red blood cell transfusion ceased to influence survival from 1 year onward."

Our news journalists report that additional information may be obtained by

**Bioscience**

**Data from Queensland University of Technology Advance Knowledge in Bioscience (Advancing student nurse knowledge of the biomedical sciences: A mixed methods study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Bioscience is now available. According to news reporting originating from Caboolture, Australia, by NewsRx correspondents, research stated, "Nursing students' ability to learn, integrate and apply bioscience knowledge to their clinical practice remains a concern. To evaluate the implementation, influence, and student perspective of a team-teaching workshop to integrate bioscience theory with clinical nursing practice."

Our news editors obtained a quote from the research from the Queensland University of Technology, "The team-teaching workshop was offered prior to commencement of the university semester as a refresher course at an Australian university. This' study employed a sequential explanatory mixed methods design incorporating both quantitative and qualitative items. An evaluation survey with quantitative and qualitative items and a focus group were employed. The qualitative data were analysed using a thematic approach. The quantitative data was combined with the emergent themes in the qualitative data. Participants were final year nursing students. Nine students attended the workshop. All students completed the evaluation (N = 9) and 44.4% (N = 4) attended the focus group. The results revealed six themes: (1) lectures are an inadequate teaching strategy for bioscience; (2) teaching strategies which incorporate active learning engage students; (3) the team-teaching workshop provides an effective learning environment; (4) the workshop content should be expanded; (5) pharmacology should relate to bioscience, and bioscience should relate to nursing; and (6) team-teaching was effective in integrating pharmacology with bioscience, and then translating this into nursing practice. Students had felt there was disjointedness between pharmacology and bioscience, and between bioscience and nursing care within their undergraduate studies."

According to the news editors, the research concluded: "The workshop that was based on team-teaching bridged those gaps, utilised active learning strategies and provided an effective learning environment Conclusion: Team-teaching that employs active learning strategies is an effective approach to assist nursing students to integrate bioscience knowledge into their nursing practice."

For more information on this research see: Advancing student nurse knowledge of
Drugs and Therapies - Immunotherapy

Data from R. Rosell et al Provide New Insights into Immunotherapy (Pathway Targeted Immunotherapy: Rationale and Evidence of Durable Clinical Responses with a Novel, EGF-directed Agent for Advanced NSCLC)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Immunotherapy have been published. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Abnormalities in the epidermal growth factor (EGF) and EGFR pathway promote progression of NSCLC. Immunization with EGF vaccine induces specific, neutralizing anti-EGF antibodies that prevent binding of the ligand to its receptor."

Our news editors obtained a quote from the research, "This concept of pathway targeted immunotherapy (PTI) was validated in vitro by dose-related suppression of EGFR, Akt, and Erk1/2 phosphorylation in cell lines with different mutations. A randomized phase II trial showed improved overall survival (OS) in subgroups with advanced NSCLC showing a clear immunologic response. By per-protocol analysis of the ensuing phase IIb trial, patients receiving EGF PTI survived 3 months longer than controls (12.43 versus 9.43 months; hazard ratio = 0.77 [95% confidence interval, 0.61-0.98]). These data were confirmed in a larger trial showing an OS benefit over control of >3 months. The variable most strongly correlated with efficacy was circulating EGF at enrolment. Patients with serum EGF levels >250 pg/mL benefited most from treatment with EGF PTI. Of 188 patients tested, 94 were above this biomarker threshold. The OS benefit from active versus control treatment was 6.7 months. More than 15% of patients had responses for >5 years. Long-term survivors are seen in all EGF PTI trials. Treatment is well-tolerated, induces high anti-EGF antibody titers, reduces levels of circulating serum EGF, achieves durable responses, and significantly prolongs OS. A threshold of 250 pg/mL has been set to enrich the study population in the ongoing pivotal trial."

According to the news editors, the research concluded: "This biomarker-guided study in an enriched population of patients with both squamous and nonsquamous stage IV NSCLC..."
aims to replicate the favorable efficacy/tolerability balance of earlier studies."

The news editors report that additional information may be obtained by contacting E. D'Hondt, Bioven Europe Ltd, London, United Kingdom. Additional authors for this research include E. Neninger, M. Nicolson, R.M. Huber, S. Thongprasert, P.M. Parikh and E. D'Hondt.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jtho.2016.08.132. This DOI is a link to an online electronic document that is either free or for purchase.

**Pharmacokinetics**

**Data from R.H. Budhraja et al Provide New Insights into Pharmacokinetics (LC-MS/MS Validation Analysis of Trastuzumab Using dSIL Approach for Evaluating Pharmacokinetics)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Pharmacokinetics are discussed in a new report. According to news reporting from Gujarat, India, by NewsRx journalists, research stated, "Quantitative targeted proteomics based approaches deploy state-of-the-art Liquid chromatography tandem mass spectrometry LC-MS technologies and are evolving as a complementary technique to standard ligand-binding based assays. Advancements in MS technology, which have augmented the specificity, selectivity and sensitivity limits of detection and freedom from antibody generation, have made it amicable towards various clinical applications."

The news correspondents obtained a quote from the research, "In our current work, a surrogate peptide based quantitative proteomics assessment is performed by selecting specific signature peptides from the complementary determining region CDR region of trastuzumab (Herclon®, Roche products in India). We developed a double Stable Isotope Label (dSIL) approach by using two different surrogate peptides to evaluate the proteolytic digestion efficiency and accurate quantification of the target analyte peptide of Herclon® in human serum. Method validation experiments were meticulously performed as per bioanalytical method validation guidelines."

According to the news reporters, the research concluded: "The dSIL approach, using an LC-MS/MS based quantification assay demonstrated good linearity over a range of 5-500 μg/mL of Herclon®, and validation experimental data is in compliance with bioanalytical regulatory guidelines."

For more information on this research see: LC-MS/MS Validation Analysis of Trastuzumab Using dSIL Approach for Evaluating Pharmacokinetics. *Molecules*, 2016;21

Data from Radboud University Provide New Insights into Type 1 Diabetes Mellitus (Enterovirus Exposure Uniquely Discriminates Type 1 Diabetes Patients with a Homozygous from a Heterozygous Melanoma Differentiation-Associated Protein 5/Interferon ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus. According to news reporting originating from Nijmegen, Netherlands, by NewsRx correspondents, research stated, "In children at risk for type 1 diabetes, innate immune activity is detected before seroconversion. Enterovirus infections have been linked to diabetes development, and a polymorphism (A946T) in the innate immune sensor recognizing enterovirus RNA, interferon-induced with helicase C domain 1/melanoma differentiation-associated protein 5, predisposes to disease."

Our news editors obtained a quote from the research from Radboud University, "We hypothesized that the strength of innate antienteroviral responses is affected in autoimmune type 1 diabetes patients and linked to the A946T polymorphism. We compared induction of interferon-stimulated genes (ISGs) in peripheral blood mononuclear cells (PBMCs) and dendritic cells (DCs) in healthy individuals and diabetes patients upon stimulation with enterovirus, enterovirus-antibody complexes, or ligands mimicking infection in relation to the A946T polymorphism. Overall, PBMCs of diabetes patients and healthy donors showed comparable ISG induction upon stimulation. No differences were observed in DCs. Interestingly, the data imply that the magnitude of responses to enterovirus and enterovirus-antibody complexes in PBMCs is critically influenced by the A946T polymorphism and elevated in heterozygotes compared to TT homozygous individuals in autoimmune diabetes patients, but not healthy controls."

According to the news editors, the research concluded: "These data imply an intrinsic difference in the responses to enterovirus and enterovirus-antibody complexes in diabetes patients carrying a TT risk genotype compared to heterozygotes that may influence control of enterovirus clearance."

For more information on this research see: Enterovirus Exposure Uniquely Discriminates Type 1 Diabetes Patients with a Homozygous from a Heterozygous Melanoma Differentiation-Associated Protein 5/Interferon Induced with Helicase C Domain 1 A946T
Genotype. *Viral Immunology*, 2016;29(7):389-397. *Viral Immunology* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. (Mary Ann Liebert, Inc. - www.liebertpub.com; Viral Immunology - www.liebertpub.com/overview/viral-immunology/57/)

Drugs and Therapies - Cysteamine Therapy

Data from Rhodes University Provide New Insights into Cysteamine Therapy [Photophysicochemical properties of nanoconjugates of zinc (II) 2(3)-mono-2-(4-oxy)phenoxy)acetic acid phthalocyanine with cysteamine capped silver and silver-gold ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Cysteamine Therapy. According to news originating from Grahamstown, South Africa, by NewsRx correspondents, research stated, "A novel asymmetrical zinc(II) 2(3)-mono-2-(4-oxy)phenoxy)acetic acid phthalocyanine (complex 1) was synthesized and subsequently linked to cysteamine capped silver (AgNPs) and silver-gold (AgAuNPs) nanoparticles (NPs) via amide bonds. The photophysicochemical properties and in vitro photodynamic therapy activity of complex 1 and its nanoconjugates were investigated."

Our news journalists obtained a quote from the research from Rhodes University, "The nanoconjugates showed improved photophysical properties compared to complex 1 alone. The fluorescence, triplet and singlet quantum yields of complex 1 were found to be 20%, 48%, and 43% respectively."

According to the news editors, the research concluded: "Complex 1 showed in vitro dark cytotoxicity, but the dark toxicity was reduced for the combination of complex 1 with AgAuNPs, this combination also gave the best photodynamic therapy activity when compared to complex 1 and its conjugate with AgNPs without AuNPs."

For more information on this research see: Photophysicochemical properties of nanoconjugates of zinc(II) 2(3)-mono-2-(4-oxy)phenoxy)acetic acid phthalocyanine with cysteamine capped silver and silver-gold nanoparticles. *Polyhedron*, 2016;119():434-444.
Data from S.E. Morales-Lopez et al Provide New Insights into Antifungals (Candida glabrata species complex prevalence and antifungal susceptibility testing in a culture collection: First description of Candida nivariensis in Argentina)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antifungals have been published. According to news reporting originating from Buenos Aires, Argentina, by NewsRx correspondents, research stated, "The presence of the cryptic species belonging to the Candida glabrata complex has not been studied in Argentina. We analyzed a collection of 117 clinical isolates of C. glabrata complex belonging to a National Culture Collection of Instituto Nacional de Microbiologia 'Dr. Carlos G. Malbran' from Argentina (40 isolates from blood samples, 18 from other normally sterile sites, 20 from vagina, 14 from urine, 7 from oral cavity, 3 from catheter, 1 from a stool sample and 14 isolates whose clinical origin was not recorded)."

Our news editors obtained a quote from the research, "The aims of this work were to determine the prevalence of the cryptic species Candida nivariensis and Candida bracarensis and to evaluate the susceptibility profile of isolates against nine antifungal drugs. Identification was carried out by using classical phenotypic tests, CHROMagar™ Candida, PCR and MALDI-TOF. The minimal inhibitory concentrations of amphotericin B, 5-fluorocytosine, fluconazole, itraconazole, voriconazole, ketoconazole, posaconazole, caspofungin and anidulafungin were determined according to the EDef 7.3 (EUCAST) reference document. Of the 117 isolates, 114 were identified as C. glabrata and three as C. nivariensis by using PCR and MALDI-TOF. There were no major differences between C. nivariensis and C. glabrata susceptibility profiles. No resistant strains were found to echinocandins. We have found that the percentage of C. nivariensis in our culture collection was 2.56."

According to the news editors, the research concluded: "This is the first description of C. nivariensis in Argentina, and data obtained could contribute to the knowledge of the epidemiology of this cryptic species."

For more information on this research see: Candida glabrata species complex prevalence and antifungal susceptibility testing in a culture collection: First description of Candida nivariensis in Argentina. *Mycopathologia*, 2016;181(11-12):871-878.
Data from Saitama Medical University Provide New Insights into Human Herpesvirus 8 (Clinical response to liposomal doxorubicin and rituximab in HHV-8-associated multicentric Castleman's disease in an HIV-positive patient)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Human Herpesvirus 8 is now available. According to news reporting from Saitama, Japan, by NewsRx journalists, research stated, "We report a patient with HIV-associated multicentric Castleman's disease who had recurrent human herpesvirus-8 viremia associated with intermittent febrile exanthema and lymphadenopathy."

The news correspondents obtained a quote from the research from Saitama Medical University, "Although the patient relapsed after single-agent treatment with liposomal doxorubicin, weekly infusions of rituximab led to complete remission even though the reactivation of the Kaposi's sarcoma was unfortunately observed."

According to the news reporters, the research concluded: "Rituximab could not only eliminate the accumulation of HHV-8 load but also play a part in the modulation of dysregulated CD20-positive B cells in HIV-associated multicentric Castleman's disease."

For more information on this research see: Clinical response to liposomal doxorubicin and rituximab in HHV-8-associated multicentric Castleman's disease in an HIV-positive patient. *Journal of Infection and Chemotherapy*, 2016;22(12):804-807. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Springer - www.springer.com; Journal of Infection and Chemotherapy - www.springerlink.com/content/1341-321x/)

Our news journalists report that additional information may be obtained by contacting T. Maeda, Saitama Med Univ, Dept. of Microbiol, Moroyama, Saitama, Japan. Additional authors for this research include T. Maeda, K. Misawa, K. Imai, Y. Fujikura and A. Kawana.

Oncology - Solid Cancer

Data from Sarah Cannon Research Institute Provide New Insights into Solid Cancer [A Phase I Study of the Cyclin-Dependent Kinase 4/6 Inhibitor Ribociclib (LEE011) in Patients with Advanced Solid Tumors and Lymphomas]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Solid Cancer. According to news reporting out of Nashville, Tennessee, by NewsRx editors, research stated, "Ribociclib (an oral, highly specific cyclin-dependent kinase 4/6 inhibitor) inhibits tumor growth in preclinical models with intact retinoblastoma protein (Rb+). This first-in-human study investigated the MTD, recommended dose for expansion (RDE), safety, preliminary activity, pharmacokinetics, and pharmacodynamics of ribociclib in patients with Rb+ advanced solid tumors or lymphomas."

Our news journalists obtained a quote from the research from Sarah Cannon Research Institute, "Patients received escalating doses of ribociclib (3-weeks-on/1-week-off or continuous). Dose escalation was guided by a Bayesian Logistic Regression Model with overdose control principle. Among 132 patients, 125 received ribociclib 3-weeks-on/1-week-off and 7 were dosed continuously. Nine dose-limiting toxicities were observed among 70 MTD/RDE evaluable patients during cycle 1, most commonly neutropenia (n = 3) and thrombocytopenia (n = 2). The MTD and RDE were established as 900 and 600 mg/day 3-weeks-on/1-week-off, respectively. Common treatment-related adverse events were (all-grade; grade 3/4) neutropenia (46%; 27%), leukopenia (43%; 17%), fatigue (45%; 2%), and nausea (42%; 2%). Asymptomatic Fridericia's corrected QT prolongation was specific to doses >= 600 mg/day (9% of patients at 600 mg/day; 33% at doses >600 mg/day). Plasma exposure increases were slightly higher than dose proportional; mean half-life at the RDE was 32.6 hours. Reduced Ki67 was observed in paired skin and tumor biopsies, consistent with ribociclib-mediated antiproliferative activity. There were 3 partial responses and 43 patients achieved a best response of stable disease; 8 patients were progression-free for >6 months. Ribociclib demonstrated an acceptable safety profile, dose-dependent plasma exposure, and preliminary signs of clinical activity."

According to the news editors, the research concluded: "Phase I-III studies of ribociclib are under way in various indications."

For more information on this research see: A Phase I Study of the Cyclin-Dependent
Kinase 4/6 Inhibitor Ribociclib (LEE011) in Patients with Advanced Solid Tumors and Lymphomas. *Clinical Cancer Research*, 2016;22(23):5696-5705. *Clinical Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. **Membrane Proteins - Immunologic Receptors**

**Data from School of Biology Advance Knowledge in Immunologic Receptors (Outside-in integrin signalling regulates haematopoietic stem cell function via Periostin-Itgav axis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Membrane Proteins - Immunologic Receptors have been published. According to news reporting originating in Thiruvananthapuram, India, by NewsRx journalists, research stated, "Integrins play an important role in haematopoietic stem cell (HSC) maintenance in the bone marrow niche. Here, we demonstrate that Periostin (Postn) via interaction with Integrin-alpha v (Itgav) regulates HSC proliferation."

The news reporters obtained a quote from the research from the School of Biology, "Systemic deletion of Postn results in peripheral blood (PB) anaemia, myelomonocytosis and lymphopenia, while the number of phenotypic HSCs increases in the bone marrow. Postn(-/-) mice recover faster from radiation injury with concomitant loss of primitive HSCs. HSCs from Postn(-/-) mice show accumulation of DNA damage generally associated with aged HSCs. Itgav deletion in the haematopoietic system leads to a similar PB phenotype and HSC-intrinsic repopulation defects. Unaffected by Postn, Vav-Itgav(-/-) HSCs proliferate faster in vitro, illustrating the importance of Postn-Itgav interaction. Finally, the Postn-Itgav interaction inhibits the FAK/PI3K/AKT pathway in HSCs, leading to increase in p27Kip1 expression resulting in improved maintenance of quiescent HSCs."

According to the news reporters, the research concluded: "Together, we demonstrate a role for Itgav-mediated outside-in signalling in regulation of HSC proliferation and stemness."

Our news correspondents report that additional information may be obtained by contacting S. Khurana, Indian Inst Sci Educ & Res, Sch Biol, Thiruvananthapuram 695016, Kerala, India. Aortic Stenosis

Data from School of Medicine Provide New Insights into Aortic Stenosis (Patient-defined goals for the treatment of severe aortic stenosis: a qualitative analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Aortic Stenosis is the subject of a report. According to news reporting out of Lebanon, New Hampshire, by NewsRx editors, research stated, "Patients with severe aortic stenosis (AS) at high risk for aortic valve replacement are a unique population with multiple treatment options, including medical therapy, surgical aortic valve replacement and transcatheter aortic valve replacement (TAVR). Traditionally, in elderly populations, goals of treatment may favour quality of life over survival."

Our news journalists obtained a quote from the research from the School of Medicine, "Professional guidelines recommend that clinicians engage patients in shared decision making, a process that may lead to decisions more aligned with patient-defined goals of care. Goals of care for high-risk patients with AS are not well defined in the literature, and patient-reported barriers to shared decision making highlight the need for explicit encouragement from clinicians for patient involvement. The purpose of this study was to elicit and report patient-defined goals from elderly patients facing treatment decisions for severe AS. This analysis was conducted at Dartmouth-Hitchcock Medical Center, an academic medical institution. In a retrospective manner, we qualitatively analysed goal statements reported by high-risk, elderly patients with severe AS evaluated for TAVR between June 2012 and August 2014. Forty-six patients provided treatment goals during consideration of TAVR and defined preferred outcomes as maintaining independence, staying alive, reducing symptoms or, most commonly, increasing their ability to do a specific activity or hobby. In the high-risk patient population considering TAVR, patient-reported goals may be obtained with a simple question delivered during the clinical encounter."

According to the news editors, the research concluded: "Encouraging patients to define their goals may lead to a greater degree of shared decision making, as advocated in current professional guidelines."

For more information on this research see: Patient-defined goals for the treatment of

*Lung Diseases and Conditions - Pulmonary*

**Data from School of Public Health Advance Knowledge in Pulmonary Tuberculosis (Adjuvant Efficacy of Nutrition Support During Pulmonary Tuberculosis Treating Course: Systematic Review and Meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Pulmonary Tuberculosis is now available. According to news reporting out of Guizhou, People's Republic of China, by NewsRx editors, research stated, "Malnutrition and tuberculosis (TB) tend to interact with each other. TB may lead to nutrition deficiencies that will conversely delay recovery by depressing immune functions."

Our news journalists obtained a quote from the research from the School of Public Health, "Nutrition support can promote recovery in the subject being treated for TB. The aim of this study was to evaluate the effectiveness of nutrition support on promoting the recovery of adult pulmonary TB patients with anti-TB drug therapy. English database of the Cochrane Controlled Trials Register, PubMed, EMBASE, and Chinese database of CBM, CNKI, VIP, and WANFANG were searched. Randomized controlled trials comparing nutrition support (given for more than 2 weeks) with no nutrition intervention, nutrition advice only, or placebo-control for TB patients being anti-TB treated were included. Two reviewers conducted data extraction, assessed the quality of the studies independently, and any discrepancies were solved by the third reviewer. Data were entered and analyzed by RevMan 5.2 software, and meta-analysis was done using risk ratios (RRs) for dichotomous variables and mean differences (MDs) for continuous variables with 95% confidence intervals (CIs). A total of 19 studies (3681 participants) were included. In nutritional support for TB patients, pooled RR and its 95% CI of sputum smears or culture-negative conversion rate and chest X-ray (CXR) absorption rate were 1.10 (1.04, 1.17) and 1.22 (1.08, 1.39), respectively, the pooled MD and its 95% CI of body mass index (BMI) and time of sputum smears or culture negativity were 0.59 (0.16, 1.2) and -5.42 (-7.93, -2.92), respectively, compared with the control group. The differences in outcomes of CXR zone affected, TB score, serum albumin, and hemoglobin were not statistically significant (p=0.76, 0.24, 0.28, and 0.20, respectively) between the intervention group and the control group. No
systemic adverse events were recorded. During anti-TB course, nutrition support may be helpful in treatment of TB patients by improving both sputum smears-or culture-negative conversion rate and BMI, shortening the time of sputum conversion negative."

According to the news editors, the research concluded: "Whether it can improve the final clinical effect, there still needs high-level quality studies to confirm in the future."

Our news journalists report that additional information may be obtained by contacting Y.Z. Zhou, Dept. of Hygiene Toxicology, School of Public Health, Zunyi Medical University, Zunyi, Guizhou 563099, People's Republic of China. Additional authors for this research include L.L. Kang, X.B. Shen and Y.Z Zhou.

**Data from Sichuan University Provide New Insights into Pleural Effusion (Primary Intestinal Lymphangiectasia Manifested as Unusual Edemas and Effusions: A Case Report)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Respiratory Tract Diseases and Conditions - Pleural Effusion is now available. According to news reporting out of Chengdu, People's Republic of China, by NewsRx editors, research stated, "Primary intestinal lymphangiectasia (PIL) is a rare disorder of unknown etiology characterized by diffuse or localized dilation and eventual rupture of the enteric lymphatic vessels in mucosa, submucosa, and/or subserosa. Lymph, rich in all kinds of proteins and lymphocytes, leaks into the gastrointestinal tract via the affected lymphatic vessels causing hypoproteinemia and lymphopenia."

Our news journalists obtained a quote from the research from Sichuan University, "The main symptom is variable degrees of pitting edemas of bilateral lower limbs. But edemas of any other parts of body, and mild serous effusions may also occur sometimes. PIL occurs in conjunction with a right hemifacial edema, a right upper limb lymphedema, asymmetric bilateral calves edemas, and a unilateral massive pleural effusion seems never to be reported before. In
addition, increased enteric protein loss that may cause severe hypoproteinemia usually get overlooked, and the lymphatic system disorders always put the diagnoses in a dilemma. We described a case of a 17-year-old Chinese girl with a history of gradually progressive swellings of right-sided face, right upper limb, and bilateral calves since 3 to 4 months of age. A right-sided massive pleural effusion, a moderate pericardial effusion, and a mild ascites have been proved unchanged by a series of computerized tomography (CT) scans since 5 years ago. The diagnosis of PIL was finally confirmed by severe hypoproteinemia, endoscopic changes, and histology of jejunum biopsy. Further lymphoscintigraphy and lymphangiography also identified lymph leakage in her bowel and several abnormal lymphatic vessels. A high-protein, low-fat diet supplemented with medium-chain triglycerides (MCT) showed some benefit. This case suggested that PIL was a rare but important etiology of hypoproteinemia, effusions, and edemas. PIL, effusions, and lymphedema can be the features of multisegmental generalized lymphatic dysplasia."

According to the news editors, the research concluded: "In addition, both lymphoscintigraphy and intranodal lymphangiography could be considered when lymphatic system disorders are suspected."

For more information on this research see: Primary Intestinal Lymphangiectasia Manifested as Unusual Edemas and Effusions: A Case Report. *Medicine*, 2016;95(10):e2849. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Data from South China University of Technology Provide New Insights into Minerals (Biofunctionalization of Selenium Nanoparticle with Dictyophora Indusiata Polysaccharide and Its Antiproliferative Activity through Death-Receptor and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Minerals are discussed in a new report. According to news reporting out of Guangdong, People's Republic of China, by NewsRx editors, research stated, "Bio-functionalized nanoparticles with semiconducting-metallic core encapsulated in a bio-or bio-derived materials are promising for applications in biology and especially in cancer diagnostic and healing. In this report, we report a facile, single-step, first-time synthesis and in-situ functionalization strategy for the preparation of monodispersed selenium nanoparticles..."
(SeNPs) functionalized using a novel polysaccharide (DP1) extracted from Dictyophora indusiata (a fungus)."

Our news journalists obtained a quote from the research from the South China University of Technology, "The DP1 functionalized SeNPs (DP1-SeNPs), where DP1 is attached to the surface via Se-O bond as well as physic-sorption had, an average diameter of 89 nm, and were highly uniform, extremely stable compared to bare SeNPs. Detailed investigation of the biological properties of DP1-SeNP illustrated that they exhibit unprecedented, enhanced, and selective antiproliferative activity through inducing cell apoptosis confirmed by nuclear condensation, DNA cleavage, and accumulation of S phase cell arrest. The mechanism of the induced apoptosis was found to be a combination of the activation of caspases 3, 8, and 9, the Fas-associated death domain protein (FADD), reactive oxygen species (ROS) overproduction, as well as mitochondrial dysfunction."

According to the news editors, the research concluded: "It is envisioned that the reported DP1-SeNPs will offer a new phase space for high-efficiency anticancer treatment with little side effect."

For more information on this research see: Biofunctionalization of Selenium Nanoparticle with Dictyophora Indusiata Polysaccharide and Its Antiproliferative Activity through Death-Receptor and Mitochondria-Mediated Apoptotic Pathways. Mental Health Diseases and Conditions - Bipolar...

Data from Stanford University Advance Knowledge in Bipolar Disorders (Long-term safety and tolerability of asenapine: A double-blind, uncontrolled, long-term extension trial in adults with an acute manic or mixed episode associated with bipolar ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Mental Health Diseases and Conditions - Bipolar Disorders is the subject of a report. According to news reporting originating in Stanford, California, by NewsRx journalists, research stated, "Asenapine (ASN) is approved in the United States as monotherapy and adjunctive therapy (to lithium or valproate) in adults with bipolar mania, and as monotherapy in pediatric patients with bipolar mania. This is the first long-term
study evaluating safety and tolerability of ASN fixed doses in this population."

Financial support for this research came from Forest Research Institute, Inc.

The news reporters obtained a quote from the research from Stanford University, "After completing a 3-week, randomized, placebo (PBO)-controlled acute trial, patients could enroll in this 26-week, fixed-dose (5 or 10 mg twice daily), double-blind extension study. Select predefined treatment emergent adverse events (TEAEs) and metabolic parameters were reported. Overall, 164 patients were treated; 88 completed the study. The incidence of TEAE was greater for PBO/ASN 5 mg (68.3%) versus ASN 5 mg/ASN 5 mg (54.7%) and ASN 10 mg/ASN 10 mg (51.0%) with sedation, headache, somnolence, akathisia, and dizziness occurring as the most prevalent TEAEs. Predefine, TEAEs were more common for PBO/ASN 5 mg (33.3%) versus ASN 5 mg/ASN 5 mg (15.1%) and ASN 10 mg/ASN 10 mg (15.7%). Weight gain (>= 7% increase from baseline to endpoint) was more frequent for ASN 10 mg/ASN 10 mg (16.3%) versus ASN 5 mg/ASN 5 mg (13.7%) and PBO/ASN 5 mg (8.9%). No clinically significance metabolic changes were observed. The incidence of serious AEs was low and primarily related to underlying bipolar I disorder. Limitations: This study lacked a comparator group and was not powered for direct comparisons of ASIA regimens. Results may not be applicable to the general bipolar population."

According to the news reporters, the research concluded: "ASN was generally safe and well tolerated in adults with an acute manic or mixed episode associated with bipolar I disorder."

For more information on this research see: Long-term safety and tolerability of asenapine: A double-blind, uncontrolled, long-term extension trial in adults with an acute manic or mixed episode associated with bipolar I disorder. *Journal of Affective Disorders*, 2017;207 ():384-392. *Journal of Affective Disorders* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Affective Disorders - www.journals.elsevier.com/journal-of-affective-disorders/)

**Macrolides**

**Data from State University Advance Knowledge in Macrolides**

(Synergistic effect of pedalitin and amphotericin B against *Cryptococcus neoformans* by in vitro and in vivo evaluation)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Macrolides are presented in a new report. According to news reporting from Araraquara, Brazil, by NewsRx journalists, research stated, "Cryptococcosis is an opportunistic fungal infection responsible for high morbidity and mortality in immunocompromised patients. Combination of antifungal substances is a promising way to increase the percentage of successful treatment."

Financial supporters for this research include FAPESP, RENAMA-CNPq, CAPES, PADC/FCF.

The news correspondents obtained a quote from the research from State University, "Pedalitin (PED) is a natural substance obtained from Pterogyne nitens. The aim of this study was to verify the efficacy of PED alone and in combination with amphotericin B (AmB) in vitro and in vivo against Cryptococcus spp. In the in vitro assay, minimum inhibitory concentrations (MICs) of 0.125 mg/L for AmB and 3.9 mg/L for PED were found when the substances were tested alone, whilst in the combination treatment the active concentration of both decreased, with MICs of 0.03 mg/L for AmB and 1 mg/L for PED. In the survival assay, fungal burden study and histopathological assays it was possible to study the efficacy of the substances alone and in combination. The efficacy of combination therapy was considered better than monotherapy as evaluated in a Galleria mellonella model and amurine model. Thus, the combination of PED and AmB is an interesting alternative for anticonryptococcal fungal treatment."

According to the news reporters, the research concluded: "Moreover, a correlation was observed between the invertebrate and murine models for this antifungal treatment combination."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijantimicag.2016.07.025. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Araraquara, Brazil, South America, Dermatological Agents, Drugs and Therapies, Topical Antifungals, Amphotericin B, Antiinfectives, Antibiotics, Macrolides, Polenes, State University.

Data from Sun Yat Sen University Provide New Insights into Hypersensitivity (Serum IFN-gamma-inducible chemokines CXCL9 and CXCL10 are elevated in non-immediate drug hypersensitivity reactions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immune System Diseases and Conditions - Hypersensitivity is now available. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "The recruitment to the skin of drug-responsive T cells is responsible for the inflammatory profiles of non immediate drug hypersensitivity reactions (niDHRs). Maculopapular exanthema (MPE) and Stevens-Johnson syndrome (SJS)/toxic epidermal necrolysis (TEN) have quite distinct T cell infiltrating patterns."

The news correspondents obtained a quote from the research from Sun Yat Sen University, "To investigate serum levels of CXCL9, CXCL10 and IFN-gamma in patients with niDHRs, including MPE and SJS/TEN, to evaluate correlations between the cytokines, and to determine whether the inflammatory factors correlate with clinical severity in patients with SJS/TEN. Twenty-four patients with SJS/TEN, 24 patients with MPE, and 24 healthy donors with good tolerance to the drugs involved in the drug reactions were recruited into the study. The modified severity-of-illness score for TEN (SCORTEN) and detachment of body surface area (dBSA) were used to assess the clinical severity of SJS/TEN. Serum levels of CXCL9, CXCL10 and IFN-gamma were determined by ELISA. Results: The niDHRs group, SJS/TEN and MPE subgroups all exhibited significantly higher levels of CXCL9; CXCL10 and IFN-gamma compared with the control group (P < 0.001). Serum IFN-gamma levels were positively correlated with CXCL9 levels and CXCL10 levels in patients with niDHRs ($r(s) = 0.576$, $r(s) = 0.449$, $P < 0.05$). None of the levels of CXCL9, CXCL10 and IFN-gamma had any correlation with modified SCORTEN index or dBSA in SJS/TEN group."

According to the news reporters, the research concluded: "The results suggest Th1 cytokine IFN-gamma and chemokines CXCL9 and CXCL10 may play roles in the pathogenesis of niDHRs."

For more information on this research see: Serum IFN-gamma-inducible chemokines CXCL9 and CXCL10 are elevated in non-immediate drug hypersensitivity reactions. Data from Sunnybrook Health Sciences Center Provide New Insights into Radiation Therapy (Implementation of a volumetric modulated arc therapy treatment planning solution for kidney and adrenal stereotactic body radiation therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Radiation Therapy have been presented. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "To develop a volumetric modulated arc therapy (VMAT) treatment planning solution in the treatment of primary renal cell carcinoma and oligometastatic adrenal lesions with stereotactic body radiation therapy. Single-arc VMAT plans (n = 5) were compared with clinically delivered step-and-shoot intensity-modulated radiotherapy (IMRT) with planning target volume coverage normalized between techniques."

Our news journalists obtained a quote from the research from Sunnybrook Health Sciences Center, "Target volume conformity, organ-at-risk (OAR) dose, treatment time, and monitor units were compared. A VMAT planning solution, created from a combination of arc settings and optimization constraints, auto-generated treatment plans in a single optimization. The treatment planning solution was evaluated on 15 consecutive patients receiving kidney and adrenal stereotactic body radiation therapy. Treatment time was reduced from 13.0 +/- 2.6 to 4.0 +/- 0.9 minutes for IMRT and VMAT, respectively. The VMAT planning solution generated treatment plans with increased target homogeneity, improved 95% conformity index, and a reduced maximum point dose to nearby OARs but with increased intermediate dose to distant OARs. The conformity of the 95% isodose improved from 1.32 +/- 0.39 to 1.12 +/- 0.05 for IMRT and VMAT treatment plans, respectively. Evaluation of the planning solution showed clinically acceptable dose distributions for 13 of 15 cases with tight conformity of the prescription isodose to the planning target volume of 1.07 +/- 0.04, delivering minimal dose to OARs."

According to the news editors, the research concluded: "The introduction of a stereotactic body radiation therapy VMAT treatment planning solution improves the efficiency of planning and delivery time, producing treatment plans of comparable or superior quality to IMRT in the case of primary renal cell carcinoma and oligometastatic adrenal lesions."

For more information on this research see: Implementation of a volumetric modulated arc therapy treatment planning solution for kidney and adrenal stereotactic body radiation therapy. Biomedical Engineering - Tissue Engineering

Data from Tabriz University of Medical Sciences Advance Knowledge in Tissue Engineering (Bacterial-derived biopolymers: Advanced natural nanomaterials for drug delivery and tissue engineering)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Biomedical Engineering - Tissue Engineering is now available. According to news reporting originating in Tabriz, Iran, by NewsRx journalists, research stated, "There are several biocompatible and biodegradable biopolymers, which found tremendous medical and pharmaceutical applications and currently receiving unprecedented attention."

Financial support for this research came from Tabriz University of Medical Sciences. The news reporters obtained a quote from the research from the Tabriz University of Medical Sciences, "Various microorganisms can synthesize a variety of these biopolymers such as polysaccharides, polyamides and polyesters, which could be used for development of new generation of drug carriers and tissue repairing materials. The size, charge, chemical structure and other physicochemical properties of bacterial biodegradable polymers represent a good compatibility in development of tissue scaffolds and also as delivery vehicles of therapeutic agents."

According to the news reporters, the research concluded: "Here, we highlight recent advances in engineering biopolymers derived from bacteria, especially for drug delivery and tissue engineering."

Our news correspondents report that additional information may be obtained by contacting J.E.N. Dolatabadi, Tabriz Univ Med Sci, Res Center Pharmaceut Nanotechnol, Fac Pharm, Tabriz, Iran. Additional authors for this research include A. Alibakhshi, M. Hejazi, Y. Omidi and J.E.N. Dolatabadi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.trac.2016.06.013. This DOI is a link to an online electronic document that is either free or for purchase.

Data from Tehran University of Medical Sciences Provide New Insights into Cyclic Peptides (Inhibition of Octreotide Acylation Inside PLGA Microspheres by Derivatization of the Amines of the Peptide with a Self-Immolative Protecting Group)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Peptides - Cyclic Peptides. According to news reporting out of Tehran, Iran, by NewsRx editors, research stated, "Acylation of biopharmaceuticals such as peptides has been identified as a major obstacle for the successful development of PLGA controlled release formulations. The purpose of this study was to develop a method to inhibit peptide acylation in poly(d,l-lactide-co-glycolide) (PLGA) formulations by reversibly and temporarily blocking the amine groups of a model peptide (octreotide) with a self-immolative protecting group (SIP), O-4-nitroph enyl-O’-4-acetoxybenzyl carbonate."

Financial support for this research came from Ministry of Health and Medical Education.

Our news journalists obtained a quote from the research from the Tehran University of Medical Sciences, "The octreotide with two self-immolative protecting groups (OctdiSIP) on the N-terminus and lysine side chain was synthesized by reaction of the peptide with O-4-nitrophenyl-O’-4-acetoxybenzyl carbonate, purified by preparative RP-HPLC and characterized by mass spectrometry. Degradation studies of OctdiSIP in aqueous solutions of different pH values showed that protected octreotide was stable at low pH (pH 5) whereas the protecting group was eliminated at physiological pH, especially in the presence of an esterase, to generate native octreotide. OctdiSIP encapsulated in PLGA microspheres, prepared using a double emulsion solvent evaporation method, showed substantial inhibition of acylation as compared to the unprotected octreotide: 52.5% of unprotected octreotide was acylated after 50 days incubation of microspheres in PBS pH 7.4 at 37 ?C, whereas OctdiSIP showed only 5.0% acylation in the same time frame."

According to the news editors, the research concluded: "The incorporation of self-immolative protection groups provides a viable approach for inhibition of acylation of peptides in PLGA delivery systems."

Our news journalists report that additional information may be obtained by contacting M. Shirangi, Dept. of Drug and Food Control, Faculty of Pharmacy, Tehran University of Medical Science, Tehran 1417614411, Iran. Additional authors for this research include M. Najafi, D.T. Rijkers, R.J. Kok, W.E. Hennink and C.F van Nostrum.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.bioconjchem.5b00598. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Cholangiocarcinoma

Data from Third Military Medical University Advance Knowledge in Cholangiocarcinoma [A polysaccharide from Pinellia ternata inhibits cell proliferation and metastasis in human cholangiocarcinoma cells by targeting of Cdc42 and 67 kDa Laminin ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cholangiocarcinoma have been published. According to news reporting originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "In this study, we isolated and purified a polysaccharide (PTPA) from the tubers of Pinellia ternate. We aimed to evaluate the cytotoxic effects of PTPA on human cholangiocarcinoma (CCA) cell lines and to identify the underlying molecular mechanism."

Our news editors obtained a quote from the research from Third Military Medical University. "PTPA at the dose from 25 to 200 μg/mL showed significant inhibitory effect on the proliferation of four cancer cell lines (SNU-245, CL-6, Sk-ChA-1 and MZ-ChA-1), among which Sk-ChA-1 was a most sensitive cell line to PTPA treatment via induction of apoptosis. Interestingly, RNA interference of Sk-ChA-1 cells with 67LR or Cdc42-targeted shRNAs resulted a similar potency in decreasing cell viability and causing apoptotic death. Moreover, PTPA (100 μg/mL) or 67LR or Cdc42 special shRNAs increased the ratio of pro-apoptotic Bax to anti-apoptotic Bcl-2, induced the activation of caspase-9 and caspase-3, but not caspase-8, and inhibited the expression of 67LR or Cdc42 protein in Sk-ChA-1 cells. Taken together, the inhibitory effect of PTPA on the cell growth of Sk-ChA-1 cells was at least in part mediated via the activation of the intrinsic mitochondrial apoptotic pathway and the downregulation of 67LR or Cdc42 protein expression."

According to the news editors, the research concluded: "Thus, PTPA may be developed as a promising candidate for chemopreventive agent in the prevention and treatment of human CCA."

The news editors report that additional information may be obtained by contacting S.G. Wang, Third Military Medical University, Inst Hepatobiliary Surg, Southwest Hosp, Chongqing, People's Republic of China. Additional authors for this research include D.J. Li, J. Chen and S.G. Wang.

Keywords for this news article include: Chongqing, People's Republic of China, Asia, Extracellular Matrix Proteins, Membrane Glycoproteins, Immunologic Receptors, Enzymes and Coenzymes, Cell Proliferation, Cholangiocarcinoma, Membrane Proteins, Laminin Receptors, Genetics, Oncology, Caspase, Third Military Medical University.

Data from Tomsk State University Advance Knowledge in Malaria [On the ecology and range of Anopheles beklemishevi (Diptera: Culicidae) with reference to the taxonomy of An. lewisi]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mosquito-Borne Diseases - Malaria have been published. According to news reporting originating in Tomsk, Russia, by NewsRx editors, the research stated, "The ecological features and geographic distribution of Anopheles beklemishevi have not been studied extensively. These studies are important in connection with the validity of the Anopheles lewisi' taxon."

The news reporters obtained a quote from the research from Tomsk State University, "The materials were collected in Russia and Kazakhstan from 1973 to 2012, and species identity was defined by cytogenetic analysis of polytene chromosomes of larvae and adult females. A total of 7,896 specimens from 34 geographic locations was included in the analysis. It was established that An. beklemishevi is distributed from the east coast of the Baltic Sea to the basin of the Lena River, and from the forest-tundra zone to the Altai and Sayan Mountain systems. This species is exophilic and is confined to high and/or swampy terrains found in the zone of conifer and mixed forests. The frequency of An. beklemishevi in the southwestern area, where it is sympatric with An. messeae s.l., has significantly decreased over the past decades. The results of the study indirectly suggest that An. beklemishevi does not play a significant role as a vector of malaria. It is highly improbable that An. beklemishevi and An. lewisi are the same species."

According to the news reporters, the research concluded: "Changes in the proportions of the species of the Maculipennis complex, as well as a shift of their ranges, will significantly impact the epidemiology of malaria over large areas of northern Eurasia."

Our news correspondents report that additional information may be obtained by contacting Y.M. Novikov, Tomsk State Univ, Dept. of Cytol & Genet, Tomsk 634050, Russia.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jvec.12215. This DOI is a link to an online electronic document that is either free or for purchase.

Nephrology

Data from University Hospital Provide New Insights into Nephrology
(The Microphthalmia-Associated Transcription Factor p.E318K Mutation Does Not Play a Major Role in Sporadic Renal Cell Tumors from Caucasian Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nephrology. According to news originating from Erlangen, Germany, by NewsRx correspondents, research stated, "The transcription factor MITF (microphthalmia-associated transcription factor) is known to induce expression of hypoxia-inducible factor (HIF1-a), which is involved in renal carcinogenesis. The MITF p.E318K mutation leads to deficient SUMOylation of MITF, resulting in enhanced activation of its target genes."

Our news journalists obtained a quote from the research from University Hospital, "A case-control study on melanoma patients who coincidentally were affected by renal cell carcinoma (RCC) has revealed an elevated risk for mutation carriers to be affected by one or both of these malignancies, suggesting a possible role for MITF p.E318K in renal carcinogenesis. The same study described an MITF mutation frequency of 1.5% in a small cohort of sporadic RCC, but comprehensive data on sporadic renal cell tumors are missing. We therefore tested a large cohort of sporadic renal tumors for MITF p.E318K mutation status. Genomic DNA was extracted from 426 formalin-fixed, paraffin-embedded sporadic renal tumors that had been graded according to the 2004 WHO classification of renal tumors and staged according to the 2002 TNM classification. The tumor cohort was enriched with papillary and chromophobe RCC, and also contained benign oncocytomas. DNA was tested for MITF p.E318K by pyrosequencing. Of 403 analyzable tumors, 402 renal tumors were wild-type ones, and only 1 case showed the MITF p.E318K mutation. This tumor was a clear-cell RCC (pT3b N0 M0 G3 according to the TNM classification 2002). The affected patient was male, 61 years old, and had no known coexisting malignancies."

According to the news editors, the research concluded: "The MITF p.E318K mutation does not appear to play a major role in sporadic RCC carcinogenesis, but is possibly restricted to a rare subpopulation of inherited RCC."

The news correspondents report that additional information may be obtained from C.G. Stoehr, Institute of Pathology, University Hospital Erlangen, Friedrich Alexander University Erlangen-Nuremberg, Erlangen, Germany. Additional authors for this research include B. Walter, S. Denzinger, P. Ghiorzo, R.A. Sturm, R. Hinze, H. Moch, K. Junker, A. Hartmann and R. Stoehr.

Data from University of Alabama Provide New Insights into Acute Lung Injury (Protective effect of suppressing STAT3 activity in LPS-induced acute lung injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Acute Lung Injury. According to news reporting originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "Acute lung injury (ALI) and acute respiratory distress syndrome (ARDS) are diseases with high mortality. Macrophages and neutrophils are responsible for inflammatory responses in ALI and ARDS, which are characterized by excessive production of proinflammatory mediators in bronchoalveolar lavage fluid (BALF) and plasma."

Funders for this research include HHS | NIH | National Institute of Neurological Disorders and Stroke (NINDS), HHS | NIH | National Heart, Lung, and Blood Institute (NHBLI).

Our news editors obtained a quote from the research from the University of Alabama, "Aberrant activation of the JAK/STAT pathway is critical for persistent inflammation in many conditions such as infection and autoimmunity. Given the importance of the STAT3 transcription factor in activating macrophages and neutrophils and augmenting inflammation, we investigated the therapeutic potential of inhibiting STAT3 activity using the small-molecule STAT3 inhibitor, LLL12. Our results demonstrate that LPS induces STAT3 activation in macrophages in vitro and in CD45(+)CD11b(+) cells from BALF in the LPS-induced ALI model in vivo. LLL12 treatment inhibits LPS-induced lung inflammation in the ALI model, which is accompanied by suppression of LPS-induced STAT3 activation and an inhibition of macrophage and inflammatory cell infiltration in lung and BALF. LLL12 treatment also suppresses expression of proinflammatory genes including IL-1 beta, IL-6, TNF-alpha, iNOS, CCL2, and MHC class II in macrophages and inflammatory cells from BALF and serum as determined by ELISA. Furthermore, hyperactivation of STAT3 in LysMCre-SOCS3(fl/fl) mice accelerates the severity of inflammation in the ALI model. Both pre- and post-LPS treatment with LLL12 decrease LPS-induced inflammatory responses in mice with ALI."

According to the news editors, the research concluded: "Importantly, LLL12 treatment attenuates STAT3 phosphorylation in human peripheral blood mononuclear cells induced by plasma from patients with ARDS, which suggests the feasibility of targeting the STAT3 pathway therapeutically for patients with ALI and ARDS."

The news editors report that additional information may be obtained by contacting H.W. Qin, Univ Alabama Birmingham, Dept. of Cell Dev & Integrat Biol, Birmingham, AL

**Biotechnology**

**Data from University of Alabama Provide New Insights into Biotechnology (Evaluating the toxicity of bDtBPP on CHO-K1 cells for testing of single-use bioprocessing systems considering media selection, cell culture volume, mixing, and exposure ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology. According to news reporting originating from Tuscaloosa, Alabama, by NewsRx correspondents, research stated, "Single-use bioprocessing bags are gaining popularity due to ease of use, lower risk of contamination, and ease of process scale-up. Bis(2,4-di-tert-butylphenyl)phosphate (bDtBPP), a degradant of tris(2,4-di-tert-butylphenyl)phosphite, marketed as Irgafos 168®, which is an antioxidant stabilizer added to resins, has been identified as a potentially toxic leachate which may impact the performance of single-use, multilayer bioprocessing bags."

Our news editors obtained a quote from the research from the University of Alabama, "In this study, the toxicity of bDtBPP was tested on CHO-K1 cells grown as adherent or suspended cells. The EC50 (effective concentration to cause 50% cell death) for adherent cells was found to be one order of magnitude higher than that for suspended CHO-K1 cells. While CHO-K1 cells had good cell viability when exposed to moderate concentrations of bDtBPP, the degradant was shown to impact the viable cell density (VCD) at much lower concentrations. Hence, in developing an industry-standard assay for testing the cytotoxicity of leachates, suspended cells (as commonly used in the bioprocessing industry) would likely be most sensitive, particularly when reporting EC50 values based on VCD. The effects of mixing, cell culture volume, and exposure duration were also evaluated for suspended CHO-K1 cells."

According to the news editors, the research concluded: "It was found that the sensitivity of cell culture to leachates from single-use plastic bags was enhanced for suspended cells cultured for longer exposure times and when the cells were subjected to continuous agitation, both of which are important considerations in the production of biopharmaceuticals."

For more information on this research see: Evaluating the toxicity of bDtBPP on CHO-K1 cells for testing of single-use bioprocessing systems considering media selection, cell culture volume, mixing, and exposure duration. *Biotechnology Progress*, 2016;32(5):1318-1323. *Biotechnology Progress* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken
Eye Diseases and Conditions - Retinal Vein Occlusion

Data from University of Alexandria Provide New Insights into Retinal Vein Occlusion (Central retinal vein occlusion: modifying current treatment protocols)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Retinal Vein Occlusion. According to news reporting originating from Alexandria, Egypt, by NewsRx correspondents, research stated, "Central retinal vein occlusion (CRVO) is a common retinal vascular disorder that can result in severe visual acuity loss. The randomized control study, CRUISE, helped establish anti-VEGFs as the standard of care in cases with CRVO."

Our news editors obtained a quote from the research from the University of Alexandria, "The extension studies for CRUISE; HORIZON and RETAIN showed that not all visual gains are maintained beyond the first year. In addition, patients showed different behavior patterns; with some patients showing complete response with few recurrences, whereas others showed partial or even no response with multiple recurrences. Long-term follow-up demonstrated that patients responding poorly to anti-VEGFs tended to do so early in the course of treatment. It also demonstrated the effectiveness of a pro re nata (PRN) protocol for improving vision and maintaining these gains over long-term follow-ups. The SHORE study further illustrated this point by demonstrating that there were minimal differences in visual outcomes between patients receiving monthly injections and patients being treated PRN. In this review we analyzed the data from the major randomized clinical trials (RCT) that looked at anti-VEGFs as the primary treatment modality in patients with CRVO (CRUISE and the extension studies HORIZON and RETAIN for ranibizumab as well as GALILEO and COPERNICUS for aflibercept). In addition, we looked at SCORE and GENEVA to help determine whether there is a place for steroids as a first line therapy in current treatment practice. We then explored alternative treatment regimens such as laser therapy and switching between anti-VEGF agents and/or steroids for non or partially responding patients."

According to the news editors, the research concluded: "Finally, we propose a simplified modified treatment algorithm for patients with CRVO for better long-term outcomes in all types of responders."

For more information on this research see: Central retinal vein occlusion: modifying

**Drugs and Therapies - Antifungals**

**Data from University of Athens Provide New Insights into Antifungals (In vitro evaluation of the impact of gastrointestinal transfer on luminal performance of commercially available products of posaconazole and itraconazole using BioGIT)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antifungals are presented in a new report. According to news reporting out of Zografos, Greece, by NewsRx editors, research stated, "Biorelevant Gastrointestinal Transfer system (BioGIT) has been shown to be useful in reproducing concentrations of drugs in the fasted upper small intestine after their administration in the stomach. In the present investigation, we evaluated the impact of gastrointestinal transfer on luminal performance of commercially available products of two highly lipophilic weak bases, posaconazole (Noxafil ® suspension) and itraconazole (Sporanox ® hard gelatin capsules and Sporanox ® oral solution) by comparing % solid fraction, concentrations and supersaturation in the duodenal compartment of BioGIT with recently reported data in the upper small intestine of healthy adults."

Financial support for this research came from Innovative Medicines Initiative Joint.

Our news journalists obtained a quote from the research from the University of Athens, "BioGIT was useful for estimating the % solid fraction in the upper small intestine, in cases where dissolution during gastric residence was incomplete, i.e. after administration of Noxafil ® and Sporanox1 capsules, and the precipitated fraction of itraconazole in the upper small intestine after administration of Sporanox ® solution; median values in vitro were similar to the luminal values. Based on the values for the area under the concentration vs. time data estimated up to 45 min post initiation of the experiment, concentrations in the duodenal compartment of BioGIT were similar to previously measured concentrations in the upper small intestine of healthy adults or they overestimated them by up to 2.5 times."

According to the news editors, the research concluded: "In most cases, supersaturation of contents in the upper small intestine was overestimated, partly due to
underestimation of luminal solubility."

Our news journalists report that additional information may be obtained by contacting C. Reppas, University of Athens, Dept. of Pharm, Zografos, Greece. Additional authors for this research include M. Vertzoni, M. Symillides, B. Hens, J. Brouwers, P. Augustijns and C. Reppas.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.018. This DOI is a link to an online electronic document that is either free or for purchase.

**Data from University of Bologna Provide New Insights into Antineoplastic Monoclonal Antibodies (Low-dose radiotherapy and concurrent FOLFIRI-bevacizumab: a Phase II study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antineoplastic Monoclonal Antibodies have been published. According to news reporting originating from Bologna, Italy, by NewsRx correspondents, research stated, "Low-dose radiation therapy (LDRT) can increase biological efficacy of chemotherapy. This Phase II trial evaluates LDRT plus FOLFIRI-bevacizumab (FOLFIRI-B) in metastatic colorectal cancer, raising the clinical complete response rate from 5 to 25%. toxicity, progression-free survival."

Our news editors obtained a quote from the research from the University of Bologna, "Patients underwent 12 FOLFIRI-B cycles plus two daily LDRT fractions (20 cGy/6 h interval) on each cycle. Statistical analysis was planned on 18 patients. Results on 18 patients are reported. Specifically considering irradiated sites: 15/18 patients had a partial (11/18) or complete (4/18) response. Among 11 partial responders, three became a pathological CR after surgery. Grade 3-4 toxicity was recorded in two patients (11.1%). At median follow-up of 30 months (range: 8-50), 7/18 patients progressed in irradiated sites. Seven out of 18 patients (38.9%) had clinical or pathological CR in lesions treated with LDRT."

According to the news editors, the research concluded: "Further studies on this newer treatment modality seem justified."

The news editors report that additional information may be obtained by contacting
A.G. Morganti, Radiation Oncology Unit, Dept. of Experimental, Diagnostic & Specialty Medicine - DIMES, University of Bologna, S Orsola-Malpighi Hospital, Bologna, Italy. Oncology - Breast Cancer

Data from University of British Columbia Provide New Insights into Breast Cancer (Differentiating the Causes of Spontaneous Rib Fracture After Breast Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting from Vancouver, Canada, by NewsRx editors, the research stated, "Spontaneous rib fracture after treatment for primary breast cancer is not uncommon."

The news correspondents obtained a quote from the research from the University of British Columbia, "Although metastatic disease accounts for about 30% of spontaneous rib fractures and should constitute the first line of diagnostic investigation, other possible contributors include primary osteoporosis or secondary osteoporosis resulting from cancer treatments. Chemotherapy-induced menopause, aromatase inhibitors, radiation therapy, and long-term bisphosphonate use can all contribute to bone fragility, including spontaneous rib fractures in the latter 3. Drawing on recent breast cancer practice guidelines as well as population-based studies of fracture risk for women with a history of breast cancer and systematic reviews, this Perspective will provide an update on recent developments in understanding how to differentiate the possible reasons for non-traumatic rib fracture in women treated for breast cancer."

According to the news reporters, the research concluded: "In addition to describing the various possible causes of spontaneous rib fracture, the recommended medical and imaging procedures for differentiating among the potential causes will be presented."

For more information on this research see: Differentiating the Causes of Spontaneous Rib Fracture After Breast Cancer. Clinical Breast Cancer, 2016;16(6):431-436. Clinical Breast Cancer can be contacted at: Cig Media Group, Lp, 3500 Maple Avenue, Ste 750, Dallas, TX 75219-3931, USA. Data from University of Calgary Advance Knowledge in Intracellular Space (The Cytoplasmic Region of Inner Helix S6 Is an Important Determinant of Cardiac Ryanodine Receptor Channel Gating)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Intracellular Space. According to news reporting from Calgary, Canada, by NewsRx journalists, research stated, "The ryanodine receptor (RyR) channel pore is formed by four S6 inner helices, with its intracellular gate located at the S6 helix bundle crossing region. The cytoplasmic region of the extended S6 helix is held by the U motif of the central domain and is thought to control the opening and closing of the S6 helix bundle."

The news correspondents obtained a quote from the research from the University of Calgary, "However, the functional significance of the S6 cytoplasmic region in channel gating is unknown. Here we assessed the role of the S6 cytoplasmic region in the function of cardiac RyR (RyR2) via structure-guided site-directed mutagenesis. We mutated each residue in the S6 cytoplasmic region of the mouse RyR2 ((4875)QQEQVKEDM(4884)) and characterized their functional impact. We found that mutations Q4876A, V4880A, K4881A, and M4884A, located mainly on one side of the S6 helix that faces the U motif, enhanced basal channel activity and the sensitivity to Ca2+ or caffeine activation, whereas mutations Q4877A, E4878A, Q4879A, and D4883A, located largely on the opposite side of S6, suppressed channel activity. Furthermore, V4880A, a cardiac arrhythmia-associated mutation, markedly enhanced the frequency of spontaneous openings and the sensitivity to cytosolic and luminal Ca2+ activation of single RyR2 channels. V4880A also increased the propensity and reduced the threshold for arrhythmogenic spontaneous Ca2+ release in HEK293 cells. Collectively, our data suggest that interactions between the cytoplasmic region of S6 and the U motif of RyR2 are important for stabilizing the closed state of the channel."

According to the news reporters, the research concluded: "Mutations in the S6/U motif domain interface likely destabilize the closed state of RyR2, resulting in enhanced basal channel activity and sensitivity to activation and increased propensity for spontaneous Ca2+ release and cardiac arrhythmias."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1074/jbc.M116.758821. This DOI is a link to an online electronic document that is either free or for purchase.

**Data from University of California Advance Knowledge in Hypercalcemia (A Young Woman With Recurrent Gestational Hypercalcemia and Acute Pancreatitis Caused by CYP24A1 Deficiency)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Hypercalcemia are presented in a new report. According to news originating from San Diego, California, by NewsRx correspondents, research stated, "The CYP24A1 gene encodes a mitochondrial 24-hydroxylase that inactivates 1,25(OH)(2)D. Loss-of-function mutations in CYP24A1 cause hypercalcemia, nephrolithiasis and nephrocalcinosis."

Our news journalists obtained a quote from the research from the University of California, "We describe a woman with CYP24A1 deficiency and recurrent gestational hypercalcemia. Her first pregnancy, at age 20, resulted with the intrauterine demise of twin fetuses. Postpartum, she developed severe hypercalcemia (14mg/dL), altered mental status, and acute pancreatitis. Her PTH was suppressed (6 pg/mL) and her 1,25(OH) 2D was elevated (165 and 195 pg/mL on postpartum day 1 and 5, respectively). Between one and three months postpartum, her serum calcium decreased from 11.4 to 10.2 mg/dL while her 1,25(OH) 2D level decreased from 83 to 24 pg/mL. Her 24-hour urine calcium was 277 mg. Six months postpartum, she became pregnant again. At 14 weeks, her albumin-corrected calcium level was 10.4 mg/dL and her 1,25(OH)(2)D level exceeded 200 pg/mL. To establish the diagnosis of CYP24A1 deficiency, we showed her 24,25(OH) 2D level to be undetectable (<2 ng/mL). Exon sequencing of the CYP24A1 gene revealed a homozygous, 8-nucleotide deletion in exon 8, causing an S334V substitution and premature termination due to a frame shift (c.999_1006del, p.Ser334Valfs*9). To prevent hypercalcemia, she was advised to discontinue prenatal vitamins, avoid sun exposure and calcium-rich foods, and start omeprazole and a calcium binder (250mg K-Phos-neutral with meals). Despite these measures, both hypercalcemia (11.5mg/dL) and acute pancreatitis recurred. Labor was induced and a healthy, normocalcemic boy was delivered. In the absence of lactation, maternal hypercalcemia resolved within 2 months. This report shows that CYP24A1-deficient subjects may be normocalcemic at baseline. Hypercalcemia may be unmasked by pregnancy through the routine use of calciferol-containing prenatal vitamins, increased 1-alpha hydroxylation of VitD by the placenta and maternal kidney, and production of PTHrP by the uteroplacental unit."

According to the news editors, the research concluded: "CYP24A1 deficiency should
be considered in patients with unexplained vitamin D-mediated hypercalcemia."

The news correspondents report that additional information may be obtained from G.N. Woods, University of California, Dept. of Med, San Diego, CA 92103, United States. Additional authors for this research include A. Saitman, H.L. Gao, N.J. Clarke, R.L. Fitzgerald and N.W. Chi.

**Diet and Nutrition**

**Data from University of Coimbra Provide New Insights into Diet and Nutrition (Ketogenic diets: from cancer to mitochondrial diseases and beyond)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Diet and Nutrition. According to news reporting originating from Coimbra, Portugal, by NewsRx correspondents, research stated, "The employment of dietary strategies such as ketogenic diets, which force cells to alter their energy source, has shown efficacy in the treatment of several diseases. Ketogenic diets are composed of high fat, moderate protein and low carbohydrates, which favour mitochondrial respiration rather than glycolysis for energy metabolism."

Funders for this research include Fundacao para a Ciencia e a Tecnologia, FEDER/Compete and National Budget.

Our news editors obtained a quote from the research from the University of Coimbra, "This review focuses on how oncological, neurological and mitochondrial disorders have been targeted by ketogenic diets, their metabolic effects, and the possible mechanisms of action on mitochondrial energy homeostasis. The beneficial and adverse effects of the ketogenic diets are also highlighted."

According to the news editors, the research concluded: "Although the full mechanism by which ketogenic diets improve oncological and neurological conditions still remains to be elucidated, their clinical efficacy has attracted many new followers, and ketogenic diets can be a good option as a co-adjuvant therapy, depending on the situation and the extent of the disease."

The news editors report that additional information may be obtained by contacting A.F. Branco, CNC - Center for Neuroscience and Cell Biology, University of Coimbra, Coimbra, Portugal. Additional authors for this research include A. Ferreira, R.F. Simoes, S. Magalhaes-Novais, C. Zehowski, E. Cope, A.M. Silva, D. Pereira, V.A. Sardao and T. Cunha-Oliveira.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/eci.12591. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Europe, Cancer, Coimbra, Portugal, Oncology, Article Review, Ketogenic Diet, Diet and Nutrition.

Oncology - Thyroid Cancer

Data from University of Edinburgh Advance Knowledge in Thyroid Cancer (Management of Invasive Differentiated Thyroid Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Thyroid Cancer have been published. According to news reporting originating in Midlothian, United Kingdom, by NewsRx journalists, research stated, "Invasive disease is a poor prognostic factor for patients with differentiated thyroid cancer (DTC). Uncontrolled central neck disease is a common cause of distressing death for patients presenting in this manner."

The news reporters obtained a quote from the research from the University of Edinburgh, "Advances in assessment and management of such cases have led to significant improvements in outcome for this patient group. This article reviews the patterns of invasion and a contemporary approach to investigation and treatment of patients with invasive DTC. Aerodigestive tract invasion is reported in around 10% of case series of DTC. Assessment should include not only clinical history and physical examination with endoscopy as indicated, but ultrasound and contrast-enhanced cross-sectional imaging. Further studies including positron emission tomography should be considered, particularly in recurrent cases that are radioactive iodine (RAI) resistant. Both the patient and the extent of disease should be carefully assessed prior to embarking on surgery. The aim of surgery is to resect all gross disease. When minimal visceral invasion is encountered early, 'shave' procedures are recommended. In the setting of transmural invasion of the airway or esophagus, however, full thickness excision is required. For intermediate cases in which invasion of the viscera has penetrated the superficial layers but is not evident in the submucosa, opinion is divided. Early reports recommended an aggressive approach. More recently authors have tended to recommend less aggressive resections with postoperative adjuvant therapies. The role of external beam radiotherapy continues to evolve in DTC with support for its use in patients considered to have RAI-resistant tumors. Patients with invasive DTC require a multidisciplinary approach to investigation and treatment."

According to the news reporters, the research concluded: "With detailed assessment, appropriate surgery, and adjuvant therapy when indicated, this patient group can expect durable control of central neck disease, despite the aggressive nature of their primary tumors."

For more information on this research see: Management of Invasive Differentiated
Data from University of Edinburgh Provide New Insights into Staphylococcus aureus (IL-1 beta-Induced Protection of Keratinocytes against Staphylococcus aureus-Secreted Proteases Is Mediated by Human beta-Defensin 2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Positive Bacteria - Staphylococcus aureus are presented in a new report. According to news reporting out of Edinburgh, United Kingdom, by NewsRx editors, research stated, "Atopic dermatitis (AD) is a common chronic inflammatory skin disease that results in significant morbidity. A hallmark of AD is disruption of the critical barrier function of upper epidermal layers, causatively linked to environmental stimuli, genetics, and infection, and a critical current target for the development of new therapeutic and prophylactic interventions."

Our news journalists obtained a quote from the research from the University of Edinburgh, "Staphylococcus aureus is an AD-associated pathogen producing virulence factors that induce skin barrier disruption in vivo and contribute to AD pathogenesis. We show, using immortalized and primary keratinocytes, that S. aureus protease SspA/V8 is the dominant secreted factor (in laboratory and AD clinical strains of S. aureus) inducing barrier integrity impairment and tight junction damage. V8-induced integrity damage was inhibited by an IL-1 beta-mediated mechanism, independent of effects on claudin-1. Induction of keratinocyte expression of the antimicrobial/host defense peptide human beta-defensin 2 (hBD2) was found to be the mechanism underpinning this protective effect. Endogenous hBD2 expression was required and sufficient for protection against V8 protease-mediated integrity damage, and exogenous application of hBD2 was protective."

According to the news editors, the research concluded: "This modulatory property of hBD2, unrelated to antibacterial effects, gives new significance to the defective induction of hBD2 in the barrier-defective skin lesions of AD and indicates therapeutic potential."

For more information on this research see: IL-1 beta-Induced Protection of Keratinocytes against Staphylococcus aureus-Secreted Proteases Is Mediated by Human beta-

Our news journalists report that additional information may be obtained by contacting D.J. Davidson, University of Edinburgh, Queens Med Res Inst, MRC Center Inflammat Res, Edinburgh EH16 4TJ, Midlothian, United Kingdom. Additional authors for this research include B.J. McHugh, A. **Microcirculation**

**Data from University of Illinois Advance Knowledge in Microcirculation (The capillary bed offers the largest hemodynamic resistance to the cortical blood supply)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Microcirculation have been published. According to news reporting originating in Chicago, Illinois, by NewsRx journalists, research stated, "The cortical angioarchitecture is a key factor in controlling cerebral blood flow and oxygen metabolism. Difficulties in imaging the complex microanatomy of the cortex have so far restricted insight about blood flow distribution in the microcirculation."

The news reporters obtained a quote from the research from the University of Illinois, "A new methodology combining advanced microscopy data with large scale hemodynamic simulations enabled us to quantify the effect of the angioarchitecture on the cerebral microcirculation. High-resolution images of the mouse primary somatosensory cortex were input into with a comprehensive computational model of cerebral perfusion and oxygen supply ranging from the pial vessels to individual brain cells. Simulations of blood flow, hematocrit and oxygen tension show that the wide variation of hemodynamic states in the tortuous, randomly organized capillary bed is responsible for relatively uniform cortical tissue perfusion and oxygenation."

According to the news reporters, the research concluded: "Computational analysis of microcirculatory blood flow and pressure drops further indicates that the capillary bed, including capillaries adjacent to feeding arterioles (d < 10 mm), are the largest contributors to hydraulic resistance."

Data from University of Innsbruck Provide New Insights into Molecular Pharmaceutics (Structural Properties, Order-Disorder Phenomena, and Phase Stability of Orotic Acid Crystal Forms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biotechnology - Molecular Pharmaceutics is the subject of a report. According to news reporting originating in Innsbruck, Austria, by NewsRx journalists, research stated, "Orotic acid (OTA) is reported to exist in the anhydrous (AH), monohydrate (Hy1), and dimethyl sulfoxide monosolvate (SDMSO) forms. In this study we investigate the (de)hydration/desolvation behavior, aiming at an understanding of the elusive structural features of anhydrous OTA by a combination of experimental and computational techniques, namely, thermal analytical methods, gravimetric moisture (de)orption studies, water activity measurements, X-ray powder diffraction, spectroscopy (vibrational, solid-state NMR), crystal energy landscape, and chemical shift calculations."

Financial support for this research came from Austrian Science Fund.

The news reporters obtained a quote from the research from the University of Innsbruck, "The Hy1 is a highly stable hydrate, which dissociates above 135 °C and loses only a small part of the water when stored over desiccants (25 °C) for more than one year. In Hy1, orotic acid and water molecules are linked by strong hydrogen bonds in nearly perfectly planar arranged stacked layers. The layers are spaced by 3.1 Å and not linked via hydrogen bonds. Upon dehydration the X-ray powder diffraction and solid-state NMR peaks become broader, indicating some disorder in the anhydrous form. The Hy1 stacking reflection (122) is maintained, suggesting that the OTA molecules are still arranged in stacked layers in the dehydration product. Desolvation of SDMSO, a nonlayer structure, results in the same AH phase as observed upon dehydrating Hy1. Depending on the desolvation conditions, different levels of order-disorder of layers present in anhydrous OTA are observed, which is also suggested by the computed low energy crystal structures. These structures provide models for stacking faults as intergrowth of different layers is possible."

According to the news reporters, the research concluded: "The variability in anhydrate crystals is of practical concern as it affects the moisture dependent stability of AH with respect to hydration."

For more information on this research see: Structural Properties, Order-Disorder Phenomena, and Phase Stability of Orotic Acid Crystal Forms. Molecular Pharmaceutics,
Our news correspondents report that additional information may be obtained by contacting D.E. Braun, Institute of Pharmacy, University of Innsbruck, Innrain 52c, 6020 Innsbruck, Austria. Additional authors for this research include K.P. Nartowski, Y.Z. Khimyak, K.R. Morris, S.R. Byrn and U.J. Griesser.

Data from University of Kebangsaan Advance Knowledge in Obesity (Tumour biology of obesity-related cancers: understanding the molecular concept for better diagnosis and treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting out of Kuala Lumpur, Malaysia, by NewsRx editors, research stated, "Obesity continues to be a major global problem. Various cancers are related to obesity and proper understanding of their aetiology, especially their molecular tumour biology is important for early diagnosis and better treatment."

Our news journalists obtained a quote from the research from the University of Kebangsaan, "Genes play an important role in the development of obesity. Few genes such as leptin, leptin receptor encoded by the db (diabetes), pro-opiomelanocortin, AgRP and NPY and melanocortin-4 receptors and insulin-induced gene 2 were linked to obesity. MicroRNAs control gene expression via mRNA degradation and protein translation inhibition and influence cell differentiation, cell growth and cell death. Overexpression of miR-143 inhibits tumour growth by suppressing B cell lymphoma 2, extracellular signal-regulated kinase-5 activities and KRAS oncogene. Cancers of the breast, uterus, renal, thyroid and liver are also related to obesity. Any disturbance in the production of sex hormones and insulin, leads to distortion in the balance between cell proliferation, differentiation and apoptosis. The possible mechanism linking obesity to cancer involves alteration in the level of adipokines and sex hormones. These mediators act as biomarkers for cancer progression and act as targets for cancer therapy and prevention. Interestingly, many anti-cancerous drugs are also beneficial in treating obesity and vice versa. We also reviewed the possible link in the mechanism of few drugs which act both on cancer and obesity."

According to the news editors, the research concluded: "The present review may be important for molecular biologists, oncologists and clinicians treating cancers and also pave the way for better therapeutic options."

For more information on this research see: Tumour biology of obesity-related cancers: understanding the molecular concept for better diagnosis and treatment. Tumor Biology, 2016;37(11):14363-14380. Tumor Biology can be contacted at: Springer, Van
Data from University of Kentucky Provide New Insights into Cardiology
(Coronary artery calcification in CKD-5D patients is tied to adverse cardiac function and increased mortality)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting originating from Lexington, Kentucky, by NewsRx correspondents, research stated, "Coronary artery calcification (CAC) is common in patients with chronic kidney disease on hemodialysis (CKD-5D) and is an important predictor of mortality. However, cardiac functional links between CAC and mortality have not been well established."

Our news editors obtained a quote from the research from the University of Kentucky, "This study tested the hypothesis that CAC increases mortality by adversely affecting cardiac function. Patients were recruited from 37 regional dialysis centers. 2-D and Doppler echocardiographic analyses were performed, and CAC was measured using 64-slice computed tomography. Relationships between CAC and echocardiographic measures of left ventricular (LV) function were analyzed. Survival was assessed with median follow-up of 37 months. There were 157 patients: 59% male, 46% Caucasian, 48% diabetic. Median age was 55 years, and median duration of CKD-5D was 45 months. Agatston CAC scores > 100 were found in 69% of patients, with 51% having a score > 400. CAC was associated with measures of LV systolic and diastolic function (global longitudinal strain (GLS; rho = 0.270, p = 0.004)), peak LV systolic velocity (rho = -0.259, p = 0.004), and estimate of LV filling pressure (E:E'; rho = 0.286, p = 0.001). Multivariate regression confirmed these relationships after adjustment for age, gender, LV ejection fraction, and coronary artery disease. Valvular calcification varied linearly with CAC (p < 0.05). Both LV diastolic and systolic functional measures were significant predictors of mortality, the strongest of which was LV diastolic dysfunction. These findings show a link between CAC, cardiac function, and mortality in CKD-5D. LV diastolic function (E'), peak LV systolic velocity, and GLS are independent predictors of mortality. Valvular calcification may be an important marker of CAC in CKD-5D."

According to the news editors, the research concluded: "These effects on cardiac function likely explain the high mortality with CKD-5D and describe a potentially-valuable role..."
for echocardiography in the routine management of these patients."

For more information on this research see: Coronary artery calcification in CKD-5D patients is tied to adverse cardiac function and increased mortality. Clinical Nephrology, 2016;86(6):291-302. Clinical Nephrology can be contacted at: Dustri-Verlag Dr Karl Feistele, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

Oncology - Solid Cancer

Data from University of Lodz Advance Knowledge in Solid Cancer (Identification of the key pathway of oxazolinoanthracyclines mechanism of action in cells derived from human solid tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Solid Cancer is the subject of a report. According to news reporting originating in Lodz, Poland, by NewsRx journalists, research stated, "Oxazolinodoxorubicin (O-DOX) and oxazolino daunorubicin (O-DAU) are novel anthracycline derivatives with a modified daunosamine moiety. In the present study, we evaluated the cytotoxicities, genotoxicities and abilities of O-DOX and O-DAU to induce apoptosis in cancer cell lines (SKOV-3; A549; HepG2), and compared the results with their parent drugs."

The news reporters obtained a quote from the research from the University of Lodz, "We assessed antiproliferative activity by MIT assay. We evaluated apoptosis-inducing ability by double-staining with fluorescent probes (Hoechst 33258/propidium iodide), and by determining expression levels of genes involved in programmed cell death by reverse transcription-polymerase chain reaction. Genotoxicities of the compounds were tested by comet assays. Oxazolinoanthracyclines demonstrated high antitumor activity. O-DOX had significantly higher cytotoxicity, apoptosis-inducing ability, and genotoxicity compared with parental doxorubicin (DOX) in all tested conditions, while O-DAU activity differed among cell lines. The mechanism of oxazoline analog action appeared to involve the mitochondrial pathway of programmed cell death. These results provide further information about oxazoline derivatives of commonly used anthracycline chemotherapy agents."

According to the news reporters, the research concluded: "O-DOX and O-DAU have the ability to induce apoptosis in tumor cells."

Our news correspondents report that additional information may be obtained by contacting M. Denel-Bobrowska, University of Lodz, Inst Biophys, Fac Biol & Environment Protect, Dept. of Med Biophys, PL-90236 Lodz, Poland. Additional authors for this research include M. Lukawska, A. Rogalska, E. Forma, M. Brys, I. Oszczapowicz and A. Marczak.

Musculoskeletal Diseases and Conditions - Chronic...

Data from University of Miami Provide New Insights into Chronic Pain (Analgesic Effect of Recombinant GABAergic Cells in a Model of Peripheral Neuropathic Pain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Musculoskeletal Diseases and Conditions - Chronic Pain have been presented. According to news reporting originating from Miami, Florida, by NewsRx correspondents, research stated, "Chronic neuropathic pain represents a clinically challenging state with a poor response to current treatment options. Long-term management of chronic pain is often associated with the development of tolerance, addiction, and other side effects, reducing the therapeutic value of treatment."

Our news editors obtained a quote from the research from the University of Miami, "Alternative strategies based on cell therapy and gene manipulation, balancing the inhibitory and excitatory events in the spinal cord, may provide sustained pain relief in the long term. Transplantation of GABAergic cells has been successfully used to enhance inhibition and to restore physiological spinal pain processing. However, since the underlying mechanism of chronic pain development involves changes in several pain-signaling pathways, it is essential to develop an approach that targets several components of pain signaling. Recombinant cell therapy offers the possibility to deliver additional analgesic substances to the restricted area in the nervous system. The current study explores the analgesic potential of genetically modified rat embryonic GABAergic cells releasing a peptidergic NMDA receptor antagonist, Serine(1)-histogranin (SHG). Overactivation of glutamate NMDA receptors contributes to the hyperexcitability of spinal neurons observed in chronic pain models. Our approach allows us to simultaneously target spinal hyperexcitability and reduced inhibitory processes. Transplantable cells were transduced by viral vectors encoding either one or six copies of SHG cDNAs. The analgesic potential of recombinant cells after their intraspinal transplantation was evaluated in a model of peripheral nerve injury. Enhanced reduction of hypersensitivity to thermal and mechanical stimuli was observed in animals treated by recombinant cells compared to the nonrecombinant group. The recombinant peptide was detected in the spinal tissue, suggesting its successful production by transplanted cells."

According to the news editors, the research concluded: "Our results demonstrate the feasibility of using recombinant cells releasing adjunct analgesic peptides in the therapy of neuropathic pain."

The news editors report that additional information may be obtained by contacting S. Jergova, Miller School of Medicine, Miami Project, University of Miami, Miami, FL, United States. Additional authors for this research include S. Gajavelli, M.S. Varghese, P. Shekane and J. Sagen.

**Nervous System Diseases and Conditions - Nervous...**

**Data from University of Michigan Advance Knowledge in Nervous System Paraneoplastic Syndrome (Opsoclonus-Myoclonus Syndrome in Primary Central Nervous System Lymphoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nervous System Diseases and Conditions - Nervous System Paraneoplastic Syndrome. According to news reporting from Ann Arbor, Michigan, by NewsRx journalists, research stated, "Adult-onset opsoclonus-myoclonus syndrome (OMS) has been associated with multiple cancers, most commonly small-cell lung carcinoma and breast adenocarcinoma. A 53-year-old woman who presented with OMS was found to have primary central nervous system (CNS) diffuse large B-cell lymphoma."

The news correspondents obtained a quote from the research from the University of Michigan, "OMS has been described in only 5 cases with non-Hodgkin lymphoma (NHL), and this is only the third reported case of OMS in NHL limited to the CNS. Although the paraneoplastic antibody panel was negative, we presume that the OMS was a paraneoplastic manifestation."

According to the news reporters, the research concluded: "Antineoplastic and anti-immune therapy had no effect on the neurologic manifestations."

Our news journalists report that additional information may be obtained by contacting J.D. Trobe, Univ Michigan Med Syst, Kellogg Eye Center, Dept. of Neurol, Ann Arbor, MI, United States. Additional authors for this research include J.D. Trobe and A. Fisher-Hubbard.

Drugs and Therapies - Central Nervous System Agents

Data from University of Michigan School of Medicine Advance Knowledge in Central Nervous System Agents (Effects of sex and remifentanil dose on rats' acquisition of responding for a remifentanil-conditioned reinforcer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Central Nervous System Agents have been published. According to news reporting originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "Opioid-conditioned reinforcement is thought to exacerbate opioid abuse and dependence. Sex/gender can influence opioid abuse behaviors, but the effects of sex/gender on opioid-conditioned reinforcement, specifically, are unclear."

Our news editors obtained a quote from the research from the University of Michigan School of Medicine, "In this study, we compared new-response acquisition with opioid-conditioned reinforcement in male and female rats. First, separate groups received response-independent remifentanil injections (0.0-32.0 mg/kg, intravenous) and presentations of a light-noise stimulus. In the experimental groups, injections and stimulus presentations always co-occurred [paired Pavlovian conditioning (PAV)]; in the control groups, the two occurred independently of each other (random PAV). Next, in the instrumental acquisition (ACQ) sessions, two novel nose-poke manipulanda were introduced. All animals (regardless of sex, dose, and PAV type) could respond in the active nose-poke, which produced the stimulus alone, or in the inactive nose-poke. Both males and females dose-dependently acquired nose-poke responding (active > inactive) after paired PAV, but not after random PAV. Therefore, the stimulus was a conditioned reinforcer. We identified three sex differences. First, only females acquired responding after paired PAV with 32.0 mg/kg remifentanil. Second, using a progressive ratio schedule for ACQ, both sexes acquired responding, but females made significantly more active responses. Third, when a single session of PAV was conducted, only males acquired responding."

According to the news editors, the research concluded: "Thus, rats' sex interacts with pharmacological and environmental factors to determine opioid-conditioned reinforcement."

For more information on this research see: Effects of sex and remifentanil dose on rats' acquisition of responding for a remifentanil-conditioned reinforcer. Behavioural Pharmacology, 2016;27(2-3 Spec I):137-47. (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology - journals.lww.com/behaviouralpharm/pages/default.aspx)

**Gram-Negative Bacteria - Escherichia coli**

**Data from University of Milan Advance Knowledge in Escherichia coli [Interplay of the modified nucleotide phosphoadenosine 5′-phosphosulfate (PAPS) with global regulatory proteins in Escherichia coli: modulation of cyclic AMP (cAMP)-dependent ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Negative Bacteria - Escherichia coli. According to news reporting out of Milan, Italy, by NewsRx editors, research stated, "In the bacterium Escherichia coli, some intermediates of the sulfate assimilation and cysteine biosynthesis pathway can act as signal molecules and modulate gene expression. In addition to sensing and utilization of sulphur sources, these signaling mechanisms also impact more global cell processes, such as resistance to antimicrobial agents and biofilm formation."

Our news journalists obtained a quote from the research from the University of Milan, "In a recent work, we have shown that inactivation of the cysH gene, encoding phosphoadenosine-phosphosulfate (PAPS) reductase, and the consequent increase in intracellular PAPS concentration, strongly affect production of several cell surface-associated structures, enhancing surface adhesion and cell aggregation. In order to identify the molecular mechanism relaying intracellular PAPS concentration to regulation of cell surface-associated structures, we looked for mutations able to suppress the effects of cysH inactivation. We found that mutations in the adenylate cyclase-encoding cyaA gene abolished the effects of PAPS accumulation; consistent with this result, cyclic AMP (cAMP)-dependent gene expression appears to be increased in the cysH mutant. Experiments aimed at the direct identification of proteins interacting with either CysC or CysH, i.e. the PAPS-related proteins APS kinase and PAPS reductase, allowed us to identify several regulators, namely, CspC, CspE, HNS and HupA. Protein-protein interaction between HupA and CysH was confirmed by a bacterial two hybrid system, and inactivation of the hupA gene enhanced the effects of the cysH mutation in terms of production of cell surface-associated factors."

According to the news editors, the research concluded: "Our results indicate that PAPS can modulate different regulatory systems, providing evidence that this molecule acts as a global signal molecule in E. coli."

For more information on this research see: Interplay of the modified nucleotide

Our news journalists report that additional information may be obtained by contacting F. Longo, University of Milan, Dept. of Biosci, I-20133 Milan, Italy. Additional authors for this research include S. Motta, P. Mauri, P. Landini and E. Rossi.

**Uterine Diseases and Conditions - Uterine Prolapse**

**Data from University of Naples Federico II Provide New Insights into Uterine Prolapse (Recurrence of vaginal prolapse after total vaginal hysterectomy with concurrent vaginal uterosacral ligament suspension: comparison between normal-weight and ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Uterine Diseases and Conditions - Uterine Prolapse. According to news reporting out of Naples, Italy, by NewsRx editors, research stated, "Obesity is one of the most important risk factors for the development and progression of the pelvic organ prolapse. However, data regarding whether obesity is a risk factor for recurrence after pelvic organ prolapse surgery are controversial."

Our news journalists obtained a quote from the research from the University of Naples Federico II, "The aim of this study was to estimate the risk of recurrent prolapse in any vaginal compartment after total vaginal hysterectomy with concurrent uterosacral ligament vaginal vault suspension among normal-weight women compared with either overweight or obese women. This is a 5-year retrospective cohort study of women who underwent total vaginal hysterectomy with concurrent vaginal uterosacral ligament suspension at one referral center for pelvic organ prolapse in Italy from January 2010 to January 2015. All women who underwent total vaginal hysterectomy with concurrent uterosacral ligament suspension were included in the analysis. Laparoscopic approach was excluded. Women were classified according to the body mass index of 2 groups: (1) normal weight (body mass index, 18.5-24.9 kg/m(2)) and (2) either overweight (body mass index, 25.0-29.9 kg/m(2)) or obese (body mass index, >= 30.0 kg/m(2)). The primary outcome was the incidence of recurrent prolapse in any vaginal compartment (anterior, posterior, or apical). Recurrent prolapse was defined as prolapse extending beyond the hymen with straining (pelvic organ prolapse quantification points Ba, C, Bp >= 0) or repeat treatment for prolapse with either pessary or surgery. Uterosacral ligament suspensions were performed with a vaginal approach with the use of sutures placed in the intermediate uterosacral ligament, at or above the ischial spine, and affixed to the vaginal apex. Delayed absorbable sutures were used, with 2 sutures per side. Three hundred sixty women who underwent total vaginal hysterectomy with concurrent uterosacral ligament suspension with at least 6 months of follow up after surgery were included in the study. The overall incidence of recurrent prolapse in
any vaginal compartment was 19.7% (71/360 women). The risk of recurrent prolapse in any vaginal compartment (ie, primary outcome) was similar in the normal-weight compared with the overweight or obese group (16.7% vs 21.3%; P=.30). Women in the normal-weight group had a lower risk of recurrent anterior vaginal prolapse (10.8% vs 20.0%; adjusted odds ratio, 0.49; 95% confidence interval, 0.25-0.94) and of multiple compartment prolapse (8.3% vs 14.6%; adjusted odds ratio, 0.53; 95% confidence interval, 0.31-0.83). After total vaginal hysterectomy with concurrent uterosacral ligament suspension, the risk of recurrent vaginal prolapse was 20% based on a composite outcome definition of any anatomic prolapse beyond the hymen or pessary or repeat surgery. The most common site of recurrence was the anterior compartment. The risk of recurrent surgery was 10%. Our study showed that women with normal-weight had similar risk of recurrent prolapse compared with the overweight or obese group."

According to the news editors, the research concluded: "In subgroup analyses, women with normal-weight had one-half the odds of recurrent anterior vaginal wall prolapse compared with those who were overweight or obese."

Our news journalists report that additional information may be obtained by contacting G. Saccone, University of Naples Federico II, Sch Med, Dept. of Neurosci Reprod Sci & Dental, Naples, Italy.

Keywords for this news article include: Naples, Italy, Europe, Nutritional and Metabolic Diseases and Conditions, Women's Health, Risk and Prevention, Gynecologic Surgical Procedures, Uterine Diseases and Conditions, Pelvic Organ Prolapse, Vaginal Hysterectomy, Uterine Prolapse, Gynecology, Bariatrics, Surgery, Obesity, University of Naples Federico II.

**Oncology - Soft Tissue Sarcomas**

**Data from University of New South Wales Advance Knowledge in Soft Tissue Sarcomas (Overcoming resistance of targeted EGFR monotherapy by inhibition of STAT3 escape pathway in soft tissue sarcoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Soft Tissue Sarcomas.

According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "Although epidermal growth factor receptor (EGFR) is often over-expressed in soft tissue sarcoma (STS), a phase II trial using an EGFR inhibitor gefitinib showed a low response rate. This study identified a new secondary resistance mechanism of gefitinib in STS, and developed new strategies to improve the effectiveness of EGFR inhibition particularly by blocking the STAT3 pathway. We demonstrated that seven STS cell lines of diverse histological..."
origin showed resistance to gefitinib despite blockade of phosphorylated EGFR (pEGFR) and downstream signal transducers (pAKT and pERK) in PI3K/AKT and RAS/ERK pathways."

The news reporters obtained a quote from the research from the University of New South Wales, "Gefitinib exposure was not associated with decrease in the ratio of pSTAT3/pSTAT1. The relative STAT3 abundance and activation may be responsible for the drug resistance. We therefore hypothesized that the addition of a STAT3 inhibitor could overcome the STAT3 escape pathway. We found that the addition of STAT3 inhibitor S3I-201 to gefitinib achieved synergistic anti-proliferative and pro-apoptotic effects in all three STS cell lines examined."

According to the news reporters, the research concluded: "This was confirmed in a fibrosarcoma xenografted mouse model, where the tumours from the combination group (418mm3) were significantly smaller than those from untreated (1032mm3) or single drug (912 and 798mm3) groups. Our findings may have clinical implications for optimising EGFR-targeted therapy in STS."

For more information on this research see: Overcoming resistance of targeted EGFR monotherapy by inhibition of STAT3 escape pathway in soft tissue sarcoma. Oncotarget, 2016;7(16):21496-509.

**Clinical Research - Clinical Trials and Studies**

**Data from University of Queensland Advance Knowledge in Clinical Trials and Studies (Educational interventions for the management of cancer-related fatigue in adults)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting from Brisbane, Australia, by NewsRx journalists, research stated, "Cancer-related fatigue is reported as the most common and distressing symptom experienced by patients with cancer. It can exacerbate the experience of other symptoms, negatively affect mood, interfere with the ability to carry out everyday activities, and negatively impact on quality of life."

The news correspondents obtained a quote from the research from the University of Queensland, "Educational interventions may help people to manage this fatigue or to cope with
this symptom, and reduce its overall burden. Despite the importance of education for managing cancer-related fatigue there are currently no systematic reviews examining this approach. To determine the effectiveness of educational interventions for managing cancer-related fatigue in adults. Search methods We searched the Cochrane Central Register of Controlled Trials (CENTRAL), and MEDLINE, EMBASE, CINAH, PsycINFO, ERIC, OTseeker and PEDro up to 1st November 2016. We also searched trials registries. Selection criteria We included randomised controlled trials (RCTs) of educational interventions focused on cancer-related fatigue where fatigue was a primary outcome. Studies must have aimed to evaluate the effect of educational interventions designed specifically to manage cancer-related fatigue, or to evaluate educational interventions targeting a constellation of physical symptoms or quality of life where fatigue was the primary focus. The studies could have compared educational interventions with no intervention or wait list controls, usual care or attention controls, or an alternative intervention for cancer-related fatigue in adults with any type of cancer. Data collection and analysis Two review authors independently screened studies for inclusion and extracted data. We resolved differences in opinion by discussion. Trial authors were contacted for additional information. A third independent person checked the data extraction. The main outcome considered in this review was cancer-related fatigue. We assessed the evidence using GRADE and created a 'Summary of Findings' table. We included 14 RCTs with 2213 participants across different cancer diagnoses. Four studies used only 'information-giving' educational strategies, whereas the remainder used mainly information-giving strategies coupled with some problem-solving, reinforcement, or support techniques. Interventions differed in delivery including: mode of delivery (face to face, web-based, audiotape, telephone); group or individual interventions; number of sessions provided (ranging from 2 to 12 sessions); and timing of intervention in relation to completion of cancer treatment (during or after completion). Most trials compared educational interventions to usual care and metaanalyses compared educational interventions to usual care or attention controls. Methodological issues that increased the risk of bias were evident including lack of blinding of outcome assessors, unclear allocation concealment in over half of the studies, and generally small sample sizes. Using the GRADE approach, we rated the quality of evidence as very low to moderate, downgraded mainly due to high risk of bias, unexplained heterogeneity, and imprecision. There was moderate quality evidence of a small reduction in fatigue intensity from a meta-analyses of eight studies (1524 participants; standardised mean difference (SMD) -0.28, 95% confidence interval (CI) -0.52 to -0.04) comparing educational interventions with usual care or attention control. We found low quality evidence from twelve studies (1711 participants) that educational interventions had a small effect on general/overall fatigue (SMD -0.27, 95% CI -0.51 to -0.04) compared to usual care or attention control. There was low quality evidence from three studies (622 participants) of a moderate size effect of educational interventions for reducing fatigue distress (SMD -0.57, 95% CI -1.09 to -0.05) compared to usual care, and this could be considered clinically significant. Pooled data from four studies (439 participants) found a small reduction in fatigue interference with daily life (SMD -0.35, 95% CI -0.54 to 0.16; moderate quality evidence). No clear effects on fatigue were found related to type of cancer treatment or timing of intervention in relation to completion of cancer treatment, and there were insufficient data available to determine the effect of educational interventions on fatigue by stage of disease, tumour type or group versus individual intervention. Three studies (571 participants) provided low quality evidence for a reduction in anxiety in favour of the intervention group (mean difference (MD) -1.47, 95% CI -2.76 to -0.18) which, for some, would be considered clinically significant. Two additional studies not included in the meta-analysis also reported statistically significant improvements in anxiety in favour of the educational intervention, whereas a third study did not. Compared with usual care or attention control, educational interventions showed no significant reduction in depressive symptoms (four studies, 881 participants, SMD-0.12, 95% CI -0.47 to 0.23; very low
quality evidence). Three additional trials not included in the meta-analysis found no between-group differences in the symptoms of depression. No between-group difference was evident in the capacity for activities of daily living or physical function when comparing educational interventions with usual care (4 studies, 773 participants, SMD 0.33, 95% CI -0.10 to 0.75) and the quality of evidence was low. Pooled evidence of low quality from two of three studies examining the effect of educational interventions compared to usual care found an improvement in global quality of life on a 0-100 scale (MD 11.47, 95% CI 1.29 to 21.65), which would be considered clinically significant for some. No adverse events were reported in any of the studies. Authors’ conclusions Educational interventions may have a small effect on reducing fatigue intensity, fatigue's interference with daily life, and general fatigue, and could have a moderate effect on reducing fatigue distress. Educational interventions focused on fatigue may also help reduce anxiety and improve global quality of life, but it is unclear what effect they might have on capacity for activities of daily living or depressive symptoms. Additional studies undertaken in the future are likely to impact on our confidence in the conclusions. The incorporation of education for the management of fatigue as part of routine care appears reasonable. However, given the complex nature of this symptom, educational interventions on their own are unlikely to optimally reduce fatigue or help people manage its impact, and should be considered in conjunction with other interventions."

According to the news reporters, the research concluded: "Just how educational interventions are best delivered, and their content and timing to maximise outcomes, are issues that require further research."

For more information on this research see: Educational interventions for the management of cancer-related fatigue in adults. Cochrane Database of Systematic Reviews, 2016;(11):2397-2471. Proteins - Phosphoproteins

Data from University of Tennessee Advance Knowledge in Phosphoproteins (Novel Small Molecule JP-153 Targets the Src-FAK-Paxillin Signaling Complex to Inhibit VEGF-Induced Retinal Angiogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - Phosphoproteins have been published. According to news reporting from Memphis, Tennessee, by NewsRx journalists, research stated, "Targeting vascular endothelial growth factor (VEGF) is a common treatment strategy for neovascular eye disease, a major cause of vision loss in diabetic retinopathy and age-related
macular degeneration. However, the decline in clinical efficacy over time in many patients suggests that monotherapy of anti-VEGF protein therapeutics may benefit from adjunctive treatments.

The news correspondents obtained a quote from the research from the University of Tennessee, "Our previous work has shown that through decreased activation of the cytoskeletal protein paxillin, growth factor-induced ischemic retinopathy in the murine oxygen-induced retinopathy model could be inhibited. In this study, we demonstrated that VEGF-dependent activation of the Src/FAK/paxillin signalosome is required for human retinal endothelial cell migration and proliferation. Specifically, the disruption of focal adhesion kinase (FAK) and paxillin interactions using the small molecule JP-153 inhibited Src-dependent phosphorylation of paxillin (Y118) and downstream activation of Akt (S473), resulting in reduced migration and proliferation of retinal endothelial cells stimulated with VEGF. However, this effect did not prevent the initial activation of either Src or FAK. Furthermore, topical application of a JP-153-loaded microemulsion affected the hallmark features of pathologic retinal angiogenesis, reducing neovascular tuft formation and increased avascular area, in a dose-dependent manner."

According to the news reporters, the research concluded: "Our results suggest that using small molecules to modulate the focal adhesion protein paxillin is an effective strategy for treating pathologic retinal neovascularization. To our knowledge, this is the first paradigm validating modulation of paxillin to inhibit angiogenesis. As such, we have identified and developed a novel class of small molecules aimed at targeting focal adhesion protein interactions that are essential for pathologic neovascularization in the eye."

Our news journalists report that additional information may be obtained by contacting C.R. Yates, University of Tennessee, Dept. of Ophthalmol, Memphis, TN 38163, United States. Additional authors for this research include J. Pagadala, D.D. Miller, J. Baudry, F. Park, E. Chaum and C.R. Yates.

stated, "To analyze patterns of recurrence and survival and identify prognostic factors in women with neuroendocrine cervical cancer (NECC). We reviewed patients with International Federation of Gynecology and Obstetrics stage I-IVA NECC who were enrolled in the Neuroendocrine Cervical Tumor Registry and treated with curative intent."

Financial support for this research came from National Institutes of Health.

The news reporters obtained a quote from the research from the University of Texas, "Event-free survival (EFS) and overall survival (OS) according to disease and treatment characteristics were analyzed using the Kaplan-Meier method. Among 40 patients with NECC, 25 (62%) had small cell NECC, eight (20%) had large cell NECC, and seven (18%) had unspecified neuroendocrine histology. With a median follow-up of 21.5 months, 32 patients (80%) experienced progression, and 28 (70%) died. For all patients, the 5-year EFS rate was 20%, and the 5-year OS rate was 27%. Patients with large cell NECC had significantly better median EFS (median not reached vs. 10.0 months, p = 0.02) and showed a trend toward better median OS (153 months vs. 21 months, p = 0.08) than patients with other histologic types. In patients with early-stage clinically node-negative disease, chemoradiation was associated with significantly better median EFS than surgery (median not reached vs. 18.0 months, p = 0.04). Patients with large cell NECC have better outcomes than patients with other subtypes of NECC. In early-stage node-negative NECC, chemoradiation yields better EFS than surgery."

According to the news reporters, the research concluded: "Most patients with NECC, even those with no evidence of nodal disease at diagnosis, rapidly develop widespread hematogenous metastases and die of their disease."

For more information on this research see: Patterns of recurrence and survival in neuroendocrine cervical cancer. Gynecologic Oncology, 2016;143(3):552-557. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Gynecologic Oncology - www.journals.elsevier.com/gynecologic-oncology/)

Our news correspondents report that additional information may be obtained by contacting M. Frumovitz, Univ Texas MD Anderson Canc Center, Dept. of Gynecol Oncol & Reprod Med, Houston, TX 77030, United States. Additional authors for this research include A. Jhingran, J. Burzawa, P. Ramalingam, A.H. Klopp, P.J. Eifel and M. Frumovitz.

stated, "Fibulin-3 (F3) is an important, disulfide-rich, extracellular matrix glycoprotein that has been associated with a number of diseases ranging from cancer to retinal degeneration. An Arg345Trp (R345W) mutation in F3 causes the rare, autosomal dominant macular dystrophy, Malattia Leventinese."

Funders for this research include Roger and Dorothy Hirl Research Fund (JDH), National Eye Institute Visual Science Core Grant, Research to Prevent Blindness.

The news correspondents obtained a quote from the research from the University of Texas Southwestern, "The purpose of this study was to identify and validate novel intracellular interacting partners of wild-type (WT) and R345W F3 in retinal pigment epithelium cells. We used stable isotope labeling by amino acids in cell culture (SILAC) to generate 'heavy' and 'light' isotopically labeled ARPE-19 cell populations which were subsequently infected with adenovirus encoding for FLAG-tagged WT or R345W F3. After immunoprecipitation, interacting proteins were identified by multidimensional protein identification technology (MudPIT). We identified sixteen new intracellular F3 interacting partners, the vast majority of which are involved in protein folding and/or degradation in the endoplasmic reticulum (ER). Eight of these interactions (ANXA5, ERdj5, PDIA4, P4HB, PDIA6, RCN1, SDF2L1, and TXNDC5) were verified at the western blotting level."

According to the news reporters, the research concluded: "These F3 interactome results can serve as the basis for pursuing targeted genetic or pharmacologic approaches in an effort to alter the fate of either WT or mutant F3."

Our news journalists report that additional information may be obtained by contacting J.D. Hulleman, Univ Texas Southwestern Med Center Dallas, Dept. of Pharmacol, Dallas, TX 75390, United States. Additional authors for this research include J.C. Genereux and A. Nguyen.

Lupus

Data from University of Tokyo Provide New Insights into Lupus (Egr2 and Egr3 in regulatory T cells cooperatively control systemic autoimmunity through Ltbp3-mediated TGF-beta 3 production)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lupus is the subject of a report. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Systemic lupus
Erythematous (SLE) is a prototypical autoimmune disease characterized by multiorgan inflammation induced by auto-antibodies. Early growth response gene 2 (Egr2), a transcription factor essential for T-cell anergy induction, controls systemic auto-immunity in mice and humans.

The news correspondents obtained a quote from the research from the University of Tokyo, "We have previously identified a subpopulation of CD4(+) regulatory T cells, CD4(+) CD25(-)LAG3(+) cells, that characteristically express both Egr2 and LAG3 and control mice model of lupus via TGF-beta 3 production. However, due to the mild phenotype of lymphocyte-specific Egr2-deficient mice, the presence of an additional regulator has been speculated. Here, we show that Egr2 and Egr3 expressed in T cells cooperatively prevent humoral immune responses by supporting TGF-beta 3 secretion. T cell-specific Egr2/Egr3 double-deficient (Egr2/3DKO) mice spontaneously developed an early onset lupus-like disease that was more severe than in T cell-specific Egr2-deficient mice. In accordance with the observation that CD4 (+)CD25(-)LAG3(+) cells from Egr2/3DKO mice completely lost the capacity to produce TGF-beta 3, the excessive germinal center reaction in Egr2/3DKO mice was suppressed by the adoptive transfer of WT CD4(+)CD25(-)LAG3(+) cells or treatment with a TGF-beta 3-expressing vector. Intriguingly, latent TGF-beta binding protein (Ltbp) 3 expression maintained by Egr2 and Egr3 was required for TGF-beta 3 production from CD4(+) CD25(-)LAG3(+) cells. Because Egr2 and Egr3 did not demonstrate cell intrinsic suppression of the development of follicular helper T cells, Egr2-and Egr3-dependent TGF-beta 3 production by CD4(+)CD25(-) LAG3(+) cells is critical for controlling excessive B-cell responses."

According to the news reporters, the research concluded: "The unique attributes of Egr2/Egr3 in T cells may provide an opportunity for developing novel therapeutics for autoantibody-mediated diseases including SLE."

Our news journalists report that additional information may be obtained by contacting T. Okamura, University of Tokyo, Max Planck Univ Tokyo Center Integrat Inflammol, Meguro Ku, Tokyo 1538505, Japan. Additional authors for this research include T. Okamura, M. Inoue, T. Komai, S. Teruya, Y. Iwasaki, S. Sumitomo, H. Shoda, K. Yamamoto and K. Fujio.

Oncology - Vestibular Schwannoma

Data from University of Virginia Advance Knowledge in Vestibular Schwannoma (Unilateral vestibular schwannoma in a patient with schwannomatosis in the absence of LZTR1 mutation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Vestibular Schwannoma is now available. According to news reporting originating from Charlottesville, Virginia, by NewsRx correspondents, research stated, "The presence of vestibular schwannomas has long been considered an exclusion criterion for the diagnosis of schwannomatosis. Recently, 2 cases of vestibular schwannoma were reported in patients with schwannomatosis, leading to a revision of the diagnostic criteria for this genetic disorder."

Our news editors obtained a quote from the research from the University of Virginia, "Overall, the relative infrequency of vestibular schwannomas in schwannomatosis is unexplained, and the genetics of this uncommon phenomenon have not been described. The authors report on a family with clinical manifestations consistent with schwannomatosis, including 4 affected members, that was identified as having an affected member harboring a unilateral cerebellopontine angle mass with extension into the internal auditory canal. Radiologically, this mass was consistent with a vestibular schwannoma and resulted in a symptomatic change in ipsilateral hearing (word recognition 86% at 52 dB) and increased latency of the wave I V interval on auditory brainstem response testing. The patient was found to be negative for a germline mutation of NF2 and LZTR1, and her affected mother was found to harbor neither NF2 nor SMARCB1 mutations on genetic testing. Although vestibular schwannomas have been classically considered to not occur in the setting of schwannomatosis, this patient with schwannomatosis and a vestibular schwannoma further confirms that schwannomas can occur on the vestibular nerve in this syndrome."

According to the news editors, the research concluded: "Further, this is the first such case found to be negative for a mutation on the LZTR1 gene."

For more information on this research see: Unilateral vestibular schwannoma in a patient with schwannomatosis in the absence of LZTR1 mutation. Journal of Neurosurgery, 2016;125(6):1469-1471. Journal of Neurosurgery can be contacted at: Amer Assoc Neurological Surgeons, 5550 Meadowbrook Drive, Rolling Meadows, IL 60008, USA.

The news editors report that additional information may be obtained by contacting G.U. Mehta, University of Virginia, Dept. of Neurosurg, Charlottesville, VA, United States. Additional authors for this research include M.J. Feldman, H. Wang, D. Ding and P. Chittiboina.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3171/2015.11.JNS151766. This DOI is a link to an online electronic document that is either free or for purchase.

Data from University of Virginia Provide New Insights into Colon Cancer
[Oral perfluorooctane sulfonate (PFOS) lessens tumor development in the APC(min) mouse model of spontaneous familial adenomatous polyposis]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Colon Cancer have been presented. According to news originating from Morgantown, West Virginia, by NewsRx correspondents, research stated, "Colorectal cancer is the second most common cause of cancer deaths for both men and women, and the third most common cause of cancer in the U.S. Toxicity of current chemotherapeutic agents for colorectal cancer, and emergence of drug resistance underscore the need to develop new, potentially less toxic alternatives."

Our news journalists obtained a quote from the research from the University of Virginia, "Our recent cross-sectional study in a large Appalachian population, showed a strong, inverse, dose-response association of serum perfluorooctane sulfonate (PFOS) levels to prevalent colorectal cancer, suggesting PFOS may have therapeutic potential in the prevention and/or treatment of colorectal cancer. In these preliminary studies using a mouse model of familial colorectal cancer, the APC(min) mouse, and exposures comparable to those reported in human populations, we assess the efficacy of PFOS for reducing tumor burden, and evaluate potential dose-response effects. At 5-6 weeks of age, APCmin mice were randomized to receive 0, 20, 250 mg PFOS/kg (females) or 0, 10, 50 and 200 mg PFOS/kg (males) via their drinking water. At 15 weeks of age, gastrointestinal tumors were counted and scored and blood PFOS levels measured. PFOS exposure was associated with a significant, dose-response reduction in total tumor number in both male and female mice. This inverse dose-response effect of PFOS exposure was particularly pronounced for larger tumors (r(2) for linear trend = 0.44 for males, p's < 0.001). The current study in a mouse model of familial adenomatous polyposis offers the first experimental evidence that chronic exposure to PFOS in drinking water can reduce formation of gastrointestinal tumors, and that these reductions are both significant and dose-dependent."

According to the news editors, the research concluded: "If confirmed in further studies, these promising findings could lead to new therapeutic strategies for familial colorectal cancer, and suggest that PFOS testing in both preventive and therapeutic models for human colorectal cancer is warranted."

For more information on this research see: Oral perfluorooctane sulfonate (PFOS) lessens tumor development in the APC(min) mouse model of spontaneous familial adenomatous polyposis. Gastroenterology - Colorectal Research

Data from University of Wisconsin Advance Knowledge in Colorectal Research [Indeterminate but Likely Unimportant Extracolonic Findings at Screening CT Colonography (C-RADS Category E3): Incidence and Outcomes Data From a Clinical Screening ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gastroenterology - Colorectal Research have been published. According to news reporting originating in Madison, Wisconsin, by NewsRx journalists, research stated, "The purpose of this study was to analyze the incidence and outcomes of unsuspected indeterminate but likely unimportant extracolonic findings (CT Colonography Reporting and Data System [C-RADS] category E3) at screening CT colonography (CTC). Over 99 months (April 2004 through June 2012), 7952 consecutive adults without symptoms of colorectal cancer (4277 women, 3675 men; mean age +/- SD, 56.7 +/- 7.3 years) underwent first-time screening CTC."

The news reporters obtained a quote from the research from the University of Wisconsin, "Findings prospectively placed into C-RADS category E3 were retrospectively reviewed, including follow-up (range, 2-10 years) and ultimate clinical outcome. Unsuspected C-RADS category E3 extracolonic findings were detected in 9.1% (725/7952) of our patient population. A total of 751 category E3 findings were detected among these 725 patients; 25 patients had multiple findings. Commonly involved organ systems included gynecologic (24.4%, 183/751), genitourinary (20.9%, 157/751), lung (20.6%, 155/751), and gastrointestinal (16.1%, 121/751). Consideration for further imaging, if clinically warranted, was suggested in 83.8% (608/725). Sixty-five patients were lost to follow-up. Conditions requiring treatment or surveillance were ultimately diagnosed in 8.3% (55/660), including eight malignant neoplasms. In the remaining 605 patients, 25 (4.1%) underwent invasive biopsy or surgery to prove benignity (including 18 complex adnexal masses), and 278 (46.0%) received additional imaging follow-up. Indeterminate but likely unimportant extracolonic findings (C-RADS category E3) occurred in less than 10% of adults without symptoms of colorectal cancer who underwent screening CTC."

According to the news reporters, the research concluded: "Over 90% of these findings ultimately proved to be clinically insignificant, with fewer than 5% requiring an invasive procedure to prove benign disease, the majority of which (> 70%) were complex adnexal lesions in women."

For more information on this research see: Indeterminate but Likely Unimportant Extracolonic Findings at Screening CT Colonography (C-RADS Category E3): Incidence and Outcomes Data From a Clinical Screening Program. American Journal of Roentgenology, 2016;207(5):996-1001. Data from Vrije University Provide New Insights into Meningeal Neoplasms (Meningiomas in three male-to-female transgender subjects using oestrogens/progestogens and review of the literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Central Nervous System Diseases and Conditions - Meningeal Neoplasms have been presented. According to news reporting originating in Amsterdam, Netherlands, by NewsRx journalists, research stated, "Sex hormones have been proposed as a possible risk factor for the development and growth of meningiomas. Hormonal therapy plays a fundamental role in the treatment of male-to-female transgenders and needs to be continued after sex reassignment surgery."

The news reporters obtained a quote from the research from Vrije University, "Usually, this treatment leads to no adverse events; however, its impact on hormone-related tumours such as meningiomas has not yet been investigated thoroughly. We searched our cohort of 2810 male-to-female transgender persons, who have been treated between 1975 and 2010, for patients with meningiomas. Additionally, we conducted a literature search in PubMed and EMBASE. We found three patients who developed a meningioma in male-to-female transgenders in addition to five other who have been described in the literature. These findings support the role of female sex hormones in the development and growth of meningiomas. This might be an underrepresentation, because there is no standard protocol for screening for meningiomas in this population and meningiomas can remain asymptomatic for several years. We observed regression of multiple meningiomas in one of these three cases after discontinuation of hormonal treatment."

According to the news reporters, the research concluded: "The decision to stop or continue cross-sex hormone therapy in these particular patients should be carefully reconsidered individually."

Our news correspondents report that additional information may be obtained by contacting P.V. ter Wengel, Vrije Universiteit Amsterdam, Medical Center, Neurosurg Center Amsterdam, Amsterdam, Netherlands. Additional authors for this research include E. Martin, L. Gooren, M. Den Heijer and S.M. Peerdeman.

Oncology - Esophageal Cancer

Data from Washington University Provide New Insights into Esophageal Cancer (Neoadjuvant Chemotherapy versus Chemoradiation Prior to Esophagectomy: Impact on Rate of Complete Pathologic Response and Survival in Esophageal Cancer Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Esophageal Cancer. According to news reporting out of St. Louis, Missouri, by NewsRx editors, research stated, "The aim of this study was to evaluate differences in pathologic complete response (pCR) rates and overall survival among patients receiving either neoadjuvant chemotherapy or chemoradiation before esophagectomy for locally advanced esophageal cancer. Patients with esophageal cancer receiving either neoadjuvant chemotherapy or chemoradiation before esophagectomy were identified using the National Cancer Database."

Our news journalists obtained a quote from the research from Washington University, "Univariate analysis compared patient, tumor, and postoperative outcome characteristics. Logistic regression was performed to identify variables associated with achieving pCR. Kaplan-Meier analysis was performed to compare overall median survival by neoadjuvant therapy type and pCR status. Finally, a Cox proportional hazards model was fitted to identify variables associated with increased mortality hazard. From 2006 to 2012, a total of 916 of 7338 of patients (12.5%) received neoadjuvant chemotherapy whereas 6422 (87.5%) received neoadjuvant chemoradiation. Patients who received neoadjuvant chemoradiation were more likely to achieve a pCR (17.2% versus 6.4%, p< 0.001) and less likely to have positive margins (5.6% versus 11.5%, p< 0.001) than were patients who received neoadjuvant chemotherapy, with no difference in 30- or 90-day mortality. Achieving a pCR was associated with improved overall median survival (59.5 +/- 4.0 months versus 30.1 +/- 0.76 months for those with persistent disease, p< 0.001). On logistic regression, neoadjuvant chemoradiation therapy was independently associated with achieving a pCR (OR = 2.75, 95% confidence interval: 2.01-3.77, p< 0.001). Despite improvement in the pCR rate with neoadjuvant chemoradiation, neoadjuvant therapy type was not independently associated with long-term survival (hazard ratio = 1.12; 95% confidence interval: 0.97-1.30, p = 0.12). Although neoadjuvant chemoradiation is more successful in downstaging esophageal cancer before esophagectomy, it was not independently prognostic for improved long-term survival."

According to the news editors, the research concluded: "Other factors affecting long-term survival among pathologic complete responders and among patients with persistent disease should be investigated to clarify this association."

Our news journalists report that additional information may be obtained by contacting T. Crabtree, Washington Univ St Louis, Div Cardiothorac Surg, St Louis, MO, United States. Additional authors for this research include C. Robinson, J. Bradley, A.C. Lockhart, V. Puri, S. Broderick, D. Kreisel, A.S. Krupnick, G.A. Patterson, B. Meyers and T...
Data from Wayne State University Provide New Insights into Vancomycin Resistance (Fosfomycin Enhances the Activity of Daptomycin against Vancomycin-Resistant Enterococci in an In Vitro Pharmacokinetic-Pharmacodynamic Model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Vancomycin Resistance. According to news reporting originating from Detroit, Michigan, by NewsRx correspondents, research stated, "Daptomycin (DAP) is being used more frequently to treat infections caused by vancomycin-resistant enterococcus (VRE). DAP tends to be less active against enterococci than staphylococci and may require high doses or combination therapy to be bactericidal."

Financial support for this research came from HHS | National Institutes of Health (NIH).

Our news editors obtained a quote from the research from Wayne State University, "Fosfomycin (FOF) has activity against VRE and has demonstrated synergistic bactericidal activity with DAP in vitro. The objective of this study was to evaluate the activity of DAP alone and in combination with FOF against VRE in an in vitro pharmacokinetic/pharmacodynamic (PK/PD) model. The activity of DAP at 8 and 12 mg/kg of body weight/day (DAP 8 and DAP 12, respectively) and FOF of 40 mg/kg intravenously every 8 h, alone and in combination, were evaluated against 2 vancomycin-resistant Enterococcus faecium strains (8019 and 5938) and 2 vancomycin-resistant E. faecalis strains (V583 and R7302) in an in vitro PK/PD model over 72 h. Cell surface charge in the presence and absence of FOF was evaluated by zeta potential analysis. Daptomycin-boron-dipyrromethene (bodipy) binding was assessed by fluorescence microscopy. The addition of FOF to DAP 8 and DAP 12 resulted in significantly increased killing over DAP alone at 72 h for 8019, V583, and R7302 (P < 0.05). Therapeutic enhancement was observed with DAP 12 plus FOF against 8019, V583, and R7302. Cell surface charge became more negative after exposure to FOF by similar to 2 to 8 mV in all 4 strains. Daptomycin-bodipy binding increased by 2.6 times in the presence of fosfomycin (P < 0.0001). The combination of DAP plus FOF may provide improved killing against VRE (including DAP-resistant strains) through modulation of cell surface charge."

According to the news editors, the research concluded: "Further studies to clarify the role of intravenous FOF are warranted."

For more information on this research see: Fosfomycin Enhances the Activity of Daptomycin against Vancomycin-Resistant Enterococci in an In Vitro Pharmacokinetic-

The news editors report that additional information may be obtained by contacting M.J. Rybak, Wayne State University, Sch Med, Detroit, MI 48202, United States. **Oncology - Non-Small-Cell Lung Cancer**

**Data from X.M. Yu and Colleagues Advance Knowledge in Non-Small-Cell Lung Cancer (Cell-Free RNA Content in Peripheral Blood as Potential Biomarkers for Detecting Circulating Tumor Cells in Non-Small Cell Lung Carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Non-Small-Cell Lung Cancer are discussed in a new report. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "Circulating tumor cells (CTCs) have been implicated in tumor progression and prognosis. Techniques detecting CTCs in the peripheral blood of patients with non-small cell lung carcinoma (NSCLC) may help to identify individuals likely to benefit from early systemic treatment."

The news reporters quoted from the research, "However, the detection of CTCs with a single marker is challenging, owing to low specificity and sensitivity and due to the heterogeneity and rareness of CTCs. Herein, the probability of cell-free RNA content in the peripheral blood as a potential biomarker for detecting CTCs in cancer patients was investigated. An immunomagnetic enrichment of real-time reverse-transcription PCR (RT-PCR) technology for analysis of CTCs in NSCLC patients was also developed. The mRNA levels of four candidate genes, cytokeratin 7 (CK7), E74-like factor 3 (ELF3), epidermal growth factor receptor (EGFR), and erythropoietin-producing hepatocellular carcinoma receptor B4 (EphB4) that were significantly elevated in tumor tissues and peripheral blood mononuclear cells (PBMCs) were determined. The expression of CK7 and ELF3 in tumor tissues and EGFR in PBMCs was associated with lymph node metastasis (all p< 0.05). The expression of CK7 in PBMCs was correlated with age and EphB4 in PBMCs correlated with histopathological type, respectively (all p< 0.05). The expression of all four genes in tumor tissues and PBMCs was
significantly correlated with the clinical stage (all \( p < 0.01 \)). Survival analysis showed that the patients with enhanced expression of CK7, ELF3, EGFR, and EphB4 mRNA in PBMCs had poorer disease-free survival (DFS) and overall survival (OS) than those without (all \( p < 0.0001 \))."

According to the news reporters, the research concluded: "The present study showed that this alteration of cell-free RNA content in peripheral blood might have clinical ramifications in the diagnosis and treatment of NSCLC patients."

For more information on this research see: Cell-Free RNA Content in Peripheral Blood as Potential Biomarkers for Detecting Circulating Tumor Cells in Non-Small Cell Lung Carcinoma. *International Journal of Molecular Sciences*, 2016;17(11):1285-1299. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Liver Diseases and Conditions - Hepatomas

**Data from Xinjiang Technical Institute of Physics and Chemistry Advance Knowledge in Hepatomas (MiR-107 suppresses proliferation of hepatoma cells through targeting HMGA2 mRNA 3' UTR)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Liver Diseases and Conditions - Hepatomas have been presented. According to news reporting originating in Urumqi, People's Republic of China, by NewsRx journalists, research stated, "Aberrant expression of miR-107 is involved in the development of several human cancers. However, the role of miR-107 in hepatocellular carcinoma (HCC) is not well documented."

The news reporters obtained a quote from the research from the Xinjiang Technical Institute of Physics and Chemistry, "In the present study, we aim to explore the function of miR-107 in hepatocarcinogenesis. Bioinformatics analysis was applied to predict the target genes of miR-107. Luciferase reporter gene assay was performed to verify the miR-107 binding sites in 3'-untranslated region (3'UTR) of high mobility group A2 (HMGA2) mRNA. The expression levels of mRNA and protein were examined using qRT-PCR and Western blot analysis. Functionally, MTT and EdU assays were carried out for proliferation analysis. Clinically, thirty HCC samples and their corresponding peritumor liver tissues were collected. Bioinformatics analysis revealed that miR-107 might target HMGA2 mRNA 3'UTR. Luciferase reporter gene assays verified that the miR-107 binding site was located in the 3'UTR of HMGA2 mRNA. Furthermore, miR-107 could down-regulate HMGA2 at the levels of mRNA and protein in a
dose dependent manner. Interestingly, miR-107 inhibited the proliferation of hepatoma cells, while antimiR-107 could promote the cell proliferation, which was blocked by the interference of HMGA2. Clinically, miR-107 was lower in HCC samples relative to peritumor liver tissues. The expression levels of miR-107 were negatively correlated with those of HMGA2 mRNA in HCC samples. MiR-107 suppresses the proliferation of hepatoma cells by targeting HMGA2 mRNA.

According to the news reporters, the research concluded: "Our finding provides new insights into the mechanism of hepatocarcinogenesis."

For more information on this research see: MiR-107 suppresses proliferation of hepatoma cells through targeting HMGA2 mRNA 3' UTR. Biochemical and Biophysical Research Communications, 2016;480(3):455-460. **Data from Zagazig University Provide New Insights into Type 2 Diabetes (Combination of Sitagliptin and Insulin against Type 2 Diabetes Mellitus with Neuropathy in Rats: Neuroprotection and Role of Oxidative and Inflammation Stress)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been presented. According to news reporting out of Zagazig, Egypt, by NewsRx editors, research stated, "The present study evaluated the effects of sitagliptin-insulin against type 2 diabetes mellitus with neuropathy in rats and possible neuroprotective mechanisms. Diabetes was induced in 32 adult male albino rats by 6-week high-fat high-sugar diet followed by streptozotocin 30 mg/kg intraperitoneal injection."

Our news journalists obtained a quote from the research from Zagazig University, "For 4 weeks thereafter, diabetic rats were divided into 4 groups, each group receiving one of the following daily: vehicle (untreated diabetic), insulin 10 IU/kg SC, sitagliptin 30 mg/kg PO or sitagliptin-insulin. We assessed systolic blood pressure (SBP), blood glucose, serum insulin and advanced glycation end-products (AGEs), thermal hyperalgesia and sciatic nerve tumor necrosis factor-alpha (TNF-alpha), superoxide dismutase (SOD) and malondialdehyde (MDA)
and sciatic histopathology. Compared to untreated and insulin-treated groups, sitagliptin decreased SBP, serum AGEs and sciatic MDA and TNF-alpha, and increased serum insulin and sciatic SOD, but insulin decreased blood glucose more. Sitagliptin-insulin (greater than sitagliptin or insulin alone) superiorly decreased and increased the above respective parameters, and ameliorated hyperalgesia and sciatic histopathological changes, but was similar to insulin in decreasing blood glucose, and similar to sitagliptin in rising serum insulin. Sitagliptin-insulin combination produced hypoglycemic and neuroprotective effect and ameliorated hyperalgesia, oxidative stress and inflammation more than either drug alone."

According to the news editors, the research concluded: "This combination might have clinical efficacy in uncontrolled type 2 diabetes with neuropathy."

For more information on this research see: Combination of Sitagliptin and Insulin against Type 2 Diabetes Mellitus with Neuropathy in Rats: Neuroprotection and Role of Oxidative and Inflammation Stress. Pharmacology, 2016;98(5-6):242-250. Pharmacology can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. Cardiovascular Diseases and Conditions - Abdominal…

Data on Abdominal Aortic Aneurysm Discussed by Researchers at University of Turin (Acute kidney injury after open and endovascular elective repair for infrarenal abdominal aortic aneurysms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Abdominal Aortic Aneurysm. According to news reporting originating from Turin, Italy, by NewsRx correspondents, research stated, "The aim of this study was to evaluate the incidence of acute kidney injury (AKI) after open and endovascular abdominal aortic aneurysm repair according to the Aneurysm Renal Injury Score classification. We retrospectively evaluated 431 patients undergoing elective open aortic repair (OAR; n = 285) or endovascular repair (n = 146) for infrarenal aortic aneurysm."
Our news editors obtained a quote from the research from the University of Turin, "All data regarding preoperative and postoperative serum creatinine concentrations and postoperative outcomes were assessed. Univariate and multivariate logistic regression models investigated the association between AKI and different risk factors and complications. The incidence of AKI was significantly higher after OAR (26.3% vs 5.5%; P < .001). A significant share of patients who experienced AKI were restored to preoperative renal function at discharge (62.5% vs 77.5% in the endovascular and OAR groups, respectively; P = .37). Preoperative serum creatinine concentration was significantly higher in those patients who further developed AKI (1.25 vs 1.04 mg/dL; P < .001). At the multivariate analysis, AKI was significantly associated with current smoking (odds ratio [OR], 2.05; 95% confidence interval [CI], 1.19-3.52; P = .01), hypertension (OR, 2.46; 95% CI, 1.21-4.3; P = .01), chronic renal disease (OR, 2.53; 95% CI, 1.42-4.53; P < .001), OAR (OR, 7.3; 95% CI, 3.25-16.42; P < .001), and arrhythmias (OR, 3.16; 95% CI, 1.09-9.13; P = .03). AKI stage did not affect postoperative outcomes, except for a longer hospital stay in patients in stage 2 and stage 3 compared with stage 1. AKI is a common but often reversible complication, especially after OAR. There is an urgent need of a common classification for AKI after aortic surgery."

According to the news editors, the research concluded: "New diagnostic markers for AKI should be evaluated in large-scale studies to assess their reliability."

The news editors report that additional information may be obtained by contacting P. Rispoli, University of Turin, Div Vasc Surg, Dept. of Surg Sci, I-10126 Turin, Italy. Additional authors for this research include G. Varetto, S. Quaglino, E. Frola, G. Scozzari, F. Bert and P. Rispoli.

Data on Abdominal Aortic Aneurysm Reported by Researchers at Galway-Mayo Institute of Technology (A computational assessment of the hemodynamic effects of crossed and non-crossed bifurcated stent-graft devices for the treatment of abdominal ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Abdominal
Aortic Aneurysm have been presented. According to news reporting out of Galway, Ireland, by NewsRx editors, research stated, "There are several issues attributed with abdominal aortic aneurysm endovascular repair. The positioning of bifurcated stent-grafts (SG) may affect SG hemodynamics."

Our news journalists obtained a quote from the research from the Galway-Mayo Institute of Technology, "The hemodynamics and geometrical parameters of crossing or non-crossing graft limbs have not being totally accessed. Eight patient-specific SG devices and four pre-operative cases were computationally simulated, assessing the hemodynamic and geometrical effects for crossed (n=4) and non-crossed (n=4) configurations. SGs eliminated the occurrence of significant recirculations within the sac prior treatment. Dean's number predicted secondary flow locations with the greatest recirculations occurring at the outlets especially during the deceleration phase. Peak drag force varied from 3.9 to 8.7 N, with greatest contribution occurring along the axial and anterior/posterior directions. Average resultant drag force was 20% smaller for the crossed configurations. Maximum drag force orientation varied from 1.4 degrees to 51 degrees. Drag force angle varied from 1 degrees to 5 degrees during one cardiac cycle. 44% to 62% of the resultant force acted along the proximal centerline where SG migration is most likely to occur. The clinician's decision for SG positioning may be a critical parameter, and should be considered prior to surgery."

According to the news editors, the research concluded: "All crossed SG devices had an increased spiral flow effect along the distal legs with reductions in drag forces."

Our news journalists report that additional information may be obtained by contacting L. Morris, Galway Mayo Inst Technol, Dept. of Mech & Ind Engn, Galway Med Technol Center, Galway, Ireland. Additional authors for this research include T. McGloughlin and L. Morris.

Drugs and Therapies - Acetaminophen Therapy

Data on Acetaminophen Therapy Described by Researchers at Virginia Commonwealth University (Severe necrosis of the palate and nasal septum resulting from intranasal abuse of acetaminophen)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Acetaminophen Therapy are
discussed in a new report. According to news reporting originating from Richmond, Virginia, by NewsRx correspondents, research stated, "Intranasal drug abuse frequently leads to sinonasal complications, particularly sinus, nasal, and palatal necrosis. Classically, this type of necrosis has been linked to cocaine use, but the intranasal abuse of prescription narcotics and other pain medications can also lead to severe damage to the sinonasal tract."

Our news editors obtained a quote from the research from Virginia Commonwealth University, "We describe a case of palatal and nasal septal necrosis resulting from intranasal acetaminophen abuse. The patient was a 34-year-old man with a remote history of polysubstance abuse who presented to the emergency department with worsening dysphagia and a recent history of exclusive intranasal acetaminophen abuse. He had an existing palatal fistula that was found to have dramatically increased in size. Examination revealed complete destruction of the soft palate and nasal septum and partial destruction of the hard palate. The areas of necrosis were surgically debrided."

According to the news editors, the research concluded: "We describe the general clinical presentation and surgical outcome of this case."

The news editors report that additional information may be obtained by contacting S.A. Hardison, Dept. of Otolaryngology, Virginia Commonwealth University, Richmond, VA, United States. Additional authors for this research include K.K. Marcum and C.R Lintzenich.

Keywords for this news article include: Pharmaceuticals, Richmond, Virginia, Acetanilides, United States, Drugs and Therapies, Acetaminophen Therapy, North and Central America.

**Gastroenterology - Achalasia**

**Data on Achalasia Described by Researchers at Washington University**

*(The learning curve for interpretation of oesophageal high-resolution manometry: a prospective interventional cohort study)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Gastroenterology - Achalasia. According to news reporting out of St. Louis, Missouri, by NewsRx editors, research stated, "High-resolution manometry has become the preferred choice of oesophagologists for oesophageal motor assessment, but the learning curve among trainees remains unclear. To determine the learning curve of high-resolution manometry interpretation."

Financial support for this research came from NIH/NIDDK.

Our news journalists obtained a quote from the research from Washington University, "A prospective interventional cohort study was performed on 18 gastroenterology trainees, naive to high-resolution manometry (median age 32 +/- 4.0 years, 44.4% female). An intake questionnaire and a 1-h standardised didactic session were performed at baseline. Multiple 1-h interpretation sessions were then conducted periodically over 15 months where 10 studies were discussed; 5 additional test studies were provided for interpretation, and results were compared to gold standard interpretation by the senior author. Hypothetical management
decisions based on trainee interpretation were separately queried. Accuracy was compared across test interpretations and sessions to determine the learning curve, with a goal of 90% accuracy. Baseline accuracy was low for abnormal body motor patterns (53.3%), but higher for achalasia/outflow obstruction (65.9%). Recognition of achalasia reached 90% accuracy after six sessions (P = 0.01), while overall accurate management decisions reached this threshold by the 4th session (P < 0.001). Based on our data, the threshold of 90% accuracy for recognition of any abnormal from normal pattern was reached after 30 studies (3rd session) but fluctuated. Diagnosis of oesophageal body motor patterns remained suboptimal; accuracy of advisability of fundoplication improved, but did not reach 90%. High-resolution manometry has a steep learning curve among trainees.

According to the news editors, the research concluded: "Achalasia recognition is achieved early, but diagnosis of other abnormal motor patterns and management decisions require further supervised training."

Our news journalists report that additional information may be obtained by contacting C.P. Gyawali, Washington University, Sch Med, Div Gastroenterol, St Louis, MO 63110, United States. Additional authors for this research include C.A. Reddy, S. Munigala, A. Patel, N. Kanuri, S. Almaskeen, M.K. Rude, A. Abdalla and C.P. Gyawali.

**Oncology - Acute Myeloid Leukemia**

**Data on Acute Myeloid Leukemia Detailed by Researchers at Columbia University (DNMT3A mutations promote anthracycline resistance in acute myeloid leukemia via impaired nucleosome remodeling)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Myeloid Leukemia. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Although the majority of patients with acute myeloid leukemia (AML) initially respond to chemotherapy, many of them subsequently relapse, and the mechanistic basis for AML persistence following chemotherapy has not been determined."

Our news journalists obtained a quote from the research from Columbia University, "Recurrent somatic mutations in DNA methyltransferase 3A (DNMT3A), most frequently at arginine 882 (DNMT3A(R882)), have been observed in AML(1-3) and in individuals with clonal hematopoiesis in the absence of leukemic transformation(4,5)."

According to the news editors, the research concluded: "Patients with DNMT3A (R882) AML have an inferior outcome when treated with standard-dose daunorubicin-based induction chemotherapy(6,7), suggesting that DNMT3A(R882) cells persist and drive relapse (8)."

Our news journalists report that additional information may be obtained by contacting S. Mukherjee, Columbia University, Irving Canc Res Center, New York, NY 10027, United States. Additional authors for this research include K. Shank, B. Spitzer, L. Luciani, R.P. Koche, F.E. Garrett-Bakelman, C. Ganelz, B.H. Durham, A. Mohanty, G. Hoermann, S.A. Rivera, A.G. Chramiec, E. Oncology - Acute Myeloid Leukemia

Data on Acute Myeloid Leukemia Reported by Researchers at University Hospital (T-lymphoid progenitors - we know what they are, but know not what they may be)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Myeloid Leukemia. According to news reporting out of Ulm, Germany, by NewsRx editors, the research stated, "An improved understanding of the biology underlying leukemogenesis, including the determination of the cells of leukemia origin, is of great importance as it can have immediate implications on patient treatment and management."

Our news journalists obtained a quote from the research from University Hospital, "The article by Riemke etal () provides further evidence that a subgroup of acute myeloid leukemia (AML), the most common acute leukemia in adults, might arise from T-lymphoid progenitor cells. This study not only supports that the lymphoid fate of early T-cell progenitors is not yet fully stabilized but also shows that under oncogenic conditions, this multilineage plasticity potential of T-lymphoid progenitors can lead to transdifferentiation into myeloid leukemia."

According to the news editors, the research concluded: "While gene expression profiles suggest that approximately 5% of all AML cases originate from T-lymphoid progenitors, novel treatment strategies targeting JAK2/STAT3 signaling might open new avenues for this AML cohort."

For more information on this research see: T-lymphoid progenitors - we know what they are, but know not what they may be. Embo Journal, 2016;35(22):2383-2385. Embo Journal can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Data on Adrenal Cortical Steroids Described by Researchers at Sichuan University (LHD-Modified Mechanism-Based Liposome Coencapsulation of Mitoxantrone and Prednisolone Using Novel Lipid Bilayer Fusion for Tissue-Specific Colocalization and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Adrenal Cortical Steroids. According to news reporting from Chengdu, People's Republic of China, by NewsRx journalists, research stated, "Coencapsulation liposomes are of interest to researchers because they maximize the synergistic effect of loaded drugs. A combination regimen of mitoxantrone (MTO) and prednisolone (PLP) has been ideal for tumor therapy."

Funders for this research include China Postdoctoral Science Foundation, National Natural Science Foundation of China, Sichuan Provincial Department of Science and Technology.

The news correspondents obtained a quote from the research from Sichuan University, "MTO and PLP offer synergistic antitumor effects confirmed by several experiments in this research. The deduced synergistic mechanism is regulation of Akt signaling pathway including the targets of p-Akt, p-GSK-3b, p-s6 ribosomal protein, and p-AMPK by MTO reactivating PLP-induced apoptosis. The liposome fusion method is adopted to create coencapsulation liposomes (PLP-MTO-YM). Low molecular weight heparin-sodium deoxycholate conjugate (LHD) then is used as a targeting ligand to prove target binding and inhibition of angiogenesis. LHD-modified liposomes (PLP-MTO-HM) have a high entrapment efficiency around 95% for both MTO and PLP. DSC results indicate that both drugs interacted with liposomes to prevent drug leak during liposome fusion. DiD-C6-HM dyes colocalize well to tumor tissue, and coadministration of DiD-HM and C6-CM did not achieve dye colocalization until 24 h after administration. In both CT26 and B16F10 mouse model, PLP-MTO-HM shows a significantly higher tumor inhibition rate relative to the coadministration of MTO-HM and PLP-CM (p <0.05 or p<0.01)."

According to the news reporters, the research concluded: "Thus, the coencapsulation system (PLP-MTO-HM) offers ideal antitumor effects relative to coadministration therapy due to enhanced synergistic effect, and this suggests a promising future for the tumor targeting vectors."

Our news journalists report that additional information may be obtained by contacting T. Hu, State Key Laboratory of Biotherapy, Collaborative Innovation Center of Biotherapy, West China Hospital, Sichuan University , 17#, Section 3, Ren Min Nan Road, Chengdu, Sichuan 610041, People's Republic of China. Additional authors for this research include H. Cao, C. Yang, L. Zhang, X. Jiang, X. Gao, F. Yang, G. He, X. Song, A. Tong, G. Guo, C. Gong, R. Li, X. Zhang, X. Wang and Y. Zheng.

Eye Diseases and Conditions - Age-Related Macular...

Data on Age-Related Macular Degeneration Detailed by Researchers at National Institutes of Health (Longitudinal Structural Changes In Late-onset Retinal Degeneration)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Eye Diseases and Conditions - Age-Related Macular Degeneration are presented in a new report. According to news reporting originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "To characterize longitudinal structural changes in early stages of late-onset retinal degeneration to investigate pathogenic mechanisms. Two affected siblings, both with a S163R missense mutation in the causative gene C1QTNF5, were followed for 8+ years."

Our news editors obtained a quote from the research from the National Institutes of Health, "Color fundus photos, fundus autofluorescence images, near-infrared reflectance fundus images, and spectral domain optical coherence tomography scans were acquired during follow-up. Both patients, aged 45 and 50 years, had good visual acuities (>20/20) in the context of prolonged dark adaptation. Baseline color fundus photography demonstrated yellow-white, punctate lesions in the temporal macula that correlated with a reticular pattern on fundus autofluorescence and near-infrared reflectance imaging. Baseline spectral domain optical coherence tomography imaging revealed subretinal deposits that resemble reticular pseudodrusen described in age-related macular degeneration. During follow-up, these affected areas developed confluent thickening of the retinal pigment epithelial layer and disruption of the ellipsoidal zone of photoreceptors before progressing to overt retinal pigment epithelium and outer retinal atrophy. Structural changes in early stages of late-onset retinal degeneration, revealed by multimodal imaging, resemble those of reticular pseudodrusen observed in age-related macular degeneration and other retinal diseases."

According to the news editors, the research concluded: "Longitudinal follow-up of these lesions helps elucidate their progression to frank atrophy and may lend insight into the pathogenic mechanisms underlying diverse retinal degenerations."

For more information on this research see: Longitudinal Structural Changes In Late-onset Retinal Degeneration. Retina-The Journal of Retinal and Vitreous Diseases, 2016;36 (12):2348-2356. Retina-The Journal of Retinal and Vitreous Diseases can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

The news editors report that additional information may be obtained by contacting C. Cukras, NEI, National Institutes of Health, Bethesda, MD 20892, United States. Additional authors for this research include J. Flamendorf, W.T. Wong, R. Ayyagari, D. Cunningham and
Enzymes and Coenzymes - Alcohol Oxidoreductases

Data on Alcohol Oxidoreductases Described by Researchers at Department of Pharmaceutical Chemistry [Development of 2-(Substituted Benzylamino)-4-Methyl-1, 3-Thiazole-5-Carboxylic Acid Derivatives as Xanthine Oxidase Inhibitors and Free Radical ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Alcohol Oxidoreductases have been published. According to news reporting originating in New Delhi, India, by NewsRx journalists, research stated, "A series of 2-(substituted benzylamino)-4-methylthiazole-5-carboxylic acid was designed and synthesized as structural analogue of febuxostat. A methylene amine spacer was incorporated between the phenyl ring and thiazole ring in contrast to febuxostat in which the phenyl ring was directly linked with the thiazole moiety."

Financial support for this research came from UGC (Moulana Azad National Fellowship), New Delhi, India.

The news reporters obtained a quote from the research from the Department of Pharmaceutical Chemistry, "The purpose of incorporating methylene amine was to provide a heteroatom which is expected to favour hydrogen bonding within the active site residues of the enzyme xanthine oxidase. The structure of all the compounds was established by the combined use of FT-IR, NMR and MS spectral data. All the compounds were screened in vitro for their ability to inhibit the enzyme xanthine oxidase as per the reported procedure along with DPPH free radical scavenging assay. Compounds 5j, 5k and 5l demonstrated satisfactory potent xanthine oxidase inhibitory activities with IC[50] values, 3.6, 8.1 and 9.9 mm, respectively, whereas compounds 5k, 5n and 5p demonstrated moderate antioxidant activities having IC[50] 15.3, 17.6 and 19.6 mm, respectively, along with xanthine oxidase inhibitory activity. Compound 5k showed moderate xanthine oxidase inhibitory activity as compared with febuxostat along with antioxidant activity."

According to the news reporters, the research concluded: "All the compounds were also studied for their binding affinity in active site of enzyme (PDB ID-1N5X)."

Immune System Diseases and Conditions - Allergies

Data on Allergies Described by Researchers at Odense University Hospital (SQ grass sublingual allergy immunotherapy tablet for disease-modifying treatment of grass pollen allergic rhinoconjunctivitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - Allergies. According to news reporting out of Odense, Denmark, by NewsRx editors, research stated, "Allergy immunotherapy is a treatment option for allergic rhinoconjunctivitis (ARC). It is unique compared with pharmacotherapy in that it modifies the immunologic pathways that elicit an allergic response."

Our news journalists obtained a quote from the research from Odense University Hospital, "The SQ Timothy grass sublingual immunotherapy (SLIT) tablet is approved in North America and throughout Europe for the treatment of adults and children (>=5 years old) with grass pollen-induced ARC. The clinical evidence for the use of SQ grass SLIT-tablet as a disease-modifying treatment for grass pollen ARC is discussed in this review. The review included the suitability of SQ grass SLIT-tablet for patients with clinically relevant symptoms to multiple Pooidae grass species, single-season efficacy, safety, adherence, coseasonal initiation, and cost-effectiveness. The data from the long-term SQ grass SLIT-tablet clinical trial that evaluated a clinical effect 2 years after a continuous 3-year treatment period were presented in the context of regulatory criteria that define a clinically meaningful effect. This trial demonstrated that the clinical effect of the SQ grass SLIT-tablet is maintained, which is also supported by the immunologic findings."

According to the news editors, the research concluded: "Therefore, the SQ grass SLIT-tablet has an indication as a disease-modifying therapy in Europe, and a sustained effect is recognized in the United States."

For more information on this research see: SQ grass sublingual allergy immunotherapy tablet for disease-modifying treatment of grass pollen allergic rhinoconjunctivitis. Allergy and Asthma Proceedings, 2016;37(2):92-104.

Our news journalists report that additional information may be obtained by contacting R. Dahl, Allergy Centre, Odense University Hospital, Odense, Denmark. Additional authors for this research include G. Roberts, J. de Blic, G.W. Canonica, J. Kleine-Tebbe, H.
Nolte, S. Lawton and H.S Nelson.

Neurodegenerative Diseases and Conditions —...

Data on Alzheimer Disease Described by Researchers at University of South Carolina School of Medicine (Molecular Signaling Mechanisms of Natural and Synthetic Retinoids for Inhibition of Pathogenesis in Alzheimer's Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Alzheimer Disease. According to news reporting from Columbia, South Carolina, by NewsRx journalists, research stated, "Retinoids, which are vitamin A derivatives, interact through retinoic acid receptors (RARs) and retinoid X receptors (RXRs) and have profound effects on several physiological and pathological processes in the brain. The presence of retinoic acid signaling is extensively detected in the adult central nervous system, including the amygdala, cortex, hypothalamus, hippocampus, and other brain areas."

The news correspondents obtained a quote from the research from the University of South Carolina School of Medicine, "Retinoids are primarily involved in neural patterning, differentiation, and axon outgrowth. Retinoids also play a key role in the preservation of the differentiated state of adult neurons. Impairment in retinoic acid signaling can result in neurodegeneration and progression of Alzheimer's disease (AD). Recent studies demonstrated severe deficiencies in spatial learning and memory in mice during retinoic acid (vitamin A) deprivation indicating its significance in preserving memory function. Defective cholinergic neurotransmission plays an important role in cognitive deficits in AD. All-trans retinoic acid is known to enhance the expression and activity of choline acetyltransferase in neuronal cell lines. Activation of RAR and RXR is also known to impede the pathogenesis of AD in mice by inhibiting accumulation of amyloids. In addition, retinoids have been shown to inhibit the expression of chemokines and pro-inflammatory cytokines in microglia and astrocytes, which are activated in AD."

According to the news reporters, the research concluded: "In this review article, we have described the chemistry and molecular signaling mechanisms of natural and synthetic retinoids and current understandings of their therapeutic potentials in prevention of AD pathology."

Our news journalists report that additional information may be obtained by
contacting M. Chakrabarti, Dept. of Pathology, Microbiology and Immunology, University of South Carolina School of Medicine, Columbia, SC, United States. Additional authors for this research include A.J. McDonald, J. Will Reed, M.A. Moss, B.C. Das and S.K Ray.

**Neurodegenerative Diseases and Conditions —**

*Data on Alzheimer Disease Discussed by Researchers at University of Kentucky (Differential Effects of Structural Modifications on the Competition of Chalcones for the PIB Amyloid Imaging Ligand-Binding Site in Alzheimer's Disease Brain and ...)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Neurodegenerative Diseases and Conditions - Alzheimer Disease is now available. According to news reporting out of Lexington, Kentucky, by NewsRx editors, research stated, "Alzheimer's disease (AD) is a complex brain disorder that still remains ill defined. In order to understand the significance of binding of different clinical in vivo imaging ligands to the polymorphic pathological features of AD brain, the molecular characteristics of the ligand interacting with its specific binding site need to be defined."

Financial supporters for this research include National Institute of Neurological Disorders and Stroke, University of Kentucky, National Institute of Allergy and Infectious Diseases, National Institute on Aging.

Our news journalists obtained a quote from the research from the University of Kentucky, "Herein, we observed that tritiated Pittsburgh Compound B ((3)H-PIB) can be displaced from synthetic Ab(1-40) and Ab(1-42) fibrils and from the PIB binding complex purified from human AD brain (ADPBC) by molecules containing a chalcone structural scaffold. We evaluated how substitution on the chalcone scaffold alters its ability to displace (3)H-PIB from the synthetic fibrils and ADPBC. By comparing unsubstituted core chalcone scaffolds along with the effects of bromine and methyl substitution at various positions, we found that attaching a hydroxyl group on the ring adjacent to the carbonyl group (ring I) of the parent member of the chalcone family generally improved the binding affinity of chalcones toward ADPBC and synthetic fibrils F40 and F42. Furthermore, any substitution on ring I at the ortho-position of the carbonyl group greatly decreases the binding affinity of the chalcones, potentially as a result of steric hindrance. Together with the finding that neither our chalcones nor PIB interact with the Congo Red/X-34 binding site, these molecules provide new tools to selectively probe the PIB binding site that is found in human AD brain, but not in brains of AD pathology animal models."
According to the news editors, the research concluded: "Our chalcone derivatives also provide important information on the effects of fibril polymorphism on ligand binding."

Our news journalists report that additional information may be obtained by contacting M.Y. Fosso, Dept. of Pharmaceutical Sciences, College of Pharmacy, University of Kentucky, 789 South Limestone Street, Lexington, Kentucky 40536-0596, United States. Additional authors for this research include K. McCarty, E. Head, S. Garneau-Tsodikova and H. LeVine.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acschemneuro.5b00266. This DOI is a link to an online electronic document that is either free or for purchase.

Enzymes and Coenzymes - Amidohydrolases

Data on Amidohydrolases Discussed by Researchers at Kirchberg Hospital [Natural Compound Histone Deacetylase Inhibitors (HDACi): Synergy with Inflammatory Signaling Pathway Modulators and Clinical Applications in Cancer]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Enzymes and Coenzymes - Amidohydrolases. According to news reporting from Luxembourg, Luxembourg, by NewsRx journalists, research stated, "The remarkable complexity of cancer involving multiple mechanisms of action and specific organs led researchers Hanahan and Weinberg to distinguish biological capabilities acquired by cancer cells during the multistep development of human tumors to simplify its understanding. These characteristic hallmarks include the abilities to sustain proliferative signaling, evade growth suppressors, resist cell death, enable replicative immortality, induce angiogenesis, activate invasion and metastasis, avoid immune destruction, and deregulate cellular energetics."

The news correspondents obtained a quote from the research from Kirchberg Hospital, "Furthermore, two important characteristics of tumor cells that facilitate the acquisition of emerging hallmarks are tumor-promoting inflammation and genome instability. To treat a multifactorial disease such as cancer, a combination treatment strategy seems to be the best approach."

According to the news reporters, the research concluded: "Here we focus on natural histone deacetylase inhibitors (HDACi), their clinical uses as well as synergies with modulators of the pro-inflammatory transcription factor signaling pathways."
For more information on this research see: Natural Compound Histone Deacetylase Inhibitors (HDACi): Synergy with Inflammatory Signaling Pathway Modulators and Clinical Applications in Cancer. *Molecules*, 2016;21(11):2784-2812. *Molecules* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. **Amino Acids**

**Data on Amino Acids Reported by Researchers at Fred Hutchinson Cancer Research Center (Quantitative Method to Investigate the Balance between Metabolism and Proteome Biomass: Starting from Glycine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Amino Acids have been published. According to news reporting from Seattle, Washington, by NewsRx journalists, research stated, "The balance between metabolism and biomass is very important in biological systems; however, to date there has been no quantitative method to characterize the balance. In this methodological study, we propose to use the distribution of amino acids in different domains to investigate this balance."

The news correspondents obtained a quote from the research from Fred Hutchinson Cancer Research Center, "It is well known that endogenous or exogenous amino acids in a biological system are either metabolized or incorporated into free amino acids (FAAs) or proteome amino acids (PAAs). Using glycine (Gly) as an example, we demonstrate a novel method to accurately determine the amounts of amino acids in various domains using serum, urine, and cell samples. As expected, serum and urine had very different distributions of FAA-Gly and PAA-Gly. Using Tet21N human neuroblastoma cells, we also found that Myc(oncogene)-induced metabolic reprogramming included a higher rate of metabolizing Gly, which provides additional evidence that the metabolism of proliferating cells is adapted to facilitate producing new cells."

According to the news reporters, the research concluded: "It is therefore anticipated that our method will be very valuable for further studies of the metabolism and biomass balance that will lead to a better understanding of human cancers."

Our news journalists report that additional information may be obtained by

**Drugs and Therapies - Ampicillins**

**Data on Ampicillins Detailed by Researchers at China University of Science and Technology (Facile synthesis of Ag/Ag3PO4/AMB composite with improved photocatalytic performance)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Ampicillins is now available. According to news reporting out of Hefei, People's Republic of China, by NewsRx editors, research stated, "Ag3PO4 exhibits extremely high photo-oxidative capabilities for organic pollutants decomposition under solar light. However, the relatively large crystallite size of Ag3PO4 lowers its light response, while the high conduction band potential intensifies the reduction to Ag by the light induced electron, limiting the practical application of Ag3PO4."

Financial supporters for this research include National Natural Science Foundation of China, National Key Technology R&D Program of the Ministry of Science and Technology, National 863 Program.

Our news journalists obtained a quote from the research from the China University of Science and Technology, "To overcome these drawbacks, we herein adopted a facile liquid phase deposition method to load Ag3PO4 onto amino-modified biochar which is an abundant and cheap byproduct of biomass pyrolysis to prepare renewable energy. The as-prepared composite (Ag/Ag3PO4/AMB) exhibited greatly enhanced photocatalytic performance to amoxicillin degradation compared with pure Ag3PO4. The results show that almost 80% amoxicillin was decomposed in 120 min in the presence of Ag/Ag3PO4/AMB, whereas only 65% of the amoxicillin was degraded with pure Ag3PO4. Multiple characterizations including X-ray diffraction (XRD), scanning electron microscope (SEM), MR, Raman, and XPS revealed that Ag3PO4 particles were evenly distributed on the surface of biochar, and a few Ag NPs were also generated due to the reduction effect of AMB. IJV-vis diffuse reflectance spectra (DRS) analysis revealed that the composite had good visible light response, while electrochemical impedance spectroscopy (EIS) measurements indicated AMB improved the efficiency of charge separation and electron transfer."

According to the news editors, the research concluded: "In addition, EPR determination suggested that the oxidant formed in photocatalysis systems under visible light irradiation plays an important role in the degradation of amoxicillin."

For more information on this research see: Facile synthesis of Ag/Ag3PO4/AMB composite with improved photocatalytic performance. *Chemical Engineering Journal,*
Data on Amyotrophic Lateral Sclerosis Reported by Researchers at Cedars-Sinai Medical Center (A model of recurrent concussion that leads to long-term motor deficits, CTE-like tauopathy and exacerbation of an ALS phenotype)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Amyotrophic Lateral Sclerosis. According to news originating from Los Angeles, California, by NewsRx correspondents, research stated, "Concussion injury is the most common form of traumatic brain injury (TBI). How recurrent concussions alter long-term outcomes is poorly understood, especially as related to the development of neurodegenerative disease."

Our news journalists obtained a quote from the research from Cedars-Sinai Medical Center, "We evaluated the functional and pathological consequences of repeated TBI over time in wild type (WT) rats as well as rats harboring the human SOD1(G93A) mutation (SOD1'), a model of familial amyotrophic lateral sclerosis (ALS). A total of 42 rats, 26 WT and 16 SOD1, were examined over a study period of 25 weeks (or endpoint). At postnatal day 60, 20 WT and 7 SOD1 rats were exposed to mild, bilateral TBI once per week for either 2 weeks (2 x TBI) or 5 weeks (5 x TBI) using a controlled cortical impact device. Six WT and nine SOD1 rats underwent sham injury with anesthesia alone. Twenty WT rats were euthanized at 12 weeks after first injury and six WT rats were euthanized at 25 weeks after first injury. SOD1 rats were euthanized when they reached ALS disease endpoint. Weekly body weights and behavioral assessments were performed. Tauopathy in brain tissue was analyzed using immunohistochemistry. 2XTBI injured rats initially demonstrated recovery of motor function but failed to recover to baseline within the 12-week study period. Relative to both 2XTBI and sham controls, 5XTBI rats demonstrated significant deficits that persisted over the 12-week period. SOD1 5XTBI rats reached a peak body weight earlier than sham SOD1 rats, indicating earlier onset of the ALS phenotype. Histologic examination of brain tissue revealed that, in contrast with sham controls, SOD1 and WT TBI rats demonstrated cortical and corpus collosum..."
thinning and tauopathy, which increased over time. Unlike previous models of repeat brain injury, which demonstrate only transient deficits in motor function, our concussion model of repeat, mild, bilateral TBI induced long-lasting deficits in motor function, decreased cortical thickness, shrinkage of the corpus callosum, increased brain tauopathy, and earlier onset of ALS symptoms in SOD1 rats."

According to the news editors, the research concluded: "This model may allow for a greater understanding of the complex relationship between TBI and neurodegenerative diseases and provides a potential method for testing novel therapeutic strategies."

For more information on this research see: A model of recurrent concussion that leads to long-term motor deficits, CTE-like tauopathy and exacerbation of an ALS phenotype. *Journal of Trauma and Acute Care Surgery*, 2016;81(6):1070-1079. *Journal of Trauma and Acute Care Surgery* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Hematologic Diseases and Conditions - Anemia**

**Data on Anemia Detailed by Researchers at University Hospital (Fetal Intra-Peritoneal Transfusion for the Management of Very Early Spontaneous Twin Anemia-Polycythemia Sequence in an Obese Patient With a Whole Anterior Placenta)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematologic Diseases and Conditions - Anemia. According to news reporting from Lausanne, Switzerland, by NewsRx journalists, research stated, "Twin anemia-polycythemia sequence (TAPS) is a rare condition in monochorionic twin pregnancies. Small intertwin placental vascular communications allow transfusion, which results in a hemoglobin difference in the twins in the absence of oligohydramnios or polyhydramnios."

The news correspondents obtained a quote from the research from University Hospital, "We report here a case of TAPS diagnosed at 17 weeks' gestation in an obese patient (BMI 42) with a whole anterior placenta. The only possible treatment at this stage of pregnancy was intra-uterine transfusion (IUT), which was repeated weekly until photocoagulation of placental anastomoses was feasible. Fetoscopic laser surgery is the only curative treatment, but
is challenging in TAPS because of the absence of polyhydramnios and the presence of minuscule anastomoses. An anterior placenta and high BMI can make the procedure even more challenging."

According to the news reporters, the research concluded: "This case report demonstrates that very early and rapidly progressing TAPS with technically complicated conditions (elevated BMI and anterior placenta) can be successfully managed with IUT until laser procedure is achievable."

Our news journalists report that additional information may be obtained by contacting C. Guenot, Materno-fetal and Obstetrics Research Unit, Departments of Gynaecology and Obstetrics, University Hospital of Lausanne CHUV, Lausanne, Switzerland. From the Swiss Fetal Laser Group, Switzerland. Additional authors for this research include R. Robyr, N. Jastrow, Y. Vial, L. Raio and D. Baud.

### Data on Anemia Detailed by Researchers at Yang Ming National University (What Constitutes Normal Hemoglobin Concentrations in Community-Dwelling Older Adults?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematologic Diseases and Conditions - Anemia is the subject of a report. According to news originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "To assess the relationship between hemoglobin concentration and cause-specific mortality. Cohort study. Data from the government-sponsored Annual Geriatric Health Examination Program."

Financial supporters for this research include Taiwan Ministry of Education, Taiwan Ministry of Science and Technology.

Our news journalists obtained a quote from the research from Yang Ming National University, "Community-dwelling Taipei citizens aged 65 and older followed up between 2006 and 2010 (N = 77,532). Mortality was determined by matching participants' medical records with national death files. Cox proportional hazards regression models were used to evaluate the relationship between hemoglobin concentration (World Health Organization (WHO)-defined anemia and 7 hemoglobin concentrations) and cause-specific mortality. The mortality risk of WHO-defined anemia increased substantially in both sexes for all-cause and cancer mortalities.
(men, hazard ratio (HR) = 1.86, 95% confidence interval (CI) = 1.71-2.02 for all-cause mortality; HR = 1.94, 95% CI = 1.69-2.22 for cancer mortality; for women, HR = 1.63, 95% CI = 1.43-1.86 for all-cause mortality; HR = 1.74, 95% CI = 1.38-2.19 for cancer mortality). Men with hemoglobin concentrations of 15.0 to 15.9 g/dL and women with hemoglobin concentrations of 13.0 to 13.9 g/dL had the lowest risks of all-cause, cardiovascular, and cancer mortality. Risks of all-cause and cancer mortality increased significantly when hemoglobin concentrations were less than 14 g/dL in men and less than 12 g/dL in women. Even mild anemia (11.0-11.9 g/dL) was associated with greater mortality risk. Stratification according to age, body mass index, estimated glomerular filtration rate, and presence of comorbidities did not lead to any substantial changes.

According to the news editors, the research concluded: "Hemoglobin concentrations associated with optimal survival in older adults were identified and additional data provided regarding the relationship between hemoglobin concentrations and cause-specific mortality risks in older adults."

The news correspondents report that additional information may be obtained from C.P. Li, Yang Ming National University, Sch Med, Taipei, Taiwan. Additional authors for this research include H.Y. Hu, Y.J. Chou, N. Huang, Y.C. Chou and C.P. Li.

**Hematologic Diseases and Conditions - Anemia**

**Data on Anemia Discussed by Researchers at Harvard School of Medicine (Anemia for the Primary Care Physician)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematologic Diseases and Conditions - Anemia. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Anemia denotes a reduced red blood cell (RBC) mass from any cause. The causes of anemia are numerous and due to decreased (or abnormal) erythropoiesis, shortened RBC life span, or blood loss."

Our news editors obtained a quote from the research from the Harvard School of Medicine, "The most common etiology of anemia is iron deficiency. A judicious work up of anemia includes evaluating the reticulocyte count and peripheral smear. The severity of illness of a patient with anemia is determined by the degree of anemia and the seriousness of the
underlying disorder."

According to the news editors, the research concluded: "Management of patients with hereditary and hemolytic anemias should involve a hematologist."

For more information on this research see: Anemia for the Primary Care Physician. Primary Care, 2016;43(4):527-542,CP5. Primary Care can be contacted at: W B Saunders Co-Elsevier Inc, 1600 John F Kennedy Boulevard, Ste 1800, Philadelphia, PA 19103-2899, USA. Anesthesia

Data on Anesthesia Discussed by Researchers at Copenhagen University Hospital (Lack of national consensus in preoperative airway assessment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Anesthesia have been published. According to news reporting originating from Copenhagen, Denmark, by NewsRx correspondents, research stated, "Difficult airway management is associated with an increased risk of morbidity and mortality. Several preoperative risk factors associated with airway management difficulties have been proposed; however, no clear guideline for airway assessments exists."

Our news editors obtained a quote from the research from Copenhagen University Hospital, "We therefore hypothesised that Danish airway assessment was lacking uniformity. We aimed to examine whether multivariable risk assessment tools and predictors for difficult intubation and mask ventilation were used systematically. Heads of anaesthesia departments were sent a six-question survey at the beginning of 2012. We asked if systematic risk assessment tools, particularly the Simplified Airway Risk Index (SARI), and predictors for difficult intubation and mask ventilation were used. Additionally, we asked if any risk factors were pre-printed on the anaesthesia record. In all, 29 of 31 (94%) departments responded. The SARI was implemented in 8 of 29 (28%, 95% confidence interval (CI): 15-46%) departments with major regional differences. There was no significant association between using the SARI and a reduced number of unanticipated difficult intubation (p = 0.06). Mallampati classification (95.2%, 95% CI: 77.3-99.2%), history of airway management difficulties (85.7%, 95% CI: 65.4-95.0%), ability to prognath (81.0%, 95% CI: 60.0-92.3%) and neck mobility (81.0%, 95% CI: 60.0-92.3%) were the main predictors registered. We found considerable inter-departmental variance in the standards employed for airway assessment and no uniform pattern in the
registration of risk factors for airway management difficulties."

According to the news editors, the research concluded: "Better prediction of difficult intubation could not be detected in departments that used the SARI."

For more information on this research see: Lack of national consensus in preoperative airway assessment. *Danish Medical Journal*, 2016;63(10):18-22. *Danish Medical Journal* can be contacted at: Danish Medical Assoc, Trondhjemsgade 9, Dk-2100 Copenhagen, Denmark.

The news editors report that additional information may be obtained by contacting A.K. Norskov, Rigshospitalet, Center Clin Intervent Res, Copenhagen Trial Unit, Copenhagen, Denmark. Additional authors for this research include C.V. Rosenstock and L.H. Lundstrom.

Keywords for this news article include: Copenhagen, Denmark, Europe, Risk and Prevention, Medical Devices, Pain Medicine, Critical Care, Anesthesia, Copenhagen University Hospital.

**Angiography**

**Data on Angiography Reported by Researchers at University of Texas Southwestern Medical Center (Noninvasive intraoperative angiography for reconstruction of head and neck defects)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Angiography. According to news reporting out of Dallas, Texas, by NewsRx editors, research stated, "Reconstruction of head and neck defects after cancer resection involves the use of local, pedicled musculocutaneous, and free flaps. Flap failure is often caused by vascular insufficiency, and it is associated with the presence of cardiovascular or peripheral vascular disease, a history of smoking, and previous radiation and/or surgery."

Our news journalists obtained a quote from the research from the University of Texas Southwestern Medical Center, "Failure rates may be reduced by the use of indocyanine green near-infrared fluorescence laser angiography, which detects perfusion deficits intraoperatively. Although this technology has been validated in other fields, there is limited experience in the head and neck region. We present 3 cases in which different head and neck flaps were used along with this technology in patients at high risk for flap failure. All flaps were successfully implanted without perioperative or long-term complications. The increasing complexity, age, and comorbidities of the head and neck cancer population pose significant reconstructive challenges. This report demonstrates the feasibility of employing intraoperative angiography for local, pedicled, and free flaps. This noninvasive tool optimizes intraoperative planning and assesses viability, potentially lowering failure rates in high-risk patients."

According to the news editors, the research concluded: "Identification of patients who most benefit from this technology warrants further investigation."

For more information on this research see: Noninvasive intraoperative angiography for reconstruction of head and neck defects. *Ear, Nose, & Throat Journal*, 2015;94(10-11):E32-6.

Our news journalists report that additional information may be obtained by contacting S.P. Daram, Dept. of Otolaryngology-Head and Neck Surgery, University of Texas
Southwestern Medical Center, Dallas, TX, United States. Additional authors for this research include J.M. Sacks and M.E Kupferman.

Keywords for this news article include: Texas, Dallas, Cardiology, Technology, Angiography, United States, North and Central America, Cardiovascular Diagnostic Techniques.

Ankylosing Spondylitis

Data on Ankylosing Spondylitis Discussed by Researchers at University Health Network [IL-7 primes IL-17 in mucosal-associated invariant T (MAIT) cells, which contribute to the Th17-axis in ankylosing spondylitis]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Ankylosing Spondylitis are discussed in a new report. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "Ankylosing spondylitis (AS) is a chronic inflammatory disease of unknown origin in which interleukin (IL) 17 has been genetically and therapeutically recognised as a key player. Identification of the cellular sources and inducers of IL-17 is crucial in our understanding of the drivers of inflammation in AS."

Our news editors obtained a quote from the research from University Health Network, "Recently, mucosal-associated invariant T (MAIT) cells have been implicated in autoimmune diseases. Their gut origin, effector phenotype and expression of multiple AS-associated genes, such as IL7R and IL23R, makes them potential contributors to the pathogenesis of AS. Mononuclear cells from patients with AS, healthy controls (HCs) and patients with rheumatoid arthritis were isolated from blood and synovial fluid (SF). Flow cytometry was used to identify MAIT cells. Phenotype was assessed by intracellular staining for cytokines and granzyme. Function was assessed by antigen-specific stimulation using Salmonella, or antigen non-specific activation via priming with IL-7 or IL-23. MAIT cells were reduced in frequency in the blood of patients with AS compared with HCs, yet patients with AS had an elevated frequency IL-17A+ MAIT cells. There was an enrichment of MAIT cells in SF, which had an exaggerated IL-17 phenotype. IL-17 elevation in AS MAIT cells was dependent on priming with IL-7 but not IL-23 or antigen stimulation. The AS-associated IL7R single nucleotide polymorphism (SNP), rs11742270, had no effect on IL-7R expression or function in the experiments performed."

According to the news editors, the research concluded: "This study reveals a potential role for MAIT cells in patients with AS and is the first linking IL-7 to the elevated IL-17 profile in patients through the AS-associated risk gene IL7R."

For more information on this research see: IL-7 primes IL-17 in mucosal-associated invariant T (MAIT) cells, which contribute to the Th17-axis in ankylosing spondylitis. Drugs and Therapies - Antibiotics

Data on Antibiotics Described by Researchers at University of Manitoba
(The Cardioprotective Role of N-Acetyl Cysteine Amide in the Prevention of Doxorubicin and Trastuzumab-Mediated Cardiac Dysfunction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antibiotics is the subject of a report. According to news reporting originating in Winnipeg, Canada, by NewsRx journalists, research stated, "In the breast cancer setting, anticancer therapies including doxorubicin (DOX) and trastuzumab (TRZ) are associated with a significantly increased risk of cardiotoxicity. Despite the increasing support for the role of oxidative stress (OS) in its pathophysiology, we still do not have an optimal antioxidant for the prevention of DOX + TRZ-mediated cardiac dysfunction."

The news reporters obtained a quote from the research from the University of Manitoba, "The objective of this study was to investigate whether the novel antioxidant N-acetylcysteine amide (NACA) can attenuate DOX + TRZ-induced heart failure in a murine model. A total of 100 C57Bl/6 female mice received 1 of the following drug regimens: (1) saline, (2) NACA, (3) DOX, (4) TRZ, (5) DOX+ TRZ, (6) NACA + DOX, (7) NACA + TRZ, and (8) NACA + DOX + TRZ. Serial echocardiography was performed over a 10-day study period, after which the mice were killed for histologic and biochemical analyses. In mice receiving DOX, the left ventricular ejection fraction (LVEF) decreased from 73% +/- 4% to 43% +/- 2% on day 10. In mice receiving DOX + TRZ, the LVEF decreased from 72% +/- 3% to 32% +/- 2% on day 10. Prophylactic administration of NACA to mice receiving DOX or DOX + TRZ was cardioprotective, with an LVEF of 62% +/- 3% and 55% +/- 3% on day 10, respectively. Histologic and biochemical analyses demonstrated a loss of cellular integrity, increased OS, and increased cardiac apoptosis in mice treated with DOX + TRZ, which was attenuated by the prophylactic administration of NACA."

According to the news reporters, the research concluded: "NACA attenuated the cardiotoxic side effects of DOX + TRZ in a murine model of chemotherapy-induced cardiac dysfunction by decreasing OS and apoptosis."

For more information on this research see: The Cardioprotective Role of N-Acetyl Cysteine Amide in the Prevention of Doxorubicin and Trastuzumab-Mediated Cardiac Dysfunction.
Data on Antibiotics Detailed by Researchers at Sojo University
(Pronounced Cellular Uptake of Pirarubicin versus That of Other Anthracyclines: Comparison of HPMA Copolymer Conjugates of Pirarubicin and Doxorubicin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Antibiotics. According to news reporting out of Kumamoto, Japan, by NewsRx editors, research stated, "Many conjugates of water-soluble polymers with biologically active molecules were developed during the last two decades. Although, therapeutic effects of these conjugates are affected by the properties of carriers, the properties of the attached drugs appear more important than the same carrier polymer in this case."

Financial supporters for this research include Ministry of Education, Culture, Sports, Science, and Technology, Ministerstvo Školstvi, Mladéže a Telovychovy, Grantova Agentura Ceske Republiky, Akademie Ved Ceske Republiky, Japan Society for the Promotion of Science, European Regional Development Fund.

Our news journalists obtained a quote from the research from Sojo University, "Pirarubicin (THP), a tetrahydropyranyl derivative of doxorubicin (DOX), demonstrated more rapid cellular internalization and potent cytotoxicity than DOX. Here, we conjugated the THP or DOX to N-(2-hydroxypropyl)methacrylamide copolymer via a hydrazone bond. The polymeric prodrug conjugates, P-THP and P-DOX, respectively, had comparable hydrodynamic sizes and drug loading. Compared with P-DOX, P-THP showed approximately 10 times greater cellular uptake during a 240 min incubation and a cytotoxicity that was more than 10 times higher during a 72-h incubation. A marginal difference was seen in P-THP and P-DOX accumulation in the liver and kidney at 6 h after drug administration, but no significant difference occurred in the tumor drug concentration during 624 h after drug administration. Antitumor activity against xenograft human pancreatic tumor (SUIT2) in mice was greater for P-THP than for P-DOX. To
sum up, the present study compared the biological behavior of two different drugs, each attached to an N-(2-hydroxypropyl)methacrylamide copolymer carrier, with regard to their uptake by tumor cells, body distribution, accumulation in tumors, cytotoxicity, and antitumor activity in vitro and in vivo. No differences in the tumor cell uptake of the polymer-drug conjugates, P-THP and P-DOX, were observed. In contrast, the intracellular uptake of free THP liberated from the P-THP was 2530 times higher than that of DOX liberated from P-DOX. This finding indicates that proper selection of the carrier, and especially conjugated active pharmaceutical ingredient (API) are most critical for anticancer activity of the polymer-drug conjugates. THP, in this respect, was found to be a more preferable API for polymer conjugation than DOX.

According to the news editors, the research concluded: "Hence the treatment based on enhanced permeability and retention (EPR) effect that targets more selectively to solid tumors can be best achieved with THP, although both polymer conjugates of DOX and THP exhibited the EPR effects and drug release profiles in acidic pH similarly."

For more information on this research see: Pronounced Cellular Uptake of Pirarubicin versus That of Other Anthracyclines: Comparison of HPMA Copolymer Conjugates of Pirarubicin and Doxorubicin. change in the quenching effect on Cyp18 intrinsic fluorescence. Using the thioxylated compound Cs7 as an isosteric derivative of CsA in competition assay, the experiment has led to the determination of k(off) value in solution.

According to the news editors, the research concluded: "Whereas the conformational heterogeneity of CsA has been found to be associated with its two-phase binding kinetics to Cyp18, the dissociation rate of CsA from complex is independent from the initial ligand structure."

Drugs and Therapies - Antibiotics

Data on Antibiotics Reported by Researchers at Vanderbilt University (Contribution of Organic Anion-Transporting Polypeptides 1A/1B to Doxorubicin Uptake and Clearance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antibiotics have been presented. According to news reporting originating in Nashville, Tennessee, by NewsRx journalists, research stated, "The organic anion-transporting polypeptides represent an important family of drug uptake transporters that mediate the cellular uptake of a broad range of substrates including numerous drugs. Doxorubicin is a highly efficacious and well-established anthracycline chemotherapeutic agent commonly used in the treatment of a wide range of cancers."

The news reporters obtained a quote from the research from Vanderbilt University, "Although doxorubicin is a known substrate for efflux transporters such as P-glycoprotein (P-gp; MDR1, ABCB1), significantly less is known regarding its interactions with drug uptake transporters. Here, we investigated the role of organic anion transporting polypeptide (OATP) transporters to the disposition of doxorubicin. A recombinant vaccinia-based method for expressing uptake transporters in HeLa cells revealed that OATP1A2, but not OATP1B1 or OATP1B3, and the rat ortholog Oatp1a4 were capable of significant doxorubicin uptake. Interestingly, transwell assays using Madin-Darby canine kidney II cell line cells stably expressing specific uptake and/or efflux transporters revealed that OATP1B1, OATP1B3, and OATP1A2, either alone or in combination with MDR1, significantly transported doxorubicin. An assessment of polymorphisms in SLCO1A2 revealed that four variants were associated with
significantly impaired doxorubicin transport in vitro. In vivo doxorubicin disposition studies revealed that doxorubicin plasma area under the curve was significantly higher (1.7-fold) in Slco1a1b(-/-) versus wild-type mice. The liver-to-plasma ratio of doxorubicin was significantly decreased (2.3-fold) in Slco1a1b2(-/-) mice and clearance was reduced by 40% compared with wild-type mice, suggesting Oatp1b transporters are important for doxorubicin hepatic uptake."

According to the news reporters, the research concluded: "We demonstrate important roles for OATP1A1B in transporter-mediated uptake and disposition of doxorubicin."

For more information on this research see: Contribution of Organic Anion-Transporting Polypeptides 1A/1B to Doxorubicin Uptake and Clearance. *Molecular Pharmacology*, 2017;91(1):14-24. *Molecular Pharmacology* can be contacted at: Amer Soc Pharmacology Experimental Therapeutics, 9650 Rockville Pike, Bethesda, MD 20814-3995, USA.

**Drugs and Therapies - Antifungals**

**Data on Antifungals Reported by Researchers at Federal University (Miltefosine inhibits Candida albicans and non-albicans Candida spp. biofilms and impairs the dispersion of infectious cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antifungals. According to news reporting originating from Rio de Janeiro, Brazil, by NewsRx correspondents, research stated, "Candida spp. can adhere to and form biofilms over different surfaces, becoming less susceptible to antifungal treatment. Resistance of biofilms to antifungal agents is multifactorial and the extracellular matrix (ECM) appears to play an important role."

Funders for this research include Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Fundacao Carlos Chagas Filho de Amparo a Pesquisa do Estado do Rio de Janeiro.

Our news editors obtained a quote from the research from Federal University, "Among the few available antifungals for treatment of candidaemia, only the lipid formulations of amphotericin B (AmB) and the echinocandins are effective against biofilms. Our group has previously demonstrated that miltefosine has an important effect against Candida albicans biofilms. Thus, the aim of this work was to expand the analyses of the in vitro antibiofilm activity of miltefosine to non-albicans Candida spp. Miltefosine had significant antifungal activity against planktonic cells and the development of biofilms of C. albicans, Candida parapsilosis, Candida tropicalis and Candida glabrata. The activity profile in biofilms was superior to fluconazole and was similar to that of AmB and caspofungin. Biofilm-derived cells with their ECM extracted became as susceptible to miltefosine as planktonic cells, confirming
the importance of the ECM in the biofilm resistant behaviour. Miltefosine also inhibited biofilm dispersion of cells at the same concentration needed to inhibit planktonic cell growth."

According to the news editors, the research concluded: "The data obtained in this work reinforce the potent inhibitory activity of miltefosine on biofilms of the four most pathogenic Candida spp. and encourage further studies for the utilisation of this drug and/or structural analogues on biofilm-related infections."

The news editors report that additional information may be obtained by contacting T. Vila, Federal University of Rio de Janeiro, Inst Biofis Carlos Chagas Filho, Center Ciencias Saude, Lab Biol Celular Fungos, BR-21941902 Rio De Janeiro, RJ, Brazil. Additional authors for this research include K. Ishida, S.H. Seabra and S. Rozental.

**Drugs and Therapies - Antifungals**

**Data on Antifungals Reported by Researchers at University of Science and Technology (Ketoconazole encapsulated in chitosan-gellan gum nanocomplexes exhibits prolonged antifungal activity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antifungals. According to news reporting originating in Haryana, India, by NewsRx journalists, research stated, "The objective of the present study was to prepare ketoconazole loaded chitosan-gellan gum (CSGG) nanoparticles and to evaluate them for antifungal activity against Aspergillus niger. Ketoconazole loaded CSGG nanoparticles were prepared by electrostatic complexation technique using chitosan (CS) as cationic polymer and gellan gum (GG) as anionic polymer with ketoconazole as drug."

Financial support for this research came from Ruma Rani.

The news reporters obtained a quote from the research from the University of Science and Technology, "It was observed that the effect of gellan gum on particle size was more pronounced in comparison to chitosan and increase in its concentration resulted in a significant increase in particle size but decrease in zeta potential. Whereas, increase in concentration of chitosan resulted in increase in zeta potential. The particle size and zeta potential of optimal formulation was 155.7 +/- 26.1 nm and 32.1 +/- 2.8 mV which obtained at concentration of chitosan (0.02% w/v) and gellan gum (0.01% w/v)."

According to the news reporters, the research concluded: "On comparative
evaluation, ketoconazole loaded CSGG nanoparticles showed significantly higher antifungal activity against Aspergillus niger than dummy CSGG nanoparticles (without drug) and drug individually."

Our news correspondents report that additional information may be obtained by contacting R. Thakur, Gum Jambheshwar Univ Sci & Technol, Dept. of Bio & Nanotechnol, Hisar 125001, Haryana, India. Additional authors for this research include P. Kaur, M. Bernela, R. Rani and R. Thakur.

**Drugs and Therapies - Antineoplastic Monoclonal...**

**Data on Antineoplastic Monoclonal Antibodies Detailed by Researchers at Children's Hospital (Ofatumumab in two pediatric nephrotic syndrome patients allergic to rituximab)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antineoplastic Monoclonal Antibodies have been published. According to news originating from Rome, Italy, by NewsRx correspondents, research stated, "Rituximab, a chimeric anti-CD20 monoclonal antibody, is an effective treatment in steroid-dependent nephrotic syndrome (SDNS). However, some patients develop adverse reactions."

Our news journalists obtained a quote from the research from Children's Hospital, "Patient 1, a 14-year-old boy with SDNS since the age of 2, was treated with oral prednisone, cyclosporine A (CsA) and mycophenolate mofetil. A first infusion of rituximab at age 12 years was well tolerated, but this was followed by a prolonged relapse unresponsive to oral prednisone, mycophenolate mofetil and CsA. A second rituximab infusion was attempted, but treatment was interrupted due to severe dyspnea. Treatment with a humanized anti-CD20 monoclonal antibody, ofatumumab, was then attempted. The patient experienced a mild allergic reaction and maintained remission despite interruption of all treatment at > 12 months of follow-up. Patient 2, a 3-year-old boy who presented at 18 months with nephrotic syndrome initially resistant to treatment with oral prednisone, was given with three intravenous boluses of methylprednisolone followed by CsA and achieved remission. Upon steroid discontinuation, the
NS relapsed. Prednisone was restarted and treatment with a single dose of rituximab was never completed due to a severe allergic reaction. Ofatumumab infusion was uneventful, and he maintained remission during the follow-up period (> 12 months) despite interruption of prednisone therapy. B cells reappeared at 7 months in both patients."

According to the news editors, the research concluded: "Ofatumumab may be a therapeutic option in severe forms of NS with allergy to rituximab."

For more information on this research see: Ofatumumab in two pediatric nephrotic syndrome patients allergic to rituximab. *Pediatric Nephrology*, 2017;32(1):181-184. *Pediatric Nephrology* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. **Antioxidants**

**Data on Antioxidants Reported by Researchers at School of Chemistry (Selective and Sensitive Monitoring of Cerebral Antioxidants Based on the Dye-Labeled DNA/Polypdopamine Conjugates)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Antioxidants are presented in a new report. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "A simple and novel method for evaluating antioxidants in complex biological fluids has been developed based on the interaction of dye-labeled single strand DNA (ssDNA) and polydopamine (PDA). Due to the interaction between ssDNA and PDA, the fluorescence of dye-labeled ssDNA (e.g., FITC-ssDNA, as donor) can be quenched by PDA (as acceptor) to the fluorescence 'off' state through Forster resonance energy transfer (FRET)."

Financial supporters for this research include China Postdoctoral Science Foundation, Shanghai Municipal Education Commission, National Natural Science Foundation of China, Shanghai Education Development Foundation.

Our news editors obtained a quote from the research from the School of Chemistry, "However, in the presence of various antioxidants, such as glutathione (GSH), ascorbic acid
(AA), cysteine (Cys), and homocysteine (Hcys), the spontaneous oxidative polymerization reaction from DA to PDA would be blocked, resulting in the freedom of FITC-ssDNA and leading to the fluorescence 'on' state. The sensing system shows great sensitivity for the monitoring of antioxidants in a fluorescent 'turn on' format. The new strategy also exhibits great selectivity and is free from the interferences of amino acids, metal ions and the biological species commonly existing in brain systems. Moreover, by combining the micro dialysis technique, the present method has been successfully applied to monitor the dynamic changes of the striatum antioxidants in rat cerebrospinal microdialysates during the normal/ischemia/reperfusion process."

According to the news editors, the research concluded: "This work establishes an effective platform for in vivo monitoring antioxidants in cerebral ischemia model, and promises new opportunities for the research of brain chemistry, neuroprotection, physiological, and pathological events."

For more information on this research see: Selective and Sensitive Monitoring of Cerebral Antioxidants Based on the Dye-Labeled DNA/Polydopamine Conjugates. *Analytical Chemistry*, 2016;88(23):11647-11653. *Analytical Chemistry* can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; Analytical Chemistry - www.pubs.acs.org/journal/ancham)

**Drugs and Therapies - Antiretrovirals**

**Data on Antiretrovirals Reported by Researchers at University of Torino (Clinical pharmacology of tenofovir clearance: a pharmacokinetic/pharmacogenetic study on plasma and urines)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antiretrovirals. According to news reporting from Turin, Italy, by NewsRx journalists, research stated, "The HIV virus and hepatitis B virus nucleotide reverse transcriptase inhibitor tenofovir has been associated with proximal tubular toxicity; the latter was found to be predicted by plasma concentrations and with single-nucleotide polymorphisms in transporters-encoding genes. A cross-sectional analysis in adult HIV-positive patients with estimated creatinine clearance > 60 ml min(-1) was performed."

The news correspondents obtained a quote from the research from the University of Torino, "Twelve-hour plasma and urinary tenofovir concentrations and single-nucleotide polymorphisms in several transporter-encoding genes were analysed. In 289 patients 12-h
tenofovir plasma, urinary and urinary to plasma ratios were 69 ng ml(-1) (interquartile range 51.5-95), 24.3 mg ml(-1) (14.3-37.7) and 384 (209-560). At multivariate analysis estimated creatinine clearance, protease inhibitors co-administration and SLC28A2 CT/TT genotypes were independently associated with plasma tenofovir exposure; ABCC10 GA/AA genotypes and protease inhibitor co-administration were independently associated with the urinary to plasma tenofovir ratio."

According to the news reporters, the research concluded: "Tenofovir clearance was associated with genetic polymorphisms in host genes and with co-administered drugs: if confirmed by ongoing studies these data may inform treatment tailoring and/or dose reductions."

Our news journalists report that additional information may be obtained by contacting A. Calcagno, Univ Torino, Dept. of Med Sci, Infect Dis Unit, Turin, Italy. Additional authors for this research include J. Cusato, L. Marinaro, L. Trentini, C. Alcantarini, M. Mussa, M. Simiele, A. D'Avolio, G. Di Perri and S. Bonora.

Drugs and Therapies - Antiretrovirals

Data on Antiretrovirals Reported by S. Llabres and Co-Researchers (Mechanism of the Pseudoirreversible Binding of Amantadine to the M2 Proton Channel)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antiretrovirals have been presented. According to news reporting originating in Genoa, Italy, by NewsRx journalists, research stated, "The M2 proton channel of influenza A virus is an integral membrane protein involved in the acidification of the viral interior, a step necessary for the release of the viral genetic material and replication of new virions. The aim of this study is to explore the mechanism of drug (un)binding to the M2 channel in order to gain insight into the structural and energetic features relevant for the development of novel inhibitors."

Financial support for this research came from Generalitat de Catalunya.
The news reporters obtained a quote from the research, "To this end, we have investigated the binding of amantadine (Amt) to the wild type (wt) M2 channel and its V27A variant using multiple independent molecular dynamics simulations, exploratory conventional metadynamics, and multiple walkers well-tempered metadynamics calculations. The results allow us to propose a sequential mechanism for the (un)binding of Amt to the wt M2 channel, which involves the adoption of a transiently populated intermediate (up state) leading to the thermodynamically favored down binding mode in the channel pore. Furthermore, they suggest that chloride anions play a relevant role in stabilizing the down binding mode of Amt to the wt channel, giving rise to a kinetic trapping that explains the experimentally observed pseudoirreversible inhibition of the wt channel by Amt. We propose that this trapping mechanism underlies the inhibitory activity of potent M2 channel blockers, as supported by the experimental confirmation of the irreversible binding of a pyrrolidine analogue from electrophysiological current assays. Finally, the results reveal that the thermodynamics and kinetics of Amt (un)binding is very sensitive to the V27A mutation, providing a quantitative rationale to the drastic decrease in inhibitory potency against the V27A variant."

According to the news reporters, the research concluded: "Overall, these findings pave the way to explore the inhibitory activity of Amt-related analogues in mutated M2 channel variants, providing guidelines for the design of novel inhibitors against resistant virus strains."

Our news correspondents report that additional information may be obtained by contacting A. Cavalli, Ist Italiano Tecnol, CompuNet, I-16163 Genoa, Italy. Additional authors for this research include J. Juarez-Jimenez, M. Masetti, R. Leiva, S. Vazquez, S. Gazzarrini, A. Moroni, A. Cavalli and F.J. Luque.

Data on Arteriovenous Fistula Reported by Researchers at University of Alabama (Safety and Efficacy of En Bloc Renal Hilar Vascular Staple Ligation: A Meta-Analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Arteriovenous Fistula have been presented. According to news reporting out of Birmingham, Alabama, by
NewsRx editors, research stated, "We reviewed the literature on the safety of en bloc ligation. We also performed a meta-analysis of the effect of using this technique with vascular staplers on perioperative factors compared to conventional renal pedicle dissection and isolated staple ligation of the renal artery and vein."

Our news journalists obtained a quote from the research from the University of Alabama, "A literature search was performed to include all primary studies related to the safety of en bloc ligation of the renal hilum. After exclusion criteria were applied 9 studies were identified for review, of which 4 included a control group and were used in the meta-analysis. The primary end point was the incidence of arteriovenous fistula. Secondary end points were procedure duration, blood loss and the number of perioperative complications. None of the total population of 595 patients in whom en bloc ligation was performed for nephrectomy were diagnosed with arteriovenous fistula formation at an average postoperative followup of 26.5 months. When comparing en bloc and isolated ligation of the renal artery and vein, the meta-analysis showed a significant improvement in procedure duration for en bloc nephrectomy. There was no difference in estimated blood loss or the number of complications."

According to the news editors, the research concluded: "En bloc ligation appears to be as safe as and potentially more beneficial in terms of perioperative factors than conventional renal pedicle dissection and isolated vascular ligation."

Our news journalists report that additional information may be obtained by contacting S. Rais-Bahrami, Univ Alabama Birmingham, Dept. of Urol WSL SR B & Radiol SR B, Birmingham, AL, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.juro.2016.07.077. This DOI is a link to an online electronic document that is either free or for purchase.

Musculoskeletal Diseases and Conditions - Arthralgia

Data on Arthralgia Reported by Researchers at Research Hospital (Alendronate- and risedronate-induced acute polyarthritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Musculoskeletal Diseases and Conditions - Arthralgia is the subject of a report. According to news reporting originating in Istanbul, Turkey, by NewsRx editors, the research stated, "Bisphosphonates are the mainstay treatment for postmenopausal osteoporosis. Although bisphosphonates are safety drugs, they have numerous side-effects such as arthralgia, elevated erythrocyte sedimentation rate and C-reactive protein, gastrointestinal
disturbances, and flu-like illness with symptoms of fatigue, fever, chills, malaise, and myalgia."

The news reporters obtained a quote from the research from Research Hospital, "We present a case of acute polyarthritis after administration of alendronate and risedronate in a 52-year-old woman. To the best of the author's knowledge, this is the first case of acute polyarthritis induced by per os administration of both alendronate and risedronate during weekly usage. This is a report of a 52-year-old woman admitted to our hospital every week in a month, within 48 h, after receiving three times alendronate and one time risedronate with diffuse arthralgias, myalgias, and swelling with effusions in both wrists, both ankles, interphalangeal joints in both hands and feet, and in both knees. When we discontinued alendronate and risedronate, oral raloxifene (60 mg/day) with oral calcium (1 g/day), and vitamin D3 (800 IU/day) was initiated. The symptoms regressed in 1 week. During the 1 year follow-up period, no myalgia, arthritis, or synovitis was detected. The side-effects of bisphosphonates are rarely reported in the literature. We believe that the prevalence of these side-effects would increase by closer follow-up of patients receiving these medications."

According to the news reporters, the research concluded: "To our knowledge, this patient is the first reported case of acute polyarthritis induced by per os administration of both alendronate and risedronate during weekly usage."

Our news correspondents report that additional information may be obtained by contacting M. Ugurlar, Sisli Hamidiye Etfal Educ & Res Hosp, Istanbul, Turkey.

**Biomedical Engineering - Artificial Saliva**

**Data on Artificial Saliva Reported by Researchers at University of Sindh**

*(Vortex-assisted ionic liquid-based dispersive liquid-liquid microextraction for assessment of chromium species in artificial saliva extract of different chewing tobacco ...)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biomedical Engineering - Artificial Saliva. According to news reporting originating from Jamshoro, Pakistan, by NewsRx correspondents, research stated, "A novel dispersive liquid-liquid microextraction (ILDLL mu E) method using an extracting solvent (ionic liquid) and dispersant (Triton X-114) was developed for the separation and preconcentration of hexavalent chromium (Cr6+) in artificial
saliva extract (ASE) of chewing tobacco products, gutkha, and mainpuri (n = 23). In the proposed method, the extraction of Cr6+ was accomplished by using ammonium pyrrolidinedithiocarbamate (APDC) as complexing agent and 1-butyl-3-methylimidazolium hexafluorophosphate [C4MIM] [PF6] as extracting solvent.

Our news editors obtained a quote from the research from the University of Sindh, "The tiny droplet of metal chelate was then dispersed into TX-114 emulsion, using vortex mixer. Various parameters such as concentration of APDC, pH of the solution, volume of [C4MIM] [PF6], and TX-114 as well as extraction time were studied. Under the most favorable conditions, the limit of detection was found to be 0.068 μg/L with the relative standard deviation < 5 %. The enrichment factor of developed method was found as 62.5, and method has been effectively applied for the analysis of Cr species in artificial saliva extract of gutkha and mainpuri products. The Cr6+ was quantitatively recovered (< 97 %) under optimal conditions, while the recovery of trivalent specie (Cr3+), at the same experimental conditions, was observed to be < 5 %. The Cr3+ was determined by the difference of total Cr and Cr6+ in artificial saliva extract of selected STP. Health risks associated with the intake of total Cr in gutkha and mainpuri were assessed in terms of estimated daily intake, such as carcinogenic and noncarcinogenic risks."

According to the news editors, the research concluded: "Estimated daily intake of Cr via chewing 10 g/day of gutkha and mainpuri was found to be below the maximum tolerable daily intake, whereas the calculated risk of cancer for Cr was observed in the acceptable range of 10E(-6)-10E(-4), except some brands of gutkha."

**Cardiovascular Diseases and Conditions** -

**Data on Atherosclerosis Reported by Researchers at Albert Einstein Israelite Hospital (Epicardial fat is associated with severity of subclinical coronary atherosclerosis in familial hypercholesterolemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions -
Atherosclerosis have been published. According to news reporting from Sao Paulo, Brazil, by NewsRx journalists, research stated, "Familial hypercholesterolemia (FH) is a common genetic disorder characterized by elevated blood cholesterol, increased prevalence of subclinical atherosclerosis and high risk of premature coronary heart disease. However, this risk is not explained solely by elevated LDL-cholesterol concentrations, and other factors may influence atherosclerosis development."

Financial support for this research came from FAPESP.

The news correspondents obtained a quote from the research from Albert Einstein Israelite Hospital, "There is evidence that increased adiposity may predispose to atherosclerosis in FH. Epicardial fat has been associated with subclinical coronary atherosclerosis in the general population. This study evaluated the association of epicardial fat (EFV) volume with the presence and extent of subclinical coronary atherosclerosis detected by computed tomography angiography in FH patients. Ninety-seven FH subjects (35% male, mean age 45 +/- 13 years, LDL-C 281 +/- 56 mg/dL, 67% with proven molecular defects) underwent computed tomography angiography and coronary artery calcium (CAC) scoring. EFV was measured in non-contrast images using a semi-automated method. Segment-stenosis score (SSS) and segment-involvement score (SIS) were calculated. Multivariate Poisson regression was utilized to assess an independent association of EFV with coronary atherosclerotic burden. EFV was positively associated with age, body mass index, waist circumference, blood glucose, the presence of the metabolic syndrome components, but not with LDL-C. After adjusting for confounders and abdominal circumference, an independent association (shown as beta coefficients and 95% confidence intervals) of EVF with CAC scores [beta = 0.263 (0.234; 0.292), p = 0.000], SIS [beta = 0.304 (0.141; 0.465) p = 0.000] and SSS [beta = 0.296 (0.121; 0.471), p = 0.001] was found."

According to the news reporters, the research concluded: "In FH, EFV was independently associated with coronary atherosclerotic presence and severity."

For more information on this research see: Epicardial fat is associated with severity of subclinical coronary atherosclerosis in familial hypercholesterolemia. Atherosclerosis, 2016;254():73-77. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. Data on Atopic Dermatitis Reported by Researchers at Central South University (The Genetics and Epigenetics of Atopic Dermatitis-Filaggrin and Other Polymorphisms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Skin Diseases and Conditions - Atopic Dermatitis are presented in a new report. According to news reporting originating from Changsha, People's Republic of China, by NewsRx correspondents, research stated, "Atopic dermatitis (AD) is a chronic inflammatory skin disease caused by a combination of genetic and environmental factors. Genetic evidences depict a complex network comprising by epidermal barrier dysfunctions and dysregulation of innate and adaptive immunity in the pathogenesis of AD."

Our news editors obtained a quote from the research from Central South University, "Mutations in the human filaggrin gene (FLG) are the most significant and well-replicated genetic mutation associated with AD, and other mutations associated with epidermal barriers such as SPINK5, FLG-2, SPRR3, and CLDN1 have all been linked to AD. Gene variants may also contribute to the abnormal innate and adaptive responses found in AD, including mutations in PRRs and AMPs, TSLP and TSLPR, IL-1 family cytokines and receptors genes, vitamin D pathway genes, FCER1A, and Th2 and other cytokines genes. GWAS and Immunochip analysis have identified a total of 19 susceptibility loci for AD. Candidate genes at these susceptibility loci identified by GWAS and Immunochip analysis also suggest roles for epidermal barrier functions, innate and adaptive immunity, interleukin-1 family signaling, regulatory T cells, the vitamin D pathway, and the nerve growth factor pathway in the pathogenesis of AD. Increasing evidences show the modern lifestyle (i.e., the hygiene hypothesis, Western diet) and other environmental factors such as pollution and environmental tobacco smoke (ETS) lead to the increasing prevalence of AD with the development of industrialization. Epigenetic alterations in response to these environmental factors, including DNA methylation and microRNA related to immune system and skin barriers, have been found to contribute to the pathogenesis of AD."

According to the news editors, the research concluded: "Genetic variants and epigenetic alteration might be the key tools for the molecular taxonomy of AD and provide the background for the personalized management."

For more information on this research see: The Genetics and Epigenetics of Atopic Dermatitis-Filaggrin and Other Polymorphisms. Clinical Reviews in Allergy & Immunology, 2016;51(3):315-328. Heart Disorders and Diseases - Atrial Fibrillation

Data on Atrial Fibrillation Detailed by Researchers at AHEPA University Hospital (Left atrial appendage occlusion for stroke prevention in atrial fibrillation: multicentre experience with the AMPLATZER Cardiac Plug)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting from Thessaloniki, Greece, by NewsRx journalists, research stated, "To investigate the safety, feasibility, and efficacy of left atrial appendage occlusion (LAAO) with the AMPLATZER Cardiac Plug (ACP) for stroke prevention in patients with atrial fibrillation (AF). Data from consecutive patients treated in 22 centres were collected."

The news correspondents obtained a quote from the research from AHEPA University Hospital, "A total of 1,047 patients were included in the study. Procedural success was 97.3%. There were 52 (4.97%) periprocedural major adverse events. Follow-up was complete in 1,001/1,019 (98.2%) of successfully implanted patients (average 13 months, total 1,349 patient-years). One-year all-cause mortality was 4.2%. No death at follow-up was reported as device-related. There were nine strokes (0.9%) and nine transient ischaemic attacks (0.9%) during follow-up. The annual rate of systemic thromboembolism was 2.3% (31/1,349 patient-years), which is a 59% risk reduction. There were 15 major bleedings (1.5%) during follow-up. The annual rate of major bleeding was 2.1% (28/1,349 patient-years), which is a 61% risk reduction. Patients with single LAAO on aspirin monotherapy or no therapy and longer follow-up had fewer cerebral and fewer bleeding events. In this multicentre study, LAAO with the ACP showed high procedural success and a favourable outcome for the prevention of AF-related thromboembolism."

According to the news reporters, the research concluded: "Modification in antithrombotic therapy after LAAO may result in reduction of bleeding events."

For more information on this research see: Left atrial appendage occlusion for stroke prevention in atrial fibrillation: multicentre experience with the AMPLATZER Cardiac Plug. Eurointervention, 2016;11(10):1170-9.

**Heart Disorders and Diseases - Atrial Fibrillation**

**Data on Atrial Fibrillation Detailed by Researchers at Fairleigh Dickinson University [Atrial Electrocardiography in Obesity and Hypertension: Clinical Insights from the Polish-Norwegian Study (PONS)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting from Florham Park, New Jersey, by NewsRx journalists, research stated, "Obesity and hypertension often coexist and represent risk factors for atrial fibrillation. This study hypothesized that their single and joint effects on atrial remodeling would be reflected in the PR interval and P-wave durations on electrocardiogram (ECG)."

The news correspondents obtained a quote from the research from Fairleigh Dickinson University, "This cross-sectional analysis of a community-based study included 11,308 men and women age 45-64. Atrial indices were obtained from digital standard 12-lead resting ECG. Analyses were adjusted for traditional cardiovascular risk factors. Both ECG indices displayed a progressive increase across anthropometric indices. Each 5-unit increment in body mass index (BMI) increased P-wave duration by 1.9 ms (95% CI 1.5-2.2) and PR interval by 2.4 ms (95% CI 1.9-3.0), with similar trends for central obesity, even among those without obesity by BMI. Both ECG indices displayed graded increases across levels of blood pressure control, including prehypertension. A joint effect of overweight and hypertension on both ECG indices was detected. P-wave duration or PR interval among people with obesity was not additionally increased by hypertension. P-wave indices increase in general and central obesity. Hypertension exerts an incremental effect in people with overweight but not in people with obesity."

According to the news reporters, the research concluded: "The study furthered the understanding of atrial remodeling in the setting of major atrial fibrillation risk factors."

For more information on this research see: Atrial Electrocardiography in Obesity and Hypertension: Clinical Insights from the Polish-Norwegian Study (PONS). Obesity, 2016;24(12):2608-2614. Obesity can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

Our news journalists report that additional information may be obtained by contacting G.D. Vaidean, Fairleigh Dickinson Univ, Sch Pharm, Div Pharm Practice, Florham Pk, NJ 07932, United States. Additional authors for this research include M. Manczuk and J.W. Magnani.

Data on Atrial Fibrillation Detailed by Researchers at Tomsk Polytechnic University (Assessment of radiological techniques application possibility for non-invasive diagnostics of latent inflammatory processes in myocardium in patients with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting out of Tomsk, Russia, by NewsRx editors, research stated, "Aim was to study the performance of single-photon emission computed tomography (SPECT) with Tc-99m-pyrophosphate (Tc-99m-PYP) in diagnostics of chronic latent inflammation in myocardium of patients with atrial fibrillation (AF). The research included 70 patients (the average age of 49.3 +/- 10.2 years) with persistent form of idiopathic AF."

Financial support for this research came from Russian Science Foundation.

Our news journalists obtained a quote from the research from Tomsk Polytechnic University, "All patients underwent myocardium SPECT with Tc-99m-PYP and cardiac magnetic resonance imaging (CMR) before the ablation. During the ablation endomyocardium sampling for histological and immunohistochemical verification of myocarditis was performed. Sensitivity of SPECT with Tc-99m-PYP in diagnoses of chronic latent myocarditis in patients with AF in relation to endomyocardial biopsy was 80 %, specificity-83 % and diagnostic accuracy-82 %. Sensitivity, specificity and diagnostic accuracy of myocardium perfusion scintigraphy for diagnostics of latent myocarditis in relation to endomyocardial biopsy was 30, 50 and 50 % correspondingly. Also the close correlation between the size of the perfusion defect and the severity of myocardial fibrosis in patients with AF was revealed. Specificity of the Lake Louise criteria for diagnostics of latent myocarditis in relation to endomyocardial biopsy was 77.6 %, sensitivity-60 % and diagnostic accuracy-74.5 %. For only LGE specificity was 16 %, sensitivity-90 % and diagnostic accuracy-28 %. The study showed the possibility of successful application of radionuclide methods for diagnostics of chronic latent myocarditis at AF."

According to the news editors, the research concluded: "Taking into account high informative values the results of scintigraphy can be also considered as a promising additional criteria for selecting patients with AF of unexplained etiology for non-invasive endomyocardial biopsy procedure."

Our news journalists report that additional information may be obtained by contacting S.I. Sazonova, Natl Res Tomsk Polytechnic Univ, Lab 31, Tomsk 634050, Russia. Additional authors for this research include J.N. Ilyushenkova, Y.B. Lishmanov, R.E. Batalov, A.E. Sazonov, L.A. Larionova, E.A. Nesterov, N.V. Varlamova, J.V. Rogovskaya, T.A. Shelkovnikova and S.V. Popov.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s12149-016-1120-9. This DOI is a link to an online electronic document that is either free or for purchase.
Data on Atrial Fibrillation Discussed by Researchers at Kanazawa University (Inflammation of left atrial epicardial adipose tissue is associated with paroxysmal atrial fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Atrial Fibrillation is now available. According to news reporting from Ishikawa, Japan, by NewsRx journalists, research stated, "Although an increased epicardial adipose tissue (EAT) volume around the left atrium (LA) is related to the atrial fibrillation (AF) burden, the role of EAT inflammation in AF is unclear. We investigated the association between AF and inflammation of the EAT around the LA."

The news correspondents obtained a quote from the research from Kanazawa University, "We retrospectively identified regions of EAT around the LA and measured the density of these areas using computed tomography (CT). A total of 32 patients who underwent their first catheter ablation for paroxysmal AF (PAF) were enrolled (mean age 62.5 +/- 11.1 years). Patients without a history of AF (n = 32), but who underwent cardiac CT and were matched by age, sex, and metabolic risk factors, were enrolled in the control group (62.2 +/- 12.1 years). The mean EAT density around the LA was significantly higher in the PAF group than in the control group (-108.1 +/- 6.7 vs.-111.6 +/- 5.5 Hounsfield units; p = 0.02), while the densities of subcutaneous adipose tissue (SAT) in the abdomen and thorax did not differ between the two groups. In a multiple logistic regression analysis, a higher EAT density was significantly associated with the presence of PAF after adjusting for other risk factors (odds ratio: 1.25; 95% confidence interval: 1.08-1.45, p = 0.003)."

According to the news reporters, the research concluded: "This study supports the hypothesis that inflammation of EAT around the LA, but not SAT, is related to the presence of PAF."

For more information on this research see: Inflammation of left atrial epicardial adipose tissue is associated with paroxysmal atrial fibrillation. Journal of Cardiology, 2016;68(5-6):406-411. Journal of Cardiology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Cardiology - www.journals.elsevier.com/journal-of-cardiology/)

Our news journalists report that additional information may be obtained by contacting H. Furusho, Kanazawa University, Grad Sch Med Sci, Dept. of Dis Control & Homeostasis, Kanazawa, Ishikawa 9208641, Japan. Additional authors for this research include H. Furusho, H. Iashiwagi, T. Kato, H. Murai, S. Usui, S. Kaneko and M. Takamura.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jjcc.2015.11.005. This DOI is a link to an online electronic document that is either free or for purchase.
Heart Disorders and Diseases - Atrial Fibrillation

Data on Atrial Fibrillation Reported by Researchers at Tokyo Women’s Medical University (Enlarged left atrium and sudden death risk in hypertrophic cardiomyopathy patients with or without atrial fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Atrial Fibrillation are discussed in a new report. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "The relationships among enlarged left atrial dimension (LAD), the presence or absence of atrial fibrillation (AF), and sudden death risk in patients with hypertrophic cardiomyopathy (HCM) remain unclear. The aim of this study was to evaluate the impact of enlarged LAD on sudden death risk in HCM patients with or without documented AF."

The news reporters obtained a quote from the research from Tokyo Women’s Medical University, "This study included 564 HCM patients (follow-up period: 10.8 +/- 7.4 years). LAD was measured from the parasternal long-axis view as the antero-posterior linear diameter at end-systole. Sudden death was defined as the combined endpoint of sudden cardiac death and potentially lethal arrhythmic events, and log rank tests and Cox proportional hazards models were applied to evaluate the impact of LAD enlargement on the combined endpoint. The proportions of patients with sudden death and potentially lethal arrhythmic events were significantly higher among patients with enlarged LAD (>= 48 mm, N = 86) compared with those without enlarged LAD (19.8% vs. 8.2%; p = 0.002). However, enlarged LAD was not identified as an independent determinant of sudden death risk in multivariate analysis of all study HCM patients [adjusted hazard ratio (HR): 1.83; 95% confidence interval (CI): 0.95-3.53; p = 0.071]. Among patients without documented AF during the follow-up periods, enlarged LAD was an independent determinant of sudden death risk (adjusted HR: 5.23; 95% CI: 2.17-12.58; p< 0.001), although there was no significant difference in sudden death risk between patients with and without enlarged LAD in patients with documented AF (adjusted HR: 0.77; 95% CI: 0.31-1.90; p = 0.567). These results suggest that the relationship between LAD and outcome is influenced by the presence or absence of AF in HCM patients."

According to the news reporters, the research concluded: "It may thus be necessary to consider the need to prevent sudden death in LAD-enlarged HCM patients without documented AF."

For more information on this research see: Enlarged left atrium and sudden death risk in hypertrophic cardiomyopathy patients with or without atrial fibrillation. Journal of Cardiology, 2016;68(5-6):478-484. Journal of Cardiology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Cardiology - www.journals.elsevier.com/journal-of-cardiology/)

Heart Disorders and Diseases - Atrial Fibrillation

Data on Atrial Fibrillation Reported by Researchers at Uppsala University (Performance and Validation of a Novel Biomarker-Based Stroke Risk Score for Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Atrial Fibrillation is the subject of a report. According to news reporting from Uppsala, Sweden, by NewsRx journalists, research stated, "Atrial fibrillation is associated with increased but variable risk of stroke. Our aim was to validate the recently developed biomarker-based ABC (age, biomarkers [high-sensitivity troponin and N-terminal fragment B-type natriuretic peptide], and clinical history of prior stroke/transient ischemic attack)-stroke risk score and compare its performance with the CHA(2)DS(2)VASc and ATRIA (Anticoagulation and Risk Factors in Atrial Fibrillation) risk scores."

The news correspondents obtained a quote from the research from Uppsala University, "The ABC-stroke score includes age, biomarkers (N-terminal fragment B-type natriuretic peptide and high-sensitivity cardiac troponin), and clinical history (prior stroke). This validation was based on 8356 patients, 16,137 person-years of follow-up, and 219 adjudicated stroke or systemic embolic events in anticoagulated patients with atrial fibrillation in the RE-LY study (Randomized Evaluation of Long-Term Anticoagulation Therapy). Levels of N-terminal fragment B-type natriuretic peptide, high-sensitivity cardiac troponin T (hs-cTnT), and high-sensitivity cardiac troponin I (hs-cTnI) were determined in plasma samples obtained at study entry. The ABC-stroke score was well calibrated with 0.76 stroke/systemic embolic events per 100 person-years in the predefined low (<1%/y) risk group, 1.48 in the medium (1%-2%/y) risk group, and 2.60 in the high (>2%/y) risk group for the ABC-stroke score with hs-cTnT. Hazard ratios for stroke/systemic embolic events were 1.95 for medium-versus low-risk groups, and 3.44 for high-versus low-risk groups. ABC-stroke score achieved C indices of 0.65 with both hs-cTnT and hs-cTnI, in comparison with 0.60 for CHA(2)DS(2)VASc (P=0.004 for hs-cTnT and P=0.022 hs-cTnI) and 0.61 for ATRIA scores (P=0.005 hs-cTnT and P=0.034 for hs-cTnI). The biomarker-based ABC-stroke score was well calibrated and consistently performed better than both the CHA(2)DS(2)VASc and ATRIA stroke scores."

According to the news reporters, the research concluded: "The ABC score should be considered an improved decision support tool in the care of patients with atrial fibrillation."

For more information on this research see: Performance and Validation of a Novel Biomarker-Based Stroke Risk Score for Atrial Fibrillation. Circulation, 2016;134(22):1697-
Aurothioglucose

Data on Aurothioglucose Reported by Researchers at Purdue University
(Antibacterial activity and mechanism of action of auranofin against multi-drug resistant bacterial pathogens)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Aurothioglucose. According to news reporting originating from West Lafayette, Indiana, by NewsRx correspondents, research stated, "Traditional methods employed to discover new antibiotics are both a time-consuming and financially-taxing venture. This has led researchers to mine existing libraries of clinical molecules in order to repurpose old drugs for new applications (as antimicrobials)."

Our news editors obtained a quote from the research from Purdue University, "Such an effort led to the discovery of auranofin, a drug initially approved as an anti-rheumatic agent, which also possesses potent antibacterial activity in a clinically achievable range. The present study demonstrates auranofin's antibacterial activity is a complex process that involves inhibition of multiple biosynthetic pathways including cell wall, DNA, and bacterial protein synthesis. We also confirmed that the lack of activity of auranofin observed against Gram-negative bacteria is due to the permeability barrier conferred by the outer membrane. Auranofin's ability to suppress bacterial protein synthesis leads to significant reduction in the production of key methicillin-resistant *Staphylococcus aureus* (MRSA) toxins. Additionally, auranofin is capable of eradicating intracellular MRSA present inside infected macrophage cells. Furthermore, auranofin is efficacious in a mouse model of MRSA systemic infection and significantly reduces the bacterial load in murine organs including the spleen and liver."

According to the news editors, the research concluded: "Collectively, this study provides valuable evidence that auranofin has significant promise to be repurposed as a novel antibacterial for treatment of invasive bacterial infections."

For more information on this research see: Antibacterial activity and mechanism of action of auranofin against multi-drug resistant bacterial pathogens. *Scientific Reports*, 2016;6 ():22571. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting S.
Data on Autacoids Reported by Researchers at Center for Disease Control and Prevention (Drug interactions between hormonal contraceptives and psychotrophic drugs: a systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biological Factors - Autacoids.

According to news reporting originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "To examine whether the co-administration of hormonal contraceptives (HC) and psychotropic drugs commonly used to treat anxiety and/or depression results in safety or efficacy concerns for either drug. We searched PubMed and Cochrane libraries for clinical or pharmacokinetic (PK) studies that examined co-administration of any HC with psychotropic drugs [selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), oral benzodiazepines, bupropion, mirtazapine, trazadone, buspirone, hydroxyzine, monoamine oxidase inhibitors (MAOIs), or atypical antipsychotics] in reproductive aged women."

Our news editors obtained a quote from the research from Center for Disease Control and Prevention, "Of 555 articles identified, 22 articles (18 studies) met inclusion criteria. We identified 5 studies on SSRIs, four on TCAs, one on bupropion, three on atypical antipsychotics and five on oral benzodiazepines. No articles met inclusion criteria for SNRIs, mirtazapine, trazadone, buspirone, hydroxyzine, monoamine oxidase inhibitors (MAOIs). Overall, clinical studies did not demonstrate differences in unintended pregnancy rates when HCs were administered with and without psychotropic drugs or in psychotropic drug treatment outcomes when psychotropic drugs were administered with and without HCs. PK studies did not demonstrate changes in drug exposure related to contraceptive safety, contraceptive effectiveness or psychotropic drug effectiveness for most classes of psychotropic drugs. However, limited PK data raise concern for HCs increasing systemic exposure of amitriptyline and imipramine (both TCAs), theoretically posing safety concerns. Limited quality and quantity evidence on use of psychotropic drugs and HCs suggests low concern for clinically significant interactions, though no data exist specifically for non-oral formulations of HC."

According to the news editors, the research concluded: "Given the high frequency of use for both HCs and psychotropic drugs among reproductive-age women in the US, this review highlights a need for further research in this area."

The news editors report that additional information may be obtained by contacting E.N. Berry-Bibee, Center Dis Control & Prevent, Div Reprod Hlth, Atlanta, GA 30333, United States. Additional authors for this research include M.J. Kim, K.B. Simmons, N.K. Tepper, H.E.M. Riley, H.P. Pagano and K.M. Curtis.

**Developmental Diseases and Conditions - Autism…**

**Data on Autism Spectrum Disorders Detailed by Researchers at St. Louis University School of Medicine (Therapeutic Effect of a Synthetic RORa/g Agonist in an Animal Model of Autism)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Developmental Diseases and Conditions - Autism Spectrum Disorders are presented in a new report. According to news reporting originating from St. Louis, Missouri, by NewsRx correspondents, research stated, "Autism is a developmental disorder of the nervous system associated with impaired social communication and interactions as well excessive repetitive behaviors. There are no drug therapies that directly target the pathology of this disease."

Financial support for this research came from U.S. Department of Health and Human Services.

Our news editors obtained a quote from the research from the St. Louis University School of Medicine, "The retinoic acid receptor-related orphan receptor a (RORA) is a nuclear receptor that has been demonstrated to have reduced expression in many individuals with autism spectrum disorder (ASD). Several genes that have been shown to be downregulated in individuals with ASD have also been identified as putative RORA target genes. Utilizing a synthetic RORA/g agonist, SR1078, that we identified previously, we demonstrate that treatment of BTBR mice (a model of autism) with SR1078 results in reduced repetitive behavior. Furthermore, these mice display increased expression of ASD-associated ROAs target genes in both the brains of the BTBR mice and in a human neuroblastoma cell line treated with SR1078."

According to the news editors, the research concluded: "These data suggest that pharmacological activation of RORA may be a method for treatment of autism."

For more information on this research see: Therapeutic Effect of a Synthetic RORa/g Agonist in an Animal Model of Autism. *Acs Chemical Neuroscience*, 2015;7(2):143-8.

Autoimmune Diseases and Conditions

Data on Autoimmune Diseases and Conditions Described by Researchers at University of California (Germinal centers and autoimmune disease in humans and mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Autoimmune Diseases and Conditions. According to news reporting originating from San Francisco, California, by NewsRx editors, the research stated, "Antibodies are involved in the pathogenesis of many autoimmune diseases. Although the mechanisms underlying the antibody response to infection or vaccination are reasonably well understood, we still have a poor understanding of the nature of autoimmune antibody responses."

Our news editors obtained a quote from the research from the University of California, "The most well studied are the anti-nuclear antibody responses characteristic of systemic lupus erythematosus and studies over the past decade or so have demonstrated a critical role for signaling by TLR7 and/or TLR9 in B cells to promote these responses. These Toll-like receptors (TLRs) can promote T-cell-independent extrafollicular antibody responses with a heavy-chain class switch and a low degree of somatic mutation, but they can also strongly boost the germinal center response that gives rise to high-affinity antibodies and long-lived plasma cells. TLRs have been shown to enhance affinity maturation in germinal center responses to produce high-affinity neutralizing antibodies in several virus infection models of mice. Although more data are needed, it appears that anti-nuclear antibodies in mouse models of lupus and in lupus patients can be generated by either pathway, provided there are genetic susceptibility alleles that compromise B-cell tolerance at one or another stage. Limited data in other autoimmune diseases suggest that the germinal center response may be the predominant pathway leading to autoantibodies in those diseases."

According to the news editors, the research concluded: "A better understanding of the mechanisms of autoantibody production may ultimately be helpful in the development of targeted therapeutics for lupus or other autoimmune diseases."

For more information on this research see: Germinal centers and autoimmune disease in humans and mice. *Immunology and Cell Biology*, 2016;94(10):918-924.
Oncology - B-Cell Lymphoma

Data on B-Cell Lymphoma Detailed by Researchers at Chinese Academy of Medical Sciences (Cerebrospinal Fluid IL-10 and IL-10/IL-6 as Accurate Diagnostic Biomarkers for Primary Central Nervous System Large B-cell Lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - B-Cell Lymphoma are discussed in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Early diagnosis of primary central nervous system lymphoma (PCNSL) represents a challenge, and cerebrospinal fluid (CSF) cytokines may be diagnostic biomarkers for PCNSL. We used an electrochemiluminescence immunoassay to measure interleukin (IL)-10, IL-6, IL-8 and tumor necrosis factor alpha (TNF-alpha) in the CSF of 22 B cell PCNSL patients and 80 patients with other CNS diseases."

The news correspondents obtained a quote from the research from the Chinese Academy of Medical Sciences, "CSF IL-10 was significantly higher in PCNSL patients than in the control group (median 74.7 pg/ml vs < 5.0 pg/ml, P< 0.000). Using a CSF IL-10 cutoff value of 8.2 pg/ml, the diagnostic sensitivity and specificity were 95.5% and 96.1%, respectively (AUC, 0.957; 95% CI, 0.901-1.000). For a CSF IL-10/IL-6 cutoff value of 0.72, the sensitivity was 95.5%, and the specificity was 100.0% (AUC, 0.976; 95% CI, 0.929-1.000). An increased CSF IL-10 level at diagnosis and post-treatment was associated with poor Progression free survival (PFS) for patients with PCNSL (P = 0.0181 and P = 0.0002, respectively). A low diagnostic value for PCNSL was found with CSF IL-8 or TNF-alpha."

According to the news reporters, the research concluded: "Increased CSF IL-10 was a reliable diagnostic biomarker for large B cell PCNSL, and an IL-10/IL-6 ratio facilitates differentiation from other conditions, especially a CNS infection."

For more information on this research see: Cerebrospinal Fluid IL-10 and IL-10/IL-6 as Accurate Diagnostic Biomarkers for Primary Central Nervous System Large B-cell Lymphoma. Scientific Reports, 2016;6():1-8. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature
Oncology - B-Cell Lymphoma

Data on B-Cell Lymphoma Detailed by Researchers at European Institute of Oncology (miR-17-92 fine-tunes MYC expression and function to ensure optimal B cell lymphoma growth)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - B-Cell Lymphoma. According to news originating from Milan, Italy, by NewsRx correspondents, research stated, "The synergism between c-MYC and miR-17-19b, a truncated version of the miR-17-92 cluster, is well-documented during tumor initiation. However, little is known about miR-17-19b function in established cancers."

Our news journalists obtained a quote from the research from the European Institute of Oncology, "Here we investigate the role of miR-17-19b in c-MYC-driven lymphomas by integrating SILAC-based quantitative proteomics, transcriptomics and 3’ untranslated region (UTR) analysis upon miR-17-19b overexpression. We identify over one hundred miR-17-19b targets, of which 40% are co-regulated by c-MYC. Downregulation of a new miR-17/20 target, checkpoint kinase 2 (Chek2), increases the recruitment of HuR to c-MYC transcripts, resulting in the inhibition of c-MYC translation and thus interfering with in vivo tumor growth. Hence, in established lymphomas, miR-17-19b fine-tunes c-MYC activity through a tight control of its function and expression, ultimately ensuring cancer cell homeostasis."

According to the news editors, the research concluded: "Our data highlight the plasticity of miRNA function, reflecting changes in the mRNA landscape and 3’ UTR shortening at different stages of tumorigenesis."

For more information on this research see: miR-17-92 fine-tunes MYC expression and function to ensure optimal B cell lymphoma growth. Nature Communications, 2015;6 ():8725. (Nature Publishing Group - www.nature.com/; Nature Communications - www.nature.com/ncomms/)

The news correspondents report that additional information may be obtained from M. Mihailovich, Dept. of Experimental Oncology, European Institute of Oncology, Viaadamello 16, Milan 20139, Italy. Additional authors for this research include M. Bremang, V. Spadotto, D. Musiani, E. Vitale, G. Varano, F. Zambelli, F.M. Mancuso, D.A. Cairns, G. Pavesi, S. Casola and T. Bonaldi.

**Bicuspid Aortic Valves**

**Data on Bicuspid Aortic Valves Reported by Researchers at University of Birmingham (Hemodynamics through the congenitally bicuspid aortic valve: a computational fluid dynamics comparison of opening orifice area and leaflet orientation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Bicuspid Aortic Valves. According to news originating from Birmingham, United Kingdom, by NewsRx correspondents, research stated, "A computational fluid dynamics model of a bicuspid aortic valve has been developed using idealised three-dimensional geometry. The aim was to compare how the orifice area and leaflet orientation affect the hemodynamics of a pure bicuspid valve."

Our news journalists obtained a quote from the research from the University of Birmingham, "By applying physiologic material properties and boundary conditions, blood flow shear stresses were predicted during peak systole. A reduced orifice area altered blood velocity, the pressure drop across the valve and the wall shear stress through the valve. Bicuspid models predicted impaired blood flow similar to a stenotic valve, but the flow patterns were specific to leaflet orientation. Flow patterns developed in bicuspid aortic valves, such as helical flow, were sensitive to cusp orientation."

According to the news editors, the research concluded: "The reduced opening area of a bicuspid aortic valve amplifies any impaired hemodynamics, but cusp orientation determines subsequent flow patterns which may determine the specific regions downstream from the valve most at risk of clinical complications."

For more information on this research see: Hemodynamics through the congenitally bicuspid aortic valve: a computational fluid dynamics comparison of opening orifice area and leaflet orientation. *Perfusion-Uk*, 2016;31(8):683-690. *Perfusion-Uk* can be contacted at: Sage Publications Ltd, 1 Olivers Yard, 55 City Road, London EC1Y 1SP, England.

The news correspondents report that additional information may be obtained from D.M. Espino, University of Birmingham, Sch Mech Engn, Birmingham B15 2TT, W Midlands, United Kingdom. Additional authors for this research include F.S.N. de Souza Junior, M.Y.S. Kuan, N.C. Green and D.M. Espino.

Keywords for this news article include: Birmingham, United Kingdom, Europe, Bicuspid Aortic Valves, Cardiology, Risk and Prevention, Bicuspid Aortic Valve, University of Birmingham.

Biguanides

Data on Biguanides Reported by Researchers at Duke University
(Metformin Targets Central Carbon Metabolism and Reveals Mitochondrial Requirements in Human Cancers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Biguanides is now available. According to news originating from Durham, North Carolina, by NewsRx correspondents, research stated, "Repurposing metformin for cancer therapy is attractive due to its safety profile, epidemiological evidence, and encouraging data from human clinical trials. Although it is known to systemically affect glucose metabolism in liver, muscle, gut, and other tissues, the molecular determinants that predict a patient response in cancer remain unknown."

Our news journalists obtained a quote from the research from Duke University, "Here, we carry out an integrative metabolomics analysis of metformin action in ovarian cancer. Metformin accumulated in patient biopsies, and pathways involving nucleotide metabolism, redox, and energy status, all related to mitochondrial metabolism, were affected in treated tumors. Strikingly, a metabolic signature obtained from a patient with an exceptional clinical outcome mirrored that of a responsive animal tumor. Mechanistically, we demonstrate with stable isotope tracing that these metabolic signatures are due to an inability to adapt nutrient utilization in the mitochondria."

According to the news editors, the research concluded: "This analysis provides new insights into mitochondrial metabolism and may lead to more precise indications of metformin in cancer."

For more information on this research see: Metformin Targets Central Carbon Metabolism and Reveals Mitochondrial Requirements in Human Cancers. Cell Metabolism, 2016;24(5):728-739. Cell Metabolism can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. Mental Health Diseases and Conditions - Bipolar...

Data on Bipolar Disorders Detailed by Researchers at University of California (Factor analysis of temperament and personality traits in bipolar patients: Correlates with comorbidity and disorder severity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mental Health Diseases and Conditions - Bipolar Disorders. According to news reporting from La Jolla, California, by NewsRx journalists, research stated, "Temperament and personality traits have been suggested as endophenotypes for bipolar disorder based on several lines of evidence, including heritability. Previous work suggested an anxious-reactive factor identified across temperament and personality inventories that produced significant group discrimination and could potentially be useful in genetic analyses."

The news correspondents obtained a quote from the research from the University of California, "We have attempted to further characterize this factor structure in a sample of bipolar patients. A sample of 1195 subjects with bipolar I disorder was evaluated, all with complete data available. Dimension reduction across two inventories identified 18 factors explaining 39% of the variance. The two largest factors reflected affective instability and general anxiety/worry, respectively. Subsequent analyses of the clinical features associated with bipolar disorder revealed specificity for the factor: in a predictable pattern. Cluster analysis of the factors identified a subgroup defined by a strong lack of generater anxiety and low affective instability represented by the first two factors. The remaining subjects could be distinguished into two clusters by the presence of either more positive characteristics, including persistence, drive, spirituality, expressivity, and humor, or more negative characteristics of depression and anxiety. Limitations: These analyses involved bipolar I subjects only and must be extended to other bipolar spectrum diagnoses, unaffected relatives, and individuals at risk. These results suggest that temperament and personality measures access latent traits associated with important clinical features of bipolar disorder."

According to the news reporters, the research concluded: "By translating clinical variables into quantitative traits, we may identify subgroups of bipolar patients with distinct clinical profiles, thereby facilitating both individual treatment strategies and genetic analyses."

For more information on this research see: Factor analysis of temperament and personality traits in bipolar patients: Correlates with comorbidity and disorder severity. *Journal of Affective Disorders*, 2017;207():282-290. *Journal of Affective Disorders* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Data on Bladder Cancer Detailed by Researchers at Affiliated Hospital (Bladder cancer cells re-educate TAMs through lactate shuttling in the microfluidic cancer microenvironment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Bladder Cancer have been published. According to news reporting from Qingdao, People's Republic of China, by NewsRx journalists, research stated, "In the present study, we aimed to investigate the influence of lactate shuttling on the functional polarization and spatial distribution of transitional cell carcinoma of the bladder (TCCB) cells and macrophages. We designed a microfluidic coculture chip for real-time integrative assays."

The news correspondents obtained a quote from the research from Affiliated Hospital, "The effect of lactate shuttling on the re-education of macrophages by TCCB cells was explored by measuring the levels of NO using a total NO assay kit and by evaluating the protein expression of iNOS, p-NF-kB-p65, Arg-1 and HIF-1a via cell immunofluorescence and western blotting. Additionally, we examined TCCB cell viability using acridine orange/ethidium bromide (AO/EB) and MitoTracker staining. Moreover, the concentration distributions of lactate and large signaling proteins in the culture chambers were measured using 4',6-diamidino-2-phenylindole (DAPI) and fluorescein isothiocyanate-dextran (FITC-dextran). Furthermore, the recruitment of macrophages and the influence of macrophages on BC metastasis were observed via light microscopy. We confirmed that TCCB cells reprogrammed macrophages into an M2 phenotype. Moreover, lactate inhibited M1 polarization and induced M2 polarization of macrophages, but blockade of cancer cell-macrophage lactate flux significantly inhibited the re-education of macrophages by TCCB cells. In addition, lactate diffused faster and deeper than large signaling proteins in the microfluidic tumor microenvironment. Furthermore, lactate alone induced the migration of macrophages, and M1, but not M2, macrophages reduced the motility of TCCB cells. TCCB cells reprogrammed macrophages into an M2 phenotype in a manner that depended on cancer cell-TAM lactate flux."

According to the news reporters, the research concluded: "Furthermore, the lactate shuttle may be a determinant of the density of TAMs in tumor tissue."

Our news journalists report that additional information may be obtained by contacting Y. Zhao, Dept. of Surgery, Affiliated Hospital of Qingdao University, Qingdao, People's Republic of China. Additional authors for this research include D. Wang, T. Xu, P. Liu, Y. Cao, Y. Wang, X. Yang, X. Xu, X. Wang and H. Niu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18632/oncotarget.5538. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Bladder Cancer

Data on Bladder Cancer Discussed by Researchers at Pennsylvania State University (FOXA1, GATA3 and PPAR gamma Cooperate to Drive Luminal Subtype in Bladder Cancer: A Molecular Analysis of Established Human Cell Lines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Bladder Cancer have been published. According to news reporting from Hershey, Pennsylvania, by NewsRx journalists, research stated, "Discrete bladder cancer molecular subtypes exhibit differential clinical aggressiveness and therapeutic response, which may have significant implications for identifying novel treatments for this common malignancy. However, research is hindered by the lack of suitable models to study each subtype."

The news correspondents obtained a quote from the research from Pennsylvania State University, "To address this limitation, we classified bladder cancer cell lines into molecular subtypes using publically available data in the Cancer Cell Line Encyclopedia (CCLE), guided by genomic characterization of bladder cancer by The Cancer Genome Atlas (TCGA). This identified a panel of bladder cancer cell lines which exhibit genetic alterations and gene expression patterns consistent with luminal and basal molecular subtypes of human disease. A subset of bladder cancer cell lines exhibit in vivo histomorphologic patterns consistent with luminal and basal subtypes, including papillary architecture and squamous differentiation. Using the molecular subtype assignments, and our own RNA-seq analysis, we found overexpression of GATA3 and FOXA1 cooperate with PPAR. activation to drive transdifferentiation of a basal bladder cancer cells to a luminial phenotype."

According to the news reporters, the research concluded: "In summary, our analysis identified a set of human cell lines suitable for the study of molecular subtypes in bladder cancer, and furthermore indicates a cooperative regulatory network consisting of GATA3, FOXA1, and PPAR. drive luminal cell fate."

For more information on this research see: FOXA1, GATA3 and PPAR gamma Cooperate to Drive Luminal Subtype in Bladder Cancer: A Molecular Analysis of Established Human Cell Lines. Scientific Reports, 2016;6():1-15. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Data on Bone Marrow Cells Detailed by Researchers at Dana-Farber Cancer Institute (Variation in the use of granulocyte-colony stimulating factor for dose dense paclitaxel: A single institution retrospective study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cell Research - Bone Marrow Cells is now available.

According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "The necessity of using granulocyte-colony stimulating factor (G-CSF) during dose-dense (DD) paclitaxel (T) after doxorubicin and cyclophosphamide (AC) is unclear. This was a retrospective cohort study including patients with stage I-III breast cancer treated at Dana-Farber Cancer Institute with adjuvant DD-ACT between January 2011 and December 2013."

The news correspondents obtained a quote from the research from Dana-Farber Cancer Institute, "Descriptive analyses evaluating patterns of G-CSF utilization during T were performed. Overall, 156 patients were treated with DD-ACT by 26 providers. The majority of patients (135, 87%) received at least one dose of G-CSF during T (group 1), 17% of these patients received it in only one cycle and 48% received it in all four cycles. Reasons for omitting G-CSF included high baseline absolute neutrophil count and pain. Twenty-one (13%) patients did not receive any G-CSF during T (group 2). Respectively, 94% and 90% of patients completed the treatment in groups 1 and 2. There were no cases of treatment cessation due to neutropenia. Six percent of patients in group 1 had at least one treatment delay. There were no treatment delays reported in group 2. Variation in the use of G-CSF by provider and by patient was found, with 11 providers choosing not to use G-CSF in at least one patient. We identified substantial variation in the use of G-CSF within the practice. However, omission of G-CSF was not associated with treatment delays or adverse events."

According to the news reporters, the research concluded: "Prospective studies are warranted to formally test whether routine G-CSF is necessary during dose-dense T therapy."

Our news journalists report that additional information may be obtained by contacting N.U. Lin, Dana Farber Canc Inst, Dept. of Med Oncol, Boston, MA 02215, United States. Heart Disorders and Diseases - Bradycardia

Data on Bradycardia Reported by Researchers at Johns Hopkins University (Bradycardia and hypotension after synthetic cannabinoid use: a case series)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Bradycardia are presented in a new report. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "Cardiotoxicity secondary to synthetic cannabinoid use has been reported to manifest with tachycardia and hypertension. We present here a case series of three patients who developed bradycardia and hypotension after synthetic cannabinoid use."

The news reporters obtained a quote from the research from Johns Hopkins University, "Our patients (age 64, 30, 56) were older and had more comorbidities than typical SC-poisoned patients. In all three cases, bradycardia occurred prehospital or shortly after arrival to the Emergency Department. Heart rate was as low as 37 beat/min. Hypotension occurred in all 3 cases. Bradycardia or hypotension lasted at least 6 hours in each instance. All patients responded well to supportive care, although symptoms persisted for as long as 48 hours. Two of the 3 patients were administered vasopressors. These cases represent the first reports of hypotension and bradycardia from synthetic cannabinoid use in the United States."

According to the news reporters, the research concluded: "Clinicians should recognize bradycardia and hypotension as potential complications of SC exposure."

Our news correspondents report that additional information may be obtained by contacting E.M. Kane, Johns Hopkins University, Sch Med, Dept. of Emergency Med, Baltimore, MD, United States. Additional authors for this research include J.S. Hinson, C.D. Jordan, K. Paziana, N.J. Sauber, R.E. Rothman and A.I. Stolbach.

Data on Bradycardia Reported by Researchers at Sheba Medical Center (The Utilization of an Insertable Cardiac Monitor in a Child With Pallid Breath-Holding Spells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Bradycardia are discussed in a new report. According to news reporting out of Ramat Gan, Israel, by NewsRx editors, research stated, "Pacing can be a successful treatment for pallid breath-holding spells, primarily in individuals with severe bradycardia. DESCRIPTION: We describe an 18-month-old girl experiencing severe pallid breath holding spells in whom repeated electrocardiographic, Holter, and electroencephalographic monitoring tests were all normal."

Our news journalists obtained a quote from the research from Sheba Medical Center, "Using a subcutaneous insertable cardiac monitor, severe bradycardia was detected during one of this girl's episodes. This finding led to a pacemaker implantation. Subsequently, her breath holding spells completely resolved. This child illustrates the ability of the insertable cardiac monitor to help and diagnose arrhythmias in children with unresolved clinical findings."

According to the news editors, the research concluded: "The ability to implant it with a minimal scar makes it ideal for uncooperative individuals with relative few and unexpected episodes that are hard to diagnose."

Our news journalists report that additional information may be obtained by contacting S. Tejman-Yarden, Sheba Med Center, Edmond J Safra Int Congenital Heart Center, Ramat Gan, Israel. Additional authors for this research include B. Ben-Zeev, Y. Goldshnit, G. Sarquella-Brugada, A. Cicurel, U. Katz, D. Mishali and M. Glikson.

Data on Brain Neoplasms Detailed by Researchers at Institute Rotary Cancer Hospital (Role of adjuvant radiation in the management of central neurocytoma: Experience from a tertiary cancer care center of India)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Central Nervous System Diseases and Conditions - Brain Neoplasms is now available. According to news originating from New Delhi, India, by NewsRx correspondents, research stated, "Neurocytoma (NC) is a rare benign neuronal tumor. A complete excision remains curative for most of these tumors, but atypical histology and extra-ventricular location often necessitates adjuvant therapy."

Our news journalists obtained a quote from the research from Institute Rotary Cancer Hospital, "We intended to explore the clinico-pathological features and treatment outcome in patients of NC in our institute. Medical records were reviewed and data collected on NC over a 6-year period (2006-2012) from the departmental archives. Disease free survival (DFS) was analyzed by Kaplan-Meier method. A total of 18 patients met the study criteria. Fourteen patients had intra-ventricular neurocytoma (IVNC), right lateral ventricle being the most common site of origin. Gross total resection and near total resection were achieved in eight cases each whereas tumor decompression and biopsy could be done in two cases. On post-operative histopathological examination, eight patients were found to have atypical NC while 10 patients had typical NC. All patients underwent adjuvant radiation. The median dose of post-operative radiation was 56 Gy. All patients were alive at their final follow-up. One patient had both clinical and radiological evidence of local relapse. In the evaluable patients (n=18), after a median follow-up of 35 months the DFS rate at 2 years and 3 years are 100% and 83% respectively. Use of adjuvant radiation to a total dose of 56 Gy enhances the local control and achieves superior survival in patients of NC."

According to the news editors, the research concluded: "Use of 3D conformal planning techniques may help us to achieve better therapeutic ratio in patients with NC."

For more information on this research see: Role of adjuvant radiation in the management of central neurocytoma: Experience from a tertiary cancer care center of India. Indian Journal of Cancer, 2015;52(4):590-7.

The news correspondents report that additional information may be obtained from S. Roy, Dept. of Radiation Oncology, Institute Rotary Cancer Hospital, All India Institute of Medical Sciences, New Delhi, India. Additional authors for this research include S. Roy, S. Das, N.P. Data on Breast Cancer Described by Researchers at Charles University
(Characterization of acquired paclitaxel resistance of breast cancer cells and involvement of ABC transporters)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting out of Prague, Czech Republic, by NewsRx editors, research stated, "Development of taxane resistance has become clinically very important issue. The molecular mechanisms underlying the resistance are still unclear."

Financial supporters for this research include Ministry of Health of the Czech Republic, Ministry of Education, Youth and Sports.

Our news journalists obtained a quote from the research from Charles University, "To address this issue, we established paclitaxel-resistant sublines of the SK-BR-3 and MCF-7 breast cancer cell lines that are capable of long-term proliferation in 100 nM and 300 nM paclitaxel, respectively. Application of these concentrations leads to cell death in the original counterpart cells. Both sublines are cross-resistant to doxorubicin, indicating the presence of the MDR phenotype. Interestingly, resistance in both paclitaxel-resistant sublines is circumvented by the second-generation taxane SB-T-1216. Moreover, we demonstrated that it was not possible to establish sublines of SK-BR-3 and MCF-7 cells resistant to this taxane. It means that at least the tested breast cancer cells are unable to develop resistance to some taxanes. Employing mRNA expression profiling of all known human ABC transporters and subsequent Western blot analysis of the expression of selected transporters, we demonstrated that only the ABCB1/PgP and ABCC3/MRP3 proteins were up-regulated in both paclitaxel-resistant sublines. We found up-regulation of ABCG2/BCRP and ABCC4 proteins only in paclitaxel-resistant SK-BR-3 cells. In paclitaxel-resistant MCF-7 cells, ABCB4/MDR3 and ABCC2/MRP2 proteins were up-regulated. Silencing of ABCB1 expression using specific siRNA increased significantly, but did not completely restore full sensitivity to both paclitaxel and doxorubicin. Thus we showed a key, but not exclusive, role for ABCB1 in mechanisms of paclitaxel resistance."

According to the news editors, the research concluded: "It suggests the involvement of multiple mechanisms in paclitaxel resistance in tested breast cancer cells."

For more information on this research see: Characterization of acquired paclitaxel resistance of breast cancer cells and involvement of ABC transporters. Toxicology and Applied Pharmacology, 2016;310():215-228. Toxicology and Applied Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www elsevier com; Toxicology and Applied Pharmacology - www journals elsevier com/toxicology and applied pharmacology/)

Our news journalists report that additional information may be obtained by contacting V. Nemcova-Furstova, Charles Univ Prague, Div Cell & Mol Biol, Fac Med 3, Prague 10000 10, Czech Republic. Oncology - Breast Cancer

Data on Breast Cancer Detailed by Researchers at Institute for Biology Research (ErbB-2 nuclear function in breast cancer growth, metastasis and resistance to therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Buenos Aires, Argentina, by NewsRx correspondents, research stated, "Approximately 15-20% of breast cancers (BC) show either membrane overexpression of ErbB-2 (MЕrbB-2), a member of the ErbBs family of receptor tyrosine kinases, or ERBB2 gene amplification. Until the development of MЕrbB-2-targeted therapies, this BC subtype, called ErbB-2-positive, was associated with increased metastatic potential and poor prognosis."

Our news journalists obtained a quote from the research from Institute for Biology Research, "Although these therapies have significantly improved overall survival and cure rates, resistance to available drugs is still a major clinical issue. In its classical mechanism, MЕrbB-2 activates downstream signaling cascades, which transduce its effects in BC. The fact that ErbB-2 is also present in the nucleus of BC cells was discovered over twenty years ago. Also, compelling evidence revealed a non-canonical function of nuclear ErbB-2 as a transcriptional regulator."

According to the news editors, the research concluded: "As a deeper understanding of nuclear ErbB-2 actions would be crucial to the disclosure of its role as a biomarker and a target of therapy in BC, we will here review its function in BC, in particular, its role in growth, metastatic spreading and response to currently available MЕrbB-2-positive BC therapies."

For more information on this research see: ErbB-2 nuclear function in breast cancer growth, metastasis and resistance to therapy. Endocrine-Related Cancer, 2016;23(12):T243-T257. Endocrine-Related Cancer can be contacted at: Bioscientifica Ltd, Euro House, 22 Apex Court Woodlands, Bradley Stoke, Bristol BS32 4JT, England.

The news correspondents report that additional information may be obtained from P.V. Elizalde, Consejo Nacl Invest Cient & Tecn, Inst Biol & Med Expt, Lab Mol Mech Carcinogenesis, Buenos Aires, DF, Argentina. Additional authors for this research include R.I.C. Russo, M.F. Chervo and R. Schillaci.

Data on Breast Cancer Detailed by X.J. Huang and Co-Authors (High expressions of LDHA and AMPK as prognostic biomarkers for breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "The purpose of this study was to investigate the potential correlation between lactate dehydrogenase A (LDHA) and AMP-activated protein kinase (AMPK) and their clinicopathologic significance in breast cancer. Western blot and qRT-PCR were used to detect the expression levels of LDHA and AMPK in eight breast cancer lines and eight breast cancer tissues."

Financial supporters for this research include National Natural Science Foundation of China, Science and Technology Planning Projects of Guangdong and Guangzhou.

The news reporters obtained a quote from the research, "In addition, LDHA and AMPK were detected by immunohistochemistry (IHC) using breast cancer tissue microarrays (TMAs) of 112 patients. The association between LDHA and AMPK expression levels was statistically analyzed. So were the prognostic roles and clinicopathologic significances in breast cancer. The expression levels of LDHA and AMPK were relatively higher in triple-negative breast cancer (TNBC) cell lines than in non-triple-negative breast cancer (NTNBC) cell lines. LDHA and AMPK were also further up-regulated in TNBC tissues than in NTNBC tissues. Correlation analysis showed a positive correlation between LDHA and AMPK expression levels. Expression of LDHA and AMPK were significantly correlated with TNM stage, distant metastasis, Ki67 status and survival outcomes of patients. Patients with both positive expression of LDHA and AMPK showed shorter overall survival (OS) and disease-free survival (DFS)."

According to the news reporters, the research concluded: "These findings improve our understanding of the expression pattern of LDHA and AMPK in breast cancer and clarify the role of LDHA and AMPK as promising prognostic biomarkers for breast cancer."

Our news correspondents report that additional information may be obtained by contacting H.L. Tang, Sun Yat Sen UniversityDept. of Breast Oncol, Center Canc, State Key Lab Oncol Sout ChinaCollaborat Innovat, Guangzhou 510060, Guangdong, People's Republic of China. Oncology - Breast Cancer

Data on Breast Cancer Discussed by Researchers at University of Turin (Predictive Diagnostic Pathology in the Target Therapy Era in Breast Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news originating from Turin, Italy, by NewsRx correspondents, research stated, "Treatment strategies in oncology are nowadays largely based on the 'target therapy model', which allows to personalize the cure of each patient depending on distinctive host and disease features. As a general concept 'targeted drugs' are effective only when the tumor exhibits the 'target', which in breast cancer pathology may correspond to the expression of estrogen receptors and/or of HER2."

Our news journalists obtained a quote from the research from the University of Turin, "These biomarkers are evaluated on breast cancer tissues by companion diagnostic tests, however, evidence suggests that the first step in breast cancer predictive pathology is still represented by morphology. For instance, histological types, such as tubular and cribriform carcinomas, define patients who may not need any treatments other than surgical excision. Neoadjuvant studies have shown that patients affected by lobular carcinomas are not likely to have any beneficial effects from chemotherapy. The second step in prediction is represented by immunophenotyping. If the immunohistochemical evaluation of four markers (estrogen and progesterone receptors, HER2 and Ki67) remains the best practice for breast cancer predictive pathology, molecular pathology has certainly reshaped the way we approach breast cancer diagnosis."

According to the news editors, the research concluded: "The aim of this review is to discuss current knowledge in predictive pathology for the management of breast cancer patients, focusing on the benefits and drawbacks of traditional tools and of novel improvements of molecular biology."

The news correspondents report that additional information may be obtained from A. Sapino, Dept. of Medical Sciences, University of Turin, via Santena 7, 10126, Turin, Italy. Additional authors for this research include D. Balmativola, R. Castiglione, L. Annaratone and A. Sapino.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2174/1389450116666150203121218. This DOI is a link to an online electronic document that is either free or for purchase.

**Data on Breast Cancer Reported by Researchers at Tabriz University of Medical Sciences (Tumor microenvironment-mediated chemoresistance in breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting originating in Tabriz, Iran, by NewsRx journalists, research stated, "Therapy resistance or tumor relapse in cancer is common. Tumors develop resistance to chemotherapeutic through a variety of mechanisms, with tumor microenvironment™ serving pivotal roles."

The news reporters obtained a quote from the research from the Tabriz University of Medical Sciences, "Using breast cancer as a paradigm, we propose that responses of cancer cells to drugs are not exclusively determined by their intrinsic characteristics but are also controlled by deriving signals from TM. Affected microenvironment by chemotherapy is an avenue to promote phenotype which tends to resist on to be ruined. Therefore, exclusively targeting cancer cells does not demolish tumor recurrence after chemotherapy. Regardless of tumor-microenvironment pathways and their profound influence on the responsiveness of treatment, diversity of molecular properties of breast cancer also behave differently in terms of response to chemotherapy. And also it is assumed that there is cross-talk between phenotypic diversity and TM. Collectively, raising complex signal from TM in chemotherapy condition often encourages cancer cells are not killed but strengthen. Here, we summarized how TM modifies responses to chemotherapy in breast cancer."

According to the news reporters, the research concluded: "We also discussed successful treatment strategies have been considered TM in breast cancer treatment."

For more information on this research see: Tumor microenvironment-mediated chemoresistance in breast cancer. Breast, 2016;30():92-100. Breast can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. Data on Breast Cancer Reported by Z. Yang and Colleagues (Downregulation of long non-coding RNA MALAT1 induces tumor progression of human breast cancer through regulating CCND1 expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting out of Tangshan, People's Republic of China, by NewsRx editors, research stated, "Metastasis-associated lung adenocarcinoma transcript 1 (MALAT1) is already known to be involved in the development and progression of many types of tumors. In the present study, we set to seek the role of MALAT1 and the molecular mechanisms in breast cancer."

Our news journalists obtained a quote from the research, "MALAT1 mRNA expression level was measured by real-time PCR in selected tissues and breast cancer cell lines. SiRNAs targeting MALAT1 were employed to knockdown the endogenous MALAT1. Then cell counting method and colony formation method were applied to reveal the proliferation changes after MALAT1 was suppressed. Afterwards, the mRNA and protein expression of growth related gene cyclinD1 (CCND1) were detected by RT-PCR and western blotting, respectively. We found a downregulation of MALAT1 expression in breast cancer cell lines and tissues. Inhibition of its expression led to enhanced cell proliferation and colony formation. Importantly, the mRNA and protein expression of CCND1 was significantly increased in MALAT1-depleted cells."

According to the news editors, the research concluded: "MALAT1 is a potential tumor suppressive long non-coding RNA that negatively regulates cell proliferation in breast cancer progression, via suppressing CCND1 expression."

For more information on this research see: Downregulation of long non-coding RNA MALAT1 induces tumor progression of human breast cancer through regulating CCND1 expression. *Open Life Sciences*, 2016;11(1):232-236. *Open Life Sciences* can be contacted at: De Gruyter Open Ltd, Bogumila Zuga 32A St, 01-811 Warsaw, Poland.

Our news journalists report that additional information may be obtained by contacting H.F. Cai, Tangshan City Workers Hosp Hebei Prov, Dept. of Breast Surg, Tangshan 063000, Hebei Province, People's Republic of China. Additional authors for this research include W. Lu, L. Ning, D. Hao, S. Jian and H.F. Cai.

Data on Bronchopulmonary Dysplasia Reported by Researchers at Mercy Hospital for Women (BNP, troponin I, and YKL-40 as screening markers in extremely preterm infants at risk for pulmonary hypertension
associated with bronchopulmonary dysplasia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Bronchopulmonary Dysplasia are discussed in a new report. According to news reporting out of Melbourne, Australia, by NewsRx editors, research stated, "Bronchopulmonary dysplasia (BPD) is often complicated by pulmonary hypertension (PH). We investigated three biomarkers potentially suitable as screening markers for extremely preterm infants at risk of BPD-associated PH."

Our news journalists obtained a quote from the research from Mercy Hospital for Women, "In this prospective observational cohort study conducted in a tertiary neonatal intensive care unit, 83 preterm infants with BPD born <28-wk gestation and still inpatients at 36-wk corrected age received an echocardiogram and blood tests of B-type natriuretic peptide (BNP), troponin I, and YKL-40. Infants were analyzed according to echocardiographic evidence of tricuspid regurgitation (TR). Thirty infants had evidence of TR on echocardiogram at 36-wk corrected age. Infants with or without TR had similar baseline demographics: mean +/- SD gestational age 26(1) +/- 1(2) vs. 26(1) +/- 11 wk and birth weight 830 +/- 206 vs. 815 +/- 187 g, respectively. There was no difference in duration of respiratory support. The right ventricular systolic pressure of infants with evidence of TR was 40 +/- 16 mmHg. BNP was the only biomarker that proved to be significantly higher in infants with evidence of TR: median (interquartile range) serum level 54.5 (35-105) vs. 41.5 (30-59) pg/ ml, P = 0.043. Subgroup analysis of infants with severe BPD requiring discharge on home oxygen or BPD-related mortality revealed similar results. There was no difference between groups for troponin I and YKL-40."

According to the news editors, the research concluded: "Increased serum levels of BNP were associated with evidence of TR at 36-wk corrected gestational age in extremely preterm infants, suggesting a potential role as a screening biomarker for BPD-associated PH."

Our news journalists report that additional information may be obtained by contacting K. Konig, Mercy Hosp Women, Dept. of Paediat, Melbourne, Vic 3084, Australia. Additional authors for this research include K.J. Guy, C.A. Nold-Petry, C.P. Barfield, G. Walsh, S.M. Drew, A. Veldman, M.F. Nold and D.M. Casalaz.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1152/ajplung.00344.2016. This DOI is a link to an online electronic document that is either free or for purchase.

Data on Bruxism Reported by Researchers at Federal University
(Association between sleep bruxism and alcohol, caffeine, tobacco, and drug abuse A systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Dental Diseases and Conditions - Bruxism are discussed in a new report. According to news reporting originating in Florianopolis, Brazil, by NewsRx journalists, research stated, "The aim of this systematic review was to answer the focused question, 'In adults, is there any association between sleep bruxism (SB) and alcohol, caffeine, tobacco, or drug abuse?' Types of Studies Reviewed. This systematic review included studies in which the investigators assessed SB diagnosis by using questionnaires, clinical assessment, or polysomnography and evaluated its association with alcohol, caffeine, tobacco, or drug abuse."

The news reporters obtained a quote from the research from Federal University, "The authors graded SB as possible, probable, or definitive. The authors developed specific search strategies for Latin American and Caribbean Health Sciences Literature, Psy-cINFO, PubMed, ScienceDirect, and Web of Science. The authors searched the gray literature by using Google Scholar and Pro-Quest. The authors evaluated the methodological quality of the included studies by using the Meta-Analysis of Statistics Assessment and Review Instrument. From among 818 studies, the authors selected 7 for inclusion in which samples ranged from 51 through 10,229 participants. SB was associated highly with alcohol and tobacco use. In 1 study, the investigators noted a positive and weak association for heavy coffee drinkers. The odds for SB seem to increase almost 2 times for those who drank alcohol, almost 1.5 times for those who drank more than 8 cups of coffee per day, and more than 2 times for those who were current smokers. The abuse of methylenedioxymethamphetamine associated with SB remained without sufficient evidence. Conclusions and Practical Implications. On the basis of limited evidence, SB was associated positively with alcohol, caffeine, and tobacco."

According to the news reporters, the research concluded: "The association between the studied drugs could not be discredited; however, there is still a need for stronger evidence based on studies with greater methodological rigor."

For more information on this research see: Association between sleep bruxism and alcohol, caffeine, tobacco, and drug abuse A systematic review. Journal of the American Dental Association, 2016;147(11):859-866,30-33. Journal of the American Dental Association can be contacted at: Amer Dental Assoc, 211 E Chicago Ave, Chicago, IL 60611, USA.

Our news correspondents report that additional information may be obtained by contacting A.L. Oncology - Cancer Care

Data on Cancer Care Discussed by T. Cooksley and Colleagues
(Emergency oncology: development, current position and future
direction in the USA and UK)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Cancer Care have been published. According to news reporting out of Manchester, United Kingdom, by NewsRx editors, research stated, "The need for supportive and palliative care services in patients with cancer is well established. However, the emerging unique challenges of acutely unwell patients with cancer necessitate the need for research into the optimal strategies and pathways for their management.

Our news journalists obtained a quote from the research, "The clinical challenges of emergency oncology alongside its increasing financial burden have led to an interest as to the best strategies for delivering this care. In the USA and UK, varying models of emergency and acute care are developing. There is a clear need for non-oncology physicians with an interest in the management of oncological emergencies to be at the heart of this work."

According to the news editors, the research concluded: "This paper considers the current situation in the USA and UK and the future directions for the delivery of this care."

For more information on this research see: Emergency oncology: development, current position and future direction in the USA and UK. Supportive Care in Cancer, 2017;25 (1):3-7. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Supportive Care in Cancer - www.springerlink.com/content/0941-4355/)

Oncology - Cancer Risk

Data on Cancer Risk Described by Researchers at St. James University Hospital (Clinical relevance of endoscopic assessment of inflammation in ulcerative colitis: Can endoscopic evaluation predict outcomes?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Cancer Risk. According
to news originating from Leeds, United Kingdom, by NewsRx correspondents, research stated, "Ulcerative colitis (UC) is a chronic inflammatory bowel condition characterised by a relapsing and remitting course. Symptom control has been the traditional mainstay of medical treatment."

Our news journalists obtained a quote from the research from St. James University Hospital, "It is well known that histological inflammatory activity persists despite adequate symptom control and absence of endoscopic inflammation. Current evidence suggests that presence of histological inflammation poses a greater risk of disease relapse and subsequent colorectal cancer risk. New endoscopic technologies hold promise for developing endoscopic markers of mucosal inflammation. Achieving endoscopic and histological remission appears be the future aim of medical treatments for UC."

According to the news editors, the research concluded: "This review article aims to evaluate the use of endoscopy as a tool in assessment of mucosal inflammation UC and its correlation with disease outcomes."

The news correspondents report that additional information may be obtained from V. Subramanian, Leeds Teaching Hosp NHS Trust, St James Univ Hosp, Dept. of Gastroenterol, Center Digest Dis, Leeds LS9 7TF, W Yorkshire, United Kingdom.

Data on Cancer Risk Discussed by M. Ward and Colleagues (Genetic Testing After Previous BRCA Testing: A Case Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cancer Risk. According to news reporting from Wichita, Kansas, by NewsRx editors, the research stated, "Mutations linked to hereditary cancer syndromes may increase an individual's risk of developing cancer, as well as its recurrence. New genes that may also carry pathogenic mutations associated with cancer risk have been identified; as a result, individuals previously tested should consider additional testing."

The news correspondents obtained a quote from the research, "This article provides a case study illustrating the importance of such testing. At a Glance Although just a small
percentage of cancers have a genetic link, individuals identified as having pathogenic mutations may develop cancers earlier-and cancers that are more aggressive-than the general population. Oncology nurses are often among the first to discuss with patients their fears regarding the risks of cancer development in future generations."

According to the news reporters, the research concluded: "Identifying a pathogenic mutation early can assist in cancer prevention or earlier detection."

For more information on this research see: Genetic Testing After Previous BRCA Testing: A Case Study. Clinical Journal of Oncology Nursing, 2016;20(6):660-663. Clinical Journal of Oncology Nursing can be contacted at: Oncology Nursing Soc, 125 Enterprise Dr, Pittsburgh, PA 15275, USA.

Our news journalists report that additional information may be obtained by contacting M. Ward, Via Christi Hosp, Canc Outreach & Risk Assessment, Wichita, KS 67214, United States.

Drugs and Therapies - Cancer Therapy

Data on Cancer Therapy Discussed by Researchers at Faculty of Pharmacy (Betulinic Acid: Recent Advances in Chemical Modifications, Effective Delivery, and Molecular Mechanisms of a Promising Anticancer Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Cancer Therapy. According to news reporting originating in Kuala Lumpur, Malaysia, by NewsRx journalists, research stated, "An important method of drug discovery is examination of diverse life forms, including medicinal plants and natural products or bioactive compounds isolated from these sources. In cancer research, lead structures of compounds from natural sources can be used to design novel chemotherapies with enhanced biological properties."

The news reporters obtained a quote from the research from the Faculty of Pharmacy, "Betulinic acid (3b-hydroxy-lup-20(29)-en-28-oic acid or BetA) is a naturally occurring pentacyclic triterpene with a wide variety of biological activities, including potent antitumor properties. Non-malignant cells and normal tissues are not affected by BetA. Because BetA exerts its effects directly on the mitochondrion and triggers death of cancerous cells, it is an important alternative when certain chemotherapy drugs fail. Mitochondrion-targeted agents such as BetA hold great promise to circumvent drug resistance in human cancers. BetA is being developed by a large network of clinical trial groups with the support of the U.S. National Cancer Institute. This article discusses recent advances in research into anticancer activity of BetA, relevant modes of delivery, and the agent's therapeutic efficacy, mechanism of action, and future perspective as a pipeline anticancer drug."
According to the news reporters, the research concluded: "BetA is a potentially important agent in cancer therapeutics."

Our news correspondents report that additional information may be obtained by contacting M. Ali-Seyed, Faculty of Pharmacy, Universiti Kebangsaan Malaysia (UKM), The National University of Malaysia, Jalan Raja Muda Abdul Aziz, Kuala Lumpur, 50300, Malaysia. Additional authors for this research include I. Jantan, K. Vijayaraghavan and S.N Bukhari.

**Drugs and Therapies - Cancer Therapy**

**Data on Cancer Therapy Reported by Researchers at Nanjing University**

[Paclitaxel-Loaded b-Cyclodextrin-Modified Poly(Acrylic Acid) Nanoparticles through Multivalent Inclusion for Anticancer Therapy]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Cancer Therapy. According to news reporting from Nanjing, People's Republic of China, by NewsRx journalists, research stated, "A nanoassembled drug delivery system for anticancer treatment, formed by the host-guest interactions between paclitaxel (PTX) and b-cyclodextrin (b-CD) modified poly(acrylic acid) (PCDAA), is successfully prepared. After such design, the aqueous solubility of PTX is greatly increased from 0.34 to 36.02 mg mL(-1), and the obtained PCDAA-PTX nanoparticles (PCDAA-PTX NPs) exhibit a sustained PTX release behavior in vitro."

Funders for this research include National Natural Science Foundation of China, Natural Science Foundation of Jiangsu Province.

The news correspondents obtained a quote from the research from Nanjing University, "In vitro cytotoxicity finds that PCDAA-PTX NPs can accumulate significantly in tumor cells and remain the pharmacological activity of PTX. The in vivo real-time biodistribution of PCDAA-PTX nanoparticles is investigated using near-infrared fluorescence imaging, indicating that the PCDAA-PTX NPs can effectively target to the tumor site by the enhanced permeability and retention effect in H22 tumor-bearing mice."

According to the news reporters, the research concluded: "Through in vivo antitumor examination, PCDAA-PTX NPs exhibit superior efficacy in impeding the tumor growth
compared to the commercially available Taxol?.

Our news journalists report that additional information may be obtained by contacting S. Yuan, Institute of Materials Engineering, National Laboratory of Solid State Microstructure, College of Engineering and Applied Sciences, Nanjing University, Nanjing, 210093, People's Republic of China. Additional authors for this research include J. Chen, J. Sheng, Y. Hu and Z. Jiang.

**Drugs and Therapies - Cancer Therapy**

**Data on Cancer Therapy Reported by Researchers at University of Washington (Preloading of Hydrophobic Anticancer Drug into Multifunctional Nanocarrier for Multimodal Imaging, NIR-Responsive Drug Release, and Synergistic Therapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Cancer Therapy is now available. According to news reporting originating in Seattle, Washington, by NewsRx journalists, research stated, "Applications of hydrophobic drug-based nanocarriers (NCs) remain largely limited because of their low loading capacity. Here, development of a multifunctional hybrid NC made of a magnetic Fe3O4 core and a mesoporous silica shell embedded with carbon dots (CDs) and paclitaxel (PTX), and covered by another layer of silica is reported."

Financial support for this research came from National Institutes of Health.

The news reporters obtained a quote from the research from the University of Washington, "The NC is prepared via a one-pot process under mild condition. The PTX loading method introduced in this study simplifies drug loading process and demonstrates a high loading capacity due to mesoporous silica dual-shell structure, supramolecular p-stacking between conjugated rings of PTX molecules, and aromatic rings of the CDs in the hybrid NC. The CDs serve as both confocal and two-photon fluorescence imaging probes, while the Fe3O4 core serves as a magnetic resonance imaging contrast agent. Significantly, NC releases PTX in response to near infrared irradiation as a result of local heating of the embedded CDs and the heating of CDs also provides an additional therapeutic effect by thermally killing cancer cells in tumor in addition to the chemotherapeutic effect of released PTX."

According to the news reporters, the research concluded: "Both in vitro and in vivo results show that NC demonstrates high therapeutic efficacy through a synergistic effect from
the combined chemo-photothermal treatments."

Our news correspondents report that additional information may be obtained by contacting M.Q. Zhang, University of Washington, Dept. of Mat Sci & Engn, Seattle, WA 98195, United States. Additional authors for this research include K. Wang, B. Tian, R. Revia, Q.X. Mu, M. Jeon, F.C. Chang and M.Q. Zhang.

**Oncology - Carcinomas**

**Data on Carcinomas Discussed by Researchers at SDM College of Dental Sciences and Hospital (Carcinoma of buccal mucosa: A site specific clinical audit)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Carcinomas. According to news reporting originating in Karnataka, India, by NewsRx journalists, research stated, "Carcinoma of buccal mucosa is the most common cancer of the oral cavity in India. Treatment of oral cancer poses unique reconstructive challenges, owing to the dynamic architecture of the oral cavity."

The news reporters obtained a quote from the research from the SDM College of Dental Sciences and Hospital, "Despite current progress in various treatment modalities, over the past 50 years survival rates have not improved drastically. Although, philosophy on treatment of buccal mucosa carcinoma remains well-established, due to the relative paucity of reported data, retrospective reviews of institutional experiences are of prime importance. This study provides a detailed insight on this site specific cancer of the oral cavity in the Indian population. The aim of this study is to analyze our experience with the management of carcinoma of buccal mucosa; associated clinical presentation, outcomes and prognostic factors. A retrospective chart review was performed of all cases of primary buccal mucosa carcinoma treated surgically between years 2008 and 2012 in SDM Craniofacial Unit, Karnataka, India. All cases were analyzed based on patient characteristics, clinical presentation, surgical and adjuvant therapy rendered and treatment outcomes. A retrospective chart review was carried out using the hospital's data base for the same. Kaplan-Meier methods were used for analyzing disease free survival (DFS). Univariate analysis of prognostic factors was performed with log rank test. The significant variables in univariate analysis were: Overall stage, T-stage (T1/T2 vs. T3/T4) and nodal status (N0 vs. N+). We found that staging, tumor size and nodal status were significant prognostic factors for DFS."
According to the news reporters, the research concluded: "The strong influence of overall disease stage, tumor size, nodal status, final histopathological report and habits of tobacco/betel quid chewing, on prognosis; emphasizes the importance of early diagnosis and prevention of carcinoma of buccal mucosa in the Indian population."

For more information on this research see: Carcinoma of buccal mucosa: A site specific clinical audit. *Indian Journal of Cancer*, 2015;52(4):605-10.

Our news correspondents report that additional information may be obtained by contacting V. Singhania, Dept. of Oral and Maxillofacial Surgery, Craniofacial Unit, SDM College of Dental Sciences and Hospital, Dharwad, Karnataka, India. Additional authors for this research include B.V. Jayade, V. Anehosur, K. Gopalkrishnan and N. Kumar.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0019-509X.178383. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Carcinomas**

**Data on Carcinomas Reported by Researchers at Chungbuk National University (Impact of Young Age at Diagnosis on Survival in Patients with Surgically Treated Renal Cell Carcinoma: A Multicenter Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Carcinomas have been published. According to news originating from Chongju, South Korea, by NewsRx correspondents, research stated, "The prognostic significance of age in renal cell carcinoma (RCC) is a subject of debate. The aim of the present multi-institutional study was to evaluate the impact of age on clinicopathological features and survival in a large cohort of patients with RCC."

Financial support for this research came from National Research Foundation of Korea.

Our news journalists obtained a quote from the research from Chungbuk National University, "A total of 5,178 patients who underwent surgery for RCC at eight institutions in Korea between 1999 and 2011 were categorized into three groups according to age at diagnosis as follows: young age (< 40 years, n= 541), middle-age (>= 40 and < 60 years, n= 2,551), and old age (>= 60 years, n= 2,096) groups. Clinicopathological variables and survival rates were compared between the three groups. Young patients had lower stage tumors with a low Fuhrman grade, a lower rate of lymphovascular invasion than patients in the other age groups. Regarding histologic type, the young age group had a lower percentage of clear cell histology and a greater incidence of Xp11.2 translocation RCC. Kaplan-Meier estimates showed that cancer-specific survival was significantly better in the young age group than in the other groups (log rank test, P = 0.008). However, age at diagnosis was not an independent predictor of survival in multivariate analysis."

According to the news editors, the research concluded: "Young age at diagnosis was associated with favorable pathologic features, although it was not an independent prognostic factor for survival in patients with surgically-treated RCC. Age itself should not be regarded as a
crucial determinant for the treatment of RCC."

For more information on this research see: Impact of Young Age at Diagnosis on Survival in Patients with Surgically Treated Renal Cell Carcinoma: A Multicenter Study. Journal of Korean Medical Science, 2016;31(12):1976-1982. Oncology - Carcinomas

Data on Carcinomas Reported by Researchers at Hannover Veterinary and Medical University (The effect of dichloroacetate in canine prostate adenocarcinomas and transitional cell carcinomas in vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Carcinomas have been presented. According to news reporting from Hannover, Germany, by NewsRx journalists, research stated, "The Warburg effect describes the ability of cancer cells to produce energy via aerobic glycolysis instead of oxidative phosphorylation of pyruvate. This deviation in mitochondrial metabolism inhibits apoptosis, allowing increased proliferation under conditions of reduced oxygen levels."

The news correspondents obtained a quote from the research from Hannover Veterinary and Medical University, "Dichloroacetate (DCA) was successfully used in several human cancer cell lines to reactivate oxidative phosphorylation in mitochondria. The aim of this study was the characterization and response of canine cancer cell lines after DCA exposure. The effect of 10 mM DCA was characterized in vitro on a set of six canine prostate adenocarcinoma and transitional cell carcinoma (TCC) derived cell lines. Cell counts, lactate levels, apoptosis, expression of apoptotic proteins, survival factors and different miRNAs were analyzed. Additionally, metabolic activity, mitochondrial activity and proliferation were investigated. DCA significantly decreased cell number of all but one utilized cell lines and leads to a significant reduction of lactate release. Decreased survivin levels were found in all cell lines, two of which presented a significant reduction in metabolic activity. Increased miR-375 levels were measured in all TCC cell lines. Reactivation of pyruvate dehydrogenase and an elevated mitochondrial activity appear to induce the transition from aerobic glycolysis back to oxidative phosphorylation."

According to the news reporters, the research concluded: "Further, these results display that DCA treatment has a suppressant effect on proliferation of canine cancer cells."

Our news journalists report that additional information may be obtained by contacting I. Nolte, Hannover Veterinary & Medical University, Small Anim Clin, D-30559 Hannover, Germany. Additional authors for this research include M. Stubbendorff, S. Willenbrock, S. Wagner, P. Schadzek, A. Ngezahayo, H.M. Escobar and I. Nolte.

**Drugs and Therapies - Cardiac Stressing Agents**

**Data on Cardiac Stressing Agents Discussed by Researchers at University of Cairo (y Simultaneous Determination of Aspirin, Dipyridamole and Two of Their Related Impurities in Capsules by Validated TLC-Densitometric and HPLC Methods)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Cardiac Stressing Agents. According to news originating from Cairo, Egypt, by NewsRx correspondents, research stated, "Aspirin (ASP) and dipyridamole (DIP) are widely used as a combination in pharmaceutical formulations for treatment of strokes. Many of these formulations are containing tartaric acid as an excipient (in DIP pellets formulation for sustained release), which increases the probability of formation of dipyridamole tartaric acid ester impurity (DIP-I)."

Our news journalists obtained a quote from the research from the University of Cairo, "On the other hand, salicylic acid (SAL) is considered to be one of the synthesis impurities and a degradation product of ASP. In this work, two chromatographic methods, namely, TLC-densitometry and HPLC, have been established and validated for simultaneous determination of ASP, DIP, SAL and DIP-I. Good separation was achieved by using silica gel as stationary phase and toluene-methanol-ethyl acetate (2:3:5, by volume) as mobile phase in the case of TLC-densitometry and Zorbax ODS column with mobile phase consisting of phosphate buffer (pH 3.3)-acetonitrile-triethylamine (40:60:0.03, by volume) for HPLC. Influence of different organic solvents in mobile phase composition has been studied to optimize the separation efficiency in TLC densitometry. Moreover, factors affecting the efficiency of HPLC, like pH of the buffer used, organic solvent ratio in the mobile phase and flow rate, have been carefully studied using one variable at a time approach."

According to the news editors, the research concluded: "Finally, the proposed methods were validated as per ICH guidelines." For more information on this research see: y Simultaneous Determination of Aspirin, Dipyridamole and Two of Their Related Impurities in Capsules by Validated TLC-Densitometric and HPLC Methods. *Journal of Chromatographic Science*, 2016;54(7):1120-1128. *Journal of Chromatographic Science* can be contacted at: Oxford Univ Press Inc,
Cardiology

Data on Cardiology Described by Researchers at Institute for Clinical Evaluative Sciences (Baseline risk has greater influence over behavioral attrition on the real-world clinical effectiveness of cardiac rehabilitation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiology are discussed in a new report. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "Few studies have examined the correlates of real-world cardiac rehabilitation (CR) effectiveness. The objective of this study was to determine the relationship between baseline risk, behavioral attrition, and the number needed to treat (NNT) associated with CR."

Our news journalists obtained a quote from the research from Institute for Clinical Evaluative Sciences, "A retrospective study was conducted among 16,061 CR patients between 1995 and 2011 in Canada. Multiple logistic regression models were derived from patient characteristics and measured baseline risk (individual's risk of death within 3 years) and behavioral attrition (individual's risk of premature dropout). We examined the treatment efficacy of CR among nondropouts using a 20% relative risk reduction. Further sensitivity analyses were performed to assess the robustness of our assumptions. We assumed no efficacy among dropouts. Both baseline risk and behavioral attrition were independently associated with NNT, although baseline risk had a stronger association with NNT than behavioral attrition. Increasing age, lower baseline fitness, history of diabetes, hypertension, and greater comorbidities were associated with lower NNT. Being female, living alone, living in the lowest neighborhood income quintile, and greater adiposity were associated with higher NNT. The clinical effectiveness of CR is largely driven by the baseline risk rather than the behavioral attrition of the populations they serve."

According to the news editors, the research concluded: "These findings have implications for risk stratification among those with greatest survival yields and programmatic needs."

For more information on this research see: Baseline risk has greater influence over behavioral attrition on the real-world clinical effectiveness of cardiac rehabilitation. *Journal of Clinical Epidemiology*, 2016;79():55-61. *Journal of Clinical Epidemiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier -
Data on Cardiology Discussed by Researchers at Wake Forest University (A TASER conducted electrical weapon with cardiac biomonitoring capability: Proof of concept and initial human trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting originating from Winston Salem, North Carolina, by NewsRx correspondents, research stated, "Despite research demonstrating the overall safety of Conducted Electrical Weapons (CEWs), commonly known by the brand name TASER®, concerns remain regarding cardiac safety. The addition of cardiac biomonitoring capability to a CEW could prove useful and even lifesaving in the rare event of a medical crisis by detecting and analyzing cardiac rhythms during the period immediately after CEW discharge."

Our news editors obtained a quote from the research from Wake Forest University, "To combine an electrocardiogram (ECG) device with a CEW to detect and store ECG signals while still allowing the CEW to perform its primary function of delivering an incapacitating electrical discharge. This work was performed in three phases. In Phase 1 standard law enforcement issue CEW cartridges were modified to demonstrate transmission of ECG signals. In Phase 2, a miniaturized ECG recorder was combined with a standard issue CEW and tested. In Phase 3, a prototype CEW with on-board cardiac biomonitoring was tested on human volunteers to assess its ability to perform its primary function of electrical incapacitation. Bench testing demonstrated that slightly modified CEW cartridge wires transmitted simulated ECG signals produced by an ECG rhythm generator and from a human volunteer. Ultimately, a modified CEW incorporating ECG monitoring successfully delivered incapacitating current to human volunteers and successfully recorded ECG signals from subcutaneous CEW probes after firing. An ECG recording device was successfully incorporated into a standard issue CEW without impeding the functioning of the device."

According to the news editors, the research concluded: "This serves as proof-of-concept that safety measures such as cardiac biomonitoring can be incorporated into CEWs and possibly other law enforcement devices."

For more information on this research see: A TASER conducted electrical weapon with cardiac biomonitoring capability: Proof of concept and initial human trial. Journal of
Cardiology

Data on Cardiology Reported by Researchers at Cedars-Sinai Heart Institute (Cardiac magnetic resonance imaging for myocardial perfusion and diastolic function-reference control values for women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting originating from Los Angeles, California, by NewsRx correspondents, research stated, "Angina, heart failure with preserved ejection fraction (HFpEF) and coronary microvascular dysfunction (CMD) in the absence of obstructive coronary artery disease (CAD) are more common in women and are associated with adverse cardiovascular prognosis. Cardiac magnetic resonance imaging (CMRI) is established for assessment of left ventricular (LV) morphology and systolic function and is increasingly used to assess myocardial perfusion and diastolic function."

Our news editors obtained a quote from the research from Cedars-Sinai Heart Institute, "Indeed, stress CMRI allows measurement of myocardial perfusion reserve index (MPRI) using semi-quantitative techniques, and quantification of LV volumetric filling patterns provides valuable insight into LV diastolic function. The utility of these two techniques remains limited, because reference control values for MPRI and LV diastolic function in asymptomatic middle-aged, women have not previously been established. To address this limitation, we recruited twenty women, without clinical cardiovascular disease or cardiovascular risk factors, with normal maximal Bruce protocol exercise treadmill testing. Subjects underwent CMRI (1.5 tesla) using a standardized protocol of adenosine stress and rest perfusion and LV cinematic imaging. Commercially available with automated CMRI segmentation was used for calculation of MPRI, LV filling profiles, and ejection fraction. Mean age was 54?9 years and mean body mass index was 25?4 kg/m(3). The exercise treadmill testing results demonstrated a normotensive group with normal functional capacity and hemodynamic response. We report reference control values for semi-quantitative MPRI as well as measures of LV systolic and diastolic function including ejection fraction, stroke volume, peak filling rate (PFR), PFR adjusted for end-diastolic volume (EDV) and stroke volume, time to PFR, and EDV index. The data herein provide reference values for MPRI and diastolic function in a cohort of healthy,
middle-aged of women."

According to the news editors, the research concluded: "These reference values may be used for comparison with a variety of patient populations, including women with CMD and HFpEF."

For more information on this research see: Cardiac magnetic resonance imaging for myocardial perfusion and diastolic function-reference control values for women. *Cardiovascular Diagnosis and Therapy*, 2016;6(1):78-86.

The news editors report that additional information may be obtained by contacting M. Bakir, Barbra Streisand Women's Heart Center, Cedars-Sinai Heart Institute, S Mark Taper Foundation Imaging Center, Biomedical Imaging Research Institute Cedars-Sinai Medical Center, Los Angeles, CA 90048, United States. **Cardiology**

**Data on Cardiology Reported by Researchers at University of Wisconsin**

*(Inhibition of late sodium current attenuates ionic arrhythmia mechanism in ventricular myocytes expressing LaminA-N195K mutation)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiology. According to news reporting from Madison, Wisconsin, by NewsRx journalists, research stated, "Lamin A and C are nuclear filament proteins encoded by the LMNA gene. Mutations in the LMNA gene cause many congenital diseases known as laminopathies, including Emery-Dreifuss muscular dystrophy, Hutchinson-Gilford progeria syndrome, and familial dilated cardiomyopathy (DCM) with conduction disease."

The news correspondents obtained a quote from the research from the University of Wisconsin, "A missense mutation (N195K) in the A-type lamins results in familial DCM and sudden arrhythmic death. The purpose of this study was to investigate the ion current mechanism of arrhythmia and DCM caused by the LaminA-N195K variant. A homozygous mouse line expressing the Lmna-N195K mutation (Lmna(N195K/N195K)) that exhibited arrhythmia, DCM, and sudden death was used. Using whole cell patch-clamp technique, we measured action potential duration (APD), Na+ currents (I-Na) in ventricular myocytes isolated from Lmna(N195K/N195K), and wild-type mice. Both peak and late INa were significantly(P < .05) increased in LmnaN195K/N195K ventricular myocytes. Similarly, Lmna(N195K/N195K) ventricular myocytes exhibited significant (P < .005) prolongation of APD (time to 50% [APD(50)] and 90% [APD(90)] repolarization) and triggered activity. Acute application of ranolazine inhibited late INa, shortened APD, and abolished triggered activity in LmnaN(195K/N195K) ventricular myocytes."

According to the news reporters, the research concluded: "Inhibition of late I-Na may
be an effective therapy in preventing arrhythmia in patients with LmA-N195K mutation-related DCM."

Our news journalists report that additional information may be obtained by contacting R.C. Balijepalli, University of Wisconsin, Dept. of Med, Cellular & Mol Arrhythmia Res Program, Madison, WI, United States. Additional authors for this research include T. Tsubouchi, T.A. Hacker, M.R. Wolff, L. Belardinelli and R.C. Balijepalli.

**Heart Disorders and Diseases - Cardiomyopathies**

**Data on Cardiomyopathies Described by S.R. Roof et al (Insulin-like growth factor 1 prevents diastolic and systolic dysfunction associated with cardiomyopathy and preserves adrenergic sensitivity)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Cardiomyopathies. According to news reporting originating from Columbus, Ohio, by NewsRx correspondents, research stated, "Insulin-like growth factor 1 (IGF-1)-dependent signalling promotes exercise-induced physiological cardiac hypertrophy. However, the in vivo therapeutic potential of IGF-1 for heart disease is not well established."

Financial supporters for this research include National Institutes of Health, American Heart Association.

Our news editors obtained a quote from the research, "Here, we test the potential therapeutic benefits of IGF-1 on cardiac function using an in vivo model of chronic catecholamine-induced cardiomyopathy. Rats were perfused with isoproterenol via osmotic pump (1 mg kg(-1) per day) and treated with 2 mg kg(-1) IGF-1 (2 mg kg(-1) per day, 6 days a week) for 2 or 4 weeks. Echocardiography, ECG, and blood pressure were assessed. In vivo pressure-volume loop studies were conducted at 4 weeks. Heart sections were analysed for fibrosis and apoptosis, and relevant biochemical signalling cascades were assessed. After 4 weeks, diastolic function (EDPVR, EDP, tau, E/A ratio), systolic function (PRSW, ESPVR, dP/dtmax) and structural remodelling (LV chamber diameter, wall thickness) were all adversely affected in isoproterenol-treated rats. All these detrimental effects were attenuated in rats treated with Iso+IGF-1. Isoproterenol-dependent effects on BP were attenuated by IGF-1 treatment. Adrenergic sensitivity was blunted in isoproterenol-treated rats but was preserved by IGF-1 treatment. Immunoblots indicate that cardioprotective p110a signalling and activated Akt are
selectively upregulated in Iso+IGF-1-treated hearts. Expression of iNOS was significantly increased in both the Iso and Iso+IGF-1 groups; however, tetrahydrobiopterin (BH4) levels were decreased in the Iso group and maintained by IGF-1 treatment. IGF-1 treatment attenuates diastolic and systolic dysfunction associated with chronic catecholamine-induced cardiomyopathy while preserving adrenergic sensitivity and promoting BH4 production.

According to the news editors, the research concluded: "These data support the potential use of IGF-1 therapy for clinical applications for cardiomyopathies."

The news editors report that additional information may be obtained by contacting S.R. Roof, Q-Test Labs, Columbus, OH, United States. Additional authors for this research include J. Boslett, D. Russell, C. del Rio, J. Alecusan, J.L. Zweier, M.T. Ziolo, R. Hamlin, P.J. Mohler and J. Curran.

Heart Disorders and Diseases - Cardiomyopathies

Data on Cardiomyopathies Reported by Researchers at University of Naples Federico II (Functional Studies and In Silico Analyses to Evaluate Non-Coding Variants in Inherited Cardiomyopathies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Cardiomyopathies have been presented. According to news originating from Naples, Italy, by NewsRx correspondents, research stated, "Point mutations are the most common cause of inherited diseases. Bioinformatics tools can help to predict the pathogenicity of mutations found during genetic screening, but they may work less well in determining the effect of point mutations in non-coding regions."

Our news journalists obtained a quote from the research from the University of Naples Federico II, "In silico analysis of intronic variants can reveal their impact on the splicing process, but the consequence of a given substitution is generally not predictable. The aim of this study was to functionally test five intronic variants (MYBPC3-c.506-2A>C, MYBPC3-c.906-
7G >T, MYBPC3-c.2308+3G >C, SCN5A-c.393-5C >A, and ACTC1-c.617-7T >C) found in five patients affected by inherited cardiomyopathies in the attempt to verify their pathogenic role. Analysis of the MYBPC3-c.506-2A >C mutation in mRNA from the peripheral blood of one of the patients affected by hypertrophic cardiac myopathy revealed the loss of the canonical splice site and the use of an alternative splicing site, which caused the loss of the first seven nucleotides of exon 5 (MYBPC3-G169AfsX14). In the other four patients, we generated minigene constructs and transfected them in HEK-293 cells. This minigene approach showed that MYBPC3-c.2308+3G >C and SCN5A-c.393-5C >A altered pre-mRNA processing, thus resulting in the skipping of one exon. No alterations were found in either MYBPC3-c.906-7G >T or ACTC1-c.617-7T >C."

According to the news editors, the research concluded: "Functional in vitro analysis of the effects of potential splicing mutations can confirm or otherwise the putative pathogenicity of non-coding mutations, and thus help to guide the patient's clinical management and improve genetic counseling in affected families."

For more information on this research see: Functional Studies and In Silico Analyses to Evaluate Non-Coding Variants in Inherited Cardiomyopathies. International Journal of Molecular Sciences, 2016;17(11):1822-1834. International Journal of Molecular Sciences can be contacted at: Mdp Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

arterial pressure and heart rate were compared before and after physical therapy (paired t tests). Differences among norepinephrine doses and physical activity levels were evaluated (Kruskal-Wallis test). Forty-one of the 47 patients (87%) tolerated the activity within safe ranges of vital signs. The change in patients' mean arterial pressure from before to after activity was not significant (P = .16), but a significant increase in heart rate occurred after activity (P < .001). A Kruskal-Wallis test showed no significant difference in the norepinephrine dose and activity level (chi(2) = 6.34, P = .17). No instances of cardiopulmonary or respiratory arrest occurred during any physical therapy sessions."

According to the news reporters, the research concluded: "Infusion of low-dose norepinephrine should not be considered an automatic reason to keep patients on bed rest."

Our news journalists report that additional information may be obtained by contacting R.A. Nievera, Barnes Jewish Hosp, Cardiothorac Intens Care Unit, St Louis, MO 63110, United States. Additional authors for this research include A. Fick and H.K. Harris.

Cardiovascular Diseases
Data on Cardiovascular Diseases Described by Researchers at New York University (Recommendations for cardiovascular disease research with lesbian, gay and bisexual adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "Aims and objectives. The purpose of this paper is to provide recommendations to strengthen cardiovascular disease research with lesbian, gay and bisexual adults, and highlight implications for practice."

Financial support for this research came from National Center for Advancing Translational Sciences.

Our news journalists obtained a quote from the research from New York University, "Lesbian, gay and bisexual individuals face significant discrimination that negatively impacts their health. Health disparities research in lesbian, gay and bisexual adults have focused on mental health, sexually transmitted infections and substance use. Although cardiovascular disease is the leading cause of death and many lesbian, gay and bisexual adults report increased risk factors for cardiovascular disease, there has been limited research in this area. This paper is a critical review. A literature search was conducted that compared cardiovascular disease risk and/or prevalence between lesbian, gay and bisexual and heterosexual adults. Measures to assess cardiovascular disease risk factors and diagnoses varied widely across the 31 included studies."
There was a lack of standardisation in definitions used for alcohol consumption, illicit drug use, mental health and self-rated physical health. Most studies that reported body mass index relied on participant self-report. Few studies included measures of physical activity and diet and those that did lacked standardisation. Only seven studies used laboratory data to establish diagnosis of cardiovascular disease. This study is the first comprehensive review on this topic. In cardiovascular disease research with lesbian, gay and bisexual adults, there is a need for: (1) inclusion of stress as a risk factor for cardiovascular disease, (2) standardised measures, (3) objective measures for determining the presence of cardiovascular disease, (4) data from electronic health records to strengthen the study of cardiovascular disease in this population. Relevance to clinical practice. Strengthening cardiovascular disease research in lesbian, gay and bisexual adults is an important step in addressing health disparities in this population."

According to the news editors, the research concluded: "Nurses and other healthcare professionals should assess sexual orientation in routine health assessments."

Our news journalists report that additional information may be obtained by contacting B.A. Caceres, New York University, Rory Meyers Coll Nursing, New York, NY, United States. Additional authors for this research include A. Brody and D. Chyun.

**Medical Imaging - Cardiovascular Imaging**

**Data on Cardiovascular Imaging Discussed by M.C. Turner and Colleagues (High-risk plaque in patients with near normal coronary angiograms)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Medical Imaging - Cardiovascular Imaging. According to news originating from Lake Charles, Louisiana, by NewsRx editors, the research stated, "The increased use of cardiac computed tomography angiography in the emergency room to triage patients who present with chest pain syndrome has led to the identification of individuals with coronary plaques with high-risk characteristics in the absence of significant stenoses."

Our news journalists obtained a quote from the research, "Anecdotal observations have suggested that the presence of coronary high-risk plaque results in an increased risk of acute coronary syndrome over time. This case presentation represents an example of this subgroup of patients."
According to the news editors, the research concluded: "Intuitively, it would seem that high-dose statin therapy would be the treatment of choice, with percutaneous intervention reserved for the development of flow-limiting lesions; however, a prospective trial to determine outcomes to our knowledge has not been performed."

The news correspondents report that additional information may be obtained from M.C. Turner, Cardiovasc Specialists Southwest Louisiana, Lake Charles, LA, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/echo.13361. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Research**

**Data on Cardiovascular Research Detailed by Researchers at Federal University (Functional topography of cardiovascular regulation along the rostrocaudal axis of the rat posterior insular cortex)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Research. According to news reporting out of Belo Horizonte, Brazil, by NewsRx editors, research stated, "Cardiovascular (CV) representation has been identified within the insular cortex (IC) and a lateralization of function previously suggested. In order to further understand the role of IC on cardiovascular control, the present study compared the CV responses evoked by stimulation of N-metil-D-aspartate (NMDA) receptors in the right and left posterior IC at different rostrocaudal levels."

Financial supporters for this research include Brazilian agencies, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Fundacao de Amparo a Pesquisa de Minas Gerais.

Our news journalists obtained a quote from the research from Federal University, "Intracortical microinjections of NMDA were performed into the IC of male Wistar rats anaesthetized with urethane (1.4?g/kg) prepared for blood pressure, heart rate and renal sympathetic nerve activity. Gene expression of NMDA receptor subunits NR2A and NR2B in the IC was confirmed by RT-PCR. Immunofluorescence for the NMDA receptor NR1 subunit was demonstrated in the IC (coordinates anteroposterior (AP)+1.5, 0.0 and -1.5?mm). A cardiac sympathoinhibitory site was identified, more rostrally located than identified in previous studies. A site of sympathoexcitatory cardiac control was identified more caudal to this region in agreement with earlier work. Under the experimental conditions, no lateralization of cardiovascular function was identified with chemical stimulation eliciting the same responses from either left or right insular cortices. No tonic role of the insula on cardiovascular control..."
was identified with the use of the NMDA antagonist, AP-5. Peri-insular microinjection of NMDA was without cardiovascular effect indicating the specificity of the insula as a cardiovascular regulatory site."

According to the news editors, the research concluded: "The current study reveals a functional topography for autonomic cardiovascular control along the rostrocaudal axis of the posterior IC."

Our news journalists report that additional information may be obtained by contacting F.R. Marins, Dept. of Physiology and Biophysics, INCT, Institute of Biological Sciences, Federal University of Minas Gerais, Belo Horizonte, Brazil. Additional authors for this research include M. Limborco-Filho, C.H. Xavier, V.C. Biancardi, G.C. Vaz, J.E. Stern, S.M. Oppenheimer and M.A Fontes.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/1440-1681.12542. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Research

Data on Cardiovascular Research Detailed by Researchers at University of Ontario [The Science of Salt: A Regularly Updated Systematic Review of Salt and Health Outcomes (August to November 2015)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Research is the subject of a report. According to news originating from Oshawa, Canada, by NewsRx correspondents, research stated, "The purpose of this review was to systematically identify, summarize, and critically appraise studies on dietary salt relating to health outcomes that were published from August to November 2015."

Our news journalists obtained a quote from the research from the University of Ontario, "The search strategy was adapted from a previous systematic review on dietary salt and health. Overall, 15 studies were included in the review: one study assessed cardiovascular events, five studies assessed blood pressure or hypertension incidence, six studies assessed surrogate outcomes for cardiovascular or kidney diseases, and three studies assessed other outcomes (age-related cataracts, rheumatoid arthritis, and bone mineral density, respectively)."

According to the news editors, the research concluded: "Four studies were selected for detailed appraisal and commentary."

The news correspondents report that additional information may be obtained from J. Arcand, University of Ontario, Fac Hlth Sci, Inst Technol, Oshawa, ON L1H 7K4, Canada. Additional authors for this research include J. Arcand, A.A. Leung, T.S. Raj, K. Trieu, J.A. Santos and N.R.C. Campbell.

Life Science Research - Cell Biology

Data on Cell Biology Detailed by Researchers at University of California
(The Hippo Pathway Kinases LATS1/2 Suppress Cancer Immunity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Life Science Research - Cell Biology. According to news reporting from La Jolla, California, by NewsRx journalists, research stated, "Poorly immunogenic tumor cells evade host immunity and grow even in the presence of an intact immune system, but the complex mechanisms regulating tumor immunogenicity have not been elucidated. Here, we discovered an unexpected role of the Hippo pathway in suppressing anti-tumor immunity."

Funders for this research include NIH, Whitworth Immunotherapy Foundation. The news correspondents obtained a quote from the research from the University of California, "We demonstrate that, in three different murine syngeneic tumor models (B16, SCC7, and 4T1), loss of the Hippo pathway kinases LATS1/2 (large tumor suppressor 1 and 2) in tumor cells inhibits tumor growth. Tumor regression by LATS1/2 deletion requires adaptive immune responses, and LATS1/2 deficiency enhances tumor vaccine efficacy. Mechanistically, LATS1/2-null tumor cells secrete nucleic-acid-rich extracellular vesicles, which induce a type I interferon response via the Toll-like receptors- MYD88/TRIF pathway. LATS1/2 deletion in tumors thus improves tumor immunogenicity, leading to tumor destruction by enhancing anti-tumor immune responses."

According to the news reporters, the research concluded: "Our observations uncover a key role of the Hippo pathway in modulating tumor immunogenicity and demonstrate a proof of concept for targeting LATS1/2 in cancer immunotherapy."

For more information on this research see: The Hippo Pathway Kinases LATS1/2 Suppress Cancer Immunity. Cell, 2016;167(6):1525-1539,176-192. Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Cell - www.journals.elsevier.com/cell/)

Data on Cell Differentiation Discussed by Researchers at Ningbo University (Characterization of microRNAs by deep sequencing in red claw crayfish Cherax quadricarinatus haematopoietic tissue cells after white spot syndrome virus infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cell Differentiation. According to news originating from Zhejiang, People's Republic of China, by NewsRx correspondents, research stated, "White spot syndrome virus (WSSV) is one of the most prevalent and widespread viruses in both shrimp and crayfish aquaculture. MicroRNAs (miRNAs) are crucial post-transcriptional regulators and play critical roles in cell differentiation and proliferation, apoptosis, signal transduction and immunity."

Financial supporters for this research include National Natural Science Foundation of China, SFFPC, FRFCU.

Our news journalists obtained a quote from the research from Ningbo University, "In this study, miRNA expression profiles were identified via deep sequencing in red claw crayfish Cherax quadricarinatus haematopoietic tissue (Hpt) cell cultures infected with WSSV at both early (i.e., 1 hpi) and late (i.e., 12 hpi) infection stages. The results showed that 2 known miRNAs, namely, miR-7 and miR-184 play key roles in immunity. Meanwhile, 106 novel miRNA candidates were predicted by software in these combined miRNA transcriptomes. Compared with two control groups, 36 miRNAs showed significantly different expression levels after WSSV challenge. Furthermore, 10 differentially expressed miRNAs in WSSV-exposed Hpt cells were randomly selected for expression analysis by quantitative real-time RT-PCR. Consistent with the expression profiles identified by deep sequencing, RT-PCR showed a significant increase or decrease in miRNA expression in Hpt cells after WSSV infection. Prediction of targets of miRNAs such as miR-7, cqu-miR-52, cqu-miR-126 and cqu-miR-141 revealed that their target genes have diverse biological roles, including not only immunity but also transcriptional regulation, energy metabolism, cell communication, cell differentiation, cell death, autophagy, endocytosis and apoptosis."

According to the news editors, the research concluded: "These results provide insight into the molecular mechanism of WSSV infection and highlight the function of miRNAs in the regulation of the immune response against WSSV infection in crustaceans."

For more information on this research see: Characterization of microRNAs by deep sequencing in red claw crayfish Cherax quadricarinatus haematopoietic tissue cells after white spot syndrome virus infection. Fish & Shellfish Immunology, 2016;59():469-483. Fish &

Cell Proliferation

Data on Cell Proliferation Reported by Researchers at Indiana University School of Medicine (Critical role of PPARg in myeloid-derived suppressor cell-stimulated cancer cell proliferation and metastasis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cell Proliferation. According to news reporting originating in Indianapolis, Indiana, by NewsRx journalists, research stated, "Lysosomal acid lipase (LAL) is a key enzyme controlling neutral lipid metabolic signaling in myeloid-derived suppressor cells (MDSCs). MDSCs from LAL-deficient (lal-/-) mice directly stimulate cancer cell proliferation."

The news reporters obtained a quote from the research from the Indiana University School of Medicine, "PPARg ligand treatment inhibited lal-/-MDSCs stimulation of tumor cell growth and metastasis in vivo, and tumor cell proliferation and migration in vitro. In addition, PPARg ligand treatment impaired lal-/-MDSCs transendothelial migration, and differentiation from lineage-negative cells. The corrective effects of PPARg ligand on lal-/-MDSCs functions were mediated by regulating the mammalian target of rapamycin (mTOR) pathway, and subsequently blocking MDSCs ROS overproduction. Furthermore, in the myeloid-specific dominant-negative PPARg (dnPPARg) overexpression bitransgenic mouse model, tumor growth and metastasis were enhanced, and MDSCs from these mice stimulated tumor cell proliferation and migration. MDSCs with dnPPARg overexpression showed increased transendothelial migration, overactivation of the mTOR pathway, and ROS overproduction."

According to the news reporters, the research concluded: "These results indicate that PPARg plays a critical role in neutral lipid metabolic signaling controlled by LAL, which provides a mechanistic basis for clinically targeting MDSCs to reduce the risk of cancer proliferation, growth and metastasis."

For more information on this research see: Critical role of PPARg in myeloid-derived suppressor cell-stimulated cancer cell proliferation and metastasis. Oncotarget, 2016;7 (2):1529-43.

Our news correspondents report that additional information may be obtained by contacting T. Zhao, Dept. of Pathology and Laboratory Medicine, Indiana University School of Medicine, Indianapolis, IN 46202, United States. Additional authors for this research include H.
Data on Cell Science Discussed by Researchers at European Molecular Biology Laboratory (PRL-3 disrupts epithelial architecture by altering the post-mitotic midbody position)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science - Cell Science have been published. According to news reporting from Heidelberg, Germany, by NewsRx journalists, research stated, "Disruption of epithelial architecture is a fundamental event during epithelial tumorigenesis. We show that the expression of the cancer-promoting phosphatase PRL-3 (PTP4A3), which is overexpressed in several epithelial cancers, in polarized epithelial MDCK and Caco(2) cells leads to invasion and the formation of multiple ectopic, fully polarized lumens in cysts."

The news correspondents obtained a quote from the research from European Molecular Biology Laboratory, "Both processes disrupt epithelial architecture and are hallmarks of cancer. The pathological relevance of these findings is supported by the knockdown of endogenous PRL-3 in MCF-7 breast cancer cells grown in threedimensional branched structures, showing the rescue from multipelumen- to single-lumen-containing branch ends. Mechanistically, it has been previously shown that ectopic lumens can arise from midbodies that have been mislocalized through the loss of mitotic spindle orientation or through the loss of asymmetric abscission. Here, we show that PRL-3 triggers ectopic lumen formation throughmidbody mispositioning without altering the spindle orientation or asymmetric abscission, instead, PRL-3 accelerates cytokinesis, suggesting that this process is an alternative new mechanism for ectopic lumen formation in MDCK cysts."

According to the news reporters, the research concluded: "The disruption of epithelial architecture by PRL-3 revealed here is a newly recognized mechanism for PRL-3 promoted cancer progression."

Our news journalists report that additional information may be obtained by contacting M. Kohn, European Mol Biol Lab, Genome Biol Unit, D-69117 Heidelberg, Germany. Additional authors for this research include G. Varsano, T. Rubio, M.L. Hennrich, T. Sachsenheimer, M. Galvez-Santisteban, F. Martin-Belmonte, A.C. Gavrin, B. Brugger and M. Kohn.

Data on Central Nervous System Agents Detailed by N. Levy-Cooperman and Co-Authors (Abuse Potential and Pharmacodynamic Characteristics of Oral and Intranasal Eluxadoline, a Mixed mu- and kappa-Opioid Receptor Agonist and delta-Opioid Receptor Agonist and Antagonist ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Central Nervous System Agents have been published. According to news originating from Toronto, Canada, by NewsRx correspondents, research stated, "Drugs with mu-opioid receptor (OR) activity can be associated with abuse and misuse. The peripherally acting mixed mu-OR and kappa-OR agonist and delta-OR antagonist eluxadoline is approved in the United States for the treatment of irritable bowel syndrome with diarrhea."

Our news journalists obtained a quote from the research, "In two separate crossover studies, we evaluated the oral and intranasal abuse potential of eluxadoline versus placebo and the active control oxycodone. Healthy recreational opioid users received eluxadoline 100, 300, and 1000 mg, oxycodone 30 and 60 mg, and placebo (oral study), or eluxadoline 100 and 200 mg, oxycodone 15 and 30 mg, and placebos matched to eluxadoline and oxycodone (intranasal study). In the oral study, Drug Liking Visual Analog Scale (VAS) peak (maximum) effect (E-max) score (primary endpoint) was significantly greater with eluxadoline 300 and 1000 mg versus placebo, but scores were significantly lower versus oxycodone. Following intranasal insufflation of eluxadoline, Drug Liking VAS E-max scores were not statistically different versus placebo, and were significantly lower versus oxycodone. Across other subjective measures, eluxadoline was generally similar to or disliked versus placebo. Pupillometry indicated no or minimal central effects with oral and intranasal eluxadoline, respectively. Adverse events of euphoric mood were reported with oral and intranasal eluxadoline but at a far lower frequency versus oxycodone."

According to the news editors, the research concluded: "These data demonstrate that eluxadoline has less abuse potential than oxycodone in recreational opioid users."

The news correspondents report that additional information may be obtained from N. Levy-Cooperman, Altreos Res Partners Inc, Toronto, ON M6P 1C6, Canada. Additional authors for this research include G. McIntyre, L. Bonifacio, M. McDonnell, J.M. Davenport, P.S. Covington, L.S. Dove and E.M. Sellers.

Data on Cervical Cancer Reported by Researchers at Shandong University (Theanine from tea and its semi-synthetic derivative TBrC suppress human cervical cancer growth and migration by inhibiting EGFR/Met-Akt∥NF-kappa B signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Cervical Cancer is now available. According to news reporting originating in Shandong, People's Republic of China, by NewsRx journalists, research stated, "Cervical cancer is the third most prevalent cancer among women worldwide. Theanine from tea and its derivatives show some anticancer activities."

The news reporters obtained a quote from the research from Shandong University, "However, the role of theanine and its derivatives against human cervical cancer and the molecular mechanisms of action remain unclear. Thus, in this study, we aim to investigate the anticancer activities and underlying mechanisms of theanine and a theanine derivative, ethyl 6-bromocoumarin-3-carboxylyl L-theanine (TBrC), against human cervical cancer. In vitro and in vivo assays for cancer cell growth and migration have confirmed the inhibition of the cell growth and migration by TBrC and theanine in highly-metastatic human cervical cancer. TBrC displays much stronger activity than theanine on inhibition of the cell growth and migration as well as induction of apoptosis and regulation of related protein expressions in the human cervical cancer cells. TBrC and theanine greatly reduced endogenous and exogenous factors-stimulated cell migration and completely repressed HGF-and EGF+ HGF-activated EGFR/Met-Alt/NF-kappa B signaling by reducing the phosphorylation and expressions of EGFR, Met, Alt, and NF-kappa B in cervical cancer cells. The enhancer of zeste homolog 2 (EZH2) knockdown decreased the cancer cell migration and NF-kappa B expression. The NE-KB knockdown reduced the cancer cell migration. TBrC and theanine reduced the EZH2 expression by more than 80%. In addition, TBrC and theanine significantly suppressed human cervical tumor growth in tumor-bearing nude mice without toxicity to the mice."

According to the news reporters, the research concluded: "Our results suggest that TBrC and theanine may have the potentials of the therapeutic and/or adjuvant therapeutic application in the treatment of human cervical cancer."

Our news correspondents report that additional information may be obtained by contacting Y.P. Sun, Shandong University, Jinan Cent Hosp, Dept. of Oncol, Jinan 250013, Shandong, People's Republic of China. Additional authors for this research include Y.P. Sun, H.R. Zhang, D.X. Ji, F. Wu, H.H. Tian, K. Liu, Y. Zhang, B.H. Wu and G.Y. Zhang.
Drugs and Therapies - Chemical Biology and Drug...  

Data on Chemical Biology and Drug Design Detailed by Researchers at School of Pharmaceutical Science (Synthesis and Evaluation of Biological and Antitumor Activities of Tetrahydrobenzothieno[2,3-d] Pyrimidine Derivatives as Novel Inhibitors of ...)  

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Chemical Biology and Drug Design is now available. According to news reporting out of Wenzhou, People's Republic of China, by NewsRx editors, research stated, "A series of tetrahydrobenzothieno[2,3-d]pyrimidine derivatives were designed, synthesized, and evaluated as inhibitors of FGFR1. These analogs were synthesized via Gewald's reaction under mild conditions."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the School of Pharmaceutical Science, "The structures of the synthesized compounds were characterized by spectroscopic data (IR, (1) H NMR and MS). Their antitumor activities were evaluated against H460, A549 and U251 cell lines in vitro. Results revealed that the tested compounds showed moderate antitumor activities. Structure-activity relationship analyses indicated that compounds with an aromatic ring substituted in the C-2 position or with larger molecules such as 3g, 4c, and 7 were more effective than others. The compound, 3g (78.8% FGFR1 inhibition at 10 mm), was identified to have the most potent antitumor activities, with IC[50] values of 7.7, 18.9, and 13.3 mm against the H460, A549, and U251 cell lines, respectively."

According to the news editors, the research concluded: "Together, the results suggested that tetrahydrobenzothieno[2,3-d]pyrimidine derivatives may serve as a potential agent for the treatment of FGFR1-mediated cancers."

Our news journalists report that additional information may be obtained by contacting X. Wang, School of Pharmaceutical Sciences, Wenzhou Medical University, Wenzhou, 325035, People's Republic of China. Additional authors for this research include D. Chen, S. Yu, Z. Zhang, Y. Wang, X. Qi, W. Fu, Z. Xie and F. Ye.

Drugs and Therapies – Chemical Biology and Drug Design

Data on Chemical Biology and Drug Design Reported by Researchers at A.E. Arbuzov Institute of Organic and Physical Chemistry (Synthesis of New 'Hybrid' Compounds Based on Benzofuroxans and Aminoalkynaphthalimides)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Chemical Biology and Drug Design are discussed in a new report. According to news reporting out of Kazan, Russia, by NewsRx editors, research stated, "Pathogenic bacteria and fungi eventually develop resistance to existing drugs, and therefore, we need constant development of new drugs. The research is aimed at addressing fundamental scientific problems-the search for new biologically active compounds among several benzofuroxan-containing 'hybrid' products."

Funders for this research include Russian Foundation for Basic Research, Southern Federal University.

Our news journalists obtained a quote from the research from the A.E. Arbuzov Institute of Organic and Physical Chemistry, "N-substituted naphthalimides were chosen as a second pharmacophore. Benzofuroxanes biological effects were studied by means of bacterial lux-biosensors."

According to the news editors, the research concluded: "Compounds IIIa, IVa, IIIc, and IVc displayed more expressed bacteriotoxic action in comparison with the initial substances Ia-c and represent a certain interest for using as antibacterial substances."

Our news journalists report that additional information may be obtained by contacting E. Chugunova, AE Arbuzov Institute of Organic and Physical Chemistry, Kazan Scientific Center, Russian Academy of Sciences, Akad Arbuzov st 8, Kazan, 420088, Russia. Drugs and Therapies - Chemotherapy

Data on Chemotherapy Described by Researchers at Flinders University (Motility patterns in mouse colon: gastrointestinal dysfunction induced by anticancer chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Chemotherapy. According to news reporting originating in Adelaide, Australia, by NewsRx editors, the research stated, "Colon cancer is a leading cause of cancer-related death in humans. 5-Fluorouracil (5-FU), a major chemotherapy treatment, has been used for decades to fight numerous types of cancers, including breast, colon, and head and neck carcinomas. Unfortunately, a large proportion of patients treated with 5-FU develop toxicities that include diarrhea, mucositis, neutropenia, and vomiting."

Financial support for this research came from National Health and Medical Research Council.

The news reporters obtained a quote from the research from Flinders University, "While the side effects of 5-FU are well known, the mechanisms underlying the induction of these unpleasant symptoms are poorly understood. The study by McQuade etal. in this issue of Neurogastroenterology & Motility provides important new potential explanations for the gastrointestinal (GI) dysfunction induced by 5-FU. These researchers carefully investigated an overlooked research area in which the symptoms of GI-motility dysfunction maybe due to an effect on the enteric nervous system. McQuade etal. delivered 5-FU treatment to mice and discovered an initial increase in GI transit (associated with acute intestinal inflammation), followed by a slowing in transit. Major differences were noted in characteristics of colonic migrating motor complexes. These effects maybe causally related to deficits in enteric ganglia or neurotransmission. Their study identified specific neurochemical classes of neurons in the myenteric plexus most affected by 5-FU. This is the first study to provide evidence that the functional intrinsic neural pathways within the enteric nervous system are likely impaired by 5-FU, leading to colonic dysmotility."

According to the news reporters, the research concluded: "This review will describe major patterns of motor activity in isolated whole mouse colon and how these patterns are modified by anticancer chemotherapy."

Drugs and Therapies - Chemotherapy

Data on Chemotherapy Reported by Researchers at Department of Hematology (A preclinical acute GVHD mouse model based on chemotherapy conditioning and MHC-matched transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Chemotherapy are presented in a new report. According to news reporting originating in Berlin, Germany, by NewsRx journalists, research stated, "Animal disease models have been criticized for lack of resemblance to human illnesses, hampering transfer of knowledge from preclinical research to clinical medicine. In the field of allogeneic hematopoietic stem cell transplantation (allo-HSCT), it is standard practice to study GVHD in lethal TBI-based murine models."

The news reporters obtained a quote from the research from the Department of Hematology, "Frequently, MHC-mismatched donors are used in GVHD models. In contrast, in clinical allo-HSCT conditioning with chemotherapy (plusminusTBI) is common and donors are often MHC-matched. Aiming at a more clinically oriented situation, we established and characterized a murine MHC-matched, minor histocompatibility antigen mismatched GVHD model (LP/J [H2k(b)]-- >C57BL/6 [H2k(b)]) using busulfan and cyclophosphamide conditioning. We found typical clinical and histological features of acute GVHD. T-cell infiltration, GVHD-specific damage and systemic inflammation were similar to observations made in patients after allo-HSCT. In survivors of acute GVHD, we found expansion of CD4+ T cells and the development of scleroderma-like chronic GVHD."

According to the news reporters, the research concluded: "The use of chemotherapy-based, minor histocompatibility antigen (miHA)-mismatched GVHD animal models may be a good option when studying clinically relevant questions in the field of allo-HSCT."

For more information on this research see: A preclinical acute GVHD mouse model based on chemotherapy conditioning and MHC-matched transplantation. Bone Marrow Transplantation, 2015;51(3):410-7. **Chromosome Structures**

**Data on Chromosome Structures Described by Researchers at Kumamoto University [HDAC9 regulates the alternative lengthening of telomere (ALT) pathway via the formation of ALT-associated PML bodies]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Chromosome Structures is now available. According to news reporting originating in Kumamoto, Japan, by NewsRx journalists, research stated, "Cancer cells overcome cellular senescence by activating the telomere maintenance mechanism, which can be either through telomerase or the alternative lengthening of telomeres (ALT). Being exclusive to cancer cells, targeting ALT is a more promising route for the development of drugs against cancer."

Funders for this research include Grant-in-Aid for Young Scientists B, Japan Society for the Promotion of Science.

The news reporters obtained a quote from the research from Kumamoto University, "The histone deacetylase (HDAC) family plays significant roles in various cellular processes. In addition to the regulation of gene expression, HDACs are also known to directly interact with many proteins. We focused on this family, and found that HDAC9 was up-regulated in ALT-positive cells. In ALT-positive cells treated with HDAC9 siRNA, there was a decrease in the telomere replicative capacity, which was evident from the C-circles assay. Furthermore, the formation of ALT-associated promyelocytic leukemia (PML) nuclear bodies (APBs) was inhibited by HDAC9 knockdown."

According to the news reporters, the research concluded: "Based on this study, it is suggested that HDAC9 regulates the formation of APBs and could be a candidate for the target of ALT-cancer therapy."

For more information on this research see: HDAC9 regulates the alternative lengthening of telomere (ALT) pathway via the formation of ALT-associated PML bodies. *Biochemical and Biophysical Research Communications*, 2016;481(1-2):25-30. *Biochemical and Biophysical Research Communications* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Data on Chronic Myeloid Leukemia Reported by A. Gratwohl and Co-Researchers (Long-term outcome of patients with newly diagnosed chronic myeloid leukemia: a randomized comparison of stem cell transplantation with drug treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Chronic Myeloid Leukemia is now available. According to news reporting originating in Basel, Switzerland, by NewsRx journalists, research stated, "Tyrosine kinase inhibitors represent today's treatment of choice in chronic myeloid leukemia (CML). Allogeneic hematopoietic stem cell transplantation (HSCT) is regarded as salvage therapy."

The news reporters obtained a quote from the research, "This prospective randomized CML-study IIIA recruited 669 patients with newly diagnosed CML between July 1997 and January 2004 from 143 centers. Of these, 427 patients were considered eligible for HSCT and were randomized by availability of a matched family donor between primary HSCT (group A; N=166 patients) and best available drug treatment (group B; N=261). Primary end point was long-term survival. Survival probabilities were not different between groups A and B (10-year survival: 0.76 (95% confidence interval (CI): 0.69-0.82) vs 0.69 (95% CI: 0.61-0.76)), but influenced by disease and transplant risk. Patients with a low transplant risk showed superior survival compared with patients with high-(p <0.001) and non-high-risk disease (p=0.047) in group B; after entering blast crisis, survival was not different with or without HSCT. Significantly more patients in group A were in molecular remission (56% vs 39%; p=0.005) and free of drug treatment (56% vs 6%; p<0.001). Differences in symptoms and Karnofsky score were not significant."

According to the news reporters, the research concluded: "In the era of tyrosine kinase inhibitors, HSCT remains a valid option when both disease and transplant risk are considered."

For more information on this research see: Long-term outcome of patients with newly diagnosed chronic myeloid leukemia: a randomized comparison of stem cell transplantation with drug treatment. Leukemia, 2015;30(3):562-9. (Nature Publishing Group - www.nature.com; Leukemia - www.nature.com/leu/)

Clinical Research - Clinical Trials and Studies

Data on Clinical Trials and Studies Described by L.L. Winkler et al
(Substituting sugar confectionery with fruit and healthy snacks at checkout - a win-win strategy for consumers and food stores? a study on consumer attitudes and sales effects ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Research - Clinical Trials and Studies. According to news reporting out of Glostrup, Denmark, by NewsRx editors, research stated, "The widespread use of in-store marketing strategies to induce unhealthy impulsive purchases has implications for shopping experience, food choice and possibly adverse health outcomes. The aim of this study was to examine consumer attitudes and evaluate sales effects of a healthy checkout supermarket intervention."

Our news journalists obtained a quote from the research, "The study was part of Project Sundhed & Lokalsamfund (Project SoL); a Danish participatory community-based health promotion intervention. Consumer attitudes towards unhealthy snack exposure in supermarkets were examined in a qualitative pre-intervention study (29 short in-store interviews, 11 semi-structured interviews and three focus group interviews). Findings were presented to food retailers and informed the decision to test a healthy checkout intervention. Sugar confectionery at one checkout counter was substituted with fruit and healthy snacking items in four stores for 4 weeks. The intervention was evaluated by 48 short exit interviews on consumer perceptions of the intervention and by linear mixed model analyses of supermarket sales data from the intervention area and a matched control area. The qualitative pre-intervention study identified consumer concern and annoyance with placement and promotion of unhealthy snacks in local stores. Store managers were willing to respond to local consumer concern and a healthy checkout intervention was therefore implemented. Exit interviews found positive attitudes towards the intervention, while intervention awareness was modest. Most participants believed that the intervention could help other consumers make healthier choices, while fewer expected to be influenced by the intervention themselves. Statistical analyses suggested an intervention effect on sales of carrot snack packs when compared with sales before the intervention in Bornholm control stores (P < 0.05). No significant intervention effect on sales of other intervention items or sugar confectionery was found. The present study finds that the healthy checkout intervention was positively evaluated by consumers and provided a 'responsible' branding opportunity for supermarkets, thus representing a win-win strategy for store managers and consumers in the short term. However, the intervention was too modest to draw conclusions on long-term sales and health implications of this initiative."

According to the news editors, the research concluded: "More research is needed to assess whether retailer-researcher collaborations on health promotion can be a winning strategy for public health."

For more information on this research see: Substituting sugar confectionery with

**Clinical Research - Clinical Trials and Studies**

**Data on Clinical Trials and Studies Described by Researchers at Chung Ang University Hospital (Comparative study of the effects of bupropion and escitalopram on Internet gaming disorder)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Clinical Research - Clinical Trials and Studies is the subject of a report. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "We compared the efficacy of bupropion and escitalopram treatments in Internet gaming disorder (IGD) patients. We recruited 119 adolescents and adults with IGD."

Our news editors obtained a quote from the research from Chung Ang University Hospital, "We treated these participants for 6 weeks in three groups as follows: 44 participants were treated with bupropion SR (bupropion group), 42 participants were treated with escitalopram (escitalopram group), and 33 patients without any medication were observed in the community (observation group). At baseline and at the 6-week follow-up visit, all subjects were evaluated using the Clinical Global Impression-Severity Scale, the Young Internet Addiction Scale, the Beck Depression Inventory, the ADHD Rating Scale, and the Behavioral Inhibition and Activation Scales. Both the escitalopram group and the bupropion group showed improvement on all clinical symptom scales after 6 weeks of treatment compared to the observation group. Additionally, the bupropion group showed greater improvement on scores for the Clinical Global Impression-Severity Scale, the Young Internet Addiction Scale, the ADHD Rating Scale, and the Behavioral Inhibition Scale than the escitalopram group. Both bupropion and escitalopram were effective in treating and managing IGD symptoms. Moreover, bupropion appeared to be more effective than escitalopram in improving attention and impulsivity in IGD patients."

According to the news editors, the research concluded: "In addition, attention and impulsivity seem to be important for the management of IGD."

The news correspondents report that additional information may be obtained from T.
Bertsche, University of Leipzig, Dept. of Clin Pharm, D-04317 Leipzig, Germany. Additional authors for this research include K. Moritz, S.J. Seichter, M. Ghanem, G. von Salis-Soglio, R. Frontini and T. Bertsche.

Clinical Research - Clinical Trials and Studies

Data on Clinical Trials and Studies Reported by Researchers at University of Paris [Randomized controlled trial of the NS5A inhibitor daclatasvir plus pegylated interferon and ribavirin for HCV genotype-4 (COMMAND-4)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Research - Clinical Trials and Studies. According to news reporting out of Creteil, France, by NewsRx editors, research stated, "Treatment options for HCV genotype-4 (GT4) are limited. This Phase III study (COMMAND-4; AI444-042) evaluated the efficacy and safety of daclatasvir (DCV), a pan-genotypic HCV NS5A inhibitor, with pegylated interferon-alpha 2a/ribavirin (PEG-IFN/RBV) in treatment-naive patients with HCV GT4 infection."

Our news journalists obtained a quote from the research from the University of Paris, "Patients were randomly assigned (2:1; blinded) to treatment with DCV 60 mg (n=82) or placebo (n=42) once daily plus PEG-IFN 180 mcg weekly and RBV 1,000-1,200 mg/day (weight-based) twice daily. DCV-treated patients with undetectable HCV RNA at weeks 4 and 12 (eRVR) received 24 weeks of DCV plus PEG-IFN/RBV; those without eRVR received an additional 24 weeks of PEG-IFN/RBV. All placebo-treated patients received 48 weeks of PEG-IFN/RBV. The primary end point was sustained virological response (SVR) at post-treatment week 12 (SVR12). Patients were 75% IL28B non-CC and 11% had cirrhosis. SVR rates (HCV RNA < lower limit of quantitation [LLOQ]) at post-treatment week 12 or later (imputed to include patients missing SVR12 assessments but had SVR after post-treatment week 12) were 82% (67/82) with DCV plus PEG-IFN/RBV versus 43% (18/42) with PEG-IFN/RBV (P <0.0001). In DCV recipients, SVR12 rates were comparable across subgroups. The safety and tolerability profile of DCV plus PEG-IFN/RBV was comparable to that of PEG-IFN/RBV. Discontinuations due to adverse events occurred in 4.9% of patients receiving DCV plus PEG-IFN/RBV and 7.1% of patients receiving PEG-UN/RBV. In treatment-naive patients with HCV GT4 infection, DCV plus PEG-IFN/RBV achieved higher SVR12 rates than PEG-IFN/RBV alone."

According to the news editors, the research concluded: "These data support DCV-based regimens for treatment of HCV GT4 infection, including all-oral combinations with other direct-acting antivirals (AI444-042; ClinicalTrials.gov NCT01448044)."

Our news journalists report that additional information may be obtained by contacting C. Hezode, Univ Paris Est, INSERM, U955, Hopital Henri Mondor AP HP, Creteil, France. **Clinical Research - Clinical Trials and Studies**

**Data on Clinical Trials and Studies Reported by Researchers at University of Texas (Incidence of Atypical Femur Fractures in Cancer Patients: The MD Anderson Cancer Center Experience)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Atypical femoral fractures (AFFs) are rare adverse events attributed to bisphosphonate (BP) use. Few cases of AFF in cancer have been described; the aim of this study is to identify the incidence and risk factors for AFF in a large cancer center."

Our news editors obtained a quote from the research from the University of Texas, "This retrospective study was conducted at the MD Anderson Cancer Center. The incidence rate of AFF among BP users was calculated from January 1, 2004 through December 31, 2013. The control group (n = 51) included 2 or 3 patients on BPs matched for age (<= 1 year) and gender. Logistic regression analysis was used to assess the relationship between clinical characteristics and AFF. Twenty-three AFF cases were identified radiographically among 10,587 BP users, the total BP exposure was 53,789 months (4482 years), and the incidence of AFF in BP users was 0.05 cases per 100,000 person-years. Meanwhile, among 300,553 patients who did not receive BPs there were 2 cases of AFF as compared with the 23 cases noted above. The odds ratio (OR) of having AFF in BP users was 355.58 times higher (95% CI, 84.1 to 1501.4, p< 0.0001) than the risk in non-BP users. The OR of having AFF in alendronate users was 5.54 times greater (OR 5.54 [95% CI, 1.60 to 19.112, p = 0.007]) than the odds of having AFF among other BP users. Patients who were on zoledronic acid (ZOL) had smaller odds of developing AFF compared with other BP users in this matched case control sample. AFFs are rare, serious adverse events that occur in patients with cancer who receive BP therapy."

According to the news editors, the research concluded: "Patients with cancer who receive BPs for prior osteoporosis therapy or for metastatic cancer are at higher risk of AFF."

For more information on this research see: Incidence of Atypical Femur Fractures in Cancer Patients: The MD Anderson Cancer Center Experience. *Journal of Bone and Mineral*
Drugs and Therapies - Coagulation Modifiers

Data on Coagulation Modifiers Detailed by Researchers at Seoul National University (End-Site-Specific Conjugation of Enoxaparin and Tetradeoxycholic Acid Using Nonenzymatic Glycosylation for Oral Delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Coagulation Modifiers is now available. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Heparin and low molecular weight heparins (LMWHs) have been the drug of choice for the treatment or the prevention of thromboembolic disease. Different methods are employed to prepare the LMWHs that are clinically approved for the market currently."

Funders for this research include Ministry of Health and Welfare, Korea Drug Development Fund, National Research Foundation of Korea.

Our news journalists obtained a quote from the research from Seoul National University, "In particular, enoxaparin, which has a reducing sugar moiety at the end-site of polysaccharide, is prepared by alkaline depolymerization. Focusing on this end-site-specific activity of LMWHs, we conjugated the tetraoligomer of deoxycholic acid (TetraDOCA; TD) at the end-site of enoxaparin via nonenzymatic glycosylation reaction. The end-site-specific conjugation is important for polysaccharide drug development because of the heterogeneity of polysaccharides. This study also showed that orally active enoxaparin and tetraDOCA conjugate (EnoxaTD) had therapeutic effect on deep vein thrombosis (DVT) without bleeding in animal models."

According to the news editors, the research concluded: "Considering the importance of end-specific conjugation, these results suggest that EnoxaTD could be a drug candidate for oral heparin development."

For more information on this research see: End-Site-Specific Conjugation of Enoxaparin and Tetradeoxycholic Acid Using Nonenzymatic Glycosylation for Oral Delivery. Journal of Medicinal Chemistry, 2016;59(23):10520-10529. Journal of Medicinal Chemistry can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. Oncology - Colon Cancer

Data on Colon Cancer Detailed by Researchers at Fujian Medical University (Overexpression of KiSS-1 reduces colorectal cancer cell invasion by downregulating MMP-9 via blocking PI3K/Akt/NF-kB signal pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Colon Cancer is now available. According to news reporting originating from Fujian, People's Republic of China, by NewsRx correspondents, research stated, "Metastasis of colorectal cancer (CRC) depends critically on MMP-9. KiSS-1 is a human malignant melanoma metastasis-suppressor gene."

Our news editors obtained a quote from the research from Fujian Medical University, "Thus, the interaction between MMP-9 and KiSS-1 has drawn considerable attention in recent years. In the present study, it was hypothesized that KiSS-1 gene could repress the metastatic potential of colorectal cancer cells by inhibiting the expression of MMP-9. Stable transfection of KiSS-1 specific siRNA and KiSS-1 expression vector in human CRC cell line HCT-116 was achieved by lentivirus infection. Moreover, the cell proliferation, invasiveness, and apoptosis were evaluated by CCK-8 method, transwell experiment, and fluorescence activated cell sorter, respectively. We also investigated the expression of MMP-9, PI3K, Akt, pAKt, and NF-kB subunit p65 using western blotting. KiSS-1 overexpression significantly decreased the cell proliferation and invasiveness of HCT-119 cells, while apoptosis was enhanced. The result of western blotting showed that synthesis of MMP-9, PI3K, p65, and phosphorylation of Akt were significantly blocked by overexpression of KiSS-1. Concatenated treatment of KiSS-1 overexpression vector with PI3K and Akt agonists attenuated the effect of KiSS-1 on the biological activity of CRC cells and also released the expression of MMP-9, PI3K, p65, and phosphorylation of Akt from the influence of overexpression of KiSS-1."

According to the news editors, the research concluded: "Overexpression of KiSS-1 suppressed the invasiveness of CRC cells, and the gene exerted its function by reducing the expression of MMP-9 via blocking of the PI3K/Akt/NF-kB pathway."

For more information on this research see: Overexpression of KiSS-1 reduces colorectal cancer cell invasion by downregulating MMP-9 via blocking PI3K/Akt/NF-kB signal pathway.
Data on Colon Cancer Reported by Researchers at China Medical University and Hospital (Dysregulation of MicroRNA-543 expression in colorectal cancer promotes tumor migration and invasion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news reporting out of Shenyang, People's Republic of China, by NewsRx editors, research stated, "MicroRNAs (miRNAs) have been proven to act as key post-transcriptional regulators of gene expression, involved in the genesis and development of multiple tumor types. However, the expression and roles of miR-543 in colorectal cancer (CRC) remain unknown."

Our news journalists obtained a quote from the research from China Medical University and Hospital, "Here, we found that miR-543 was constitutively up-regulated in CRC tissues and its over-expression promoted tumor cell migration and invasion. Moreover, we identified PTEN as a direct target of miR-543 using subsequent software analysis and a dual-luciferase reporter assay."

According to the news editors, the research concluded: "Data presented here demonstrate that miR-543 acts as a tumor promoter and plays a vital role in CRC metastasis. These findings confirm that miR-543 may potentially serve as a novel therapeutic target for treating CRC."

Our news journalists report that additional information may be obtained by contacting J.P. Zhou, China Med Univ, Hosp 1, Dept. of Gen Surg, Gastrointestinal Surg, Shenyang 110001, Liaoning Provin, People's Republic of China. Additional authors for this research include J.P. Zhou, M. Dong and W.W. Sheng.

Data on Congenital Heart Disease Described by Researchers at Cleveland Clinic (Use of dofetilide in adult patients with atrial arrhythmias and congenital heart disease: A PACES collaborative study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Congenital Diseases and Conditions - Congenital Heart Disease are presented in a new report. According to news reporting originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Arrhythmia management has become the major treatment challenge in adult patients with congenital heart disease (ACHD). We sought to investigate the utility and safety profile of dofetilide for atrial arrhythmias in ACHD."

Our news editors obtained a quote from the research from Cleveland Clinic, "A retrospective chart review was performed. We included patients (age >= 18 years) with congenital heart disease who had atrial fibrillation (AF) or intra-atrial reentrant tachycardia treated with dofetilide. We identified 64 patients with a mean age at initiation of 42.14 years. ACHD type included single ventricle (n = 19, 30%), transposition of the great arteries (n = 14, 22%), atrial septal defect (n = 9, 14%), tetralogy of Fallot (n = 8, 12%), atrioventricular canal defect (n = 5, 8%), mitraValvular stenosis (n = 7, 11%), and other (n = 2, 3%). Thirty-five (55%) had atrial fibrillation, and 29 (45%) had intra-atrial reentrant tachycardia. A total of 3 (4.7%) patients had major inpatient adverse events: torsades de pointes (n = 1, 1.5%), ventricular tachycardia (n = 1, 1.5%), and corrected QT prolongation requiring discontinuation (n = 1, 1.5%). Dofetilide was discontinued in 1 patient because of sinus node dysfunction, and another patient discontinued therapy before discharge because of persistent arrhythmia. Of the patients who were discharged on dofetilide (n = 59, 92%), 40 (68%) had adequate rhythm control and 19 (32%) had partial rhythm control. After a median follow-up of 3 years, 29 (49%) patients remained on dofetilide and 2 (3%) patients died. Reasons for discontinuation included waning effect (n = 16, 57%), side effects (n = 5, 18%), noncompliance (n = 2, 7%), successful ablation (n = 3, 11%), high cost (n = 1, 3.5%), and unknown (n = 1, 3.5%). Dofetilide remains a viable antiarrhythmic drug option in this challenging population. At 3 years, 49% remained on dofetilide."

According to the news editors, the research concluded: "Close monitoring of renal function, concomitant medications, and corrected QT interval is required."

The news editors report that additional information may be obtained by contacting P.F. Aziz, Cleveland Clin Childrens, Div Pediat Cardiol, Cleveland, OH, United States. Additional authors for this research include S.G. Al-Kindi, J. Abraham, S. Sanatani, D.J. Bradley, C. Halsey, I.H. Law, S. Balaji, I. Shetty and P.F. Aziz.

Intracellular Signaling Peptides and Proteins - Cyclin G

Data on Cyclin G Reported by Researchers at Osaka University
(Comprehensive phenotypic analysis of knockout mice deficient in cyclin G1 and cyclin G2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Intracellular Signaling Peptides and Proteins - Cyclin G have been published. According to news reporting originating from Osaka, Japan, by NewsRx correspondents, research stated, "Cyclin G1 (CycG1) and Cyclin G2 (CycG2) play similar roles during the DNA damage response (DDR), but their detailed roles remain elusive. To investigate their distinct roles, we generated knockout mice deficient in CycG1 (G1KO) or CycG2 (G2KO), as well as double knockout mice (DKO) deficient in both proteins."

Our news editors obtained a quote from the research from Osaka University, "All knockouts developed normally and were fertile. Generation of mouse embryonic fibroblasts (MEFs) from these mice revealed that G2KO MEFs, but not G1KO or DKO MEFs, were resistant to DNA damage insults caused by camptothecin and ionizing radiation (IR) and underwent cell cycle arrest. CycG2, but not CycG1, co-localized with H2AX foci in the nucleus after gamma-IR, and gamma H2AX-mediated DNA repair and dephosphorylation of CHK2 were delayed in G2KO MEFs. H2AX associated with CycG1, CycG2, and protein phosphatase 2A (PP2A), suggesting that H2AX affects the function of PP2A via direct interaction with its B' subunit. Furthermore, expression of CycG2, but not CycG1, was abnormal in various cancer cell lines. Kaplan-Meier curves based on TCGA data disclosed that head and neck cancer patients with reduced CycG2 expression have poorer clinical prognoses."

According to the news editors, the research concluded: "Taken together, our data suggest that reduced CycG2 expression could be useful as a novel prognostic marker of cancer."

For more information on this research see: Comprehensive phenotypic analysis of knockout mice deficient in cyclin G1 and cyclin G2. Scientific Reports, 2016;6():1-12. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Enzymes and Coenzymes - Cysteine Endopeptidases

Data on Cysteine Endopeptidases Reported by Researchers at RIKEN (Calpain research for drug discovery: challenges and potential)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Enzymes and Coenzymes - Cysteine Endopeptidases have been presented. According to news reporting originating from Saitama, Japan, by NewsRx correspondents, research stated, "Calpains are a family of proteases that were scientifically recognized earlier than proteasomes and caspases, but remain enigmatic. However, they are known to participate in a multitude of physiological and pathological processes, performing 'limited proteolysis' whereby they do not destroy but rather modulate the functions of their substrates."

Our news editors obtained a quote from the research from RIKEN, "Calpains are therefore referred to as 'modulator proteases'. Multidisciplinary research on calpains has begun to elucidate their involvement in pathophysiological mechanisms. Therapeutic strategies targeting malfunctions of calpains have been developed, driven primarily by improvements in the specificity and bioavailability of calpain inhibitors."

According to the news editors, the research concluded: "Here, we review the calpain superfamily and calpain-related disorders, and discuss emerging calpain-targeted therapeutic strategies."

The news editors report that additional information may be obtained by contacting T.C. Saido, RIKEN Brain Sci Inst, Lab Proteolyt Neurosci, Wako, Saitama 3510198, Japan. Additional authors for this research include T.C. Saido and H. Sorimachi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrd.2016.212. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Saitama, Japan, Asia, Protease, Article Review, Drugs and Therapies, Cysteine Endopeptidases, Enzymes and Coenzymes, Peptide Hydrolases, Calpain, RIKEN.

Cystic Fibrosis

Data on Cystic Fibrosis Reported by Researchers at School of Medicine (Molecular Epidemiology of Mutations in Antimicrobial Resistance Loci of Pseudomonas aeruginosa Isolates from Airways of Cystic Fibrosis Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cystic Fibrosis are discussed in a new report. According to news reporting originating in Hannover, Germany, by NewsRx journalists, research stated, "The chronic airway infections with Pseudomonas aeruginosa in people with cystic fibrosis (CF) are treated with aerosolized antibiotics, oral fluoroquinolones, and/or intravenous combination therapy with aminoglycosides and beta-lactam antibiotics. An international strain collection of 361 P. aeruginosa isolates from 258 CF patients seen at 30 CF clinics was examined for mutations in 17 antimicrobial susceptibility and resistance loci that had been identified as hot spots of mutation by genome sequencing of serial isolates from a single CF clinic."

Financial supporters for this research include Hannover Biomedical Research School HBRS, Deutsche Forschungsgemeinschaft (DFG).

The news reporters obtained a quote from the research from the School of Medicine, "Combinatorial amplicon sequencing of pooled PCR products identified 1,112 sequence variants that were not present in the genomes of representative strains of the 20 most common clones of the global P. aeruginosa population. A high frequency of singular coding variants was seen in spuE, mexA, gyrA, rpoB, fusA1, mexZ, mexY, oprD, ampD, parR, parS, and envZ (amgS), reflecting the pressure upon P. aeruginosa in lungs of CF patients to generate novel protein variants. The proportion of nonneutral amino acid exchanges was high. Of the 17 loci, mexA, mexZ, and pagL were most frequently affected by independent stop mutations."

According to the news reporters, the research concluded: "Private and de novo mutations seem to play a pivotal role in the response of P. aeruginosa populations to the antimicrobial load and the individual CF host."

For more information on this research see: Molecular Epidemiology of Mutations in Antimicrobial Resistance Loci of Pseudomonas aeruginosa Isolates from Airways of Cystic Fibrosis Patients. Antimicrobial Agents and Chemotherapy, 2016;60(11):6726-6734. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Herpesvirus Diseases and Conditions -...

**Data on Cytomegalovirus Reported by B. Pignoloni and Co-Researchers**

(Distinct Roles for Human Cytomegalovirus Immediate Early Proteins IE1 and IE2 in the Transcriptional Regulation of MICA and PVR/CD155 Expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Herpesvirus Diseases and Conditions - Cytomegalovirus have been published. According to news originating from Isernia, Italy, by NewsRx correspondents, research stated, "Elimination of virus-infected cells by cytotoxic lymphocytes is triggered by activating receptors, among which NKG2D and DNAM-1/CD226 play an important role. Their ligands, that is, MHC class I-related chain (MIC) A/B and UL16-binding proteins (ULBP) 1-6 (NKG2D ligand), Nectin-2/CD112, and poliovirus receptor (PVR)/CD155 (DNAM-1 ligand), are often induced on virus-infected cells, although some viruses, including human CMV (HCMV), can block their expression."

Our news journalists obtained a quote from the research, "In this study, we report that infection of different cell types with laboratory or low-passage HCMV strains upregulated MICA, ULBP3, and PVR, with NKG2D and DNAM-1 playing a role in NK cell-mediated lysis of infected cells. Inhibition of viral DNA replication with phosphonoformic acid did not prevent ligand upregulation, thus indicating that early phases of HCMV infection are involved in ligand increase. Indeed, the major immediate early (IE) proteins IE1 and IE2 stimulated the expression of MICA and PVR, but not ULBP3. IE2 directly activated MICA promoter via its binding to an IE2-responsive element that we identified within the promoter and that is conserved among different alleles of MICA. Both IE proteins were instead required for PVR upregulation via a mechanism independent of IE DNA binding activity. Finally, inhibiting IE protein expression during HCMV infection confirmed their involvement in ligand increase. We also investigated the contribution of the DNA damage response, a pathway activated by HCMV and implicated in ligand regulation. However, silencing of ataxia telangiectasia mutated, ataxia telangiectasia and Rad3-related protein, and DNA-dependent protein kinase did not influence ligand expression."

According to the news editors, the research concluded: "Overall, these data reveal that MICA and PVR are directly regulated by HCMV IE proteins, and this may be crucial for the onset of an early host antiviral response."

For more information on this research see: Distinct Roles for Human Cytomegalovirus Immediate Early Proteins IE1 and IE2 in the Transcriptional Regulation of MICA and PVR/CD155 Expression. *Journal of Immunology*, 2016;197(10):4066-4078. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. (The American Association of Immunologists - www.aai.org; Journal of Immunology - www.jimmunol.org)

The news correspondents report that additional information may be obtained from A. Santoni, Mediterranean Neurol Inst Neuromed, I-86077 Pozzilli, Isernia, Italy. Additional

Cytoplasmic Vesicles

Data on Cytoplasmic Vesicles Detailed by Researchers at China University of Science and Technology (Giant Cellular Vacuoles Induced by Rare Earth Oxide Nanoparticles are Abnormally Enlarged Endo/Lysosomes and Promote mTOR-Dependent TFEB Nucleus ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cytoplasmic Vesicles. According to news reporting from Anhui, People's Republic of China, by NewsRx journalists, research stated, "Many nanomaterials are reported to disrupt lysosomal function and homeostasis, but how cells sense and then respond to nanomaterial-elicited lysosome stress is poorly understood. Nucleus translocation of transcription factor EB (TFEB) plays critical roles in lysosome biogenesis following lysosome stress induced by starvation."

Funders for this research include National Basic Research Program of China, National Natural Science Foundation of China, China Postdoctoral Science Foundation.

The news correspondents obtained a quote from the research from the China University of Science and Technology, "The authors previously reported massive cellular vacuolization, along with autophagy induction, in cells treated with rare earth oxide (REO) nanoparticles. Here, the authors identify these giant cellular vacuoles as abnormally enlarged and alkalinized endo/lysosomes whose formation is dependent on macropinocytosis. This vacuolization causes deactivation of mammalian target of rapamycin (mTOR), a TFEB-interacting kinase that resides on the lysosome membrane. Subsequently, TFEB is dephosphorylated at serine 142 and translocated into cell nucleus. This nucleus translocation of TFEB is observed only in vacuolated cells and it is critical for maintaining lysosome homeostasis after REO nanoparticle treatment, as knockdown of TFEB gene significantly compromises lysosome function and enhances cell death in nanoparticle-treated cells."

According to the news reporters, the research concluded: "Our results reveal that cellular vacuolization, which is commonly observed in cells treated with REOs and other nanomaterials, represents a condition of profound lysosome stress, and cells sense and respond
to this stress by facilitating mTOR-dependent TFEB nucleus translocation in an effort to restore lysosome homeostasis."

For more information on this research see: Giant Cellular Vacuoles Induced by Rare Earth Oxide Nanoparticles are Abnormally Enlarged Endo/Lysosomes and Promote mTOR-Dependent TFEB Nucleus Translocation. *Small*, 2016;12(41):5759-5768. DNA Research

Data on DNA Research Reported by Researchers at Seoul National University [BioVLAB-mCpG-SNP-EXPRESS: A system for multi-level and multi perspective analysis and exploration of DNA methylation, sequence variation (SNPs), and gene expression from ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in DNA Research. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Measuring gene expression, DNA sequence variation, and DNA methylation status is routinely done using high throughput sequencing technologies. To analyze such multi-omics data and explore relationships, reliable bioinformatics systems are much needed."

Our news editors obtained a quote from the research from Seoul National University, "Existing systems are either for exploring curated data or for processing omics data in the form of a library such as IL Thus scientists have much difficulty in investigating relationships among gene expression, DNA sequence variation, and DNA methylation using multi-omics data. In this study, we report a system called BioVLAB-mCpG-SNP-EXPRESS for the integrated analysis of DNA methylation, sequence variation (SNPs), and gene expression for distinguishing cellular phenotypes at the pairwise and multiple phenotype levels. The system can be deployed on either the Amazon cloud or a publicly available high-performance computing node, and the data analysis and exploration of the analysis result can be conveniently done using a web-based interface. In order to alleviate analysis complexity, all the process are fully automated, and graphical workflow system is integrated to represent real-time analysis progression. The
BioVLAB-mCpG-SNP-EXPRESS system works in three stages. First, it processes and analyzes multi-omics data as input in the form of the raw data, i.e., FastQ files. Second, various integrated analyses such as methylation vs. gene expression and mutation vs. methylation are performed. Finally, the analysis result can be explored in a number of ways through a web interface for the multi-level, multi-perspective exploration. Multi-level interpretation can be done by either gene, gene set, pathway or network level and multi-perspective exploration can be explored from either gene expression, DNA methylation, sequence variation, or their relationship perspective. The utility of the system is demonstrated by performing analysis of phenotypically distinct 30 breast cancer cell line data set.

According to the news editors, the research concluded: "BioVLAB-mCpG-SNP-EXPRESS is available at http://biohealth.snu.ac.kr/software/biovlab_mcpg.snp_express/".

For more information on this research see: BioVLAB-mCpG-SNP-EXPRESS: A system for multi-level and multi perspective analysis and exploration of DNA methylation, sequence variation (SNPs), and gene expression from multi-omics data. Methods, 2016;111 ():64-71. Methods can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Methods - www.journals.elsevier.com/methods/)

The news editors report that additional information may be obtained by contacting S. Kim, Seoul National University, Interdisciplinary Program Bioinformat, Seoul, South Korea. Additional authors for this research include S. Lee, S. Seo, D. Jung, H. Chang, K.P. Nephew and S. Kim.

Keywords for this news article include: Seoul, South Korea, Asia, Genetics, Genetics, DNA Research, Seoul National University.

Proteins - DNA-Binding Proteins

Data on DNA-Binding Proteins Described by Researchers at Jiangsu Province Academy of Traditional Chinese Medicine (Icariside II inhibits the EMT of NSCLC cells in inflammatory microenvironment via down-regulation of Akt/NF-kappa B signaling ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - DNA-Binding Proteins have been published. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "Inflammatory microenvironment created by immune cells is favorable for tumor metastasis. Epithelial-mesenchymal transition (EMT) is involved in the progression of cancer invasion and metastasis in inflammatory microenvironment."

Our news journalists obtained a quote from the research from the Jiangsu Province Academy of Traditional Chinese Medicine, "In this study, we sought to investigate the effects of Icariside II, a flavonol glycoside isolated from Epimedium koreanum Nakai, on A549 and H1299 cells migration in inflammatory microenvironment. At non-cytotoxic concentrations, Icariside II could inhibit invasion and EMT of A549 and H1299 cells induced by LPS-stimulated-THP-1 medium or by pro-inflammatory cytokine tumor necrosis factor- (TNF-). Exposure to Icariside II resulted in the increment of E-cadherin, accompanied with decrement of N-cadherin, vimentin, Slug, and Snail in A549 and H1299 cells stimulated by TNF1.
Furthermore, Icariside II suppressed TNF--triggered nuclear translocation of NF-B and phosphorylation of IB, and repressed the DNA-binding activity of NF-B. Further data demonstrated that Akt/GSK-3, other than MAPK signaling pathway was taking a part in the inhibitory potential of Icariside II on NF-B activation. Importantly, Icariside II also impeded lung metastasis of A549 cells and EMT in nude mice."

According to the news editors, the research concluded: "Icariside II might prohibit invasion through inactivating Akt/NF-B pathway."

Keywords for this news article include: Jiangsu, People's Republic of China, Asia, Transcription Factors, DNA-Binding Proteins, Nuclear Proteins, NF-kappa B, Jiangsu Province Academy of Traditional Chinese Medicine.

Data on Dementia Reported by Researchers at Tokyo Women's Medical University (Serum high-molecular-weight adiponectin level and incident dementia in patients with vascular risk factors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases and Conditions - Dementia have been published. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "The involvement of metabolic factors in the development of dementia has received much attention. However, previous studies have yielded conflicting results regarding how blood adipocytokine level impacts cognitive decline and dementia."

Financial support for this research came from Ministry of Health, Labour and Welfare.

The news reporters obtained a quote from the research from Tokyo Women's Medical University, "This study aimed to clarify whether serum high-molecular-weight (HMW) adiponectin level is related to incident dementia. Data were from 466 patients (mean age 67.8 years, male 57%)--who had normal cognitive function and received brain magnetic resonance imaging--from amongst the 1106 patients in the Osaka Follow-up Study for Carotid Atherosclerosis, Part 2, a prospective cohort study of cardiovascular events and dementia amongst patients with vascular risk factors enrolled between 2001 and 2009. Baseline HMW adiponectin levels were measured using frozen serum. Dementia occurrence was examined in June 2013. Serum HMW adiponectin level was 4.33 ? 2.95 mg/ml; the levels were lower in men than in women and negatively correlated with body mass index. During the follow-up period
(median 6.9 years), 47 patients had incident dementia including Alzheimer's disease dementia (27), vascular dementia (13), mixed dementia (four), other dementia (three). Risks of dementia in patients with high versus low HMW adiponectin levels were almost identical (p=0.689). No association was found between adiponectin levels and Alzheimer's disease dementia or vascular dementia in the whole group or amongst men and women separately. This study demonstrated that serum HMW adiponectin level has little association with future dementia.

According to the news reporters, the research concluded: "Determination of metabolic factors involved in dementia requires evaluation of other biomarkers or parameters."

Our news correspondents report that additional information may be obtained by contacting K. Kitagawa, Dept. of Neurology, Tokyo Women's Medical University, Tokyo, Japan. Additional authors for this research include K. Miwa, S. Okazaki, M. Sakaguchi and H. Mochizuki.

Diabetes

Data on Diabetes Described by Researchers at Michigan State University (Improving Coordination of Care Among Healthcare Professionals and Patients With Diabetes and Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Diabetes have been published. According to news reporting originating from East Lansing, Michigan, by NewsRx correspondents, research stated, "Patients with diabetes and cancer have higher mortality and morbidity rates, and are more likely to be hospitalized during treatment. In addition, they often prioritize cancer treatment over self-management of diabetes."

Our news editors obtained a quote from the research from Michigan State University, "This research aims to identify the issues regarding the management of diabetes in patients with cancer by examining the perspectives of oncology providers, nurses, and patients. This study used six focus groups of oncology providers, nurses, and patients with preexisting diabetes who received chemotherapy for a solid tumor or lymphoma. Participants were recruited from two outpatient cancer centers in Michigan. All focus group discussions were audio recorded and transcribed, and thematic analysis was conducted to identify common themes. Three overarching themes were identified by patients, nurses, and oncologists: prioritization and responsibility, care coordination, and health/self-management. This study highlighted areas for
improvement in the management of patients with preexisting diabetes being treated with chemotherapy."

According to the news editors, the research concluded: "Additional research is needed to test interventions that improve care coordination and self-management in this population."

For more information on this research see: Improving Coordination of Care Among Healthcare Professionals and Patients With Diabetes and Cancer. Clinical Journal of Oncology Nursing, 2016;20(6):645-651. Clinical Journal of Oncology Nursing can be contacted at: Oncology Nursing Soc, 125 Enterprise Dr, Pittsburgh, PA 15275, USA.

Diabetes

Data on Diabetes Discussed by Researchers at Niigata University of Pharmacy and Applied Life Sciences (Attenuation of Endoplasmic Reticulum Stress-Mediated Liver Damage by Mulberry Leaf Diet in Streptozotocin-Induced Diabetic Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Diabetes is now available. According to news reporting out of Niigata, Japan, by NewsRx editors, research stated, "Endoplasmic reticulum stress (ERS) plays a crucial role in the development of insulin resistance and diabetes mellitus. Although antidiabetic use of mulberry leaves (MLs) has been popular due to their many anti-oxidative flavonoid compounds and free radical scavenging effects, ML's effects on ERS in experimental diabetic hepatocyte injury remain unknown."

Our news journalists obtained a quote from the research from the Niigata University of Pharmacy and Applied Life Sciences, "To investigate how ML affect ERS in diabetic liver, Sprague-Dawley (SD) rats were assigned to induce diabetes by a single intraperitoneal injection of streptozocin (STZ; 55 mg/kg) and fed with either normal chow or a diet containing 25% mulberry leaf powde..."
sterol regulatory element binding protein isoform 1c (SREBP 1c) levels in diabetic liver."

According to the news editors, the research concluded: "These results may suggest that MLs can preserve hepatic function in experimental diabetes by modulating ERS mediated apoptosis and liver damage."

Our news journalists report that additional information may be obtained by contacting R. Afrin, * Dept. of Clinical Pharmacology, Faculty of Pharmaceutical Sciences, Niigata University of Pharmacy and Applied Life Sciences, Niigata 956-8603, Japan. Additional authors for this research include S. Arumugam, M.I. Wahed, V. Pitchaimani, V. Karuppagounder, R. Sreedhar, M. Harima, H. Suzuki, S. Miyashita, T. Nakamura, K. Suzuki, M. Nakamura, K. Data on Diabetes Mellitus Discussed by Researchers at Chinese University of Hong Kong (Birth weight in live births and stillbirths)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Diabetes Mellitus. According to news reporting out of Hong Kong, People's Republic of China, by NewsRx editors, research stated, "To establish a normal range of birth weights for gestational age at delivery and to compare the proportion of live births and stillbirths that are classified as small-for-gestational age (SGA) according to our normal range vs that of the INTERGROWTH-21st standard. The study population comprised 113 019 live births and 437 (0.4%) stillbirths."

Our news journalists obtained a quote from the research from the Chinese University of Hong Kong, "The inclusion criterion for establishing a normal range of birth weights for gestational age was the live birth of a phenotypically normal neonate >= 24 weeks' gestation and the exclusion criteria were smoking and prepregnancy hypertension, diabetes mellitus, systemic lupus erythematosus or antiphospholipid syndrome, pre-eclampsia, gestational hypertension, gestational diabetes mellitus or iatrogenic preterm birth for fetal growth restriction in the current pregnancy. Inclusion criteria were met by 92 018 live births. The proportions of live births and stillbirths with birth weights < 5th and < 10th percentiles of our normal range and those
according to the INTERGROWTH-21st standard were determined and compared by the chi-square test and McNemar test. The proportions of live births and stillbirths with a birth weight < 5th percentile according to our standard were significantly higher than and discordant with the proportion according to the INTERGROWTH-21st standard (live birth: 5.6% vs 3.4%; stillbirth: 37.2% vs 22.7%). Similarly, the proportion of live births and stillbirths with a birth weight < 10th percentile according to our standard were significantly higher than and discordant with those according to the INTERGROWTH-21st standard (live birth: 11.2% vs 6.9%; stillbirth: 44.3% vs 32.6%)."

According to the news editors, the research concluded: "The INTERGROWTH-21st standard underestimates the proportion of SGA live births and stillbirths in our population."

Our news journalists report that additional information may be obtained by contacting L.C.Y. Poon, Chinese University of Hong Kong, Dept. of Obstet & Gynaecol, Hong Kong, Hong Kong, People's Republic of China. Additional authors for this research include M.Y. Tan, G. Yerlikaya, A. Syngelaki and K.H. Nicolaides.

Drugs and Therapies - Diclofenac Therapy

Data on Diclofenac Therapy Discussed by Researchers at Tsinghua University (Enhanced adsorption of diclofenac sodium on the carbon nanotubes-polytetrafluorethylene electrode and subsequent degradation by electro-peroxone treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Diclofenac Therapy is now available. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Effective adsorption of pharmaceuticals and then degradation of them in the regeneration process are attractive for their complete removal from water or wastewater. The adsorption of diclofenac sodium (DS) on the prepared carbon nanotubes-polytetrafluorethylene (CNTs-PTFE) anode was enhanced in the presence of applied voltage."

Financial supporters for this research include National Nature Science Foundation of China, Tsinghua University Initiative Scientific Research Program, Collaborative Innovation Center for Regional Environmental Quality.

Our news journalists obtained a quote from the research from Tsinghua University, "Compared with open circuit adsorption, the initial adsorption rate and adsorbed amount of DS in static adsorption experiments increased 2.1 and 1.2 times, respectively. After adsorption, the CNTs-PTFE anode was changed to cathode to in-situ degrade the adsorbed DS, and all DS was
degraded after 10 min using the electro-peroxone treatment. The mineralization efficiency increased with increasing ozone concentrations and current intensity, and complete mineralization of DS was achieved at 100 mA and 27 mg/L O-3 after 1 h treatment. The regenerated CNTs-PTFE electrode kept stable adsorption capacity for DS in five adsorption-degradation cycles.

According to the news editors, the research concluded: "This CNTs-PTFE electrode has a promising application for the removal of pharmaceuticals from water or wastewater via the electrosorption and subsequent oxidative degradation, and the electro-peroxone process is an effective method to regenerate the spent electrode and mineralize the adsorbed pollutants."

Our news journalists report that additional information may be obtained by contacting S.B. Deng, Tsinghua Univ, Beijing Key Lab Emerging Organ Contaminants Contr, State Key Joint Lab Environm Simulat & Pollut Con, Sch Environm, Beijing 100084, People's Republic of China. Disease Attributes - Disease Progression

Data on Disease Progression Discussed by C.B. Saw and Colleagues (Dose planning management of patients undergoing salvage whole brain radiation therapy after radiosurgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Disease Attributes - Disease Progression is the subject of a report. According to news reporting out of Dunmore, Pennsylvania, by NewsRx editors, research stated, "Dose or treatment planning management is necessary for the re-irradiation of intracranial relapses after focal irradiation, radiosurgery, or stereotactic radiotherapy. The current clinical guidelines for metastatic brain tumors are the use of focal irradiation if the patient presents with 4 lesions or less."

Our news journalists obtained a quote from the research, "Salvage treatments with the use of whole brain radiation therapy (WBRT) can then be used to limit disease progression if there is an intracranial relapse. However, salvage WBRT poses a number of challenges in dose
planning to limit disease progression and preserve neurocognitive function."

According to the news editors, the research concluded: "This work presents the dose planning management that addresses a method of delineating previously treated volumes, dose level matching, and the dose delivery techniques for WBRT."

For more information on this research see: Dose planning management of patients undergoing salvage whole brain radiation therapy after radiosurgery. Medical Dosimetry, 2016;41(4):277-280. Medical Dosimetry can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Medical Dosimetry - www.journals.elsevier.com/medical-dosimetry/)

Our news journalists report that additional information may be obtained by contacting C.B. Saw, NROC, Dunmore, PA 18512, United States. Additional authors for this research include F. Battin, J. McKeague, M. Haggerty, M. Baikadi and C. Peters.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.meddos.2016.05.004. This DOI is a link to an online electronic document that is either free or for purchase.

Digestive System Diseases and Conditions - Dysphagia

Data on Dysphagia Discussed by H. Larsson and Colleagues (Grade of eosinophilia versus symptoms in patients with dysphagia and esophageal eosinophilia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Dysphagia. According to news reporting out of Trollhattan, Sweden, by NewsRx editors, research stated, "The aim of this study was to assess whether the symptom severity and health-related quality of life (HRQL) of patients with dysphagia and esophageal eosinophilia correlate with disease activity as expressed by the number of eosinophils in the esophageal mucosa. This study included newly diagnosed (n = 58) or relapsed patients (n = 7), where 40% were diagnosed in connection with esophageal bolus impaction."

Our news journalists obtained a quote from the research, "The mean age was 45 years (19-88), and 74% were men. Symptoms and HRQL were recorded using the Watson Dysphagia Scale (WDS), the European Organization for Research and Treatment of Cancer Quality of Life Questionnaire - Oesophageal Module 18 and the Short Form-36 Questionnaire. Histological samples gathered from the proximal and distal esophageal mucosa were stained using both hematoxylin and eosin (HE) and an immunohistochemical (IHC) technique against Eosinophil Major Basic Protein,' and the peak number of eosinophils per high-power field was assessed. More eosinophils were detected after IHC staining than HE staining (P < 0.001). No correlation was found between symptoms or the HRQL and the number of eosinophils."

According to the news editors, the research concluded: "However, higher numbers of eosinophils at the proximal esophagus were found in patients with concomitant bolus impaction (IHC P< 0.05 and HE P< 0.05) and could serve as a risk marker."

Our news journalists report that additional information may be obtained by contacting H. Larsson, NAL Med Center, Dept. of ENT Head & Neck Surg, Trollhattan, Sweden. Additional authors for this research include E. Norder Grusell, B. Tegtmeyer, M. Ruth, H. Bergquist and M. Bove.

Keywords for this news article include: Trollhattan, Sweden, Europe, Digestive System Diseases and Conditions, Immunology, Diagnostics and Screening, Hematologic Diseases and Conditions, Hemic and Immune Systems, Deglutition Disorders, Leukocyte Disorders, Gastroenterology, Granulocytes, Eosinophilia, Blood Cells, Eosinophils, Dysphagia.

**Ebola Virus**

**Data on Ebola Virus Discussed by Researchers at Emory University (Implementation of an educational program for nursing students amidst the Ebola virus disease epidemic)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Ebola Virus is now available. According to news reporting originating in Atlanta, Georgia, by NewsRx journalists, research stated, "The global Ebola virus disease (EVD) epidemic of 2014/2015 prompted faculty at Emory University to develop an educational program for nursing students to increase EVD knowledge and confidence and decrease concerns about exposure risk. The purpose of this article is to describe the development, implementation, and evaluation of the EVD Just-in-Time Teaching (JiTT) educational program."

The news reporters obtained a quote from the research from Emory University, "Informational sessions, online course links, and a targeted, self-directed slide presentation were developed and implemented for the EVD educational program. Three student surveys administered at different time points were used to evaluate the program and change in students' EVD knowledge, confidence in knowledge, and risk concern. Implementation of a JiTT educational program effectively achieved our goals to increase EVD knowledge, decrease fear, and enhance student confidence in the ability to discuss EVD risk. These achievements were sustained over time."

According to the news reporters, the research concluded: "JiTT methodology is an effective strategy for schools of nursing to respond quickly and comprehensively during an unanticipated infectious disease outbreak."

Our news correspondents report that additional information may be obtained by contacting E.P. Ferranti, Emory University, Nell Hodgson Woodruff Sch Nursing, Off Academy Adv, Atlanta, GA 30322, United States. Additional authors for this research include L. Wands, K.A. Yeager, B. Baker, M.K. Higgins, J. Lupo and S.B. Dunbar.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.outlook.2016.04.002. This DOI is a link to an online electronic document that is either free or for purchase.

Biological Factors - Eicosanoids

Data on Eicosanoids Described by Researchers at Robert-Debre University Hospital (Cyclooxygenase-2-Derived Prostaglandins Mediate Cerebral Microcirculation in a Juvenile Ischemic Rat Model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Biological Factors - Eicosanoids have been presented. According to news reporting from Paris, France, by NewsRx journalists, research stated, "We previously showed that the selective neuronal nitric oxide synthase inhibitor 7-nitroindazole (7-NI) increases cerebral microcirculation in a juvenile ischemic rat model. We address the roles of cyclooxygenase (COX)-elaborated prostaglandins in collateral recruitment and blood supply."

The news correspondents obtained a quote from the research from Robert-Debre University Hospital, "Fourteen-day-old rats were subjected to ischemia-reperfusion and treated with either PBS or 7-NI (25 mg/kg) at the reperfusion onset. Six-keto-prostaglandin F (1 alpha) was measured using ELISA. COX-1 and COX-2 and prostaglandin terminal synthesizing enzymes were evaluated using reverse-transcriptase polymerase chain reaction and immunofluorescence. Microvascular blood flow indexes (artery diameter and capillaries number) were measured using sidestream dark-field videomicroscopy in PBS-and 7-NI-treated ischemic rats in the absence or presence of the COX-2 inhibitor NS-398 (5 mg/kg). Cell death was measured with the TUNEL (terminal transferase dUTP nick end labeling) assay and cleavedcaspase-3 immunostaining. Six-keto-prostaglandin F-1 alpha and COX-2, associated with a prostaglandin E synthase, were significantly increased in PBS-and 7-NI-treated animals 15 minutes and 1 hour after ischemia-reperfusion, respectively. In contrast and as compared with PBS, 7-NI significantly decreased prostacyclin synthase and cytosolic prostaglandins E synthase mRNA. Selective COX-2 inhibition significantly decreased blood flow indexes and significantly reversed the effects of 7-NI, including the number of TUNEL+-and cleaved-caspase-3(+)nuclei."

According to the news reporters, the research concluded: "These results show that the juvenile rat brains mostly respond to ischemia by a COX-2-dependent prostaglandins production and suggest that the transcriptional responses observed under 7-NI facilitate and reorient COX2- dependent prostaglandins production."

For more information on this research see: Cyclooxygenase-2-Derived

**Embryo Transfer**

**Data on Embryo Transfer Reported by Researchers at Harvard School of Medicine (Building a model to increase live birth rate through patient-specific optimization of embryo transfer day)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Embryo Transfer. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Many practices are moving away from cleavage-stage transfer in favor of blastocyst transfer. The purpose of this study is to evaluate how the overall live birth rate for fresh IVF cycles may increase by optimizing the day of transfer for each patient."

Financial support for this research came from Eunice Kennedy Shriver National Institute of Child Health and Human Development.

Our news editors obtained a quote from the research from the Harvard School of Medicine, "This is a retrospective cohort study of 1225 first fresh autologous IVF cycles performed between May 2012 and November 2013. Stepwise logistic regression was used to determine characteristics associated with live birth following cleavage-stage versus blastocyst transfer. The optimal transfer day (i.e., the day that maximized the odds of live birth) was determined for each patient, and the actual live birth rate was compared with the projected rate had each patient undergone transfer on her optimal day. With transfer on the optimal day for each patient, the overall birth rate would have increased from its actual value of 34.8 % to a projected 43.0 %, a 24 % increase. The majority of this increase (21 %) was due to optimization of patients who underwent cleavage-stage transfer but had a higher projected birth rate from blastocyst transfer. These patients were older (37.8 versus 36.0 years, p< 0.01) and had more follicles ae <yen >18 mm than patients who should have remained with a cleavage-stage transfer."

According to the news editors, the research concluded: "A model can be built enabling patient-specific identification of optimal transfer day; within this discovery cohort,
such optimization was estimated to increase live birth following a fresh transfer by 24%. This study suggests blastocyst transfer should be more widely offered; however, there remain patients for whom a cleavage-stage transfer may yield better outcomes.

The news editors report that additional information may be obtained by contacting R.H. Goldman, Harvard Med Sch, Brigham & Women's Hospital, Dept. of Obstet Gynecol & Reprod Biol, Center Infertil & Reprod Surg, Boston, MA 02115, United States. Additional authors for this research include D.J. Kaser, S.A. Missmer, S.S. Srouji, L.V. Farland and C. Racowsky.

Heart Disorders and Diseases - Endocarditis

Data on Endocarditis Reported by O. Kumpf and Co-Researchers (Rapid molecular diagnosis of infective aortic valve endocarditis caused by Coxiella burnetii)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Endocarditis. According to news originating from Berlin, Germany, by NewsRx correspondents, research stated, "We describe a case of Q-fever endocarditis with severe destruction of the aortic valve with perivalvular abscess formation and cardiac failure. The patient needed urgent operative treatment and postoperative critical care."

Our news journalists obtained a quote from the research, "All specimens sent for microbiological examination were negative. Molecular analysis, including fluorescence in situ hybridization of aortic valve tissue combined with PCR and sequencing, led to the correct diagnosis and to appropriate anti-infective treatment. The patient subsequently recovered from complex cardiovascular surgery."

According to the news editors, the research concluded: "This is the first report on Q-fever endocarditis that was rapidly diagnosed using these methods."

For more information on this research see: Rapid molecular diagnosis of infective aortic valve endocarditis caused by Coxiella burnetii. Infection, 2016;44(6):813-817. Infection can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. (Springer - www.springer.com; Infection - www.springerlink.com/content/0300-8126/)

The news correspondents report that additional information may be obtained from O.
Data on Endometrial Cancer Discussed by Researchers at Eskisehir Osmangazi University (Ovarian endometrioid carcinoma with yolk sac tumor component in a postmenopausal woman)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Endometrial Cancer is the subject of a report. According to news originating from Eskisehir, Turkey, by NewsRx correspondents, research stated, "Yolk sac tumor (YST) coexisting with a variety of histologic patterns have been described, but with an epithelial malignant component is extremely rare."

Our news journalists obtained a quote from the research from Eskisehir Osmangazi University, "It has been suggested that this rare tumor represents an adenocarcinoma with aberrant differentiation because it occurs in the same age range as epithelial ovarian carcinoma and shows an aggressive behavior and poor prognosis. Although chemotherapy is effective for pure YST, YST with endometrioid adenocarcinoma does not respond to chemotherapy."

According to the news editors, the research concluded: "Here the authors report a post-menopausal women with ovarian endometrioid adenocarcinoma (OEC) associated with YST."

The news correspondents report that additional information may be obtained from D. Arik, Eskisehir Osmangazi Univ, Fac Med, Dept. of Pathol, Eskisehir, Turkey.

Data on Environmental Research and Public Health Reported by Researchers at Deakin University (Impact of an 8-Month Trial Using Height-Adjustable Desks on Children’s Classroom Sitting Patterns and Markers of Cardio-Metabolic and Musculoskeletal ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Environmental Health - Environmental Research and Public Health have been published. According to news reporting originating in Burwood, Australia, by NewsRx journalists, research stated, "During school hours, children can sit for prolonged and unbroken periods of time. This study investigated the impact of an 8-month classroom-based intervention focusing on reducing and breaking-up sitting time on children's cardio-metabolic risk factors (i.e., body mass index, waist circumference, blood pressure) and perceptions of musculoskeletal discomfort."

The news reporters obtained a quote from the research from Deakin University, "Two Year-6 classes (24 students per class) in one primary school were assigned to either an intervention or control classroom. The intervention classroom was equipped with height-adjustable desks and the teacher was instructed in the delivery of pedagogical strategies to reduce and break-up sitting in class. The control classroom followed standard practice using traditional furniture. At baseline, and after 8-months, time spent sitting, standing, stepping, and sitting-bouts (occasions of continuous sitting) as well as the frequency of sit-to-stand transitions were obtained from activPAL inclinometers and the time spent in light-intensity physical activity was obtained from ActiGraph accelerometers. Demographics and musculoskeletal characteristics were obtained from a self-report survey. Hierarchical linear mixed models found that during class-time, children's overall time spent sitting in long bouts (>10 min) were lower and the number of sit-to-stand transitions were higher in the intervention group compared to the control group, while no changes were observed for musculoskeletal pain/discomfort. No significant intervention effects were found for the anthropometrics measures and blood pressure. Height-adjustable desks and pedagogical strategies to reduce/break-up sitting can positively modify classroom sitting patterns in children."

According to the news reporters, the research concluded: "Longer interventions, larger and varied sample size may be needed to show health impacts; however, these desks did not increase musculoskeletal pain/discomfort."

For more information on this research see: Impact of an 8-Month Trial Using Height-Adjustable Desks on Children's Classroom Sitting Patterns and Markers of Cardio-Metabolic and Musculoskeletal Health. International Journal of Environmental Research and Public Health, 2016;13(12):771-785. International Journal of Environmental Research and Public Health can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Data on Epilepsy Described by Researchers at Monash University
(Temporal patterns of epileptiform discharges in genetic generalized epilepsies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Epilepsy have been published. According to news originating from Melbourne, Australia, by NewsRx correspondents, research stated, "We sought to investigate the temporal patterns and sleep-wake cycle-related epileptiform discharges (EDs) in genetic generalized epilepsies (GGEs). We studied 24-hour ambulatory electroencephalography (EEG) recordings of patients with GGE, diagnosed and classified according to the International League against Epilepsy criteria."

Our news journalists obtained a quote from the research from Monash University, "We manually coded the type of discharge, time of occurrence, duration, and arousal state of each ED. We employed mixed effects Poisson regression modeling to study the temporal distribution of epileptiform discharges. Additionally, we used multinomial regression analysis to explore the significance of the relationship between different states of arousal and types of epileptiform discharges. We analyzed 6923 EDs from 105 abnormal 24-hour EEGs. Mixed effects Poisson regression analysis demonstrated significant changes in ED counts across time blocks. This distribution was largely influenced by the state of arousal. Generalized fragments (duration < 2 s) and focal discharges were more frequent during non-REM sleep while paroxysms (duration 2 s) were more frequent in wakefulness. Overall, 67% of epileptiform discharges occurred in non-REM sleep and only 33% occurred in wakefulness. Twenty-four patients (23%) had ED exclusively in sleep. Epileptiform discharges peaked from 23:00 through 07:00 h. There is a time-of-day dependency of ED with a significant influence exerted by the state of arousal. Our observations suggest that the generation of epileptiform discharges is not a random process but is the result of complex interactions among biological rhythms such as the sleep-wake cycle and the intrinsic circadian pacemaker."

According to the news editors, the research concluded: "High density of ED in sleep suggests that 24-hour EEG recording with the capture of natural sleep may be more useful than routine EEG to diagnose GGE."

For more information on this research see: Temporal patterns of epileptiform discharges in genetic generalized epilepsies. Epilepsy & Behavior, 2016;64():18-25. Epilepsy & Behavior can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Epilepsy & Behavior - www.journals.elsevier.com/epilepsy-and-behavior/)

Central Nervous System Diseases and Conditions - …

Data on Epilepsy Discussed by Researchers at Temple University
(Clinical features and postoperative seizure outcome in patients with drug-resistant gelastic seizures without hypothalamic hamartoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System Diseases and Conditions - Epilepsy are presented in a new report. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "The objective of this study was to describe the clinical characteristics and surgical outcome in patients with gelastic seizures without hypothalamic hamartoma. We retrospectively reviewed all the video-EEG reports over a 5-year period (2007-2011) for the occurrence of the terms 'laugh' or 'giggle' in the text body."

The news correspondents obtained a quote from the research from Temple University, "All the patients with at least one documented gelastic seizure at the epilepsy monitoring unit were studied. In patients who underwent epilepsy surgery, seizure outcomes were analyzed. Sixteen patients (10 females and 6 males) with a mean age of 46.3 years were studied. Seven patients had invasive intracranial EEG recordings. Seizure onset zone was in a temporal lobe in four patients and the frontal lobe in one patient. Two patients did not have gelastic seizures during their intracranial EEG monitoring. Nine patients underwent resective epilepsy surgery for their seizures. Six patients (67%) were seizure-free after surgery. In adult patients, gelastic seizures can be seen in patients with focal epilepsy without hypothalamic hamartoma."

According to the news reporters, the research concluded: "Nonhypothalamic hamartoma gelastic seizures originating from the temporal lobe can be amenable to surgery."

For more information on this research see: Clinical features and postoperative seizure outcome in patients with drug-resistant gelastic seizures without hypothalamic hamartoma. Epilepsy & Behavior, 2016;64():90-93. Epilepsy & Behavior can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Epilepsy & Behavior - www.journals.elsevier.com/epilepsy-and-behavior/)

Our news journalists report that additional information may be obtained by contacting C. Gutierrez, Temple University, Dept. of Neurol, Temple Univ Hosp, Comprehens Epilepsy Center, Philadelphia, PA 19122, United States. Additional authors for this research include A.A. Asadi-Pooya, C.T. Skidmore, S.D. Tobochnik, C. LoPinto-Khoury and M.R. Sperling.

Data on Escherichia coli Reported by Researchers at Nankai University (Directed Evolution of Dunaliella salina Ds-26-16 and Salt-Tolerant Response in Escherichia coli)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Escherichia coli are presented in a new report. According to news reporting originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "Identification and evolution of salt tolerant genes are crucial steps in developing salt tolerant crops or microorganisms using biotechnology. Ds-26-16, a salt tolerant gene that was isolated from Dunaliella salina, encodes a transcription factor that can confer salt tolerance to a number of organisms including Escherichia coli (E. coli), Haematococcus pluvialis and tobacco."

Our news editors obtained a quote from the research from Nankai University, "To further improve its salt tolerance, a random mutagenesis library was constructed using deoxyinosine triphosphate-mediated error-prone PCR technology, and then screened using an E. coli expression system that is based on its broad-spectrum salt tolerance. Seven variants with enhanced salt tolerance were obtained. Variant EP-5 that contained mutation S32P showed the most improvement with the E. coli transformant enduring salt concentrations up to 1.54 M, in comparison with 1.03 M for the wild type gene. Besides, Ds-26-16 and EP-5 also conferred E. coli transformant tolerance to freezing, cold, heat, Cu2+ and alkaline. Homology modeling revealed that mutation S32P in EP-5 caused the conformational change of N-and C-terminal alpha-helixes."

According to the news editors, the research concluded: "Expression of Ds-26-16 and EP-5 maintained normal cellular morphology, increased the intracellular antioxidant enzymatic activity, reduced malondialdehyde content, and stimulated Nitric Oxide synthesis, thus enhancing salt tolerance to E. coli transformants."

For more information on this research see: Directed Evolution of Dunaliella salina Ds-26-16 and Salt-Tolerant Response in Escherichia coli. International Journal of Molecular Sciences, 2016;17(11):817-829. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

The news editors report that additional information may be obtained by contacting Y. Guo, Nankai Univ, Dept. of Biochem & Mol Biol, Coll Life Sci, Tianjin 300071, People's Republic of China. Additional authors for this research include Y.P. Dong, X. Hong, X.N. Pang, D.F. Chen and X.W. Chen.

Keywords for this news article include: Tianjin, People's Republic of China, Asia, Gram-Negative Bacteria, Gammaproteobacteria, Enterobacteriaceae, Escherichia coli, Escherichia Coli, Proteobacteria, Genetics, Nankai University.

**Essential Amino Acids**

**Data on Essential Amino Acids Described by Researchers at University of Kansas (Charge Type, Charge Spacing, and Hydrophobicity of Arginine-Rich Cell-Penetrating Peptides Dictate Gene Transfection)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Essential Amino Acids is the subject of a report. According to news reporting originating from Lawrence, Kansas, by NewsRx correspondents, research stated, "Noncovalent complexation of plasmid DNA (pDNA) with cell-penetrating peptides (CPPs) forms relatively large complexes with poor gene expression. Yet, condensing these CPP-pDNA complexes via addition of calcium chloride produces small and stable nanoparticles with high levels of gene expression."

Financial support for this research came from Faculty of Pharmacy, King Abdulaziz University.

Our news editors obtained a quote from the research from the University of Kansas, "This simple formulation offered high transfection efficiency and negligible cytotoxicity in HEK-293 (a virus-immortalized kidney cell) and A549 (a human lung cancer cell line). Small changes in CPP charge type, charge spacing, and hydrophobicity were studied by using five arginine-rich CPPs: the well-known hydrophilic polyarginine R9 peptide, a hydrophilic RH9 peptide, and three amphiphilic peptides (RA9, RL9, and RW9) with charge distributions that favor membrane penetration. R9 and RW9 nanoparticles were significantly more effective than the other CPPs under most formulation conditions. However, these CPPs exhibit large differences in membrane penetration potential."

According to the news editors, the research concluded: "Maximum transfection resulted from an appropriate balance of complexing with pDNA, releasing DNA, and membrane penetration potential."

For more information on this research see: Charge Type, Charge Spacing, and Hydrophobicity of Arginine-Rich Cell-Penetrating Peptides Dictate Gene Transfection. *Molecular Pharmaceutics*, 2016;13(3):1047-57. (American Chemical Society - www.acs.org; Molecular Pharmaceutics - www.pubs.acs.org/journal/mpohbp)

The news editors report that additional information may be obtained by contacting N.A. Alhakamy, Dept. of Pharmaceutical Chemistry, University of Kansas, Lawrence, Kansas 66047, United States. Additional authors for this research include P. Dhar and C.J Berkland.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.molpharmaceut.5b00871. This DOI is a link to an online electronic document that is either free or for purchase.

Data on Ethnopharmacology Detailed by Researchers at University of Mauritius (A quantitative ethnobotanical survey of phytocosmetics used in the tropical island of Mauritius)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Ethnopharmacology have been published. According to news reporting originating from Reduit, Mauritius, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: With a net turnover worth of 181 billion, the cosmetic industry is a leading worldwide business with a very lucrative future. Nonetheless, due to recent concerns regarding toxicity of synthetic cosmetics, herbal products have come into the limelight of cosmetology."

Our news editors obtained a quote from the research from the University of Mauritius, "The tropical island of Mauritius has a well-anchored diversity of indigenous plant species which are exploited for various purposes but no study has been designed to (i) quantitatively document, (ii) assess the effectiveness, and (iii) study the incidence of adverse effects and perception associated with the use of herbal products for cosmetic applications. Data was collected from herbal users via face-to-face interviews using semi-structured questionnaire. Quantitative ethnobotanical indices (fidelity level (FL), variety of use (VU) and relative frequency of citation (RFC)) were calculated. Twenty five herbs belonging to 21 families were recorded in use for 29 different cosmetics applications. Many of the documented species represented well-known plants, although we also recorded a few plants being exploited for new cosmetic applications. Plants with the highest RFC were Curcuma longa L (0.45), Lawsonia inermis L. (0.42) and Aloe vera (L.) Burm.f. (0.42). A total of 8 plants were reported to score 100% with respect to the FL. Interestingly, Lawsonia inermis L being the highly cited plant species showed a clear dominance as a popular phytocosmetic and which has also been extensively documented for its pharmacological properties. Moreover, it was found that 25% of the respondents experienced adverse effects; with pruritus (11%) being the most reported condition. It was also observed that participants perceived herbs/herbal products to be free from adverse effects. Most of the plants reported have been described in previous studies for their bioactive components which tend to justify their use as phytocosmetics."

According to the news editors, the research concluded: "Further research should be geared to explore the potential of these plant products for the cosmetic industry."

The news editors report that additional information may be obtained by contacting M.F. Mahomoodally, University of Mauritius, Dept. of Hlth Sci, Fac Sci, Reduit, Mauritius.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jep.2016.07.039. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Ethnopharmacology

Data on Ethnopharmacology Discussed by Researchers at Prince Songkla University (A survey of herbal weeds for treating skin disorders from Southern Thailand: Songkhla and Krabi Province)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Ethnopharmacology is now available. According to news reporting out of Songkhla, Thailand, by NewsRx editors, research stated, "Ethnopharmacological relevance: Skin diseases are common health problems which affecting to all ages. In Thailand, the number of patients diagnosed with skin diseases is increasing every year."

Funders for this research include Research and Development Office, Prince of Songkla University.

Our news journalists obtained a quote from the research from Prince Songkla University, "Nowadays, The Ministry of Public Health is supporting and promoting herbs for treating various disorders, including disorders of the skin to reduce the problem of antibiotic resistance and adverse drug reactions. This study aimed to: (1) enumerate the herbal weeds for treating skin disorders; (2) study local knowledge of weed utilization for treating skin disorders according to the folk healers in Songkhla and Krabi province; and (3) study quantitative data by Informant consensus factor (ICF), Use value (UV) and Fidelity level (FL) value. Field surveys and Semi-structured interviews about the local names, parts of plants used, preparation and use method, as well as local properties were done. The data were further analyzed by descriptive statistics, interpretation and quantitative indexes (ICF, UV as well as FL). The results discovered 44 herbal species of weeds belonging to 41 genera in 25 families. The most used plant families were Amaranthaceae (6 species). Most plants were used to treat abscess (18 species; 40.91%). The highest UV was recorded for Commelina benghalensis (0.65). The highest ICF values were found in vitiligo, ringworm, tinea versicolor and burns (1.00 each). The highest FL values were recorded for Cleome gynandra, Cleome viscosa, Sphenoclea zeylanica, Acmella oleracea, Leersia hexandra, Cyperus involucratus, Phyllanthus urinaria and Iresine herbstii (100.00 each). A review of the literatures revealed that 34 plant species had already been tested for their pharmacological activities. The biological activities associated with treatment of skin diseases can be divided into four categories: antimicrobial, anti-inflammatory, wound healing and antioxidant activity. The information indicates that herbal weedy utilization is still importance to the treatment of traditional healers through accumulated experience for a long time. Therefore, this study is a guide to the conservation of folk medicinal knowledge."

According to the news editors, the research concluded: "It might be implied as the basis for drug development and application of herbal weeds to treat skin disorders along with promoting sustainable use of natural resource."

Our news journalists report that additional information may be obtained by contacting O. Neamsuvan, Prince Songkla University, Fac Tradit Thai Med, Hat Yai 90110, Songkhla, Thailand.

Drugs and Therapies - Ethnopharmacology

Data on Ethnopharmacology Reported by Researchers at University of Belgrade [Antihyperalgesic activity of Filipendula ulmaria (L.) Maxim. and Filipendula vulgaris Moench in a rat model of inflammation]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Ethnopharmacology are discussed in a new report. According to news reporting originating from Belgrade, Serbia, by NewsRx correspondents, research stated, "Ethnopharmaceutical relevance: Meadowsweet (Filipendula ulmaria (L.) Maxim.), and dropwort (Filipendula vulgaris Moench) flowers are traditionally used to treat various ailments, including inflammatory conditions. The aim of the present study was to validate the aforementioned ethnomedicinal claim by assessing antihyperalgesic and antiedematous activities and toxicity of orally administered lyophilized flower infusions (LFIs) of F. ulmaria and F. vulgaris in experimental animals."

Financial support for this research came from Ministry of Education, Science and Technological Development of Republic of Serbia.

Our news editors obtained a quote from the research from the University of Belgrade, "The phytochemical analysis of LFIs was performed by HPLC-DAD. Antihyperalgesic and antiedematous activities were estimated in a rat model of inflammation induced by intraplantar injection of carrageenan using Von Frey anesthesiometer and plethysmometer, respectively. Moreover, acute oral toxicity of LFIs in mice was evaluated by observing changes in animal behavior and mortality for a period of 14 days following the treatment. HPLC-DAD analysis revealed the presence of phenolic acids and flavonoids in LFIs, among which spiraeoside was identified as the principal component (56.27 +/- 1.03 and 55.67 +/- 1.82 mg/g of LFI in F. ulmaria and F. vulgaris, respectively). The LFIs of F. ulmaria and F. vulgaris (100-300 mg/kg; p.o.) produced significant and dose-dependent antihyperalgesic effects: ED50 +/- SEM values were 164.8 +/- 15.4 mg/kg (110.3-246.3 mg/kg) and 172.2 +/- 6.2 mg/kg (147.4-201.3 mg/kg) for F. ulmaria and F. vulgaris, respectively. On the other hand, LFIs of both species (100-300 mg/kg; p.o.) did not significantly reduce edema. Good safety profiles were evidenced in the toxicological study. The median lethal dose (LD50) of the tested extracts is likely to be greater than 2000 mg/kg."

According to the news editors, the research concluded: "The results of the present study support the use of F. ulmaria and F. vulgaris flowers in folk medicine for relieving pain in diseases with an inflammatory component."

For more information on this research see: Antihyperalgesic activity of Filipendula
The news reporters obtained a quote from the research from the University of Central Florida, "Riboflavin is a critical metabolite enabling all organisms to maintain redox homeostasis. B. burgdorferi appears to lack the metabolic capacity for de novo synthesis of riboflavin and so likely relies on scavenging riboflavin from the host environment. In this study, we sought to investigate the role of bb0318 in B. burgdorferi pathogenesis. No in vitro growth defect was observed for the Delta bb0318 clone. However, the mutant spirochetes displayed reduced levels of survival when exposed to exogenous hydrogen peroxide or murine macrophages. Spirochetes lacking bb0318 were found to have a 100-fold-higher 50% infectious dose than spirochetes containing bb0318. In addition, at a high inoculum dose, bb0318 was found to be important for effective spirochete dissemination to deep tissues for as long as 3 weeks postinoculation and to be critical for B. burgdorferi infection of mouse hearts."

According to the news reporters, the research concluded: "Together, these data implicate bb0318 in the oxidative stress response of B. burgdorferi and indicate the contribution of bb0318 to B. burgdorferi mammalian infectivity."

For more information on this research see: Gene bb0318 Is Critical for the Oxidative Stress Response and Infectivity of Borrelia burgdorferi"

Our news correspondents report that additional information may be obtained by contacting M.W. Jewett, University of Central Florida, Coll Med, Burnett Sch Biomed Sci, Div Immun & Pathogenesis, Orlando, FL 32816, United States. Additional authors for this research include G. Aranjuez, P.P. Adams and M.W. Jewett.

**Digestive System Diseases and Conditions** -

**Data on Functional Dyspepsia Described by Researchers at Dongguk University Ilsan Hospital (Visceral adiposity is associated with an increased risk of functional dyspepsia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Digestive System Diseases and Conditions - Functional Dyspepsia is now available. According to news reporting originating in Goyang, South Korea, by NewsRx journalists, research stated, "The relationship between visceral adiposity and the incidence of functional dyspepsia (FD) has not yet been studied. The purpose of the present study is to evaluate the association between visceral adiposity and the risk of FD."

Financial support for this research came from Dongguk University Research Fund 2010.

The news reporters obtained a quote from the research from Dongguk University Ilsan Hospital, "This is a case-control study that compares the abdominal adipose tissue area between subjects with FD and control subjects without FD, who underwent abdomen computerized tomography (CT) for health examinations in a tertiary center. Retrospectively, a telephone survey was conducted to diagnose FD using the Rome III criteria. We measured various indices of obesity including body mass index (BMI), waist circumference (WC), visceral adipose tissue (VAT) area, subcutaneous adipose tissue (SAT) area and the VAT/SAT ratio in order to evaluate the association between FD and abdominal adiposity. A total of 363 subjects were included in the present study. FD was diagnosed in 90 subjects (24.8%). In the univariate analysis, WC, VAT area, TAT area, VAT/SAT ratio, and the presence of erosive esophagitis were significantly higher in the FD group than in the non-FD group. In the multivariate analysis, a higher VAT area (odds ratio (OR), 3.76; 95% confidence interval (CI), 1.24-11.40; highest quartile vs lowest quartile, p=0.019) and VAT/SAT ratio (OR, 2.35; 95% CI, 1.27-4.32; highest quartile vs lowest quartile, p=0.006) were independently associated with a risk of FD."
According to the news reporters, the research concluded: "Visceral adiposity as measured by the VAT area and VAT/SAT ratio is associated with an increased risk of FD."

Our news correspondents report that additional information may be obtained by contacting J.G. Jung. Dept. of Internal Medicine, Dongguk University Ilsan Hospital, College of Medicine, Goyang, South Korea. Additional authors for this research include J.N. Yang, C.G. Lee, S.H. Choi, W.G. Kwack, J.H. Lee and H.W Kang.

**Fuzzy Logic**

**Data on Fuzzy Logic Discussed by Researchers at University of Coimbra (Automated fluence map optimization based on fuzzy inference systems)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Fuzzy Logic. According to news reporting originating in Coimbra, Portugal, by NewsRx journalists, research stated, "The planning of an intensity modulated radiation therapy treatment requires the optimization of the fluence intensities. The fluence map optimization (FMO) is many times based on a nonlinear continuous programming problem, being necessary for the planner to define a priori weights and/or lower bounds that are iteratively changed within a trial-and-error procedure until an acceptable plan is reached."

Financial supporters for this research include FEDER, Fundacao para a Ciencia e a Tecnologia (FCT).

The news reporters obtained a quote from the research from the University of Coimbra, "In this work, the authors describe an alternative approach for FMO that releases the human planner from trial-and-error procedures, contributing for the automation of the planning process. The FMO is represented by a voxel-based convex penalty continuous nonlinear model. This model makes use of both weights and lower/upper bounds to guide the optimization process toward interesting solutions that are able to satisfy all the constraints defined for the treatment. All the model's parameters are iteratively changed by resorting to a fuzzy inference system. This system analyzes how far the current solution is from a desirable solution, changing in a completely automated way both weights and lower/upper bounds. The fuzzy inference system is based on fuzzy reasoning that enables the use of common-sense rules within an iterative optimization process. The method is built in two stages: in a first stage, an admissible solution is calculated, trying to guarantee that all the treatment planning constraints are being
satisfied. In this first stage, the algorithm tries to improve as much as possible the irradiation of the planning target volumes. In a second stage, the algorithm tries to improve organ sparing, without jeopardizing tumor coverage. The proposed methodology was applied to ten head-and-neck cancer cases already treated in the Portuguese Oncology Institute of Coimbra (IPOCFG) and signalized as complex cases. IMRT treatment was considered, with 7, 9, and 11 equidistant beam angles. It was possible to obtain admissible solutions for all the patients considered and with no human planner intervention. The results obtained were compared with the optimized solution using a similar optimization model but with human planner intervention. For the vast majority of cases, it was possible to improve organ sparing and at the same time to assure better tumor coverage. Embedding a fuzzy inference system into FMO allows human planner reasoning to be used in the guidance of the optimization process toward interesting regions in a truly automated way.”

According to the news reporters, the research concluded: “The proposed methodology is capable of calculating high quality plans within reasonable computational times and can be an important contribution toward fully automated radiation therapy treatment planning.”

For more information on this research see: Automated fluence map optimization based on fuzzy inference systems. *Medical Physics*, 2016;43(3):1083-95. *Medical Physics* can be contacted at: Amer Assoc Physicians Medicine Amer Inst Physics, Ste 1 No 1, 2 Huntington Quadrangle, Melville, NY 11747-4502, USA. Membrane Proteins - G-Protein-Coupled Receptors

Data on G-Protein-Coupled Receptors Described by N.T Zaveri et al

[Nociceptin Opioid Receptor (NOP) as a Therapeutic Target: Progress in Translation from Preclinical Research to Clinical Utility]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Membrane Proteins - G-Protein-Coupled Receptors. According to news reporting originating from Mountain View, California, by NewsRx editors, the research stated, "In the two decades since the discovery of the nociceptin opioid receptor (NOP) and its ligand, nociceptin/orphaninFQ (N/OFQ), steady progress has been achieved in understanding the pharmacology of this fourth opioid..."
receptor/peptide system, aided by genetic and pharmacologic approaches. This research spawned an explosion of small-molecule NOP receptor ligands from discovery programs in major pharmaceutical companies."

Funders for this research include National Institute of Neurological Disorders and Stroke, National Heart, Lung, and Blood Institute, National Institute on Drug Abuse.

Our news editors obtained a quote from the research, "NOP agonists have been investigated for their efficacy in preclinical models of anxiety, cough, substance abuse, pain (spinal and peripheral), and urinary incontinence, whereas NOP antagonists have been investigated for treatment of pain, depression, and motor symptoms in Parkinson's disease. Translation of preclinical findings into the clinic is guided by PET and receptor occupancy studies, particularly for NOP antagonists. Recent progress in preclinical NOP research suggests that NOP agonists may have clinical utility for pain treatment and substance abuse pharmacotherapy."

According to the news editors, the research concluded: "This review discusses the progress toward validating the NOP-N/OFQ system as a therapeutic target."

The news editors report that additional information may be obtained by contacting N.T. Zaveri, Astraea Therapeutics, 320 Logue Avenue, Suite 142, Mountain View, California 94043, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.jmedchem.5b01499. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Gastric Cancer

Data on Gastric Cancer Reported by Researchers at Shanghai Jiao-Tong University (Bone marrow-derived mesenchymal stem cells increase drug resistance in CD133-expressing gastric cancer cells by regulating the PI3K/AKT pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Bone marrow-derived mesenchymal stem cells (BM-MSCs) are recruited to primary tumours to compose the tumour microenvironment. In various cancers, CD133(-) positive cells have been shown to possess cancer stem cell properties that confer chemoresistance."
Funders for this research include Health Bureau of Shanghai, Shanghai Jiao-tong University School of Medicine.

Our news editors obtained a quote from the research from Shanghai Jiao-Tong University, "This study aimed to investigate the role of BM-MSCs in the anti-tumour drug resistance of CD133(-) expressing gastric cancer cells and explore the underlying mechanisms that governing this role. We found that CD133(+) gastric cancer cells displayed more resistance to chemotherapeutics than CD133(-) cells. In addition, BM-MSCs increased the antiapoptotic abilities and chemoresistance of CD133(+) cells via upregulation of Bcl-2 and downregulation of BAX. Mechanistically, BM-MSCs triggered activation of the PI3K/Akt signalling cascade in CD133(+) cells. Blocking the PI3K/Akt pathway inhibited the promotion of chemoresistance. Furthermore, BM-MSCs enhanced the drug resistance of CD133(-) overexpressing cells in vitro and in vivo, but not that of CD133(-) knockdown cells, which demonstrated the contribution of CD133 to this process."

According to the news editors, the research concluded: "We demonstrated that BM-MSCs increased the anti-apoptotic abilities and drug resistance of CD133(-) expressing cells via activation of the PI3K/Akt pathway following Bcl-2 upregulation and BAX downregulation, in which CD133 played a significant role. Targeting this route may help improve the efficacy of chemotherapy in gastric cancer."

The news editors report that additional information may be obtained by contacting B.J. Jiang, Shanghai Jiao Tong University, Sch Med, Shanghai Peoples Hosp 9, Dept. of Gen Surg, Shanghai 201900, People's Republic of China. Additional authors for this research include J.W. Yu, X.C. Ni, J.G. Wu, S.L. Wang and B.J. Jiang.

**Gastroenterology**

**Data on Gastroenterology Reported by Researchers at Cedars-Sinai Medical Center (Prohibitin 1 Regulates the H19-Igf2 Axis and Proliferation in Hepatocytes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gastroenterology. According to news reporting originating in Los Angeles, California, by NewsRx journalists, research stated, "Prohibitin 1 (PHB1) is a mitochondrial chaperone that regulates cell growth. Phb1 knock-out
mice exhibit liver injury and hepatocellular carcinoma (HCC)."

Financial supporters for this research include National Cancer Institute, Plan Nacional of I+D and Departamento de Educacion del Gobierno Vasco.

The news reporters obtained a quote from the research from Cedars-Sinai Medical Center, "Phb1 knock-out livers show induction of tumor growth-associated genes, H19 and insulin-like growth factor 2 (Igf2). These genes are controlled by the imprinting control region (ICR) containing CCCTC-binding transcription factor (CTCF)-binding sites. Because Phb1 knock-out mice exhibited induction of H19 and Igf2, we hypothesized that PHB1-mediated regulation of the H19-Igf2 axis might control cell proliferation in normal hepatocytes. H19 and Igf2 were induced (8-20-fold) in 3-week-old Phb1 knock-out livers, in Phb1 siRNA-treated AML12 hepatocytes (2-fold), and HCC cell lines when compared with control. Phb1 knockdown lowered CTCF protein in AML12 by approximate to 30% when compared with control. CTCF overexpression lowered basal H19 and Igf2 expression by 30% and suppressed Phb1 knockdown-mediated induction of these genes. CTCF and PHB1 co-immunoprecipitated and co-localized on the ICR element, and Phb1 knockdown lowered CTCF ICR binding activity. The results suggest that PHB1 and CTCF cooperation may control the H19-Igf2 axis. Human HCC tissues with high levels of H19 and IGF2 exhibited a 40-50% reduction in PHB1 and CTCF expression and their ICR binding activity. Silencing Phb1 or overexpressing H19 in the mouse HCC cell line, SAMe-D, induced cell growth. Blocking H19 induction prevented Phb1 knockdown-mediated growth, whereas H19 overexpression had the reverse effect. Interestingly H19 silencing induced PHB1 expression."

According to the news reporters, the research concluded: "Taken together, our results demonstrate that the H19-Igf2 axis is negatively regulated by CTCF-PHB1 cooperation and that H19 is involved in modulating the growth-suppressive effect of PHB1 in the liver."

Our news correspondents report that additional information may be obtained by contacting S.C. Lu, Cedars Sinai Med Center, Div Gastroenterol & Hepatol, Los Angeles, CA 90048, United States. Additional authors for this research include N. Mavila, K.S. Ko, J.M. Mato and S.C. Lu.

Hormones - Gastrointestinal Hormones

Data on Gastrointestinal Hormones Discussed by Researchers at Uppsala University (PET imaging of epidermal growth factor receptor expression in tumours using 89Zr-labelled ZEGFR:2377 affibody molecules)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hormones - Gastrointestinal Hormones. According to news reporting from Uppsala, Sweden, by NewsRx journalists, research stated, "Epidermal growth factor receptor (EGFR) is a transmembrane tyrosine kinase receptor, which is overexpressed in many types of cancer. The use of EGFR-targeting monoclonal antibodies and tyrosine-kinase inhibitors improves significantly survival of patients with colorectal, non-small cell lung cancer and head and neck squamous cell carcinoma."

The news correspondents obtained a quote from the research from Uppsala University, "Detection of EGFR overexpression provides important prognostic and predictive information influencing management of the patients. The use of radionuclide molecular imaging would enable non-invasive repeatable determination of EGFR expression in disseminated cancer. Moreover, positron emission tomography (PET) would provide superior sensitivity and quantitation accuracy in EGFR expression imaging. Affibody molecules are a new type of imaging probes, providing high contrast in molecular imaging. In the present study, an EGFR-binding affibody molecule (ZEGFR:2377) was site-specifically conjugated with a deferoxamine (DFO) chelator and labelled under mild conditions (room temperature and neutral pH) with a positron-emitting radionuclide (89)Zr. The (89)Zr-DFO-ZEGFR:2377 tracer demonstrated specific high affinity (160 ± 60 pM) binding to EGFR-expressing A431 epidermoid carcinoma cell line. In mice bearing A431 xenografts, (89)Zr-DFO-ZEGFR:2377 demonstrated specific uptake in tumours and EGFR-expressing tissues. The tracer provided tumor uptake of 2.6 ± 0.5% ID/g and tumour-to-blood ratio of 3.7 ± 0.6 at 24 h after injection. (89)Zr-DFO-ZEGFR:2377 provides higher tumour-to-organ ratios than anti-EGFR antibody (89)Zr-DFO-cetuximab at 48 h after injection. EGFR-expressing tumours were clearly visualized by microPET using (89)Zr-DFO-ZEGFR:2377 at both 3 and 24 h after injection."

According to the news reporters, the research concluded: "(89)Zr-DFO-ZEGFR:2377 is a potential probe for PET imaging of EGFR-expression in vivo."

Our news journalists report that additional information may be obtained by contacting J. Garousi, Institute of Immunology, Genetic and Pathology, Uppsala University, SE-75185 Uppsala, Sweden. Genetics

Data on Genetics Described by Researchers at National Cancer Center Research Institute (IER5 generates a novel hypo-phosphorylated active form of HSF1 and contributes to tumorigenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Genetics is the subject of a report. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "The transcription factors HSF1 and p53 both modulate the stress response, thereby protecting and facilitating the recovery of stressed cells, but both have the potential to promote tumor development. Here we show that a p53 target gene, IER5, encodes an activator of HSF1."

Our news journalists obtained a quote from the research from National Cancer Center Research Institute, "IER5 forms a ternary complex with HSF1 and the phosphatase PP2A, and promotes the dephosphorylation of HSF1 at numbers of serine and threonine residues, generating a novel, hypo-phosphorylated active form of HSF1. IER5 is also transcriptionally upregulated in various cancers, although this upregulation is not always p53-dependent. The IER5 locus is associated with a so-called super enhancer, frequently associated with hyperactivated oncogenes in cancer cell lines. Enhanced expression of IER5 induces abnormal HSF1 activation in cancer cells and contributes to the proliferation of these cells under stressed conditions."

According to the news editors, the research concluded: "These results reveal the existence of a novel IER5-mediated cancer regulation pathway that is responsible for the activation of HSF1 observed in various cancers."

For more information on this research see: IER5 generates a novel hypo-phosphorylated active form of HSF1 and contributes to tumorigenesis. Scientific Reports, 2016;6():19174. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting Y. Asano, Division of Rare Cancer Research, National Cancer Center Research Institute, Tsukiji 5-1-1, Chuo-ku, Tokyo 104-0045, Japan. Additional authors for this research include T. Kawase, A. Okabe, S. **Oncology - Glioblastomas**

**Data on Glioblastomas Discussed by Researchers at Capital Medical University [LncRNA and mRNA expression profiles of glioblastoma multiforme (GBM) reveal the potential roles of IncRNAs in GBM pathogenesis]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Glioblastomas. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Glioblastoma multiforme (GBM) is the most common brain malignancy. Long non-coding RNAs (lncRNAs) are aberrantly expressed in many cancers and are involved in their cell proliferation, apoptosis, angiogenesis, and invasion."

Financial supporters for this research include Natural Science Foundation of China, Natural Science Foundation of Beijing City, The Excellence Talents Training Projects of Beijing City.

Our news journalists obtained a quote from the research from Capital Medical University, "The functional roles of lncRNAs in GBM are less known. We analyzed a cohort of exon microarray datasets from The Cancer Genome Atlas. The differently expressed lncRNAs and mRNA were subjected to construct lncRNA-mRNA coexpression network. Probable functions for lncRNAs were predicted according to lncRNA-mRNA network and genomic adjacency by GO and pathway analysis. The expression of lncRNAs and mRNAs in GBM tissues versus normal brain tissues was examined by quantitative reverse transcription polymerase chain reaction. The 398 lncRNAs and 1995 mRNAs were identified as distinctively expressed in GBM. Probable functional roles for 98 lncRNAs were involved in 30 pathways and 32 gene functions related to tumorigenesis, development, and metastasis. The identified sets of key lncRNAs specific to GBM were subsequently verified by experiment in GBM tissues. Our reports predict the biological functions of a multitude of lncRNAs in GBM that could be potential diagnostic and prognostic biomarkers as well as therapeutic targets."

According to the news editors, the research concluded: "Moreover, our research provides a road map for the identification and analysis of lncRNAs in tumors."

For more information on this research see: LncRNA and mRNA expression profiles of glioblastoma multiforme (GBM) reveal the potential roles of IncRNAs in GBM pathogenesis. *Tumor Biology*, 2016;37(11):14537-14552. *Tumor Biology* can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. Oncology - Glioblastomas

**Data on Glioblastomas Discussed by Researchers at Sungkyunkwan University (WNT signaling in glioblastoma and therapeutic opportunities)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Glioblastomas have been presented. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "WNTs and their downstream effectors regulate proliferation, death, and migration and cell fate decision. Deregulation of WNT signaling is associated with various cancers including GBM, which is the most malignant primary brain cancer."

Our news journalists obtained a quote from the research from Sungkyunkwan University, "In this review, we will summarize the experimental evidence supporting oncogenic roles of WNT signaling in GBM and discuss current progress in the targeting of WNT signaling as an anti-cancer approach. In particular, we will focus on (1) genetic and epigenetic alterations that lead to aberrant WNT pathway activation in GBM, (2) WNT-mediated control of GBM stem cell maintenance and invasion, and (3) cross-talk between WNT and other signaling pathways in GBM."

According to the news editors, the research concluded: "We will then review the discovery of agents that can inhibit WNT signaling in preclinical models and the current status of human clinical trials."

For more information on this research see: WNT signaling in glioblastoma and therapeutic opportunities. *Laboratory Investigation*, 2015;96(2):137-50. (Nature Publishing Group - www.nature.com/; Laboratory Investigation - www.nature.com/labinvest/)

The news correspondents report that additional information may be obtained from Y. Lee, Dept. of Health Sciences and Technology, SAIHST, Sungkyunkwan University, Seoul, South Korea. Additional authors for this research include J.K. Lee, S.H. Ahn, J. Lee and D.H Nam.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/labinvest.2015.140. This DOI is a link to an online electronic document that is either free or for purchase.

Gliosarcomas

**Data on Gliosarcomas Reported by Researchers at All India Institute of Medical Sciences (Clinical outcome of patients with primary gliosarcoma treated with concomitant and adjuvant temozolomide: A single institutional analysis of 27 cases)**
Researchers detail new data in Gliosarcomas. According to news reporting originating from New Delhi, India, by NewsRx correspondents, research stated, "The prognosis of primary gliosarcoma (PGS) remains dismal with current treatment modalities. We analyzed the outcome of PGS patients treated with concurrent and adjuvant temozolomide (TMZ)."

Our news editors obtained a quote from the research from the All India Institute of Medical Sciences, "Retrospective single institutional analysis. We retrospectively evaluated 27 patients of PGS treated with radiotherapy (RT) and TMZ during 2007-2012. Overall survival (OS) was estimated by the use of Kaplan Meier method and toxicities were evaluated using common terminology criteria for adverse events version 2.0 (National Cancer Institute, USA). Median age at presentation and Karnofsky performance status was 45 years and 90 respectively and male: female ratio was 20:7. Patients received adjuvant RT to a total dose of 60 Gy at 2 Gy/fraction. All patients except 5 received adjuvant TMZ to a median number of 6 cycles. Grade 2 and 3 hematological toxicity was seen in 8% and 4% of patients respectively during concurrent RT. During adjuvant chemotherapy, 13.6% had Grade 3 thrombocytopenia and 9.5% had Grade 3 neutropenia. Median OS was 16.7 months (1 year and 2 year actuarial OS was 70.8% and 32.6% respectively). Adjuvant TMZ was associated with a better survival (median survival 21.21 vs. 11.93 months; p=0.0046) on univariate analysis and also on multivariate analysis (hazard ratio 1.82, 95% confidence interval: 1.503-25.58; p=0.012). The results of our study, largest series of patients with PGS treated with concurrent and adjuvant TMZ shows an impressive survival with acceptable toxicity."

According to the news editors, the research concluded: "We suggest TMZ be included in the 'standard of care' for this tumor."

For more information on this research see: Clinical outcome of patients with primary gliosarcoma treated with concomitant and adjuvant temozolomide: A single institutional analysis of 27 cases. *Indian Journal of Cancer*, 2015;52(4):599-603.

The news editors report that additional information may be obtained by contacting G.K. Rath, Dept. of Radiation Oncology, Dr BRA IRCH, All India Institute of Medical Sciences, New Delhi, India. The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0019-509X.178407. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Asia, India, New Delhi, Gliosarcomas. Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
NewsRx correspondents, research stated, "We assessed etravirine resistance in treatment-experienced, HIV-1-infected children (n=41)/adolescents (n= 60) who received twice-daily etravirine 5.2 mg/kg and a background regimen (boosted protease inhibitor plus nucleoside/nucleotide reverse transcriptase inhibitors, optional enfuvirtide/raltegravir) in a Phase II, open-label, multicentre trial (PIANO). In addition to phenotypes, viral genotypes were assessed by population and deep sequencing (PS and DS) in virological failures (VFs; baseline and end point) and responders (baseline)."

Our news editors obtained a quote from the research from Janssen Infectious Diseases-Diagnostics B.V.B.A., "Minority resistance-associated mutations (RAMs) were defined as those with frequencies above 1% and not detected with PS. By week 48, 41/101 (40.6%) patients experienced VF; 17/41 (41.5%) VFs and 22/54 (40.8%) responders had >= 1 baseline etravirine RAM by PS, mainly A98G, K101E, V106I and G190A. Baseline minority etravirine RAMs (n) were detected in 8/40 VFs (V90I [2], A98G [1], L100I [1], V106I [1], E138G [1] and Y181C [2]) and 5/38 responders (V90I [3], A98G [1], V106I [1] and E138G [1]). The most frequent emerging non-nucleoside reverse transcriptase inhibitor RAMs detected by PS (>= 3 VFs; n) were the etravirine RAMs Y181C (8), V90I (3), L100I (3) and E138A (3). In 15 of 29 (51.7%) VFs with baseline DS/PS and end point PS data, = 1 emerging etravirine RAM was detected by PS, which was not detected at baseline by DS in most cases (12/15 [80.0%]). In 10/26 (38.5%) VFs with baseline/end point DS data, >= 1 additional emerging minority etravirine RAM was detected. Patterns of etravirine resistance in adults, adolescents and children experiencing VF are similar."

According to the news editors, the research concluded: "The presence of minority etravirine RAMs at baseline was not consistently associated with treatment failure."

The news editors report that additional information may be obtained by contacting L. Tambuyzer, Janssen Infect Dis BVBA, Beerse, Belgium. Additional authors for this research include K. Thys, A. Hoogstoel, S. Nijs, F. Tomaka, M. Opsomer, S. De Meyer and J. Vingerhoets.

**Immune System Diseases and Conditions - HIV/AIDS**

**Data on HIV/AIDS Discussed by Researchers at New York State Psychiatric Institute and Hospital (Early sex work initiation and condom use among alcohol-using female sex workers in Mombasa, Kenya: a cross-sectional analysis)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - HIV/AIDS have been published. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Early initiation of sex work is prevalent among female sex workers (FSWs) worldwide. The objectives of this study were to investigate if early initiation of sex work was associated with: (1) consistent condom use, (2) condom negotiation self-efficacy or (3) condom use norms among alcohol-using FSWs in Mombasa, Kenya."

Our news journalists obtained a quote from the research from New York State Psychiatric Institute and Hospital, "In-person interviews were conducted with 816 FSWs in Mombasa, Kenya. Sample participants were: recruited from HIV prevention drop-in centres, 18 years or older and moderate risk drinkers. Early initiation was defined as first engaging in sex work at 17 years or younger. Logistic regression modelled outcomes as a function of early initiation, adjusting for drop-in centre, years in sex work, supporting others and HIV status. FSWs who initiated sex work early were significantly less likely to report consistent condom use with paying sex partners compared with those who initiated sex work in adulthood. There was no significant difference between groups in consistent condom use with non-paying sex partners. FSWs who initiated sex work early endorsed less condom negotiation self-efficacy with paying sex partners compared with FSWs who did not initiate sex work early. Findings highlight a need for early intervention for at-risk youth and adolescent FSWs, particularly in relation to HIV sexual risk behaviours."

According to the news editors, the research concluded: "Evidence-based interventions for adolescent FSWs or adult FSWs who began sex work in adolescence should be developed, implemented and evaluated."

For more information on this research see: Early sex work initiation and condom use among alcohol-using female sex workers in Mombasa, Kenya: a cross-sectional analysis. Sexually Transmitted Infections, 2016;92(8):593-598. Sexually Transmitted Infections can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. (BMJ Publishing Group - group.bmj.com/; Sexually Transmitted Infections - sti.bmj.com/)

Imune System Diseases and Conditions - HIV/AIDS

Data on HIV/AIDS Reported by Researchers at University of Stellenbosch (Point-of-Care Cepheid Xpert HIV-1 Viral Load Test in Rural African Communities Is Feasible and Reliable)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - HIV/AIDS have been published. According to news reporting originating from Tygerberg, South Africa, by NewsRx correspondents, research stated, "Routine monitoring of HIV-1 RNA or viral load (VL) in patients on antiretroviral therapy (ART) is important, but there are multiple impediments to VL testing in resource-constrained settings. An accurate point-of-care (POC) HIV-1 VL test could alleviate many of these challenges."

Funders for this research include U.S. President's Emergency Plan for AIDS Relief (PEPFAR), Wellcome Trust DELTAS Initiatives/Sub-Saharan Africa Network for TB/HIV Research Excellence (SANTHE).

Our news editors obtained a quote from the research from the University of Stellenbosch, "We compared the performance of the Cepheid Xpert HIV-1 VL assay against the laboratory-based Abbott m2000sp/m2000rt assay (Abbott assay). ART-naive individuals participating in the Botswana Combination Prevention Project in 20 communities provided EDTA-blood specimens during household surveys. Both the POC Xpert HIV-1 VL and Abbott assays were performed on specimens sampled from 277 individuals. We found a high correlation between the Xpert HIV-1 VL and Abbott assay results (r(2) = 0.92; P< 0.001). The overall mean difference in the HIV-1 RNA values obtained by Xpert HIV-1 VL assay and Abbott assay was 0.34 log(10) copies/ml (95% confidence interval [CI], 0.26 to 0.40 log(10) copies/ml) (P < 0.001). Using a clinically relevant level of 1,000 copies/ml as a threshold, agreement was 90.6% (95% CI, 87.9 to 93.1%), with a sensitivity of 98.6% (95% CI, 97.2 to 100%). The two methods agreed on their detectability of HIV-1 RNA (>40 copies/ml) at 97.1% (95% CI, 95.5 to 98.7%), with a sensitivity of 99.6% (95% CI, 97.2 to 100%). The POC Cepheid Xpert HIV-1 VL assay showed high agreement and accuracy with a laboratory-based method of HIV-1 RNA testing. The POC Xpert HIV-1 VL assay tended to overestimate HIV-1 VL, although the difference was below a clinically relevant threshold of 0.5 log(10) copies/ml."

According to the news editors, the research concluded: "The POC Cepheid Xpert HIV-1 VL assay is a promising tool for monitoring patients on ART in southern Africa."

For more information on this research see: Point-of-Care Cepheid Xpert HIV-1 Viral Load Test in Rural African Communities Is Feasible and Reliable. *Journal of Clinical Microbiology*, 2016;54(12):3050-3055. *Journal of Clinical Microbiology* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

The news editors report that additional information may be obtained by contacting S. Moyo, University of Stellenbosch, Div Med Virol, Fac Med & Hlth Sci, Tygerberg, South Africa. Nervous System Diseases and Conditions -

Data on Headache and Migraine Reported by Researchers at University of Iowa (Higher augmentation index is associated with tension-type headache and migraine in middle-aged/older humans with obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nervous System Diseases and Conditions - Headache and Migraine. According to news reporting originating in Iowa City, Iowa, by NewsRx journalists, research stated, "Obesity is a major risk factor for chronic daily headaches, including migraine and tension-type headache (TTH). Although migraine is associated with increased risk of cardiovascular diseases (CVD), a relation between TTH and CVD risk has not been established."

Financial supporters for this research include National Institutes of Health, American Heart Association.

The news reporters obtained a quote from the research from the University of Iowa, "It was hypothesized that higher carotid-femoral pulse wave velocity (CFPWV) and augmentation index (AI), measures of aortic stiffness and pressure wave reflection, respectively, and biomarkers of CVD risk, would be higher among adults with obesity and migraine or TTH compared with those with no headache. Adults with obesity (n=93; body mass index (>=)30 kg/m(2) ) who were between 40 and 75 years old with at least one additional CVD risk factor were enrolled. Subjects had CFPWV and AI assessed and a complete neurological exam for diagnosis of headache in the past 12 months. Adults with obesity and TTH (p=0.018), but not migraine (p=0.29), had significantly higher AI compared with those with no headache. When both CFPWV and AI were considered in a logistic regression model with migraine or TTH, only AI was associated with TTH (p=0.008) and migraine (p=0.032) but could not distinguish between the two headache phenotypes."

According to the news reporters, the research concluded: "Increased aortic AI but not stiffness is associated with TTH and migraine among middle-aged/older adults with obesity and high CVD risk."

For more information on this research see: Higher augmentation index is associated with tension-type headache and migraine in middle-aged/older humans with obesity. *Obesity*, 2016;24(4):865-70. (Nature Publishing Group - www.nature.com/; Obesity - www.nature.com/oby/)

Our news correspondents report that additional information may be obtained by contacting G.Z. Kalil, Dept. of Health and Human Physiology, University of Iowa, Iowa City, Iowa, United States. Additional authors for this research include A. Recober, A. Hoang-Tienor, M. Bridget Zimmerman, W.G. Haynes and G.L. Pierce.

The direct object identifier (DOI) for that additional information is:
Data on Heart Attack Discussed by Researchers at University of Amsterdam (Extracorporeal life support during cardiac arrest and cardiogenic shock: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Attack is now available. According to news reporting out of Amsterdam, Netherlands, by NewsRx editors, research stated, "Veno-arterial extracorporeal life support (ECLS) is increasingly used in patients during cardiac arrest and cardiogenic shock, to support both cardiac and pulmonary function. We performed a systematic review and meta-analysis of cohort studies comparing mortality in patients treated with and without ECLS support in the setting of refractory cardiac arrest and cardiogenic shock complicating acute myocardial infarction."

Our news journalists obtained a quote from the research from the University of Amsterdam, "We systematically searched MEDLINE, EMBASE, the Cochrane Central Register of Controlled Trials and the publisher subset of PubMed updated to December 2015. Thirteen studies were included of which nine included cardiac arrest patients (n = 3098) and four included patients with cardiogenic shock after acute myocardial infarction (n = 235). Data were pooled by a Mantel-Haenzel random effects model and heterogeneity was examined by the I (2) statistic. In cardiac arrest, the use of ECLS was associated with an absolute increase of 30 days survival of 13 % compared with patients in which ECLS was not used [95 % CI 6-20 %; p< 0.001; number needed to treat (NNT) 7.7] and a higher rate of favourable neurological outcome at 30 days (absolute risk difference 14 %; 95 % CI 7-20 %; p< 0.0001; NNT 7.1). Propensity matched analysis, including 5 studies and 438 patients (219 in both groups), showed similar results. In cardiogenic shock, ECLS showed a 33 % higher 30-day survival compared with IABP (95 % CI, 14-52 %; p< 0.001; NNT 13) but no difference when compared with TandemHeart/Impella (-3 %; 95 % CI -21 to 14 %; p = 0.70; NNH 33). In cardiac arrest, the use of ECLS was associated with an increased survival rate as well as an increase in favourable neurological outcome."

According to the news editors, the research concluded: "In the setting of cardiogenic shock there was an increased survival with ECLS compared with IABP."

For more information on this research see: Extracorporeal life support during cardiac arrest and cardiogenic shock: a systematic review and meta-analysis. Intensive Care Medicine, 2016;42(12):1922-1934. Intensive Care Medicine can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Heart Disorders and Diseases - Heart Disease

Data on Heart Disease Described by Researchers at Tabriz University of Medical Sciences (Predictors of health-promoting behaviors in patients with coronary artery disease in the Iranian population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Disease have been presented. According to news reporting originating in Tabriz, Iran, by NewsRx journalists, research stated, "This study was carried out to determine the predictors of health-promoting behaviors (HPBs) in patients with coronary artery diseases (CAD) in the Iranian population. In this cross-sectional descriptive study, 250 eligible patients ages 42-80 years with a body mass index (BMI) between 18 and 45.7 kg/m(2) with CAD who were admitted to a cardiac hospital in Urmia, Iran participated."

The news reporters obtained a quote from the research from the Tabriz University of Medical Sciences, "Valid questionnaires used the Health Promoting Lifestyle Profile-II (HPLP-II), Cardiac Self-Efficacy (CSE) and General Self-Efficacy (GSE) scales to assess HPBs, CSE and GSE, respectively. Fifty five percent of participants were men and mean (SD) age was 59 (12.1) years. Hierarchical multiple regression analysis indicated that CSE, GSE, education and BMI were the best predictors of HPBs, respectively. This model predicted 31% of HPB change (adjusted R-2=0.31). Responsibility for health and spiritual growth motivates patients to apply HPBs."

According to the news reporters, the research concluded: "However, physical activity and stress management are least applied."

Our news correspondents report that additional information may be obtained by contacting M. Alizadeh, Tabriz Univ Med Sci, Tabriz Hlth Serv Management Res Center, Tabriz, Iran.
Keywords for this news article include: Tabriz, Iran, Asia, Cardiovascular Diseases and Conditions, Heart Disorders and Diseases, Arterial Occlusive Diseases, Coronary Artery Disease, Myocardial Ischemia, Arteriosclerosis, Heart Disease, Cardiology, Angiology, Tabriz University of Medical Sciences.

Heart Disorders and Diseases - Heart Disease

Data on Heart Disease Discussed by Researchers at University of Amsterdam (Prenatal Undernutrition and Autonomic Function in Adulthood)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Disease have been published. According to news originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Early-life adversity has been shown to be associated with cardiovascular disease and mortality in later life, but little is known about the mechanisms that underlie this association. Prenatal undernutrition, a severe early-life stressor, is associated with double the risk of coronary heart disease and increased blood pressure responses to psychological stress."

Our news journalists obtained a quote from the research from the University of Amsterdam, "In the present study, we tested the hypothesis that prenatal undernutrition induces alterations in the autonomic nervous system, which may increase the risk of developing heart disease. We studied autonomic function in 740 men and women (mean [SD] age, 58 [0.9] years) who were members of the Dutch famine birth cohort. We compared those exposed to famine during early (n = 64), mid (n = 107), or late gestation (n = 127) to those unexposed to famine in utero (n = 442). Participants underwent a series of 3 psychological stressors (Stroop, mirror tracing, and speech) while their blood pressure and heart rate were recorded continuously. Data had sufficient quality in 602 participants for derivation of autonomic function indices by spectral analysis. The stress protocol led to significant sample-level changes in systolic blood pressure, heart rate, and all cardiovascular control measures (all p values < .001). None of the autonomic function parameters, at rest or in response to stress, differed significantly (all p values > .050) according to prenatal famine exposure. Prenatal undernutrition was not associated with autonomic function in late adulthood."

According to the news editors, the research concluded: "We conclude that altered autonomic function does not seem to explain our previous findings of increased coronary heart disease risk among those exposed to famine prenatally."

For more information on this research see: Prenatal Undernutrition and Autonomic Function in Adulthood. Psychosomatic Medicine, 2016;78(9):991-997. Psychosomatic Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA.

The news correspondents report that additional information may be obtained from S.R. de Rooij, University of Amsterdam, Academy Med Center, Dept. of Clin Epidemiol Biostat & Bioinformat, Amsterdam, Netherlands. Additional authors for this research include A. Jones, D.I. Phillips, C. Osmond, J.M. Karemaker, T.J. Roseboom and R.C. Painter.

Heart Disorders and Diseases - Heart Disease

Data on Heart Disease Reported by Researchers at Peking University (Association between plasma ADAMTS-7 levels and severity of disease in patients with stable obstructive coronary artery disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Heart Disorders and Diseases - Heart Disease are presented in a new report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The metalloproteinase family of a disintegrin and metalloproteinase with thrombospondin motifs-7 (ADAMTS-7) was reported to be a novel locus associated with human coronary artery disease. This study aimed to investigate plasma ADAMTS-7 levels in stable obstructive CAD patients and elucidate the relationship between plasma ADAMTS-7 levels and the severity of CAD as assessed by the Syntax score."

Our news journalists obtained a quote from the research from Peking University, "This was a single center cross-sectional study performed in 182 CAD patients. ELISA was used to measure plasma ADAMTS-7 levels. All patients were divided into subgroup according to the ADAMTS-7 median in this cohort: high group with ADAMTS-7 > = 0.99 ng/mL and low group with ADAMTS-7 < 0.99 ng/mL. Furthermore, all patients were divided into tertiles according to their Syntax scores (low group: Syntax score <= 10.0; moderate group: 10.0 < Syntax score <= 18.0; high group: Syntax score > 18.0). We followed up the participants continuously until the first major adverse cardiovascular event (MACE) for a mean time of 22.0 months. Plasma ADAMTS-7 levels in the high Syntax score group were significantly higher compared with the low Syntax score group (3.29 [0.08-26.3] ng/mL vs 1.24 [0.15-8.78] ng/mL, P=0.010). Plasma ADAMTS-7 levels were significantly positively correlated with the Syntax score tertiles (r=0.157, P=0.035). Logistic regression analysis indicated that the plasma ADAMTS-7 level was one of the independent predictors for the Syntax score tertiles (B=1.118, 95% CI: 1.194-7.830, P=0.020), together with HbA1c (B=0.946, 95% CI: 1.248-5.312, P=0.010), uric acid (B=-0.019, 95% CI: 0.974-0.988, P<0.001), and coronary artery calcium score (B=-0.001, 95% CI: 0.998-0.999, P<0.001). Compared with the low ADAMTS-7 group, the high ADAMTS-7 group had significantly higher Syntax score (17.10 +/- 8.42 vs 14.96 +/- 8.11, P=0.047). Kaplan Meier analysis showed patients in the high plasma ADAMTS-7 group tend to have a lower event-free survival rate than patients in the low plasma ADAMTS-7 group. Unfortunately, no difference was detected (86.8% vs 88.0%, log rank=0.314, P=0.575). The plasma ADAMTS-7 level was positively correlated with the Syntax score significantly."

According to the news editors, the research concluded: "The elevated plasma ADAMTS-7 level may be involved in the severity of disease in patients with stable coronary artery disease."

For more information on this research see: Association between plasma ADAMTS-7 levels and severity of disease in patients with stable obstructive coronary artery disease. Medicine, 2016;95(48):228-234. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier -
Data on Heart Failure Described by Researchers at University of Naples Federico II (Sleep-disordered breathing, impaired cardiac adrenergic innervation and prognosis in heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Failure is now available. According to news originating from Naples, Italy, by NewsRx correspondents, research stated, "Unfavourable effects of sleep-disordered breathing (SDB) in heart failure (HF) are mainly mediated by impaired sympathetic activity. Few data are available on SDB and cardiac adrenergic impairment evaluated at myocardial level."

Our news journalists obtained a quote from the research from the University of Naples Federico II, "The aim of the study was to assess the relationship between SDB, cardiac sympathetic innervation assessed by I-123-metaiodobenzylguanidine (I-123-MIBG) imaging and prognosis in HF. Observational, prospective study enrolling patients with HF and reduced systolic function. Patients underwent nocturnal cardiorespiratory monitoring to assess SDB presence by apnoea/hypopnoea index (AHI), and I-123-MIBG imaging to calculate heart-tomediastinum (H/M) ratios and washout rate. Patients were prospectively followed for 29 +/- 18 months for the combined endpoint of cardiovascular death and HF hospitalisation. Ninety-four patients (66.1 +/- 9.8 years; left ventricular ejection fraction 32 +/- 7%) were enrolled; 72 (77%) showed SDB and, compared with non-SDB, significantly reduced early (1.67 +/- 0.22 vs 1.77 +/- 0.13; p=0.019) and late H/M ratios (1.50 +/- 0.22 vs 1.61 +/- 0.23; p=0.038). Dividing patients into two groups according to SDB severity, patients with a moderate-severe disturbance (AHI > 15; n=43) showed significantly worse survival for the composite study outcome (log-rank test, p=0.001) with respect to patients with mild or no disorder (AHI <= 15; n=51). Adding SDB variables to the already known prognostic role of I-123-MIBG imaging, we observed a worse survival in patients with both SDB and H/M impairment."

According to the news editors, the research concluded: "Patients with systolic HF and SDB show more impaired cardiac adrenergic innervation assessed by I-123-MIBG imaging, and more adverse prognosis compared with HF patients without SDB."

For more information on this research see: Sleep-disordered breathing, impaired cardiac adrenergic innervation and prognosis in heart failure. *Heart*, 2016;102(22):1813-1819.
Heart Disorders and Diseases - Heart Failure

Data on Heart Failure Reported by Researchers at University of Glasgow (The incremental prognostic and clinical value of multiple novel biomarkers in heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Heart Failure have been presented. According to news originating from Glasgow, United Kingdom, by NewsRx correspondents, research stated, "In recent years there has been an increase in the number of biomarkers in heart failure (HF). The clinical role for these novel biomarkers in combination is not clear."

Our news journalists obtained a quote from the research from the University of Glasgow, "The following novel biomarkers were measured from 628 patients recently hospitalized with decompensated HF; mid-regional pro-adrenomedullin (MR-proADM), mid-regional pro-atrial natriuretic peptide (MR-proANP), copeptin, high-sensitivity cardiac troponin T (hs-cTnT), ST2, galectin-3, cystatin C, combined free light chains (cFLC) and high sensitivity C-reactive protein (hsCRP). The incremental prognostic value of these novel biomarkers was evaluated within an extensive model containing established predictors of mortality. During a mean (SD) follow-up of 3.2 (1.5) years, 290 (46%) patients died. Elevated concentrations of all novel biomarkers were associated with an increased unadjusted risk of mortality but only two-thirds were independent predictors following multivariable analysis. Using dichotomized cut-points from receiver operating characteristic analysis, MR-proADM, hs-cTnT, cFLC, hsCRP, and ST2 remained independent predictors of mortality. Further dichotomization into low (0-2 elevated biomarkers) or high (at least three of the five biomarkers elevated) risk groups provided greatest incremental prognostic value (hazard ratio 2.20, 95% confidence interval 1.37-3.54; P = 0.001) and improved the performance of the model (C-statistic 0.730 from 0.721, net reclassification index 32.5%). The novel biomarkers included in this study added little, if any, incremental prognostic value on their own to a model containing established predictors of mortality. However, following dichotomization, five of the novel biomarkers provided
incremental prognostic value."

According to the news editors, the research concluded: "There was a clear gradient in the risk of death with increasing numbers of elevated novel biomarkers, with the presence of at least three identifying patients at greatest risk of mortality."

The news correspondents report that additional information may be obtained from C.E. Jackson, University of Glasgow, Cardiovasc Res Center, British Heart Fdn, Glasgow G12 8TA, Lanark, United Kingdom. Heart Disorders and Diseases - Heart Failure

Data on Heart Failure Reported by Researchers at University of New Mexico (Hyponatremia, Cognitive Function, and Mobility in an Outpatient Heart Failure Population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news originating from Albuquerque, New Mexico, by NewsRx correspondents, research stated, "The association of hyponatremia with cognitive impairment and mobility in heart failure (HF) patients is unknown. The purpose of this study was to determine if hyponatremia is associated with cognitive and mobility impairment as measured by simple, validated, and time-sensitive tests."

Our news journalists obtained a quote from the research from the University of New Mexico, "This was a prospective study in patients with reduced and preserved ejection fraction (HFrEF, HFpEF) seen in outpatient HF clinics. Hyponatremia was defined as sodium level <= 136 mEq/L. Cognitive function was measured using the Montreal Cognitive Assessment (MoCA) tool, and mobility was measured with the Timed Up and Go test (TUG-t). A total of 121 patients were evaluated; 30% were hyponatremic (134 +/- 1.9 mEq/l, range 128-136 mEq/l). Overall, 92% of hyponatremic patients had cognitive impairment (MoCA <26) compared to 76% of the non-hyponatremic patients [relative risk 1.2 (confidence interval: 1.02-1.4, p=0.02)]. In regard to mobility, 72% of hyponatremic patients and 62% of non-hyponatremic patients (p=0.4) had TUG-t times that were considered to be worse than average. A total of 84% (N=76) of HFrEF and 71% (N=22) of HFpEF patients had cognitive impairment (p=0.86). HFrEF patients had significantly lower overall MoCA scores (21.2 +/- 3.7 vs. 23.3 +/- 3.6, p=0.006) and similar TUG-t times compared to HFpEF patients. Most heart failure patients (HFrEF and HFpEF) seen in an ambulatory setting had impairment of cognitive function and mobility, with a higher
prevalence among those with hyponatremia."

According to the news editors, the research concluded: "Screening can be done using tests that can be administered in a clinical setting."

For more information on this research see: Hyponatremia, Cognitive Function, and Mobility in an Outpatient Heart Failure Population. *Medical Science Monitor*, 2016;22():4978-4985. *Medical Science Monitor* can be contacted at: Int Scientific Literature, Inc, 361 Forest Lane, Smithtown, NY 11787, USA.

**Heart Function Tests**

**Data on Heart Function Tests Detailed by Researchers at Medical University (Electrocardiography in Rats: a Comparison to Human)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Function Tests. According to news reporting originating from Warsaw, Poland, by NewsRx correspondents, research stated, "Electrocardiography (ECG) in rats is a widely applied experimental method in basic cardiovascular research. The technique of ECG recordings is simple; however, the interpretation of electrocardiographic parameters is challenging."

Our news editors obtained a quote from the research from Medical University, "This is because the analysis may be biased by experimental settings, such as the type of anesthesia, the strain or age of animals. Here, we aimed to review electrocardiographic parameters in rats, their normal range, as well as the effect of experimental settings on the parameters variation."

According to the news editors, the research concluded: "Furthermore, differences and similarities between rat and human ECG are discussed in the context of translational cardiovascular research."

For more information on this research see: Electrocardiography in Rats: a Comparison to Human. *Physiological Research*, 2016;65(5):717-725. *Physiological Research* can be contacted at: Acad Sciences Czech Republic, Inst Physiology, Videnska 1083, Prague 4 142 20, Czech Republic.

The news editors report that additional information may be obtained by contacting M. Ufnal, Medical University of Warsaw, Dept. of Expt Physiol & Pathophysiol, Lab Center Preclin Res, Warsaw, Poland.
Gram-Negative Bacteria - Helicobacter pylori

Data on Helicobacter pylori Discussed by Researchers at Yonsei University (Activation of NF-κB and AP-1 Mediates Hyperproliferation by Inducing b-Catenin and c-Myc in Helicobacter pylori-Infected Gastric Epithelial Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Helicobacter pylori have been published. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "In the gastric mucosa of Helicobacter pylori (H. pylori)-infected patients with gastritis or adenocarcinoma, proliferation of gastric epithelial cells is increased. Hyperproliferation is related to induction of oncogenes, such as b-catenin and c-myc.”

Financial support for this research came from National Research Foundation of Korea.

The news correspondents obtained a quote from the research from Yonsei University, "Even though transcription factors NF-κB and AP-1 are activated in H. pylori-infected cells, whether NF-κB or AP-1 regulates the expression of b-catenin or c-myc in H. pylori-infected cells has not been clarified. The present study was undertaken to investigate whether H. pylori-induced activation of NF-κB and AP-1 mediates the expression of oncogenes and hyperproliferation of gastric epithelial cells. Gastric epithelial AGS cells were transiently transfected with mutant genes for IkBa (MAD3) and c-Jun (TAM67) or treated with a specific NF-κB inhibitor caffeic acid phenethyl ester (CAPE) or a selective AP-1 inhibitor SR-11302 to suppress activation of NF-κB or AP-1, respectively. As reference cells, the control vector pcDNA was transfected to the cells. Wild-type cells or transfected cells were cultured with or without H. pylori. H. pylori induced activation of NF-κB and AP-1, cell proliferation, and expression of oncogenes (b-catenin, c-myc) in AGS cells, which was inhibited by transfection of MAD3 and TAM67. Wild-type cells and the cells transfected with pcDNA showed similar activities of NF-κB and AP-1, proliferation, and oncogene expression regardless of treatment with H. pylori."

According to the news reporters, the research concluded: "Both CAPE and SR-11302 inhibited cell proliferation and expression of oncogenes in H. pylori-infected cells. H. pylori-induced activation of NF-κB and AP-1 regulates transcription of oncogenes and mediates hyperproliferation in gastric epithelial cells."

For more information on this research see: Activation of NF-κB and AP-1 Mediates Hyperproliferation by Inducing b-Catenin and c-Myc in Helicobacter pylori-Infected Gastric Epithelial Cells. Yonsei Medical Journal, 2016;57(3):647-51.

Our news journalists report that additional information may be obtained by contacting E. Byun, Dept. of Food and Nutrition, Brain Korea 21 PLUS Project, College of Human Ecology, Yonsei University, Seoul, South Korea. Additional authors for this research include B. Park, J.W. Lim and H. Kim.
Hematopoietic

Data on Hematopoietic Detailed by Researchers at Capital Medical University (New strategies of DLI in the management of relapse of hematological malignancies after allogeneic hematopoietic SCT)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematopoietic is the subject of a report. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "DLI is an effective strategy for patients with recurrent hematological malignancies after allogeneic hematopoietic SCT (allo-HSCT). DLI has been widely applied to boost the graft vs tumor (GVT) or GVL effects."

Our news journalists obtained a quote from the research from Capital Medical University, "However, given the potentially severe complications associated with conventional DLI and transient GVL effect, new strategies for DLI are emerging. In this review, we have discussed the recent important studies on DLI as a prophylactic or therapeutic modality for relapsed hematological disorders after allo-HSCT. The strategies to separate GVL from GVHD have also been discussed. Leukemia-targeting therapy and lymphodepletion combined with DLI, and prophylactic DLI after allo-HSCT are often employed for patients with high risk of relapse, which has been reviewed as well."

According to the news editors, the research concluded: "In addition, we have also discussed the issues on DLI to be further addressed, such as the doses, timing and frequency of DLI in different clinical settings, leukemic antigen-specific DLI as well as how to augment GVL effect while attenuating GVHD."

For more information on this research see: New strategies of DLI in the management of relapse of hematological malignancies after allogeneic hematopoietic SCT. Bone Marrow Transplantation, 2015;51(3):324-32. Bone Marrow Transplantation can be contacted at: Nature Publishing Group, 345 Park Avenue South, New York, NY 10010-1707, USA. Data on Hematopoietic Stem Cells Reported by Researchers at Peking University People's Hospital (Causes of mortality after haploidentical hematopoietic stem cell transplantation and the comparison with HLA-identical sibling hematopoietic stem ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Stem Cell Research - Hematopoietic Stem Cells. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "This study was performed to investigate incidence, causes and factors influencing mortality after haploidentical hematopoietic stem cell transplantation (HSCT) and to compare differences between haploidentical HSCT and HLA-identical sibling HSCT. From January 2000 to June 2011, 1411 patients with acute leukemia or myelodysplastic syndrome were included in this study."

Our news journalists obtained a quote from the research from Peking University People's Hospital, "Of these patients, 571 received HLA-identical sibling HSCT and 840 received haploidentical HSCT. The cumulative incidence of overall mortality and transplant-related mortality (TRM) after haploidentical HSCT was higher than those after HLA-identical sibling HSCT (38.7% vs. 33.3%, p=0.012 and 27.5% vs. 19.9%, p=0.002), but the incidence of relapse-related mortality (RRM) did not differ between the two groups (15.6% vs. 16.7%, p=0.943). A multivariate analysis suggested that high-risk disease status and haploidentical HSCT correlated with a higher incidence of overall mortality (p <0.0001, hazard ratio=1.911 and p=0.019, hazard ratio=1.249); in addition, in haploidentical HSCT, only high-risk disease status correlated with a higher incidence of overall mortality (p <0.0001, hazard ratio=1.845). Our study suggested that haploidentical HSCT provided a higher incidence of overall mortality and TRM but the same incidence of RRM compared with HLA-identical sibling HSCT."

According to the news editors, the research concluded: "Therefore, HLA-identical sibling HSCT remains the first choice, but haploidentical HSCT is available for patients without an HLA-identical sibling donor."

For more information on this research see: Causes of mortality after haploidentical hematopoietic stem cell transplantation and the comparison with HLA-identical sibling hematopoietic stem cell transplantation. Bone Marrow Transplantation, 2015;51(3):391-7. Bone Marrow Transplantation can be contacted at: Nature Publishing Group, 345 Park Avenue South, New York, NY 10010-1707, USA. (Nature Publishing Group - www.nature.com/; Bone Marrow Transplantation - www.nature.com/bmt/)

Our news journalists report that additional information may be obtained by contacting C.H. Yan, Peking University People's Hospital, Peking University Institute of Hematology, Beijing Key Laboratory of Hematopoietic Stem Cell Transplantation, Beijing, People's Republic of China. Data on Hepatitis B Virus Detailed by A. Ducancelle and Co-Authors

(Different precore/core mutations of hepatitis B interact with, limit, or favor liver fibrosis severity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Liver Diseases and Conditions - Hepatitis B Virus. According to news originating from Angers, France, by NewsRx correspondents, research stated, "The impact of basal core promoter (BCP) and precore (PC) mutants of the hepatitis B virus (HBV) on liver disease severity remains controversial. The aim of the present study was to screen BCP and PC mutations in 252 HBV surface antigen (HBsAg) positive carriers in France and to assess relationships between these mutations and severe fibrosis."

Our news journalists obtained a quote from the research, "Direct sequencing of the precore/core gene was used to detect A1762T/G1764A and G1757A mutations in the BCP and G1896A and G1899A mutations in the PC region. The prevalences of A1762T/G1764A, G1757A, G1896A, and G1899A mutations were 34.1%, 38.7%, 54.9%, and 29.3% (P < 0.001), respectively. The independent predictors of severe fibrosis (>= F3 Metavir) were older age (P < 0.001), male gender (P = 0.012), elevated alanine aminotransferase (P < 0.001), and the double A1762T/G1764A mutant with no other mutations (P = 0.011). Interestingly, the association of the G1899A mutation with the double A1762T/G1764A mutant significantly counteracted the deleterious effect of the sole double A1762T/G1764A mutant (odds ratio [OR] = 0.28 vs. OR = 3.55, respectively, P = 0.028). Patients with the A1762T/G1764A mutation have a higher risk of severe fibrosis. The G1899A mutation is a protective factor against severe fibrosis that counteracted the deleterious effect of the A1762T/G1764A mutation."

According to the news editors, the research concluded: "Finally, host phenotypic and HBV genotypic markers independently predict fibrosis severity."

The news correspondents report that additional information may be obtained from A. Ducancelle, SFR 4208, HIFIH Lab, UPRES EA 3859, F-49000 Angers, France. Additional authors for this research include A. Pivert, S. Bertrais, J. Boursier, V. Balan, P. Veillon, H. le

Keywords for this news article include: Angers, France, Europe, Liver Diseases and Conditions, Risk and Prevention, Digestive System Diseases and Conditions, Infectious Disease and Conditions, Hepadnaviridae Infections, Hepatitis B Virus, Orthohepadnavirus, Gastroenterology, Liver Cirrhosis, Liver Fibrosis, DNA Viruses, Genetics, Viral.

Liver Diseases and Conditions - Hepatitis C Virus

Data on Hepatitis C Virus Reported by Researchers at Walgreen Co. [New all oral therapy for chronic hepatitis C virus (HCV): a novel long-term cost comparison]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Hepatitis C Virus have been published. According to news originating from Deerfield, Illinois, by NewsRx correspondents, research stated, "In the US, the prevalence of hepatitis C virus (HCV) has surpassed the prevalence of human immunodeficiency virus (HIV), with about 3.3 million people chronically infected with the disease. Given the aging of the Baby Boomer generation and the subsequent implementation of age-based screening recommendations, HCV diagnoses are expected to increase."

Our news journalists obtained a quote from the research from Walgreen Co., "Utilization of anti-viral pharmacotherapy is also expected to increase as more effective and tolerable all-oral therapies for HCV become available in the United States. This research allows payors to assess the disease burden and treatment impact of HCV in their member group. A set of three integrated economic models was developed to estimate the disease and cost burden of HCV based on existing literature, wholesale acquisition costs, industry standards, and actuarial judgment. Model 1 estimates the HCV antibody prevalence of HCV in a payer's member group based on population size and the age, sex, and region distribution of the members. Model 2 predicts the number of uncured chronic HCV members who represent the future treatment and medical cost burden for the payer over the next 14 years. Model 3 contrasts the pharmacy, medical, and overall costs for treatment and medical care over 14 years for three therapeutic scenarios: interferon-based standard of care (SOC), all oral therapy, and natural course of disease progression, while accounting for the frequency of HCV genotype within the member population. In a payer population of 100,000 members with an age, sex, and region distribution matching the United States, the seroprevalence of HCV was estimated to be 1.26 %. Combined pharmacy and medical costs for uncured chronic HCV positive members was least expensive for all oral therapy. The per patient with HCV cost savings for all oral therapy compared to SOC were about $3000 per year over 14 years. In a sensitivity analysis, the 12-week all oral therapy for genotype 1 provided overall cost savings vs. a 24-week interferon-based SOC regimen until all oral therapy costs exceeded $99,000."

According to the news editors, the research concluded: "In most modeled scenarios, the all-oral therapeutic scenario was less costly than SOC, even in sensitivity analyses."

For more information on this research see: New all oral therapy for chronic hepatitis C virus (HCV): a novel long-term cost comparison. Cost Effectiveness and Resource Allocation, 2015;13():1-13. Cost Effectiveness and Resource Allocation can be contacted at:
Data on Hepatomegaly Discussed by Researchers at Philipps University (Altered glycogen metabolism causes hepatomegaly following an Atg7 deletion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Liver Diseases and Conditions - Hepatomegaly are discussed in a new report. According to news reporting from Marburg, Germany, by NewsRx journalists, research stated, "Autophagy is a lysosomal degradation process involved in the turnover of organelles or other cell constituents, in providing sources for energy production under starving conditions and in cell metabolism. A key protein in the macroautophagic machinery is the autophagy-related protein (Atg) 7. Constitutive deletion of Atg7 is lethal at birth."

The news correspondents obtained a quote from the research from Philipps University, "A conditional deletion of Atg7 in hepatocytes leads to hepatomegaly and in aged animals to liver tumors. With this study, we aim at analyzing the hepatomegaly development in more detail. The 3- to 4-fold enlargement of the liver takes place between days 25 and 35 after birth (P25-P35) and persists at least until P90. This is accompanied by a change in the expression of enzymes involved in the glycogen/glucose metabolism. While glycogen synthesis is inhibited, glucose is preferentially kept as glucose-6-phosphate inside the cells, inducing a swelling of the cells caused by hyperosmolarity. An increase of lipogenic enzymes suggests that glucose-6-phosphate is delivered to lipogenic pathways, which is supported by the occurrence of a steatosis around P30. The development of hepatomegaly is accompanied by a polyploidisation of hepatocytes, an enhanced expression of genes related to inflammatory processes and an infiltration of macrophages and granulocytes. Our data provide evidence that the attenuation of macroautophagy in hepatocytes leads to a glucose retention that causes cell swelling."

According to the news reporters, the research concluded: "The resulting hepatomegaly, which develops in a time interval of about 10 days, perturbs liver perfusion and induces an inflammatory reaction together with polyploidisation."

For more information on this research see: Altered glycogen metabolism causes hepatomegaly following an Atg7 deletion. Cell and Tissue Research, 2016;366(3):651-665. Cell and Tissue Research can be contacted at: Springer, 233 Spring St, New York, NY 10013,

Hereditary Angioedema

Data on Hereditary Angioedema Reported by Researchers at Semmelweis University (Risk of thromboembolism in patients with hereditary angioedema treated with plasma-derived C1-inhibitor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hereditary Angioedema are presented in a new report. According to news reporting originating from Budapest, Hungary, by NewsRx correspondents, research stated, "Plasma-derived C1-inhibitor (C1-INH) concentrates (pdC1-INH) have been used as safe and effective treatments for hereditary angioedema with C1-INH deficiency (C1-INH-HAE) for >30 years. Notwithstanding this, sporadic reports and a study into the high-dose therapy of neonates with C1-INH concentrate administered in an off-label indication raised concerns that this drug might increase the risk of thromboembolism."

Our news editors obtained a quote from the research from Semmelweis University, "To investigate the incidence of thromboembolism and the background of the risk factors related to treatment with pdC1-INH. Our retrospective cohort study of 144 patients with C1-INH-HAE compared the incidence of thromboembolism and its risk factors in patients who received pdC1-INH with those who did not receive pdC1-INH as well as with those treated with danazol or with tranexamic acid. During the observation period (29 years), 104 of the 144 subjects received pdC1-INH. The average dose per treatment was 573.59 IU. None of the patients used an indwelling central venous catheter. Multiple risk factors for thromboembolism were identified in 93 of the 104 patients treated with pdC1-INH. The incidence rate of thromboembolism was 0.0019/100 person-years in patients treated with pdC1-INH, whereas it was 0.0211/100 person-years in the not-treated group."

According to the news editors, the research concluded: "Our cohort study did not find any evidence for an increased risk of thromboembolism during treatment with pdC1-INH, despite the presence of multiple predisposing factors."

For more information on this research see: Risk of thromboembolism in patients with hereditary angioedema treated with plasma-derived C1-inhibitor. Allergy and Asthma Proceedings, 2016;37(2):164-70.

The news editors report that additional information may be obtained by contacting H.
Farkas, Hungarian Angioedema Center, 3rd Dept. of Internal Medicine, Semmelweis University, Budapest, Hungary. Additional authors for this research include K.V. Kohalmi, N. Veszeli, Z. Zotter, K. Varnai and L. Varga.

Hormones

Data on Hormones Described by Researchers at Marmara University School of Medicine (The neuroprotective and anti-apoptotic effects of melatonin on hemolytic hyperbilirubinemia-induced oxidative brain damage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hormones have been published. According to news reporting originating from Istanbul, Turkey, by NewsRx correspondents, research stated, "Melatonin exerts protection in several inflammatory and neurodegenerative disorders. To investigate the neuroprotective effects of melatonin in an experimental hemolysis-induced hyperbilirubinemia, newborn Sprague-Dawley rats (25-40 g, n=72) were injected with phenylhydrazine hydrochloride (PHZ; 75 mg/kg) and the injections were repeated at the 24th hour."

Financial support for this research came from Scientific Research Project Commission of Marmara University (BAPKO).

Our news editors obtained a quote from the research from the Marmara University School of Medicine, "Rats were treated with saline or melatonin (10 mg/kg) 30 min before the first and second PHZ injections and 24 h after the 2nd PHZ injections. Control rats (n=24) were injected with saline, but not PHZ. At sixth hours after the last injections of saline or melatonin, all rats were decapitated. Tumor necrosis factor (TNF)-a, IL-1b, IL-10 and brain-derived neurotrophic factor (BDNF) and S100B levels in the plasma were measured. Brain tissue malondialdehyde (MDA), glutathione (GSH) levels and myeloperoxidase (MPO) activities were measured, and brain tissues were evaluated for apoptosis by TUNEL method. In the saline-treated PHZ group, hemoglobin, hematocrit levels were reduced, and total/direct bilirubin levels were elevated when compared to control group. Increased plasma TNF-a, IL-1b levels, along with decreased BDNF, S100B and IL-10 values were observed in the saline-treated PHZ group, while these changes were all reversed in the melatonin-treated group. Increased MDA levels and MPO activities in the brain tissues of saline-treated hyperbilirubinemic rats, concomitant with depleted brain GSH stores, were also reversed in the melatonin-treated hyperbilirubinemic rats. Increased TUNEL(+) cells in the hippocampus of saline-treated PHZ group were reduced by melatonin treatment."
According to the news editors, the research concluded: "Melatonin exerts neuroprotective and anti-apoptotic effects on the oxidative neuronal damage of the newborn rats with hemolysis and hyperbilirubinemia."

The news editors report that additional information may be obtained by contacting A. Pazar, Dept. of Paediatrics, Marmara University School of Medicine, Istanbul, Turkey. Additional authors for this research include M. Kolgazi, A. Memisoglu, E. Bahadir, S. Sirvanci, A. Yaman, B.C. Yegen and E. Ozek.

**Genetics - Human Genetics**

**Data on Human Genetics Described by Researchers at Osaka City University (Twin's Birth-Order Differences in Height and Body Mass Index From Birth to Old Age: A Pooled Study of 26 Twin Cohorts Participating in the CODATwins Project)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Genetics - Human Genetics is now available. According to news reporting originating from Osaka, Japan, by NewsRx correspondents, research stated, "We analyzed birth order differences in means and variances of height and body mass index (BMI) in monozygotic (MZ) and dizygotic (DZ) twins from infancy to old age. The data were derived from the international CODATwins database."

Our news editors obtained a quote from the research from Osaka City University, "The total number of height and BMI measures from 0.5 to 79.5 years of age was 397,466. As expected, first-born twins had greater birth weight than second-born twins. With respect to height, first-born twins were slightly taller than second-born twins in childhood. After adjusting the results for birth weight, the birth order differences decreased and were no longer statistically significant. First-born twins had greater BMI than the second-born twins over childhood and adolescence. After adjusting the results for birth weight, birth order was still associated with BMI until 12 years of age. No interaction effect between birth order and zygosity was found. Only limited evidence was found that birth order influenced variances of height or BMI. The results were similar among boys and girls and also in MZ and DZ twins."

According to the news editors, the research concluded: "Overall, the differences in height and BMI between first-and second-born twins were modest even in early childhood, while adjustment for birth weight reduced the birth order differences but did not remove them for BMI."

For more information on this research see: Twin's Birth-Order Differences in Height

The news editors report that additional information may be obtained by contacting Y. Yokoyama, Dept. of Public Health Nursing, Osaka City University, Osaka, Japan. **Neurodegenerative Diseases and Conditions -**

**Data on Huntington Disease Reported by Researchers at Institute of Neuroscience (Hereditary chorea - what else to consider when the Huntington's disease genetics test is negative?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Neurodegenerative Diseases and Conditions - Huntington Disease. According to news reporting originating from Glasgow, United Kingdom, by NewsRx correspondents, research stated, "Chorea, cognitive, behavioural and psychiatric disturbance occur in varying combinations in Huntington's disease (HD). This is often easy to recognise particularly in the presence of an autosomal dominant history."

Our news editors obtained a quote from the research from the Institute of Neuroscience, "Whilst HD may be the most common aetiology of such a presentation, several HD phenocopies should be considered if genetic testing for HD is negative. We searched PubMed and the Cochrane Database from January 1, 1946 up to January 1, 2016, combining the search terms: 'chorea', 'Huntington's disease', 'HDL' and 'phenocopies'. HD phenocopies frequently display additional movement disorders such as myoclonus, dystonia, parkinsonism and tics. Here, we discuss the phenotypes, and investigations of HD-like disorders where the combination of progressive chorea and cognitive impairment is obvious, but HD gene test result is negative. Conditions presenting with sudden onset chorea such as vascular, infectious and autoimmune causes are not the primary focus of our discussion, but we will make a passing reference to these as some of these conditions are potentially treatable. Hereditary forms of chorea are a heterogeneous group of conditions and this number is increasing. While most of these conditions are not curable, molecular genetic testing has enabled many of these disorders to be distinguished from HD."

According to the news editors, the research concluded: "Getting a precise diagnosis may enable patients and their families to better understand the nature of their condition."

Musculoskeletal Diseases and Conditions

Data on Hyperostosis Reported by Researchers at National Institutes of Health (Phenotypic and Genotypic Characterization and Treatment of a Cohort With Familial Tumoral Calcinosisis/Hyperostosis-Hyperphosphatemia Syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Hyperostosis. According to news reporting originating in Bethesda, Maryland, by NewsRx journalists, research stated, "Familial tumoral calcinosisis (FTC)/hyperostosis-hyperphosphatemia syndrome (HHS) is a rare disorder caused by mutations in the genes encoding fibroblast growth factor-23 (FGF23), N-acetylgalactosaminyltransferase 3 (GALNT3), or KLOTHO. The result is functional deficiency of, or resistance to, intact FGF23 (iFGF23), causing hyperphosphatemia, increased renal tubular reabsorption of phosphorus (TRP), elevated or inappropriately normal 1,25-dihydroxyvitamin D-3 (1,25D), ectopic calcifications, and/or diaphyseal hyperostosis."

The news reporters obtained a quote from the research from the National Institutes of Health, "Eight subjects with FTC/HHS were studied and treated. Clinical manifestations varied, even within families, ranging from asymptomatic to large, disabling calcifications. All subjects had hyperphosphatemia, increased TRP, and elevated or inappropriately normal 1,25D. C-terminal FGF23 was markedly elevated whereas iFGF23 was comparatively low, consistent with increased FGF23 cleavage. Radiographs ranged from diaphyseal hyperostosis to massive calcification. Two subjects with severe calcifications also had overwhelming systemic inflammation and elevated C-reactive protein (CRP). GALNT3 mutations were identified in seven subjects; no causative mutation was found in the eighth. Biopsies from four subjects showed ectopic calcification and chronic inflammation, with areas of heterotopic ossification observed in one subject. Treatment with low phosphate diet, phosphate binders, and phosphaturia-inducing therapies was prescribed with variable response. One subject experienced complete resolution of a calcific mass after 13 months of medical treatment. In the two subjects..."
with systemic inflammation, interleukin-1 (IL-1) antagonists significantly decreased CRP levels with resolution of calcinosis cutis and perilesional inflammation in one subject and improvement of overall well-being in both subjects. This cohort expands the phenotype and genotype of FTC/HHS and demonstrates the range of clinical manifestations despite similar biochemical profiles and genetic mutations. Overwhelming systemic inflammation has not been described previously in FTC/HHS; the response to IL-1 antagonists suggests that anti-inflammatory drugs may be useful adjuvants."

According to the news reporters, the research concluded: "In addition, this is the first description of heterotopic ossification reported in FTC/HHS, possibly mediated by the adjacent inflammation."

**Cardiovascular Diseases and Conditions -**

**Data on Hypertension Described by Researchers at University of Florida (Vascular Smooth Muscle Cells From Hypertensive Patient-Derived Induced Pluripotent Stem Cells to Advance Hypertension Pharmacogenomics)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating from Gainesville, Florida, by NewsRx correspondents, research stated, "Studies in hypertension (HTN) pharmacogenomics seek to identify genetic sources of variable antihypertensive drug response. Genetic association studies have detected single-nucleotide polymorphisms (SNPs) that link to drug responses; however, to understand mechanisms underlying how genetic traits alter drug responses, a biological interface is needed."

Our news editors obtained a quote from the research from the University of Florida, "Patient-derived induced pluripotent stem cells (iPSCs) provide a potential source for studying
otherwise inaccessible tissues that may be important to antihypertensive drug response. The present study established multiple iPSC lines from an HTN pharmacogenomics cohort. We demonstrated that established HTN iPSCs can robustly and reproducibly differentiate into functional vascular smooth muscle cells (VSMCs), a cell type most relevant to vasculature tone control. Moreover, a sensitive traction force microscopy assay demonstrated that iPSC-derived VSMCs show a quantitative contractile response on physiological stimulus of endothelin-1. Furthermore, the inflammatory chemokine tumor necrosis factor α induced a typical VSMC response in iPSC-derived VSMCs. These studies pave the way for a large research initiative to decode biological significance of identified SNPs in hypertension pharmacogenomics.

Treatment of hypertension remains suboptimal, and a pharmacogenomics approach seeks to identify genetic biomarkers that could be used to guide treatment decisions; however, it is important to understand the biological underpinnings of genetic associations. Mouse models do not accurately recapitulate individual patient responses based on their genetics, and hypertension-relevant cells are difficult to obtain from patients. Induced pluripotent stem cell (iPSC) technology provides a great interface to bring patient cells with their genomic data into the laboratory and to study hypertensive responses."

According to the news editors, the research concluded: "As an initial step, the present study established an iPSC bank from patients with primary hypertension and demonstrated an effective and reproducible method of generating functional vascular smooth muscle cells."

For more information on this research see: Vascular Smooth Muscle Cells From Hypertensive Patient-Derived Induced Pluripotent Stem Cells to Advance Hypertension Pharmacogenomics. Stem Cells Translational Medicine, 2015;4(12):1380-90.

Data on Hypertension Described by Researchers at University of Groningen (No influence of antihypertensive agents on plasma free metanephrines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news reporting originating from Groningen, Netherlands, by NewsRx correspondents, research stated. "Hypertension can be the predominant
sign of pheochromocytoma (PCC) and sympathetic paraganglioma (sPGL) and screening for PCC/sPGL is often performed in patients who are already being treated with antihypertensive agents. There is very little information about the influence of antihypertensive drugs on plasma free metanephrines.

Our news editors obtained a quote from the research from the University of Groningen, "The aim of this study was to determine whether commonly prescribed antihypertensive drugs can falsely elevate plasma free metanephrines concentrations measured by LC-MS/MS analysis. In a prospective study we included patients with newly diagnosed hypertension, who started monotherapy with an antihypertensive agent (i.e. beta-blocker, thiazide diuretic or angiotensin-converting enzyme (ACE) inhibitor). Plasma free metanephrine (MN) and normetanephrine (NMN) levels were measured before and one month after the start of the medication quantified by LC-MS/MS. Between 2009 and 2014, 39 patients were included (beta-blocker n = 13, thiazide diuretic n = 14 and ACE inhibitor n = 12). In the whole group, the median plasma free MN and NMN concentrations at baseline were 0.19 [0.17-026] nmol/L and 0.56 [0.38-0.95] nmol/L. One month after the start of antihypertensive treatment, the median plasma free MN and NMN concentrations were comparable; 0.20 [0-16-0.24] nmol/L and 0.63 [0.39-0.75] nmol/L, respectively (P = 0.43 and P = 039). Separate analysis for each of the three antihypertensive agents examined did not reveal any significant changes in the median plasma free MN and NMN concentrations. The measurement of plasma free MN and NMN with LC-MS/MS is not affected by use of beta-blockers, diuretics and ACE inhibitors."

According to the news editors, the research concluded: "Withdrawal of these drugs prior to the quantification of plasma metanephrines is therefore not necessary."

The news editors report that additional information may be obtained by contacting T.E. Oisinga, University of Groningen, Groningen University Medical Center, Dept. of Endocrinol AA31, NL-9700 RB Groningen, Netherlands. Additional authors for this research include I.P. Kema, M.N. Kerstens, W.H.A. Jong, M. van Faassen, R.P.F. Dullaart, T.P. Links and A.N.A. van der Horst-Schrivers.

Data on Hypertension Detailed by G.M. Keating and Co-Authors
(Macitentan: A Review in Pulmonary Arterial Hypertension)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Hypertension is now available. According to news reporting originating in Auckland, New Zealand, by NewsRx editors, the research stated, "Macitentan (Opsumit®) is an orally active, potent, dual endothelin (ET) receptor antagonist that is indicated for the treatment of pulmonary arterial hypertension (PAH). In the pivotal SERAPHIN trial in patients aged ae <yen >12 years with PAH, the risk of first PAH-related event or all-cause death (primary composite endpoint) was significantly reduced by 45 % with oral macitentan 10 mg once daily versus placebo."

The news reporters obtained a quote from the research, "Macitentan significantly reduced the risk of the primary composite endpoint across various patient subgroups. The risk of all-cause hospitalization and PAH-related hospitalization was also significantly reduced by macitentan, according to post hoc analysis. Macitentan was generally well tolerated in SERAPHIN."

According to the news reporters, the research concluded: "Macitentan is an important option for the treatment of PAH."

Our news correspondents report that additional information may be obtained by contacting G.M. Keating, Springer, Auckland 0754, New Zealand.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s40256-016-0188-x. This DOI is a link to an online electronic document that is either free or for purchase.

severe pulmonary arterial hypertension, but adverse effects like infusion site pain can lead to treatment discontinuation. The objective of this study was to evaluate safety, tolerability and clinical effects of a rapid up-titration dosing regimen of subcutaneous treprostinil using proactive infusion site pain management.

Our news journalists obtained a quote from the research from the University of Heidelberg, "Effects of rapid up-titration dosing regimen on tolerability and clinical parameters were evaluated in this 16-week, open-label multi-centre study. Thirty-nine patients with idiopathic or heritable pulmonary arterial hypertension on stable treatment with oral pulmonary arterial hypertension-approved drugs (90% on dual combination therapy) were included. Patients achieved a median treprostinil dosage of 35.7 ng/kg/min after 16 weeks. A good overall safety profile was demonstrated with 3 patients (8%) withdrawing due to infusion site pain, which occurred in 97% of patients. After 16 weeks, median 6-min walking distance, cardiac index, pulmonary vascular resistance, and tricuspid annular plane systolic excursion improved. Rapid up-titration of subcutaneous treprostinil was well tolerated, achieving a clinically effective dose associated with improvement of exercise capacity and haemodynamics after 16 weeks."

According to the news editors, the research concluded: "A rapid dose titration regimen and proactive infusion site pain management may improve the handling of this therapy and contribute to better treatment outcome."

For more information on this research see: Safety, Tolerability and Clinical Effects of a Rapid Dose Titration of Subcutaneous Treprostinil Therapy in Pulmonary Arterial Hypertension: A Prospective Multi-Centre Trial. Respiration, 2016;92(6):362-370. Respiration can be contacted at: Karger, Allschwilerstrasse 10, Ch-4009 Basel, Switzerland. Data on Hypertension Reported by Researchers at University of Pittsburgh (Human epithelial Na+ channel missense variants identified in the GenSalt study alter channel activity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hypertension. According to news reporting originating in Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "Mutations in genes encoding subunits of the epithelial Na+ channel (ENaC) can cause early onset familial hypertension, demonstrating the importance of this channel in modulating blood pressure. It remains unclear whether other genetic variants resulting in subler alterations of channel function result in hypertension or altered sensitivity of blood pressure to dietary salt."

The news reporters obtained a quote from the research from the University of Pittsburgh, "This study sought to identify functional human ENaC variants to examine how these variants alter channel activity and to explore whether these variants are associated with altered sensitivity of blood pressure to dietary salt. Six-hundred participants of the Genetic Epidemiology Network of Salt Sensitivity (GenSalt) study with salt-sensitive or salt-resistant blood pressure underwent sequencing of the genes encoding ENaC subunits. Functional effects of identified variants were examined in a Xenopus oocyte expression system. Variants that increased channel activity included three in the gene encoding the alpha-subunit (alpha S115N, alpha R476W, and alpha V481M), one in the beta-subunit (beta S635N), and one in the gamma-subunit (gamma L438Q). One alpha-subunit variant (alpha A334T) and one gamma-subunit variant (beta D31N) decreased channel activity. Several alpha-subunit extracellular domain variants altered channel inhibition by extracellular Na+ (Na+ self-inhibition). One variant (alpha A334T) decreased and one (alpha V481M) increased cell surface expression. Association between these variants and salt sensitivity did not reach statistical significance."

According to the news reporters, the research concluded: "This study identifies novel functional human ENaC variants and demonstrates that some variants alter channel cell surface expression and/or Na+ self-inhibition."

For more information on this research see: Human epithelial Na+ channel missense variants identified in the GenSalt study alter channel activity. American Journal of Physiology-Renal Physiology, 2016;311(5):F908-F914. American Journal of Physiology-Renal Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Keywords for this news article include: Pittsburgh, Pennsylvania, United States, North and Central America, Cardiovascular Diseases and Conditions, Blood Pressure, Epidemiology, Hypertension, Genetics, University of Pittsburgh.

Data on Hypophosphatemia Detailed by X. Zhang and Co-Authors [Population pharmacokinetic and pharmacodynamic analyses from a 4-month intradose escalation and its subsequent 12-month dose titration studies for a human monoclonal anti-FGF23 ...]
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Hypophosphatemia. According to news reporting from Princeton, New Jersey, by NewsRx journalists, research stated, "X-linked hypophosphatemia (XLH) is an inherited metabolic bone disease with abnormally elevated serum FGF23 resulting in low renal maximum threshold for phosphate reabsorption, low serum phosphate (Pi) and 1,25-dihydroxyvitamin D levels with subsequent development of short stature and skeletal deformities. KRN23 is a novel human anti-FGF23 antibody for the treatment of XLH."

Financial support for this research came from Kyowa Hakko Kirin.

The news correspondents obtained a quote from the research, "The pharmacokinetics (PK) and pharmacodynamics (PD) models of KRN23 were assessed following subcutaneous dosing every 28 days over an initial 4-month dose escalation (0.05-0.6 mg/kg) and a subsequent 12-month titration period (0.1-1.0 mg/kg) in XLH adults. The PK of KRN23 was described by a 1-compartmental model with first-order absorption and elimination at doses (>=)0.1 mg/kg. The elimination half-life was 17.8 days. Covariates did not affect KRN23 PK. Mean peak serum Pi was attained 7-10 days after dosing and progressively increased following each of the initial 4 doses with comparable peak values attained following the sixth through tenth doses with a slight decrease thereafter. A PK-PD model with a maximum effect (Emax) and a time-varying effective concentration to reach 50% of Emax (EC50,t) described data adequately. Typical Emax was 1.5 mg/dL."

According to the news reporters, the research concluded: "Typical EC50,t was 1780 ng/mL and 5999 ng/mL after first and last dose, respectively."

Our news journalists report that additional information may be obtained by contacting X. Zhang, Kyowa Hakko Kirin Pharma Inc, Princeton, NJ, United States. Additional authors for this research include T. Peyret, N.H. Gosselin, J.F. Marier, E.A. Imel and T.O Carpenter.

Data on Immunoglobulins Discussed by Researchers at Technical University [Balancing Selectivity and Efficacy of Bispecific Epidermal Growth Factor Receptor (EGFR) x c-MET Antibodies and Antibody-Drug Conjugates]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunology - Immunoglobulins.

According to news reporting from Darmstadt, Germany, by NewsRx journalists, research stated, "Bispecific antibodies (bsAbs) and antibody-drug conjugates (ADCs) have already demonstrated benefits for the treatment of cancer in several clinical studies, showing improved drug selectivity and efficacy. In particular, simultaneous targeting of prominent cancer antigens, such as EGF receptor (EGFR) and c-MET, by bsAbs has raised increasing interest for potentially circumventing receptor cross-talk and c-MET-mediated acquired resistance during anti-EGFR monotherapy."

The news correspondents obtained a quote from the research from Technical University, "In this study, we combined the selectivity of EGFR x c-MET bsAbs with the potency of cytotoxic agents via bispecific antibody-toxin conjugation. Affinity-attenuated bispecific EGFR x c-MET antibody-drug conjugates demonstrated high in vitro selectivity toward tumor cells overexpressing both antigens and potent anti-tumor efficacy. Due to basal EGFR expression in the skin, ADCs targeting EGFR in general warrant early safety assessments. Reduction in EGFR affinity led to decreased toxicity in keratinocytes."

According to the news reporters, the research concluded: "Thus, the combination of bsAb affinity engineering with the concept of toxin conjugation may be a viable route to improve the safety profile of ADCs targeting ubiquitously expressed antigens."

**Immunology - Immunoglobulins**

**Data on Immunoglobulins Reported by Researchers at Singapore National University (DNA Nanostructures Carrying Stoichiometrically Definable Antibodies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immunoglobulins have been published. According to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Targeted drug delivery is one of the key challenges in cancer nanomedicine."

Financial support for this research came from Ministry of Education - Singapore.

Our news editors obtained a quote from the research from Singapore National University, "Stoichiometric and spatial control over the antibodies placement on the nanomedicine vehicle holds a pivotal role to overcome this key challenge. Here, a DNA tetrahedral is designed with available conjugation sites on its vertices, allowing to bind one, two, or three cetuximab antibodies per DNA nanostructure."

According to the news editors, the research concluded: "This stoichiometrically definable cetuximab conjugated DNA nanostructure shows enhanced targeting on the breast cancer cells, which results with higher overall killing efficacy of the cancer cells."

The news editors report that additional information may be obtained by contacting M.I. Setyawati, Singapore National University, Dept. of Chem & Biomol Engn, Singapore 117585, Singapore. Additional authors for this research include R.V. Kutty and D.T. Leong.

**Immunology - Immunoglobulins**

**Data on Immunoglobulins Reported by Researchers at University of Delaware (Identifying a robust design space for glycosylation during monoclonal antibody production)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Immunology - Immunoglobulins. According
to news reporting out of Newark, Delaware, by NewsRx editors, research stated, "Glycan distribution has been identified as a critical quality attribute for many biopharmaceutical products, including monoclonal antibodies. Consequently, determining quantitatively how process variables affect glycan distribution is important during process development to control antibody glycosylation."

Our news journalists obtained a quote from the research from the University of Delaware, "In this work, we assess the effect of six bioreactor process variables on the glycan distribution of an IgG1 produced in CHO cells. Our analysis established that glucose and glutamine media concentration, temperature, pH, agitation rate, and dissolved oxygen (DO) had small but significant effects on the relative percentage of various glycans. In addition, we assessed glycosylation enzyme transcript levels and intracellular sugar nucleotide concentrations within the CHO cells to provide a biological explanation for the observed effects on glycan distributions. From these results we identified a robust operating region, or design space, in which the IgG1 could be produced with a consistent glycan distribution. Since our results indicate that perturbations to bioreactor process variables will cause only small (even if significant) changes to the relative percentage of various glycans (<+/- 1.5%) changes that are too small to affect the bioactivity and efficacy of this IgG1 significantly it follows that the glycan distribution obtained will be consistent even with relatively large variations in bioreactor process variables."

According to the news editors, the research concluded: "However, for therapeutic proteins where bioactivity and efficacy are affected by small changes to the relative percentage of glycans, the same analysis would identify the manipulated variables capable of changing glycan distribution, and hence can be used to implement a glycosylation control strategy."

Our news journalists report that additional information may be obtained by contacting B.A. Ogunnaike, University of Delaware, Dept. of Chem & Biomol Engn, Newark, DE 19716, United States. Additional authors for this research include J. Hayes, D. Radhakrishnan, J. Fernandez, B. Meyer, A.S. Robinson and B.A. Ogunnaike.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/btpr.2316. This DOI is a link to an online electronic document that is either free or for purchase.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Immunosuppressive Agents is the subject of a report. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "There is significant variability in the serum concentrations of tacrolimus attained early post transplant due to drug interactions and genomic variation. We evaluated whether tacrolimus concentrations early post transplant correlated with incidence of acute GvHD in 120 consecutive patients allografted with a uniform reduced-intensity conditioning regimen."

The news correspondents obtained a quote from the research from the University of Pennsylvania Hospital, "All patients received standard prophylaxis with oral tacrolimus and IV methotrexate. The primary variable of interest was mean weekly tacrolimus concentrations in the initial 4 weeks post transplant. In multivariate analysis, week 1 tacrolimus concentration was an independent predictor of acute grade 2-4 GvHD (hazard ratio (HR), 0.90; 95% confidence interval (CI), 0.84-0.97; p<0.01). This association was driven by a lower risk of acute grade 2-4 GvHD in patients with week 1 tacrolimus concentrations >12 ng/mL (HR, 0.47; 95% CI, 0.25-0.88; p=0.02). Week 1 tacrolimus concentrations were not associated with chronic GvHD, relapse or overall survival. Lower tacrolimus concentrations at weeks 2, 3 and 4 were not associated with a higher incidence of GvHD."

According to the news reporters, the research concluded: "In summary, we found that higher tacrolimus concentrations during the first week after allografting with a reduced-intensity conditioning regimen were associated with significantly reduced risk of acute grade 2-4 GvHD without increasing risk of relapse."

For more information on this research see: Higher tacrolimus concentrations early after transplant reduce the risk of acute GvHD in reduced-intensity allogeneic stem cell transplantation. *Bone Marrow Transplantation*, 2015;51(4):568-72. *Bone Marrow Transplantation* can be contacted at: Nature Publishing Group, 345 Park Avenue South, New York, NY 10010-1707, USA. Data on Immunotherapy Reported by Researchers at Washington University (Harnessing NK Cell Memory for Cancer Immunotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Immunotherapy is the subject of a report. According to news reporting from St. Louis, Missouri, by NewsRx journalists, research stated, "Due to their ability to kill cancer cells and produce proinflammatory cytokines, natural killer (NK) cells have long been of clinical interest for their antitumor properties."

The news correspondents obtained a quote from the research from Washington University, "The recent discovery of NK cell memory demonstrates that NK cell functions, and potentially antitumor responses, can be enhanced long term. Following nonspecific activation with the cytokines IL-12, IL-16, and IL-18 or in response to antigens or cytomegalovirus (CMV), human and mouse NK cells exhibit stable, enhanced functional responses with phenotypic and molecular changes."

According to the news reporters, the research concluded: "Here we review mechanisms driving the differentiation of NK cell memory-like properties, evidence for antitumor activity, and the challenges and opportunities in harnessing memory-like NK cells for cancer immunotherapy."

Our news journalists report that additional information may be obtained by contacting T.A. Fehniger, Washington University, Div Oncol, Dept. of Med, Sch Med, St Louis, MO 63110, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.it.2016.09.005. This DOI is a link to an online electronic document that is either free or for purchase.

Data on Insulin Resistance Described by Researchers at NIIST  
(Symplocos cochinchinensis enhances insulin sensitivity via the down regulation of lipogenesis and insulin resistance in high energy diet rat model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Endocrine System Diseases and Conditions -
Insulin Resistance have been published. According to news reporting originating in Thiruvananthapuram, India, by NewsRx journalists, research stated, "Ethnopharmacological relevance: This plant has been utilized in Indian system of medicine for treatment of diabetes. This is clearly evident from the composition of Ayurvedic preparation for diabetes 'Nisakathakadi Kashayam' where this is one of the main ingredients of this preparation. Aim of the study: The study aims in elucidating the molecular mechanisms underlying the insulin sensitizing effects of Symplocos cochinchinensis ethanol extract (SCE) using a high fructose and saturated fat (HFS) fed insulin resistant rat model."

Financial support for this research came from ICMR, India.

The news reporters obtained a quote from the research from NIIST, "Experimental groups consisted of normal diet (ND), ND+SCE 500 mg/kg bwd, HFS +vehicle, HFS+metformin 100 mg/kg bwd, HFS-FSCE 250/500 mg/kg bwd. Initially the animals were kept under HFS diet for 8 weeks, and at the end of 8 week period, animals were found to develop insulin resistance and dyslipidemia. Post-administration of SCE, metformin or vehicle were carried out for 3 weeks. Gene and protein expressions relevant to insulin signalling pathway were analysed. HFS significantly altered the normal physiology of animals via proteins and genes relevant to metabolism like stearoyl-CoA desaturase (SCD1), sterol regulatory element binding protein 1 (SREBP-1c), fatty acid synthase (FAS), glucose 6 phosphatase (G6Pase), phosphoenol pyruvate carboxykinase (PEPCK), glucose transporter 2 (GLUT2), protein tyrosine phosphatase 1B (PTP1B), peroxisome proliferator activated receptor alpha (PPAR alpha), sirtuin 1 (SIRT1) and glucokinase. SCE administration attenuates the insulin resistance in HFS rat by the down regulation of SCD1 gene expression that modulates SREBP-1c dependent and independent hepatic lipid accumulation."

According to the news reporters, the research concluded: "SCE enhances insulin sensitivity via the down regulation of lipogenesis and insulin resistance in HFS rat model."

Our news correspondents report that additional information may be obtained by contacting K.G. Raghu, NIIST, CSIR, Agroproc & Nat Prod Div, Thiruvananthapuram 695019, Kerala, India. Additional authors for this research include M.P. Riya, A. Nair, A. Mishra, A.K. Srivastava and K.G. Raghu.

Data on Intermediate Uveitis Detailed by Researchers at Medical University (Analysis of a Functional IL-6 Gene Polymorphism in HLAB27 Associated and Intermediate Uveitis Gives New Insight in Disease Pathogenesis and Commonality with Other ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Eye Diseases and Conditions - Intermediate Uveitis. According to news originating from Graz, Austria, by NewsRx correspondents, research stated, "Interleukin 6 (IL-6) plays a crucial role in both adaptive and innate immunity. The rs1800795 gene polymorphism of IL-6 is associated with various autoimmune diseases, like multiple sclerosis."

Our news journalists obtained a quote from the research from Medical University, "134 patients with HLAB27 positive iridocyclitis, 84 patients with intermediate uveitis, 132 controls, and 65 HLAB27 positive controls were recruited for the present case-control study. Main outcome measures were genotype distribution and allelic frequencies determined by polymerase chain reaction. The frequency of carriers of the minor allele for rs1800795 was significantly higher in patients with intermediate uveitis compared to controls (p=0.04; OR: 1.46; CI: 1.02-2.11). Frequencies of the minor allele for rs1800795 did not differ significantly in patients with HLAB27 associated uveitis when compared to controls (p >0.05). These findings further deepen our understanding of the commonality between multiple sclerosis and intermediate uveitis."

According to the news editors, the research concluded: "Given the functionality of the investigated polymorphism, new pathophysiological insights are gained that help to evaluate possible therapeutic targets."

The news correspondents report that additional information may be obtained from L. Ewald, Dept. of Ophthalmology, Medical University Graz, Auenbruggerplatz 4, 8036 Graz, Austria. Additional authors for this research include L.W. Beate, S. Stephanie, R. Wilfried and el-S Yosuf.

Data on Intermittent Claudication Reported by Researchers at University of Heidelberg (Results of common femoral artery thromboendarterectomy evaluation of a traditional surgical management in the endovascular era)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Intermittent Claudication is now available. According to news reporting from Heidelberg, Germany, by NewsRx journalists, research stated, "The aim of this study was to investigate the long-term outcome of common femoral artery thromboendarterectomy in patients with peripheral arterial occlusive disease. The study retrospectively evaluated 713 vessels in 655 patients (75% male; mean age, 69.4 +/- 9.5 years) who underwent common femoral thromboendarterectomy from January 2006 until May 2012 in two high-volume vascular centers."

The news correspondents obtained a quote from the research from the University of Heidelberg, "Critical limb ischemia was present in 221 patients, and intermittent claudication was present in 434. Three patent tibial arteries, described as runoff vessels, were available in 33% of the cohort, two were present in 28.3%, one runoff vessel was present in 23.4%, and 15.2% (n = 102) showed no runoff option. Hybrid procedures were used to treat 255 limbs (35.8%). The primary end point was primary patency (PP). Secondary patency (SP), limb salvage, and survival were the secondary end points. Survival rates were 93.9%, 83.0%, 74.1%, and 60.1% at 1, 3, 5, and 7 years, respectively. PP was 78.5% and SP was 89.1% at 7 years. Patency rates were 97.3% (PP) and 97.8% (SP) at 6 months and 90.2% (PP) and 98.3% (SP) at 3 years, respectively, with 76 target lesion revascularizations. No significant difference was demonstrated for PP rates stratified for nonhybrid procedures and hybrid procedures (78.1% vs 78.6%; P = .22) and for critical limb ischemia vs intermittent claudication (76.3% vs 79.4%; P = .20) at 7 years. The mean +/- standard deviation ankle-brachial index increased from 0.46 +/- 0.3 preoperatively to 0.81 +/- 0.2 postoperatively and to 0.77 +/- 0.3 at 7 years (P < .001). A total of 20 major amputations were performed, achieving a limb salvage rate of 92.6%. Procedure-related complications occurred in 11.5% during 7 years of follow-up. Open surgery for common femoral artery stenosis is safe and effective in the long-term."

According to the news reporters, the research concluded: "Endovascular therapy will need to compete with these excellent results."

Our news journalists report that additional information may be obtained by contacting C.M. Wieker, University of Heidelberg, Dept. of Vasc & Endovasc Surg, D-69120 Heidelberg, Germany. Additional authors for this research include E. Schonefeld, N. Osada, C. Luhrs, R. Benkening, G. Torsello and D. Bockler.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jvs.2016.04.036. This DOI is a link to an online electronic document that is either free or for purchase.
Data on Intracranial Hypertension Reported by Researchers at King Saud University (Idiopathic Intracranial Hypertension Induced by Topical Application of Vitamin A)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Central Nervous System Diseases and Conditions - Intracranial Hypertension are discussed in a new report. According to news reporting originating from Riyadh, Saudi Arabia, by NewsRx correspondents, research stated, "A 21-year-old nonobese woman developed headaches and papilledema while excessively using 3 topical preparations of vitamin A. Neuroimaging studies were unremarkable and opening pressure on lumbar puncture was 300 mm H2O with normal cerebrospinal fluid composition."

Our news editors obtained a quote from the research from King Saud University, "After discontinuation of the topical vitamin A preparations, the symptoms and signs of increased intracranial pressure resolved."

According to the news editors, the research concluded: "The association of intracranial hypertension and topical vitamin A application has only been reported once previously."

The news editors report that additional information may be obtained by contacting Y.M. Mohammad, King Saud Univ, Dept. of Internal Med, Riyadh 11472, Saudi Arabia. Additional authors for this research include I.R. Raslan and F.A. Al-Hussain.

Keywords for this news article include: Riyadh, Saudi Arabia, Asia, Central Nervous System Diseases and Conditions, Cardiovascular Diseases and Conditions, Brain Diseases and Conditions, Intracranial Hypertension, Pseudotumor Cerebri, Vitamin A, King Saud University.

Data on Ketones Discussed by Researchers at Institute of Statistical Science (Genome-Wide Pharmacogenomic Study on Methadone Maintenance Treatment Identifies SNP rs17180299 and Multiple Haplotypes on CYP2B6, SPON1, and GSG1L Associated with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Ketones are discussed in a new report. According to news reporting originating in Taipei, Taiwan, by NewsRx journalists, research stated, "Methadone maintenance treatment (MMT) is commonly used for controlling opioid dependence, preventing withdrawal symptoms, and improving the quality of life of heroin-dependent patients. A steady-state plasma concentration of methadone enantiomers, a measure of methadone metabolism, is an index of treatment response and efficacy of MMT."

The news reporters obtained a quote from the research from the Institute of Statistical Science, "Although the methadone metabolism pathway has been partially revealed, no genome-wide pharmacogenomic study has been performed to identify genetic determinants and characterize genetic mechanisms for the plasma concentrations of methadone R-and S-enantiomers. This study was the first genome-wide pharmacogenomic study to identify genes associated with the plasma concentrations of methadone R-and S-enantiomers and their respective metabolites in a methadone maintenance cohort. After data quality control was ensured, a dataset of 344 heroin-dependent patients in the Han Chinese population of Taiwan who underwent MMT was analyzed. Genome-wide single-locus and haplotype-based association tests were performed to analyze four quantitative traits: the plasma concentrations of methadone R-and S-enantiomers and their respective metabolites. A significant single nucleotide polymorphism (SNP), rs17180299 (raw p=2.24 ? 10(-8)), was identified, accounting for 9.541% of the variation in the plasma concentration of the methadone R-enantiomer. In addition, 17 haplotypes were identified on SPON1, GSG1L, and CYP450 genes associated with the plasma concentration of methadone S-enantiomer. These haplotypes accounted for approximately one-fourth of the variation of the overall S-methadone plasma concentration. The association between the S-methadone plasma concentration and CYP2B6, SPON1, and GSG1L were replicated in another independent study. A gene expression experiment revealed that CYP2B6, SPON1, and GSG1L can be activated concomitantly through a constitutive androstane receptor (CAR) activation pathway."

According to the news reporters, the research concluded: "This study revealed new genes associated with the plasma concentration of methadone, providing insight into the genetic foundation of methadone metabolism. The results can be applied to predict treatment responses and methadone-related deaths for individualized MMTs."

For more information on this research see: Genome-Wide Pharmacogenomic Study on Methadone Maintenance Treatment Identifies SNP rs17180299 and Multiple Haplotypes on CYP2B6, SPON1, and GSG1L Associated with Plasma Concentrations of Methadone R- and S-enantiomers in Heroin-Dependent Patients. Plos Genetics, 2016;12(3):e1005910. (Public Library of Science - www.plos.org; Plos Genetics - www.plosgenetics.org)

Our news correspondents report that additional information may be obtained by contacting H.C. Yang, Institute of Statistical Science, Academia Sinica, Taipei, Taiwan. Additional authors for this research include S.K. Chu, C.L. Huang, H.W. Kuo, S.C. Wang, S.W. Liu, I.K. Ho and Y.L Liu.
Data on Laryngeal Cancer Detailed by Researchers at University Hospital [Use of concurrent chemoradiation in advanced staged (T4) laryngeal cancer]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Laryngeal Cancer have been published. According to news reporting out of Cleveland, Ohio, by NewsRx editors, research stated, "Patients with advanced laryngeal cancer sometimes desire organ preservation protocols even if it portends a worse outcome. To assess outcomes of patients with T4 laryngeal cancer treated with chemoradiation therapy."

Our news journalists obtained a quote from the research from University Hospital, "Case series with chart review at a tertiary university hospital. Twenty-four patients with T4 laryngeal cancer all declined total laryngectomy with adjuvant radiation as the primary treatment modality and alternatively received concurrent chemoradiation therapy. The primary outcome was overall survival. Secondary outcomes were rates of tracheotomy dependence, gastric tube dependence, and need for salvage laryngectomy. All patients had T4 laryngeal disease, 71% had cartilage invasion and 59% had regional metastasis to the neck. Kaplan-Meier analysis determined 2-year and 5-year overall survival to be 64% and 59% respectively. The locoregional recurrence rate was 25%. The distant metastasis rate was 21%. The rate of salvage laryngectomy was 17%, which occurred at a mean of 56.5 months after the original diagnosis. The rate of tracheotomy dependence was 33% while gastric tube dependence was 25%. Advanced T4 laryngeal cancer, particularly with cartilage invasion, remains a surgical disease best treated with total laryngectomy and adjuvant radiation."

According to the news editors, the research concluded: "This data may help guide patients and practitioners considering concurrent chemoradiation therapy for definitive treatment of advanced laryngeal cancer."

Our news journalists report that additional information may be obtained by contacting P. Lavertu, University Hospital Cleveland, Medical Center, Ear Nose & Throat Inst, Cleveland, OH 44106, United States. Additional authors for this research include R.P. Rezaee, T. Wang, A.M. Garcia-Jarchow, C.A. Zender, M. Gibson, M. Yao and P. Lavertu.

Lipopolysaccharides

Data on Lipopolysaccharides Discussed by Researchers at National Cancer Institute (Secreted Thrombospondin-1 Regulates Macrophage Interleukin-1b Production and Activation through CD47)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lipopolysaccharides is the subject of a report. According to news reporting originating in Bethesda, Maryland, by NewsRx journalists, research stated, "Thrombospondin-1 regulates inflammation by engaging several cell surface receptors and by modulating activities of other secreted factors. We have uncovered a novel role of thrombospondin-1 in modulating production and activation of the proinflammatory cytokine IL-1b by human and murine macrophages."

The news reporters obtained a quote from the research from National Cancer Institute, "Physiological concentrations of thrombospondin-1 limit the induction by lipopolysaccharide of IL-1b mRNA and total protein production by human macrophages. This inhibition can be explained by the ability of thrombospondin-1 to disrupt the interaction between CD47 and CD14, thereby limiting activation of NF-kB/AP-1 by lipopolysaccharide. Only the CD47-binding domain of thrombospondin-1 exhibits this activity. In contrast, CD47, CD36, and integrin-binding domains of thrombospondin-1 independently enhance the inflammasome-dependent maturation of IL-1b in human THP-1 monocyte-derived macrophages. Correspondingly, mouse bone marrow-derived macrophages that lack either thrombospondin-1 or CD47 exhibit diminished induction of mature IL-1b in response to lipopolysaccharide. Lack of CD47 also limits lipopolysaccharide induction of IL-1b, NLRP3, and caspase-1 mRNAs. These data demonstrate that thrombospondin-1 exerts CD47-dependent and -independent pro-and anti-inflammatory effects on the IL-1b pathway."

According to the news reporters, the research concluded: "Therefore, thrombospondin-1 and its receptor CD47 may be useful targets for limiting the pro-inflammatory effects of lipopolysaccharide and for treating endotoxemia."

For more information on this research see: Secreted Thrombospondin-1 Regulates Macrophage Interleukin-1b Production and Activation through CD47. Scientific Reports, 2016;6 ():19684. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting E.V. Stein, Laboratory of Pathology, Center for Cancer Research, National Cancer Institute, National Institutes of Health, Bethesda, MD 20892-1500, United States. Membrane Proteins - Lipoprotein Receptors

Data on Lipoprotein Receptors Reported by Researchers at University of Maryland [Evidence That Factor VIII Forms a Bivalent Complex with the Low Density Lipoprotein (LDL) Receptor-related Protein 1 (LRP1) IDENTIFICATION OF CLUSTER IV ON LRP1 AS ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Membrane Proteins - Lipoprotein Receptors are discussed in a new report. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Hemophilia A is a bleeding disorder caused by a deficiency in coagulation factor VIII (fVIII) that affects 1 in 5,000 males. Current prophylactic replacement therapy, although effective, is difficult to maintain due to the cost and frequency of injections."

Our news journalists obtained a quote from the research from the University of Maryland, "Hepatic clearance of fVIII is mediated by the LDL receptor-related protein 1 (LRP1), a member of the LDL receptor family. Although it is well established that fVIII binds LRP1, the molecular details of this interaction are unclear as most of the studies have been performed using fragments of fVIII and LRP1. In the current investigation, we examine the binding of intact fVIII to full-length LRP1 to gain insight into the molecular interaction. Chemical modification studies confirm the requirement for lysine residues in the interaction of fVIII with LRP1. Examination of the ionic strength dependence of the interaction of fVIII with LRP1 resulted in a Debye-Huckel plot with a slope of 1.8 +/- 0.5, suggesting the involvement of two critical charged residues in the interaction of fVIII with LRP1. Kinetic studies utilizing surface plasmon resonance techniques reveal that the high affinity of fVIII for LRP1 results from avidity effects mediated by the interactions of two sites in fVIII with complementary sites on LRP1 to form a bivalent fVIII.LRP1 complex."

According to the news editors, the research concluded: "Furthermore, although fVIII bound avidly to soluble forms of clusters II and IV from LRP1, only soluble cluster IV competed with the binding of fVIII to full-length LRP1, revealing that cluster IV represents the major fVIII binding site in LRP1."

For more information on this research see: Evidence That Factor VIII Forms a Bivalent Complex with the Low Density Lipoprotein (LDL) Receptor-related Protein 1 (LRP1) IDENTIFICATION OF CLUSTER IV ON LRP1 AS THE MAJOR BINDING SITE. *Journal of Biological Chemistry*, 2016;291(50):26035-26044. *Journal of Biological Chemistry* can be contacted at: Amer Soc Biochemistry Molecular Biology Inc, 9650 Rockville Pike, Bethesda, MD 20814-3996, USA. Biotechnology - Liposomes

Data on Liposomes Discussed by Researchers at Graduate School (Real-time characterization of fibrillization process of amyloid-beta on phospholipid membrane using a new label-free detection technique based on a cantilever-based liposome ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biotechnology - Liposomes is the subject of a report. According to news originating from Kyoto, Japan, by NewsRx correspondents, research stated, "The dynamic behavior of amyloid-beta protein (A beta) fibrillization on cell membrane is closely related to the progression of Alzheimers disease (AD). In this paper, we reports a new approach for real-time monitoring of the fibrillization process of A beta on lipid membrane using a miniaturized cantilever-based liposome biosensor, which contributes to the technology development of A beta label-free detection and the mechanism elucidation of A beta fibrillization on cell membrane. 1,2-Dipalmitoyl-sn-glycero-3-phosphocholine (DPPC) liposome as model cell membrane was immobilized on the cantilever surface and A beta(140) was selected as a target protein in this work."

Our news journalists obtained a quote from the research from Graduate School, "Liposome-A beta interaction is evaluated by detecting the resistance change rate of the strain gauge embedded in the cantilever, which is directly proportional to the deflection of cantilever. 24-h real-time monitoring result clearly shows chronological change in the resistance with the progress of A beta fibrillization on liposomes. Moreover, it is found that the extent of liposome-A beta interaction is closely dependent on the aggregate state and concentration of A beta but is less dependent on the type of used solvent (water or serum). It is indicated that DPPC liposome shows sufficient affinity and selectivity to A beta even in serum. In particular, a concentration of A beta as low as 1 mu M can be detected using the cantilever-based liposome biosensor. Furthermore, it is confirmed that this biosensor has a potential of recognizing different states of A beta."

According to the news editors, the research concluded: "We expect that the cantilever-based liposome biosensor becomes an effective tool for accelerating amyloid related research and developing the early diagnosis approach of AD."

For more information on this research see: Real-time characterization of fibrillization process of amyloid-beta on phospholipid membrane using a new label-free detection technique based on a cantilever-based liposome biosensor. Oncology - Liver Cancer

Data on Liver Cancer Detailed by Researchers at University Hospital
(Oncological Evaluation by Positron-emission Tomography, Circulating Tumor Cells and Alpha Fetoprotein in Patients With Hepatocellular Carcinoma on the Waiting List for Liver ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting originating in Murcia, Spain, by NewsRx journalists, research stated, "The objectives of this study are the determination of the number of circulating tumor cells (CTCs), by means of the IsoFlux enrichment system (Fluxion Biosciences Inc, San Francisco, California, United States) in patients with hepatocellular carcinoma (HCC) in compliance with the Milan criteria and on the waiting list for hepatic transplantation, as well as the study of its relation with the a-fetoprotein levels (AFP) and positron-emission tomography-computed tomography (PET-CT) findings. An oncological evaluation with PET-CT, CTCs, and AFP was conducted in 24 consecutive patients with HCC eligible for orthotopic liver transplantation according to the Milan criteria."

The news reporters obtained a quote from the research from University Hospital, "The diagnosis of HCC was made according to clinical, biological, and radiological findings. We detected CTCs in peripheral blood in 21 of 24 patients (87.5%) before liver transplantation, with a mean number CTCs of 156 +/- 370 (range, 2 to 1768) with statistically significant association between number of CTCs detected in peripheral blood and the time within the waiting list (P < .05), but not between AFP levels and standard uptake value and time to orthotopic liver transplantation (P > .05)."

According to the news reporters, the research concluded: "PET-TC, CTCs, and AFP levels could be an essential key for the correct management of the patients with HCC on the waiting list for liver transplantation."

Our news correspondents report that additional information may be obtained by contacting P.A. Cascales-Campos, Clin Univ Hosp Virgen de la Arrixaca IMIB, Dept. of Surg,

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.transproceed.2016.07.035. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Liver Cancer

Data on Liver Cancer Discussed by Researchers at National Cheng Kung University (Sp1-mediated ectopic expression of T-cell lymphoma invasion and metastasis 2 in hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Liver Cancer have been presented. According to news reporting originating in Tainan, Taiwan, by NewsRx journalists, research stated, "T-cell lymphoma invasion and metastasis 2 (TIAM2) is a neuron-specific protein that has been found ectopically expressed in hepatocellular carcinoma (HCC). Results from clinical specimens and cellular and animal models have shown that the short form of TIAM2 (TIAM2S) functions as an oncogene in the tumorigenesis of liver cancer."

Financial support for this research came from Ministry of Science and Technology, Taiwan.

The news reporters obtained a quote from the research from National Cheng Kung University, "However, the regulation of TIAM2S ectopic expression in HCC cells remains largely unknown. This study aimed to identify the mechanism underlying the ectopic expression of TIAM2S in liver cancer cells. In this report, we provide evidence illustrating that Sp1 binds directly to the GC box located in the TIAM2S core promoter. We further demonstrated that overexpression of Sp1 in HepaRG cells promotes endogenous TIAM2S mRNA and protein expressions, and knockdown of Sp1 in 2 HCC cell lines, HepG2 and PLC/PRF/5, led to a substantial reduction in TIAM2S mRNA and protein in these cells. Of 60 paired HCC samples, 70% showed a significant increase (from 1.1-to 3.6-fold) in Sp1 protein expression in the tumor cells. The elevated Sp1 expression was highly correlated with both TIAM2S mRNA and protein expressions in these samples."

According to the news reporters, the research concluded: "Together, these results illustrate that Sp1 positively controls TIAM2S transcription and that Sp1-mediated transcriptional activation is essential for TIAM2S ectopic expression in liver cancer cells."

Our news correspondents report that additional information may be obtained by
contacting W.H. Yen, Institute of Molecular Medicine, College of Medicine, National Cheng Kung University, Tainan, 70101, Taiwan. Additional authors for this research include W.S. Ke, J.J. Hung, T.M. Chen, J.S. Chen and H.S Sun.

Oncology - Liver Cancer

Data on Liver Cancer Discussed by Researchers at University Hospital (Combination of the oral histone deacetylase inhibitor resminostat with oncolytic measles vaccine virus as a new option for epi-virotherapeutic treatment of hepatocellular ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Liver Cancer have been presented. According to news reporting originating from Tubingen, Germany, by NewsRx correspondents, research stated, "Epigenetic therapies such as histone deacetylase inhibitors (HDACi) not only have the capability to decrease tumor cell proliferation and to induce tumor cell death but also to silence antiviral response genes. Here, we investigated whether the combination of an oncolytic measles vaccine virus (MeV) with the novel oral HDACi resminostat (Res), being in clinical testing in patients with hepatocellular carcinoma (HCC), results in an enhanced efficacy of this epi-virotherapeutic approach compared to any of the two corresponding monotherapies."

Our news editors obtained a quote from the research from University Hospital, "When testing a panel of human hepatoma cell lines, we found (i) a significantly improved rate of primary infections when using oncolytic MeV under concurrent treatment with resminostat, (ii) a boosted cytotoxic effect of the epi-virotherapeutic combination (Res + MeV) with enhanced induction of apoptosis, and, quite importantly, (iii) an absence of any resminostat-induced impairment of MeV replication and spread. Beyond that, we could also show that (iv) resminostat, after hepatoma cell stimulation with exogenous human interferon (IFN)-beta, is able to prevent the induction of IFN-stimulated genes, such as IFIT-1. This finding outlines the possible impact of resminostat on cellular innate immunity, being instrumental in overcoming resistances to MeV-mediated viral oncolysis."

According to the news editors, the research concluded: "Thus, our results support the onset of epi-virotherapeutic clinical trials in patients exhibiting advanced stages of HCC."

For more information on this research see: Combination of the oral histone deacetylase inhibitor resminostat with oncolytic measles vaccine virus as a new option for epi-virotherapeutic treatment of hepatocellular carcinoma. Molecular Therapy-Oncolytics, 2015;2 ():1-11. Molecular Therapy-Oncolytics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

The news editors report that additional information may be obtained by contacting U.M. Lauer, Univ Hosp Tuebingen, Dept. of Internal Med 1, Tubingen, Germany. Additional

Oncology - Liver Cancer

Data on Liver Cancer Reported by Researchers at Fourth Military Medical University (Functional and clinical evidence that TAZ is a candidate oncogene in hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Liver Cancer are presented in a new report. According to news reporting out of Shaanxi, People's Republic of China, by NewsRx editors, research stated, "Transcriptional co-activator with PDZ-binding motif (TAZ) has been reported to be associated with carcinogenesis. However, the cellular function of TAZ in human hepatocellular carcinoma (HCC) remains elusive."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Fourth Military Medical University, "In this study, an immunohistochemistry analysis revealed that the expression of TAZ in cancer tissue samples from 180 HCC patients was significantly higher than that in adjacent normal tissues. In addition, TAZ overexpression was significantly correlated with aggressive tumor characteristics such as tumor size, TNM stage, lymph node or distant metastasis, histological differentiation, and recurrent HCC (p <0.05). The Kaplan-Meier test showed that TAZ-positive expression was related to a poor prognosis compared to TAZ-negative expression (p <0.05). Furthermore, the expression level of TAZ was generally correlated with the invasiveness of cancer cells."

According to the news editors, the research concluded: "The overexpression of TAZ in the Huh7 cell line, which endogenously expresses TAZ at low levels, significantly promoted cell proliferation, migration and invasion and inhibited apoptosis, whereas RNA interference-mediated knockdown of TAZ in the highly invasive cell line MHCC-97H significantly suppressed cell proliferation, migration and invasion in vitro and tumor formation in vivo."

Our news journalists report that additional information may be obtained by contacting Y. Guo, The State Key Laboratory of Cancer Biology, Dept. of Biochemistry and Molecular Biology, The Fourth Military Medical University, Xi'an, Shaanxi, 710032, People's Republic of China. Additional authors for this research include Q. Pan, J. Zhang, X. Xu, X. Liu,
Data on Liver Cancer Reported by Researchers at Shandong Cancer Hospital (Oxaliplatin-rapamycin combination was superior to mono-drug in treatment of hepatocellular carcinoma both in vitro and in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting out of Shandong, People's Republic of China, by NewsRx editors, research stated, "The presented study aimed to investigate the antitumor efficacy of combination of oxaliplatin with rapamycin, an mTOR inhibitor, in hepatocellular carcinoma (HCC). The activation status of mTOR pathway was first examined in HCC cell lines HepG2, BEL7402, and HuH7 using Western blotting."

Our news journalists obtained a quote from the research from Shandong Cancer Hospital, "Effects of rapamycin, oxaliplatin, and their combination on the proliferation of HCC cells were determined in vitro using MTT assay and in vivo using a nude mice model bearing HepG2 xenografts. Drug-induced cell apoptosis was examined by flow cytometry. Expression of apoptosis-related protein was determined by Western blotting. We observed that mTOR pathway was activated in all three cell lines used in the current study. MTT assay demonstrated that oxaliplatin in combination with rapamycin synergistically inhibited the proliferation of HCC cells. The combination regimen reduced terminal tumor burden more efficiently than the corresponding monotherapy. The percentages of apoptotic cells and the expression levels of apoptosis-related proteins including cleaved caspase-9,-3, and PARP were significantly higher in combination-treatment groups than those in mono-drug-treatment groups. The ratios of Bax/Bcl-2 in cells exposed to both oxaliplatin and rapamycin were significantly increased compared to those in cells subjected to oxaliplatin or rapamycin alone treatment."

According to the news editors, the research concluded: "Results obtained in the presented study suggested that combination of oxaliplatin and rapamycin was superior to mono-drug and may have a potential value in treatment of HCC."

For more information on this research see: Oxaliplatin-rapamycin combination was superior to mono-drug in treatment of hepatocellular carcinoma both in vitro and in vivo. Neoplasma, 2016;63(6):880-887. Neoplasma can be contacted at: Aepress Sro, Bajzova 7, Bratislava, 821 08, Slovakia.

Our news journalists report that additional information may be obtained by contacting Y.L. Sun, Shandong Canc Hosp & Inst, Dept. of Med Oncol, Jinan, Shandong, People's Republic of China. Additional authors for this research include Y.L. Sun, L.Q. Cao and M.J. Li.

Data on Liver Cancer Reported by Researchers at Shandong University School of Medicine (HBV preS2 promotes the expression of TAZ via miRNA-338-3p to enhance the tumorigenesis of hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Liver Cancer. According to news reporting originating from Shandong, People's Republic of China, by NewsRx correspondents, research stated, "Transactivators encoded by HBV, including HBx and preS2, play critical role in hepatocellular carcinoma (HCC). YAP, a downstream effector of the Hippo pathway, is involved in hepatocarcinogenesis mediated by HBx."

Our news editors obtained a quote from the research from the Shandong University School of Medicine, "Here, we investigated whether preS2, another transactivator encoded by HBV, regulates the Hippo pathway to promote HCC. We found that preS2 overexpression upregulated TAZ, a downstream effector of the Hippo pathway, at protein level but not at mRNA level. preS2 suppressed miRNA-338-3p expression in HCC cell lines. miRNA-338-3p mimics downregulated TAZ, while miRNA-338-3p inhibitor restored the expression of TAZ, suggesting that TAZ is a direct target of miRNA-338-3p. TAZ overexpression stimulated growth of HCC cell lines. Knockdown of TAZ dampened preS2-promoted HCC proliferation and migration. Thus, preS2 upregulates TAZ expression by repressing miRNA-338-3p."

According to the news editors, the research concluded: "TAZ is necessary for preS2-promoted HCC proliferation and migration."

For more information on this research see: HBV preS2 promotes the expression of TAZ via miRNA-338-3p to enhance the tumorigenesis of hepatocellular carcinoma. Oncotarget, 2015;6(30):29048-59.

The news editors report that additional information may be obtained by contacting P. Liu, Key Laboratory for Experimental Teratology of Ministry of Education and Dept. of Immunology, Shandong University School of Medicine, Jinan, Shandong, 250012, People's Republic of China. Data on Liver Cancer Reported by Researchers at Zhejiang University (A54 Peptide Modified and Redox-Responsive Glucolipid Conjugate Micelles for Intracellular Delivery of Doxorubicin in Hepatocarcinoma Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Liver Cancer. According to news reporting out of Hangzhou, People's Republic of China, by NewsRx editors, research stated, "Redox-responsive nanomaterials applied in drug delivery systems (DDS) have attracted an increasing attention in pharmaceutical research as a carrier for antitumor therapy. However, there would be unwanted drug release from a redox-responsive DDS with no selection at nontarget sites, leading to undesirable toxicities in normal tissues and cells."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Zhejiang University, "Here, an A54 peptide modified and PEGylated reduction cleavable glucolipid conjugate (A54-PEG-CSO-ss-SA, abbreviated to APC(ss)A) was designed for intracellular delivery of doxorubicin (DOX). The synthesized APC(ss)A could be assembled via micellization self assembly in aqueous water above the critical micelle concentration (54.9 µg/mL) and exhibited a high drug encapsulation efficiency (77.92%). The APC(ss)A micelles showed an enhanced redox sensitivity in that the disulfide bond could be degraded quickly and the drug would be released from micelles in 10 mM levels of glutathione (GSH). The cellular uptake studies highlighted the affinity of APC(ss)A micelles toward the hepatoma cells (BEL-7402) compared to that toward HepG2 cells. In contrast with the nonresponsive conjugate, the drug was released from APC(ss)A micelles more quickly in 10 mM level of GSH concentration (tumor cells). Moreover, the DOX-loaded APC(ss)A micelles displayed an increased cytotoxicity which was 1.6- to 2.0-fold that of unmodified and nonresponsive micelles. In vivo, the APC(ss)A micelles had stronger distribution to liver and hepatoma tissue and prolonged the circulation and retention time, while the drug release only occurred in the tumor tissue. The APC(ss)A/DOX showed the tumor inhibition rate equal to that of commercial doxorubicin hydrochloric without negative consequence."

According to the news editors, the research concluded: "This study suggested that the APC(ss)A/DOX showed promising potential to treat the tumor for its special tumor targeting, selective intracellular drug release, enhanced antitumor activity, and reduced toxicity on normal tissues."

Our news journalists report that additional information may be obtained by contacting F.Q. Hu, Zhejiang University, Coll Pharmaceut Sci, Hangzhou 310058, Zhejiang,
Data on Liver Transplants Described by H. Chen et al (Nontumoral portal vein thrombosis in patients awaiting liver transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Liver Transplants is now available. According to news reporting out of Barcelona, Spain, by NewsRx editors, research stated, "Portal vein thrombosis (PVT) occurs in approximately 2%-26% of the patients awaiting liver transplantation (LT) and is no longer an absolute contraindication for LT. Nearly half of PVT cases are accidentally found during the LT procedure."

Our news journalists obtained a quote from the research, "The most important risk factor for PVT development in cirrhosis may be the severity of liver disease and reduced portal blood flow. Whether other inherited or acquired coagulation disorders also play a role is not yet clear. The development of PVT may have no effect on the liver disease progression, especially when it is nonocclusive. PVT may not increase the risk of wait-list mortality, but it is a risk factor for poor early post-LT mortality. Anticoagulation and transjugular intrahepatic portosystemic shunt (TIPS) are 2 major treatment strategies for patients with PVT on the waiting list. The complete recanalization rate after anticoagulation is approximately 40%. The role of TIPS to maintain PV patency for LT as the primary indication has been reported, but the safety and efficacy should be further evaluated. PVT extension and degree may determine the surgical technique to be used during LT. If a 'conventional' end-to-end portal anastomotic technique is used, there is not a major impact on post-LT survival."

According to the news editors, the research concluded: "Post-LT PVT can significantly reduce both graft and patient survival after LT and can preclude future options for re-LT."

Our news journalists report that additional information may be obtained by contacting H. Chen, Barcelona Hepatic Hemodynamic Laboratory, Liver Unit, Barcelona, Spain. Additional authors for this research include F. Turon, V. Hernandez-Gea, J. Fuster, A. Garcia-Criado, M. Barrufet, A. Darnell, C. Fondevila, J.C. Garcia-Valdecasas and J.C Garcia-Pagan.

Oncology - Lung Cancer

Data on Lung Cancer Detailed by Researchers at University of Niigata (Autocrine Semaphorin3A signaling is essential for the maintenance of stem-like cells in lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting from Niigata, Japan, by NewsRx journalists, research stated, "Cancer stem-like cells (CSCs) exist in tumor tissues composed of heterogeneous cell population and are characterized by their self-renewal capacity and tumorigenicity. Many studies demonstrate that eradication of CSCs prevents development and recurrences of tumor; yet, molecules critical for the maintenance of CSCs have not been completely understood."

Financial support for this research came from JSPS KAKENHI.

The news correspondents obtained a quote from the research from the University of Niigata, "We previously reported that Semaphorin3A (Sema3a) knockdown suppressed the tumorigenicity and proliferative capacity of Lewis lung carcinoma (LLC) cells. Therefore, we identified Sema3a as an essential factor for the establishment or maintenance of CSCs derived from LLC (LLC-stem cell). shRNA against Sema3a was introduced into LLC cells to establish a LLC-stem cell line and its effects on tumorigenesis, sphere formation, and mTORC1 activity were tested. Sema3a knockdown completely abolished tumorigenicity and the sphere-formation and self-renewal ability of LLC-stem cells. The Sema3a knockdown was also associated with decreased expression of mRNA for stem cell markers. The self-renewal ability abolished by Sema3a knockdown could not be recovered by exogenous addition of recombinant SEMA3A. In addition, the activity of mammalian target of rapamycin complex 1 (mTORC1) and the expression of its substrate p70S6K1 were also decreased."

According to the news reporters, the research concluded: "These results demonstrate that Sema3a is a potential therapeutic target in eradication of CSCs."

For more information on this research see: Autocrine Semaphorin3A signaling is essential for the maintenance of stem-like cells in lung cancer. Biochemical and Biophysical Research Communications, 2016;480(3):375-379. Kidney Diseases and Conditions - Lupus Nephritis

Data on Lupus Nephritis Reported by Researchers at Addenbrooke's Hospital (Con: The use of calcineurin inhibitors in the treatment of lupus nephritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Kidney Diseases and Conditions - Lupus Nephritis are presented in a new report. According to news reporting originating in Cambridge, United Kingdom, by NewsRx journalists, research stated, "Lupus nephritis (LN) therapy has limited efficacy due to its toxicity, and LN patients suffer high risks of renal and cardiovascular morbidity and mortality. Calcineurin inhibitors (CNIs) have been used for over > 30 years in LN treatment and are an established alternative therapy for Class V nephritis, but uncertainty remains about their role in proliferative disease or in the maintenance of remission."

The news reporters obtained a quote from the research from Addenbrooke's Hospital, "More recently, the combination of CNIs with mycophenolate mofetil (MMF) and glucocorticoid combination therapy, 'multitarget' therapy and the use of tacrolimus as opposed to ciclosporin has received attention. Is the evidence now sufficient to support the routine use of regimens including CNIs in LN? Although CNIs appear to have similar efficacy to MMF-based regimens as induction therapy, and are comparable with azathioprine as maintenance treatment, CNI toxicities, such as new-onset hypertension, hyperglycaemia and nephrotoxicity, have been problematic. Multitarget therapy improves the rate of complete remission in short-term studies, but whether this benefit is maintained over the longer term is uncertain. However, patient tolerability is lower and the frequency of serious events is higher in multitarget versus cyclophosphamide-based regimens, and there is a paucity of evidence from non-Asian ethnic groups. CNI-based therapy is also complicated by the absence of standardized dosing and the need for drug level monitoring, as well as by pharmacogenetic differences. Also, multitarget therapy increases the complexity and the cost of treatment. There is insufficient evidence to support the routine use of CNI-based or multitarget therapy for proliferative LN."

According to the news reporters, the research concluded: "Further data on long-term renal and cardiovascular outcomes and strategies to improve tolerability and safety are required."

Our news correspondents report that additional information may be obtained by
Autoimmune Diseases and Conditions - Lupus

Data on Lupus Reported by Researchers at King's College
(Sifalimumab, an anti-interferon-a monoclonal antibody, in moderate to severe systemic lupus erythematosus: a randomised, double-blind, placebo-controlled study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Lupus. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "The efficacy and safety of sifalimumab were assessed in a phase IIb, randomised, double-blind, placebo-controlled study (NCT01283139) of adults with moderate to severe active systemic lupus erythematosus (SLE). 431 patients were randomised and received monthly intravenous sifalimumab (200 mg, 600 mg or 1200 mg) or placebo in addition to standard-of-care medications. Patients were stratified by disease activity, interferon gene-signature test (high vs low based on the expression of four genes) and geographical region."

Financial support for this research came from MedImmune.

Our news journalists obtained a quote from the research from King’s College, "The primary efficacy end point was the percentage of patients achieving an SLE responder index response at week 52. Compared with placebo, a greater percentage of patients who received sifalimumab (all dosages) met the primary end point (placebo: 45.4%; 200 mg: 58.3%; 600 mg: 56.5%; 1200 mg 59.8%). Other improvements were seen in Cutaneous Lupus Erythematosus Disease Area and Severity Index score (200 mg and 1200 mg monthly), Physician's Global Assessment (600 mg and 1200 mg monthly), British Isles Lupus Assessment Group-based Composite Lupus Assessment (1200 mg monthly), 4-point reductions in the SLE Disease Activity Index-2000 score and reductions in counts of swollen joints and tender joints. Serious adverse events occurred in 17.6% of patients on placebo and 18.3% of patients on sifalimumab. Herpes zoster infections were more frequent with sifalimumab treatment. Sifalimumab is a promising treatment for adults with SLE."

According to the news editors, the research concluded: "Improvement was consistent across various clinical end points, including global and organ-specific measures of disease activity."

Immune System Diseases and Conditions -

Data on Lymphoproliferative Disorders Detailed by Researchers at University of Auvergne (Usefulness of EUS-guided fine needle aspiration biopsy in the diagnosis of suspected or recurring lymphoproliferative disorders)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immune System Diseases and Conditions - Lymphoproliferative Disorders is the subject of a report. According to news reporting from Clermont Ferrand, France, by NewsRx journalists, research stated, "EUS-guided fine needle aspiration biopsy (EUS-FNAB) of deep-seated lymphadenopathy is proposed to identify lymphoproliferative disorders when no superficial lesion is accessible. We analyzed prospectively collected data of 115 EUS-FNABs from 73 thoracic or abdominopelvic targets in 52 patients with suspected lymphoproliferative disorders (LPDs) between January 2005 and May 2011 from a single institution."

The news correspondents obtained a quote from the research from the University of Auvergne, "Conventional histology and immunohistochemistry procedures were performed on samples. No complications were recorded. An LPD was identified in 29 cases and ruled out in 21 cases. In 2 cases the analysis was negative, but an LPD was identified using a secondary procedure. For the identification of LPDs irrespective of subtype, this procedure has positive and negative predictive values of 100% and 91.3% respectively, with 93.6% sensitivity and 100% specificity. In 31 patients finally diagnosed with LPDs, an accurate diagnosis meeting the 2008 World Health Organization classification criteria was established in 21 (68%) cases, success being significantly associated with target size above 30 mm in multivariate analysis (odds ratio 7.47; p = 0.05). EUS-FNAB of deep-seated lymphadenopathy with conventional morphological assessment appears to have a high diagnostic value for LPD identification and can obviate invasive surgery."

According to the news reporters, the research concluded: "A sub-classification was possible in two thirds of the cases."

For more information on this research see: Usefulness of EUS-guided fine needle

Our news journalists report that additional information may be obtained by contacting L. Poincloux, Univ Auvergne, CNRS, ISIT, UMR 6284, Clermont Ferrand, France. Additional authors for this research include M. Andre, C. Darcha, M. Goutte, M. Dapoigny, G. Bommelaer, A. Abergel and O. Tournilhac.

Mosquito-Borne Diseases - Malaria

**Data on Malaria Detailed by Researchers at International Center for Genetic Engineering and Biotechnology (Compartmentalized Metabolic Engineering for Artemisinin Biosynthesis and Effective Malaria Treatment by Oral Delivery of Plant Cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mosquito-Borne Diseases - Malaria have been published. According to news reporting originating from New Delhi, India, by NewsRx correspondents, research stated, "Artemisinin is highly effective against drug-resistant malarial parasites, which affects nearly half of the global population and kills > 500 000 people each year. The primary cost of artemisinin is the very expensive process used to extract and purify the drug from Artemisia annua."

Our news editors obtained a quote from the research from International Center for Genetic Engineering and Biotechnology, "Elimination of this apparently unnecessary step will make this potent antimalarial drug affordable to the global population living in endemic regions. Here we reported the oral delivery of a non-protein drug artemisinin biosynthesized (similar to 0.8 mg/g dry weight) at clinically meaningful levels in tobacco by engineering two metabolic pathways targeted to three different cellular compartments (chloroplast, nucleus, and mitochondria). The doubly transgenic lines showed a three-fold enhancement of isopentenyl pyrophosphate, and targeting AACPR, DBR2, and CYP71AV1 to chloroplasts resulted in higher expression and an efficient photo-oxidation of dihydroartemisinic acid to artemisinin. Partially purified extracts from the leaves of transgenic tobacco plants inhibited in vitro growth progression of Plasmodium falciparum-infected red blood cells. Oral feeding of whole intact plant cells bioencapsulating the artemisinin reduced the parasitemia levels in challenged mice in comparison with commercial drug."

According to the news editors, the research concluded: "Such novel synergistic approaches should facilitate low-cost production and delivery of artemisinin and other drugs
through metabolic engineering of edible plants."

The news editors report that additional information may be obtained by contacting S. Kumar, Int Center Genet Engn & Biotechnol, Metab Engn Grp, New Delhi 110067, India. Additional authors for this research include M. Subramaniyan, K. Rawat, M. Kalamuddin, M.I. Qureshi, P. Malhotra, A. Mohmmed, K. Cornish, H. Daniell and S. Kumar.

Keywords for this news article include: New Delhi, India, Asia, Metabolic Engineering, Epidemiology, Mosquito-Borne Diseases, Protozoan Infections, Sesquiterpenes, Artemisinins, Peroxides, Genetics, Malaria, International Center for Genetic Engineering and Biotechnology.

**Oncology - Malignant Mesothelioma**

**Data on Malignant Mesothelioma Reported by Researchers at Tokushima University (Downregulation of thymidylate synthase by RNAi molecules enhances the antitumor effect of pemetrexed in an orthotopic malignant mesothelioma xenograft mouse model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Malignant Mesothelioma are discussed in a new report. According to news originating from Tokushima, Japan, by NewsRx correspondents, research stated, "Malignant pleural mesothelioma (MPM) is an incurable cancer with an increasing incidence. Currently, pemetrexed (PMX)-based chemotherapy is the mainstay of chemotherapy for MPM, however, the outcome of PMX-based chemotherapy in patients with MPM is dismal."

Our news journalists obtained a quote from the research from Tokushima University, "RNA interference (RNAi) technology has been considered as an effective tool to substantially enhance the therapeutic efficacy of chemotherapeutic agents in many preclinical and clinical settings. In this study, therefore, we investigated whether non-viral anti-thymidylate synthase RNAi embedded liposome (TS shRNA lipoplex) would effectively guide the downregulation of TS in human malignant mesothelioma MSTO-211H cells. Consequently, it enhanced the antitumor effect of PMX both in vitro and in vivo. TS shRNA effectively enhanced the in vitro cell growth inhibition upon treatment with PMX via downregulating TS expression in the MSTO-211H cell line. In in vivo orthotopic tumor model, the combined treatment of PMX and TS shRNA lipoplex efficiently combated the progression of orthotopic thoracic tumors and as a result prolonged mouse survival, compared to each single treatment."

According to the news editors, the research concluded: "Our findings emphasize the pivotal relevance of RNAi as an effective tool for increasing the therapeutic efficacy of PMX, a cornerstone in the treatment regimens of MPM, and thereby, raising the possibility for the development of a novel therapeutic strategy, combination therapy of TS-shRNA and PMX, that can surpass many of the currently applied, but less effective, therapeutic regimes against lethal

The news correspondents report that additional information may be obtained from A.S. Abu Lila, Dept. of Pharmacokinetics and Biopharmaceutics, Institute of Health Biosciences, Tokushima University, Tokushima, Japan. Additional authors for this research include C. Kato, M. Fukushima, C.L. Huang, H. Wada and T. Ishida.

Health and Medicine - Medical Research

Data on Medical Research Discussed by Researchers at Hamadan University (Effect of a high fat diet on ovary morphology, in vitro development, in vitro fertilisation rate and oocyte quality in mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Health and Medicine - Medical Research is the subject of a report. According to news reporting from Hamadan, Iran, by NewsRx journalists, research stated, "The aim of this study was to determine the effect of a high-fat diet (HFD) on oocyte maturation and quality in a mouse model. Female BALB/c mice were allocated to one of the following groups: (a) control group (n=40), which received a controlled diet; or (b) HFD group (n=40), which received an HFD for 12 weeks."

The news correspondents obtained a quote from the research from Hamadan University, "Sections of the ovary were examined histologically. The number of follicles and corpora lutea were counted. In vitro maturation and in vitro fertilisation (IVF) were assessed in germinal vesicle (GV) and metaphase II (MII) oocytes, respectively. The expression of bone morphogenetic protein 15 (BMP15) and leptin receptor genes in GV and MII oocytes was evaluated using reverse transcription real-time polymerase chain reactions. In the HFD group, there was a decreased number of primordial and Graafian follicles, as well as corpora lutea (p <0.05). The rate of oocyte development to the MII stage was also reduced (p <0.001). Cumulus expansion was observed more frequently in the control group than the HFD group (p <0.05)."
The IVF rate in the HFD group was lower than that in the control group (p <0.05). In the HFD group, BMP15 and leptin receptor genes were upregulated in the GV stage (p >0.05) and MII stage (p <0.05), compared to the control group.

According to the news reporters, the research concluded: "An HFD reduces folliculogenesis in the primordial and Graafian stages, in vitro maturation and in vitro fertilisation rates, as well as oocyte quality in mice."

Our news journalists report that additional information may be obtained by contacting M. Sohrabi, Research Center for Molecular Medicine, Hamadan University of Medical Sciences, Hamadan, Iran. Additional authors for this research include A.M. Roushandeh, Z. Alizadeh, A. Vahidinia, M. Vahabian and M. Hosseini.

Data on Medical Research Reported by Researchers at Chinese People's Liberation Army General Hospital (Identification of Two Disease-causing Genes TJP2 and GJB2 in a Chinese Family with Unconditional Autosomal Nonsyndromic Hereditary ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Health and Medicine - Medical Research. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "There are more than 300 genetic loci that have been found to be related to hereditary hearing impairment (HHI), including 92 causative genes for nonsyndromic hearing loss, among which 34 genes are related to autosomal dominant nonsyndromic HHI (ADNSHHI). Traditional linkage analysis and candidate gene sequencing are not effective at detecting the ADNSHHI, especially for the unconditional families that may have more than one pathogenic cause."

Our news journalists obtained a quote from the research from Chinese People's Liberation Army General Hospital, "This study identified two disease-causing genes TJP2 and GJB2 in a Chinese family with unconditional ADNSHHI. To decipher the genetic code of a Chinese family (family 686) with ADNSHHI, different gene screening techniques have been performed, including linkage analysis, candidate genes screening, high-throughput sequencing and Sanger sequencing. These techniques were done on samples obtained from this family over a period of 10 years. We identified a pathogenic missense mutation, c. 2081G >A (p.G694E), in TJP2, a gene that plays a crucial role in apoptosis and age-related hearing loss (ARHL). The mutation was co-segregated in this pedigree in all, but not in the two patients who presented with different phenotypes from the other affected family members. In one of the two patients,
we confirmed that the compound heterozygosity for p.Y136* and p.G45E in the GJB2 gene may account for the phenotype shown in this patient. We identified the co-occurrence of two genetic causes in family 686. The possible disease-causing missense mutation of TJP2 in family 686 presents an opportunity for further investigation into ARHL."

According to the news editors, the research concluded: "It is necessary to combine various genes screening methods, especially for some unconventional cases."

Our news journalists report that additional information may be obtained by contacting Q.J. Wang, Dept. of Otolaryngology-Head and Neck, Chinese People's Liberation Army Institute of Otolaryngology, Chinese People's Liberation Army General Hospital, Beijing 100853, People's Republic of China. Additional authors for this research include Y.L. Zhao, Q. Liu, H. Yuan, Y. Gao, L. Lan, L. Yu, D.Y. Wang, J. Guan and Q.J Wang.

Oncology - Melanoma

Data on Melanoma Detailed by Researchers at Institute of Molecular Cell Biology (Activation of mutant TERT promoter by RAS-ERK signaling is a key step in malignant progression of BRAF-mutant human melanomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Melanoma are presented in a new report. According to news reporting from Singapore, Singapore, by NewsRx journalists, research stated, "Although activating BRAF/NRAS mutations are frequently seen in melanomas, they are not sufficient to drive malignant transformation and require additional events. Frequent co-occurrence of mutations in the promoter for telomerase reverse transcriptase (TERT), along with BRAF alterations, has recently been noted and correlated with poorer prognosis, implicating a functional link between BRAF signaling and telomerase reactivation in melanomas."

The news correspondents obtained a quote from the research from the Institute of Molecular Cell Biology, "Here, we report that RAS-ERK signaling in BRAF mutant melanomas is critical for regulating active chromatin state and recruitment of RNA polymerase II at mutant TERT promoters. Our study provides evidence that the mutant TERT promoter is a key
substrate downstream of the RAS-ERK pathway. Reactivating TERT and hence reconstituting telomerase is an important step in melanoma progression from nonmalignant nevi with BRAF mutations."

According to the news reporters, the research concluded: "Hence, combined targeting of RAS-ERK and TERT promoter remodeling is a promising avenue to limit long-term survival of a majority of melanomas that harbor these two mutations."

For more information on this research see: Activation of mutant TERT promoter by RAS-ERK signaling is a key step in malignant progression of BRAF-mutant human melanomas. Proceedings of the National Academy of Sciences of the United States of America, 2016;113 (50):14402-14407. **Oncology - Melanoma**

**Data on Melanoma Reported by Researchers at University of Sydney**

*(Public preferences for communicating personal genomic risk information: a focus group study)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Melanoma have been published. According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "Personalized genomic risk information has the potential to motivate behaviour change and promote population health, but the success of this will depend upon effective risk communication strategies. To determine preferences for different graphical and written risk communication formats, and the delivery of genomic risk information including the mode of communication and the role of health professionals."

Funders for this research include Sydney Catalyst Pilot and Seed Funding, National Health and Medical Research Council, Cancer Institute NSW.

The news reporters obtained a quote from the research from the University of Sydney, "Focus groups, transcribed and analysed thematically. Thirty-four participants from the public. Participants were provided with, and invited to discuss, a hypothetical scenario giving an individual’s personalized genomic risk of melanoma displayed in several graphical formats. Participants preferred risk formats that were familiar and easy to understand, such as a ‘double pie chart’ and ‘100 person diagram’ (pictograph). The 100 person diagram was considered persuasive because it humanized and personalized the risk information. People described the pie
chart format as resembling bank data and food (such as cake and pizza). Participants thought that email, web-based platforms and postal mail were viable options for communicating genomic risk information. However, they felt that it was important that a health professional (either a genetic counsellor or 'informed' general practitioner) be available for discussion at the time of receiving the risk information, to minimize potential negative emotional responses and misunderstanding. Face-to-face or telephone delivery was preferred for delivery of high-risk results."

According to the news reporters, the research concluded: "These public preferences for communication strategies for genomic risk information will help to guide translation of genome-based knowledge into improved population health."

Our news correspondents report that additional information may be obtained by contacting A.E. Cust, University of Sydney, Sydney Sch Public Hlth, Canc Epidemiol & Serv Res, Sydney, NSW 2050, Australia. Additional authors for this research include L.A. Keogh, J. Hersch, A.J. Newson, P. Butow, G. Williams and A.E. Cust.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/hex.12406. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Sydney, Australia, Australia and New Zealand, Risk and Prevention, Oncology, Melanoma, Genetics, University of Sydney.

**Stem Cell Research - Mesenchymal Stem Cells**

**Data on Mesenchymal Stem Cells Reported by Researchers at Affiliated Hospital 1 (Low-magnitude, high-frequency vibration promotes the adhesion and the osteogenic differentiation of bone marrow-derived mesenchymal stem cells cultured on a ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Stem Cell Research - Mesenchymal Stem Cells are presented in a new report. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "The positive effect of low-magnitude, high-frequency (LMHF) vibration on implant osseointegration has been demonstrated; however, the underlying cellular and molecular mechanisms remain unknown. The aim of this study was to explore the effect of LMHF vibration on the adhesion and the osteogenic differentiation of bone marrow-derived mesenchymal stem cells (BMSCs) cultured on hydroxyapatite (HA)-coated surfaces in an in vitro model as well as to elucidate the molecular mechanism responsible for the effects of LMHF vibration on osteogenesis."

The news reporters obtained a quote from the research from Affiliated Hospital 1, "LMHF vibration resulted in the increased expression of fibronectin, which was measured by immunostaining and RT-qPCR. Stimulation of BMSCs by LMHF vibration resulted in the
rearrangement of the actin cytoskeleton with more prominent F-actin. Moreover, the expression of integrin, vinculin and paxillin was notably increased following LMHF stimulation. Scanning electron microscope observations revealed that there were higher cell numbers and more extracellular matrix attached to the HA-coated surface in the LMHF group. Alkaline phosphatase activity as well as the expression of osteogenic-specific genes, namely Runx2, osterix, collagen I and osteocalcin, were significantly elevated in the LMHF group. In addition, the protein expression of Wnt10B, -catenin, Runx2 and osterix was increased following exposure to LMHF vibration. Taken together, the findings of this study indicate that LMHF vibration promotes the adhesion and the osteogenic differentiation of BMSCs on HA-coated surfaces in vitro, and LMHF vibration may directly induce osteogenesis by activating the Wnt/-catenin signaling pathway."

According to the news reporters, the research concluded: "These data suggest that LMHF vibration enhances the osseointegration of bone to a HA-coated implant, and provide a scientific foundation for improving bone-implant osseointegration through the application of LMHF vibration."

For more information on this research see: Low-magnitude, high-frequency vibration promotes the adhesion and the osteogenic differentiation of bone marrow-derived mesenchymal stem cells cultured on a hydroxyapatite-coated surface: The direct role of Wnt/-catenin signaling pathway activation. *International Journal of Molecular Medicine*, 2016;38 (5):1531-1540. *International Journal of Molecular Medicine* can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

**Stem Cell Research - Mesenchymal Stem Cells**

**Data on Mesenchymal Stem Cells Reported by Researchers at New Jersey Institute of Technology (Sodium Tungstate for Promoting Mesenchymal Stem Cell Chondrogenesis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Stem Cell Research - Mesenchymal Stem Cells. According to news reporting from Newark, New Jersey, by NewsRx journalists, research stated, "Articular cartilage has a limited ability to heal. Mesenchymal stem cells (MSCs) derived from the bone marrow have shown promise as a cell type for cartilage regeneration strategies."

The news correspondents obtained a quote from the research from the New Jersey Institute of Technology, "In this study, sodium tungstate (Na2WO4), which is an insulin mimetic, was evaluated for the first time as an inductive factor to enhance human MSC
chondrogenesis. MSCs were seeded onto three-dimensional electrospun scaffolds in growth medium (GM), complete chondrogenic induction medium (CCM) containing insulin, and CCM without insulin. Na2WO4 was added to the media leading to final concentrations of 0, 0.01, 0.1, and 1 mM. Chondrogenic differentiation was assessed by biochemical analyses, immunostaining, and gene expression. Cytotoxicity using human peripheral blood mononuclear cells (PBMCS) was also investigated. The chondrogenic differentiation of MSCs was enhanced in the presence of low concentrations of Na2WO4 compared to control, without Na2WO4. In the induction medium containing insulin, cells in 0.01mM Na2WO4 produced significantly higher sulfated glycosaminoglycans, collagen type II, and chondrogenic gene expression than all other groups at day 28. Cells in 0.1 mM Na2WO4 had significantly higher collagen II production and significantly higher sox-9 and aggrecan gene expression compared to control at day 28. Cells in GM and induction medium without insulin containing low concentrations of Na2WO4 also expressed chondrogenic markers. Na2WO4 did not stimulate PBMC proliferation or apoptosis.

According to the news reporters, the research concluded: "The results demonstrate that Na2WO4 enhances chondrogenic differentiation of MSCs, does not have a toxic effect, and may be useful for MSC-based approaches for cartilage repair."

For more information on this research see: Sodium Tungstate for Promoting Mesenchymal Stem Cell Chondrogenesis. *Stem Cells and Development*, 2016;25(24):1909-1918. *Stem Cells and Development* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. **Microcirculation**

**Data on Microcirculation Reported by Researchers at Department of Anesthesiology (Sidestream dark field imaging of the serosal microcirculation during gastrointestinal surgery)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Microcirculation have been published. According to news originating from Nieuwegein, Netherlands, by NewsRx correspondents, research stated, "The study aimed to describe the serosal microcirculation of the human bowel using sidestream dark field imaging, a microscopic technique using polarized light to visualize erythrocytes
through capillaries. We also compared its feasibility to the current practice of sublingual microcirculatory assessment."

Our news journalists obtained a quote from the research from the Department of Anesthesiology, "In 17 patients sidestream dark field measurements were performed during gastrointestinal surgery. Microcirculatory parameters like microvascular flow index (MFI), proportion of perfused vessels (PPV), perfused vessel density (PVD) and total vessel density (TVD) were determined for every patient, sublingually and on the bowel serosa. Sixty measurements were done on the bowel of which eight (13%) were excluded, five owing to too much bowel peristalsis and three because of pressure artefacts. Image stability was in favour of sublingual measurements [pixel loss per image, bowel 145 (95% CI 126-164) vs sublingual 55 (95% CI 41-68); p<0.001] and time to acquire a stable image [bowel 96 s (95% CI 63-129) vs. sublingual 46 s (95% CI 29-64); p=0.013]. No difference in the MFI was observed [bowel 2.9 (interquartile range 2.87-2.95) vs sublingual 3.0 (interquartile range 2.91-3.0); p=0.081]. There was a difference in the PPV [bowel 95% (95% CI 94-96) vs sublingual 97% (95% CI 97-99); p<0.001], PVD [bowel 12.9 mm/mm² (95% CI 11.1-14.8) vs sublingual 17.4 mm/mm² (95% CI 15.6-19.1); p=0.003] and the TVD [bowel 13.6 mm/mm² (95% CI 11.6-15.6) vs sublingual 17.7 mm/mm² (95% CI 16.0-19.4); p=0.008]. Sidestream dark field imaging is a very promising technique for bowel microcirculatory visualization and assessment."

According to the news editors, the research concluded: "It is comparable to sublingual assessment and the analysis produces a similar outcome with slightly differing anatomical features."

The news correspondents report that additional information may be obtained from A.F. de Bruin, Dept. of Anesthesiology, Intensive Care and Pain Medicine, St Antonius Hospital, Nieuwegein, Netherlands. Additional authors for this research include V.N. Kornmann, K. van der Sloot, J.L. van Vugt, M.P. Gosselink, A. Smits, B. Van Ramshorst, E.C. Boerma, P.G. Noordzij, D. Boerma and M. van Iterson.

**Oncology - Molecular Cancer and Carcinogenesis**

**Data on Molecular Cancer and Carcinogenesis Discussed by Researchers at University of Minnesota (Functional activation of PPAR in human upper aerodigestive cancer cell lines)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Molecular Cancer and Carcinogenesis is now available. According to news reporting originating in Minneapolis, Minnesota, by NewsRx
journalists, research stated, "Upper aerodigestive cancer is an aggressive malignancy with relatively stagnant long-term survival rates over 20yr. Recent studies have demonstrated that exploitation of PPAR pathways may be a novel therapy for cancer and its prevention."

The news reporters obtained a quote from the research from the University of Minnesota, "We tested whether PPAR is expressed and inducible in aerodigestive carcinoma cells and whether it is present in human upper aerodigestive tumors. Human oral cancer CA-9-22 and NA cell lines were treated with the PPAR activators eicosatetraynoic acid (ETYA), 15-deoxy-12,14-prostaglandin J2 (PG-J2), and the thiazolidinedione, ciglitazone, and evaluated for their ability to functionally activate PPAR luciferase reporter gene constructs. Cellular proliferation and clonogenic potential after PPAR ligand treatment were also evaluated. Aerodigestive cancer specimens and normal tissues were evaluated for PPAR expression on gene expression profiling and immunoblotting. Functional activation of PPAR reporter gene constructs and increases in PPAR protein were confirmed in the nuclear compartment after PPAR ligand treatment. Significant decreases in cell proliferation and clonogenic potential resulted from treatment. Lipid accumulation was induced by PPAR activator treatment. 75% of tumor specimens and 100% of normal control tissues expressed PPAR RNA, and PPAR protein was confirmed in 66% of tumor specimens analyzed by immunoblotting. We conclude PPAR can be functionally activated in upper aerodigestive cancer and that its activation downregulates several features of the neoplastic phenotype."

According to the news reporters, the research concluded: "PPAR expression in human upper aerodigestive tract tumors and normal cells potentially legitimizes it as a novel intervention target in this disease."

Our news correspondents report that additional information may be obtained by contacting F.G. Ondrey, University of Minnesota, Dept. of Otolaryngol, Minneapolis, MN 55455, United States. Additional authors for this research include B.R. Wuertz, G. Harris, R. Abu Ghazallah, W.A. Miller, P.M. Gaffney and F.G. Ondrey.

**Data on Molecular Research Detailed by Researchers at Konkuk University (Effects of Ganodermanondiol, a New Melanogenesis Inhibitor from the Medicinal Mushroom Ganoderma lucidum)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Molecular Research. According to news reporting out of Chungju, South Korea, by NewsRx editors, research stated, "Ganoderma lucidum, a species of the Basidiomycetes class, has been attracting international attention owing
to its wide variety of biological activities and great potential as an ingredient in skin care cosmetics including 'skin-whitening' products. However, there is little information available on its inhibitory effect against tyrosinase activity."

Our news journalists obtained a quote from the research from Konkuk University, "Therefore, the objectives of this study were to investigate the chemical composition of G. lucidum and its inhibitory effects on melanogenesis. We isolated the active compound from G. lucidum using ethanol extraction and ethyl acetate fractionation. In addition, we assayed its inhibitory effects on tyrosinase activity and melanin biosynthesis in B16F10 melanoma cells. In this study, we identified a bioactive compound, ganoderanondiol, which inhibits the activity and expression of cellular tyrosinase and the expression of tyrosinase-related protein-1 (TRP-1), TRP-2, and microphthalmia-associated transcription factor (MITF), thereby decreasing melanin production. Furthermore, ganoderanondiol also affected the mitogen-activated protein kinase (MAPK) cascade and cyclic adenosine monophosphate (cAMP)-dependent signaling pathway, which are involved in the melanogenesis of B16F10 melanoma cells."

According to the news editors, the research concluded: "The finding that ganoderanondiol from G. lucidum exerts an inhibitory effect on tyrosinase will contribute to the use of this mushroom in the preparation of skin care products in the future."

For more information on this research see: Effects of Ganoderanondiol, a New Melanogenesis Inhibitor from the Medicinal Mushroom Ganoderma lucidum. *International Journal of Molecular Sciences*, 2016;17(11):610-621. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Our news journalists report that additional information may be obtained by contacting J.W. Kim, Konkuk University, Dept. of Biomed Chem, Chungju 27478, South Korea. Additional authors for this research include H.I. Kim, J.H. Kim, O.C. Kwon, E.S. Son, C.S. Lee and Y.J. Park.

**Life Science Research - Molecular and Cellular Biology**

**Data on Molecular and Cellular Biology Discussed by Researchers at Zhongshan Ophthalmic Center (TRIM14 Inhibits cGAS Degradation Mediated by Selective Autophagy Receptor p62 to Promote Innate Immune Responses)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Life Science Research - Molecular and Cellular Biology are presented in a new report. According to news reporting originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Cyclic GMP-AMP synthase (cGAS) is an essential DNA virus sensor that triggers type I interferon (IFN) signaling by producing cGAMP to initiate antiviral immunity. However, post-translational regulation of cGAS remains largely unknown."

Our news editors obtained a quote from the research from Zhongshan Ophthalmic Center, "We report that K48-linked ubiquitination of cGAS is a recognition signal for p62-dependent selective autophagic degradation. The induction of TRIM14 by type I IFN
accelerates cGAS stabilization by recruiting USP14 to cleave the ubiquitin chains of cGAS at lysine (K) 414. Knockout of TRIM14 impairs herpes simplex virus type 1 (HSV-1)-triggered antiviral responses in a cGAS-dependent manner. Due to impaired type I IFN production, Trim14(-/-) mice are highly susceptible to lethal HSV-1 infection."

According to the news editors, the research concluded: "Taken together, our findings reveal a positive feedback loop of cGAS signaling generated by TRIM14-USP14 and provide insights into the crosstalk between autophagy and type I IFN signaling in innate immunity."

For more information on this research see: TRIM14 Inhibits cGAS Degradation Mediated by Selective Autophagy Receptor p62 to Promote Innate Immune Responses. Molecular Cell, 2016;64(1):105-119. Molecular Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Molecular Cell - www.journals.elsevier.com/molecular-cell/)

The news editors report that additional information may be obtained by contacting J.J. Huang, Sun Yat Sen UniversityState Key Lab Ophthalmol, Zhongshan Ophthalm Center, Guangzhou 510275, Guangdong, People's Republic of China. Additional authors for this research include Q.C. Meng, Y.F. Oncology - Multiple Myeloma

Data on Multiple Myeloma Detailed by Researchers at Jagiellonian University (Characteristics and outcomes of patients with multiple myeloma aged 21-40years versus 41-60years: a multi-institutional case-control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Multiple Myeloma are presented in a new report. According to news reporting from Krakow, Poland, by NewsRx journalists, research stated, "We compared the outcomes of multiple myeloma (MM) patients aged 21-40 and 41-60years in the novel agent era. This case-control study included 1089 patients between 2000 and 2015."

The news correspondents obtained a quote from the research from Jagiellonian University, "Cases and controls were matched for sex, International Staging System (ISS) stage and institution. There were 173 patients in the younger group and 916 patients in the older group. Younger patients presented with a higher incidence of lytic lesions (82% vs. 72%; P=0 <bold>04) and high-risk cytogenetic abnormalities (83% vs. 68%; P=0 <bold>007), but lower rate of elevated lactate dehydrogenase (21% vs. 44%; P<0 <bold>001). Five- and 10-year overall survival (OS) in younger versus older patients was 83% vs. 67% and 56% vs. 39%, respectively (P <0 <bold>001). Similar results were seen when studying the subset of 780 patients who underwent autologous transplantation. Younger patients
with ISS stage 1 had a better OS than older patients (P <0.001).

According to the news reporters, the research concluded: "There was no survival difference between younger and older patients with ISS stage 2 or 3. Younger MM patients, aged 21-40 years, treated in the era of novel agents have a better OS than their counterparts aged 41-60 years, but the survival advantage observed in younger patients was lost in more advanced stages of MM."

**Musculoskeletal Diseases and Conditions - Muscular...**

**Data on Muscular Dystrophy Described by Researchers at Tokyo Women's Medical University (Target resequencing of neuromuscular disease-related genes using next-generation sequencing for patients with undiagnosed early-onset neuromuscular ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Musculoskeletal Diseases and Conditions - Muscular Dystrophy. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Neuromuscular disorders are clinically and genetically heterogeneous diseases with broadly overlapping clinical features. Progress in molecular genetics has led to the identification of numerous causative genes for neuromuscular disorders, but Sanger sequencing-based diagnosis remains labor-intensive and expensive because the genes are large, the genotypes and phenotypes of neuromuscular disorders overlap and multiple genes related to a single phenotype exist."

Our news journalists obtained a quote from the research from Tokyo Women's Medical University, "Recently, the advent of next-generation sequencing (NGS) has enabled efficient, concurrent examination of several related genes. Thus, we used NGS for target resequencing of neuromuscular disease-related genes from 42 patients in whom undiagnosed early-onset neuromuscular disorders. Causative genes were identified in 19/42 (45.2%) patients (six, congenital muscular dystrophy; two, Becker muscular dystrophy (BMD); three, limb-girdle..."
muscular dystrophy; one, concurrent BMD and Fukuyama congenital muscular dystrophy; three, nemaline myopathy; one, centronuclear myopathy; one, congenital fiber-type disproportion; one, myosin storage myopathy; and one, congenital myasthenic syndrome). We detected variants of uncertain significance in two patients. In 6/19 patients who received a definitive diagnosis, the diagnosis did not require muscle biopsy."

According to the news editors, the research concluded: "Thus, for patients with suspected neuromuscular disorders not identified using conventional genetic testing alone, NGS-based target resequencing has the potential to serve as a powerful tool that allows definitive diagnosis."

The news correspondents report that additional information may be obtained from K. Saito, Tokyo Women's Medical University, Inst Med Genet, Tokyo, Japan. Additional authors for this research include E. Kondo, M. Urano, R. Aoki and K. Saito.

**Hematologic Diseases and Conditions**

**Data on Myelodysplastic Syndromes Reported by Researchers at Soochow University (Monosomal karyotype of chromosome 5/7 was an independent poor prognostic factor for Chinese myelodysplastic syndrome patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematologic Diseases and Conditions - Myelodysplastic Syndromes. According to news reporting out of Suzhou, People's Republic of China, by NewsRx editors, research stated, "Monosomal karyotype (MK) was defined as the presence of at least 2 autosomal monosomies or of a single monosomy associated with at least one additional structural abnormality. 6.4-16.3% myelodysplastic syndrome (MDS) patients were reported to fulfill the criteria for MK and associated with poor prognosis in the majority of patients with MDS. In order to further clarify the prognostic significance of MK in Chinese MDS patients, 2080 primary patients were retrospectively analyzed in our center."

Funders for this research include National Key Scientific Projects of China, Priority Academic Program Development of Jiangsu Higher Education Institutions, National Public
Our news journalists obtained a quote from the research from Soochow University, "MK was observed in 8.1% patients (168/2080), and monosomies of chromosome 5/7 were the most frequent types of MK. We further found that MK was significantly associated with elderly patients, higher bone marrow blasts and relatively poor cytogenetics. In addition, MDS patients with MK (n = 59) had poor survival than those without MK (n = 491) in total cohort (P < 0.001), and there was significant difference in the OS between the patients with MK (n = 56) and without MK (n = 53) in the relatively poor cytogenetics group (P = 0.0025). Incorporation of MK into IPSS-R could further stratify MDS patients into different prognostic groups (P < 0.001). Interestingly, monosomies of chromosome 5/7 rather than MK were significantly related to shorter OS (HR = 2.709, P< 0.001) by multivariate analysis."

According to the news editors, the research concluded: "Our results suggested that 8.1% MDS patients were presented with MK, and the incidence of MK increased with the number of cytogenetic abnormalities. Monosomies of chromosome 5/7 were the most frequent MK as well as an independent poor risk factor for OS in Chinese MDS patients."

For more information on this research see: Monosomal karyotype of chromosome 5/7 was an independent poor prognostic factor for Chinese myelodysplastic syndrome patients. Cancer Genetics, 2016;209(9):423-429. Cancer Genetics can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Korea.

Our news journalists obtained a quote from the research from Sejong University, "Macrophages can be categorized into two extreme subsets, classically activated (M1) and alternatively activated (M2) macrophages based on their distinct functional abilities in response to microenvironmental stimuli. In a tumor microenvironment, tumor associated macrophages (TAMs) are considered to be of the polarized M2 phenotype that enhances tumor progression and represent a poor prognosis. Furthermore, TAMs enhance tumor angiogenesis, growth, metastasis, and immunosuppression by secreting a series of cytokines, chemokines, and proteases."

According to the news editors, the research concluded: "The regulation of macrophage polarization is considered to be a potential future therapy for cancer management."

For more information on this research see: "Diverse macrophages polarization in tumor microenvironment. Archives of Pharmacal Research, 2016;39(11):1588-1596. Nanotechnology - Nanocomplexes

Data on Nanocomplexes Discussed by Researchers at Ben-Gurion University of the Negev (Mechanisms of cellular uptake and endosomal escape of calcium-siRNA nanocomplexes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nanotechnology - Nanocomplexes. According to news reporting originating in Beer Sheva, Israel, by NewsRx journalists, research stated, "Ca2+-siRNA nanocomplexes represent a simple yet an effective platform for siRNA delivery into the cell cytoplasm, with subsequent successful siRNA-induced target gene silencing. Herein, we aimed to elucidate the roles played by calcium ions in siRNA nanocomplex formation, cell uptake, and endosomal escape."

The news reporters obtained a quote from the research from the Ben-Gurion University of the Negev, "We investigated whether the replacement of Ca2+ in the nanocomplex by other bivalent cations would affect their cell entry and subsequent gene silencing. Our results indicate that Mg2+ and Ba2+ lead to the formation of nanocomplexes of similar physical features (size = 100 nm, surface charge zeta = -8 mV) as the Ca2+-siRNA nanocomplexes. Yet, these nanocomplexes were not uptaken by the cells to the same extent as those prepared with Ca2+, and siRNA-induced target gene silencing was not obtained. Cell internalization of Ca2+-
siRNA nanocomplexes, examined by employing chemical inhibitors to clathrin-, caveolin- and dynamin-mediated endocytosis pathways, indicated the involvement of all mechanisms in the process. Inhibition of endosome acidification by bafilomycin completely abolished the siRNA-mediated silencing by Ca2+-siRNA nanocomplexes."

According to the research reporters, the research concluded: "Collectively, our results indicate that Ca2+ promotes cell internalization and rapid endosomal escape, thus leading to the efficient siRNA-induced target gene silencing elicited by the Ca2+-siRNA nanocomplexes."

Our news correspondents report that additional information may be obtained by contacting M. Goldshtein, Ben Gurion University of the Negev, Avram & Stella Goldstein Goren Dept. of Biotechnol En, IL-8410501 Beer Sheva, Israel. Additional authors for this research include E. Forti, E. Ruvinov and S. Cohen.

**Nanotechnology - Nanomaterials**

**Data on Nanomaterials Reported by Researchers at Joint Research Center (The JRC Nanomaterials Repository: A unique facility providing representative test materials for nanoEHS research)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nanotechnology - Nanomaterials have been published. According to news reporting from Ispra, Italy, by NewsRx journalists, research stated, "The European Commission has established a Nanomaterials Repository that hosts industrially manufactured nanomaterials that are distributed world-wide for safety testing of nanomaterials. In a first instance these materials were tested in the OECD Testing Programme."

The news correspondents obtained a quote from the research from Joint Research Center, "They have then also been tested in several EU funded research projects. The JRC Repository of Nanomaterials has thus developed into serving the global scientific community active in the nanoEHS (regulatory) research. The unique Repository facility is a state-of-the-art installation that allows customised sub-sampling under the safest possible conditions, with traceable final sample vials distributed world-wide for research purposes. This paper describes the design of the Repository to perform a semi-automated subsampling procedure, offering high degree of flexibility and precision in the preparation of NM vials for customers, while guaranteeing the safety of the operators, and environmental protection. The JRC nanomaterials
According to the news reporters, the research concluded: "Their wide use world-wide facilitates the generation of comparable and reliable experimental results and datasets in (regulatory) research by the scientific community, ultimately supporting the further development of the OECD regulatory test guidelines."

For more information on this research see: The JRC Nanomaterials Repository: A unique facility providing representative test materials for nanoEHS research. Regulatory Toxicology and Pharmacology, 2016;81():334-340. **Nanotechnology - Nanoparticles**

**Data on Nanoparticles Described by Researchers at Colorado School of Mines (Surface Modification of Gd Nanoparticles with pH-Responsive Block Copolymers for Use As Smart MRI Contrast Agents)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nanotechnology - Nanoparticles. According to news reporting originating in Golden, Colorado, by NewsRx journalists, research stated, "Despite recent advances in the understanding of fundamental cancer biology, cancer remains the second most common cause of death in the United States. One of the primary factors indicative of high cancer morbidity and mortality and aggressive cancer phenotypes is tumors with a low extracellular pH (pHe)."

Financial supporters for this research include Colorado School of Mines, Colorado Office of Economic Development and International Trade.

The news reporters obtained a quote from the research from the Colorado School of Mines, "Thus, the ability to measure tumor pH in vivo using noninvasive and accurate techniques that also provide high spatiotemporal resolution has become increasingly important and is of great interest to researchers and clinicians. In an effort to develop a pH-responsive magnetic resonance imaging (MRI) contrast agent (CA) that has the potential to be used to measure tumor pH, well-defined pH-responsive polymers, synthesized via reversible addition-fragmentation chain transfer polymerization, were attached to the surface of gadolinium-based nanoparticles (GdNPs) via a 'grafting to' method after reduction of the thiocarbonylthio end groups. The successful modification of the GdNPs was verified by transmission electron
microscopy, Fourier transform infrared spectroscopy, thermogravimetric analysis and dynamic light scattering. The performance of the pH-responsive polymer modified GdNPs was then evaluated for potential use as smart MRI CAs via monitoring the relaxivity changes with changing environmental pH."

According to the news reporters, the research concluded: "The results suggested that the pH-responsive polymers can be used to effectively modify the GdNPs surface to prepare a smart contrast agent for MRI."

Our news correspondents report that additional information may be obtained by contacting L. Zhu, Dept. of Chemistry and Geochemistry, Colorado School of Mines, Golden, Colorado 80401, United States. Additional authors for this research include Y. Yang, K. Farquhar, J. Wang, C. Tian, J. Ranville and S.G Boyes.

Nanotechnology

Data on Nanotechnology Detailed by Researchers at Purdue University (Optical Clearing Delivers Ultrasensitive Hyperspectral Dark-Field Imaging for Single-Cell Evaluation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nanotechnology. According to news reporting originating from West Lafayette, Indiana, by NewsRx correspondents, research stated, "A single-cell optical clearing methodology is developed and demonstrated in hyperspectral dark-field microscopy (HSDFM) and imaging of plasmonic nanoprobes. Our strategy relies on a combination of delipidation and refractive index (RI) matching with highly biocompatible and affordable agents."

Financial supporters for this research include W.M. Keck Foundation, Purdue Center for Cancer Research.

Our news editors obtained a quote from the research from Purdue University, "Before applying the RI-matching solution, the delipidation step by using a mild solvent effectively eliminates those high-density, lipid-enriched granular structures which emit strong scattering. Upon treatment, the background scattering from cellular organelles could be repressed to a negligible level while the scattering signals from plasmonic nanomaterials increase, leading to a significant improvement of the signal-to-noise ratio (SNR). With this method established, the versatility and applicability of HSDFM are greatly enhanced. In our demonstration, quantitative mapping of the dimerization-activated receptor kinase HER2 is achieved in a single cancer cell by a nonfluorescent approach. High-resolution imaging for
oncogenic mRNAs, namely ER, PR, and HER2, is performed with single labeling. More importantly, in situ multiplex detection of mRNA and protein is made possible by HSDFM since it overcomes the difficulties of complex staining and signal imbalance suffered by the conventional optical imaging. Last, we show that with optical clearing, characterization of intracellularly grown gold particulates is accomplished at an unprecedented spatiotemporal resolution.

According to the news editors, the research concluded: "Taken together, the uniqueness of optical clearing and HSDFM is expected to open ample avenues for single-cell studies and biomedical engineering."

The news editors report that additional information may be obtained by contacting Y. Cui, Dept. of Agricultural and Biological Engineering, Bindley Bioscience Center and Birck Nanotechnology Center, Purdue Center for Cancer Research, Purdue University, West Lafayette, Indiana 47907, United States. Additional authors for this research include X. Wang, W. Ren, J. Liu and J. Irudayaraj.

**Oncology - Nasopharyngeal Carcinoma**

**Data on Nasopharyngeal Carcinoma Reported by Researchers at Cancer Hospital (Therapeutic effect of TMZ-POH on human nasopharyngeal carcinoma depends on reactive oxygen species accumulation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Nasopharyngeal Carcinoma. According to news reporting originating from Jinan, People's Republic of China, by NewsRx correspondents, research stated, "Nasopharyngeal carcinoma (NPC) is a common head and neck malignancy without efficient chemotherapeutic agents for it. In our current study, we demonstrated the cytotoxicity effects of a newly patented compound temozolomide-perillyl alcohol (TMZ-POH) on NPC in vitro and in vivo, and the possible mechanisms involved."

Our news editors obtained a quote from the research from Cancer Hospital, "Human NPC cell lines CNE1, CNE2, HNE2, and SUME-a were treated with control (DMSO), TMZ, POH, TMZ plus POH, and TMZ-POH. Our data indicated that TMZ-POH could inhibit NPC cell proliferation, cause G2/M arrest and DNA damage. TMZ-POH triggered apoptosis in NPC cells via significant activation of caspase-3 and poly(ADP-ribose) polymerase (PARP). Importantly, TMZ-POH-induced cell death was found to be associated with (i) the loss of inner mitochondrial membrane potential (DPSm) and release of mitochondrial Cytochrome c, (ii) the increase in ROS generation, and (iii) the activation of stress-activated protein kinases (SAPK)/c-
Jun N-terminal kinases (JNK) signaling pathway. The generation of ROS in response to TMZ-POH seems to play a crucial role in the cell death process since the blockage of ROS production using the antioxidant N-acetyl-L-cysteine or catalase reversed the TMZ-POH-induced JNK activation, DNA damage, and cancer cell apoptosis."

According to the news editors, the research concluded: "These results provide the rationale for further research and preclinical investigation of the antitumor effect of TMZ-POH against human NPC."

For more information on this research see: Therapeutic effect of TMZ-POH on human nasopharyngeal carcinoma depends on reactive oxygen species accumulation. *Oncotarget*, 2016;7(2):1651-62.

The news editors report that additional information may be obtained by contacting L. Xie, Shandong Provincial Key Laboratory of Radiation Oncology, Shandong Cancer Hospital and Institute, Jinan, Shandong Province, People's Republic of China. Additional authors for this research include X. Song, W. Guo, X. Wang, L. Wei, Y. Li, L. Lv, W. Wang, T.C. Chen and X. Song.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18632/oncotarget.6410. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Nasopharyngeal Carcinoma**

**Data on Nasopharyngeal Carcinoma Reported by Researchers at Wenzhou Medical University (MiR-17-5p promotes cancer cell proliferation and tumorigenesis in nasopharyngeal carcinoma by targeting p21)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Nasopharyngeal Carcinoma. According to news originating from Wenzhou, People's Republic of China, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) may act as either tumor suppressors or oncogenes in various types of cancers. Previous studies have indicated that miR-17-5p is involved in the initiation and development of human tumors."

Our news journalists obtained a quote from the research from Wenzhou Medical University, "However, its mechanism and function in nasopharyngeal carcinoma (NPC) remain largely unclear. In this study, we evaluated the expression profiles of miR-17-5p and p21 in NPC cell lines and tissues by quantitative real-time PCR (qRT-PCR). For the analysis, we have established a stable overexpression or depletion of miR-17-5p NPC cell lines for analyzing the effects of cell proliferation by MTT, colony formation, and cell cycle assay. A nude mice xenograft model was used to verify the tumor growth in vivo. MiR-17-5p was overexpressed, whereas the expression of p21 was downregulated in NPC cell lines and tissues. The miR-17-5p expression level was inversely correlated with the p21 mRNA level in NPC samples. Furthermore, analysis of 2(-Delta Delta Ct) value in 81 NPC patients suggested that the elevated expression level of miR-17-5p or the downregulated expression level of p21 was significantly
correlated with tumor size (T classification) and tumor stage, and Kaplan-Meier survival analysis revealed a correlation between miR-17-5p or p21 expression level and overall survival times in 81 NPC patients. MiR-17-5p promoted cell growth in vivo and in vitro by directly targeting p21."

According to the news editors, the research concluded: "Our results indicate that miR-17-5p can promote the occurrence of NPC and it may serve as a potential novel diagnostic maker or therapeutic target for NPC in the future."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cam4.863. This DOI is a link to an online electronic document that is either free or for purchase.

**Natural Language Processing**

**Data on Natural Language Processing Discussed by Researchers at University of Utah (The use of natural language processing on narrative medication schedules to compute average weekly dose)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Natural Language Processing have been published. According to news reporting from Salt Lake City, Utah, by NewsRx journalists, research stated, "Medications with non-standard dosing and unstandardized units of measurement make the estimation of prescribed dose difficult from pharmacy dispensing data. A natural language processing tool named the SIG extractor was developed to identify and extract elements from narrative medication instructions to compute average weekly doses (AWDs) for disease-modifying antirheumatic drugs."

The news correspondents obtained a quote from the research from the University of Utah, "The goal of this paper is to evaluate the performance of the SIG extractor. This agreement study utilized Veterans Health Affairs pharmacy data from 2008 to 2012. The SIG extractor was designed to extract key elements from narrative medication schedules (SIGs) for 17 select medications to calculate AWD, and these medications were categorized by generic name and route of administration. The SIG extractor was evaluated against an annotator-derived reference standard for accuracy, which is the fraction of AWDs accurately computed. The overall accuracy was 89% [95% confidence interval (CI) 88%, 90%]. The accuracy was >= 85%
for all medications and route combinations, except for cyclophosphamide (oral) and cyclosporine (oral), which were 79% (95% CI 72%, 85%) and 66% (95% CI 58%, 73%), respectively. The SIG extractor performed well on the majority of medications, indicating that AWD calculated by the SIG extractor can be used to improve estimation of AWD when dispensed quantity or days' supply is questionable or improbable.”

According to the news reporters, the research concluded: "The working model for annotating SIGs and the SIG extractor are generalized and can easily be applied to other medications."

Our news journalists report that additional information may be obtained by contacting C.C. Lu, University of Utah, Salt Lake City, UT, United States. Additional authors for this research include J.W. Leng, G.W. Cannon, X. Zhou, M. Egger, B. South, Z. Buringham, Q. Zeng and B.C. Sauer.

Keywords for this news article include: Salt Lake City, Utah, United States, North and Central America, Emerging Technologies, Drugs and Therapies, Epidemiology, Natural Language Processing, Machine Learning, University of Utah.

**Surgery - Nephrectomy**

**Data on Nephrectomy Described by Researchers at Fox Chase Cancer Center (Perioperative Outcomes Following Partial Nephrectomy Performed on Patients Remaining on Antiplatelet Therapy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Surgery - Nephrectomy are discussed in a new report. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "We evaluated the risk of bleeding complications in patients undergoing partial nephrectomy in whom perioperative antiplatelet therapy was continued, as antiplatelet therapy is increasingly used and hemorrhage is a significant concern in partial nephrectomy. In this 2-center retrospective analysis 1,097 patients underwent partial nephrectomy between 2000 and 2014."

Our news editors obtained a quote from the research from Fox Chase Cancer Center, "The cohort was split into 3 groups of perioperative continuation of antiplatelet therapy (group 1-67), antiplatelet therapy stopped preoperatively (group 2-254) and no chronic antiplatelet therapy (group 3-776). Bleeding complications were defined as any transfusion, or any hospital readmission or secondary procedure performed for hemorrhage. Multivariable analysis was performed to elucidate independent risk factors for bleeding complications. Patients in group 1 were older (median age 66 years vs 64 and 57 years in groups 2/3, p< 0.0001), and had greater comorbidity (median ASA classification score 3 vs 2 and 2, p< 0.0001). Group 1 had a higher rate of bleeding complications (20.9% vs 7.1% and 6.4%, p< 0.0001) and transfusions (16.4%
Multivariable analysis revealed continued antiplatelet therapy was an independent predictor of bleeding complications (OR 2.19, 95% CI 1.06-4.51, p = 0.03). These findings appear attributable to intraoperative clopidogrel use. On multivariable analysis the use of aspirin alone was not associated with bleeding complications (OR 1.64, 95% CI 0.72-3.75, p = 0.24). The risk of bleeding complications due to antiplatelet therapy use at partial nephrectomy may be due to clopidogrel.

According to the news editors, the research concluded: "The need to continue perioperative aspirin alone does not appear to be a contraindication to the safe performance of partial nephrectomy."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.juro.2016.07.001. This DOI is a link to an online electronic document that is either free or for purchase.

**Nephrology**

**Data on Nephrology Described by Researchers at Baylor University College of Medicine (Neonatal extracorporeal renal replacement therapy—a routine renal support modality?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nephrology have been published. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Peritoneal dialysis (PD) is generally considered the preferred extracorporeal therapy for neonates with acute kidney injury (AKI). However, there are situations when PD is not suitable, such as in patients with previous abdominal surgery, hyperammonemia and significant ascites or anasarca."

Our news editors obtained a quote from the research from the Baylor University College of Medicine. "Additionally, with a need to start PD soon after catheter placement, there is increased risk of PD catheter leak and infection. Extracorporeal continuous renal replacement therapy (CRRT) is challenging in severely ill neonates as it requires obtaining adequately sized central venous access to accommodate adequate blood flow rates and also adaptation of a CRRT machine meant for older children and adults. In addition, ultrafiltration often cannot be set in
sufficiently small increments to be suitable for neonates. Although CRRT practices can be modified to fit the needs of infants and neonates, there is a need for a device designed specifically for this population."

According to the news editors, the research concluded: "Until that becomes available, providing the highest level of care for neonates with AKI is dependent on the shared experiences of members of the pediatric nephrology community."

For more information on this research see: Neonatal extracorporeal renal replacement therapy-a routine renal support modality? Pediatric Nephrology, 2016;31(11):2013-2015. Pediatric Nephrology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Pediatric Nephrology - www.springerlink.com/content/0931-041x/)

The news editors report that additional information may be obtained by contacting A. Akcan-Arikan, Baylor College of Medicine, Sect Pediat Crit Care Med, Dept. of Pediat, Houston, TX 77030, United States. Additional authors for this research include J.R. Angelo and A. Akcan-Arikan.

Intercellular Signaling Peptides and Proteins - Nerve...

Data on Nerve Growth Factors Detailed by Researchers at University of Torino (Neuregulin1 alpha activates migration of neuronal progenitors expressing ErbB4)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Intercellular Signaling Peptides and Proteins - Nerve Growth Factors have been published. According to news originating from Turin, Italy, by NewsRx correspondents, research stated, "Deficits in neuronal migration during development in the central nervous system may contribute to psychiatric diseases. The ligand neuregulin1 (NRG1) and its receptor ErbB4 are genes conferring susceptibility to schizophrenia, playing a key role in the control of neuronal migration both during development and adulthood."

Financial support for this research came from University of Torino.

Our news journalists obtained a quote from the research from the University of Torino, "Several NRG1 and ErbB4 isoforms were identified, which deeply differ in their characteristics. Here we focused on the four ErbB4 isoforms and the two NRG1 isoforms differing in their EGF-like domain, namely alpha and beta. We hypothesized that these isoforms, which are differently regulated in schizophrenic patients, could play different roles in neuronal migration. Our hypothesis was strengthened by the observation that both NRG1 alpha and NRG1 beta and the four ErbB4 isoforms are expressed in the medial and lateral ganglionic eminences and in the cortex during development in rat. We analysed in vitro the signal transduction pathways activated by the different ErbB4 isoforms following the treatment with soluble recombinant NRG1 alpha or NRG1 beta and the ability to stimulate migration."

According to the news editors, the research concluded: "Our data show that two ErbB4 isoforms, namely JMa-cyt2 and JMb-cyt1, following NRG1 alpha and NRG1 beta
treatment, strongly activate AKT phosphorylation, conferring high migratory activity to neuronal progenitors, thus demonstrating that both NRG1 alpha and NRG1 beta can play a role in neuronal migration."

For more information on this research see: Neuregulin1 alpha activates migration of neuronal progenitors expressing ErbB4. Molecular and Cellular Neuroscience, 2016;77():87-94. Molecular and Cellular Neuroscience can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Molecular and Cellular Neuroscience - www.journals.elsevier.com/molecular-and-cellular-neuroscience/)

The news correspondents report that additional information may be obtained from G. Gambarotta, Univ Torino, Dept. of Clin & Biol Sci, Turin, Italy. Additional authors for this research include M. El Soury, S. De Marchis, I. Perroteau, S. Geuna and G. Gambarotta.

Oncology - Neuroendocrine Cancer

Data on Neuroendocrine Cancer Described by Researchers at University of Fribourg (The matricellular protein CYR61 interferes with normal pancreatic islets architecture and promotes pancreatic neuroendocrine tumor progression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Neuroendocrine Cancer is the subject of a report. According to news reporting from Fribourg, Switzerland, by NewsRx journalists, research stated, "The significance of matricellular proteins during development and cancer progression is widely recognized. However, how these proteins actively contribute to physiological development and pathological cancer progression is only partially elucidated."

The news correspondents obtained a quote from the research from the University of Fribourg, "In this study, we investigated the role of the matricellular protein Cysteine-rich 61 (CYR61) in pancreatic islet development and carcinogenesis. Transgenic expression of CYR61 in b cells (Rip1CYR mice) caused irregular islets morphology and distorted sorting of a cells, but did not alter islets size, number or vascularization. To investigate the function of CYR61 during carcinogenesis, we crossed Rip1CYR mice with Rip1Tag2 mice, a well-established model of b cell carcinogenesis. Beta tumors in Rip1Tag2CYR mice were larger, more invasive and more vascularized compared to tumors in Rip1Tag2 mice. The effect of CYR61 on angiogenesis was fully abrogated by treating mice with the anti-VEGFR2 mAb DC101. Results from in vitro assays demonstrated that CYR61 modulated integrin a6b1-dependent invasion and adhesion without altering its expression. Taken together, these results show that CYR61 expression in pancreatic b cells interferes with normal islet architecture, promotes islet tumor growth, invasion and VEGF/VERGFR-2-dependent tumor angiogenesis."

According to the news reporters, the research concluded: "Taken together, these
observations demonstrate that CYR61 acts as a tumor-promoting gene in pancreatic neuroendocrine tumors."

For more information on this research see: The matricellular protein CYR61 interferes with normal pancreatic islets architecture and promotes pancreatic neuroendocrine tumor progression. *Oncotarget*, 2016;7(2):1663-74.

Our news journalists report that additional information may be obtained by contacting Y.T. Huang, Dept. of Medicine, Faculty of Science, University of Fribourg, Fribourg, Switzerland. Additional authors for this research include Q. Lan, L. Ponsonnet, M. Blanquet, G. Christofori, J. Zaric and C. Ruegg.

**Oncology - Neuroendocrine Cancer**

**Data on Neuroendocrine Cancer Reported by Researchers at Harris Health System (Management of neuroendocrine tumors)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Neuroendocrine Cancer is the subject of a report. According to news reporting out of Houston, Texas, by NewsRx editors, the research stated, "Current strategies for managing neuroendocrine tumors (NETs) in adult patients are reviewed, with a focus on medication safety concerns. NETs usually originate in the gastrointestinal or bronchopulmonary tract."

Our news journalists obtained a quote from the research from Harris Health System, "Symptoms due to hormonal hypersecretion often occur in patients with foregut or midgut NETs or liver metastases. Surgical resection is recommended for most localized NETs, while systemic cytotoxic chemotherapy is typically used for high-grade and pancreatic tumors. The standard of care for metastatic NETs is somatostatin analog therapy with octreotide (available in both short- and long-acting formulations) or a depot formulation of lanreotide. Everolimus and sunitinib are targeted therapies with approved indications for use in treating advanced pancreatic NETs. Some patients with liver-predominant disease or liver metastases may undergo regional chemoembolization procedures. Pharmacists should be cognizant of differences between newer and older chemoembolization agents and procedures, as well as differences between somatostatin analog products used as medications and the radiolabelled forms used, in diagnostic scintigraphy. Other medication safety issues in NET management arise during perioperative supportive care, patient education, compliance counseling, and management of adverse effects of targeted therapies and chemotherapy, including stomatitis, hyperthyroidism, and hand-foot skin reaction. Somatostatin analog therapy is the mainstay for management of locally advanced or metastatic NETs. Liver-directed therapy is an option for localized unresectable disease; platinum-based chemotherapy is the first-line treatment for poorly differentiated tumors."

According to the news editors, the research concluded: "Optimal sequencing of these..."
treatments and targeted therapies such as everolimus and tyrosine kinase inhibitors remains to be elucidated."

For more information on this research see: Management of neuroendocrine tumors. American Journal of Health-System Pharmacy, 2016;73(21):1729-1744. American Journal of Health-System Pharmacy can be contacted at: Amer Soc Health-System Pharmacists, 7272 Wisconsin Ave, Bethesda, MD 20814, USA.

Our news journalists report that additional information may be obtained by contacting C. Chung, Harris Hlth Syst, Lyndon B Johnson Gen Hosp, Houston, TX 77230, United States.

Neurons

Data on Neurons Discussed by Researchers at Chongqing Medical University (beta-Caryophyllene protects invitro neurovascular unit against oxygen-glucose deprivation and re-oxygenation-induced injury)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurons. According to news reporting out of Chongqing, People's Republic of China, by NewsRx editors, research stated, "Beta-Caryophyllene (BCP) mediates neuroprotection in cerebral ischemic animals. The neurovascular unit (NVU) acts as an intricate network to maintain the neuronal homeostatic microenvironment."

Our news journalists obtained a quote from the research from Chongqing Medical University, "However, the effects exerted by BCP on NVU remain unclear. Therefore, we established an invitro NVU model to investigate the effects of BCP on oxygen-glucose deprivation and re-oxygenation (OGD/R)-induced injury. This model involved the co-culture of brain microvascular endothelial cells, neurons, and astrocytes. BCP (10mol/L) was applied for 24h prior to OGD/R and maintained throughout OGD/R. Blood-brain barrier (BBB) integrity and neuronal apoptosis were analyzed. BCP pre-treatment prior to the initiation of OGD/R significantly (i) decreased BBB permeability and neuronal apoptosis, (ii) mitigated oxidative stress damage and the release of inflammatory cytokines, (iii) down-regulated Bax expression, metalloproteinase-9 activity and expression, and (iv) up-regulated claudin-5, occludin, ZO-1, growth-associated protein-43 and Bcl-2 expression. Thus, BCP pre-treatment exerted multiple protective effects on NVU in the context of OGD/R-induced injury. These protective effects potentially occur via reductions in oxidative stress damage and inflammatory cytokines that induce BBB breakdown, subsequently resulting in reduced neuronal apoptosis."

According to the news editors, the research concluded: "The NVU serves as putative
therapeutic targets for cerebral ischemia, and the results of this study provide new insights for the application of BCP as a neuroprotective agent."

Oncology - Non-Hodgkin Lymphoma

Data on Non-Hodgkin Lymphoma Detailed by Researchers at Beijing University (Molecular genetics related to non-Hodgkin lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Non-Hodgkin Lymphoma are presented in a new report. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Non-Hodgkin lymphoma (NHL) is a serious disease, with a high proportion of mortality. Molecular genetic abnormalities are very common in NHL, but specific characterization in accordance to molecular genetics for lymphoma subtypes is not yet completed."

Our news editors obtained a quote from the research from Beijing University, "This article summarizes the relationship between B-and T-NHL and molecular genetics. We focus on NHL subtypes and emphasize its features to figure out what is exposed about NHL genetics. The basis of this method is collection of biological specimens for genomic and genetic analyses."

According to the news editors, the research concluded: "This summary may help to prompt prediction of outcomes and guide therapy in the future."

For more information on this research see: Molecular genetics related to non-Hodgkin lymphoma. Open Life Sciences, 2016;11(1):86-90. Open Life Sciences can be contacted at: De Gruyter Open Ltd, Bogumila Zuga 32A St, 01-811 Warsaw, Poland.

The news editors report that additional information may be obtained by contacting X.Q. Ding, Beijing Univ Tradit Chinese Med, Affiliated Hosp 2, Dept. of Hematol, Beijing 100078, People's Republic of China. Additional authors for this research include X.L. Mao and X.Q. Ding.

**Oncology - Non-Small Cell Lung Cancer**

**Data on Non-Small Cell Lung Cancer Reported by Researchers at Gunma University (Dosimetric comparison of carbon ion and X-ray radiotherapy for Stage IIIA non-small cell lung cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news originating from Maebashi, Japan, by NewsRx correspondents, research stated, "The present study compared the dose-volume histograms of patients with Stage IIIA non-small cell lung cancer (NSCLC) treated with carbon ion radiotherapy with those of patients treated with X-ray radiotherapy. Patients with Stage IIIA NSCLC (n = 10 patients for each approach) were enrolled."

Our news journalists obtained a quote from the research from Gunma University, "Both radiotherapy plans were calculated with the same targets and organs at risk on the same CT. The treatment plan for the prophylactic lymph node and primary tumor (PTV1) delivered 40 Gy for X-ray radiotherapy and 40 Gy (relative biological effectiveness; RBE) for carbon ion radiotherapy. The total doses for the primary tumor and clinically positive lymph nodes (PTV2) were 60 Gy for X-ray radiotherapy and 60 Gy (RBE) for carbon ion radiotherapy. The homogeneity indexes for PTV1 and PTV2 were superior for carbon ion radiotherapy in comparison with X-ray radiotherapy (PTV1, 0.57 vs 0.65, P = 0.009; PTV2, 0.07 vs 0.16, P = 0.005). The normal lung mean dose, V5, V10 and V20 for carbon ion radiotherapy were 7.7 Gy (RBE), 21.4%, 19.7% and 17.0%, respectively, whereas the corresponding doses for X-ray radiotherapy were 11.9 Gy, 34.9%, 26.6% and 20.8%, respectively. Maximum spinal cord dose, esophageal maximum dose and V50, and bone V10, V30 and V50 were lower with carbon ion radiotherapy than with X-ray radiotherapy."

According to the news editors, the research concluded: "The present study indicates that carbon ion radiotherapy provides a more homogeneous target dose and a lower dose to organs at risk than X-ray radiotherapy for Stage IIIA non-small cell lung cancer."

The news correspondents report that additional information may be obtained from N. Kubo, Gunma University, Dept. of Radiat Oncol, Grad Sch Med, Maebashi, Gunma 3718511, Japan. Additional authors for this research include J. Saitoh, H. Shimada, K. Shirai, H. Kawamura, T. Ohno and T. Nakano.

Keywords for this news article include: Maebashi, Japan, Asia, Non-Small Cell Lung Cancer, Lung Neoplasms, Radiotherapy, Oncology, Therapy, Gunma University.
Non-Steroidal Anti-Inflammatory Agents

Data on Non-Steroidal Anti-Inflammatory Agents Detailed by Researchers at University of Lyon (Encapsulation of NSAIDs for inflammation management: Overview, progress, challenges and prospects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Non-Steroidal Anti-Inflammatory Agents. According to news reporting from Lyon, France, by NewsRx journalists, research stated, "Non-steroidal anti-inflammatory drugs (NSAIDs) are among the most widely prescribed drugs. Debilitating diseases such as rheumatoid arthritis and osteoarthritis are commonly managed by NSAIDs."

The news correspondents obtained a quote from the research from the University of Lyon, "However, NSAIDs pharmacological mechanism is often associated with the presence of gastrointestinal side effects. NSAIDs encapsulation is performed in order to overcome some of the drawbacks linked to their clinical use. To fulfill this purpose, various vectors like polymer-based nanoparticles, liposomes and solid lipid nanoparticles have been proposed. Such vehicles could have advantages but some limitations as well. This manuscript highlights current NSAIDs encapsulation approaches based on either preformed polymers or lipids. Moreover, properties of the prepared carriers and their applications are also discussed. Many factors are taken into account for selecting carrier type and encapsulation method. It was concluded that different vehicles and preparation methods have been employed for NSAIDs encapsulation. Mostly, vehicles sizes ranged within the nanoscale."

According to the news reporters, the research concluded: "Main advantages that have been confirmed by in vitro and in vivo studies include promoted stability, sustained release and bioavailability enhancement."

Our news journalists report that additional information may be obtained by contacting A. Elaissari, University of Lyon, CNRS, UMR 5007, LAGEP, F-69622 Lyon, France. Additional authors for this research include K. Miladi, Q.A. Nazari, H. Greige-Gerges, H. Fessi and A. Elaissari.

Data on Nuclear Engineering Discussed by Researchers at Istanbul University (Do F-18-FDG PET/CT findings have a relationship with histopathological and immunohistochemical factors of breast cancer in men?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Engineering - Nuclear Engineering have been presented. According to news reporting from Istanbul, Turkey, by NewsRx journalists, research stated, "PurposeWe aimed to investigate the relationship between histopathological and immunohistochemical features of male breast cancer (MBC) and comprehensive fluorine-18-fluorodeoxyglucose (F-18-FDG) PET/computed tomography (CT) parameters.MethodsFifteen male patients with newly diagnosed breast cancer who underwent F-18-FDG PET/CT were included in the study. Maximum and average standardized uptake value (SUVmax and SUVavg), metabolic total volume, and total lesion glycolysis (TLG) were compared with the histopathological and immunohistochemical findings of patients." The news correspondents obtained a quote from the research from Istanbul University, "In addition, metabolic tumor-node-metastases (TNM) staging was performed following the determination of metastatic axillary lymph nodes and tumor size by F-18-FDG PET/CT and verified by histopathological evaluation.ResultsThere were no significant differences between all groups classified on the basis of histopathological and immunohistochemical parameters for SUVmax, SUVavg, TLG, and metabolic total volume. The only difference was found in patients with distant metastases and stage IV. SUVmax, SUVavg, and TLG were higher in patients with distant metastases compared with patients without distant metastases (P: 0.005, 0.011, and 0.042, respectively). Strong correlations were found between metabolic TNM staging and histopathological TNM staging (for T stage; r: 0.590, P: 0.021, N stage; r: 0.694, P: 0.002, TNM stage; r: 0.835, P: 0.002). In addition, no differences were found with any metabolic F-18-FDG PET/CT parameters in survival.Conclusion Although no correlation was found between metabolic parameters and groups categorized on the basis of histopathological or immunohistochemical features, F-18-FDG PET/CT is a reliable imaging modality to determine tumor size, axillary lymph node involvement, and metabolic TNM staging of MBC."

According to the news reporters, the research concluded: "In addition, none of those metabolic F-18-FDG PET/CT parameters predicted survival in MBC."

For more information on this research see: Do F-18-FDG PET/CT findings have a relationship with histopathological and immunohistochemical factors of breast cancer in men? Data on Obesity Described by Researchers at Purdue University
(Almond Consumption during Energy Restriction Lowers Truncal Fat and Blood Pressure in Compliant Overweight or Obese Adults)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting from West Lafayette, Indiana, by NewsRx journalists, research stated, "The inclusion of almonds in an energy-restricted diet has been reported both to enhance or to have no effect on weight loss. Their effects specifically on visceral body fat stores during energy restriction have not been widely examined."

The news correspondents obtained a quote from the research from Purdue University, "In addition, almond consumption has been associated with reduced blood pressure (BP), but whether this is linked to or independent of changes in body composition has to our knowledge not been examined. We evaluated the effects of consuming almonds as part of an energy-restricted diet on body composition, specifically visceral adipose tissue (VAT) and BP, compared to a nut-free energy-restricted diet. A randomized controlled 12-wk clinical trial of 86 healthy adults [body mass index (in kg/m(2)): 25-40] was conducted. Participants were randomly assigned to 1 of 2 energy-restricted (500-kcal deficit/d) diets: an almond-enriched diet (AED) (15% energy from almonds) or a nut-free diet (NFD). A linear mixed-model analysis on primary outcomes such as body weight, body fat, VAT, and BP was performed on all participants [intention-to-treat (ITT) analysis] and compliant participants (complier analysis). Body weight, truncal and total fat percentage, VAT, and systolic BP decreased after 12 wk of energy restriction in both the ITT and complier analyses (P < 0.05). The complier analysis (but not the ITT analysis) indicated a greater mean +/- SEM reduction in truncal fat (AED: -1.21% +/- 0.26%, NFD: -0.48% +/- 0.24%; P = 0.025), total fat (AED: -1.79% +/- 0.36%; NFD: -0.74% +/- 0.33%; P = 0.035), and systolic BP (AED: -2.71 +/- 1.2 mm Hg; NFD: 0.815 +/- 1.1 mm Hg; P = 0.029), and a greater tendency for VAT loss (AED: -8.19 +/- 1.8 cm(2); NFD: -3.99 +/- 1.7 cm(2); P = 0.09) over time in the AED group than the NFD group. Moderate almond consumption by compliant overweight and obese individuals during energy restriction results in greater proportional reductions of truncal and total body fat as well as diastolic BP and hence may help to reduce metabolic disease risk in obesity."

According to the news reporters, the research concluded: "This trial was registered at clinicaltrials.gov as NCT02360787." For more information on this research see: Almond Consumption during Energy Restriction Lowers Truncal Fat and Blood Pressure in Compliant Overweight or Obese Adults. *Journal of Nutrition*, 2016;146(12):2513-2519. *Journal of Nutrition* can be contacted at: Amer Soc Nutrition-Asn, 9650 Rockville Pike, Bethesda, MD 20814, USA. Data on Obesity Reported by M.F. Pino and Colleagues (Active Individuals have High Mitochondrial Content and Oxidative Markers in Their Abdominal Subcutaneous Adipose Tissue)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting originating from Orlando, Florida, by NewsRx correspondents, research stated, "Exercise training (training) effects on white adipose tissue (WAT) thermogenic and oxidative capacities in humans are inconclusive. This study aimed to investigate whether an active lifestyle is characterized by thermogenic and/or oxidative transcriptional markers in human WAT."

Our news editors obtained a quote from the research, "In vivo maximal muscle ATP synthetic rates (ATPmax) were measured by P-31-MRS, body composition by DXA, and peak oxygen uptake (VO(2)peak) by cycle ergometry in active (n = 7) and sedentary (SED) individuals before and after 3 weeks of training (n = 9, SED only). mRNA expressions of brown adipose and beta-oxidation markers, as well as mitochondrial DNA content (mtDNA), were measured by qRT-PCR and qPCR, respectively, in WAT. ATPmax and VO(2)peak were higher in active versus SED individuals. Following training in SED individuals, ATPmax and VO(2) peak increased. Proliferator-activated receptor gamma coactivator-1 alpha and carnitine palmitoyltransferase-1 beta gene expressions and mtDNA content were significantly higher in WAT of active versus SED individuals before training. mRNA contents of brown and beige-specific markers were not different between cohorts. Training effectively increased ATPmax and VO(2)peak but had no effect on mtDNA content or expressions of genes that regulate thermogenic and oxidative capacities in WAT."

According to the news editors, the research concluded: "Results indicate that an active lifestyle is characterized by elevated mitochondrial content and oxidative, not thermogenic, markers of WAT."

For more information on this research see: Active Individuals have High Mitochondrial Content and Oxidative Markers in Their Abdominal Subcutaneous Adipose Tissue. *Obesity*, 2016;24(12):2467-2470. *Obesity* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. Data on Obesity, Fitness and Wellness Discussed by Researchers at Alfaisal University (Characterizing the morbid genome of ciliopathies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Obesity, Fitness and Wellness is the subject of a report. According to news reporting originating in Riyadh, Saudi Arabia, by NewsRx journalists, research stated, "Ciliopathies are clinically diverse disorders of the primary cilium. Remarkable progress has been made in understanding the molecular basis of these genetically heterogeneous conditions; however, our knowledge of their morbid genome, pleiotropy, and variable expressivity remains incomplete."

The news reporters obtained a quote from the research from Alfaisal University, "We applied genomic approaches on a large patient cohort of 371 affected individuals from 265 families, with phenotypes that span the entire ciliopathy spectrum. Likely causal mutations in previously described ciliopathy genes were identified in 85% (225/265) of the families, adding 32 novel alleles. Consistent with a fully penetrant model for these genes, we found no significant difference in their 'mutation load' beyond the causal variants between our ciliopathy cohort and a control non-ciliopathy cohort. Genomic analysis of our cohort further identified mutations in a novel morbid gene TXNDC15, encoding a thiol isomerase, based on independent loss of function mutations in individuals with a consistent ciliopathy phenotype (Meckel-Gruber syndrome) and a functional effect of its deficiency on ciliary signaling. Our study also highlighted seven novel candidate genes (TRAPPC3, EXOC3L2, FAM98C, C17orf61, LRRCC1, NEK4, and CELSR2) some of which have established links to ciliogenesis. Finally, we show that the morbid genome of ciliopathies encompasses many founder mutations, the combined carrier frequency of which accounts for a high disease burden in the study population. Our study increases our understanding of the morbid genome of ciliopathies."

According to the news reporters, the research concluded: "We also provide the strongest evidence, to date, in support of the classical Mendelian inheritance of Bardet-Biedl syndrome and other ciliopathies."

For more information on this research see: Characterizing the morbid genome of ciliopathies. *Genome Biology*, 2016;17():20-30. *Genome Biology* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. Peptides - Oligopeptides

Data on Oligopeptides Reported by Researchers at Mossakowski Medical Research Center (Protective Effects of Selol Against Sodium Nitroprusside-Induced Cell Death and Oxidative Stress in PC12 Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Peptides - Oligopeptides is the subject of a report. According to news reporting out of Warsaw, Poland, by NewsRx editors, research stated, "Selol is an organic selenitetriglyceride formulation containing selenium at +4 oxidation level that can be effectively incorporated into catalytic sites of Se-dependent antioxidants. In the present study, the potential antioxidative and cytoprotective effects of Selol against sodium nitroprusside (SNP)-evoked oxidative/nitrosative stress were investigated in PC12 cells and the underlying mechanisms analyzed."

Financial supporters for this research include The statutory budget of the Mossakowski Medical Research Centre, Polish Academy of Sciences, The statutory budget of the Medical University of Warsaw.

Our news journalists obtained a quote from the research from Mossakowski Medical Research Center, "Spectrophoto- and spectrofluorimetric methods as well as fluorescence microscopy were used in this study; mRNA expression was quantified by real-time PCR. Selol dose-dependently improved the survival and decreased the percentage of apoptosis in PC12 cells exposed to SNP. To determine the mechanism of this protective action, the effect of Selol on free radical generation and on antioxidative potential was evaluated. Selol offered significant protection against the elevation of reactive oxidative species (ROS) evoked by SNP. Moreover, this compound restored glutathione homeostasis by ameliorating the SNP-evoked disturbance of GSH/GSSG ratio. The protective effect exerted by Selol was associated with the prevention of SNP-mediated down-regulation of antioxidative enzymes: glutathione peroxidase (Se-GPx), glutathione reductase (GR), and thioredoxin reductase (TrxR). Finally, GPx inhibition significantly abolished the cytoprotective effect of Selol."

According to the news editors, the research concluded: "These results suggest that Selol effectively protected PC12 cells against SNP-induced oxidative damage and death by adjusting free radical levels and antioxidant system, and suppressing apoptosis. Selol could be successfully used in the treatments of diseases that involve oxidative stress and resulting apoptosis."

For more information on this research see: Protective Effects of Selol Against Sodium Nitroprusside-Induced Cell Death and Oxidative Stress in PC12 Cells. Neurochemical Research, 2016;41(12):3215-3226. Neurochemical Research can be contacted at: Springer, Plenum Publishers, 233 Spring St, New York, NY 10013, USA. **Oncology**

**Data on Oncology Reported by Researchers at University of Kashmir**

(Emerging tale of UPR and cancer: an essentiality for malignancy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology. According to news reporting originating in Jammu Kashmir, India, by NewsRx journalists, research stated, "A set of cellular response to counter any alteration in homeostasis of a cell originating at endoplasmic reticulum is collectively termed as unfolded protein response (UPR). It initially is adaptive in nature as to restore cellular normalcy failing in course often activates pro-apoptotic signaling pathway resulting in cell death."

Funders for this research include Department of Biotechnology, Ministry of Science and Technology, Department of Science and Technology, India, FIST.

The news reporters obtained a quote from the research from the University of Kashmir, "UPR has emerged as an essential adaptation mechanism that cross talk with various cellular processes for cancer pathogenesis. Interestingly, it plays diverse role in plethora of signaling pathways instrumental in transformation, cell invasion, cell migration, metastasis, neovascularization, proliferation, and maintenance of energy metabolism of cancerous cells. In cancerous cells, it is triggered by change in microenvironment of a cell usually driven by hypoxia, acidosis, and nutrient deprivation, which often leads to positive selection pressure involving the reprogramming of energy metabolism which promotes channelization of limited metabolites into the hexosamine biosynthetic pathway (HBP). Substantial evidences suggest the role of UPR in oncogene (Myc, mTOR, RAS, HER2) driven cancer transformation and progression."

According to the news reporters, the research concluded: "In this review, we have comprehensively underlined the role played by UPR in adaptation, transformation, proliferation, invasion, and metastasis of cancerous cells."

For more information on this research see: Emerging tale of UPR and cancer: an essentiality for malignancy. Tumor Biology, 2016;37(11):14381-14390. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. (Springer - www.springer.com; Tumor Biology - www.springerlink.com/content/1010-4283/)

Data on Oral Cancer Described by Researchers at Grigore T. Popa University of Medicine and Pharmacy (Study of Biochemical Level for Mg and Ca-Mg Imbalance in Patients with Oral Cancer and Potentially Malignant Disorder and their Prostetical and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Oral Cancer have been published. According to news reporting from Iasi, Romania, by NewsRx journalists, research stated, "In the last decade it has been noticed a significant increase of indicators of oral cancer and oral potentially malignant disorders frequency, which led to the integration of this pathology among the primary problems of public health regarding dental medicine. It seems that besides the essential role of magnesium and calcium in the functions of human body, the changes of serum and salivary levels of magnesium and calcium may play a role in the pathogenesis of oral cancer and oral potentially malignant disorders."

The news correspondents obtained a quote from the research from the Grigore T. Popa University of Medicine and Pharmacy, "The aim of the study was to measure the serum levels of magnesium and calcium in patients with oral cancer and oral potentially malignant disorders. The serum and saliva levels of magnesium in oral cancer were higher than in healthy controls subjects."

According to the news reporters, the research concluded: "There are no significant statistic differences between the serum variations of total calcium and salivary calcium in the studied groups, compared to the controls."

For more information on this research see: Study of Biochemical Level for Mg and Ca-Mg Imbalance in Patients with Oral Cancer and Potentially Malignant Disorder and their Prostetical and DSSS Treatment. Revista De Chimie, 2016;67(10):2087-2090. Revista De Chimie can be contacted at: Chiminform Data S A, Calea Plevnei Nr 139, Sector 6, Bucharest R-77131, Romania.

Data on Oral and Maxillofacial Surgery Reported by Researchers at University of Washington (Limiting Antibiotics When Managing Mandible Fractures May Not Increase Infection Risk)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Surgery - Oral and Maxillofacial Surgery. According to news reporting originating from Seattle, Washington, by NewsRx correspondents, research stated, "To estimate and compare 1) the frequencies of surgical site infections (SSIs) and 2) adverse antibiotic effects (AAEs) between patients who receive only intraoperative antibiotics (study group) and those who receive intraoperative antibiotics plus additional preoperative or postoperative antibiotics (control group) while undergoing operative treatment of open mandibular fractures. The authors designed a retrospective cohort study and enrolled a sample derived from patients presenting to the Harborview Medical Center from 2009 through 2014 for the management of open mandibular fractures."

Our news editors obtained a quote from the research from the University of Washington, "Eligible patients were at least 18 years of age with open, isolated mandibular fractures treated by open reduction and internal fixation using transoral approaches or closed reduction and intermaxillary fixation. The primary predictor variable was antibiotic exposure. The study group received antibiotics administered within 1 hour before the incision, with possible intraoperative re-dosing, and the control group received antibiotics according to the study group plus preoperative or postoperative antibiotics. The primary outcome was SSI frequency. The secondary outcome was AAE frequency. Univariate, bivariate, and multiple logistic regression analyses were performed. Statistical significance was set at a P value less than or equal to .05. The sample was comprised of 510 patients (mean age, 29 +/- 11.4 yr; 86% men). The study group had 58 patients (11%) and the control group had 452 patients (89%). The SSI frequencies in the study and control groups were 9 and 17%, respectively (P = .13). There were 5 (1%) AAEs reported, all in the control group. In the multivariable logistic regression model, only tobacco use was associated with an increased risk for SSI (odds ratio = 2.8; 95% confidence interval, 1.5-5.5; P = .0015)."

According to the news editors, the research concluded: "Limiting antibiotic exposure to only intraoperative antibiotic prophylaxis in patients undergoing transoral operative treatment of isolated open mandibular fractures was not associated with an increased risk of SSIs."

The news editors report that additional information may be obtained by contacting J. Dillon, University of Washington, Dept. of Oral & Maxillofacial Surg, Seattle, WA 98195, United States. Additional authors for this research include B. Bailey, Y. Patel, N. Smiley, T. Dodson, D. Kim and J. Dillon.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.joms.2016.05.019. This DOI is a link to an online electronic document that is either free or for purchase.
Transplant Medicine - Organ Preservation

Data on Organ Preservation Reported by Researchers at Seoul National University Hospital (Induction chemotherapy in head and neck squamous cell carcinoma of the paranasal sinus and nasal cavity: a role in organ preservation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Transplant Medicine - Organ Preservation have been presented. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "The role of induction chemotherapy (IC) for eyeball preservation has not been established in head and neck squamous cell carcinoma (HNSCC) of the paranasal sinus and nasal cavity (PNSNC). Periorbital involvement frequently leads to eyeball exenteration with a margin of safety."

Financial support for this research came from Seoul National University Hospital.

The news correspondents obtained a quote from the research from Seoul National University Hospital, "We evaluated the treatment outcomes, including survival and eyeball preservation, of patients who received IC for HNSCC of the PNSNC. We reviewed 21 patients diagnosed with HNSCC of the PNSNC who were treated with IC. We analyzed response, eyeball preservation rate, and overall survival. Tumors were located in the paranasal sinus (n=14) or nasal cavity (n=7). Most patients had stage T4a (n=10) or T4b (n=7) disease. More than half of the patients received a chemotherapy regimen of docetaxel, fluorouracil, and cisplatin (n=11). Thirteen patients (61.9%) achieved a partial response after IC and 15 patients (71.4%) achieved T down-staging. Among 17 patients with stage T4 disease, which confers a high risk of orbital exenteration, 14 (82.4%) achieved preservation of the involved eye. The 3-year overall survival (OS) rate of patients who achieved a partial response to IC was 84.6%. The 3-year OS rate of patients with stable disease or disease progression after IC was 25.0% (p=0.038). IC could be considered for down-staging patients with advanced T-stage disease."

According to the news reporters, the research concluded: "It could also be a reasonable option for eyeball preservation in locally advanced HNSCC of the PNSNC."

For more information on this research see: Induction chemotherapy in head and neck squamous cell carcinoma of the paranasal sinus and nasal cavity: a role in organ preservation. The Korean Journal of Internal Medicine, 2016;31(3):570-8.

Our news journalists report that additional information may be obtained by contacting C.Y. Ock, Dept. of Internal Medicine, Seoul National University Hospital, Seoul, South Korea. Additional authors for this research include B. Keam, T.M. Kim, D.H. Han, T.B. Won, S.H. Lee, J.H. Hah, T.K. Kwon, D.W. Kim, D.Y. Kim, C.S. Rhee, H.G. Wu, M.W. Sung and D.S Heo.

Oxides

Data on Oxides Reported by C.de A. Mendes and Colleagues (Carbon dioxide contrast medium for endovascular treatment of ilio-femoral occlusive disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oxides is now available. According to news originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "Compare the use of carbon dioxide contrast medium with iodine contrast medium for the endovascular treatment of ilio-femoral occlusive disease in patients without contraindications to iodine. From August 2012 to August 2014, 21 consecutive patients with ilio-femoral occlusive disease who were eligible for endovascular treatment and lacked contraindications to either iodine contrast or carbon dioxide were randomized into the carbon dioxide or iodine groups and subjected to ilio-femoral angioplasty. We analyzed the feasibility of the procedures, the surgical and clinical outcomes, the procedure lengths, the endovascular material costs, the contrast costs and the quality of the angiographic images in each group."

Our news journalists obtained a quote from the research, "No conversions to open surgery and no contrast media related complications were noted in either group. A post-operative femoral pulse was present in 88.9% of the iodine group and 80% of the carbon dioxide group. No differences in procedure length, endovascular material cost or renal function variation were noted between the groups. Four patients in the carbon dioxide group required iodine supplementation to complete the procedure. Contrast media expenses were reduced in the carbon dioxide group. Regarding angiographic image quality, 82% of the carbon dioxide images were graded as either good or fair by observers. The use of carbon dioxide contrast medium is a good option for ilio-femoral angioplasty in patients without contraindications to iodine and is not characterized by differences in endovascular material costs, procedure duration and surgical outcomes."

According to the news editors, the research concluded: "In addition, carbon dioxide has lower contrast expenses compared with iodine."

The news correspondents report that additional information may be obtained from C.d.e. A Mendes, Hospital Israelita Albert Einstein, Sao Paulo, SP, Brazil. Additional authors for this research include A.de A. Martins, M.P. Teivelis, S. Kuzniec, A.Y. Varella, A. Fioranelli and N. Wolosker.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.6061/clinics/2015%2810%2903. This DOI is a link to an online electronic document that is either free or for purchase.
Enzymes and Coenzymes - Oxidoreductases

Data on Oxidoreductases Described by Researchers at Monsanto (Safety assessment of dicamba mono-oxygenases that confer dicamba tolerance to various crops)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - Oxidoreductases. According to news reporting out of St. Louis, Missouri, by NewsRx editors, research stated, "Dicamba tolerant (DT) soybean, cotton and maize were developed through constitutive expression of dicamba mono-oxygenase (DMO) in chloroplasts. DMO expressed in three DT crops exhibit 91.6-97.1% amino acid sequence identity to wild type DMO."

Our news journalists obtained a quote from the research from Monsanto, "All DMO forms maintain the characteristics of Rieske oxygenases that have a history of safe use. Additionally, they are all functionally similar in vivo since the three DT crops are all tolerant to dicamba treatment. None of these DMO sequences were found to have similarity to any known allergens or toxins. Herein, to further understand the safety of these DMO variants, a weight of evidence approach was employed. Each purified DMO protein was found to be completely deactivated in vitro by heating at temperatures 55 degrees C and above, and all were completely digested within 30 s or 5 min by pepsin and pancreatin, respectively. Mice orally dosed with each of these DMO proteins showed no adverse effects as evidenced by analysis of body weight gain, food consumption and clinical observations."

According to the news editors, the research concluded: "Therefore, the weight of evidence from all these protein safety studies support the conclusion that the various forms of DMO proteins introduced into DT soybean, cotton and maize are safe for food and feed consumption, and the small amino acid sequence differences outside the active site of DMO do not raise any additional safety concerns."

For more information on this research see: Safety assessment of dicamba mono-oxygenases that confer dicamba tolerance to various crops. Regulatory Toxicology and Pharmacology, 2016;81():171-182. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Data on Pancreas Research Reported by Researchers at University of Minnesota (Intrapancreatic Splenule in a Pancreas Allograft: Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gastroenterology - Pancreas Research are presented in a new report. According to news reporting originating from Minneapolis, Minnesota, by NewsRx correspondents, research stated, "A 16-year-old white man was involved in a motor vehicle collision and suffered head, chest, and abdominal trauma. Despite initial resuscitative efforts, he progressed to brain death and was designated to be an organ donor by his family."

Our news editors obtained a quote from the research from the University of Minnesota, "He had no earlier medical or surgical history and no high-risk behaviors. Blood work revealed normal creatinine, liver function tests, lipase, and amylase. Viral serologies were negative except for cytomegalovirus IgG and Epstein-Barr virus nucleic acid. Imaging revealed a right kidney contusion, a manubrial fracture, and fractures of right first rib and bilateral scapulae. No other abdominal trauma was identified, specifically to the pancreas, duodenum, or spleen. Our transplant center accepted the pancreas from this donor. During back-table inspection of the pancreas, a 1.5 x 1.5 cm dark purple rubbery mass was identified within the parenchyma of the pancreas in the tail. An incisional biopsy of the lesion was sent for frozen section, which yielded a mixed inflammatory infiltrate consisting of neutrophils and lymphocytes and an overlying fibrous capsule. The diagnosis of lymphoma or another neoplasm could not be definitely ruled out. Owing to uncertainty in diagnosis, the entire lesion was excised along with the distal pancreas with the use of a linear stapler. The staple line was oversewn with running 4-0 polypropylene suture, and the pancreas was transplanted."

According to the news editors, the research concluded: "After surgery, the pancreas allograft functioned well with a small pancreatic leak, which had resolved by the first postoperative outpatient visit."

The news editors report that additional information may be obtained by contacting K. Yadav, University of Minnesota, Dept. of Surg, Div Transplant, Minneapolis, MN, United States. Additional authors for this research include O.K. Serrano and R. Kandaswamy.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.transproceed.2016.09.003. This DOI is a link to an online electronic document that is either free or for purchase.

Data on Pancreatitis Discussed by Researchers at University of Valencia (Epigenetic Regulation of Early- and Late-Response Genes in Acute Pancreatitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Digestive System Diseases and Conditions - Pancreatitis is the subject of a report. According to news reporting from Valencia, Spain, by NewsRx journalists, research stated, "Chromatin remodeling seems to regulate the patterns of proinflammatory genes. Our aim was to provide new insights into the epigenetic mechanisms that control transcriptional activation of early- and late-response genes in initiation and development of severe acute pancreatitis as a model of acute inflammation."

The news correspondents obtained a quote from the research from the University of Valencia, "Chromatin changes were studied by chromatin immunoprecipitation analysis, nucleosome positioning, and determination of histone modifications in promoters of proinflammatory genes in vivo in the course of taurocholate-induced necrotizing pancreatitis in rats and in vitro in rat pancreatic AR42J acinar cells stimulated with taurocholate or TNF-alpha. Here we show that the upregulation of early and late inflammatory genes rely on histone acetylation associated with recruitment of histone acetyltransferase CBP. Chromatin remodeling of early genes during the inflammatory response in vivo is characterized by a rapid and transient increase in H3K14ac, H3K27ac, and H4K5ac as well as by recruitment of chromatin-remodeling complex containing BRG-1. Chromatin remodeling in late genes is characterized by a late and marked increase in histone methylation, particularly in H3K4. JNK and p38 MAPK drive the recruitment of transcription factors and the subsequent upregulation of early and late inflammatory genes, which is associated with nuclear translocation of the early gene Egr-1."

According to the news reporters, the research concluded: "Specific and strictly ordered epigenetic markers such as histone acetylation and methylation, as well as recruitment of BRG-1-containing remodeling complex are associated with the upregulation of both early and late proinflammatory genes in acute pancreatitis. Our findings highlight the importance of epigenetic regulatory mechanisms in the control of the inflammatory cascade."

For more information on this research see: Epigenetic Regulation of Early- and Late-Response Genes in Acute Pancreatitis. *Journal of Immunology*, 2016;197(10):4137-4150. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Perfusion

**Data on Perfusion Reported by M. De Sousa Mendes and Colleagues**

*(Prediction of human fetal pharmacokinetics using ex vivo human placenta perfusion studies and physiologically based models)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Perfusion. According to news reporting out of Paris, France, by NewsRx editors, research stated, "Pregnant women can be exposed to numerous drugs during the gestational period. For obvious ethical reasons, in vivo studies of fetal exposure to drugs are limited."

Our news journalists obtained a quote from the research, "Information about the transplacental transfer of drugs prior to their administration to pregnant women would be highly useful. In the present study, a novel approach was developed quantitatively predict or to predict the fetal exposure to drugs administered to the mother quantitatively. Transplacental parameters estimated from ex vivo human placenta perfusion experiments were implemented in pregnancy-physiologically based pharmacokinetic (p-PBPK) models in order to predict fetal PK. Thereafter, fetal PK profiles for two antiretroviral drugs, tenofovir (TFV) and emtricitabine (FTC) were simulated. These predictions were then compared to observed cord blood concentrations, to validate these models. Parameters obtained from the ex vivo experiments enabled a good prediction of observed cord blood concentrations without additional a scaling factor. Moreover, a sensitivity analysis showed that fetal predictions were sensitive to changes in transplacental parameters values obtained ex vivo."

According to the news editors, the research concluded: "The integration of ex vivo human placental perfusion parameters in a p-PBPK model should be a promising new approach for predicting human fetal exposure to xenobiotics."

Data on Pharmaceutical Education Reported by Researchers at University of Houston (Effect of Communication Style on Perceptions of Medication Side Effect Risk among Pharmacy Students)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Education - Pharmaceutical Education. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "To assess the effect of communication style, and frequency and severity of medication side-effects, on pharmacy students' perception of risk of experiencing side effects. One hundred responses from pharmacy students were obtained using an online survey."

Our news journalists obtained a quote from the research from the University of Houston, "Participants were presented with a drug information box containing drug name, drug usage, and one side-effect associated with the drug. Information on side-effect for each drug was presented in one of eight experimental conditions, in a 2 (side-effect frequency: low, high), X2 (side-effect severity: mild, severe) X2 (communication style: verbal, verbal + natural frequency) factorial design. Risk perception of experiencing side effects was measured. Communication style was found to have a significant impact on risk perception depending on the context of frequency and severity associated with the side effect. Communication style plays a significant role in formulating risk perceptions of medication side effects."

According to the news editors, the research concluded: "Training in pharmaceutical counseling should include special emphasis on effective language use."

The news correspondents report that additional information may be obtained from S.S. Sansgiry, University of Houston, Coll Pharm, Houston, TX 77030, United States. Additional authors for this research include C.R. Beatty and S.S. Sansgiry.

Data on Pharmaceutical and Biomedical Analysis Discussed by Researchers at Wenzhou Medical University (An UPLC-MS/MS method for the quantitation of alectinib in rat plasma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biotechnology - Pharmaceutical and Biomedical Analysis is the subject of a report. According to news reporting out of Zhejiang, People's Republic of China, by NewsRx editors, research stated, "Currently, crizotinib is the first generation drug, which has been used in the treatment of ALK-rearranged non-small cell lung cancer (NSCLC). However, more and more patients are found in crizotinib-resistance."

Our news journalists obtained a quote from the research from Wenzhou Medical University, "In the last year, alectinib has been approved for treatment of patients with crizotinib-resistance. In this study, we aim to develop and validate a simple, rapid and sensitive tandem mass spectrometry (UHPLC-MS/MS) method for determination of alectinib in rat plasma. Diazepam was chosen as an internal standard (IS). Protein precipitation by acetonitrile was utilized to prepare plasma samples. Chromatographic separation was achieved on a RRHD Eclipse Plus C18 (2.1 x 50 mm, 1.8 μm) column with a gradient mobile phase consisting of acetonitrile and water (containing 0.1% formic acid). The analytes were detected by an electrospray ionization (ESI) source in positive mode. A dynamic multiple reaction monitoring (MRM) method was developed to detect specific precursor and product ions. The target fragment ions were m/z 483.2 -> 396.1 for alectinib and m/z 285.0 -> 192.9 for diazepam (IS). Linear calibration plots were achieved in the range of 1-500 ng/ml for alectinib (R²= 0.997) in rat plasma. Mean recoveries of alectinib in rat plasma ranged from 84.2% to 92.2%. The intra- and inter-day precision was below 9.3% and accuracy was from -1.4% to 12.1%. No obvious matrix effect was found. This method shows a good performance: accuracy, precision and stability."

According to the news editors, the research concluded: "It has been fully validated and successfully applied to pharmacokinetic study of alectinib."

For more information on this research see: An UPLC-MS/MS method for the quantitation of alectinib in rat plasma. Journal of Pharmaceutical and Biomedical Analysis, 2017;132():227-231. Pharmacokinetics

Data on Pharmacokinetics Detailed by Researchers at Wenzhou Medical University (Determination of Arbutin in Rat Plasma Using Liquid Chromatography-Tandem Mass Spectrometry: Application to a Pharmacokinetic Study After Oral Administration of the ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Pharmacokinetics are presented in a new report. According to news reporting from Wenzhou, People's Republic of China, by NewsRx journalists, research stated, "A rapid and sensitive bioassay based on liquid chromatography-tandem mass spectrometry (LC-MS-MS) has been developed and validated to measure arbutin in rat plasma. Sample preparation of plasma after the addition of indapamide as internal standard (IS) involved solid-phase extraction (SPE) on C18 cartridges."

The news correspondents obtained a quote from the research from Wenzhou Medical University, "Reversed-phase chromatography using acetonitrile and 0.5% formic acid solution (pH 2.56) was used for separation in a run time of 4.0 min. The analytes were detected in the negative ion mode using selective reaction monitoring (SRM) of the transitions at m/z 271.2 -> 107.8 for arbutin and 364.3 -> 189.0 for indapamide. The method has the following performance characteristics: a reliable response range of 7.5-5250.0 ng/mL with correlation coefficients (r) of > 0.995. The lower limit of quantitation (LLOQ) was 7.5 ng/mL. The intra- and inter-day precision and accuracy of the quality control (QC) samples at low, medium and high concentration levels showed <= 8.79% relative standard deviation (RSD) and -1.15 to 1.49% relative error (RE)."

According to the news reporters, the research concluded: "The method was successfully applied to a pharmacokinetic study to measure arbutin in rats after extracts of Vaccinium vitis-idaea was orally administered."

Keywords for this news article include: Wenzhou, People's Republic of China, Asia, Drug Administration Routes, Oral Administration, Pharmacokinetics, Pharmaceuticals, Wenzhou Medical University.

Data on Pharmacology Described by Researchers at Seoul National University (Pharmacological and Mechanical Thromboprophylaxis in Critically Ill Patients: a Network Meta-Analysis of 12 Trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Pharmacology. According to news reporting originating from Seongnam, South Korea, by NewsRx correspondents, research stated, "Thromboprophylaxis for venous thromboembolism is widely used in critically ill patients. However, only limited evidence exists regarding the efficacy and safety of the various thromboprophylaxis techniques, especially mechanical thromboprophylaxis."

Our news editors obtained a quote from the research from Seoul National University, "Therefore, we performed meta-analysis of randomized controlled trials (RCTs) that compared the overall incidence of deep vein thrombosis (DVT) for between unfractionated heparin (UFH), low-molecular-weight heparin (LMWH), and intermittent pneumatic compression (IPC) in critically ill patients. A Bayesian random effects model for multiple treatment comparisons was constructed. The primary outcome measure was the overall incidence of DVT at the longest follow-up. The secondary outcome measure was the incidence of major bleeding, as defined by the original trials. Our analysis included 8,622 patients from 12 RCTs. The incidence of DVT was significantly lower in patients treated with UFH (OR, 0.45; 95% CrI, 0.22-0.83) or LMWH (OR, 0.38; 95% CrI, 0.18-0.72) than in patients in the control group. IPC was associated with a reduced incidence of DVT compared to the control group, but the effect was not statistically significant (OR, 0.50; 95% CrI, 0.20-1.23). The risk of DVT was similar for patients treated with UFH and LMWH (OR, 1.16; 95% CrI, 0.68-2.11). The risk of major bleeding was similar between the treatment groups in medical critically ill patients and also in critically ill patients with a high risk of bleeding."

According to the news editors, the research concluded: "In critically ill patients, the efficacy of mechanical thromboprophylaxis in reducing the risk of DVT is not as robust as those of pharmacological thromboprophylaxis."

For more information on this research see: Pharmacological and Mechanical Thromboprophylaxis in Critically Ill Patients: a Network Meta-Analysis of 12 Trials. Journal of Korean Medical Science, 2016;31(11):1828-1837. Pharmacology

Data on Pharmacology Detailed by Researchers at University of Cologne (Person-directed, non-pharmacological interventions for sleepiness at work and sleep disturbances caused by shift work)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacology. According to news reporting out of Cologne, Germany, by NewsRx editors, research stated, "Shift work is often associated with sleepiness and sleep disorders. Person-directed, non-pharmacological interventions may positively influence the impact of shift work on sleep, thereby improving workers' well-being, safety, and health."

Our news journalists obtained a quote from the research from the University of Cologne, "To assess the effects of person-directed, non-pharmacological interventions for reducing sleepiness at work and improving the length and quality of sleep between shifts for shift workers. Search methods We searched CENTRAL, MEDLINE Ovid, Embase, Web of Knowledge, ProQuest, PsycINFO, OpenGrey, and OSH-UPDATE from inception to August 2015. We also screened reference lists and conference proceedings and searched the World Health Organization (WHO) Trial register. We contacted experts to obtain unpublished data. Selection criteria Randomised controlled trials (RCTs) (including cross-over designs) that investigated the effect of any person-directed, non-pharmacological intervention on sleepiness on-shift or sleep length and sleep quality off-shift in shift workers who also work nights. Data collection and analysis At least two authors screened titles and abstracts for relevant studies, extracted data, and assessed risk of bias. We contacted authors to obtain missing information. We conducted meta-analyses when pooling of studies was possible. We included 17 relevant trials (with 556 review-relevant participants) which we categorised into three types of interventions: (1) various exposures to bright light (n = 10); (2) various opportunities for napping (n = 4); and (3) other interventions, such as physical exercise or sleep education (n = 3). In most instances, the studies were too heterogeneous to pool. Most of the comparisons yielded low to very low quality evidence. Only one comparison provided moderate quality evidence. Overall, the included studies' results were inconclusive. We present the results regarding sleepiness below. Bright light Combining two comparable studies (with 184 participants altogether) that investigated the effect of bright light during the night on sleepiness during a shift, revealed a mean reduction 0.83 score points of sleepiness (measured via the Stanford Sleepiness Scale (SSS) (95% confidence interval (CI) -1.3 to -0.36, very low quality evidence). Another trial did not find a significant difference in overall sleepiness on another sleepiness scale (16 participants, low quality evidence). Bright light during the night plus sunglasses at dawn did not significantly influence sleepiness compared to normal light (1 study, 17 participants, assessment via reaction time, very low quality evidence). Bright light during the day shift did not significantly reduce sleepiness during the day compared to normal light (1 trial, 61 participants, subjective assessment, low quality evidence) or compared to normal light plus placebo capsule (1 trial, 12 participants, assessment via reaction time, very low quality evidence). Napping during the night shift A meta-analysis on a single nap opportunity and the effect on the mean reaction time as a surrogate for sleepiness, resulted in a 11.87 ms reduction (95% CI 31.94 to -8.2, very low quality evidence). Two other studies also reported statistically non-significant decreases in reaction time (1 study seven participants; 1 study 49 participants, very low quality evidence). A two-nap opportunity resulted in a statistically non-significant increase of sleepiness (subjective assessment) in one study (mean difference (MD) 2.32, 95% CI
-24.74 to 29.38, 1 study, 15 participants, low quality evidence). Other interventions Physical exercise and sleep education interventions showed promise, but sufficient data to draw conclusions are lacking. Authors' conclusions Given the methodological diversity of the included studies, in terms of interventions, settings, and assessment tools, their limited reporting and the very low to low quality of the evidence they present, it is not possible to determine whether shift workers' sleepiness can be reduced or if their sleep length or quality can be improved with these interventions.

According to the news editors, the research concluded: "We need better and adequately powered RCTs of the effect of bright light, and naps, either on their own or together and other non-pharmacological interventions that also consider shift workers' chronobiology on the investigated sleep parameters."

For more information on this research see: Person-directed, non-pharmacological interventions for sleepiness at work and sleep disturbances caused by shift work. Cochrane Database of Systematic Reviews, 2016;(8):868-1027. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Pharmacology

Data on Pharmacology Reported by Researchers at UNC Eshelman School of Pharmacy (Optimizing Medication Outcomes in Neurocritical Care: Focus on Clinical Pharmacology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacology have been presented. According to news originating from Chapel Hill, North Carolina, by NewsRx correspondents, research stated, "Drug dosing in neurocritically ill patients presents enormous challenges for clinicians due to the complex pathophysiological alterations. These alterations are dynamic both, between and within patients."

Our news journalists obtained a quote from the research from the UNC Eshelman School of Pharmacy, "Unpredictable exposure from standard dosing regimens, which were extrapolated to intensive care unit patients from healthy volunteer studies, may influence medication outcomes. Knowledge of potential alterations in pharmacokinetics/pharmacodynamics in these patients could be applied to maximize the clinical response and minimize adverse effects. Recognizing potential confounding clinical and treatment factors affecting drug response is an important step, but it is not enough. Overcoming absorption and distribution challenges by using specialized formulations and delivery systems is an area of active research. Improved methods for measuring drug concentrations in clinical settings across different matrices are also needed. Even with these advances, defining
endogenous mediators signaling drug-target activation is necessary. Identifying biomarkers in disease and changes when a drug has reached its target will be pivotal."

According to the news editors, the research concluded: "This information will improve our understanding of the pharmacogenomic and pharmacokinetic variables affecting pharmacodynamic endpoints across a spectrum of neurologic diseases."

For more information on this research see: Optimizing Medication Outcomes in Neurocritical Care: Focus on Clinical Pharmacology. *Seminars in Neurology*, 2016;36(6):586-600. *Seminars in Neurology* can be contacted at: Thieme Medical Publ Inc, 333 Seventh Ave, New York, NY 10001, USA. **Drugs and Therapies - Pharmacy Practice**

**Data on Pharmacy Practice Detailed by Researchers at University of British Columbia (The impact of medication reviews by community pharmacists)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Pharmacy Practice. According to news reporting originating from Vancouver, Canada, by NewsRx correspondents, research stated, "Many Canadians use prescription medicines that are unnecessary or that can lead to adverse events. In response, many provinces have introduced programs in which pharmacists are paid to perform medication reviews with patients."

Our news editors obtained a quote from the research from the University of British Columbia, "As the evidence on such programs is equivocal, we investigated the impact of British Columbia's program. Interrupted time series. British Columbia, Canada. All residents of British Columbia who received a medication review between May 1, 2012, and June 30, 2013 (163,776 individuals). Using British Columbia's population-based PharmaNet drug utilization system, we collected data on community pharmacist-led medication reviews. The PharmaNet database contains a record of all medication reviews conducted in an ambulatory setting. We studied the impact of first medication reviews conducted between May 2012 and June 2013. We used interrupted time series analysis to assess longitudinal changes in patients receiving a standard review (n = 147,770) and a more intensive pharmacist consultation (n = 16,006). Our outcomes included drug utilization, costs, potentially inappropriate prescriptions, and medication persistence measured through the proportion of commonly used chronic medications that were eventually refilled. Overall, we observed few changes in the level or trend of any of
the outcomes we studied. Both review types were followed by significant increases in both the number of prescriptions per month and expenditures. The continuation of long-term medications did not change for 3 of 4 classes, and increased very slightly for the final class. We found no evidence of deprescribing, either for classes that are potentially problematic for long-term use (benzodiazepines and proton pump inhibitors) or for potentially inappropriate prescriptions in seniors. Our results suggest that medication reviews did not significantly modify prescription drug use by recipients."

According to the news editors, the research concluded: "Future iterations of such programs might be modified to be better targeted and to encourage closer collaboration between pharmacists and prescribing health care professionals."

For more information on this research see: The impact of medication reviews by community pharmacists. *Journal of the American Pharmacists Association*, 2016;56(5):513-520,43. *Journal of the American Pharmacists Association* can be contacted at: Amer Pharmaceutical Assoc, 2215 Constitution Ave NW, Washington, DC 20037, USA.

**Drugs and Therapies - Pharmacy and Pharmacology**

**Data on Pharmacy and Pharmacology Detailed by Researchers at School of Pharmaceutical Science (Preparation, in-vitro and in-vivo characterisation of CoQ10 microparticles: electrospaying-enhanced bioavailability)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Pharmacy and Pharmacology is now available. According to news originating from Penang, Malaysia, by NewsRx correspondents, research stated, "This study aimed to prepare Coenzyme Q10 (CoQ10) microparticles using electrospaying technology, and evaluate the in-vitro properties and in-vivo oral bioavailability. Electrospaying was successfully used to prepare CoQ10 to enhance its solubility and dissolution properties."

Our news journalists obtained a quote from the research from the School of Pharmaceutical Science, "In-vitro evaluation of the electro sprayed microparticles showed bioavailability-enhancing properties such as reduced crystallinity and particle size. The formulation was evaluated using dissolution study and in-vivo oral bioavailability using rat model. The dissolution study revealed enhanced dissolution properties of electro sprayed microparticles compared with physical mixture and raw material. The absorption profiles
showed increasing mean plasma levels CoQ10 in the following order: raw material <physical mixture <electrosprayed microparticles."

According to the news editors, the research concluded: "Based on the findings in this study, electrospraying is a highly prospective technology to produce functional nano-and micro-structures as delivery vehicles for drugs with poor oral bioavailability due to rate-limiting solubility."

The news correspondents report that additional information may be obtained from W.Y. Fung, School of Pharmaceutical Sciences, UniversitiSains Malaysia, Penang, Malaysia. Additional authors for this research include M.T. Liong and K.H Yuen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jphp.12502. This DOI is a link to an online electronic document that is either free or for purchase.

Hematology - Plasma

Data on Plasma Discussed by Researchers at University of Otago (Collection tubes containing citrate stabiliser over-estimate plasma glucose, when compared to other samples undergoing immediate plasma separation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Hematology - Plasma are presented in a new report. According to news reporting from Christchurch, New Zealand, by NewsRx journalists, research stated, "Blood collection tubes containing citrate lower pH, thereby inhibiting glycolysis. When compared to other additives, they introduce an over-estimation in measured glucose."

The news correspondents obtained a quote from the research from the University of Otago, "This study explored this overestimation across a range of glucose values. Blood samples collected into lithium-heparin tubes then cooled prior to immediate refrigerated plasma separation, were used as the primary comparator. Venous blood from individuals with and without diabetes was collected into tubes containing lithium-heparin, or fluoride, or fluoride-citrate (Terumo ™ Venosafe). Plasma was separated at time intervals of zero, 2 and 24 h. Preparation of the 'time zero' lithium-heparin and fluoride samples was optimised by processing these samples under cooled conditions. The remaining samples were prepared at room temperature. Plasma was analysed in the routine clinical laboratory using the hexokinase method. Median plasma glucose for the 50 participants was 7.1 mmol/L (range 3.1-21.5). At 'time zero', fluoride-citrate glucose was 0.37 mmol/L (95% CI 0.26-0.48) higher than lithium-heparin glucose and 029 mmol/L (95% CI 0.21-0.36) higher than glucose from fluoride tubes. Following delayed plasma separation at 24 h, glucose loss from the lithium heparin tubes averaged 0.2 mmol.L-1.hr(-1). In contrast, the fluoride citrate tubes showed minimal glucose loss over 24 h. Acid stabilises glycolysis but causes an over-estimation in glucose, across a
range of plasma glucose values, when compared to blood collected into conventional tubes under cooled conditions."

According to the news reporters, the research concluded: "The magnitude of the over-estimation seen with the fluoride-citrate tubes is unlikely to be due solely to the differential glucose stabilisation rates of acid, compared to cooling."

For more information on this research see: Collection tubes containing citrate stabiliser over-estimate plasma glucose, when compared to other samples undergoing immediate plasma separation. *Clinical Biochemistry*, 2016;49(18):1406-1411. *Clinical Biochemistry* can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. **Data on Pneumothorax Reported by Researchers at Princess Alexandra Hospital (Venous cutdown versus the Seldinger technique for placement of totally implantable venous access ports)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Respiratory Tract Diseases and Conditions - Pneumothorax are presented in a new report. According to news reporting originating from Brisbane, Australia, by NewsRx correspondents, research stated, "Totally implantable venous access ports (TIVAPs) provide patients with a safe and permanent venous access, for instance in the administration of chemotherapy for oncology patients. There are several methods for TIVAP placement, and the optimal evidence-based method is unclear."

Our news editors obtained a quote from the research from Princess Alexandra Hospital, "To compare the efficacy and safety of three commonly used techniques for implanting TIVAPs: the venous cutdown technique, the Seldinger technique, and the modified Seldinger technique. This review includes studies that use Doppler or real-time two-dimensional ultrasonography for locating the vein in the Seldinger technique. Search methods The Cochrane Vascular Trials Search Co-ordinator searched the Cochrane Vascular Specialised Register (last searched August 2015) and the Cochrane Central Register of Controlled Trials (CENTRAL) (2015, Issue 7), as well as clinical trials registers. Selection criteria We included randomised or quasi-randomised controlled clinical trials that randomly allocated people requiring TIVAP to the venous cutdown, Seldinger, or modified Seldinger technique. Two review authors
independently assessed studies for inclusion eligibility, with a third review author checking excluded studies. Data collection and analysis Two review authors independently extracted data. We assessed all studies for risk of bias. We assessed heterogeneity using \( \chi^2 \) statistic and variance (I\(^2 \)) statistic methods. Dichotomous outcomes, summarised as odds ratio (OR) with 95% confidence interval (CI), were: primary implantation success, complications (in particular infection), pneumothorax, and catheter complications. We conducted separate analyses to assess the two access veins, subclavian and internal jugular (IJ) vein, in the Seldinger technique versus the venous cutdown technique. We used both intention-to-treat (ITT) and on-treatment analyses and pooled data using a fixed-effect model. We included nine studies with a total of 1253 participants in the review. Five studies compared Seldinger technique (subclavian vein access) with venous cutdown technique (cephalic vein access). Two studies compared Seldinger (IJ vein) versus venous cutdown (cephalic vein). One study compared the modified Seldinger technique (cephalic vein) with the venous cutdown (cephalic vein), and one study compared the Seldinger (subclavian vein) versus the Seldinger (IJ vein) technique. Seldinger technique (subclavian or IJ vein access) versus venous cutdown (cephalic vein): We included seven trials with 1006 participants for analysis. Both ITT (OR 0.40; 95% CI 0.25 to 0.65) and on-treatment analysis (OR 0.59; 95% CI 0.36 to 0.98) showed that the Seldinger technique for implantation of TIVAP had a higher success rate compared with the venous cutdown technique. We found no difference between overall peri-and postoperative complication rates: ITT (OR 1.16; 95% CI 0.76 to 1.75) and on-treatment analysis (OR 0.93; 95% CI 0.62 to 1.40). In the Seldinger group, the majority of the trials reported use of the subclavian vein for venous access, with only a limited number of trials utilising the IJ vein for access. When individual complication rates of infection, pneumothorax, and catheter complications were analysed, the Seldinger technique (subclavian vein access) was associated with a higher rate of catheter complications compared to the venous cutdown technique: ITT (OR 6.77; 95% CI 2.31 to 19.79) and on-treatment analysis (OR 6.62; 95% CI 2.24 to 19.58). There was no difference in incidence of infections, pneumothorax, and other complications between the groups. Modified Seldinger technique (cephalic vein) versus venous cutdown (cephalic vein): We identified one trial with 164 participants. ITT analysis showed no difference in primary implantation success rate between the modified Seldinger technique (69/82, 84%) and the venous cutdown technique (66/82, 80%), \( P = 0.686 \). We observed no differences in the peri-or postoperative complication rates. Seldinger (subclavian vein access) versus Seldinger (IJ vein access): We identified one trial with 83 participants. The primary success rate was 84% (37/44) for Seldinger (subclavian vein) versus 74% (29/39) for the Seldinger (IJ vein). There was a higher overall complication rate in the subclavian group (48%) compared to the jugular group (23%), \( P = 0.02 \). However, when specific complications were compared individually, we found no differences between the groups. The overall quality of the trials included in this review was moderate. The methods used for randomisation were inadequate in four of the nine included studies, but sensitivity analysis excluding these trials did not alter the outcome. The nature of the interventions, either venous cutdown or Seldinger techniques, meant that it was not feasible to blind the participant or personnel, therefore we judged this to be at low risk of bias. The majority of participants in the included trials were oncology patients at tertiary centres, and the outcomes were applicable to the typical clinical scenario. For all outcomes, when comparing venous cutdown and Seldinger technique, serious imprecision was evident by wide confidence intervals in the included trials. The quality of the overall evidence was therefore downgraded from high to moderate. Due to the limited number of included studies we were unable to assess publication bias. Authors’ conclusions Moderate-quality evidence showed that the Seldinger technique has a higher primary implantation success rate compared with the venous cutdown technique. The majority of trials using the Seldinger technique used the subclavian vein for venous access, and only a few trials reported the use of the internal jugular vein for venous
access. Moderate-quality evidence showed no difference in the overall complication rate between the Seldinger and venous cutdown techniques. However, when the Seldinger technique with subclavian vein access was compared with the venous cutdown group, there was a higher reported incidence of catheter complications. The rates of pneumothorax and infection did not differ between the Seldinger and venous cutdown group.

According to the news editors, the research concluded: "We identified only one trial for each of the comparisons modified Seldinger technique (cephalic vein) versus venous cutdown (cephalic vein) and Seldinger (subclavian vein access) versus Seldinger (IJ vein access), thus a definitive conclusion cannot be drawn for these comparisons and further research is recommended."

For more information on this research see: Venous cutdown versus the Seldinger technique for placement of totally implantable venous access ports. Cochrane Database of Systematic Reviews, 2016;(8):2945-3024. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news editors report that additional information may be obtained by contacting C.C.T. Hsu, Princess Alexandra Hospital, Dept. of Med Imaging, Brisbane, Qld 4102, Australia. Additional authors for this research include G.N.C. Kwan, H. Evans-Barns, J.A. Rophael and M.L. van Driel.

Membrane Proteins - Porins

Data on Porins Discussed by Researchers at Kyungpook National University (Molecular mechanisms regulating aquaporin-2 in kidney collecting duct)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Membrane Proteins - Porins are presented in a new report. According to news reporting originating from Taegu, South Korea, by NewsRx correspondents, research stated, "The kidney collecting duct is an important renal tubular segment for regulation of body water homeostasis and urine concentration. Water reabsorption in the collecting duct principal cells is controlled by vasopressin, a peptide hormone that induces the osmotic water transport across the collecting duct epithelia through regulation of water channel proteins aquaporin-2 (AQP2) and aquaporin-3 (AQP3)."

Our news editors obtained a quote from the research from Kyungpook National University, "In particular, vasopressin induces both intracellular translocation of AQP2-bearing vesicles to the apical plasma membrane and transcription of the Aqp2 gene to increase AQP2 protein abundance. The signaling pathways, including AQP2 phosphorylation, RhoA phosphorylation, intracellular calcium mobilization, and actin depolymerization, play a key role in the translocation of AQP2."

According to the news editors, the research concluded: "This review summarizes recent data demonstrating the regulation of AQP2 as the underlying molecular mechanism for
the homeostasis of water balance in the body."

The news editors report that additional information may be obtained by contacting T.H. Kwon, Kyungpook National University, Sch Med, Dept. of Biochem & Cell Biol, Taegu 41944, South Korea.

Keywords for this news article include: Taegu, South Korea, Asia, Membrane Transport Proteins, Aquaporins, Article Review, Membrane Glycoproteins, Membrane Proteins, Carrier Proteins, Ion Channels, Aquaporin 2, Vasopressin, Hormones, Porins, Kyungpook National University.

**Post-Operative Complications**

**Data on Post-Operative Complications Detailed by Researchers at University of Miami (Free Versus Pedicled TRAM Flaps: Cost Utilization and Complications)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Post-Operative Complications. According to news reporting out of Miami, Florida, by NewsRx editors, research stated, "Conventionally, free transverse rectus abdominis myocutaneous (fTRAM) flap breast reconstruction has been associated with decreased donor site morbidity and improved flap inset. However, clinical success depends upon more sophisticated technical expertise and facilities."

Our news journalists obtained a quote from the research from the University of Miami, "This study aims to characterize postoperative outcomes undergoing free versus pedicled TRAM (pTRAM) flap breast reconstruction. Nationwide inpatient sample database (2008-2011) was reviewed for cases of fTRAM (ICD-9-CM 85.73) and pTRAM (85.72) breast reconstruction. Inclusion criteria were females undergoing pTRAM or fTRAM breast reconstruction; males were excluded. We examined demographics, hospital setting, insurance information, patient income, and comorbidities. Clinical endpoints included postoperative complications, length-of-stay (LOS), and total charges (TC). Bivariate/multivariate analyses were performed to identify independent risk factors associated with increased complications and resource utilization. Overall, 21,655 cases were captured. Seventy-percent were Caucasian, 95% insured, and 72% treated in an urban teaching hospital. There were 9 pTRAM and 6 fTRAM in-hospital mortalities. On bivariate analysis, the fTRAM cohort was more likely to be obese (OR 1.2), undergo revision (OR 5.9), require hemorrhage control (OR 5.7), suffer hematoma complications (OR 1.9), or wound infection (OR 1.8) (p < 0.003). The pTRAM cohort was more likely to suffer pneumonia (OR 1.6) and pulmonary embolism (OR 2.0) (p < 0.004). Reconstruction type did not affect risk of flap loss or seroma occurrence. TC were higher with fTRAM (p < 0.001). LOS was not affected by procedure type. On risk-adjusted multivariate analysis, fTRAM was an independent risk factor for increased LOS (OR 1.6), TC (OR 1.8), and postoperative complications (OR 1.3) (p < 0.001). Free TRAM has an increased risk of postoperative complications and resource utilization versus pTRAM on the current largest risk-adjusted analysis. Further analyses are required to elucidate additional factors influencing
outcomes following these procedures. This journal requires that authors assign a level of evidence to each article."

According to the news editors, the research concluded: "For a full description of these Evidence-Based Medicine ratings, please refer to the Table of Contents or the A3 online Instructions to Authors. www.springer.com/00266."

Our news journalists report that additional information may be obtained by contacting S.R. Thaller, University of Miami, DeWitt Daughtry Family Dept. of Surg, Div Plast Aesthet & Reconstruct Surg, Miami, FL 33136, United States. Additional authors for this research include D.J. Gerth, J. Tashiro and S.R. Thaller.

Propiophenones

Data on Propiophenones Detailed by Researchers at University of Michigan (Identification of non-reported bupropion metabolites in human plasma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Propiophenones. According to news reporting out of Ann Arbor, Michigan, by NewsRx editors, research stated, "Bupropion and its three active metabolites exhibit clinical efficacy in the treatment of major depression, seasonal depression and smoking cessation. The pharmacokinetics of bupropion in humans is highly variable."

Our news journalists obtained a quote from the research from the University of Michigan, "It is not known if there are any non-reported metabolites formed in humans in addition to the three known active metabolites. This paper reports newly identified and non-reported metabolites of bupropion in human plasma samples. Human subjects were dosed with a single oral dose of 75mg of an immediate release bupropion HCl tablet. Plasma samples were collected and analysed by LC-MS/MS at 0, 6 and 24h. Two non-reported metabolites (M1 and M3) were identified with mass-to-charge (m/z) ratios of 276 (M1, hydration of bupropion) and 258 (M3, hydroxylation of threo/erythrohydrobupropion) from human plasma in addition to the known hydroxybupropion, threo/erythrohydrobupropion and the glucuronidation products of the major metabolites (M2 and M4-M7)."

According to the news editors, the research concluded: "These new metabolites may provide new insight and broaden the understanding of bupropion's variability in clinical
pharmacokinetics."

Our news journalists report that additional information may be obtained by contacting D.X. Sun, University of Michigan, Dept. of Pharmaceut Sci, Ann Arbor, MI 48109, United States. Additional authors for this research include R.J. Luo, J. Windak, X.Y. Zhang, A. Babiskin, M. Kelly, G. Harrington, V.L. Ellingrod, M. Kamali, M. McInnis and D.X. Sun.

**Oncology - Prostate Cancer**

**Data on Prostate Cancer Detailed by Researchers at International Agency for Research on Cancer (Prostate cancer burden in Central and South America)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Prostate Cancer is the subject of a report. According to news reporting out of Lyon, France, by NewsRx editors, research stated, "Rationale and objective: The incidence of prostate cancer has increased in Central and South America (CSA) in the last few decades. We describe the geographical patterns and trends of prostate cancer in CSA."

Our news journalists obtained a quote from the research from International Agency for Research on Cancer, "We obtained regional and national-level cancer incidence data from 48 population-based registries in 13 countries and nation-wide cancer deaths from the WHO mortality database for 18 countries. We estimated world population age-standardized incidence (ASR) and mortality (ASMR) rates per 100,000 person-years for 2003-2007 and the estimated annual percent change (EAPC) to describe time trends. Prostate cancer was the most common cancer diagnosis and one of the leading causes of cancer deaths among males in most CSA countries. From 2003-2007, ASRs varied between countries (6-fold) and within countries (Brazil: 3-6-fold). French Guyana (147.1) and Brazil (91.4) had the highest ASRs whereas Mexico (28.9) and Cuba (24.3) had the lowest. ASMRs varied by 4-fold. Belize, Uruguay and Cuba (24.128.9) had the highest ASMRs while Peru, Nicaragua, and El Salvador (6.8-9.7) had the lowest. In Argentina, Brazil, Chile and Costa Rica prostate cancer incidence increased by 2.8-4.8% annually whereas mortality remained stable between 1997 and 2008. The geographic and temporal variation of prostate cancer rates observed in CSA may in part reflect differences in diagnostic and registration practices, healthcare access, treatment and death certification, and public awareness."

According to the news editors, the research concluded: "The incidence of prostate
cancer is expected to increase given recent early detection activities and increased public awareness; however, the impact of these factors on mortality remains to be elucidated."

**Oncology - Prostate Cancer**

**Data on Prostate Cancer Detailed by Researchers at University Health Network (Technical Note: Method to correlate whole-specimen histopathology of radical prostatectomy with diagnostic MR imaging)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting originating in Toronto, Canada, by NewsRx journalists, research stated, "Validation of MRI-guided tumor boundary delineation for targeted prostate cancer therapy is achieved via correlation with gold-standard histopathology of radical prostatectomy specimens. Challenges to accurate correlation include matching the pathology sectioning plane with the in vivo imaging slice plane and correction for the deformation that occurs between in vivo imaging and histology."

Funders for this research include Cancer Care Ontario, National Institutes of Health (NIH), Ontario Institute for Cancer Research (OICR).

The news reporters obtained a quote from the research from University Health Network, "A methodology is presented for matching of the histological sectioning angle and position to the in vivo imaging slices. Patients (n=4) with biochemical failure following external beam radiotherapy underwent diagnostic MRI to confirm localized recurrence of prostate cancer, followed by salvage radical prostatectomy. High-resolution 3-D MRI of the ex vivo specimens was acquired to determine the pathology sectioning angle that best matched the in vivo imaging slice plane, using matching anatomical features and implanted fiducials. A novel sectioning device was developed to guide sectioning at the correct angle, and to assist the insertion of reference dye marks to aid in histopathology reconstruction. The percentage difference in the positioning of the urethra in the ex vivo pathology sections compared to the positioning in in vivo images was reduced from 34% to 7% through slicing at the best match angle. Reference dye marks were generated, which were visible in ex vivo imaging, in the tissue
sections before and after processing, and in histology sections. The method achieved an almost fivefold reduction in the slice-matching error and is readily implementable in combination with standard MRI technology. The technique will be employed to generate datasets for correlation of whole-specimen prostate histopathology with in vivo diagnostic MRI using 3-D deformable registration, allowing assessment of the sensitivity and specificity of MRI parameters for prostate cancer."

According to the news reporters, the research concluded: "Although developed specifically for prostate, the method is readily adaptable to other types of whole tissue specimen, such as mastectomy or liver resection."

For more information on this research see: Technical Note: Method to correlate whole-specimen histopathology of radical prostatectomy with diagnostic MR imaging. Medical Physics, 2016;43(3):1065-72. Oncology - Prostate Cancer

Data on Prostate Cancer Discussed by Researchers at Cleveland State University (Effects of interferons and double-stranded RNA on human prostate cancer cell apoptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "Prostate cancer is the second most commonly diagnosed cancer among men in the United States. Prostate cancer therapy is severely hampered by lack of response and development of resistance to conventional chemotherapeutic drugs in patients."

The news reporters obtained a quote from the research from Cleveland State University, "Therefore, the development and discovery of new drugs have become an urgent clinical need. Interferons (IFNs), a family of pleiotropic cytokines, exert antitumor activities due
to their anti-proliferative, immunomodulatory and proapoptotic functions. Here, we report that pretreatment of prostate cancer PC-3 cells with IFNs sensitized these cells to double-stranded RNAs (dsRNAs)-induced apoptosis. The enhancement effect of IFN treatment was dependent on IFN subtypes, in particular, IFN \( \gamma \). In comparison with IFN \( \alpha \) or \( \beta \), IFN \( \gamma \) treatment remarkably augmented apoptosis in PC-3 cells induced with polyinosinic:polycytidylic acid (poly I:C), a synthesized form of dsRNA. We demonstrated that IFN-signaling was necessary for these effects by using mutant cell lines. Transfection of 2-5A, the activator of RNase L, or silencing of dsRNA-dependent protein kinase R (PKR) by siRNA did not have any significant impact on this event, suggesting that neither RNase L nor PKR was involved in poly I:C/IFN \( \gamma \)-induced apoptosis in the cells. Further investigation of the apoptotic pathway revealed that Bak, a pro-apoptotic member of the Bcl-2 family, was synergistically up-regulated by IFN \( \gamma \) and poly I:C, whereas other members of the family were not affected. Knocking down of Bak demonstrated its contribution to poly I:C/IFN \( \gamma \)-induced apoptosis in the cells.

According to the news reporters, the research concluded: "We believe our findings will precipitate the design of novel therapeutic strategies for prostate cancer."

For more information on this research see: Effects of interferons and double-stranded RNA on human prostate cancer cell apoptosis. *Oncotarget*, 2015;6(36):39184-95.

results showed that capsaicin induced prostate cancer cell death in a time-and concentration-dependent manner, increased the levels of microtubule-associated protein light chain 3-II (LC3-II, a marker of autophagy) and the accumulation of the cargo protein p62 suggesting an autophagy blockage. Moreover, confocal microscopy revealed that capsaicin treatment increased lysosomes which co-localized with LC3 positive vesicles in a similar extent to that produced by the lysosomal protease inhibitors E64 and pepstatin pointing to an autophagolysosomes breakdown inhibition. Furthermore, we found that capsaicin triggered ROS generation in cells, while the levels of ROS decreased with N-acetyl-cysteine (NAC), a ROS scavenger. Co-treatment of cells with NAC and capsaicin abrogated the effects of capsaicin on autophagy and cell death."

According to the news editors, the research concluded: "Normal prostate PNT2 and RWPE-1 cells were more resistant to capsaicin-induced cytotoxicity and did not accumulate p62 protein. Taken together, these results suggest that ROS-mediated capsaicin-induced autophagy blockage contributes to antiproliferation in prostate cancer cells, which provides new insights into the anticancer molecular mechanism of capsaicin."

For more information on this research see: The pepper's natural ingredient capsaicin induces autophagy blockage in prostate cancer cells. Oncotarget, 2016;7(2):1569-83. Oncology - Prostate Cancer

Data on Prostate Cancer Discussed by Researchers at Western University (Pathological, Oncologic and Functional Outcomes of a Prospective Registry of Salvage High Intensity Focused Ultrasound Ablation for Radio-recurrent Prostate Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Prostate Cancer is the subject of a report. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "In this prospective registry we prospectively assessed the oncologic, functional and safety outcomes of salvage high intensity focused ultrasound for radio-recurrent prostate cancer. A total of 81 men were prospectively recruited and evaluated at regular scheduled study visits to 6 months after high intensity focused ultrasound and thereafter as per standard of care."

The news correspondents obtained a quote from the research from Western University, "Transrectal ultrasound guided biopsy was performed at 6 months. The primary end
point was absence or histological persistence of disease at 6-month biopsy. Secondary end points included quality of life, biochemical recurrence-free survival, overall survival, cancer specific survival and progression to androgen deprivation therapy. Survival analysis was performed according to the Kaplan-Meier method and multivariate analysis was performed using the log rank (Mantel-Cox) test. Mean +/- SD prostate specific antigen before high intensity focused ultrasound was 4.06 +/- 2.88 ng/ml. At 6 months 63 men underwent biopsy, of whom 22 (35%) had residual disease. At a mean followup of 53.5 +/- 31.6 months median biochemical recurrence-free survival was 63 months. The 5-year overall and cancer specific survival rates were 88% and 94.4%, respectively. Nadir prostate specific antigen less than 0.5 ng/ml was a significant predictor of biochemical recurrence-free survival (p = 0.014, 95% CI 1.22-5.87). I-PSS significantly increased (p < 0.001) while IIEF-5 scores decreased and the SF-36 score did not change significantly. The rate of rectal fistulization and severe incontinence was 3.7% each. A total of 223 complications were recorded in the 180 days after high intensity focused ultrasound (Clavien-Dindo grade I-195, grade II-20, grade III-7, grade IVa-1).

According to the news reporters, the research concluded: "Salvage high intensity focused ultrasound appears to be a viable treatment option for radio-recurrent prostate cancer, with acceptable morbidity."

Oncology - Prostate Cancer

Data on Prostate Cancer Reported by Researchers at Mayo Clinic (Predictors of Time to Metastasis in Castration-resistant Prostate Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Prostate Cancer are discussed in a new report. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "To investigate predictors of time to metastasis among men treated with androgen deprivation therapy for nonmetastatic prostate cancer who developed castration-resistant..."
prostate cancer (CRPC) within the Shared Equal Access Regional Cancer Hospital cohort. This is a retrospective analysis of 458 nonmetastatic CRPC men."

Our news journalists obtained a quote from the research from Mayo Clinic, "Metastases were detected in routine bone scans or other imaging tests. Predictors of time to metastasis were analyzed using proportional hazards model with CRPC as time zero. A total of 256 (56%) men were diagnosed with metastatic disease over a median follow-up of 36 months. Metastasis-free survival was 79%, 65%, 52%, 47%, and 41% at 1, 2, 3, 4, and 5 years after CRPC, respectively. In multivariable analysis, Gleason score 8-10 (hazard ratio [HR] = 1.61; P = .026), receiving primary localized treatment (HR = 1.38; P = .028), higher prostate-specific antigen (PSA) levels at CRPC diagnosis (logPSA HR = 1.64; P < .001), and PSA doubling time = 6 months (HR = 1.42; P = .040) were independently associated with shorter time to metastasis. Race, year of CRPC, age, and time from androgen deprivation therapy to CRPC were not associated with metastasis. Among nonmetastatic CRPC men, nearly 60% developed metastatic disease during the first 5 years, with most of the metastasis occurring within the first 3 years. Higher Gleason score, receiving primary treatment, higher PSA, and shorter PSA doubling time were independently associated with shorter time to metastasis."

According to the news editors, the research concluded: "Therefore, these variables can be used to stratify patients according to metastasis risk."

For more information on this research see: Predictors of Time to Metastasis in Castration-resistant Prostate Cancer. Urology, 2016;96():171-176. Oncology - Prostate Cancer

Data on Prostate Cancer Reported by X. Filella and Colleagues

[Prostate Cancer Detection and Prognosis: From Prostate Specific Antigen (PSA) to Exosomal Biomarkers]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Prostate specific antigen (PSA) remains the most used biomarker in the management of early prostate cancer (PCa), in spite of the problems related to false positive results and
overdiagnosis. New biomarkers have been proposed in recent years with the aim of increasing specificity and distinguishing aggressive from non-aggressive PCa."

Our news editors obtained a quote from the research, "The emerging role of the prostate health index and the 4Kscore is reviewed in this article. Both are blood-based tests related to the aggressiveness of the tumor, which provide the risk of suffering PCa and avoiding negative biopsies. Furthermore, the use of urine has emerged as a non-invasive way to identify new biomarkers in recent years, including the PCA3 and TMPRSS2:ERG fusion gene.

Available results about the PCA3 score showed its usefulness to decide the repetition of biopsy in patients with a previous negative result, although its relationship with the aggressiveness of the tumor is controversial. More recently, aberrant microRNA expression in PCa has been reported by different authors. Preliminary results suggest the utility of circulating and urinary microRNAs in the detection and prognosis of PCa."

According to the news editors, the research concluded: "Although several of these new biomarkers have been recommended by different guidelines, large prospective and comparative studies are necessary to establish their value in PCa detection and prognosis."

For more information on this research see: Prostate Cancer Detection and Prognosis: From Prostate Specific Antigen (PSA) to Exosomal Biomarkers. *International Journal of Molecular Sciences*, 2016;17(11):381-402. *International Journal of Molecular Sciences* can be contacted at: Mdp Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

**Gram-Negative Bacteria - Proteus mirabilis**

**Data on Proteus mirabilis Detailed by Researchers at Sun Yat Sen University (Characterization of CTX-M-140, a Variant of CTX-M-14 Extended-Spectrum beta-Lactamase with Decreased Cephalosporin Hydrolytic Activity, from Cephalosporin-Resistant ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Proteus mirabilis have been published. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "CTX-M-140, a novel CTX-M-type extended-spectrum beta-lactamase (ESBL), was identified in cephalosporin-resistant clinical isolates of Proteus mirabilis. CTX-M-140 contained an alanine-to-threonine substitution at position 109 compared to its putative progenitor, CTX-M-14."

Our news journalists obtained a quote from the research from Sun Yat Sen University, "When it was expressed in an Escherichia coli isogenic background, CTX-M-140 conferred 4-to 32-fold lower MICs of cephalosporins than those with CTX-M-14, indicating that..."
the phenotype was attributable to this single substitution. For four mutants of CTX-M-14 that were constructed by site-directed mutagenesis (A109E, A109D, A109K, and A109R mutants), MICs of cephalosporins were similar to those for the E. coli host strain, which suggested that the alanine at position 109 was essential for cephalosporin hydrolysis. The kinetic properties of native CTX-M-14 and CTX-M-140 were consistent with the MICs for the E. coli clones. Compared with that of CTX-M-14, a lower hydrolytic activity against cephalosporins was observed for CTX-M-140. bla(CTX-M-140) is located on the chromosome as determined by I-CeuI pulsed-field gel electrophoresis (I-CeuIPFGE) and Southern hybridization. The genetic environment surrounding bla(CTX-M-140) is identical to the sequence found in different plasmids with blaCTX-M-9-group genes among the Enterobacteriaceae. Genome sequencing and analysis showed that P. mirabilis strains with bla(CTX-M-140) have a genome size of similar to 4 Mbp, with a GC content of 38.7% and 23 putative antibiotic resistance genes."

According to the news editors, the research concluded: "Our results indicate that alanine at position 109 is critical for the hydrolytic activity of CTX-M-14 against oxyimino-cephalosporins."

For more information on this research see: Characterization of CTX-M-140, a Variant of CTX-M-14 Extended-Spectrum beta-Lactamase with Decreased Cephalosporin Hydrolytic Activity, from Cephalosporin-Resistant Proteus mirabilis. *Antimicrobial Agents and Chemotherapy*, 2016;60(10):6121-6126. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. in the Tunisian population and to expand knowledge of CARD14 variants in the European population."

Financial supporters for this research include National Institutes of Health, University of Tunisia.

Our news journalists obtained a quote from the research, "CARD14 coding exons were resequenced in patients with psoriasis and controls from Tunisia and Europe, including 16 European cases with generalized pustular psoriasis (GPP). Novel variants were evaluated for their effect on nuclear factor (NF)-kB signalling. Rare variants in CARD14 were significantly enriched in Tunisian cases compared with controls. Three were collectively found in 5% of Tunisian cases, and all affected the N-terminal region of the protein harbouring its caspase recruitment domain or coiled-coil domain. These variants were c.349G >A (p.Gly117Ser), c.205C >T (p.Arg69Trp) and c.589G >A (p.Glu197Lys). c.589G >A (p.Glu197Lys) led to upregulation of NF-kB activity in a similar manner to that of previously described psoriasis-associated mutations. p.Arg69Trp led to sevenfold downregulation of NF-kB activity. One Tunisian case harboured a c.1356+5G >A splice alteration that is predicted to lead to loss of exon 9, which encodes part of the coiled-coil domain. No cases of GPP harboured an interleukin-36RN mutation, but one of 16 cases of GPP with a family history of psoriasis vulgaris harboured a c.1805C >T (p.Ser602Leu) mutation in CARD14."

According to the news editors, the research concluded: "These observations provide further insights into the genetic basis of psoriasis in the Tunisian population and provide functional information on novel CARD14 variants seen in cases from Tunisia and other populations."

The news correspondents report that additional information may be obtained from M. Ammar, Laboratoire de Genetique d'Immunologie et de Pathologies Humaines, Faculte des Sciences de Tunis, Universite Tunis El Manar, Tunis, Tunisia. Additional authors for this research include C.T. Jordan, L. Cao, E. Lim, C. Bouchlaka Souissi, A. Jrad, I. Omrane, S. Koudhi, I. Zarra, H. Anbunathan, M. Mokni, N. Doss, E. Guttman-Yassky, A.B. El Gaaied, A. Menter and A.M Bowcock.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Lung Diseases and Conditions - Pulmonary Hypertension is now available. According to news originating from Los Angeles, California, by NewsRx correspondents, research stated, "This study aims to evaluate the safety and efficacy of transcatheter fenestrated ASD closure and to summarize the literature regarding the published techniques and outcomes of transcatheter partial ASD closure. Patients with left ventricular diastolic dysfunction (LVDD) or right ventricular (RV) dysfunction and/or pulmonary hypertension (PHT) may suffer untoward consequences of complete closure of an ostium secundum atrial septal defect (ASD)."

Our news journalists obtained a quote from the research from the University of California, "Therefore, for patients that fall under these categories we suggest partial occlusion of the defect, which may be better tolerated than complete defect closure. After obtaining IRB approval, a search for patients that have undergone percutaneous ASD closure was performed in the Ahmanson/UCLA Adult Congenital Heart Disease Center database to identify which patients received a fenestrated ASD closure device. Eight consecutive patients ranging between 22 and 83 years of age (mean 48 years) with PHT and/or LVDD or RV dysfunction who underwent fenestrated transcatheter ASD closure at UCLA were identified. None of the subjects experienced complications related to the procedure. Postprocedure clinical evaluation showed improvement in symptoms and exercise capacity. Available follow-up transthoracic echocardiography data (mean 4 months, range 0-20 months) demonstrated patent fenestrations in four of eight patients. None of the patients had thromboembolic or infectious complications and there were no device migrations, erosions or embolizations."

According to the news editors, the research concluded: "Partial ASD occlusion in patients with diastolic dysfunction or RV dysfunction and/or PHT is safe and may be better tolerated than complete ASD closure in selected patients."

For more information on this research see: Fenestrated Transcatheter ASD Closure in Adults with Diastolic Dysfunction and/or Pulmonary Hypertension: Case Series and Review of the Literature. Congenital Heart Disease, 2016;11(6):663-671. Congenital Heart Disease can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell - www.wiley.com/; Congenital Heart Disease - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1747-0803)

The news correspondents report that additional information may be obtained from A. Abdelkarim, University of California, David Geffen Sch Med, Ahmanson UCLA Adult Congenital Heart Dis Center, Los Angeles, CA 90095, United States. Additional authors for this research include D.S. Levi, B. Tran, J. Ghobrial and J. Aboulhosn.

Nanotechnology - Quantum Dots

Data on Quantum Dots Detailed by Researchers at University of Algarve (Environmental behaviour and ecotoxicity of quantum dots at various trophic levels: A review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nanotechnology - Quantum Dots have been published. According to news reporting originating in Faro, Portugal, by NewsRx journalists, research stated, "Despite the wide application of quantum dots (QDs) in electronics, pharmacy and nanomedicine, limited data is available on their environmental health risk. To advance our current understanding of the environmental impact of these engineered nanomaterials, the aim of this review is to give a detailed insight on the existing information concerning the behaviour, transformation and fate of QDs in the aquatic environment, as well as on its mode of action (MoA), ecotoxicity, trophic transfer and biomagnification at various trophic levels (microorganisms, aquatic invertebrates and vertebrates)."

Funders for this research include Science Without Borders Program, Portuguese Foundation for Science and Technology.

The news reporters obtained a quote from the research from the University of Algarve, "Data show that several types of Cd-based QDs, even at low concentrations (bmg Cd L-1), induce different toxic effects compared to their dissolved counterpart, indicating nano-specific ecotoxicity. QD ecotoxicity at different trophic levels is highly dependent on its physico-chemical properties, environmental conditions, concentration and exposure time, as well as, species, while UV irradiation increases its toxicity. The state of the art regarding the MoA of QDs according to taxonomic groups is summarised and illustrated. Accumulation and trophic transfer of QDs was observed in freshwater and seawater species, while limited biomagnification and detoxification processes were detected. Finally, current knowledge gaps are discussed and recommendations for future research identified."

According to the news reporters, the research concluded: "Overall, the knowledge available indicates that in order to develop sustainable nanotechnologies there is an urgent need to develop Cd-free QDs and new 'core-shell-conjugate' QD structures."

Our news correspondents report that additional information may be obtained by contacting M.J. Bebianno, University of Algarve, Fac Sci & Technol, CIMA, P-8005139 Faro, Portugal. Additional authors for this research include N.C. Mestre, S.M.T. Saboia-Morais and M.J. Bebianno.

Rare Diseases

Data on Rare Diseases Reported by Researchers at Yonsei University
(Rare high-impact disease variants: properties and identifications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Rare Diseases. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Although many genome-wide association studies have been performed, the identification of disease polymorphisms remains important. It is now suspected that many rare disease variants induce the association signal of common variants in linkage disequilibrium (LD)."

Our news journalists obtained a quote from the research from Yonsei University, "Based on recent development of genetic models, the current study provides explanations of the existence of rare variants with high impacts and common variants with low impacts. Disease variants are neither necessary nor sufficient due to gene-gene or gene-environment interactions. A new method was developed based on theoretical aspects to identify both rare and common disease variants by their genotypes. Common disease variants were identified with relatively small odds ratios and relatively small sample sizes, except for specific situations in which the disease variants were in strong LD with a variant with a higher frequency. Rare disease variants with small impacts were difficult to identify without increasing sample sizes; however, the method was reasonably accurate for rare disease variants with high impacts. For rare variants, dominant variants generally showed better Type II error rates than recessive variants; however, the trend was reversed for common variants. Type II error rates increased in gene regions containing more than two disease variants because the more common variant, rather than both disease variants, was usually identified."

According to the news editors, the research concluded: "The proposed method would be useful for identifying common disease variants with small impacts and rare disease variants with large impacts when disease variants have the same effects on disease presentation."

For more information on this research see: Rare high-impact disease variants: properties and identifications. Genetics Research, 2016;98():e6. (Cambridge University Press - journals.cambridge.org/action/displayJournal?jid=GRH)

Our news journalists report that additional information may be obtained by contacting L. Park, Natural Science Research Institute, Yonsei University, 134 Shinchon-Dong, Seodaemun-Gu, Seoul, 120-749, South Korea.

Data on Retinitis Pigmentosa Described by Researchers at Institute of Ophthalmology (Mutations in REEP6 Cause Autosomal-Recessive Retinitis Pigmentosa)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Eye Diseases and Conditions - Retinitis Pigmentosa. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "Retinitis pigmentosa (RP) is the most frequent form of inherited retinal dystrophy. RP is genetically heterogeneous and the genes identified to date encode proteins involved in a wide range of functional pathways, including photoreceptor development, phototransduction, the retinoid cycle, cilia, and outer segment development."

Funders for this research include Foundation Fighting Blindness, National Eye Institute, NEI, RP Fighting Blindness, Fight for Sight, The Wellcome Trust, The National Institute for Health Research (UK), Biomedical Research Centre at Moorfields Eye Hospital, UCL Institute of Ophthalmology, Fight for Sight UK, Moorfields Eye Hospital Special Trustees, Foundation Fighting Blindness - USA.

Our news journalists obtained a quote from the research from the Institute of Ophthalmology, "Here we report the identification of biallelic mutations in Receptor Expression Enhancer Protein 6 (REEP6) in seven individuals with autosomal-recessive RP from five unrelated families. REEP6 is a member of the REEP/Yop1 family of proteins that influence the structure of the endoplasmic reticulum but is relatively unstudied. The six variants identified include three frameshift variants, two missense variants, and a genomic rearrangement that disrupts exon 1. Human 3D organoid optic cups were used to investigate REEP6 expression and confirmed the expression of a retina-specific isoform REEP6.1, which is specifically affected by one of the frameshift mutations. Expression of the two missense variants (c.383C >T [p.Pro128Leu] and c.404T >C [p.Leu135Pro]) and the REEP6.1 frameshift mutant in cultured cells suggest that these changes destabilize the protein. Furthermore, CRISPR-Cas9-mediated gene editing was used to produce Reep6 knock-in mice with the p.Leu135Pro RP-associated variant identified in one RP-affected individual. The homozygous knock-in mice mimic the clinical phenotypes of RP, including progressive photoreceptor degeneration and dysfunction of the rod photoreceptors."

According to the news editors, the research concluded: "Therefore, our study implicates REEP6 in retinal homeostasis and highlights a pathway previously uncharacterized in retinal dystrophy."

The news correspondents report that additional information may be obtained from M.E. Cheetham, UCL, Inst Ophthalmol, London EC1V 9EL, United Kingdom. Additional authors for this research include S.A. Agrawal, A. Eblimit, J. Bellingham, M.C. Xu, F. Wang, C. Chakarova, D.A. Parfitt, A. Lane, T. Burgoyne, S. Hull, K.J. Carss, A. Fiorentino, M.J. Hayes, P.M. Munro, R. Nicols, N. Pontikos, G.E. Holder, C. Asomugha and Raymond.

The direct object identifier (DOI) for that additional information is:
Data on Retinopathy of Prematurity Detailed by Researchers at University of Adelaide (Adverse effects of red blood cell transfusions in neonates: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Retinopathy of Prematurity. According to news reporting originating in Adelaide, Australia, by NewsRx journalists, research stated, "Controversy exists regarding the contribution of blood transfusions to a range of adverse clinical outcomes in neonates. The aim of our systematic review was to identify the broader literature on harmful effects and associations potentially attributable to red blood cell (RBC) transfusions."

The news reporters obtained a quote from the research from the University of Adelaide, "A comprehensive search of MEDLINE (PubMed) and EMBASE was undertaken. Eligible studies included both randomized controlled trials (RCTs) and nonrandomized studies examining the effects of small volume (10-20 mL/kg) RBC transfusions on neonates. Primary outcomes of interest were mortality, chronic lung disease, retinopathy of prematurity, necrotizing enterocolitis, and intraventricular hemorrhage. Two independent authors conducted a review of abstracts and then of full-text article reviews as well as data extraction and quality assessments. Sixty-one studies were eligible for inclusion, including 16 (26%) randomized studies. The majority of studies were nonrandomized (n = 45; 74%), which included 32 observational studies with and 13 studies without a comparator group. There was no evidence that rates of mortality differed between restrictive and liberal strategies for transfusion (eight RCTs: risk ratio, 1.24; 95% confidence interval, 0.89-1.672, heterogeneity = 0%) or for necrotizing enterocolitis (five RCTs: risk ratio, 1.45; 95% confidence interval, 0.91-2.33; heterogeneity = 0%). A liberal strategy also was not superior to restrictive transfusion practice in the pooled randomized studies for rates of retinopathy of prematurity, chronic lung disease, or intraventricular hemorrhage. Statistically significant differences in a range of harmful outcomes between neonates exposed to restrictive and liberal RBC transfusion practice were not found."

According to the news reporters, the research concluded: "However, the risks of bias identified in many studies and the lack of consistent reporting and definitions of events limits our conclusions."

Our news correspondents report that additional information may be obtained by contacting A. Keir, University of Adelaide, Sch Med, Adelaide, SA, Australia. Additional authors for this research include S. Pal, M. Trivella, L. Lieberman, J. Callum, N. Shehata and S.J. Stanworth.

Keywords for this news article include: Adelaide, Australia, Australia and New Zealand, Respiratory Tract Diseases and Conditions, Digestive System Diseases and Conditions, Gastrointestinal Diseases and Conditions, Retinal Diseases and Conditions, Lung Diseases and Conditions, Eye Diseases and Conditions, Hemorrhage, Article Review, Retinopathy of Prematurity, Necrotizing Enterocolitis, Transfusion Medicine, Blood Transfusion, Medical Devices, Gastroenteritis, Ophthalmology, Cell Research, Blood Cells, University of Adelaide.

Oncology - Rhabdomyosarcomas

Data on Rhabdomyosarcomas Reported by Researchers at University of Virginia (Fusion transcriptome profiling provides insights into alveolar rhabdomyosarcoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Rhabdomyosarcomas are discussed in a new report. According to news reporting from Charlottesville, Virginia, by NewsRx journalists, research stated, "Gene fusions and fusion products were thought to be unique features of neoplasia. However, more and more studies have identified fusion RNAs in normal physiology."

Financial supporters for this research include St. Baldrick's Foundation, HHS | NIH | National Cancer Institute (NCI).

The news correspondents obtained a quote from the research from the University of Virginia, "Through RNA sequencing of 27 human noncancer tissues, a large number of fusion RNAs were found. By analyzing fusion transcriptome, we observed close clusterings between samples of same or similar tissues, supporting the feasibility of using fusion RNA profiling to reveal connections between biological samples. To put the concept into use, we selected alveolar rhabdomyosarcoma (ARMS), a myogenic pediatric cancer whose exact cell of origin is not clear. PAX3-FOXO1 (paired box gene 3 fused with forkhead box O1) fusion RNA, which is considered a hallmark of ARMS, was recently found during normal muscle cell differentiation. We performed and analyzed RNA sequencing from various time points during myogenesis and uncovered many chimeric fusion RNAs. Interestingly, we found that the fusion RNA profile of RH30, an ARMS cell line, is most similar to the myogenesis time point when PAX3-FOXO1 is expressed. In contrast, full transcriptome clustering analysis failed to uncover this connection. Strikingly, all of the 18 chimeric RNAs in RH30 cells could be detected at the same myogenic time point(s). In addition, the seven chimeric RNAs that follow the exact transient expression pattern as PAX3-FOXO1 are specific to rhabdomyosarcoma cells. Further testing with clinical samples also confirmed their specificity to rhabdomyosarcoma."

According to the news reporters, the research concluded: "These results provide further support for the link between at least some ARMSs and the PAX3-FOXO1-expressing myogenic cells and demonstrate that fusion RNA profiling can be used to investigate the etiology of fusion-gene-associated cancers."

Our news journalists report that additional information may be obtained by contacting H. Li, University of Virginia, Center Canc, Charlottesville, VA 22908, United States. Additional authors for this research include M. Babiceanu, S. Kumar, Y.M. Jia, F.J. Qin, F.G. Barr and H. Li.

**Health and Medicine - Rural Health**

**Data on Rural Health Discussed by M.J. Rogers and Colleagues (Cancer diagnosed in the Emergency Department of a Regional Health Service)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Health and Medicine - Rural Health are discussed in a new report. According to news originating from Geelong, Australia, by NewsRx correspondents, research stated, "Patients diagnosed with cancer in the Emergency Department (ED) have more advanced disease at diagnosis and poorer outcomes. High rates of initial presentation to ED suggest potential problems with access to care."

Our news journalists obtained a quote from the research, "The aim of this project was to interpret findings in regional/rural Victoria and explore implications for practice. Cross-sectional study linking two independent data sets. Regional city of Geelong and surrounding rural areas in south-west Victoria. All newly diagnosed cancer patients in 2009. Number of cancer patients diagnosed in the ED. One in five newly diagnosed cancer patients present to ED 6 months prior to cancer diagnosis. One in 10 is diagnosed as a result of their ED visit. Patients presenting to ED were older, more often men and from disadvantaged areas. Symptoms on presentation included chest complaints, bowel obstruction, abdominal pain, anaemia and generalised weakness. Cancer diagnosed in the ED is associated with advanced stage and shorter survival. Reasons for presentation to ED would be multifactorial and include complex cases with coexisting symptoms making diagnosis difficult. The general public appear to have a low level of awareness of alternative primary care services or difficulty accessing such information."

According to the news editors, the research concluded: "Some of the changes towards reducing the number of patients presenting to ED will include patient education."

For more information on this research see: Cancer diagnosed in the Emergency Department of a Regional Health Service. *The Australian Journal of Rural Health*, 2016;24

The news correspondents report that additional information may be obtained from M.J. Rogers, Barwon South Western Regional Integrated Cancer Services, Barwon Health, Geelong, Victoria, Australia. Salicylic Acids

Data on Salicylic Acids Reported by F. Gengo and Colleagues (Platelet response to increased aspirin dose in patients with persistent platelet aggregation while treated with aspirin 81 mg)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Salicylic Acids have been published. According to news reporting out of Buffalo, New York, by NewsRx editors, research stated, "This study demonstrates that patients who are taking 81 mg of aspirin and are nonresponsive benefit from a dose of 162 mg or greater vs a different antiplatelet therapy. We identified 100 patients who were nonresponsive to aspirin 81 mg via whole blood aggregometry and observed how many patients became responsive at a dose of 162 mg or greater."

Financial support for this research came from National Institutes of Health.

Our news journalists obtained a quote from the research, "Platelet nonresponsiveness was defined as >10 O of resistance to collagen 1 ?g/mL and/or an ohms ratio of collagen 1 ?g/mL to collagen 5 ?g/mL >0.5 and/or >6 O to arachidonate. Borderline response was defined as an improvement in 1 but not both of the above criteria. Of the initial 100 patients who were nonresponsive to an aspirin dose of 81 mg, 79% became responsive at a dose of 162 mg or >162 mg. Only 6% did not respond to any increase in dose. We believe that patients treated with low-dose aspirin who have significant risk for secondary vascular events should be individually assessed to determine their antiplatelet response."

According to the news editors, the research concluded: "Those found to have persistent platelet aggregation despite treatment with 81 mg of aspirin have a higher likelihood of obtaining an adequate antiplatelet response at a higher aspirin dose."

For more information on this research see: Platelet response to increased aspirin dose in patients with persistent platelet aggregation while treated with aspirin 81 mg. Journal of Clinical Pharmacology, 2015;56(4):414-21. Journal of Clinical Pharmacology can be contacted at: SAGE Publications, USA , 2455 Teller Road, Thousand Oaks, CA 91320, USA. (Sage Publications - www.sagepub.com/; Journal of Clinical Pharmacology - jcp.sagepub.com)

Our news journalists report that additional information may be obtained by contacting F. Gengo, Dental Neurologic Institute, Buffalo, NY, United States. Additional authors for this research include E.S. Westphal, M.M. Rainka, M. Janda, M.J. Robson, J.M. Hourihane and V. Bates.
Data on Science Detailed by Researchers at Ajou University (A structural insight into the negative effects of opioids in analgesia by modulating the TLR4 signaling: An in silico approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news reporting originating from Suwon, South Korea, by NewsRx correspondents, research stated, "Opioids are considered the gold standard therapy for pain. However, TLR-dependent negative effects in analgesia have highlighted the complexities in the pharmacodynamics of opioids."

Our news editors obtained a quote from the research from Ajou University, "While successive studies have reported that morphine and Morphine-3-glucuronide (M3G) activate the TLR4 pathway, the structural details of this mechanism are lacking. Here, we have utilized various computational tools to reveal the structural dynamics of the opioid-bound TLR4/MD2 complex, and have proposed a potential TLR4 activation mechanism. Our results support previous findings, and include the novel insight that the stable binding of morphine and naloxone, but not M3G, in the MD2 cavity, is TLR4 dependent."

According to the news editors, the research concluded: "Morphine interacts with MD2 near its Phe126 loop to induce the active conformation (MD2(C)); however, this binding is likely reversible, and the complex gains stability upon interaction with TLR4."

For more information on this research see: A structural insight into the negative effects of opioids in analgesia by modulating the TLR4 signaling: An in silico approach. Scientific Reports, 2016;6():1-15. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting S. Choi, Ajou University, Dept. of Mol Sci & Technol, Suwon 443749, South Korea. Additional authors for this research include M.A. Anwar, D. Yesudhas, J. Krishnan and S. Choi.

Data on Science Detailed by Researchers at University of Leicester
(Structural basis of N-Myc binding by Aurora-A and its destabilization by kinase inhibitors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science have been published. According to news reporting originating from Leicester, United Kingdom, by NewsRx correspondents, research stated, "Myc family proteins promote cancer by inducing widespread changes in gene expression. Their rapid turnover by the ubiquitin-proteasome pathway is regulated through phosphorylation of Myc Box I and ubiquitination by the E3 ubiquitin ligase SCFFbxW7."

Financial supporters for this research include Cancer Research UK, EC | European Research Council (ERC).

Our news editors obtained a quote from the research from the University of Leicester, "However, N-Myc protein (the product of the MYCN oncogene) is stabilized in neuroblastoma by the protein kinase Aurora-A in a manner that is sensitive to certain Aurora-A-selective inhibitors. Here we identify a direct interaction between the catalytic domain of Aurora-A and a site flanking Myc Box I that also binds SCFFbxW7. We determined the crystal structure of the complex between Aurora-A and this region of N-Myc to 1.72-angstrom resolution. The structure indicates that the conformation of Aurora-A induced by compounds such as ali-sertib and CD532 is not compatible with the binding of N-Myc, explaining the activity of these compounds in neuroblastoma cells and providing a rational basis for the design of cancer therapeutics optimized for destabilization of the complex."

According to the news editors, the research concluded: "We also propose a model for the stabilization mechanism in which binding to Aurora-A alters how N-Myc interacts with SCFFbxW7 to disfavor the generation of Lys48-linked polyubiquitin chains."

The news editors report that additional information may be obtained by contacting R. Bayliss, University of Leicester, Dept. of Canc Studies, Leicester LE1 9HN, Leics, United Kingdom. Additional authors for this research include S.G. Burgess, E. Poon, A. Carstensen, M. Eilers, L. Chesler and R. Bayliss.

Data on Science Reported by Researchers at Mahidol University
(Undiluted Serum Eye Drops for the Treatment of Persistent Corneal Epithelial Defects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Science have been published. According to news reporting originating in Bangkok, Thailand, by NewsRx journalists, research stated, "Several studies found that 50-100% serum eye drops provided greater benefits without inducing detrimental effects on the corneal epithelial healing. This study assessed the efficacy of undiluted serum eye drops for the treatment of persistent corneal epithelial defects (PED)."

The news reporters obtained a quote from the research from Mahidol University, "A total of 109 eyes received 100% serum eye drops for PED were recruited into this study. The data were compared with an historical control group of 79 eyes with PED who received conventional treatments from 2006-2011 at the same institution. Main outcome measures were complete healing of PED and incidence of adverse events. No significant difference in demographics between the 2 groups was noted. The success rate of the treatment and control groups were 87.16% (95% CI 0.79-0.93) and 69.62% (95% CI 0.59-0.80) (P = 0.001), respectively. The median time to complete epithelialization was 14 days (95% CI 12-21) in the treatment group and 28 days (95% CI 21-59) in the control group (P = 0.001). Serum treatment, primary diagnosis of non-limbal stem cell deficiency etiology, and prior contact lens wear significantly correlated with the corneal re-epithelialization. There were no serious side effects encountered during the study period."

According to the news reporters, the research concluded: "Undiluted serum therapy is effective and safe for treating PED."

For more information on this research see: Undiluted Serum Eye Drops for the Treatment of Persistent Corneal Epithelial Defects. Scientific Reports, 2016;6():1-7. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com; Scientific Reports - www.nature.com/srep/)

Our news correspondents report that additional information may be obtained by contacting K. Lekhanont, Mahidol University, Ramathibodi Hosp, Dept. of Ophthalmol, Bangkok, Thailand. Additional authors for this research include P. Jongkhajornpong, T. Anothaisintawee and V. Chuckpaiwong.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Sclerosing Cholangitis have been published. According to news reporting originating in Erlangen, Germany, by NewsRx editors, the research stated, "Primary biliary cirrhosis (PBC) and primary sclerosing cholangitis (PSC) represent the major clinical entities of chronic cholestatic liver diseases. Both disorders are characterized by portal inflammation and slowly progress to obliterative fibrosis and eventually liver cirrhosis."

The news reporters obtained a quote from the research from Friedrich-Alexander-University, "Although immune-pathogenic mechanisms have been implicated in the pathogenesis of PBC and PSC, neither disorder is considered to be a classical autoimmune disease, as PSC and PBC patients do not respond to immune-suppressants. Furthermore, the decreased bile flow resulting from the immune-mediated tissue assault and the subsequent accumulation of toxic bile products in PBC and PSC not only perpetuates biliary epithelial damage, but also alters the composition of the intestinal and biliary microbiota and its mutual interactions with the host. Consistent with the close association of PSC and inflammatory bowel disease (IBD), the polyclonal hyper IgM response in PBC and (auto-) antibodies which cross-react to microbial antigens in both diseases, an expansion of individual microbes leads to shifts in the composition of the intestinal or biliary microbiota and a subsequent altered integrity of epithelial layers, promoting microbial translocation. These changes have been implicated in the pathogenesis of both devastating disorders."

According to the news reporters, the research concluded: "Thus, we will discuss here these recent findings in the context of novel and alternative therapeutic options."

For more information on this research see: Impact of Microbes on the Pathogenesis of Primary Biliary Cirrhosis (PBC) and Primary Sclerosing Cholangitis (PSC). *International Journal of Molecular Sciences*, 2016;17(11):1528-1538. *International Journal of Molecular Sciences* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Enzymes and Coenzymes - Serine Endopeptidases

Data on Serine Endopeptidases Detailed by Researchers at School of Medicine (Prediction of cardiovascular events with levels of proprotein convertase subtilisin/kexin type 9: A systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Enzymes and Coenzymes - Serine Endopeptidases. According to news reporting from Athens, Greece, by NewsRx journalists,
research stated, "Inhibition of proprotein convertase subtilisin/kexin type 9 (PCSK9) reduces atherogenic lipoproteins and could lead to reduction of cardiovascular (CV) events. However, it is unclear whether blood PCSK9 levels predict future CV events."

The news correspondents obtained a quote from the research from the School of Medicine, "We performed a meta-analysis of all longitudinal studies to determine the ability of PCSK9 levels to predict risk of future CV events. A comprehensive search of electronic databases was conducted up to February 2016. Longitudinal studies that reported events or relative risk (RR) estimates with 95% confidence intervals (CI) were included. All 9 studies included (12,081 participants, mean follow-up 6.62 years) reported results on total CV events. The pooled RR of total CV events for an increase in baseline PCSK9 by 1 standard deviation (SD) was 1.098 (95% CI, 1.02-1.18), corresponding to a risk increase of 10% (Z = 2.43, p = 0.015). The pooled RR of total CV events for subjects categorized in the highest tertile of baseline PCSK9 was 1.228 (95% CI, 1.035-1.457), corresponding to a risk increase of 23% (Z = 2.35, p = 0.019). When pooled estimates were derived independently for low- and high-CV risk populations, baseline PCSK9 levels predicted total CV events only in apparently healthy subjects (RR = 1.13, 95% CI: 1.050-1.222, Z = 3.21, p = 0.001) and not in populations with established CV or renal disease (RR = 1.09, 95% CI: 0.961-1.23, Z = 1.33, p = 0.182). PCSK9 levels are modestly but significantly associated with increased risk of total CV events."

According to the news reporters, the research concluded: "These results suggest a predictive role of PCSK9 levels on CV health and support the possible clinical role of PCSK9 inhibitors."

For more information on this research see: Prediction of cardiovascular events with levels of proprotein convertase subtilisin/kexin type 9: A systematic review and meta-analysis. Atherosclerosis, 2016;252():50-60. Atherosclerosis can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. (Elsevier - www.elsevier.com; Atherosclerosis - www.journals.elsevier.com/atherosclerosis/)

Our news journalists report that additional information may be obtained by contacting C. Vlachopoulos, Hippokrateion Hospital, Athens Med Sch, Dept. of Cardiol 1, Hypertens & Cardiometabol Unit, Athens, Greece. Additional authors for this research include D. Terentes-Printzios, G. Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
news originating from London, United Kingdom, by NewsRx correspondents, research stated, "Terrestrial solar ultraviolet radiation (UVR) exerts both beneficial and adverse effects on human skin. Epidemiological studies show a lower incidence of skin cancer in people with pigmented skins compared to fair skins."

Financial supporters for this research include Walgreens Boots Alliance, UK, National Institute for Health Research, King’s College London.

Our news journalists obtained a quote from the research from King's College, "This is attributed to photoprotection by epidermal melanin, as is the poorer vitamin D status of those with darker skins. We summarize a wide range of photobiological responses across different skin colours including DNA damage and immunosuppression. Some studies show the generally modest photoprotective properties of melanin, but others show little or no effect. DNA photodamage initiates non-melanoma skin cancer and is reduced by a factor of about 3 in pigmented skin compared with white skin. This suggests that if such a modest reduction in DNA damage can result in the significantly lower skin cancer incidence in black skin, the use of sunscreen protection might be extremely beneficial for susceptible population. Many contradictory results may be explained by protocol differences, including differences in UVR spectra and exposure protocols."

According to the news editors, the research concluded: "We recommend that skin type comparisons be done with solar-simulated radiation and standard erythema doses or physical doses (J/m(2)) rather than those based solely on clinical endpoints such as minimal erythema dose (MED)."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/pcmr.12511. This DOI is a link to an online electronic document that is either free or for purchase.

**Small Interference RNAs (siRNAs)**

**Data on Small Interference RNAs (siRNAs) Detailed by Researchers at Chongqing University (Stimuli-responsive hybrid nanocarriers developed by controllable integration of hyperbranched PEI with mesoporous silica nanoparticles for sustained ...)**
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Small Interference RNAs (siRNAs) is now available. According to news reporting from Chongqing, People's Republic of China, by NewsRx journalists, research stated, "Small interfering RNA (siRNA) is a highly potent drug in gene-based therapy with the challenge being to deliver it in a sustained manner. The combination of mesoporous silica nanoparticles (MSNs) and polycations in the confined pore space allows for incorporation and controlled release of therapeutic siRNA payloads."

The news correspondents obtained a quote from the research from Chongqing University, "We hereby constructed MSNs with expanded mesopores and pore-surface-hyperbranched poly(ethyleneimine) (PEI) tethered with redox-cleavable linkers that could carry a high payload of siRNA (120 mg center dot g(-1)). The developed nanocarriers were efficiently taken up by cancer cells and were subsequently able to escape to the cytoplasm from the endosomes, most likely owing to the integrated PEI. Triggered by the intracellular redox conditions, the siRNA was sustainably released inside the cells over a period of several days. Functionality of siRNAs was demonstrated by using cell-killing siRNA as cargo. Despite not being the aim of the developed system, in vitro experiments using cell-killing siRNAs showed that the efficacy of siRNA transfection was comparable to the commercial in vitro transfection agent Lipofectamine."

According to the news reporters, the research concluded: "Consequently, the developed MSN-based delivery system offers a potential approach to hybrid nanocarriers for more efficient and long-term siRNA delivery and, in a longer perspective, in vivo gene silencing for RNA interference (RNAi) therapy."

For more information on this research see: Stimuli-responsive hybrid nanocarriers developed by controllable integration of hyperbranched PEI with mesoporous silica nanoparticles for sustained intracellular siRNA delivery. International Journal of Nanomedicine, 2016;11():6591-6608. International Journal of Nanomedicine can be contacted at: Dove Medical Press Ltd, PO Box 300-008, Albany, Auckland 0752, New Zealand.

Health and Medicine - Spinal Research

Data on Spinal Research Reported by Researchers at Department of Orthopedic Surgery (The role of preoperative vascular embolization in surgery for metastatic spinal tumours)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Spinal Research have been published. According to news reporting originating in Singapore, Singapore, by NewsRx journalists, research stated, "To determine the effect of preoperative embolization on intraoperative blood loss in surgery for metastatic spinal tumours stratified by tumour type, type of surgical approach and extent of surgery. We retrospectively analysed 218 patients undergoing open surgery for metastatic spine tumours in our institution between 2005 and 2014."

The news reporters obtained a quote from the research from the Department of Orthopedic Surgery, "The cohort was divided to those who underwent preoperative embolization and those who did not. The patients were further stratified into different subgroups by tumour types, types of surgical procedure, levels of instrumentation and levels of decompression. Estimated blood loss, duration of surgery and length of hospital stay were compared between emboziled and non-embolized cases in each subgroup. The impact of embolization extent, the time gap between embolization and index surgery on blood loss were also studied. Preoperative embolization was performed in 45 out of 218 patients. Non-embolized cases had insignificantly lesser blood loss and shorter duration of surgery compared to embolized cases in all subgroups. Embolization, however, conferred reduction in length of hospital stay in some of the subgroups, yet the differences were not significant. The patients who achieved total embolization bled less than those who achieved subtotal or partial embolization."

According to the news reporters, the research concluded: "The effectiveness of the embolization procedure in reducing intraoperative blood loss was found to be profound when the gap between embolization and surgery was within 24 h. Our study demonstrated that success of embolization in reducing blood loss depends on the extent of embolization and time interval between embolization and index surgery."

For more information on this research see: The role of preoperative vascular embolization in surgery for metastatic spinal tumours. European Spine Journal, 2016;25 (12):3962-3970. European Spine Journal can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; European Spine Journal - www.springerlink.com/content/0940-6719/)

Data on Spinocerebellar Ataxias Described by Researchers at Complutense University (Dysregulation Of The Endocannabinoid Signaling System In The Cerebellum And Brainstem In A Transgenic Mouse Model Of Spinocerebellar Ataxia Type-3)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Neurodegenerative Diseases and Conditions - Spinocerebellar Ataxias have been presented. According to news reporting originating in Madrid, Spain, by NewsRx journalists, research stated, "Spinocerebellar ataxia type-3 (SCA-3) is a rare disease but it is the most frequent type within the autosomal dominant inherited ataxias. The disease lacks an effective treatment to alleviate major symptoms and to modify disease progression."

Funders for this research include MICINN, CIBERNED.

The news reporters obtained a quote from the research from Complutense University, "Our recent findings that endocannabinoid receptors and enzymes are significantly altered in the post-mortem cerebellum of patients affected by autosomal-dominant hereditary ataxias suggest that targeting the endocannabinoid signaling system may be a promising therapeutic option. Our goal was to investigate the status of the endocannabinoid signaling system in a transgenic mouse model of SCA-3, in the two CNS structures most affected in this disease cerebellum and brainstem. These animals exhibited progressive motor incoordination, imbalance, abnormal gait, muscle weakness, and dystonia, in parallel to reduced in vivo brain glucose metabolism, deterioration of specific neuron subsets located in the dentate nucleus and pontine nuclei, small changes in microglial morphology, and reduction in glial glutamate transporters. Concerning the endocannabinoid signaling, our data indicated no changes in CB2 receptors. By contrast, CB1 receptors increased in the Purkinje cell layer, in particular in terminals of basket cells, but they were reduced in the dentate nucleus. We also measured the levels of endocannabinoid lipids and found reductions in anandamide and oleoylethanolamide in the brainstem. These changes correlated with an increase in the FAAH enzyme in the brainstem, which also occurred in some cerebellar areas, whereas other endocannabinoid-related enzymes were not altered."

According to the news reporters, the research concluded: "Collectively, our results in SCA-3 mutant mice confirm a possible dysregulation in the endocannabinoid system in the most important brain structures affected in this type of ataxia, suggesting that a pharmacological manipulation addressed to correct these changes could be a promising option in SCA-3."

For more information on this research see: Dysregulation Of The Endocannabinoid Signaling System In The Cerebellum And Brainstem In A Transgenic Mouse Model Of Spinocerebellar Ataxia Type-3. Neuroscience, 2016;339():191-209. Neuroscience can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. Data on Spinocerebellar Ataxias Reported by Researchers at Taipei Medical University (Depression as the Primary Cause of Insomnia and Excessive Daytime Sleepiness in a Family with Multiple Cases of Spinocerebellar Ataxia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Spinocerebellar Ataxias. According to news originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Spinocerebellar ataxia (SCA) is a hereditary disease characterized by central nervous system-related motor dysfunctions. Sleep disorders and frequent non-motor manifestations are commonly comorbid with SCA."

Our news journalists obtained a quote from the research from Taipei Medical University, "To elucidate this relationship, we present three cases in a family that included multiple SCA type 2 patients with various sleep disorders. Complete physical examination, and genetic and imaging studies were performed. Anti-parkinsonism medications were prescribed after neurological examination. Clonazepam and/or quetiapine were administered for sleep disorders but failed to resolve insomnia and excessive daytime sleepiness (EDS). Based on DSM-5 criteria, all cases were diagnosed with depression. After treatment with serotonin-norepinephrine reuptake inhibitors and noradrenergic and specific serotonergic antidepressants, symptoms of insomnia and EDS, which are strongly associated with depression in SCA type 2 patients, improved significantly."

According to the news editors, the research concluded: "It is crucial to recognize insomnia and EDS in neurodegenerative diseases, not only for earlier diagnosis, but also to improve quality of life."

For more information on this research see: Depression as the Primary Cause of Insomnia and Excessive Daytime Sleepiness in a Family with Multiple Cases of Spinocerebellar Ataxia. *Journal of Clinical Sleep Medicine*, 2016;12(7):1059-1061. *Journal of Clinical Sleep Medicine* can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

The news correspondents report that additional information may be obtained from I.C. Liu, Taipei Medical University, Sch Med, Dept. of Psychiat, Coll Med, Taipei, Taiwan. Additional authors for this research include Y.L. Chen, D. Pei, S.M. Yu and I.C. Liu.

Oncology - Squamous Cell Carcinoma

Data on Squamous Cell Carcinoma Discussed by Researchers at Chiba University (Regulation of MMPI3 by antitumor microRNA-375 markedly inhibits cancer cell migration and invasion in esophageal squamous cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Squamous Cell Carcinoma is the subject of a report. According to news reporting originating from Chiba, Japan, by NewsRx correspondents, research stated, "Esophageal squamous cell carcinoma (ESCC) is one of the most aggressive malignancies. Recently developed molecular targeted therapies are not available for patients with ESCC."

Our news editors obtained a quote from the research from Chiba University, "After curative surgical resection, patients frequently suffer distant metastasis and recurrence. Exploration of novel ESCC metastatic pathways may lead to the development of new treatment protocols for this disease. Accordingly, we have sequentially identified microRNA (miRNA)-mediated metastatic pathways in several cancers. Our past studies of miRNA expression signatures have shown that microRNA-375 (miR-375) is frequently reduced in several types of cancers, including ESCC. In the present study, we aimed to investigate novel miR-375-mediated metastatic pathways in ESCC cells. The expression of miR-375 was downregulated in ESCC tissues, and ectopic expression of this miRNA markedly inhibited cancer cell migration and invasion, suggesting that miR-375 acted as an antimetastatic miRNA in ESCC cells. Our strategies for miRNA target searching demonstrated that matrix metalloproteinase 13 (MMP13) was directly regulated by miR-375 in ESCC cells. Overexpression of MMP13 was observed in ESCC clinical tissues, and the expression of MMP13 promoted cancer cell aggressiveness. Moreover, oncogenic genes, including CENPF, KIF14 and TOP2A, were shown to be regulated downstream of MMP13. Taken together, these findings demonstrated that the antitumor miR-375/oncogenic MMP13 axis had a pivotal role in ESCC aggressiveness."

According to the news editors, the research concluded: "These results provide novel insights into the potential mechanisms of ESCC pathogenesis."

The news editors report that additional information may be obtained by contacting N. Seki, Chiba University, Grad Sch Med, Dept. of Funct Genom, Chuo Ku, Chiba 2608670,

Oncology - Squamous Cell Carcinoma

Data on Squamous Cell Carcinoma Reported by Researchers at Birmingham Women's NHS Foundation Trust (Over-expression of DNMT3A predicts the risk of recurrent vulvar squamous cell carcinomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Squamous Cell Carcinoma have been published. According to news reporting out of Birmingham, United Kingdom, by NewsRx editors, research stated, "Cancer initiation and progression has been linked to aberrant expression of the DNA methyltransferases (DNMT), the enzymes which establish and maintain DNA methylation patterns throughout the genome. In this study, we investigated if DNMT expression in vulvar squamous cell carcinomas (VSCC) was related to clinical outcome."

Our news journalists obtained a quote from the research from Birmingham Women's NHS Foundation Trust, "DNMT1, DNMT3A and DNMT3B expression was measured in a subset of cases drawn from a cohort of consecutive women treated for primary VSCC at the Pan Birmingham Gynaecological Cancer Centre between 2001 and 2008. Univariable and multivariable competing risk modelling was performed to identify whether DNMT expression was associated with local disease recurrence or disease morbidity. Over-expression of DNMT3A in the invasive component of the tumour was seen in 44% of tumours and was associated with an increased risk of local vulvar recurrence (LVR) (HR = 4.51, p = 0.012). This risk was found to increase further after adjustment for disease stage (HR = 6.00, p = 0.003) and groin node metastasis (HR = 4.81, p = 0.008). Over-expression of DNMT3B was associated with an increased risk of LVR (HR = 5.69 p = 0.03), however this ceased to be significant after adjustment for groin node metastasis. In a subset analysis, over-expression of DNMT3A was found to be significantly more common in VSCCs that stained negative for CDKN2A."

According to the news editors, the research concluded: "These observations are consistent with the possibility that epigenetic changes contribute to vulvar neoplasia and DNMT3A over-expression may be useful in predicting local disease recurrence."

Our news journalists report that additional information may be obtained by contacting R. Ganesan, Birmingham Womens NHS Fdn Trust, Birmingham B15 2TG, W Midlands, United Kingdom. Additional authors for this research include M. Pereira, R. Fox, N.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ygyno.2016.09.001. This DOI is a link to an online electronic document that is either free or for purchase.

Gram-Positive Bacteria - Staphylococcus aureus

Data on Staphylococcus aureus Described by Researchers at University of Texas (In Vitro Assessment of the Antimicrobial Efficacy of Optimized Nitroglycerin-Citrate-Ethanol as a Nonantibiotic, Antimicrobial Catheter Lock Solution for Prevention ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Positive Bacteria - Staphylococcus aureus have been presented. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "The rapid, broad-spectrum, biofilm-eradicating activity of the combination of 0.01% nitroglycerin, 7% citrate, and 20% ethanol and its potential as a nonantibiotic, antimicrobial catheter lock solution (ACLS) were previously reported. Here, a nitroglycerincitrate-ethanol (NiCE) ACLS optimized for clinical assessment was developed by reducing the nitroglycerin and citrate concentrations and increasing the ethanol concentration."

The news reporters obtained a quote from the research from the University of Texas, "Biofilm-eradicating activity was sustained when the ethanol concentration was increased from 20 to 22% which fully compensated for reducing the citrate concentration from 7% to 4% as well as the nitroglycerin concentration from 0.01% to 0.0015% or 0.003%. The optimized formulations demonstrated complete and rapid (2 h) eradication of methicillin-resistant Staphylococcus aureus (MRSA), vancomycin-intermediate Staphylococcus aureus (VISA), methicillin-resistant Staphylococcus epidermidis (MRSE), vancomycin-resistant enterococci (VRE), multidrug-resistant (MDR) Pseudomonas aeruginosa, MDR Klebsiella pneumoniae, MDR Enterobacter cloacae, MDR Acinetobacter baumannii, MDR Escherichia coli, MDR Stenotrophomonas maltophilia, Candida albicans, and Candida glabrata biofilms. The optimized NiCE lock solutions demonstrated anticoagulant activities comparable to those of heparin lock solutions. NiCE lock solution was significantly more effective than taurolidine-citrate-heparin lock solution in eradicating biofilms of Staphylococcus aureus and Candida glabrata."

According to the news reporters, the research concluded: "The optimized, nonantibiotic, heparin-free NiCE lock solution demonstrates rapid broad-spectrum biofilm eradication as well as effective anticoagulant activity, making NiCE a high-quality ACLS candidate for clinical assessment."

Stem Cell Research

Data on Stem Cell Research Detailed by Researchers at University of Michigan (Nanomedicine strategies for sustained, controlled and targeted treatment of cancer stem cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Stem Cell Research are discussed in a new report. According to news reporting out of Ann Arbor, Michigan, by NewsRx editors, research stated, "Cancer stem cells (CSCs) are original cancer cells that are of characteristics associated with normal stem cells. CSCs are toughest against various treatments and thus responsible for cancer metastasis and recurrence."

Our news journalists obtained a quote from the research from the University of Michigan, "Therefore, development of specific and effective treatment of CSCs plays a key role in improving survival and life quality of cancer patients, especially those in the metastatic stage. Nanomedicine strategies, which include prodrugs, micelles, liposomes and nanoparticles of biodegradable polymers, could substantially improve the therapeutic index of conventional therapeutics due to its manner of sustained, controlled and targeted delivery of high transportation efficiency across the cell membrane and low elimination by intracellular autophagy, and thus provide a practical solution to solve the problem encountered in CSCs treatment."

According to the news editors, the research concluded: "This review gives briefly the latest information to summarize the concept, strategies, mechanisms and current status as well as future promises of nanomedicine strategies for treatment of CSCs."

Our news journalists report that additional information may be obtained by contacting J. Gao, University of Michigan, Dept. of Pharmaceut Sci, Ann Arbor, MI 48109, United States. Additional authors for this research include W. Li, Y.J. Guo and S.S. Feng.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2217/nnm-2016-0261. This DOI is a link to an online electronic document that is either free or for purchase.

Stem Cell Research

Data on Stem Cell Research Reported by M.G. Francipane and Colleagues (Therapeutic potential of mTOR inhibitors for targeting cancer stem cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Stem Cell Research have been published. According to news reporting originating from Palermo, Italy, by NewsRx correspondents, research stated, "The mammalian target of rapamycin (mTOR) pathway is aberrantly activated in many cancer types. As the intricate network of regulatory mechanisms controlling mTOR activity is uncovered, more refined drugs are designed and tested in clinical trials."

Our news editors obtained a quote from the research, "While first generation mTOR inhibitors have failed to show clinical efficacy due partly to the feedback relief of oncogenetic circuits, newly developed inhibitors show greater promise as anti-cancer agents. An effective drug must defeat the cancer stem cells (CSCs) while sparing the normal stem cells. Due to its opposing role on normal and malignant stem cells, mTOR lends itself very well as a therapeutic target. Indeed, a preferential inhibitory effect on CSCs has already been shown for some mTOR inhibitors."

According to the news editors, the research concluded: "These results provide a compelling rationale for the clinical development of mTOR-targeted therapies."

The news editors report that additional information may be obtained by contacting M.G. Francipane, RI MED Fdn, I-90133 Palermo, Italy.

Cardiovascular Diseases and Conditions - Subclavian…

Data on Subclavian Steal Syndrome Reported by Researchers at Department of Surgery (Eversion Subclavian Endarterectomy and Transposition for Coronary-Subclavian Steal Syndrome in a Patient with Refractory Angina Pectoris)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Subclavian Steal Syndrome. According to news reporting originating in Mexico City, Mexico, by NewsRx journalists, research stated, "Late onset of angina pectoris associated with subclavian artery (SA) atherosclerotic occlusive disease is a rare and recognized cause of myocardial ischemia when the lesion is proximal to a left internal mammary artery (LIMA) to coronary bypass. The symptoms typically exacerbate by increasing the flow demand in the extremity; this phenomenon is known as late coronary subclavian steal syndrome."

The news reporters obtained a quote from the research from the Department of Surgery, "We describe the case of a 66-year-old woman who underwent coronary-artery bypass grafting from the LIMA to the left anterior descending coronary artery in 2000. Years later, she experienced refractory angina pectoris associated to an occlusive lesion in the proximal left SA."

According to the news reporters, the research concluded: "SA endarterectomy with eversion technique and subclavian-carotid transposition restored the antegrade flow with resolution of the symptomatology."

Our news correspondents report that additional information may be obtained by contacting C.A. Hinojosa, Inst Nacl Ciencias Med & Nutr Salvador Zubiran, Dept. of Surg, Sect Vasc Surg & Endovasc Therapy, Mexico City 14000, DF, Mexico. Additional authors for this research include J.E. Anaya-Ayala, H. Laparra-Escareno, M. Guerrero-Hernandez and J. Galindo-Uribe.

Data on Sulfonamides Described by Researchers at University of Silesia (Amorphous Protic Ionic Systems as Promising Active Pharmaceutical Ingredients: The Case of the Sumatriptan Succinate Drug)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Sulfonamides have been presented. According to news reporting originating in Katowice, Poland, by NewsRx journalists, research stated, "In this article, we highlight the benefits coming from the application of amorphous protic ionic systems as active pharmaceutical ingredients (APIs). Using the case of the sumatriptan (STR) drug, we show that the conversion of nonionic API to partially ionized amorphous protic succinate salt (STR SUCC) brings a substantial improvement in apparent solubility."

Financial support for this research came from Narodowe Centrum Nauki.

The news reporters obtained a quote from the research from the University of Silesia, "Since in general the disordered systems reveal a tendency to self-arrangement during storage, the dominant part of this article is dedicated to the physical stability issue of sumatriptan and its ionic counterpart. To recognize the crystallization tendency of the studied systems, the calorimetric measurements were performed. Additionally, the role of ion dynamics in spontaneous nucleation of amorphous sumatriptan succinate is discussed. The differential scanning calorimetry analysis of ionic and nonionic sumatriptan reveals many similarities in thermal properties of these APIs as well as distinct differences in their resistance against crystallization in the supercooled liquid state. To determine the long-term physical stability of STR SUCC at room temperature conditions, the time scale of structural relaxation below their glass transition temperatures is estimated."

According to the news reporters, the research concluded: "We show that in contrast to nonionic materials, ta predictions of STR SUCC are much more complex and require aging experiments."

Our news correspondents report that additional information may be obtained by contacting Z. Wojnarowska, Institute of Physics, University of Silesia, Uniwersytecka 4, 40-007 Katowice, Poland. Additional authors for this research include J. Knapik, M. Rams-Baron, A. Jedrzejowska, M. Paczkowska, A. Krause, J. Cielecka-Piontek, M. Jakerska, B. Ladowski and M. Paluch.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.molpharmaceut.5b00911. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Systolic Heart Failure

Data on Systolic Heart Failure Described by Researchers at National University (Combined analysis of cross-reacting antibodies anti-beta 1AR and anti-B13 in advanced stages of Chagas heart disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Systolic Heart Failure. According to news reporting from Santa Fe, Argentina, by NewsRx journalists, research stated, "Autoantibodies cross-reacting with the b1 adrenergic receptor (anti-b1AR and anti-p2b) and cardiac myosin antigens (anti-B13) have been related to the pathogenesis of chronic Chagas heart disease (CCHD). Studies exploring their levels in different stages are scarce."

The news correspondents obtained a quote from the research from National University, "We aimed to evaluate the relationship of these autoantibodies with the clinical profile of chronic patients, especially regarding their classificatory accuracy in severe presentation with heart failure. We conducted a cross-sectional study of 155 T. cruzi-seropositive patients and 26 age-and gender-matched healthy controls. They were categorised in three stages of CCHD. Serum antibodies were measured by specific immunoassays. Symptomatic individuals showed increased levels of anti-b1AR and anti-B13, while anti-p2b antibodies were similar between groups. A composite logistic regression model including anti-B13, anti-b1AR antibody levels and age was able to predict systolic heart failure yielding an area under the curve of 83% (sensitivity of 67% and specificity of 89%). In our study, anti-b1AR and anti-B13 antibodies were higher in individuals with chronic Chagas heart disease stage III, mainly in those with dilated cardiomyopathy associated with systolic heart failure. Logistic regression analysis showed that both antibodies were good predictors of severe CCHD."

According to the news reporters, the research concluded: "As well as being involved in disease progression, anti-b1AR and anti-B13 antibodies may be used as a serum marker of poor prognosis in terms of heart compromise."

For more information on this research see: Combined analysis of cross-reacting antibodies anti-beta 1AR and anti-B13 in advanced stages of Chagas heart disease. Data on Thoracoscopy Detailed by Researchers at Sichuan University
(Undiagnosed pulmonary sequestration results in an unexplained hemorrhagic shock in thoracoscopic pulmonary lobectomy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Surgical Procedures - Thoracoscopy. According to news reporting out of Chengdu, People's Republic of China, by NewsRx editors, research stated, "We report the first case of pulmonary sequestration which was not detected in the preoperative evaluation, resulting in a life-threatening hemorrhagic shock rapidly during the procedure of thoracoscopic pulmonary lobectomy."

Our news journalists obtained a quote from the research from Sichuan University, "The anesthesiologists could not figure out the reason for the hemorrhagic shock in the surgery until an emergent laparotomy was performed."

According to the news editors, the research concluded: "The aim of presenting this clinical case is to highlight the vigilance for undiagnosed pulmonary sequestration which lacks any specific clinical feature but has the potential to become an anesthetic disaster."

Our news journalists report that additional information may be obtained by contacting C.R. Wu, Sichuan University, Translat Neurosci Center, West China Hosp, Chengdu 610041, Sichuan, People's Republic of China. Additional authors for this research include H.P. Li, T. Liang and C.R. Wu.

correspondents, research stated, "Traversing proton beam-irradiated, mid/high-Z nanoparticles produce site-specific enhancement of X-ray photon-electron emission via the Coulomb nanoradiator (CNR) effect, resulting in a nano-to micro-scale therapeutic effect at the nanoparticle-uptake target site. Here, we demonstrate the uptake of iron oxide nanoparticles (IONs) and nanoradiator-mediated, site-specific thrombolysis without damaging the vascular endothelium in an arterial thrombosis mouse model."

Our news journalists obtained a quote from the research from Catholic University, "The enhancement of low-energy electron (LEE) emission and reactive oxygen species (ROS) production from traversing proton beam-irradiated IONs was examined. Flow recovery was only observed in CNR-treated mice, and greater than 50% removal of the thrombus was achieved. A 2.5-fold greater reduction in the thrombus-enabled flow recovery was observed in the CNR group compared with that observed in the untreated ION-only and proton-only control groups (p < 0.01)."

According to the news editors, the research concluded: "Enhancement of the X-ray photon-electron emission was evident from both the pronounced Shirley background in the electron yield and the 1.2- to 2.5-fold enhanced production of ROS by the proton-irradiated IONs, which suggests chemical degradation of the thrombus without potent emboli."

For more information on this research see: Coulomb nanoradiator-mediated, site-specific thrombolytic proton treatment with a traversing pristine Bragg peak. Scientific Reports, 2016;6():1-9. Cardiovascular Diseases and Conditions - Thrombosis

Data on Thrombosis Discussed by Researchers at King's College Hospital (Anti-Coagulation and Deep Brain Stimulation: Never the Twain Shall Meet)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Thrombosis. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Deep brain stimulation (DBS) for movement disorders is usually performed in older patients who may be prone to vascular co-morbidities such as atrial fibrillation or valvular disease that may require anti-coagulation. This potentially increases the risk of peri-operative intra-cranial haemorrhage and thus anti-coagulation therapy is generally considered a contraindication for DBS implantation."

Our news journalists obtained a quote from the research from King’s College
Hospital, "Cessation of anti-coagulants has to be balanced with the risk of thrombosis or ischaemic complications and, to compound issues, there is a paucity of guidelines and consensus on the management of anti-coagulation in patients undergoing DBS. To date, we have performed DBS successfully in 4 patients on lifelong anti-coagulation, having carefully managed their anti-coagulation in the peri-operative period. One patient developed a moderate haematoma around the implantable pulse generator 2 days post-operatively that was treated conservatively. Otherwise no other adverse effects or haemorrhagic complications occurred. We therefore propose that DBS implantation in this group of patients is safe, provided strict observation of protocols and careful management of the anti-coagulation therapy are undertaken."

According to the news editors, the research concluded: "We describe the indications for anti-coagulation and provide a guideline for therapy in such patients according to our experience."

Our news journalists report that additional information may be obtained by contacting K. Ashkan, King's College Hospital, London, UK. Additional authors for this research include A. Alamri and I. Ughratdar.

Cardiovascular Diseases and Conditions - Thrombosis

Data on Thrombosis Discussed by Researchers at University of Helsinki

[Decreased maximum clot firmness in rotational thromboelastometry (ROTEM (R)) is associated with bleeding during extracorporeal mechanical circulatory support]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Thrombosis have been published. According to news reporting out of Helsinki, Finland, by NewsRx editors, research stated, "We aimed to characterize the coagulation disturbances which may increase the risk of bleeding, thrombosis or death shortly after implantation of an extracorporeal membrane oxygenation (ECMO) or ventricular assist (VAD) device. Antithrombotic treatment was started in 23 VAD and 24 ECMO patients according to the hospital protocol."

Our news journalists obtained a quote from the research from the University of Helsinki, "Additionally, conventional laboratory testing, rotational thromboelastometry (ROTEM ®) and platelet function analysis (Multiplate) were performed at predetermined..."
intervals. Four out of twenty-four (16.7%) of ECMO patients and 6/23 (26.1%) of VAD patients had severe bleeding after the procedure. When all the patients were analyzed together, low maximum clot firmness (MCF) in ExTEM and FibTEM analyses was associated with severe bleeding (p <0.05) and low MCF in FibTEM with 30-day mortality. Low platelet count and hematocrit levels were also associated with severe bleeding. When VAD and ECMO patients were separated into different groups, the association between ROTEM ® parameters, bleeding and survival was found only in limited time points. Four patients with VAD had cerebral ischemia indicative of thromboembolism. However, this had no significant correlation with ROTEM ® or Multiplate ® parameters. Hypocoagulation shown by ROTEM ® was associated with bleeding complications in patients with mechanical circulatory support."

According to the news editors, the research concluded: "In contrast, hypercoagulation did not correlate with clinical thrombosis."

For more information on this research see: Decreased maximum clot firmness in rotational thromboelastometry (ROTEM ®) is associated with bleeding during extracorporeal mechanical circulatory support. *Perfusion-Uk*, 2016;31(8):625-633. *Perfusion-Uk* can be contacted at: Sage Publications Ltd, 1 Olivers Yard, 55 City Road, London EC1Y 1SP, England.

**Cardiovascular Diseases and Conditions - Thrombosis**

**Data on Thrombosis Reported by Researchers at University of Oviedo (Collateral Development in Thrombosis of the Hepatic Artery After Transplantation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Thrombosis have been published. According to news reporting out of Oviedo, Spain, by NewsRx editors, research stated, "The authors sought to identify strictures or hepatic artery obstruction with posterior collateral transformation in our series of liver transplantation, treatment, and evolution. The thrombosis or severe hepatic artery stenosis sometimes presents a compensation mechanism, the collateral transformation of the artery."

Our news journalists obtained a quote from the research from the University of Oviedo, "From April 2002 to December 2011 we collected 18 cases of collateral transformation. We analyzed data regarding the transplantation, diagnosis, treatment, clinical evolution, liver function, and Doppler-ultrasound. The main indication was alcoholic cirrhosis, followed by hepatocellular carcinoma hepatitis C virus. The mean cold ischemia time was 292.2 minutes mean hot ischemia was 48.8. The anastomosis was performed on the gastroduodenal-splenic
patch donor in 14 cases, the celiac trunk in 2 cases, and on grafts to the aorta in another 2. Doppler ultrasound showed 8 cases without complications, 8 with low flows, and 2 cases with alterations of the right hepatic artery. Computed tomographic (CT) angiography was performed in patients with impaired eco-Doppler and found 4 obstructions, 2 cases with kinking, 1 stenosis, and 3 normal cases. Three patients with low flows were re operated and another re-transplanted. After diagnosis of collateral transformation, all were treated with antiplatelet agents. Two cases of angioplasty were associated. The collaterals were diagnosed 1 month to 44.8 months after transplantation. Five patients died. In the latest data, 10 patients do not have analytical alteration. The Doppler ultrasound shows 7 cases being normal and 6 with flow but low resistances."

According to the news editors, the research concluded: "In our series, all patients with collateral transformation, except one who was transplanted, maintain good liver function with permeable vessels."

Our news journalists report that additional information may be obtained by contacting C.M.G. Bernardo, University of Oviedo, Univ Hosp Cent Asturias HUCA, HPB & Liver Transplant Unit, Dept. of Gen Surg, Oviedo, Spain. Additional authors for this research include B.A. Garcia, P.R. Buil, A.M. de Leon, L.G. Dieguez, V.C. Rodrigo, I.G.P. Arrillaga and L.V. Velasco.

## Oncology - Thyroid Cancer

### Data on Thyroid Cancer Detailed by Researchers at Medical University (Papillary Thyroid Carcinoma: Association Between Germline DNA Variant Markers and Clinical Parameters)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Thyroid Cancer are discussed in a new report. According to news reporting originating in Gdansk, Poland, by NewsRx journalists, research stated, "Papillary thyroid cancer (PTC) is reported to be highly heritable in epidemiological studies. Genome-wide association studies (GWAS) have uncovered several variants associated with PTC predisposition."

The news reporters obtained a quote from the research from Medical University, "It remains unknown whether these variants might contribute to better clinical stratification of PTC
patients. In order to assess the usefulness of germline genetic analyses in the management of PTC patients, the genotypes of five variants (rs965513, rs944289, rs116909374, rs2439302, and rs966423) were determined in 1216 PTC patients and 1416 controls. Additionally, the expression of seven genes located close to GWAS variants (PTCSC3, MBIP, NKX2-1, FOXE1, DIRC3, PTCSC2, and NRG1) were measured in 73 PTC paired tumor/normal tissues, respectively. Next, the association was analyzed between the genotypes of the germline variants and the levels of gene expression with clinical/pathological features such as age, sex, TNM staging, multifocality status, extrathyroidal expansion, and MACIS score. The risk allele of rs965513 was associated with larger tumor size (p = 0.025) and extrathyroidal expansion (odd ratio [OR] = 1.29, p = 0.045). The variant rs2439302 showed association with lymph node metastasis (OR = 1.24, p = 0.016), and multifocality status of the tumor (OR = 1.24, p = 0.012). The expression of MBIP was associated with T stage (p = 0.010). MBIP and PTCSC3 displayed lower expression in PTC tissue in males than in females (p = 0.025 and p = 0.036, respectively). NKX2-1 displayed lower expression in patients with N1 stage (p = 0.040). The studied germline risk alleles predisposing to PTC were associated with a more aggressive course of the disease reflected by larger tumor diameter, higher multifocality rate, and more advanced N stage at the time of diagnosis. These results show that germline variants not only predispose to PTC but also might impact its clinical course."

According to the news reporters, the research concluded: "However, these associations were only moderate, and further large multi-ethnic studies are required to evaluate the usefulness of these germline variants in the clinical stratification of PTC patients."

Biomedical Engineering - Tissue Engineering

Data on Tissue Engineering Discussed by Researchers at Texas A&M University (Cold Plasma Reticulation of Shape Memory Embolic Tissue Scaffolds)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Biomedical Engineering - Tissue Engineering are
discussed in a new report. According to news originating from College Station, Texas, by NewsRx correspondents, research stated, "Polyurethane shape memory polymer (SMP) foams are proposed for use as thrombogenic scaffolds to improve the treatment of vascular defects, such as cerebral aneurysms. However, gas blown SMP foams inherently have membranes between pores, which can limit their performance as embolic tissue scaffolds."

Financial supporters for this research include National Institutes of Health, National Institute of Biomedical Imaging and Bioengineering, National Institute of Neurological Disorders and Stroke, National Science Foundation.

Our news journalists obtained a quote from the research from Texas A&M University, "Reticulation, or the removal of membranes between adjacent foam pores, is advantageous for improving device performance by increasing blood permeability and cellular infiltration. This work characterizes the effects of cold gas plasma reticulation processes on bulk polyurethane SMP films and foams. Plasma-induced changes on material properties are characterized using scanning electron microscopy, uniaxial tensile testing, goniometry, and free strain recovery experiments. Device specific performance is characterized in terms of permeability, platelet attachment, and cell-material interactions."

According to the news editors, the research concluded: "Overall, plasma reticulated SMP scaffolds show promise as embolic tissue scaffolds due to increased bulk permeability, retained thrombogenicity, and favorable cell-material interactions."

The news correspondents report that additional information may be obtained from D.J. Maitland, Texas A&M University, Biomed Engn, College Stn, TX 77843, United States. Additional authors for this research include N.C. Docherty, M.B.B. Monroe, K.P. Ezell, J.K. Carrow, S.M. Hasan, A.K. Gaharwar and D.J. Maitland.

Skin Diseases and Conditions - Toxic Epidermal

Data on Toxic Epidermal Necrolysis Reported by Researchers at Royal Adelaide Hospital (Early toxic epidermal necrolysis syndrome post-intra-cranial tumor resection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Skin Diseases and Conditions - Toxic Epidermal Necrolysis. According to news reporting from Adelaide, Australia, by NewsRx
journalists, research stated, "SJS and TEN are two rare self-limited but serious cutaneous drug reactions with significant morbidity and mortality. There are many drugs associated with the condition."

The news correspondents obtained a quote from the research from Royal Adelaide Hospital, "We report a case of early TEN syndrome post Carbamazepine use, review the current literature and discuss the management challenges. A 51-year-old female was admitted to hospital for investigation and management of complex partial seizures secondary to a meningioma. She was commenced on 100mg BD of Carbamazepine for seizure control and discharged home. Surgical resection of the meningioma was performed electively 2 weeks later. A localized erythematous macular rash mainly in the left shoulder was noted on postoperative day 3. Two days later, the patient had sloughing of the mucosa of the lips in addition to progression of the rash. Early Toxic Epidermal Necrolysis (TEN) syndrome was diagnosed by the Burns and Dermatology teams and the culprit drug was discontinued. Skin biopsy confirmed the diagnosis. The patient was commenced on intravenous immunoglobulins with excellent improvement in skin integrity and resolution of excoriations noted on discharge. Stevens - Johnson syndrome (SJS) and TEN are two rare self-limited but serious cutaneous drug reactions with significant morbidity and mortality. The current treatment of TENS/SJS is divided into early management and symptom control. The immediate cessation of the culprit drug is quintessential. There is vast documented evidence of carbamazepine-induced SJS/TEN in patients of Asian ethnicity due to the presence of the HLA allele B*1502."

According to the news reporters, the research concluded: "HLA-B*1502 screening should be performed when using aromatic anticonvulsants such as carbamazepine in high-risk patients."

Our news journalists report that additional information may be obtained by contacting T.K. Ramachandren, Royal Adelaide Hospital, Adelaide, SA 5000, Australia.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/0036933015615265. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Toxicology and Pharmacology**

**Data on Toxicology and Pharmacology Reported by Researchers at Merck & Company (Role of chronic toxicology studies in revealing new toxicities)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- New research on Drugs and Therapies - Toxicology and Pharmacology is the subject of a report. According to news reporting originating in West Point, Pennsylvania, by NewsRx journalists, research stated, "Chronic (>3 months) preclinical toxicology studies are conducted to support the safe conduct of clinical trials exceeding 3 months in duration. We have conducted a review of 32 chronic toxicology studies in non-rodents (22 studies in dogs and 10 in non-human primates) and 27 chronic toxicology studies in rats dosed with Merck compounds to determine the frequency at which additional target organ toxicities are observed in chronic toxicology studies as compared to subchronic studies of 3 months in duration."

The news reporters obtained a quote from the research from Merck & Company, "Our review shows that majority of the findings are observed in the subchronic studies since additional target organs were not observed in 24 chronic non rodent studies and in 21 chronic rodent studies. However, 6 studies in non rodents and 6 studies in rodents yielded new findings that were not seen in studies of 3 month or shorter duration. For 3 compounds the new safety findings did contribute to termination of clinical development plans."

According to the news reporters, the research concluded: "Although the incidence of compound termination associated with chronic toxicology study observations is low (similar to 10%), the observations made in these studies can be important for evaluating human safety risk."

For more information on this research see: Role of chronic toxicology studies in revealing new toxicities. Regulatory Toxicology and Pharmacology, 2016;82():94-98. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Regulatory Toxicology and Pharmacology - www.journals.elsevier.com/regulatory-toxicology-and-pharmacology/)

Our news correspondents report that additional information may be obtained by contacting A. Galijatovic-Idrizbegovic, Merck & Co Inc, West Point, PA 19486, United States. Proteins - Transcription Factors

Data on Transcription Factors Discussed by Researchers at Kyoto University [Expression of metastasis suppressor gene AES driven by a Yin Yang (YY) element in a CpG island promoter and transcription factor YY2]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Proteins - Transcription Factors is the subject of a report. According to news reporting from Kyoto, Japan, by NewsRx journalists, research stated, "We
recently found that the product of the AES gene functions as a metastasis suppressor of colorectal cancer (CRC) in both humans and mice. Expression of amino-terminal enhancer of split (AES) protein is significantly decreased in liver metastatic lesions compared with primary colon tumors."

Financial support for this research came from Japan Agency for Medical Research and Development.

The news correspondents obtained a quote from the research from Kyoto University, "To investigate its downregulation mechanism in metastases, we searched for transcriptional regulators of AES in human CRC and found that its expression is reduced mainly by transcriptional dysregulation and, in some cases, by additional haploidization of its coding gene. The AES promoter-enhancer is in a typical CpG island, and contains a Yin-Yang transcription factor recognition sequence (YY element). In human epithelial cells of normal colon and primary tumors, transcription factor YY2, a member of the YY family, binds directly to the YY element, and stimulates expression of AES. In a transplantation mouse model of liver metastases, however, expression of YY2 (and therefore of AES) is downregulated. In human CRC metastases to the liver, the levels of AES protein are correlated with those of YY2. In addition, we noticed copy-number reduction for the AES coding gene in chromosome 19p13.3 in 12% (5/42) of human CRC cell lines. We excluded other mechanisms such as point or indel mutations in the coding or regulatory regions of the AES gene, CpG methylation in the AES promoter enhancer, expression of microRNAs, and chromatin histone modifications."

According to the news reporters, the research concluded: "These results indicate that Aes may belong to a novel family of metastasis suppressors with a CpG-island promoter enhancer, and it is regulated transcriptionally."

Our news journalists report that additional information may be obtained by contacting M.M. Taketo, Kyoto University, Grad Sch Med, Gastrointestinal Surg, Kyoto, Japan. Additional authors for this research include M. Sonoshita, H. Miyoshi, Y. Itatani, S. Ito, K. Kawada, Y. Sakai and M.M. Taketo.

Proteins - Transcription Factors

Data on Transcription Factors Reported by L.M. Williams and Colleagues [The transcription factor, Nuclear factor, erythroid 2 (Nfe2), is a regulator of the oxidative stress response during Danio rerio development]
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Transcription Factors. According to news reporting out of Bar Harbor, Maine, by NewsRx editors, research stated, "Development is a complex and well-defined process characterized by rapid cell proliferation and apoptosis. At this stage in life, a developmentally young organism is more sensitive to toxicants as compared to an adult."

Our news journalists obtained a quote from the research, "In response to pro-oxidant exposure, members of the Cap'n'Collar (CNC) basic leucine zipper (bZIP) transcription factor family (including Nfe2 and Nfe2-related factors, Nrf1 and Nrf2) activate the expression of genes whose protein products contribute to reduced toxicity. Here, we studied the role of the CNC protein, Nfe2, in the developmental response to pro-oxidant exposure in the zebrafish (Danio rerio). Following acute waterborne exposures to diquat or tert-butyldihydroperoxide (tBOOH) at one of three developmental stages, wildtype (WT) and nfe2 knockout (KO) embryos and larvae were morphologically scored and their transcriptomes sequenced. Early in development, KO animals suffered from hypochromia that was made more severe through exposure to pro-oxidants; this phenotype in the KO may be linked to decreased expression of alas2, a gene involved in heme synthesis. WT and KO eleutheroembryos and larvae were phenotypically equally affected by exposure to pro-oxidants, where tBOOH caused more pronounced phenotypes as compared to diquat. Comparing diquat and tBOOH exposed embryos relative to the WT untreated control, a greater number of genes were up-regulated in the tBOOH condition as compared to diquat (tBOOH: 304 vs diquat: 148), including those commonly found to be differentially regulated in the vertebrate oxidative stress response (OSR) (e.g. hsp70.2, txn1, and gsr). When comparing WT and KO across all treatments and times, there were 1170 genes that were differentially expressed, of which 33 are known targets of the Nrf proteins Nrf1 and Nrf2. More specifically, in animals exposed to pro-oxidants a total of 968 genes were differentially expressed between WT and KO across developmental time, representing pathways involved in coagulation, embryonic organ development, body fluid level regulation, erythrocyte differentiation, and oxidation-reduction, amongst others. The greatest number of genes that changed in expression between WT and KO occurred in animals exposed to diquat at 2 h post fertilization (hpf). Across time and treatment, there were six genes (dhx40, cfap70, dna19b, slc35f4, spi-c, and gpr19) that were significantly up-regulated in KO compared to WT and four genes (fhad1, cyp4v7, nlrp12, and slc16a6a) that were significantly down-regulated. None of these genes have been previously identified as targets of Nfe2 or the Nrf family."

According to the news editors, the research concluded: "These results demonstrate that the zebrafish Nfe2 may be a regulator of both primitive erythropoiesis and the OSR during development."

For more information on this research see: The transcription factor, Nuclear factor, erythroid 2 (Nfe2), is a regulator of the oxidative stress response during Danio rerio development. Aquatic Toxicology, 2016;180():141-154. Aquatic Toxicology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Aquatic Toxicology - www.journals.elsevier.com/aquatic-toxicology/)

Data on Tuberculosis Discussed by Researchers at University of Oviedo
(Comparison of isothermal helicase-dependent amplification and PCR for the detection of Mycobacterium tuberculosis by an electrochemical genomagnetic assay)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mycobacterium Infections - Tuberculosis have been published. According to news reporting originating in Oviedo, Spain, by NewsRx journalists, research stated, "Methods for the early and sensitive detection of pathogenic bacteria suited to low-resource settings could impact diagnosis and management of diseases. Helicase-dependent isothermal amplification (HDA) is an ideal tool for this purpose, especially when combined with a sequence-specific detection method able to improve the selectivity of the assay."

Financial supporters for this research include European Regional development Fund, Principado de Asturias Government, Ministerio de Economia y Competitividad.

The news reporters obtained a quote from the research from the University of Oviedo, "The implementation of this approach requires that its analytical performance is shown to be comparable with the gold standard method, polymerase chain reaction (PCR). In this study, we optimize and compare the asymmetric amplification of an 84-base-long DNA sequence specific for Mycobacterium tuberculosis by PCR and HDA, using an electrochemical genomagnetic assay for hybridization-based detection of the obtained single-stranded amplicons. The results indicate the generalizability of the magnetic platform with electrochemical detection for quantifying amplification products without previous purification. Moreover, we demonstrate that under optimal conditions the same gene can be amplified by either PCR or HDA, allowing the detection of as low as 30 copies of the target gene sequence with acceptable reproducibility. Both assays have been applied to the detection of M. tuberculosis in sputum, urine, and pleural fluid samples with comparable results."

According to the news reporters, the research concluded: "Simplicity and isothermal nature of HDA offer great potential for the development of point-of-care devices."

For more information on this research see: Comparison of isothermal helicase-dependent amplification and PCR for the detection of Mycobacterium tuberculosis by an electrochemical genomagnetic assay. *Analytical and Bioanalytical Chemistry*, 2016;408 (30):8603-8610. *Analytical and Bioanalytical Chemistry* can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. Mycobacterium Infections - Tuberculosis

Data on Tuberculosis Reported by Researchers at University of Leicester (Development of an In Vitro Assay for Detection of Drug-Induced Resuscitation-Promoting-Factor-Dependent Mycobacteria)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Mycobacterium Infections - Tuberculosis. According to news reporting originating from Leicester, United Kingdom, by NewsRx correspondents, research stated, "Tuberculosis is a major infectious disease that requires prolonged chemotherapy with a combination of four drugs."

Our news editors obtained a quote from the research from the University of Leicester, "Here we present data suggesting that treatment of Mycobacterium tuberculosis, the causative agent of tuberculosis, and Mycobacterium smegmatis, a model organism widely used for the screening of antituberculosis agents, with first-line drugs resulted in the generation of substantial populations that could be recovered only by the addition of a culture supernatant from growing mycobacteria. These bacilli failed to grow in standard media, resulting in significant underestimation of the numbers of viable mycobacteria in treated samples. We generated M. smegmatis strains overexpressing M. tuberculosis resuscitation-promoting factors (Rpfs) and demonstrated their application for the detection of Rpf-dependent mycobacteria generated after drug exposure."

According to the news editors, the research concluded: "Our data offer novel opportunities for validation of the sterilizing activity of antituberculosis agents."

For more information on this research see: Development of an In Vitro Assay for Detection of Drug-Induced Resuscitation-Promoting-Factor-Dependent Mycobacteria. Antimicrobial Agents and Chemotherapy, 2016;60(10):6227-6233. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news editors report that additional information may be obtained by contacting G.V. Mukamolova, University of Leicester, Dept. of Infect Immun & Inflammation, Leicester, Leics, United Kingdom. Additional authors for this research include F.F. Pu, O. Turapov and G.V. Mukamolova.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/AAC.00518-16. This DOI is a link to an online electronic document that is either free or for purchase.
Data on Type 2 Diabetes Described by Y. Kimura et al (Clinical Significance of Determining Plasma MicroRNA33b in Type 2 Diabetic Patients with Dyslipidemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is now available. According to news reporting originating from Aomori, Japan, by NewsRx correspondents, research stated, "Sterol regulatory element-binding protein (SREBP)-1c is the dominant liver insulin-stimulated isoform and strongly correlates with diabetic dyslipidemia characterized by hyperinsulinemia [i.e., high-density lipoprotein cholesterol (HDL-C) levels and hypertriglyceridemia], MicroRNA (miRNA) 33b is harbored in the intron of SREBP-1c and represses ATP-binding cassette, sub-family A, and member 1 (ABCA1) expression, essential for HDL formation."

Our news editors obtained a quote from the research, "We measured plasma miRNA33b levels as possible biomarkers for diabetic dyslipidemia in patients with type 2 diabetes mellitus (T2DM) showing insulin resistance. The participants included 50 patients with T2DM (M/F 31/19) enrolled in an educational program for controlling blood glucose levels at Hirosaki University Hospital. HbA1c, fasting plasma glucose, insulin, and lipid levels were determined. Plasma miRNA33b, miRNA33a and miRNA148a were quantified using a TaqMan ® MicroRNA Assay, and values were corrected with reference to miRNA16. Mean BMI of participants were 28.2 +/- 6.6 (kg/m(2)) and the Homeostasis Model Assessment of Insulin Resistance was 4.3 +/- 2.7. Patients' laboratory findings indicated diabetic dyslipidemia with insulin resistance. Plasma miRNA33b/16 levels revealed a positive correlation with plasma insulin level (r=0.326, P=0.021), serum C-peptide (r =0.280, P=0.049), and triglyceride (r= 0.351, P=0.012), but no association with HDL-C (r=-0.210, P=.143). The blood level of miRNA33a was approximately 1/150th of that of miRNA33b and was not correlated with the above parameters."

According to the news editors, the research concluded: "We postulated that plasma miRNA33b may be useful as a new metabolic biomarker of dyslipidemia in patients with T2DM as well as metabolic syndrome via an insulin/SREBP-1c/miRNA33b/ABCA1 pathway."

For more information on this research see: Clinical Significance of Determining Plasma MicroRNA33b in Type 2 Diabetic Patients with Dyslipidemia. *Journal of Atherosclerosis and Thrombosis*, 2016;23(11):1276-1285. *Journal of Atherosclerosis and Thrombosis* can be contacted at: Japan Atherosclerosis Soc, Nichinai-Kaikan B1, 3-28-8 Hongo Bunkyo-Ku, Tokyo, 113-0033, Japan.

The news editors report that additional information may be obtained by contacting N. Tamasawa, Aomori Rosai Hosp, Dept. of Diabet & Endocrinol, Hachinohe, Aomori 0318551, Japan. Data on Type 2 Diabetes Reported by Researchers at Gunma University (Fibroblast growth factor 23 inhibits osteoblastic gene expression and induces osteoprotegerin in vascular smooth muscle cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is now available. According to news reporting out of Maebashi, Japan, by NewsRx editors, research stated, "Elevated fibroblast growth factor 23 (FGF23) levels are associated with cardiovascular mortality in patients with chronic kidney disease. However, both clinical and basic research have demonstrated conflicting evidence regarding the pathophysiological role of FGF23 in vascular calcification."

Our news journalists obtained a quote from the research from Gunma University, "The aim of this study was to determine the role of FGF23 in the osteoblastic gene expression in vascular smooth muscle cells (SMCs). We transduce human aortic SMCs (HASMCs) expressing klotho and FGF receptors with the adenovirus expressing human FGF23 (Ad-FGF23). We observed significant decreases in the expression of osteoblast-marker genes including BMP2, BMP4, MSX2, RUNX2 and ALP, as well as reduced calcification. Notably, Ad-FGF23 increased mRNA and protein levels of osteoprotegerin (OPG), and human OPG promoter was activated by FGF23. Moreover, in HASMCs overexpressing klotho, FGF23 upregulated OPG expression, whereas depletion of klotho by siRNA attenuated FGF23-induced OPG expression. Furthermore, in 73 consecutive patients with type 2 diabetes mellitus undergoing cardiac computed tomography to determine coronary calcium scores (CCSs), serum FGF23 levels were positively correlated with OPG independent of phosphate and estimated glomerular filtration rate (eGFR, r - 0.65, p< 0.01). Serum FGF23 levels were significantly elevated in patients with high CCSs (>= 100) compared to those with low CCSs (< 100). Our in vitro results indicate that FGF23 suppresses osteoblastic gene expression and induces OPG expression in HASMCs."

According to the news editors, the research concluded: "Together with our cross-sectional clinical assessment, the present study lends support to our hypothesis that FGF23 counteracts osteogenic conversion of vascular SMCs as a part of a compensatory mechanism to mitigate vascular calcification."

For more information on this research see: Fibroblast growth factor 23 inhibits osteoblastic gene expression and induces osteoprotegerin in vascular smooth muscle cells. Atherosclerosis, 2016;253():102-110. Atherosclerosis can be contacted at: Elsevier Ireland Ltd,

**Nutritional and Metabolic Diseases and Conditions**...

**Data on Type 2 Diabetes Reported by Researchers at University of Ottawa (Reactive Oxygen Species and Oxidative Stress in Obesity-Recent Findings and Empirical Approaches)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting originating from Ottawa, Canada, by NewsRx correspondents, research stated, "High levels of reactive oxygen species (ROS) are intricately linked to obesity and associated pathologies, notably insulin resistance and type 2 diabetes. However, ROS are also thought to be important in intracellular signaling, which may paradoxically be required for insulin sensitivity."

Our news editors obtained a quote from the research from the University of Ottawa, "Many theories have been developed to explain this apparent paradox, which have broadened our understanding of these important small molecules. While many sites for intracellular ROS production have been described, mitochondrial generated ROS remain a major contributor in most cell types. Mitochondrial ROS generation is controlled by a number of factors described in this review. Moreover, these studies have established both a demand for novel sensitive approaches to measure ROS, as well as a need to standardize and review their suitability for different applications. To properly assess levels of ROS and mitochondrial ROS in the development of obesity and its complications, a growing number of tools have been developed. This paper reviews many of the common methods for the investigation of ROS in mitochondria, cell, animal, and human models. Available approaches can be generally divided into those that measure ROS-induced damage (e.g., DNA, lipid, and protein damage); those that measure antioxidant levels and redox ratios; and those that use novel biosensors and probes for a more direct measure of different forms of ROS (e.g., 2',7'-dichlorofluorescein (DCF), dihydroethidium (DHE) and its mitochondrial targeted form (MitoSOX), Amplex Red, roGFP, HyPer, mt-cpYFP, ratiometric H2O2 probes, and their derivatives). Moreover, this review provides caveats and strengths for the use of these techniques in different models."
According to the news editors, the research concluded: "Advances in these techniques will undoubtedly advance the understanding of ROS in obesity and may help resolve unanswered questions in the field."

The news editors report that additional information may be obtained by contacting M.E. Harper, University of Ottawa, Fac Med, Dept. of Biochem Microbiol & Immunol, Ottawa, ON, Canada. Additional authors for this research include D.A. Patten and M.E. Harper.

**Nutritional and Metabolic Diseases and Conditions -**

**Data on Type 2 Diabetes Reported by Y. Lu and Co-Researchers**

*(Astragalus polysaccharide modulates ER stress response in an OVA-LPS induced murine model of severe asthma)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Endoplasmic reticulum (ER) stress has been recently revealed to play a pivotal role in the pathogenesis of severe asthma. Astragalus polysaccharide (APS), a major bioactive component from Astragalus membranaceus, exerts immunomodulatory and anti-inflammatory effects and has been shown to suppress ER stress in chronic diseases such as type-2 diabetes."

Funders for this research include Natural Science Foundation, Natural Science Project.

The news correspondents obtained a quote from the research, "However, the pharmaceutical application of APS in the treatment of severe asthma is unknown. The results obtained here indicate that APS significantly attenuates eosinophils and neutrophil-dominant airway inflammation by reducing the mRNA levels of Cxcl5, 118, and chemokine (C-C motif) ligand 20 (Cc120) and the protein levels of IL13RA and IL17RA. APS also inhibits the activation of unfolded protein response by decreasing the levels of ER stress markers such as C/EBP homologous protein (CHOP), which was associated with a reduction of PERK phosphorylation. Moreover, APS substantially blocks the nuclear translocation of ATF6 and NF-kappa B p65. Interestingly, we observed that APS markedly suppresses mucus hypersecretion by decreasing the levels of mucin (MUC) 5AC and MUC5B, which might be due to inhibition of goblet cells differentiation by suppressing the expression of IRE1 beta-correlated genes."

According to the news reporters, the research concluded: "In summary, APS can have potential pharmaceutical application in treatment of severe asthma."

Our news journalists report that additional information may be obtained by contacting X. Zhao, Jiangsu Key Lab Pediat Resp Dis, Nanjing 210023, Jiangsu, People's Republic of China. Additional authors for this research include Q.Q. Xing, J.Y. Xu, D. Ding and X. Zhao.

**Inflammatory Bowel Diseases and Conditions**

**Data on Ulcerative Colitis Reported by Researchers at Tianjin University**

*Colon targeted oral drug delivery system based on alginate-chitosan microspheres loaded with icariin in the treatment of ulcerative colitis*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Inflammatory Bowel Diseases and Conditions - Ulcerative Colitis is now available. According to news reporting out of Tianjin, People's Republic of China, by NewsRx editors, research stated, "In recent years, oral colon specific drug delivery system has been paid more attention in the treatment of inflammatory bowel disease (IBD). As the special pH condition in gastrointestinal tract, the challenge for treatment of IBD was that the colon drug delivery system should endure the low pH in stomach and release drugs quickly in high pH in colon."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Tianjin University, "Icariin with the poor solubility and low bioavailability limited the treatment of many diseases in clinic. In this study, the protective mechanism of alginate-chitosan microspheres loaded with icariin were investigated with trinitrobenzene sulfonic acid (TNBS)/ethanol induced colonic mucosal injury in rats. The results of drug release showed that the icariin loaded into microspheres released only 10% in simulated gastric fluid and a high amount of 65.6% released in simulated colonic fluid. The fluorescence tracer indicated high retention of targeted microspheres more than 12 h in colon. The microspheres loaded with icariin could not only reduce the colonic injury by decreasing the colon mucosa damage index in rats, but also reduce
the inflammatory response by reducing the production and gene expression of inflammatory mediators and cytokines in colonic mucosa."

According to the news editors, the research concluded: "All the results indicate that targeted microspheres loaded with icariin could exert the colon-protective effects through reducing the inflammatory response, which would be developed as a potential drug controlled release system for treatment of ulcerative colitis."

Our news journalists report that additional information may be obtained by contacting Y.L. Cui, Tianjin University for Traditional Chinese Medicine, Res Center Tradit Chinese Med, Key Lab Modern Chinese Med, Tianjin 300193, People's Republic of China. Additional authors for this research include G.F. Wang, J. Zhou, L.N. Gao and Y.L. Cui.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.002. This DOI is a link to an online electronic document that is either free or for purchase.

**Data on Urology Reported by Researchers at Shanghai Jiao-Tong University (Etiology and Management of Male Iatrogenic Urethral Stricture: Retrospective Analysis of 172 Cases in a Single Medical Center)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Health and Medicine - Urology. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "To investigate the etiology and management of male iatrogenic urethral stricture in China. The data of 172 patients with iatrogenic urethral stricture who underwent treatment at a high volume reference center in China from January 2008 to February 2014 were analyzed retrospectively."

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "Databases were analyzed to understand the impact of different types of iatrogenic injury on stricture location, length and treatment of urethral strictures, as well as success rates. The most common type of iatrogenic stricture was urethral instrumentations in 80 patients (46.51%). Mean stricture length was 3.3 +/- 2.54 cm and the longest strictures were those caused by intravesica I instillation. Substitution urethroplasty was the most common..."
intervention and was performed in 60.47% (104/172) of patients. The overall success rate was 85.00% (136/160). Univariable analyses revealed that the type of iatrogenic injury was significantly related to restenosis (p = 0.036), and it is more apt to postoperative restenosis in the type of intravesical instillation than others. Our results showed that urethral instrumentation is the most common etiology of iatrogenic urethral stricture, and most iatrogenic urethral strictures involve the anterior urethra."

According to the news editors, the research concluded: "The different etiologies are closely associated with stricture location, length and the overall prognosis of urethral strictures."

The news correspondents report that additional information may be obtained from Q. Fu, Shanghai Jiao Tong University, Affiliated Peoples Hosp 6, Dept. of Urol, Shanghai 200233, People's Republic of China. Additional authors for this research include J. Zhang, Y.L. Sa, S.B. Jin, Y.M. Xu, Q. Fu and M. Lazzeri.

**Oncology - Urothelial Cancer**

**Data on Urothelial Cancer Described by Researchers at University of Texas Southwestern (Comparing Changes in Renal Function After Radical Surgery for Upper Tract Urothelial Carcinoma and Renal Cell Carcinoma)**

2017 JAN 14 (NewsRx) - By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Urothelial Cancer have been published. According to news originating from Dallas, Texas, by NewsRx correspondents, research stated, "To compare changes in renal function after radical nephrectomy for renal cell carcinoma (RCC) and radical nephroureterectomy for upper tract urothelial carcinoma (UTUC), and assess their effects on non-cancer-specific mortality (CSM). Clinicopathologic data from 1114 patients with RCC or UTUC treated surgically from 1997 to 2013 were compiled."

Our news journalists obtained a quote from the research from the University of Texas Southwestern, "Patients who underwent nephron-sparing surgeries, had bilateral disease, received chemotherapy, or had < 1 month of follow-up were excluded. Renal function (estimated glomerular filtration rate [eGFR]) was calculated preoperatively, 3 months postoperatively, and at last follow-up. Events were defined as >= 25% decline in eGFR from baseline. Event-free survival and non-CSM were assessed using Kaplan-Meier analysis. Multivariable Cox regression was performed to identify predictors of events. Four hundred thirty-five patients were included (317 radical nephrectomy, 118 radical nephroureterectomy). Median follow-up was 38.2 months. UTUC patients were older (P < .001), had worse Charlson score (P < .001), and more frequently used tobacco (P = .006). Median baseline eGFR was
lower in UTUC patients (58.4 vs 74.9, P < .001). RCC patients experienced a larger event rate following surgery at first (56.8% vs 31.4%, P < .001) and last (51.7% vs 35.6%, P = .003) follow-up than UTUC patients. On Kaplan-Meier analysis, UTUC patients exhibited worse non-CSM (P < .001). Postsurgical decline in renal function was a significant predictor of non-CSM in RCC patients at first (hazard ratio = 4.71, P = .041) and last (hazard ratio = 4.56, P = .018) follow-up, whereas this was not the case for UTUC patients. UTUC patients had worse baseline eGFR and overall health status than RCC patients. RCC patients experienced greater postsurgical declines in renal function."

According to the news editors, the research concluded: "These results shed light on differences in patient characteristics between these forms of kidney cancer and guide expectations for postoperative renal function."

The news correspondents report that additional information may be obtained from V. Margulis, Univ Texas Southwestern Med Center Dallas, Dept. of Urol, Dallas, TX 75390, United States. Additional authors for this research include R. Hutchinson, C. Menegaz, A.Q. Haddad, L. Jiang, A.I. Sagalowsky, J.A. Cadeddu, Y. Lotan and V. Margulis.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.urology.2016.07.015. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Urothelial Cancer**

**Data on Urothelial Cancer Detailed by Researchers at Chang Gung University (Adjuvant radiotherapy for locally advanced upper tract urothelial carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Urothelial Cancer. According to news reporting out of Taoyuan, Taiwan, by NewsRx editors, research stated, "There is relatively little literature on adjuvant radiotherapy after radical nephroureterectomy with bladder cuff excision (RNU) for patients with upper tract urothelial carcinoma (UTUC). This study was designed to determine the efficacy of adjuvant radiotherapy for patients with pT3N0M0 UTUC."

Our news journalists obtained a quote from the research from Chang Gung University, "We retrospectively reviewed 198 patients treated with RNU between December 2001 and January 2015. Postoperative radiotherapy was administered in 40 (20.2%) of patients. Patients who received radiotherapy were younger than those that did not (65.2 vs. 70.5 years, p = 0.023). With median follow up of 29.1 months, Kaplan-Meier analysis with the log-rank test
demonstrated no significant differences between those omitting vs receiving adjuvant radiotherapy in regards to 2-year rates of overall survival (72.0% vs. 73.4%, p = 0.979), cancer-specific survival (73.2% vs. 75.3%, p = 0.844), and recurrence-free survival (61.2% vs. 66.3%, p = 0.742). However, in multivariable analysis with Cox regression, young age, absence of chronic kidney disease, negative lymphovascular invasion, negative surgical margin, and adjuvant chemotherapy were also associated with better cancer-specific survival.

According to the news editors, the research concluded: "Adjuvant radiotherapy did not offer any significant benefit in terms of overall, cancer-specific, and recurrence-free survivals in patients with pT3N0M0 UTUC after RNU. More effective systemic adjuvant chemotherapy is necessary to improve the outcome of these patients."

Our news journalists report that additional information may be obtained by contacting Y.C. Huang, Chang Gung University, Grad Inst Clin Med Sci, Coll Med, Taoyuan, Taiwan. Additional authors for this research include Y.H. Chang, K.H. Chiu, A.W. Shindel and C.H. Lai.

**Immunization - Vaccines**

**Data on Vaccines Reported by A. De Beuckelaer and Colleagues (Type I Interferons Interfere with the Capacity of mRNA Lipoplex Vaccines to Elicit Cytolytic T Cell Responses)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immunization - Vaccines is the subject of a report. According to news reporting from Ghent, Belgium, by NewsRx journalists, research stated, "Given their high potential to evoke cytolytic T cell responses, tumor antigen-encoding messenger RNA (mRNA) vaccines are now being intensively explored as therapeutic cancer vaccines. mRNA vaccines clearly benefit from wrapping the mRNA into nano-sized carriers such as lipoplexes that protect the mRNA from degradation and increase its uptake by dendritic cells in vivo. Nevertheless, the early innate host factors that regulate the induction of cytolytic T cells to mRNA lipoplex vaccines have remained unresolved."

The news correspondents obtained a quote from the research, "Here, we demonstrate that mRNA lipoplexes induce a potent type I interferon (IFN) response upon subcutaneous, intradermal and intranodal injection. Regardless of the route of immunization applied, these type I IFNs interfered with the generation of potent cytolytic T cell responses. Most importantly, blocking type I IFN signaling at the site of immunization through the use of an IFNAR blocking antibody greatly enhanced the prophylactic and therapeutic antitumor efficacy of mRNA lipoplexes in the highly aggressive B16 melanoma model."
According to the news reporters, the research concluded: "As type I IFN induction appears to be inherent to the mRNA itself rather than to unique properties of the mRNA lipoplex formulation, preventing type I IFN induction and/or IFNAR signaling at the site of immunization might constitute a widely applicable strategy to improve the potency of mRNA vaccination."

For more information on this research see: Type I Interferons Interfere with the Capacity of mRNA Lipoplex Vaccines to Elicit Cytolytic T Cell Responses. *Molecular Therapy*, 2016;24(11):2012-2020. *Molecular Therapy* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. **Vinyl Compounds**

**Data on Vinyl Compounds Detailed by Researchers at Hokkaido University [Difference in the Dissolution Behaviors of Tablets Containing Polyvinylpolypyrrolidone (PVPP) Depending on Pharmaceutical Formulation After Storage Under High Temperature ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Vinyl Compounds. According to news originating from Hokkaido, Japan, by NewsRx correspondents, research stated, "Storage under high temperature and humid conditions has been reported to decrease the dissolution rate for some kinds of tablets containing polyvinylpolypyrrolidone (PVPP) as a disintegrant. The aim of this study was to elucidate the properties of pharmaceutical formulations with PVPP that cause a decrease in the dissolution rate after storage under high temperature and humid conditions by using model tablets with a simple composition."

Our news journalists obtained a quote from the research from Hokkaido University, "Model tablets, which consisted of rosuvastatin calcium or 5 simple structure compounds, salicylic acid, 2-aminodiphenylmethane, 2-aminobiphenyl, 2-(p-tolyl) benzoic acid or 4,4'-biphenol as principal agents, cellulose, lactose hydrate, PVPP and magnesium stearate as additives, were made by direct compression. The model tablets were wrapped in paraffin papers and stored for 2 weeks at 40 degrees C/75% relative humidity (RH). Dissolution tests were carried out by the paddle method in the Japanese Pharmacopoeia 16th edition. Model tablets with a simple composition were able to reproduce a decreased dissolution rate after storage at 40
degrees C/75% RH. These tablets showed significantly decreased water absorption activities after storage. In the case of tablets without lactose hydrate by replacing with cellulose, a decreased dissolution rate was not observed. Carboxyl and amino groups in the structure of the principal agent were not directly involved in the decreased dissolution. 2-Benzylaniline tablets showed a remarkably decreased dissolution rate and 2-aminobiphenyl and 2-(p-tolyl) benzoic acid tablets showed slightly decreased dissolution rates, though 4,4’-biphenol tablets did not show a decrease dissolution rate. We demonstrated that additives and structure of the principal agent were involved in the decreased in dissolution rate for tablets with PVPP. The results suggested that one of the reasons for a decreased dissolution rate was the inclusion of lactose hydrate in tablets.

According to the news editors, the research concluded: "The results also indicated that compounds as principal agents with low affinity for PVPP may be easily affected by airborne water under high temperature and humid conditions."

The news correspondents report that additional information may be obtained from Y. Takekuma, Hokkaido University, Fac Pharmaceut Sci, Sapporo, Hokkaido, Japan. Additional authors for this research include H. Ishizaka, M. Sumi, Y. Sato and M. Sugawara.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18433/J3HW3Q. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Hokkaido, Japan, Asia, Organic Chemicals, Vinyl Compounds, Hydrocarbons, Polyvinyls, Polyeenes, Hokkaido University.

Our news journalists obtained a quote from the research from King George Medical University, "This case-control study included 130 subjects each in three arms (TBM, pulmonary tuberculosis and healthy control). This study was performed in a large tertiary care institution of..."
North India. Subjects were enrolled from August 2013 to July 2015. Vitamin D levels were measured using enzyme immunoassay. SNPs in VDR and TLR-2 gene were assessed using polymerase chain reaction-sequencing method. TBM patients were followed for 6 months. Vitamin D deficiency was significantly more common in TBM compared to controls and pulmonary tuberculosis (TBM versus controls p < 0.001; TBM versus pulmonary tuberculosis p < 0.001). The heterozygous (TC) and mutant (CC) genotypes of Taq1 VDR SNP were significantly associated with TBM as compared to controls [TC; p < 0.001, odds ratio (OR) = 3.53 (1.95-6.40); CC; p = 0.002 OR = 5.97 (1.89-18.84)]. The heterozygous genotypes were significantly associated with TBM as compared with pulmonary tuberculosis [p = 0.001; OR = 2.53 (1.43-4.45)]. Heterozygous (TG) and mutants (GG) forms of Apa1 VDR SNPs were significantly associated with TBM compared to controls [TG; p = 0.001, OR = 2.86 (1.58-5.17), GG; p = 0.002, OR = 5.11 (1.80-14.54)] and pulmonary tuberculosis. There was no significant difference in the frequency of TLR-2 SNPs. No association was found between outcome of TBM and vitamin D deficiency, VDR or TLR-2 SNPs."

According to the news editors, the research concluded: "Vitamin D deficiency and VDR polymorphisms are associated with the susceptibility of TBM."

Proteins - Cytoskeletal Proteins

Davis Heart and Lung Research Institute Details Findings in Cytoskeletal Proteins (CRISPR-mediated Genome Editing Restores Dystrophin Expression and Function in mdx Mice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - Cytoskeletal Proteins have been published. According to news reporting originating in Columbus, Ohio, by NewsRx journalists, research stated, "Duchenne muscular dystrophy (DMD) is a degenerative muscle disease caused by genetic mutations that lead to the disruption of dystrophin in muscle fibers. There is no
curative treatment for this devastating disease."

The news reporters obtained a quote from the research from Davis Heart and Lung Research Institute, "Clustered regularly interspaced short palindromic repeat/Cas9 (CRISPR/Cas9) has emerged as a powerful tool for genetic manipulation and potential therapy. Here we demonstrate that CRISPR-mediated genome editing efficiently excised a 23-kb genomic region on the X-chromosome covering the mutant exon 23 in a mouse model of DMD, and restored dystrophin expression and the dystrophin-glycoprotein complex at the sarcolemma of skeletal muscles in live mdx mice. Electroporation-mediated transfection of the Cas9/gRNA constructs in the skeletal muscles of mdx mice normalized the calcium sparks in response to osmotic shock. Adenovirus-mediated transduction of Cas9/gRNA greatly reduced the Evans blue dye uptake of skeletal muscles at rest and after downhill treadmill running."

According to the news reporters, the research concluded: "This study provides proof evidence for permanent gene correction in DMD."

For more information on this research see: CRISPR-mediated Genome Editing Restores Dystrophin Expression and Function in mdx Mice. Molecular Therapy, 2015;24 (3):564-9. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

Heart Disorders and Diseases - Tachycardia

Department of Cardiology Describes Findings in Tachycardia (The Lewis Lead for Detection of Ventriculoatrial Conduction Type)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Tachycardia. According to news reporting from Berlin, Germany, by NewsRx journalists, research stated, "Identification of a possible ventriculoatrial (VA) dissociation in wide QRS complex tachycardias is one of the most reliable criteria for differentiation of tachycardia origin. The Lewis lead has been proposed for detection of atrial activity during ventricular tachycardias."

The news correspondents obtained a quote from the research from the Department of Cardiology, "A modified Lewis-lead-ECG will be superior to the standard-lead ECG for detection of ventriculoatrial conduction during ventricular tachycardia. Forty-seven patients underwent electrophysiological study, stimulated with a fixed cycle length of 400 ms in the
ventricle. During stimulation, a standard-lead ECG and a modified Lewis-lead ECG were recorded. Simultaneously, VA conduction was documented by intracardiac electrograms. Surface ECGs were presented to 6 blinded examiners for VA conduction assessment. Type of VA conduction was correctly diagnosed in significantly more ECGs in the Lewis-lead ECG group (mean, 35.0 [75%]) than in the standard-lead ECG group (mean, 29.2 [62%]; p=0.045). Ventriculoatrial dissociation also was significantly more often correctly diagnosed in the Lewis-lead ECG group (mean, 17.7 [71%]) than in the standard-lead ECG group (mean, 12.7 [49%]; p=0.014). Interobserver agreement was moderate in both groups (k=0.45 and k=0.49, respectively).

According to the news reporters, the research concluded: "Compared with standard-lead ECG, modified Lewis-lead ECG is associated with significantly improved detection of VA conduction type during fast ventricular pacing and thus may help improve ECG diagnosis."

Our news journalists report that additional information may be obtained by contacting M. Huemer, Dept. of Cardiology, Campus Virchow Klinikum, Charite-University Medicine Berlin, Berlin, Germany. Additional authors for this research include H. Meloh, P. Attanasio, A. Wutzler, A.S. Parwani, H. Matsuda, F. Blaschke, L.H. Boldt and W. Haverkamp.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
(inception through December 2014) and performed meta-analysis using random effects model. Detection of AF, use of anticoagulation at follow-up, recurrent stroke or TIA, and mortality were major outcomes. Four RCTs with 1149 total patients were included in the meta-analysis. Prolonged cardiac monitoring >= 7 days compared to shorter cardiac monitoring of <= 48 hours duration increased the detection of AF (>= 30 seconds duration) in patients after cryptogenic stroke or TIA (13.8% vs. 2.5%; odds ratio [OR], 6.4; 95% confidence interval [CI], 3.50-11.73; P< 0.00001; I-2, 0%). It also increased the odds of AF detection of any duration (22.6% vs. 5.2%; 5.68[3.3-9.77]; P< 0.00001; I-2, 0%). The patients who underwent prolonged monitoring were more likely to be on anticoagulation at followup (2.21[1.52-3.21]; P< 0.0001; I-2, 0%). No differences in recurrent stroke or TIA (0.78[0.40-1.55]; P = 0.48; I-2, 0%) and mortality (1.33 [0.29-6.00]; P = 0.71; I-2, 0%) were observed between two strategies.

According to the news editors, the research concluded: "Prolonged cardiac monitoring improves detection of atrial fibrillation and anti-coagulation use after cryptogenic stroke or TIA and therefore should be considered instead of shorter duration of cardiac monitoring."

Our news journalists report that additional information may be obtained by contacting K. Dahal, LRG Healthcare, Dept. of Med, Laconia, NH, United States. Additional authors for this research include B. Chapagain, R. Maharjan, H. Farah, A. Nazeer, R.J. Lootens and A. Rosenfeld.

**Hematology - Laboratory Hematology**

**Department of Pathology and Laboratory Medicine Details Findings in Laboratory Hematology (Verifying the performance characteristics of the TEG5000 thromboelastogram in the clinical laboratory)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hematology - Laboratory Hematology. According to news reporting originating in Sacramento, California, by NewsRx journalists, research stated, "To verify the manufacturer performance claims of the TEG5000 with traditional laboratory methods. Samples were concurrently measured using the TEG5000 analyzer and either PT, APTT, fibrinogen, factor activities, platelet count, or platelet function testing using whole blood or platelet-rich plasma methods."

The news reporters obtained a quote from the research from the Department of
Pathology and Laboratory Medicine, "Within-run imprecision yielded coefficient of variation (CV) of <5%. There was no correlation of PT or APTT with R time. Only Factor VIII and factor XII activity significantly correlated with R time. There was significant correlation between k angle with FBG, PLT count, and factor levels. There was weak inverse correlation between angle results and measures of platelet function. All laboratory methods were significantly correlated with MA. There were significant differences between citrated whole blood and fresh citrated plasma for angle and MA, and between fresh and frozen plasma for R time and MA. We demonstrated a high % inhibition noted with normal, drug naïve donors, especially with ADP PLT mapping (50% inhibition), but less so with AA PLT mapping (20% inhibition). For TEG platelet mapping, 19/22 (86.3%) and 17/22 (77.3%) results were concordant with traditional aggregation results."

According to the news reporters, the research concluded: "We demonstrated both the lack of, and strong correlation between laboratory tests and the TEG parameters."

Our news correspondents report that additional information may be obtained by contacting R.C. Gosselin, Dept. of Pathology and Laboratory Medicine, UC Davis Health System, Sacramento, CA, United States. Additional authors for this research include E.E. Estacio, J.Y. Song and D.M Dwyre.

**Bacterial Infections and Mycoses - Bacteremia**

**Division of Nephrology Details Findings in Bacteremia (Organism-specific bacteremia by hemodialysis access)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Bacterial Infections and Mycoses - Bacteremia. According to news originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Data on hemodialysis (HD)-related organism specific bacteremia rates by type of access over an extended period are scant in the literature. Using a registry data base we examined all positive blood cultures by organisms for each type of HD access over 14 years."

Our news journalists obtained a quote from the research from the Division of Nephrology, "The IRB-approved registry data collection of prevalent patients at our HD unit
from 1/1/1999 through 12/31/2012 was analyzed. All positive blood cultures were recorded and expressed as episodes/1,000 days by access type: arteriovenous fistula (AVF), arteriovenous graft (AVG), and central venous catheter (CVC). The rate of positive blood cultures in patients with CVCs was 1.86/1,000 days and was much higher than in patients with an AVF (0.08/1,000 days, p< 0.001) or an AVG (0.31/1,000 days, p< 0.002). There was considerable fluctuation in the bacteremia rate in CVCs with a spike during 2004 -2008, due predominately to coagulase-negative staphylococcus (CNS) bacteremia. The rate subsequently decreased after retraining of staff. The exit site infection (ESI) rate of CVCs was low, suggesting this was not contributing to the cause of the increase rate of CNS bacteremia. Those patients using a CVC had a markedly increased risk of multiple episodes compared to those using an AVF. Bacteremia with Pseudomonas, polymicrobial, and fungal organisms occurred only in those with a CVC. The frequency and type of positive blood culture in HD patients are highly associated with type of access used. The high rate of CNS bacteremia with CVC in conjunction with low ESI rate suggests that contamination at the time of accessing the catheter may be the problem. Staff training was followed by a decrease in infection rates."

According to the news editors, the research concluded: "Trending organism-specific bacteremia infection rates in HD units may provide important clues to bacteremia causality and thus prevention."

For more information on this research see: Organism-specific bacteremia by hemodialysis access. Clinical Nephrology, 2016;86(3):141-146. Clinical Nephrology can be contacted at: Dustri-Verlag Dr Karl Feistle, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

The news correspondents report that additional information may be obtained from J.J. Zhang, Thomas Jefferson Sch, Sidney Kimmel Med College, Div Nephrol, Philadelphia, PA, United States. Additional authors for this research include R.A. Burr, H.S. Sheth and B. Piraino.

**DNA Research**

**Duke University Reports Findings in DNA Research (Integrative modelling of tumour DNA methylation quantifies the contribution of metabolism)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on DNA Research have been published. According to news reporting out of Durham, North Carolina, by NewsRx editors, research stated, "Altered DNA methylation is common in cancer and often considered an early event in tumorigenesis. However, the sources of heterogeneity of DNA methylation among tumours remain poorly defined."

Our news journalists obtained a quote from the research from Duke University, "Here we capitalize on the availability of multi-platform data on thousands of human tumours to build integrative models of DNA methylation. We quantify the contribution of clinical and..."
molecular factors in explaining intertumoral variability in DNA methylation. We show that the levels of a set of metabolic genes involved in the methionine cycle is predictive of several features of DNA methylation in tumours, including the methylation of cancer genes. Finally, we demonstrate that patients whose DNA methylation can be predicted from the methionine cycle exhibited improved survival over cases where this regulation is disrupted. This study represents a comprehensive analysis of the determinants of methylation and demonstrates the surprisingly large interaction between metabolism and DNA methylation variation."

According to the news editors, the research concluded: "Together, our results quantify links between tumour metabolism and epigenetics and outline clinical implications."

Our news journalists report that additional information may be obtained by contacting J.W. Locasale, Duke University, Dept. of Pharmacol & Canc Biol, Sch Med, Durham, NC 27710, United States. Additional authors for this research include L.K. Mentch, A.G. Clark and J.W. Locasale.

**Endometrial cancer driver mutations detectable in uterine lavage fluid**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Mutations that have been linked to endometrial cancer can be found in the uterine lavage fluid of pre- and post-menopausal women both with and without detectable cancer, according to a study published in *PLOS Medicine* by John Martignetti from the Icahn School of Medicine at Mount Sinai, New York, USA, and colleagues.

There are no effective screening methods for endometrial cancer, which is currently increasing in both incidence and mortality in the United States. In the new study, researchers performed uterine lavage - where the inside of the uterus is rinsed with saline fluid to collect loose cells and DNA - on 107 women undergoing diagnostic hysteroscopy due to post-menopausal uterine bleeding or abnormal pelvic ultrasound results. The cells and DNA collected were analyzed with either one of two next-generation sequencing panels to detect previously established driver mutations of endometrial cancer. Hysteroscopy samples were analyzed using classic histopathology.

Of the 107 women in the study, 7 were found to have histopathological evidence of endometrial cancer and all 7, even those with only microscopic evidence of cancer, had significant cancer-driver gene mutations in their uterine lavage fluid. However, 51 women without histopathological evidence of cancer also carried cancer-driver mutations in the cells and DNA from their lavage fluid. Age and post-menopausal status were both positively associated with the likelihood of harboring these mutations. Due to this unexpected finding, uterine lavage fluid was not able to distinguish between women with and without clinically relevant evidence of endometrial cancer. More research is needed to shed light on the
significance of driver mutations in women without evidence of cancer.

"Given that a uterine lavage can be easily and quickly performed even outside of the operating room and in a physician's office-based setting, our findings suggest the future possibility of this approach for screening women for the earliest stages of endometrial cancer," the authors say. "However, our findings suggest that further insight into development of endometrial cancer or its interruption are needed before translation to the clinic."

Oncology - Breast Cancer

Erasmus University Medical Center Describes Findings in Breast Cancer (Annexin-A1 and caldesmon are associated with resistance to tamoxifen in estrogen receptor positive recurrent breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting from Rotterdam, Netherlands, by NewsRx journalists, research stated, "Tamoxifen therapy resistance constitutes a major cause of death in patients with recurrent estrogen receptor (ER) positive breast cancer. Through high resolution mass spectrometry (MS), we previously generated a 4-protein predictive signature for tamoxifen therapy outcome in recurrent breast cancer."

The news correspondents obtained a quote from the research from Erasmus University Medical Center, "ANXA1 and CALD1, which were not included in the classifier, were however the most differentially expressed proteins. We first evaluated the clinical relevance of these markers in our MS cohort, followed by immunohistochemical (IHC) staining on an independent set of tumors incorporated in a tissue microarray (TMA) and regression analysis in relation to time to progression (TTP), clinical benefit and objective response. In order to assess which mechanisms ANXA1 and CALD1 might have been involved in, we performed Ingenuity pathway analysis (IPA) on ANXA1 and CALD1 correlated proteins in our MS cohort. ANXA1 (Hazard ratio [HR]=1.83; 95% confidence interval [CI]: 1.22-2.75; p=0.003) and CALD1 (HR=1.57; 95% CI: 1.04-2.36; p=0.039) based patient stratification showed significant association to TTP, while IHC staining on TMA showed that both ANXA1 (HR=1.82; 95% CI: 1.12-3.00; p=0.016) and CALD1 (HR=2.29; 95% CI: 1.40-3.75; p=0.001) expression was associated with shorter TTP independently of traditional predictive factors. Pearson correlation analysis showed that the majority of proteins correlated to ANXA1 also correlated with CALD1. IPA indicated that ANXA1 and CALD1 were associated with ER-downregulation and NF-kB signaling."

According to the news reporters, the research concluded: "We hereby report that ANXA1 and CALD1 proteins are independent markers for tamoxifen therapy outcome and are associated to fast tumor progression."

For more information on this research see: Annexin-A1 and caldesmon are associated with resistance to tamoxifen in estrogen receptor positive recurrent breast cancer. Oncotarget, 2016;7(3):3098-110.

**Escend Pharmaceuticals, Inc.**

**Escend Pharmaceuticals, Inc., Receives Second Orphan Drug Designation from FDA for ES-3000**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Escend Pharmaceuticals, Inc., a privately held company focused on the development of small molecule therapeutics for oncology orphan diseases, announced that the FDA Office of Orphan Products Development (OOPD) has granted orphan drug designation for its lead product candidate, ES-3000, for the treatment of acute myeloid leukemia (AML). The FDA previously granted ES-3000 orphan designation for the treatment of chronic myeloid leukemia (CML).

"This accomplishment validates the potential significance ES-3000 can have in shifting the AML treatment paradigm," said Saira Bates, Co-founder & CEO of Escend. "The treatment of patients with AML is complicated by relapse and refractory disease which is often attributed to the resistance of leukemic stem cells to standard therapeutics. ES-3000 will be used in conjunction with standard agents to target leukemic stem cells for more durable remissions."

The FDA orphan drug designation provides 7 years of marketing exclusivity and certain incentives, including federal grants, tax credits, and waived FDA fees. Successive drug approvals for ES-3000 in the treatment of CML and AML give Escend the possibility of up to 14 years of drug exclusivity.

**Cholesterol**

**FH and other findings from Geisinger-Regeneron genomics studies**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- DANVILLE, Pa. - A study conducted by Geisinger Health System in
collaboration with the Regeneron Genetics Center (RGC) has found that a life-threatening genetic disorder known as Familial Hypercholesterolemia (FH) is both underdiagnosed and undertreated. It was published in the peer-reviewed journal Science on Dec. 23 alongside another significant study from the same Geisinger-RGC collaboration known as DiscovEHR. That other study describes exome sequencing and analyses of the first 50,726 adult participants in the DiscovEHR cohort - all members of the Geisinger MyCode Community Health Initiative.

In the FH study, the collaborators examined genetic variants causing FH in the DiscovEHR cohort and then compared the findings against the de-identified medical histories of these patients as contained in Geisinger electronic health records. Traditionally, in the United States, FH is diagnosed in patients with high cholesterol who also have a family history of early heart attacks and strokes. Genetic testing for FH is currently uncommon in clinical practice.

FH is caused by a defect that makes the body unable to remove "bad" cholesterol from the blood. This cholesterol (low density lipoprotein cholesterol or LDL-C) then accumulates, often undetected, and can lead to early death from heart attacks or stroke - even in very young people.

Results of the new study found many undiagnosed cases of FH and helped to define the extent of FH in the general population.

"The study shows us that FH is about twice as common as it was once thought to be, and that large-scale genetic testing for FH helps identify cases that would otherwise be missed," said Michael F. Murray, M.D., Geisinger director of clinical genomics. "We now hope to use DNA sequencing to guide better management for patients."

Among the many findings of the study were that 1 in every 256 people has a disease-causing mutation, or variant, in one of the three FH genes. It showed that participants with a deleterious FH gene variant had significantly higher "bad" cholesterol than those without an FH gene variant. They also had significantly increased odds of both general and premature coronary artery disease.

"Being able to connect patient's de-identified medical records with their DNA data is an advantage that few others in this field have. Paired with the RGC's unique technological and analytical resources, we are able to make meaningful discoveries that may advance the implementation of precision medicine today and the development of new or improved medicines tomorrow," said Noura Abul-Husn, M.D., Ph.D., associate director of translational genetics at the RGC and co-author of the paper.

The study identified 35 mutations, or variants, in the genes LDLR, APOB, and PCSK9 that have been determined to cause FH. Only 24 percent of people who carry FH-causing variants had sufficient criteria within their electronic health records to support a probable or definite FH diagnosis, meaning that without genetic confirmation, many of these patients would go undiagnosed and likely undertreated. Indeed, 42 percent of people with these FH-causing variants did not have a recent active prescription for statins, the first line therapy for cholesterol lowering. Among statin-treated people with FH-causing variants, less than half met goals for cholesterol lowering.

"Geisinger is committed to translating this important research directly into improved care for our patients," said Geisinger Executive Vice President and Chief Scientific Officer David H. Ledbetter, Ph.D. "We have begun a major effort to confirm individual patient findings and inform individual participants and their doctors when genetic findings, that are known to cause illness, are discovered in our population," he said.

FH is one of 27 genetic conditions being targeted at Geisinger. So far, nearly 200 patients - including 29 FH carriers - have already been informed they carry one or more disease-causing genetic mutations with consequences that can be treated. These conditions are mainly
related to risk for cancer or cardiovascular illness. The effort to return individual results will continue as more findings are confirmed. For details see go.geisinger.org/results.

Oncology - Lung Cancer

Faculty of Medicine Reports Findings in Lung Cancer (Case report: Durable response to afatinib in a patient with lung cancer harboring two uncommon mutations of EGFR and a KRAS mutation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news reporting out of Osaka, Japan, by NewsRx editors, research stated, "Comprehensive genomic profiling for non-small cell lung cancer (NSCLC) is likely to identify more patients with rare genetic alterations including uncommon epidermal growth factor receptor gene (EGFR) mutations. It remains unclear how such patients should be treated, however."

Our news journalists obtained a quote from the research from the Faculty of Medicine, "We here report a case of NSCLC positive for two uncommon mutations of EGFR and a KRAS mutation, including its treatment with the second-generation EGFR tyrosine kinase inhibitor (TKI) afatinib. Tumor specimen obtained by a NSCLC patient with no smoking history was analyzed by next-generation sequencing. Comprehensive genomic profiling revealed that the patient harbored the EGFR mutations G719C and S768I as well as the E49K mutation of KRAS. Treatment with afatinib was clinically effective as confirmed by PET-CT scans of bone metastases and by a marked decrease in the serum concentration of carcinoembryonic antigen. Afatinib was the most effective among seven EGFR-TKIs tested in inhibiting the growth of Ba/F3 cells expressing EGFR(S768I), showing an efficacy similar to that apparent with cells expressing the common EGFR mutant L858R, whereas first- and third-generation EGFR-TKIs were markedly less effective against EGFR(S768I) than against EGFR(L858R). These data suggest that EGFR-TKIs differ in their activity toward cells expressing EGFR(S768I) in vitro. Consistently, afatinib was clinically effective for the treatment of NSCLC harboring G719C and S768I mutations of EGFR."

According to the news editors, the research concluded: "Further studies are warranted to determine the most appropriate EGFR-TKI for treatment of NSCLC harboring uncommon EGFR mutations."

Our news journalists report that additional information may be obtained by contacting H. Hayashi, Kindai Univ, Fac Med, Dept. of Med Oncol, Osaka, Osaka 5898511, Japan. Additional authors for this research include E. Banno, Y. Togashi, H. Hayashi, K. Sakai, M. Takeda, H. Kaneda, K. Nishio and K. Nakagawa.
Fat fuels the road to cancer cell spread

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Cancer cells spread to other sites in the body through promoting the growth of new 'roads' to travel on. In a study to be published on December 26th in the top scientific journal, Nature, an international and multidisciplinary team of researchers, led by Prof. Dr. Peter Carmeliet (VIB-KU Leuven), discovered how a shift to increased fat utilization is required for the development and growth of these 'roads', termed lymphatic vessels - a special kind of blood vessels. This discovery paves the way towards developing therapeutics to limit lymphatic vessel growth in cancer by targeting fat utilization.

The spread of cancer, termed metastasis, is one of the most important and life-threatening complications of cancer today. Current chemotherapy and radiotherapy can effectively treat many cancers, however, the spread of cancer cells to multiple sites within the body results in the majority of deaths associated with cancer. In order for cancer cells to spread, they must find a pre-existing 'road', or build a new 'road' to travel on. Lymphatic vessels, a specialized kind of vessels transporting fluid rather than blood, are a primary route of cancer cell spread, and the formation of new lymphatic vessels, termed lymphangiogenesis, is a poorly understood process, which currently lacks clinically approved drugs to prevent their growth during disease.

Fat fuels lymphatics

Expanding upon recent work in the laboratory published in top journals such as Cell and Nature, a team consisting of Drs. Brian Wong, Xingwu Wang and Annalisa Zecchin, guided by Prof. Carmeliet sought to investigate the nutrient utilization (metabolism) of lymphatic vessels. The study began with a simple observation: lymphatics use more fat (fatty acids) compared to blood vessels. This is the first description of the nutrient utilization of lymphatic vessels. Using drugs to prevent fat utilization by lymphatics prevented lymphatic growth, an important step in translating this finding to the cancer setting and inhibition of metastasis.

What cells eat determines what they become

To understand why these cells are so reliant on fat, the researchers investigated how lymphatics develop. Lymphatics 'transform' from blood vessels during embryonic development, and this study shows that the signals that transform blood vessels to lymphatics also change their 'taste' to prefer eating fat. The novelty of this discovery is that this 'transformation' relies on an increase of fat utilization. In this process, the fat is used to generate molecules which can modify important factors that regulate the expression of the genetic code, termed epigenetic changes, which can ensure the function of lymphatics. The hard-wiring of the genetic code...
(DNA) itself is not altered by fat, but the utilization of this code that defines the lymphatic gene signature is modulated. A key translational aspect to this finding was the proof that resupplying another (fat) nutrient source could restore the growth and function of lymphatics.

Dr. Brian Wong (VIB-KU Leuven): "Our study shows that the usage of fat by lymphatics is programmed in their development, and required for their growth and function. We have demonstrated by enhancing or preventing the usage of fat (or fat byproducts), we can control the growth of lymphatics."

The next steps to preventing cancer cell spread and treating cancer patients

The immediate next steps of this research are clear and two-fold. On one hand, inhibitors of fat usage will be tested on a large scale for their ability to reduce metastasis in different types of cancer. On the other hand, we will test whether dietary fat supplements (for instance in the form of ketone bodies, used by athletes) can heal faulty lymphatics, a major complication in cancer patients undergoing surgical cancer removal, which leads to the debilitating swelling and dysfunction of the arms and legs, termed lymphedema, for which no drug is available.

Prof. Peter Carmeliet (VIB-KU Leuven): "Our immediate next studies are focusing on further translating these findings to the cancer setting. Previously, we could not develop drugs to target the growth of lymphatic vessels because we did not understand how they develop and function. Our work demonstrates the importance of their reliance on fat, and provides essential steps towards developing effective drugs to prevent excessive lymphatic growth in cancer, but also to treat incapacitating complications of lymphedema."

Neoplasms

Federal University Reports Findings in Neoplasms (The prevalence of CALR mutations in a cohort of patients with myeloproliferative neoplasms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neoplasms. According to news reporting originating in Rio de Janeiro, Brazil, by NewsRx journalists, research stated, "To investigate the prevalence of calreticulin (CALR) mutations in JAK2-and MPL-non-mutated patients with suspected myeloproliferative neoplasm (MPN) from a large MPN clinic and confirm a diagnosis of MPN. JAK2/MPL-non-mutated patients from the Belfast City Hospital (BCH) with either of the MPNs -ET or MF -and diagnosed between 1988 and 2014 were selected for CALR screen."

Financial support for this research came from Conselho Nacional de Desenvolvimento Cientifico e Tecnologico.

The news reporters obtained a quote from the research from Federal University, "All cases were validated according to the WHO 2008 classification for MPNs. Statistical analysis was performed with Minitab 16 Statistical Software package. Exon 9 of CALR was amplified by PCR using genomic DNA, and mutations were detected by fragment analysis. Of the 62
JAK2/MPL-non-mutated MPN patients screened, 57 had ET and 5 had MF; 34 patients (53.1%) carried CALR mutations. Three of 5 MF patients were CALR positive. Thirty-one ET patients (54.3%) harboured CALR mutation, whereas 26 (45.7%) were classified as 'triple negatives'. Detection of CALR mutations in a cohort of JAK2/MPL-non-mutated patients with suspected MPN confirmed the diagnosis of MPN in around 53% of cases. This is lower than initially reported, but similar to subsequent studies."

According to the news reporters, the research concluded: "However, a sizable cohort of patients remains lacking a specific molecular marker."

Our news correspondents report that additional information may be obtained by contacting E. Grinsztejn, Medicine, Universidade Federal do Rio de Janeiro, Rio de Janeiro, Brazil. Additional authors for this research include M.J. Percy, D. McClenaghan, M. Quintana, R.J. Cuthbert and M.F McMullin.

**Findings from A. Albitar and Co-Authors in the Area of Laboratory Hematology Reported (Positive selection and high sensitivity test for MYD88 mutations using locked nucleic acid)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Hematology - Laboratory Hematology is the subject of a report. According to news reporting from Irvine, California, by NewsRx journalists, research stated, "Detection of mutations in the myeloid differentiation primary response gene 88 (MYD88) has clinical implications on diagnosis and therapy, especially in patients with Waldenström's macroglobulinemia (WM) and IgM monoclonal gammopathy of unknown significance (IgM-MGUS). We describe a method that provides greatly increased sensitivity for detecting minority mutations in MYD88."

The news correspondents obtained a quote from the research, "We used a locked nucleic acid oligonucleotide to block amplification of wild-type DNA during polymerase chain reaction (PCR). Sanger sequencing of amplified DNA was used for detecting mutations in MYD88 gene. This approach was used to test samples from patients with WM and IgM-MGUS. When compared to traditional PCR followed by Sanger sequencing, our methodology was
significantly more sensitive (one mutant allele in a background of 200 wild-type alleles). Using sequencing allowed us to visualize the PCR product, giving advantages over other methodologies such as allele-specific PCR. Based on analyzing 36 randomly selected, MYD88 mutated, clinically tested samples, we demonstrate that traditional PCR failed to detect MYD88 mutations in 64% of the samples that were clearly positive by wild-type blocking PCR.”

According to the news reporters, the research concluded: ”The new methodology is essential for attaining accurate results in clinical testing.”

Our news journalists report that additional information may be obtained by contacting A. Albitar, NeoGenomics Laboratories, Irvine, CA, United States. Additional authors for this research include W. Ma, I. DeDios, J. Estella, S. Agersborg and M. Albitar.

Oncology - Breast Cancer

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news originating from Tres Cantos, Spain, by NewsRx correspondents, research stated, "We study the correlation between cytoskeleton organization and stiffness of three epithelial breast cancer cells lines with different degrees of malignancy: MCF-10A (healthy), MCF-7 (tumorigenic/noninvasive), and MDA-MB-231 (tumorigenic/invasive). Peak-force modulation atomic force microscopy is used for high-resolution topography and stiffness imaging of actin filaments within living cells."

Our news journalists obtained a quote from the research, "In healthy cells, local stiffness is maximum where filamentous actin is organized as well-aligned stress fibers, resulting in apparent Young's modulus values up to 1 order of magnitude larger than those in regions where these structures are not observed, but these organized actin fibers are barely observed in tumorigenic cells. We further investigate cytoskeleton conformation in the three cell lines by immunofluorescence confocal microscopy. The combination of both techniques determines that actin stress fibers are present at apical regions of healthy cells, while in
tumorigenic cells they appear only at basal regions, where they cannot contribute to stiffness as probed by atomic force microscopy. These results substantiate that actin stress fibers provide a dominant contribution to stiffness in healthy cells, while the elasticity of tumorigenic cells appears not predominantly determined by these structures. We also discuss the effects of the high-frequency indentations inherent to peak-force atomic force microscopy for the identification of mechanical cancer biomarkers."

According to the news editors, the research concluded: "Whereas conventional low loading rate indentations (1 Hz) result in slightly differentiated average stiffness for each cell line, in high-frequency measurements (250 Hz) healthy cells are clearly discernible from both tumorigenic cells with an enhanced stiffness ratio; however, the two cancerous cell lines produced indistinguishable results."

The news correspondents report that additional information may be obtained from A. Calzado-Martin, Instituto de Microelectronica de Madrid (IMM, CSIC) Isaac Newton 8, 28760, Tres Cantos, Madrid, Spain. Additional authors for this research include M. Encinar, J. Tamayo, M. Calleja and A. San Paulo.

epithelia and squamous cell carcinomas, a similar control mechanism is present. By contrast, columnar epithelia differentiate an apical domain that recruits CRB3, Merlin (also known as NF2), KIBRA (also known as WWC1) and SAV1 to induce Hippo signalling and retain YAP/TAZ in the cytoplasm despite contact with the basal layer extracellular matrix.

According to the news reporters, the research concluded: "When columnar epithelial tumours lose their apical domain and become invasive, YAP/TAZ becomes nuclear and tumour growth becomes sensitive to the Src inhibitor Dasatinib."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1242/dev.133728. This DOI is a link to an online electronic document that is either free or for purchase.

Bone Research

Findings from A. Gobbi and Co-Authors Provide New Insights into Bone Research (One-Stage Cartilage Repair Using a Hyaluronic Acid-Based Scaffold With Activated Bone Marrow-Derived Mesenchymal Stem Cells Compared With Microfracture Five-Year ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Bone Research have been published. According to news originating from Milan, Italy, by NewsRx correspondents, research stated, "Articular cartilage injury is frequently encountered, yet treatment options capable of providing durable cartilage repair are limited. To investigate the medium-term clinical outcomes of cartilage repair using a 1-stage technique of a hyaluronic acid-based scaffold with activated bone marrow aspirate concentrate (HA-BMAC) and compare results with those of microfracture."

Our news journalists obtained a quote from the research, "A secondary aim of this study was to identify specific patient demographic factors and cartilage lesion characteristics that are associated with superior outcomes. Cohort study; Level of evidence, 2. Fifty physically active patients (mean age, 45 years) with grade IV cartilage injury of the knee (lesion size, 1.5-24 cm(2)) were treated with HA-BMAC or microfracture and were observed prospectively for 5 years. Patients were placed into the HABMAC group if the health insurance policy of the treating institution supported this option; otherwise, they were placed into the microfracture
group. Objective and subjective clinical assessment tools were used preoperatively and at 2 and 5 years post-operatively to compare treatment outcomes. Significant improvements in outcome scores were achieved in both treatment groups at 2 years (P < .001). In the microfracture group, 64% were classified as normal or nearly normal according to the International Knee Documentation Committee (IKDC) objective score at 2 years, compared with 100% of those treated with HA-BMAC (P < .001). Normal or nearly normal objective assessments in the microfracture group declined significantly after 5 years to 28% of patients (P = .004). All patients treated with HA-BMAC maintained improvement at 5 years according to Lysholm, Tegner, IKDC objective, and IKDC subjective scores. Tegner, IKDC objective, and Knee injury and Osteoarthritis Outcome Score (KOOS) assessments demonstrated higher scores in the HA-BMAC treatment group compared with microfracture at 5 years. Lysholm and IKDC subjective scores were similar between treatment groups at 5 years. Poorer outcomes in the microfracture group were demonstrated in cases of lesions larger than 4 cm(2) and nonsolitary lesions. Age greater than 45 years, large size of lesion, and treatment of multiple lesions were not associated with poorer outcome in patients treated with HA-BMAC. Repair of chondral injury using a hyaluronic acid-based scaffold with activated bone marrow aspirate concentrate provides better clinical outcomes and more durable cartilage repair at medium-term follow-up compared with microfracture. Positive short-term clinical outcomes can be achieved with either microfracture or HA-BMAC.

According to the news editors, the research concluded: "Cartilage repair using HA-BMAC leads to successful medium-term outcomes independent of age or lesion size."

The news correspondents report that additional information may be obtained from A. Gobbi, Orthopaed Arthroscop Surg Int OASI Biore Fdn Gob, Milan, Italy.

Mycobacterium Infections - Tuberculosis

Findings from A. Nusrath Unissa and Co-Authors Provides New Data about Tuberculosis (A Note on Derivatives of Isoniazid, Rifampicin, and Pyrazinamide Showing Activity Against Resistant Mycobacterium tuberculosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mycobacterium Infections - Tuberculosis is now available. According to news reporting out of Tamil Nadu, India, by NewsRx editors, research stated, "Drug-resistant tuberculosis (DR-TB) is a serious problem that impedes the success of the TB control program. Of note, multidrug-resistant (MDR)-TB and extensively drug-resistant (XDR)-TB have certainly complicated the scenario."
Financial support for this research came from Indian Council of Medical Research.

Our news journalists obtained a quote from the research, "One of the possible strategies to overcome drug resistance in an economic and simple manner would involve modification of existing anti-TB drugs to obtain derivatives that can work on resistant TB bacilli. These may have improved half-life and increased bioavailability, be more efficacious, and serve as cost-effective alternatives, as compared to new drugs identified through conventional methods of drug discovery and development. Although extensive literature is available on the activity of various derivatives of first-line drugs (isoniazid, rifampicin and pyrazinamide) on drug-susceptible Mycobacterium tuberculosis (MTB), reports on the activity of derivatives on resistant MTB are very limited, to our knowledge."

According to the news editors, the research concluded: "In light of this, the present review aims to provide a concise report on the derivatives of first-line drugs that have the potential to overcome the resistance to the parental drug and could thus serve as effective alternatives."

Our news journalists report that additional information may be obtained by contacting A. Nusrath Unissa, Centre for Biomedical Informatics, National Institute for Research in Tuberculosis, Chennai, Tamil Nadu, 600 031, India. Additional authors for this research include L.E. Hanna and S. Swaminathan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/cbdd.12684. This DOI is a link to an online electronic document that is either free or for purchase.

Skin Diseases and Conditions - Mastocytosis

Findings from A. Payerols et al Has Provided New Information about Mastocytosis (Exophthalmos, Diplopia, and Bilateral Eyelid Edema: Symptoms of Ocular Mastocytosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Skin Diseases and Conditions - Mastocytosis have been presented. According to news reporting from Montpellier, France, by NewsRx journalists, research stated, "Mastocytosis is characterized by clonal mast cell proliferation with
accumulation within various organs and uncontrolled activation with excessive mast cell mediator release. Ocular manifestations have rarely been published."

The news correspondents obtained a quote from the research, "We describe a 63-year-old man with bilateral exophthalmos that led to the diagnosis of systemic mastocytosis. A patient presented with bilateral eyelid edema with exophthalmos associated with binocular diplopia. Ophthalmologic examination showed bilateral axial, symmetrical, and painless exophthalmos with eyelid edema, and limitation in elevation of the right eye. Visual acuity was normal. Orbital magnetic resonance imaging showed increased volume of both the superior and medial recti muscles and right inferior oblique muscle, and histopathological examination of orbital fat and muscle biopsies revealed an infiltration by mast cells. Serum tryptase was elevated. The patient also complained of a long history of pruritis and diffuse skin erythema that could be elicited with just mild pressure (Darier's sign). A bone marrow biopsy confirmed the infiltration of abnormal mast cells with a D816V mutation in the KIT gene. Treatment with cladribine was initiated and resulted in resolution in both ocular and systemic signs and symptoms that persisted without relapse 18 months after discontinuation. Ocular mastocytosis is a rare condition, which was previously reported to involve the conjunctiva, cornea, uvea, eyelid, orbit, and choroid. Cases of ocular mastocytosis can be classified into two main groups: mast cells tumors (mastocytomas) and ocular manifestations associated with systemic mastocytosis. Histological examination of ocular samples is rarely performed, and there are no standard criteria for the diagnosis of ocular mastocytosis. Our case emphasizes cladribine could represent an alternative treatment."

According to the news reporters, the research concluded: "Our case is the first published case of exophthalmos and eyelid edema associated with systemic mastocytosis confirmed by pathologic examination of periocular biopsies that was treated effectively with cladribine."

For more information on this research see: Exophthalmos, Diplopia, and Bilateral Eyelid Edema: Symptoms of Ocular Mastocytosis. Optometry and Vision Science, 2016;93 (11):1440-1443. Proteomics
Findings from AGH University of Science and Technology in Proteomics Reported (MYTHBUSTERS: a universal procedure for sample preparation for mass spectrometry)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Proteomics have been presented. According to news reporting originating from Krakow, Poland, by NewsRx correspondents, research stated, "Improvements in proteomic strategies from the development of new and robust separation and identification techniques have led to broad applications of proteomics to solve numerous biological questions. For all analyses, sample quality is unquestionably a critical factor; therefore protein extraction is of utmost importance."

Our news editors obtained a quote from the research from the AGH University of Science and Technology, "The ideal extraction method should provide reproducible spectra of the most comprehensive repertoire of proteins, while minimizing sample loss and degradation. It is already known that to capture the whole proteome is an unenforceable task. Many protein extraction protocols have been described, yet there is no 'one perfect procedure' taking into account the vast diversity of biological and physical properties of proteins, including their charge, size, hydrophobicity, interactions and sub-cellular localization. The research presented here reflects the main obstacle occurring in proteomic experimental design; i.e. the lack of reproducibility as a result of alterations in protein extraction methods. We have performed a series of experiments, aimed towards identification of the aptamer-binding partners in cancerous cells. Aptamers are chemically synthesized, short, single-stranded nucleic acids with a strictly defined three-dimensional structure, which allows them to interact with a target molecule with high affinity. The low immunogenicity and cellular-targeting properties of aptamers might facilitate design of suitable drugs with low side-effects. Aptamers can be used for identification of molecules associated with a pathogenic state of a cell. Aptamers can be considered as a powerful-tool, since they possess unique properties to benefit cancer diagnosis, prevention and treatment. We have used different types of protein extraction methods prior to analyses of complex biological samples by mass spectrometry, based on slight changes of homogenization-buffers, and have observed the changes in the identified compounds."

According to the news editors, the research concluded: "These results should prove to be very useful for future proteomic studies and the design of studies in terms of sample preparation, especially sample homogenization and protein extraction."

The news editors report that additional information may be obtained by contacting A. Drabik, AGH Univ Sci & Technol, Dept. of Biochem & Neurobiol, PL-30059 Krakow, Poland. Additional authors for this research include J. Ner-Kluza, A. Bodzon-Kulakowska and P. Suder.

Oncology - B-Cell Lymphoma

Findings from Aalborg University Hospital Provides New Data on B-Cell Lymphoma (Uterine, but not ovarian, female reproductive organ involvement at presentation by diffuse large B-cell lymphoma is associated with poor outcomes and a high ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - B-Cell Lymphoma is the subject of a report. According to news reporting originating in Aalborg, Denmark, by NewsRx journalists, research stated, "Involvement of the internal female reproductive organs by diffuse large B-cell lymphoma (DLBCL) is uncommon, and there are sparse data describing the outcomes of such cases. In total, 678 female patients with DLBCL staged with positron emission tomography/computed tomography and treated with rituximab-containing chemotherapy were identified from databases in Denmark, Great Britain, Australia, and Canada."

Funders for this research include A.P. Moller og Hustru Chastine Mc-Kinney Mollers Fond til almene Formaal, North Denmark Region.

The news reporters obtained a quote from the research from Aalborg University Hospital, "Overall, 27/678 (4%) had internal reproductive organ involvement: uterus (n=14), ovaries (n=10) or both (n=3). In multivariate analysis, women with uterine DLBCL experienced inferior progression-free survival and overall survival compared to those without reproductive organ involvement, whereas ovarian DLBCL was not predictive of outcome. Secondary central nervous system (CNS) involvement (SCNS) occurred in 7/17 (41%) women with uterine DLBCL (two patients with concomitant ovarian DLBCL) and 0/10 women with ovarian DLBCL without concomitant uterine involvement. In multivariate analysis adjusted for other risk factors for SCNS, uterine involvement by DLBCL remained strongly associated with SCNS (Hazard ratio 14 <bold > </bold >13, 95% confidence interval 5<bold > </bold >09-39<bold > </bold >25, P<0 <bold > </bold >0.001). Because involvement of the uterus by DLBCL appears to be associated with a high risk of SCNS, those patients should be considered for CNS staging and prophylaxis."

According to the news reporters, the research concluded: "However, more studies are needed to determine whether the increased risk of secondary CNS involvement also applies to women with localized reproductive organ DBLCL."

The direct object identifier (DOI) for that additional information is:
Findings from Academic Medical Center Provide New Insights into Immunoglobulins [Safety and efficacy of LY3015014, a monoclonal antibody to proprotein convertase subtilisin/kexin type 9 (PCSK9): a randomized, placebo-controlled Phase 2 study]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Immunology - Immunoglobulins is now available. According to news reporting from Amsterdam, Netherlands, by NewsRx journalists, research stated, "The objective of this study was to evaluate the efficacy, safety, and tolerability of LY3015014 (LY), a neutralizing antibody of proprotein convertase subtilisin/kexin type 9 (PCSK9), administered every 4 or 8 weeks in patients with primary hypercholesterolaemia, when added to a background of standard-of-care lipid-lowering therapy, including statins. Double-blind, placebo-controlled trial randomized 527 patients with primary hypercholesterolaemia from June 2013 to January 2014 at 61 community and academic centres in North America, Europe, and Japan."

Financial support for this research came from Eli Lilly and Company. The news correspondents obtained a quote from the research from Academic Medical Center, "Patients were randomized to subcutaneous injections of LY 20, 120, or 300 mg every 4 weeks (Q4W); 100 or 300 mg every 8 weeks (Q8W) alternating with placebo Q4W; or placebo Q4W. The primary endpoint was percentage change from baseline in low-density lipoprotein cholesterol (LDL-C) by beta quantification at Week 16. The mean baseline LDL-C by beta quantification was 136.3 (SD, 45.0)mg/dL. LY3015014 dose-dependently decreased LDL-C, with a maximal reduction of 50.5% with 300 mg LY Q4W and 37.1% with 300 mg LY Q8W compared with a 7.6% increase with placebo maintained at the end of the dosing interval. There were no treatment-related serious adverse events (AEs). The most common AE terms (> 10% of any treatment group) reported more frequently with LY compared with placebo were injection site (IS) pain and IS erythema. No liver or muscle safety issues emerged. LY3015014 dosed every 4 or 8 weeks, resulted in robust and durable reductions in LDL-C. No clinically relevant safety issues emerged with the administration of LY."

According to the news reporters, the research concluded: "The long-term effects on cardiovascular outcomes require further investigation."

Our news journalists report that additional information may be obtained by
contacting J.J. Kastelein, Dept. of Vascular Medicine, Academic Medical Center of the University of Amsterdam, Meibergdreef 9, Room F4-1592, 1105 AZ Amsterdam, Netherlands. Additional authors for this research include S.E. Nissen, D.J. Rader, G.K. Hovingh, M.D. Wang, T. Shen and K.A Krueger.

Oncology - Cancer Risk

Findings from Academic Medical Center in the Area of Cancer Risk Reported (Phenotype, Cancer Risk, and Surveillance in Beckwith-Wiedemann Syndrome Depending on Molecular Genetic Subgroups)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Cancer Risk have been presented. According to news reporting originating in Amsterdam, Netherlands, by NewsRx journalists, research stated, "Patients with Beckwith-Wiedemann syndrome (BWS) have an increased risk to develop cancer in childhood, especially Wilms tumor and hepatoblastoma. The risk varies depending on the cause of BWS."

The news reporters obtained a quote from the research from Academic Medical Center, "We obtained clinical and molecular data in our cohort of children with BWS, including tumor occurrences, and correlated phenotype and genotype. We obtained similar data from larger cohorts reported in the literature. Phenotype, genotype and tumor occurrence were available in 229 of our own patients. Minor differences in phenotype existed depending on genotype/epigenotype, similar to earlier studies. By adding patients from the literature, we obtained data on genotype and tumor occurrence of in total 1,971 BWS patients. Tumor risks were highest in the IC1 (H19/IGF2:IG-DMR) hypermethylation subgroup (28%) and pUPD subgroup (16%) and were lower in the KCNQ1OT1:TSS-DMR (IC2) subgroup (2.6%), CDKN1C (6.9%) subgroup, and the group in whom no molecular defect was detectable (6.7%). Wilms tumors (median age 24 months) were frequent in the IC1 (24%) and pUPD (7.9%) subgroups. Hepatoblastoma occurred mostly in the pUPD (3.5%) and IC2 (0.7%) subgroups, never in the IC1 and CDKN1C subgroups, and always before 30 months of age. In the CDKN1C subgroup 2.8% of patients developed neuroblastoma. We conclude tumor risks in BWS differ markedly depending on molecular background."

According to the news reporters, the research concluded: "We propose a differentiated surveillance protocol, based on tumor risks in the various molecular subgroups causing BWS."

For more information on this research see: Phenotype, Cancer Risk, and Surveillance in Beckwith-Wiedemann Syndrome Depending on Molecular Genetic Subgroups. American Journal of Medical Genetics Part A, 2016;170(9):2248-2260. American Journal of

**Drugs and Therapies - Coumarins and Indandiones**

**Findings from Academic Medical Center in the Area of Coumarins and Indandiones Reported (Quantitative Method for Simultaneous Analysis of a 5-Probe Cocktail for Cytochrome P450 Enzymes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Coumarins and Indandiones is the subject of a report. According to news originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "The metabolic activity of P450 enzymes in vivo can be determined using selective probe drugs. The simultaneous administration of multiple CYP-specific probe drugs is commonly known as the 'cocktail approach.' Disadvantages of a cocktail are large volumes of samples required for analysis and time-consuming analyses."

Our news journalists obtained a quote from the research from Academic Medical Center, "The aim of this study was to develop and validate a simplified but sensitive method for the simultaneous quantification of 5 probe drugs [caffeine (CYP1A2), metoprolol (CYP2D6), midazolam (CYP3A4), omeprazole (CYP2C19), and S-warfarin (CYP2C9)] in a previously validated cocktail using a liquid chromatography-tandem mass spectrometry (LC-MS/MS) method. The method entailed a single method for sample preparation that enables quick processing of the samples containing all 5 probe drugs in a small volume of blood (>= 10 μL) followed by a chiral and nonchiral LC-MS/MS method. The method was validated for selectivity, specificity, resolution of racemic warfarin, linearity, accuracy, imprecision, recovery, process efficiency, ionization efficiency, and carryover effect. The method showed good selectivity without matrix interferences and differentiated S-and R-warfarin enantiomers with adequate resolution (R-s = 1.55). For all analytes, the mean process efficiency was >95%, and the mean ionization efficiency was >97%. Furthermore, the accuracy was between 94.9% and 108% for all analytes, and the within-and between-run imprecision were <11.7% for the lower limit of quantification and <12.6% for the middle level and upper limit of quantification. The method presented here enables the simultaneous quantification of the 5 probes in a very small blood volume (>= 10 mL)."
According to the news editors, the research concluded: "Furthermore, it is less time consuming than previously reported methods because it requires only 1 simple method for sample preparation followed by a nonchiral and chiral LC-MS/MS method that can be performed sequentially."

For more information on this research see: Quantitative Method for Simultaneous Analysis of a 5-Probe Cocktail for Cytochrome P450 Enzymes. *Therapeutic Drug Monitoring*, 2016;38(6):761-768. *Therapeutic Drug Monitoring* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Findings from Aga Khan University Hospital Yields New Findings on Subdural Hematoma (Comparison of Irrigation versus No Irrigation during Burr Hole Evacuation of Chronic Subdural Hematoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Central Nervous System Diseases and Conditions - Subdural Hematoma are presented in a new report. According to news reporting originating from Karachi, Pakistan, by NewsRx correspondents, research stated, "To compare the results of the use of irrigation versus no irrigation during burr hole evacuation of chronic subdural hematoma (CSDH). The study was a retrospective chart review of those patients who underwent burr hole evacuation of CSDH during a period of 5 years."

Our news editors obtained a quote from the research from Aga Khan University Hospital, "Cases were divided into two groups based on the use of irrigation during surgery. A subdural drain was placed in all patients (i.e., in both the irrigation and no-irrigation groups) and removed 24 to 48 hours postoperatively. The total sample size was 56, of which 34 patients were in the irrigation group and 22 in the no-irrigation group. Recurrence rate was 17.6% in the irrigation group and 9.1% in the no-irrigation group (p = 0.46). Systemic complications were predominantly cardiac related in the no-irrigation group compared with respiratory complications in the irrigation group. The irrigation group had a mortality rate of 5.9% compared with 4.5% in the no-irrigation group (p = 0.66)."

According to the news editors, the research concluded: "No statistically significant difference was found between the two groups in terms of recurrence or mortality."

For more information on this research see: Comparison of Irrigation versus No Irrigation during Burr Hole Evacuation of Chronic Subdural Hematoma. *Journal of*
Antioxidants

Findings from Ahmedabad University Update Knowledge of Antioxidants (Can CuO nanoparticles lead to epigenetic regulation of antioxidant enzyme system?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Antioxidants is the subject of a report. According to news reporting originating in Gujarat, India, by NewsRx journalists, research stated, "Copper has been used from ancient time in various applications. Scientists have exploited its means of exposure and consequences to living organisms."

The news reporters obtained a quote from the research from Ahmedabad University, "The peculiar property of nanomaterials that is a high surface to volume ratio has increased the range of application in products. Copper oxide nanoparticles (CuO NPs) are widely used in industrial applications such as semiconductor devices, gas sensor, batteries, solar energy converter, microelectronics, heat transfer fluids and consumer products. In contrast, acute toxicity of CuO NPs has also been reported. Subsequently, human and environmental health may be at a high risk. Their frequent use can also contaminate ecosystems. Therefore, the toxicity of CuO NPs needs to be thoroughly understood. In this review, we have tried to discuss the recent facts and mechanism that have been explored for CuO NPs-induced toxicity at a cellular, in vivo and ecotoxicological level. Accordingly, the main cause for induction of toxicity by CuO NPs is the generation of reactive oxygen species (ROS) followed by the mitochondrial destruction that leads to apoptosis via the intrinsic pathway or under the condition such as hypoxia cell on exposure to CuO NPs may commit to necrosis. Moreover, CuO NPs also result in activation of MAPK pathways, ERKs and JNK/SAPK thus play an important role in the activation of AP-1. Furthermore, CuO NPs also leads to up-regulation of p53 and caspase three genes."

According to the news reporters, the research concluded: "Therefore, careful measures are required to explore omic technology to understand the molecular mechanism of the deleterious effects caused by CuO NPs."

For more information on this research see: Can CuO nanoparticles lead to epigenetic regulation of antioxidant enzyme system? Journal of Applied Toxicology, 2017;37(1):84-91.
Findings from Aichi Medical University Broaden Understanding of Lymphoma (Synergistic activity of Card11 mutant and Bcl6 in the development of diffuse large B-cell lymphoma in a mouse model)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Lymphoma. According to news reporting out of Aichi, Japan, by NewsRx editors, research stated, "Diffuse large B-cell lymphoma (DLBCL) is the most common subtype of malignant lymphoma; it derives from germinal center B cells. Although DLBCL harbors many genetic alterations, synergistic roles between such alterations in the development of lymphoma are largely undefined."

Financial support for this research came from Japan Society for the Promotion of Science.

Our news journalists obtained a quote from the research from Aichi Medical University, "We previously established a mouse model of lymphoma by transplanting gene-transduced germinal center B cells into mice. Here, we chose one of the frequently mutated genes in DLBCL, Card11 mutant, to explore its possible synergy with other genes, using our lymphoma model. Given that BCL6 and BCL2 expression and/or function are often deregulated in human lymphoma, we examined the possible synergy between Card11, Bcl6, and Bcl2. Germinal center B cells were induced in vitro, transduced with Card11 mutant, Bcl6, and Bcl2, and transplanted. Mice rapidly developed lymphomas, with exogenously transduced Bcl2 being dispensable. Although some mice developed lymphoma in the absence of transduced Bcl6, the absence was compensated by elevated expression of endogenous Bcl6. Additionally, the synergy between Card11 mutant and Bcl6 in the development of lymphoma was confirmed by the fact that the combination of Card11 mutant and Bcl6 caused lymphoma or death significantly earlier and with higher penetrance than Card11 mutant or Bcl6 alone. Lymphoma cells expressed interferon regulatory factor 4 and PR domain 1, indicating their differentiation toward plasmablasts, which characterize activated B cell-like DLBCL that represents a clinically aggressive subtype in humans."

According to the news editors, the research concluded: "Thus, our mouse model provides a versatile tool for studying the synergistic roles of altered genes underlying lymphoma development."

For more information on this research see: Synergistic activity of Card11 mutant and Bcl6 in the development of diffuse large B-cell lymphoma in a mouse model. Cancer Science,
Our news journalists report that additional information may be obtained by contacting S. Tsuzuki, Aichi Med Univ, Dept. of Biochem, Sch Med, Nagakute, Aichi 4801195, Japan. Additional authors for this research include K. Matsuo, M. Seto, S. Nakamura and S. Tsuzuki.

**Lung Diseases and Conditions - Pneumonia**

**Findings from Aichi Medical University in the Area of Pneumonia Reported (Case-control study of pneumonia patients with Streptococcus anginosus group bacteria in their sputum)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Pneumonia are discussed in a new report. According to news reporting originating from Aichi, Japan, by NewsRx correspondents, research stated, "In recent years, Streptococcus anginosus group (SAG) bacteria are becoming increasingly recognized as important pneumonia-causing pathogens. Although several small studies have been reported, the features of SAG pneumonia remain unclear, because the identification of SAG from sputum cultures is not routinely performed in most microbiology laboratories."

Our news editors obtained a quote from the research from Aichi Medical University, "The aim of this study was to elucidate the clinical characteristics of SAG pneumonia. This was a retrospective case-control study utilizing data obtained in our hospital between September 2009 and June 2016. We investigated 31 patients with SAG pneumonia (PWP), and also assessed the difference between the 31 PWP and 37 patients without pneumonia (PWOP) in whose sputum SAG was detected. Seventy-one percent of the patients were men and the median age was 78 years in the PWP. Univariate analysis indicated that the PWP were significantly more often a bed-ridden (p < 0.01) with comorbid aspiration than were the PWOP (p < 0.05). Among the PWP, nursing and healthcare-associated pneumonia (NHCAP) was the more common type of pneumonia (54.8%). S. anginosus was detected significantly more frequently in sputum cultures of PWP than PWOP (p < 0.01), and multiple pathogens were detected more frequently in PWP (p < 0.01). Streptococcus constellatus was the most frequently detected pathogen in patients with a single bacterial infection. Empyema was observed only in patients with multiple bacteria. SAG should be recognized as important causative pathogens of pneumonia, particularly among elderly patients with underlying disease associated with
aspiration."

According to the news editors, the research concluded: "NHCAP was the more common type of SAG pneumonia in this study."

For more information on this research see: Case-control study of pneumonia patients with Streptococcus anginosus group bacteria in their sputum. *Journal of Infection and Chemotherapy*, 2016;22(12):794-799. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Oncology - Acute Leukemia**

**Findings from Ain Shams University Provides New Data on Acute Leukemia (Stanniocalcin1 gene expression in patients with acute leukemia: impact on response to therapy and disease outcome)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Acute Leukemia. According to news reporting from Cairo, Egypt, by NewsRx journalists, research stated, "Stanniocalcin1 (STC1) is a hormone that regulates cell growth and survival; this study aimed to evaluate the STC1 gene expression in patients with acute leukemia and assess its prognostic significance. Seventy-six patients with acute leukemia were enrolled for determination of mRNA STC1 by real-time quantitative polymerase chain reaction at diagnosis and at day 28."

The news correspondents obtained a quote from the research from Ain Shams University, "Median STC1 gene expression was 16.2 and 4.43 in patients with acute myeloid leukemia and 9.67 and 2.37 in patients with acute lymphoblastic leukemia on days 0 and 28, respectively. A cutoff level for STC1 gene expression was established subdividing patients into high-and low-STC1 gene expression groups. Median STC1 gene expression at days 0 and 28 was significantly higher among patients who were nonresponders to therapy than among those who were therapy responders in both groups. Patients achieving complete remission had significantly lower baseline STC1 gene expression than those in relapse. High STC1 gene expression was associated with shorter overall and disease-free survival times."

According to the news reporters, the research concluded: "STC1 gene expression at
diagnosis might be a useful prognostic marker for clinical outcome and monitoring therapeutic response in patients with acute leukemia."

Our news journalists report that additional information may be obtained by contacting H.M. Abaza, Clinical Pathology Department, Ain Shams University, Cairo, Egypt. Additional authors for this research include M.I. Elmougy, H.M. El Maraghy and H.M Mahmoud.

**Oncology - Lung Cancer**

**Findings from Ajou University Reveals New Findings on Lung Cancer**

*(Baseline neutrophil-lymphocyte ratio is associated with baseline and subsequent presence of brain metastases in advanced non-smallcell lung cancer)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Lung Cancer have been presented. According to news originating from Suwon, South Korea, by NewsRx correspondents, research stated, "We examined the predictive value of neutrophil-lymphocyte ratio (NLR) by examining their association with the baseline presence and subsequent development of brain metastases in patients with stage IV non-small cell lung cancer (NSCLC). We examined the predictive value of NLR for brain metastasis in 260 stage IV NSCLC."

Our news journalists obtained a quote from the research from Ajou University, "Logistic regression models and competing risk analysis were used to determine the association of NLR with baseline and subsequent presence of brain metastases. Multivariate analysis reveals that patients with high NLR (> = 4.95) had significantly more brain metastases at diagnosis than those with low NLR (Odds Ratio = 2.59, P = 0.01). In patients who had no baseline brain metastasis, competing risks analysis revealed that patients with high NLR showed higher cumulative incidence of subsequent brain metastases, compared to those with low NLR (P = 0.017). A high NLR was associated with the baseline presence or the subsequent development of brain metastases, particularly in the group with adenocarcinoma (P = 0.013 and P = 0.044, respectively). Furthermore, an increase in NLR during treatment was associated with subsequent brain metastases (P = 0.004)."
According to the news editors, the research concluded: "The NLR is an independent predictive factor for the baseline presence of brain metastases and subsequent brain metastases in stage IV NSCLC."

For more information on this research see: Baseline neutrophil-lymphocyte ratio is associated with baseline and subsequent presence of brain metastases in advanced non-small cell lung cancer. DNA Research

Findings from Ajou University School of Medicine Broaden Understanding of DNA Research (Significance of the DNA-Histone Complex Level as a Predictor of Major Adverse Cardiovascular Events in Hemodialysis Patients: The Effect of Uremic Toxin on ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in DNA Research. According to news reporting originating from Suwon, South Korea, by NewsRx correspondents, research stated, "Neutrophils can release the DNA-histone complex into circulation following exposure to inflammatory stimuli. This prospective study investigated whether the DNA-histone complex and other biomarkers could predict major cardiovascular adverse events (MACEs) in hemodialysis (HD) patients."

Our news editors obtained a quote from the research from the Ajou University School of Medicine, "The levels of circulating DNA-histone complexes, cell-free DNA, interleukin (IL)-6, and neutrophil elastase were measured in 60 HD patients and 28 healthy controls. MACE was assessed at 24 months. Uremic toxin-induced neutrophil released contents were measured in vitro. Compared with controls, HD patients showed higher levels of DNA-histone complexes and IL-6. The DNA-histone complex level was inversely associated with the Kt/V. In a multivariable Cox analysis, the high level of DNA-histone complexes was a significant independent predictor of MACE. The uremic toxins induced DNA-histone complex formation in normal neutrophils in vitro. The DNA-histone complex is a potentially useful marker to predict MACE in HD patients."

According to the news editors, the research concluded: "Uremic toxins induced DNA-histone complex formation in vitro."

For more information on this research see: Significance of the DNA-Histone Complex Level as a Predictor of Major Adverse Cardiovascular Events in Hemodialysis Patients: The Effect of Uremic Toxin on DNA-Histone Complex Formation. Blood Purification,
Findings from Ajou University School of Medicine Has Provided New Information about Pharmacoepidemiology (A normalization method for combination of laboratory test results from different electronic healthcare databases in a distributed research ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Pharmacoepidemiology have been presented. According to news originating from Suwon, South Korea, by NewsRx correspondents, research stated, "Distributed research networks (DRNs) afford statistical power by integrating observational data from multiple partners for retrospective studies. However, laboratory test results across care sites are derived using different assays from varying patient populations, making it difficult to simply combine data for analysis."

Financial support for this research came from Ministry of Health & Welfare, Republic of Korea.

Our news journalists obtained a quote from the research from the Ajou University School of Medicine, "Additionally, existing normalization methods are not suitable for retrospective studies. We normalized laboratory results from different data sources by adjusting for heterogeneous clinico-epidemiologic characteristics of the data and called this the subgroup-adjusted normalization (SAN) method. Subgroup-adjusted normalization renders the means and standard deviations of distributions identical under population structure-adjusted conditions. To evaluate its performance, we compared SAN with existing methods for simulated and real datasets consisting of blood urea nitrogen, serum creatinine, hematocrit, hemoglobin, serum potassium, and total bilirubin. Various clinico-epidemiologic characteristics can be applied together in SAN. For simplicity of comparison, age and gender were used to adjust population heterogeneity in this study. In simulations, SAN had the lowest standardized difference in means (SDM) and Kolmogorov-Smirnov values for all tests (p <0.05). In a real dataset, SAN had the lowest SDM and Kolmogorov-Smirnov values for blood urea nitrogen, hematocrit, hemoglobin, and serum potassium, and the lowest SDM for serum creatinine (p <0.05). Subgroup-adjusted normalization performed better than normalization using other methods."

According to the news editors, the research concluded: "The SAN method is
applicable in a DRN environment and should facilitate analysis of data integrated across DRN partners for retrospective observational studies."

The news correspondents report that additional information may be obtained from D. Yoon, Dept. of Biomedical Informatics, Ajou University School of Medicine, Ajou University, Suwon, South Korea. Additional authors for this research include M.J. Schuemie, J.H. Kim, D.K. Kim, M.Y. Park, E.K. Ahn, E.Y. Jung, D.K. Park, S.Y. Cho, D. Shin, Y. Hwang and R.W Park.

Drugs and Therapies - Pharmaceutical Research

Findings from Ajou University Update Understanding of Pharmaceutical Research (Dual release and molecular mechanism of bilayered aceclofenac tablet using polymer mixture)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmaceutical Research. According to news reporting out of Suwon, South Korea, by NewsRx editors, research stated, "The objectives of the present study were to develop a controlled-release bilayered tablet of aceclofenac (AFN) 200 mg with dual release and to gain a mechanistic understanding of the enhanced sustained release capability achieved by utilizing a binary mixture of the sustained release materials. Different formulations of the sustained-release layer were formulated by employing hydroxypropyl methylcellulose (HPMC) and hydroxypropyl cellulose (HPC) as the major retarding polymers."

Funders for this research include Ministry of Science, ICT, Future Planning, 2013.

Our news journalists obtained a quote from the research from Ajou University, "The in vitro dissolution studies of AFN bilayered tablets were carried out in intestinal fluid (pH 6.8 buffer). The mechanism of the synergistic rate-retarding effect of the polymer mixture containing HPC and carbomer was elucidated by the rate of swelling and erosion in intestinal fluid and the molecular interactions in the polymer network. The optimized bilayered tablets had similar in vitro dissolution profiles to the marketed tablet Clanza ® CR based on the similarity factor (f2) in combination with their satisfactory micromeritic, physicochemical properties, and stability profiles. Drug release from HPMC-based matrix was controlled by non-Fickian transport, while drug release from HPC-based matrix was solely governed by drug diffusion. The swelling and erosion data exhibited a dramatic increase of water uptake and a reduction of weight loss in the polymer mixture-loaded tablet. Fourier transform infrared (FTIR) spectra
revealed strong hydrogen bonding between HPC and carbomer in the polymer mixture. Regarding spatial distribution of polymers in the polymer mixture-loaded tablet, carbomer was found to be the main component of the gel layer during the first 2 h of the hydration process, which was responsible for retarding drug release at initial stage."

According to the news editors, the research concluded: "This process was then followed by a gradual transition of HPC from the glassy core to the gel layer for further increasing gel strength."

Our news journalists report that additional information may be obtained by contacting B.J. Lee, Ajou University, Inst Pharmaceut Sci & Technol, Suwon 16499, South Korea. Additional authors for this research include V.H. Nguyen and B.J. Lee.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijpharm.2016.10.021. This DOI is a link to an online electronic document that is either free or for purchase.

**Hormones**

**Findings from Akershus University Hospital in the Area of Hormones Reported (A systematic comparison of copy number alterations in four types of female cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Hormones. According to news reporting originating in Lorenskog, Norway, by NewsRx journalists, research stated, "Detection and localization of genomic alterations and breakpoints are crucial in cancer research. The purpose of this study was to investigate, in a methodological and biological perspective, different female, hormone-dependent cancers to identify common and diverse DNA aberrations, genes, and pathways."

The news reporters obtained a quote from the research from Akershus University Hospital, "In this work, we analyzed tissue samples from patients with breast (n = 112), ovarian (n = 74), endometrial (n = 84), or cervical (n = 76) cancer. To identify genomic aberrations, the Circular Binary Segmentation (CBS) and Piecewise Constant Fitting (PCF) algorithms were used and segmentation thresholds optimized. The Genomic Identification of Significant Targets in Cancer (GISTIC) algorithm was applied to the segmented data to identify significantly altered regions and the associated genes were analyzed by Ingenuity Pathway Analysis (IPA) to detect over-represented pathways and functions within the identified gene sets. Analyses of high-resolution copy number alterations in four different female cancer types are presented. For appropriately adjusted segmentation parameters the two segmentation algorithms CBS and PCF..."
performed similarly. We identified one region at 8q24.3 with focal aberrations that was altered at significant frequency across all four cancer types. Considering both, broad regions and focal peaks, three additional regions with gains at significant frequency were revealed at 1p21.1, 8p22, and 13q21.33, respectively. Several of these events involve known cancer-related genes, like PPP2R2A, PSCA, PTP4A3, and PTK2. In the female reproductive system (ovarian, endometrial, and cervix [OEC]), we discovered three common events: copy number gains at 5p15.33 and 15q11.2, further a copy number loss at 8p21.2. Interestingly, as many as 75% of the aberrations (75% amplifications and 86% deletions) identified by GISTIC were specific for just one cancer type and represented distinct molecular pathways."

According to the news reporters, the research concluded: "Our results disclose that some prominent copy number changes are shared in the four examined female, hormone-dependent cancer whereas others are definitive to specific cancer types."

For more information on this research see: A systematic comparison of copy number alterations in four types of female cancer. *BMC Cancer*, 2016;16():28-42. *BMC Cancer* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. **Findings from Al Zaytoonah University Reveals New Findings on Environmental Research and Public Health (Activity Pattern of Urban Adult Students in an Eastern Mediterranean Society)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Environmental Health - Environmental Research and Public Health have been published. According to news reporting originating in Amman, Jordan, by NewsRx journalists, research stated, "Knowledge of human activity patterns is needed in air pollution exposure and health risk assessment. However, human activity patterns have never been evaluated in the Eastern Mediterranean societies."

The news reporters obtained a quote from the research from Al Zaytoonah University, "Therefore, we investigated the activity pattern of 285 subjects (17-63 years) in Amman, Jordan during October to November, 2015. The subjects spent >80% of their time indoors during weekend days and >85% on workdays. They spent similar to 4.8% and similar to 5.7% in transportation during weekend days and workdays, respectively. Males had a different activity pattern than females on weekend days, but both genders had similar activity patterns on workdays. On workdays, males spent less time indoors than females. The activity pattern found in this study is a bit different than that for North Americans and Europeans, who spend more time indoors and in transit. The activity pattern found in this study was very different than that
observed for Koreans, who spent about 59% and 67% indoors on workdays and weekend, respectively. The main outcomes of this survey can be utilized in human exposure studies."

According to the news reporters, the research concluded: "This study and the upcoming future studies have been encouraged and supported by the regional WHO office in Amman."

Our news correspondents report that additional information may be obtained by contacting I. Odeh, Al Zaytoonah Univ Jordan, Dept. of Basic Sci, Amman 11733, Jordan.

**Intercellular Signaling Peptides and Proteins -...**

**Findings from Albert Einstein College of Medicine Reveals New Findings on Fibroblast Growth Factors (Association of inflammatory, lipid and mineral markers with cardiac calcification in older adults)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Intercellular Signaling Peptides and Proteins - Fibroblast Growth Factors. According to news reporting originating from Bronx, New York, by NewsRx correspondents, research stated, "Calcification of the aortic valve and adjacent structures involves inflammatory, lipid and mineral metabolism pathways. We hypothesised that circulating biomarkers reflecting these pathways are associated with cardiac calcification in older adults."

Financial supporters for this research include National Heart, Lung, and Blood Institute, National Institute on Aging, National Institute of Neurological Disorders and Stroke.

Our news editors obtained a quote from the research from the Albert Einstein College of Medicine, "We investigated the associations of various biomarkers with valvular and annular calcification in the Cardiovascular Health Study. Of the 5888 participants, up to 3585 were eligible after exclusions for missing biomarker, covariate or echocardiographic data. We evaluated analytes reflecting lipid (lipoprotein (Lp) (a), Lp-associated phospholipase A(2) (LpPLA(2)) mass and activity), inflammatory (interleukin-6, soluble (s) CD14) and mineral metabolism (fetuin-A, fibroblast growth factor (FGF)-23) pathways that were measured within 5 years of echocardiography. The relationships of plasma biomarkers with aortic valve calcification (AVC), aortic annular calcification (AAC) and mitral annular calcification (MAC) were assessed with relative risk (RR) regression. Calcification was prevalent: AVC 59%, AAC 45% and MAC 41%. After adjustment, Lp(a), LpPLA(2) mass and activity and sCD14 were positively associated with AVC. RRs for AVC per SD (95% CI) were as follows: Lp(a), 1.051 (1.022 to 1.081); LpPLA(2) mass, 1.036 (1.006 to 1.066) and LpPLA(2) activity, 1.037 (1.004 to 1.071); sCD14, 1.039 (1.005 to 1.073). FGF-23 was positively associated with MAC, 1.040 (1.004 to 1.078) and fetuin-A was negatively associated, 0.949 (0.911 to 0.989). No biomarkers
were significantly associated with AAC. This study shows novel associations of circulating FGF-23 and fetuin-A with MAC, and LpPLA(2) and sCD14 with AVC, confirming that previously reported for Lp(a).

According to the news editors, the research concluded: "Further investigation of Lp and inflammatory pathways may provide added insight into the aetiology of AVC, while study of phosphate regulation may illuminate the pathogenesis of MAC."

For more information on this research see: Association of inflammatory, lipid and mineral markers with cardiac calcification in older adults. *Heart*, 2016;102(22):1826-1834. *Heart* can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. Lipid Research

**Findings from Albert Einstein College of Medicine in Lipid Research Reported [Lipoprotein (a) level, apolipoprotein (a) size, and risk of unexplained ischemic stroke in young and middle-aged adults]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lipid Research have been published. According to news reporting originating from Bronx, New York, by NewsRx correspondents, research stated, "Circulating lipoprotein (a) [Lp(a)] level relates inversely to apolipoprotein (a) [apo(a)] size. Both smaller apo(a) isoforms and higher Lp(a) levels have been linked to coronary heart disease and stroke, but their independent contributions are less well defined."

Our news editors obtained a quote from the research from the Albert Einstein College of Medicine, "We examined the role of Lp(a) in younger adults with cryptogenic stroke. Lp(a) and apo(a) isoforms were evaluated in a prospectively designed case-control study of patients with unexplained ischemic stroke and stroke-free controls, ages 18 to 64. Serum Lp(a) was measured among 255 cases and 390 controls with both apo(a)-size independent and dependent assays. Apo(a) size was determined by agarose gel electrophoresis. Cases and controls were similar in socio-demographic characteristics, but cases had more hypertension, diabetes, smoking, and migraine with aura. In race-specific analyses, Lp(a) levels showed positive associations with cryptogenic stroke in whites, but not in the smaller subgroups of
blacks and Hispanics. After full adjustment, comparison of the highest versus lowest quartile in whites was significant for apo(a)-size-independent (OR = 2.10 [95% CI = 1.04, 4.27], p = 0.040), and near-significant for apo(a)-size-dependent Lp(a) (OR = 1.81 [95% CI = 0.95, 3.47], p = 0.073). Apo(a) size was not associated with cryptogenic stroke in any race-ethnic subgroup. This study underscores the importance of Lp(a) level, but not apo(a) size, as an independent risk factor for unexplained ischemic stroke in young and middle-aged white adults."

According to the news editors, the research concluded: "Given the emergence of effective Lp(a)-lowering therapies, these findings support routine testing for Lp(a) in this setting, along with further research to assess the extent to which such therapies improve outcomes in this population."

For more information on this research see: Lipoprotein (a) level, apolipoprotein (a) size, and risk of unexplained ischemic stroke in young and middle-aged adults. *Atherosclerosis*, 2016;253():47-53. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Drugs and Therapies - Antipsychotic Agents**

**Findings from Alexza Pharmaceuticals Broaden Understanding of Antipsychotic Agents (A randomized, placebo-controlled repeat-dose thorough QT study of inhaled loxapine in healthy volunteers)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Antipsychotic Agents is the subject of a report. According to news reporting originating from Mountain View, California, by NewsRx correspondents, research stated, "This randomized, double-blind, active-and placebo-controlled, crossover, thorough QT study assessed the effect of two inhaled loxapine doses on cardiac repolarization as measured by corrected QT (QTC) interval in healthy subjects (ClinicalTrials.gov NCT01854710). Subjects received two doses of inhaled loxapine (10 mg) 2 hours apart+oral placebo, two doses of inhaled placebo+oral placebo, or two doses of inhaled placebo+oral moxifloxacin (400 mg; positive control), with (>=)3 days washout between treatments."

Our news editors obtained a quote from the research from Alexza Pharmaceuticals, "Two-sided 90% confidence intervals (CIs) were calculated around least-squares mean predose placebo-subtracted individually corrected QT durations (DDTcIs) at 12 time points throughout
24 hours after dosing. A DDTcI 95% upper CI exceeding 10 msec was the threshold indicating QTc prolongation (primary endpoint). Secondary endpoints included Fridericia- and Bazett-corrected QT duration and QTcI outliers. Pharmacokinetics and adverse events (AEs) were also assessed. Of 60 subjects enrolled (mean age, 33.8 years; 52% male), 44 completed the study. Post loxapine dosing, no DDTcI 95% upper CI exceeded 10 msec; the largest was 6.31 msec 5 minutes post dose 2. Methodology was validated by DDTcI 95% lower CIs exceeding 5 msec at 9 of 12 time points after moxifloxacin dosing. Loxapine plasma concentrations increased rapidly (mean Cmax, 177 ng/mL; median tmax 2 minutes after dose 2, 2.03 hours after dose 1). There were no deaths, serious AEs, or AEs leading to discontinuation, and one severe AE.

According to the news editors, the research concluded: "Primary and secondary endpoints indicated two therapeutic doses of inhaled loxapine did not cause threshold QTc prolongation in this study."

The news editors report that additional information may be obtained by contacting J.V. Cassella, Alexza Pharmaceuticals, Inc, Mountain View, CA and Teva Pharmaceuticals, Frazer, PA, United States. Additional authors for this research include D.A. Spyker and P.P Yeung.

**Musculoskeletal Diseases and Conditions - Noonan…**

**Findings from Alfred I DuPont Hospital for Children Broaden Understanding of Noonan Syndrome (A Novel Rasopathy Caused by Recurrent De Novo Missense Mutations in PPP1CB Closely Resembles Noonan Syndrome with Loose Anagen Hair)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Noonan Syndrome have been published. According to news originating from Wilmington, Delaware, by NewsRx correspondents, research stated, "Noonan syndrome is a rasopathy caused by mutations in multiple genes encoding components of the RAS/MAPK pathway. Despite its variable phenotype, limited genotype-phenotype correlations exist."

Funders for this research include National Institute of General Medical Sciences,
Our news journalists obtained a quote from the research from Alfred I DuPont Hospital for Children, "Noonan syndrome with loose anagen hair (NS-LAH) is characterized by its distinctive hair anomalies, developmental differences, and structural brain abnormalities and is caused by a single recurrent missense SHOC2 mutation. SHOC2 forms a complex with protein phosphatase 1 (PP1C). Protein phosphatases counterbalance kinases and control activation of signaling proteins, such as the mitogen-activated protein kinases of the RAS/MAPK pathway. Here we report four patients with de novo missense mutations in protein phosphatase one catalytic subunit beta (PPP1CB), sharing a recognizable phenotype. Three individuals had the recurrent PPP1CB c.146C >G, p.Pro49Arg mutation, the fourth had a c.166G >C, p.Ala56Pro change. All had relative or absolute macrocephaly, low-set and posteriorly angulated ears, and developmental delay. Slow growing and/or sparse hair and/or an unruly hair texture was present in all. Three individuals had feeding difficulties requiring feeding tubes. One of two males had cryptorchidism, another had pectus excavatum. Short stature was present in three. A female with the recurrent mutation had a Dandy-Walker malformation and optic nerve hypoplasia. Mild ventriculomegaly occurred in all, cerebellar tonsillar ectopia was seen in two and progressed to Chiari 1 malformation in one individual. Based on the combination of phenotypic findings and PPP1CB's effect on RAF dephosphorylation within the RAS/MAPK pathway, this novel condition can be considered a rasopathy, most similar to NS-LAH."

According to the news editors, the research concluded: "Collectively, these mutations meet the standardized criteria for pathogenicity."

The news correspondents report that additional information may be obtained from K.W. Gripp, Alfred I DuPont Hosp Children, Div Med Genet, Wilmington, DE 19803, United States. Additional authors for this research include K.A. Aldinger, J.T. Bennett, L. Baker, J. Tusi, N. Powell-Hamilton, D. Stabiley, K. Sol-Church, A.E. Timms and W.B. Dobyns.

Findings from American Cancer Society in the Area of Colon Cancer Reported (Common variants in the obesity-associated genes FTO and MC4R are not associated with risk of colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "Obesity is a convincing risk factor for colorectal cancer. Genetic variants in or near FTO and MC4R are consistently associated with body mass index and other body size measures, but whether they are also associated with colorectal cancer risk is unclear." The news correspondents obtained a quote from the research from American Cancer Society, "In the discovery stage, we tested associations of 677 FTO and 323 MC4R single nucleotide polymorphisms (SNPs) 100 kb upstream and 300 kb downstream from each respective locus with risk of colorectal cancer in data from the Colon Cancer Family Registry (CCFR: 1960 cases; 1777 controls). Next, all SNPs that were nominally statistically significant (p < 0.05) in the discovery stage were included in replication analyses in data from the Genetics and Epidemiology of Colorectal Cancer Consortium (GECCO: 9716 cases; 9844 controls). In the discovery stage, 43 FTO variants and 18 MC4R variants were associated with colorectal cancer risk (p < 0.05). No SNPs remained statistically significant in the replication analysis after accounting for multiple comparisons."

According to the news reporters, the research concluded: "We found no evidence that individual variants in or near the obesity-related genes FTO and MC4R are associated with risk of colorectal cancer."

For more information on this research see: Common variants in the obesity-associated genes FTO and MC4R are not associated with risk of colorectal cancer. Cancer Epidemiology, 2016;44():1-4. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Findings from Amgen Has Provided New Data on Toxicology and Pharmacology (Carcinogenicity risk assessment of romosozumab: A review of scientific weight-of-evidence and findings in a rat lifetime pharmacology study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Toxicology and Pharmacology. According to news reporting from Thousand Oaks, California, by NewsRx journalists, research stated, "Romosozumab is a humanized immunoglobulin G(2) monoclonal antibody that binds and blocks the action of sclerostin, a protein secreted by the osteocyte and an extracellular inhibitor of canonical Wnt signaling. Blockade of sclerostin binding to low-density lipoprotein receptor-related proteins 5 and 6 (LRP5 and LRP6) allows Wnt ligands to activate canonical Wnt signaling in bone, increasing bone formation and decreasing bone resorption, making sclerostin an attractive target for osteoporosis therapy."

The news correspondents obtained a quote from the research from Amgen, "Because romosozumab is a bone-forming agent and an activator of canonical Wnt signaling, questions have arisen regarding a potential carcinogenic risk. Weight-of-evidence factors used in the assessment of human carcinogenic risk of romosozumab included features of canonical Wnt signaling, expression pattern of sclerostin, phenotype of loss-of-function mutations in humans and mice, mode and mechanism of action of romosozumab, and findings from romosozumab chronic toxicity studies in rats and monkeys. Although the weight-of-evidence factors supported that romosozumab would pose a low carcinogenic risk to humans, the carcinogenic potential of romosozumab was assessed in a rat lifetime study. There were no romosozumab-related effects on tumor incidence in rats."

According to the news reporters, the research concluded: "The findings of the lifetime study and the weight-of-evidence factors collectively indicate that romosozumab administration would not pose a carcinogenic risk to humans."

Our news journalists report that additional information may be obtained by contacting R.W. Boyce, One Amgen Inc, Thousand Oaks, CA 91320, United States. Additional authors for this research include M. Felx, N. Mellal, A. Varela, P. Mann, J. Jolette, R. Samadfan, S.Y. Smith, K. Locher, S. Buntich, M.S. Ominsky, I. Pyrah and R.W. Boyce.

Findings from Amirkabir University of Technology Update Knowledge of Biological Macromolecules (Encapsulation of Aloe Vera extract into natural Tragacanth Gum as a novel green wound healing product)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Life Science Research - Biological Macromolecules have been presented. According to news reporting originating from Tehran, Iran, by NewsRx correspondents, research stated, "Application of natural materials in wound healing is an interest topic due to effective treatment with no side effects. In this paper, Aloe Vera extract was encapsulated into Tragacanth Gum through a sono-chemical microemulsion process to prepare a wound healing product."

Our news editors obtained a quote from the research from the Amirkabir University of Technology, "FESEM/EDX and FT-IR proved the successfully formation of the nanocapsules with spherical shape by cross-linking aluminum ions with Tragacanth Gum. The therapeutic characteristics of the prepared wound healing product were investigated using antimicrobial, cytotoxicity and wound healing assays."

According to the news editors, the research concluded: "Relative high antimicrobial activities with the microbial reduction of 84, 91 and 80% against E. coli, S. aureus and C. albicans, a cell viability of 98% against human fibroblast cells and a good wound healing activity with considerable migration rate of fibroblast cells are the important advantages of the new formed wound healing product."

For more information on this research see: Encapsulation of Aloe Vera extract into natural Tragacanth Gum as a novel green wound healing product. *International Journal of Biological Macromolecules*, 2016;93():344-349. *International Journal of Biological Macromolecules* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Findings from Anhui Medical University Yields New Findings on Chronic Hepatitis B Virus [NKp30(+) NK cells are associated with HBV control during pegylated-interferon-alpha-2b therapy of chronic hepatitis B]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Chronic Hepatitis B Virus have been published. According to news originating from Anhui, People's Republic of China, by NewsRx correspondents, research stated, "A pressing need exists for improved therapeutic options for chronic hepatitis B (CHB). Pegylated-interferon-alpha (Peg-IFN-alpha) achieves sustained off-treatment responses in many cases because of its direct anti-viral effects and regulation of the immune response."

Our news journalists obtained a quote from the research from Anhui Medical University, "However, non-responsiveness to Peg-IFN-alpha is frequent, and the mechanism is poorly understood. In this study, we found that the frequency and absolute number of NKp30(+) natural killer (NK) cells increased markedly, accompanied by enhanced CD107a and IFN-gamma production, during Peg-IFN-alpha-2b monotherapy or combination therapy with adefovir dipivoxil in patients with CHB, especially in responders. The responders and non-responders differed in the frequency of polyfunctional IFN-gamma(+) CD107(+) NK cells. In addition, the increase in NKp30+ NK cells was negatively correlated with the HBV viral load and plasma HBeAg. Moreover, it was found that IL-15 may contribute to the up-regulation of NKp30 on the NK cells, and this up-regulation was not induced in vitro by Peg-IFN-alpha-2b alone. However, in the non-responders, these NKp30(+) NK cells were dysfunctional because of increased NKG2A expression, which partly explains the inactivation of NKp30(+) NK cells and the reduced capacity of these cells to produce antiviral cytokines."

According to the news editors, the research concluded: "These findings may provide a new mechanism to explain the variable efficacy of Peg-IFN-alpha-2b therapy."

For more information on this research see: NKp30(+) NK cells are associated with HBV control during pegylated-interferon-alpha-2b therapy of chronic hepatitis B. *Scientific Reports*, 2016;6():1-10. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Findings from Anjo-Kosei Hospital in the Area of Heart Attack Reported
[Lipoprotein(a) levels predict adverse vascular events after acute myocardial infarction]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Heart Attack is now available. According to news reporting originating from Anjo, Japan, by NewsRx correspondents, research stated, "Lipoprotein(a) [Lp(a)], which is genetically determined, has been reported as an independent risk factor for atherosclerotic vascular disease. However, the prognostic value of Lp(a) for secondary vascular events in patients after coronary artery disease has not been fully elucidated."

Our news editors obtained a quote from the research from Anjo-Kosei Hospital, "This 3-year observational study included a total of 176 patients with ST-elevated myocardial infarction (STEMI), whose Lp(a) levels were measured within 24 h after primary percutaneous coronary intervention. We divided enrolled patients into two groups according to Lp(a) level and investigated the association between Lp(a) and the incidence of major adverse cardiac and cerebrovascular events (MACCE). A Kaplan-Meier analysis demonstrated that patients with higher Lp(a) levels had a higher incidence of MACCE than those with lower Lp(a) levels (log-rank P = 0.034). A multivariate Cox regression analysis revealed that Lp(a) levels were independently correlated with the occurrence of MACCE after adjusting for other classical risk factors of atherosclerotic vascular diseases (hazard ratio 1.030, 95% confidence interval: 1.011-1.048, P = 0.002). In receiver-operating curve analysis, the cutoff value to maximize the predictive power of Lp(a) was 19.0 mg/dl (area under the curve = 0.674, sensitivity 69.2%, specificity 62.0%). Evaluation of Lp(a) in addition to the established coronary risk factors improved their predictive value for the occurrence of MACCE."

According to the news editors, the research concluded: "Lp(a) levels at admission independently predict secondary vascular events in patients with STEMI. Lp(a) might provide useful information for the development of secondary prevention strategies in patients with myocardial infarction."

For more information on this research see: Lipoprotein(a) levels predict adverse vascular events after acute myocardial infarction. Heart and Vessels, 2016;31(12):1923-1929. Heart and Vessels can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Heart and Vessels - www.springerlink.com/content/0910-8327/)

Oncology - Cervical Cancer

Findings from Aristotle University Yields New Data on Cervical Cancer (Genetic polymorphisms of FAS and EVER genes in a Greek population and their susceptibility to cervical cancer: a case control study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Cervical Cancer. According to news reporting originating in Thessaloniki, Greece, by NewsRx journalists, research stated, "The aim of the study was to evaluate the association of two SNPs of EVER1/2 genes’ region (rs2290907, rs16970849) and the FAS-670 polymorphism with the susceptibility to precancerous lesions and cervical cancer in a Greek population. Among the 515 women who were included in the statistical analysis, 113 belong to the case group and present with precancerous lesions or cervical cancer (27 with persistent CIN1, 66 with CIN2/3 and 20 with cervical cancer) and 402 belong to the control group."

The news reporters obtained a quote from the research from Aristotle University, "The chi-squared test was used to compare the case and the control groups with an allelic and a genotype-based analysis. The results of the statistical analysis comparing the case and the control groups for all the SNPs tested were not statistically significant. Borderline significant difference (p value = 0.079) was only found by the allelic model between the control group and the CIN1/CIN2 patients' subgroup for the polymorphism rs16970849. The comparison of the other case subgroups with the control group did not show any statistically significant difference."

According to the news reporters, the research concluded: "None of the SNPs included in the study can be associated with statistical significance with the development of precancerous lesions or cervical cancer."

For more information on this research see: Genetic polymorphisms of FAS and EVER genes in a Greek population and their susceptibility to cervical cancer: a case control study. *BMC Cancer*, 2016;16():1-7. *BMC Cancer* can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. (BioMed Central - www.biomedcentral.com; BMC Cancer - www.biomedcentral.com/bmcancer/)

Findings from Arizona State University Provides New Data about Prostate Cancer (Mathematical Models of Androgen Resistance in Prostate Cancer Patients under Intermittent Androgen Suppression Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Prostate Cancer are presented in a new report. According to news reporting originating in Tempe, Arizona, by NewsRx journalists, research stated, "Predicting the timing of a castrate resistant prostate cancer is critical to lowering medical costs and improving the quality of life of advanced prostate cancer patients. We formulate, compare and analyze two mathematical models that aim to forecast future levels of prostate-specific antigen (PSA)."

The news reporters obtained a quote from the research from Arizona State University, "We accomplish these tasks by employing clinical data of locally advanced prostate cancer patients undergoing androgen deprivation therapy (ADT). While these models are simplifications of a previously published model, they fit data with similar accuracy and improve forecasting results. Both models describe the progression of androgen resistance. Although Model 1 is simpler than the more realistic Model 2, it can fit clinical data to a greater precision. However, we found that Model 2 can forecast future PSA levels more accurately."

According to the news reporters, the research concluded: "These findings suggest that including more realistic mechanisms of androgen dynamics in a two population model may help androgen resistance timing prediction."

Our news correspondents report that additional information may be obtained by contacting J. Baez, Arizona State University, Sch Math & Stat Sci, Tempe, AZ 85287, United States.

Findings from Arnaud de Villeneuve Hospital in the Area of Small Cell Lung Cancer Reported (Safety and Immunogenicity of the PRAME Cancer Immunotherapeutic in Patients with Resected Non-Small Cell Lung Cancer: A Phase I Dose Escalation Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Small Cell Lung Cancer have been
published. According to news reporting originating in Montpellier, France, by NewsRx journalists, research stated, "Adjuvant platinum-based chemotherapy is standard treatment for surgically resected stage II to IIIA NSCLC, but the relapse rate is high. The preferentially expressed antigen of melanoma (PRAME) tumor antigen is expressed in two-thirds of NSCLC and offers an attractive target for antigen-specific immunization."

The news reporters obtained a quote from the research from Arnaud de Villeneuve Hospital, "A phase I dose escalation study assessed the safety and immunogenicity of a PRAME immunotherapeutic consisting of recombinant PRAME plus proprietary immunostimulant AS15 in patients with surgically resected NSCLC (NCT01159964). Patients with PRAME-positive resected stage IB to IIIA NSCLC were enrolled in three consecutive cohorts to receive up to 13 injections of PRAME immunotherapeutic (recombinant PRAME protein dose of 20 μg, 100 pg, or 500 pg, with a fixed dose of AS15). Adverse events, predefined dose-limiting toxicity, and the anti-PRAME humoral response (measured by enzyme-linked immunosorbent assay) were coprimary end points. Anti-PRAME cellular responses were assessed. A total of 60 patients were treated (18 received 20 μg of PRAME, 18 received 100 μg of PRAME, and 24 received 500 μg of PRAME). No dose-limiting toxicity was reported. Adverse events considered by the investigator to be causally related to treatment were grade 1 or 2, and most were injection site reactions or fever. All patients had detectable anti-PRAME antibodies after four immunizations. The percentages of patients with PRAME-specific CD4-positive T cells were higher at the dose of 500 μg compared with lower doses. No predefined CD8-positive T-cell responses were detected. The PRAME immunotherapeutic had an acceptable safety profile. All patients had anti-PRAME humoral responses that were not dose related, and 80% of those treated at the highest dose showed a cellular immune response. The dose of 500 μg was selected."

According to the news reporters, the research concluded: "However, further development was stopped after negative results with a similar immunotherapeutic in patients with NSCLC."

Our news correspondents report that additional information may be obtained by contacting J.L. Pujol, Arnaud de Villeneuve Hosp; Thorac Oncol Unit, Resp Dis, Montpellier, France. Additional authors for this research include T. De Pas, A. Rittmeyer, E. Vallieres, B. Kubisa, E. Levchenko, S. Wiesemann, G.A. Masters, R. Shen, S.A. Tjulandin, H.S. Hofmann, N. Vanhoutte, B. Salaun, M. Debois, S. Jarnjak, P.M.D. Alves, J. Louahed, V.G. Brichard and Lehm.

Findings from Astex Pharmaceuticals Provides New Data on Chemical Biology (Structure of the Epigenetic Oncogene MMSET and Inhibition by N-Alkyl Sinefungin Derivatives)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Chemical Research - Chemical Biology. According to news reporting originating from Cambridge, United Kingdom, by NewsRx correspondents, research stated, "The members of the NSD subfamily of lysine methyl transferases are compelling oncology targets due to the recent characterization of gain-of-function mutations and translocations in several hematological cancers. To date, these proteins have proven intractable to small molecule inhibition."

Funders for this research include Cancer Research UK, Royal Marsden NHS Foundation Trust.

Our news editors obtained a quote from the research from Astex Pharmaceuticals, "Here, we present initial efforts to identify inhibitors of MMSET (aka NSD2 or WHSC1) using solution phase and crystal structural methods. On the basis of 2D NMR experiments comparing NSD1 and MMSET structural mobility, we designed an MMSET construct with five point mutations in the N-terminal helix of its SET domain for crystallization experiments and elucidated the structure of the mutant MMSET SET domain at 2.1 angstrom resolution. Both NSD1 and MMSET crystal systems proved resistant to soaking or cocrystallography with inhibitors."

According to the news editors, the research concluded: "However, use of the close homologue SETD2 as a structural surrogate supported the design and characterization of N-alkyl sinefungin derivatives, which showed low micromolar inhibition against both SETD2 and MMSET."

For more information on this research see: Structure of the Epigenetic Oncogene MMSET and Inhibition by N-Alkyl Sinefungin Derivatives. ACS Chemical Biology, 2016;11 (11):3093-3105. ACS Chemical Biology can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; ACS Chemical Biology - www.pubs.acs.org/journal/acbcct)

Heart Disorders and Diseases - Atrial Fibrillation

Findings from Attikon University Hospital Provides New Data on Atrial Fibrillation (Acute effects of unilateral temporary stellate ganglion block on human atrial electrophysiological properties and atrial fibrillation inducibility)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news originating from Athens, Greece, by NewsRx correspondents, research stated, "In experimental models, stellate ganglion block (SGB) reduces the induction of atrial fibrillation (AF), while data in humans are limited. The aim of this study was to assess the effect of unilateral SGB on atrial electrophysiological properties and AF induction in patients with paroxysmal AF."

Our news journalists obtained a quote from the research from Attikon University Hospital, "Thirty-six patients with paroxysmal AF were randomized in a 2:1 order to temporary, transcutaneous, pharmaceutical SGB with Lidocaine or placebo before pulmonary vein isolation. Lidocaine was 1:1 randomly infused to the right or left ganglion. Before and after randomization, atrial effective refractory period (ERP) of each atrium, difference between right and left atrial ERP, intra- and interatrial conduction time, AF inducibility, and AF duration were assessed. After SGB, right atrial ERP was prolonged from a median (1st-3rd quartile) of 240 (220-268) ms to 260 (240-300) ms (P <.01) and left atrial ERP from 235 (220-260) ms to 245 (240-280) ms (P <.01). AF was induced by atrial pacing in all 24 patients before SGB, but only in 13 patients (54%) after the intervention (P <.01). AF duration was shorter after SGB: 1.5 (0.0-5.8) minutes from 5.5 (3.0-12.0) minutes (P <.01). Intraand interatrial conduction time was not significantly prolonged. No significant differences were observed between right and left SGB. No changes were observed in the placebo group. Unilateral temporary SGB prolonged atrial ERP, reduced AF inducibility, and decreased AF duration. An equivalent effect of right and left SGB on both atria was observed."

According to the news editors, the research concluded: "These findings may have a clinical implication in the prevention of drug refractory and postsurgery AF and deserve further clinical investigation."

The news correspondents report that additional information may be obtained from D. Leftheriotis, Attikon Univ Hosp Athens, Dept. of Cardiol, GR-12462 Athens, Greece. Additional authors for this research include P. Flevari, C. Kossyvakis, D. Katsaras, C. Batistaki, C. Arvaniti, G. Giannopoulos, S. Defteros, G. Kostopanagiotou and J. Lekakis.

Chemistry - Biochemistry

Findings from B. Peck and Co-Researchers in the Area of Biochemistry Reported (Lipid desaturation - the next step in targeting lipogenesis in cancer?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Chemistry - Biochemistry is the subject of a report. According to news originating from Wurzburg, Germany, by NewsRx correspondents, research stated, "Metabolic reprogramming is a central feature of transformed cells. Cancer metabolism is now fully back in the focus of cancer research, as the interactions between oncogenic signalling and cellular metabolic processes are uncovered."

Funders for this research include Deutsche Forschungsgemeinschaft, Deutsche Krebshilfe.

Our news journalists obtained a quote from the research, "One aspect of metabolic reprogramming in cancer is alterations in lipid metabolism. In contrast to most untransformed tissues, which satisfy their demand from dietary lipids, cancer cells frequently re-activate de novo lipogenesis. However, compounds targeting fatty acid synthase (FASN), a multiprotein complex integral to lipogenesis, have so far shown limited efficacy in pre-clinical cancer models and to date only one FASN inhibitor has entered clinical trials. Recently, a number of studies have suggested that enhanced production of fatty acids in cancer cells could also increases their dependence on the activity of desaturases, a class of enzymes that insert double bonds into acyl-CoA chains. Targeting desaturase activity could provide a window of opportunity to selectively interfere with the metabolic activity of cancer cells."

According to the news editors, the research concluded: "This review will summarise some key findings that implicate altered lipid metabolism in cancer and investigate the molecular interactions between lipid desaturation and cancer cell survival."

The news correspondents report that additional information may be obtained from A. Schulze, Comprehens Canc Center Mainfranken, Wurzburg, Germany.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/febs.13681. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from B.H. Munos and Co-Authors Provide New Insights into Clinical Pharmacology and Therapeutics (Biomedical Innovation: Lessons From the Past and Perspectives for the Future)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Clinical Pharmacology and Therapeutics are presented in a new report. According to news reporting originating from Washington, District of Columbia, by NewsRx editors, the research stated, "Back around the turn of the millennium, the future of the pharmaceutical industry was bright. Amazing technologies were converging to enable a top-to-bottom reengineering of drug research and development (R&D)."

Our news editors obtained a quote from the research, "The 'omics,' combinatorial chemistry, high-throughput screening, robotic automation, and systems biology, promised to bring order and method to drug research's bewildering complexity. Pharmaceutical executives—many of whom were ill at ease with their scientists' freewheeling ways—were excited."

According to the news editors, the research concluded: "Gushing with an enthusiasm that was typical of the times, a former industry Chief Executive Officer spoke gloweringly of the launch of 'two to three new blockbusters... each year driving a quadrupling of revenues.(1)."

For more information on this research see: Biomedical Innovation: Lessons From the Past and Perspectives for the Future. Clinical Pharmacology & Therapeutics, 2016;100 (6):588-590. Findings from B.M. Nelms et al Update Understanding of Medical Entomology [Bionomics and Vector Potential of Culex thriambus (Diptera: Culicidae) Mosquitoes in Lake County, California]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Health and Medicine - Medical Entomology is the subject of a report. According to news reporting out of Lakeport, California, by NewsRx editors, research stated, "California statewide West Nile virus (WNV) minimum infection rates in Culex thriambus Dyar mosquitoes are high; however, few specimens are submitted and tested each year, as their distribution seems limited to larval habitats along riparian systems. To evaluate the role of Cx. thriambus in the amplification, maintenance, and overwintering of WNV in Lake County, CA, the bionomics and vector potential of the species was investigated during 2014 and 2015."

Our news journalists obtained a quote from the research, "Culex thriambus was the most abundant mosquito species, with 1,153 adults and 7,624 immatures collected by vacuum aspiration and dip sampling, respectively, at the primary study site. Detection of WNV in four mosquito pools during September through November coincided with peak seasonality. Females entered and maintained a reproductive diapause during winter under field and seminatural conditions. Diapause was initiated in the majority of Cx. thriambus females by October and was terminated by 30 March. Some parous females (7.1%) and those in host-seeking arrest (7.1%) were collected throughout the winter period. An accrual of 679.51 degree-days (degrees D) was necessary for diapause termination under seminatural conditions. Culex thriambus females fed on 16 different avian species during spring and summer, and no mammalian feeds were detected. West Nile viral RNA was detected in four of 42 Cx. thriambus pools tested during June through November and infection rates ranged from 3.53-28.15/1,000 tested."

According to the news editors, the research concluded: "In summary, WNV transmission may be increased along riparian corridors throughout California where Cx. thriambus mosquitoes remain relatively abundant."

Our news journalists report that additional information may be obtained by contacting B.M. Nelms, Lake Cty Vector Control Dist, Lakeport, CA 95453, United States. Additional authors for this research include T.C. Thiemann, D.N. Bridges, A.E. Williams, M.L. Koschik, B.M. Ryan and J.J. Scott.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/jme/tjw123. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Diseases and Conditions:...

Findings from Barrow Neurological Institute Broaden Understanding of Arteriovenous Fistula (Validation of an 'endovascular-first' approach to spinal dural arteriovenous fistulas: an intention-to-treat analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Arteriovenous Fistula have been presented. According to news reporting originating from Phoenix, Arizona, by NewsRx correspondents, research stated, "Spinal dural arteriovenous fistulas (SDAVFs) require pretreatment angiography; embolization can be performed in the same session. To validate this approach, obliteration and morbidity rates of 'endovascular-first' (embolization and microsurgery in the case of embolization failures) must be compared with rates for 'microsurgery-first' (microsurgical ligation without attempted embolization) approaches."

Our news editors obtained a quote from the research from Barrow Neurological Institute, "We reviewed our institutional database (January 1998-October 2015) for SDAVFs, performing an intention-to-treat analysis comparing endovascular-first and microsurgery-first approaches. A total of 71 patients underwent surgical and/or endovascular treatment for SDAVFs. All SDAVFs were ultimately occluded. Of 35 patients under consideration for an endovascular-first approach, radicular artery anatomy or anterior spinal artery embolization risk precluded attempting embolization in seven cases (20%). Among 28 patients undergoing embolization, angiographic non-opacification of the fistula was noted in 18 (64%). Fourteen patients had obliteration with excellent casting of the draining vein (50%) and did not undergo surgery. There were no significant differences in total complications (9% vs 11%; p=1.0) or permanent complications (3% vs 4%; p=1.0) after attempted endovascular and surgical treatment. Based on an intention-to-treat analysis, there were no significant differences in total complications (11% vs 14%; p=1.0), permanent complications (6% vs 3%; p=0.61), or the symptomatic resolution/improvement rate (80% vs 78%; p=1.0) between endovascular-first and microsurgery-first groups."

According to the news editors, the research concluded: "Our results support attempted embolization of SDAVFs prior to consideration of microsurgery, allowing for a less invasive treatment option in the same session as diagnostic angiography."

For more information on this research see: Validation of an 'endovascular-first' approach to spinal dural arteriovenous fistulas: an intention-to-treat analysis. Journal of Neurointerventional Surgery, 2016;9(1):102-105. (BMJ Publishing Group - group.bmj.com; Journal of Neurointerventional Surgery - jnis.bmj.com/)

The news editors report that additional information may be obtained by contacting B.A. Gross, Dept. of Neurosurgery, Barrow Neurological Institute, St Joseph's Hospital and Medical Center, Phoenix, Arizona, United States. Additional authors for this research include F.C. Albuquerque, K. Moon and C.G McDougall.

**Drugs and Therapies - Radiation Therapy**

**Findings from Baskent University in the Area of Radiation Therapy Reported (Dosimetric analysis of testicular doses in prostate intensity-modulated and volumetric-modulated arc radiation therapy at different energy levels)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Radiation Therapy. According to news reporting out of Adana, Turkey, by NewsRx editors, research stated, "The aim of this study is to evaluate the incidental testicular doses during prostate radiation therapy with intensity-modulated radiotherapy (IMRT) and volumetric-modulated arc radiotherapy (VMAT) at different energies. Dosimetric data of 15 patients with intermediate-risk prostate cancer who were treated with radiotherapy were analyzed."

Our news journalists obtained a quote from the research from Baskent University, "The prescribed dose was 78 Gy in 39 fractions. Dosimetric analysis compared testicular doses generated by 7-field intensity-modulated radiotherapy and volumetric modulated arc radiotherapy with a single arc at 6, 10, and 15 MV energy levels. Testicular doses calculated from the treatment planning system and doses measured from the detectors were analyzed. Mean testicular doses from the intensity-modulated radiotherapy and volumetric-modulated arc radiotherapy per fraction calculated in the treatment planning system were 16.3 +/- 10.3 cGy vs 21.5 +/- 11.2 cGy (p = 0.03) at 6 MV, 13.4 +/- 10.4 cGy vs 17.8 +/- 10.7 cGy (p = 0.04) at 10 MV, and 10.6 +/- 8.5 cGy vs 14.5 +/- 8.6 cGy (p = 0.03) at 15 MV, respectively. Mean scattered testicular doses in the phantom measurements were 99.5 +/- 17.2 cGy, 118.7 +/- 16.4 cGy, and 193.9 +/- 14.5 cGy at 6, 10, and 15 MV, respectively, in the intensity-modulated radiotherapy plans. In the volumetric-modulated arc radiotherapy plans, corresponding testicular doses per course were 90.4 +/- 16.3 cGy, 103.6 +/- 16.4 cGy, and 139.3 +/- 14.6 cGy at 6, 10, and 15 MV, respectively."

According to the news editors, the research concluded: "This study was the first to measure the incidental testicular doses by intensity-modulated radiotherapy and volumetric-modulated arc radiotherapy plans at different energy levels during prostate-only irradiation. Higher photon energy and volumetric-modulated arc radiotherapy plans resulted in higher incidental testicular doses compared with lower photon energy and intensity-modulated radiotherapy plans."

Our news journalists report that additional information may be obtained by contacting C. Onal, Baskent University, Dept. of Radiat Oncol, Fac Med, Adana, Turkey. Additional authors for this research include G. Arslan, Y. Dolek and E. Efe.

Lung Diseases and Conditions - Asthma

Findings from Benaroya Research Institute Broaden Understanding of Asthma (STAT6 Regulates the Development of Eosinophilic versus Neutrophilic Asthma in Response to Alternaria alternata)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Asthma. According to news reporting from Seattle, Washington, by NewsRx journalists, research stated, "Human asthma is a heterogeneous disease characterized by the expression of both Th2 and Th17 cytokines. In vitro and in vivo studies have shown a reciprocal regulation between Th2 and Th17 pathways, suggesting a potential induction of neutrophil-promoting Th17 inflammation in the absence of a Th2 response."

The news correspondents obtained a quote from the research from Benaroya Research Institute, "Alternaria alternata is a clinically relevant allergen that is associated with severe and fatal asthma exacerbations. Exposure to A. alternata is characterized by a predominant Th2 response, but can also induce the production of factors associated with Th17 responses (e.g., CXCL8) from epithelial cells. Using a mouse model, we found that wild-type mice develop an eosinophilic Th2 airway disease in response to A. alternata exposure, whereas IL-4-, IL-13-, and STAT6-deficient mice exhibit a primarily neutrophilic response. Neutrophilic asthma in STAT6(-/)-mice was accompanied by elevated lung levels of TNF-alpha, CXCL1, CXCL2, and CXCL5, and was steroid resistant. Neutralization of Th17 signaling only partially reduced neutrophil numbers and total airway inflammation. Airway neutrophilia developed in RAG-deficient and CD4-depleted BALB/c mice, suggesting that the suppression of neutrophil responses is dependent on Th2 cytokine production by T cells and that airway neutrophilia is primarily an innate response to allergen."

According to the news reporters, the research concluded: "These results highlight the importance of combination therapies for treatment of asthma and establish a role for factors other than IL-17 as targets for neutrophilic asthma."

For more information on this research see: STAT6 Regulates the Development of Eosinophilic versus Neutrophilic Asthma in Response to Alternaria alternata. *Journal of Immunology*, 2016;197(12):4541-4551. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Autoimmune Diseases and Conditions - Multiple...

Findings from Bezmialem Vakif University Provides New Data about Multiple Sclerosis (Could Heterozygous Beta Thalassemia Provide Protection Against Multiple Sclerosis?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Multiple Sclerosis. According to news reporting originating in Istanbul, Turkey, by NewsRx journalists, research stated, "Heterozygous beta thalassemia (HBT) has been proposed to increase the risk of developing autoimmune disease. Our aim in this study was to examine the prevalence of HBT among multiple sclerosis (MS) patients."

The news reporters obtained a quote from the research from Bezmialem Vakif University, "HBT frequency was investigated in our MS group (243 patients with MS). Hemoglobin electrophoresis (HE) was carried out if MS patients had a mean corpuscular volume of (MCV) <80 fl and a mean corpuscular hemoglobin level of (MCH) <27 pg/L according to a complete blood count (CBC). If MCV was lower than 80 fl, MCH was lower than 27 pg/L, and Hemoglobin A2 equal to or higher than 3.5%, a diagnosis of HBT was established. The frequency of patients with HBT in our MS patient group was statistically compared with the prevalence of HBT in the city of Istanbul, where our MS patients lived. The HBT prevalence was 0.823% (2 patients) in the MS patient group. The prevalence of HBT in Istanbul has been reported to be 4.5%. According to the z-test, the HBT prevalence in our MS patient group was significantly lower than that in Istanbul (Z=6.3611, two-sided p value <0.0001. 95% confidence interval of prevalence of HBT in our MS patient group: 0.000998-0.029413)."

According to the news reporters, the research concluded: "Contrary to our hypothesis at the outset of study, the reduced HBT prevalence in the MS group compared to HBT frequency in the city of Istanbul might indicate that HBT is protective against MS."

For more information on this research see: Could Heterozygous Beta Thalassemia Provide Protection Against Multiple Sclerosis? Medical Science Monitor, 2016;22():4854-4858. Medical Science Monitor can be contacted at: Int Scientific Literature, Inc, 361 Forest Lane, Smithtown, NY 11787, USA.

Our news correspondents report that additional information may be obtained by contacting M.A. Cikrikcioglu, Bezmialem Vakif Univ, Fac Med, Dept. of Internal Med, Istanbul, Turkey. Additional authors for this research include M.E. Ozcan, G. Halac, I. Gultepe, K. Celik, Y. Sekin, E.E. Eser, S. Burhan, G. Cetin and O. Uysal.

Findings from Bharati Vidyapeeth Deemed University Provide New Insights into Toxicology and Pharmacology [Acute and repeated doses (28 days) oral toxicity study of Vicenin-1, a flavonoid glycoside isolated from fenugreek seeds in laboratory mice]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Toxicology and Pharmacology is now available. According to news reporting from Maharashtra, India, by NewsRx journalists, research stated, "Vicenin-1 (fenugreek glycoside) has been proven to possess potent anti-inflammatory and anti-oxidant activity. The objective of the present investigation was to determine in-vivo acute and subacute (28-days repeated dose) oral toxicity of Vicenin-1 isolated from fenugreek seed."

The news correspondents obtained a quote from the research from Bharati Vidyapeeth Deemed University, "Vicenin-1 (93%) was isolated from a hydroalcoholic extract of fenugreek seed and characterized using HPLC, TLC, H-1 NMR and C-13 NMR. Acute oral toxicity (AOT) and subacute toxicity studies of Vicenin-1 were carried out according to OECD 425 (up-and-down procedure) and OCED 407 guidelines in Swiss albino mice. In AOT, Vicenin-1 showed 10% mortality when administered at a dose of 5000 mg/kg. However, when vicenin-1 was administered for at doses of 37.5, 75, or 150 mg/kg 28-days it did not show any mortality at the administered doses. Vicenin-1 (75 mg/kg) did not show observational, behavioral, biochemical or histopathological toxic effects. There were minor alterations in body weight, hematology, and histopathology of mice administered with Vicenin-1 (150 mg/kg), but these changes were within normal laboratory ranges. The highest concentration of Venicin-1 was found in liver (3.46%) followed by lung (0.65%)."

According to the news reporters, the research concluded: "Vicenin-1 showed median lethal dose (LD50) of 4837.5 mg/kg with no-observed-adverse-effect levels (NOAEL) at 75 mg/kg and lowest adverse effect levels (LOAEL) at 150 mg/kg for both sexes of mice during AOT and sub-acute toxicity study, respectively."

For more information on this research see: Acute and repeated doses (28 days) oral toxicity study of Vicenin-1, a flavonoid glycoside isolated from fenugreek seeds in laboratory mice. Regulatory Toxicology and Pharmacology, 2016;81();522-531. Oncology - Myelogenous Leukemia

**Findings from Binzhou Medical University Provide New Insights into Myelogenous Leukemia (HOXB4 knockdown reverses multidrug resistance of human myelogenous leukemia K562/ADM cells by downregulating P-gp, MRP1 and BCRP expression via PI3K/Akt ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Myelogenous Leukemia. According to news reporting out of Shandong, People's Republic of China, by NewsRx editors, research stated, "Multidrug resistance (MDR) plays a pivotal role in human chronic myelogenous leukemia (CML) chemotherapy failure. MDR is mainly associated with the overexpression of drug efflux transporters of the ATP-binding cassette (ABC) proteins."

Our news journalists obtained a quote from the research from Binzhou Medical University, "Phosphoinositide 3-kinase (PI3K)/Akt signaling cascade is involved in the MDR phenotype and is correlated with multidrug resistance 1 (MDR1)/P-glycoprotein (P-gp), multidrug resistance-associated protein 1 (MRP1) and breast cancer resistance protein (BCRP) expression in many human malignancies. Homeobox (HOX) B4, a member of the HOX gene family, has been reported to be correlated with occurrence, development, poor prognosis and drug resistance of human leukemia. In the present study, HOXB4 expression was analyzed in K562 cell line and its MDR subtype K562/ADM. Compared with K562 cells, drug-resistant K562/ADM cells demonstrated evidently higher HOXB4 expression. In addition, we firstly investigated the reversal effect of HOXB4 deletion on K562/ADM cells and the underlying mechanism. The Cell Counting kit-8 (CCK-8) and flow cytometry assays showed that knockdown of HOXB4 enhanced chemosensitivity and decreased drug efflux in K562/ADM cells."

According to the news editors, the research concluded: "Moreover, HOXB4 knockout led to downregulation of P-gp, MRP1 and BCRP expression and PI3K/Akt signaling activity, suggesting that repression of HOXB4 might be a key point to reverse MDR of K562/ADM cells."

Our news journalists report that additional information may be obtained by contacting X.H. Jia, Binzhou Med Univ, Dept. of Pediat, Affiliated Hosp, Binzhou 256603, Shandong, People's Republic of China. Additional authors for this research include X.H. Jia, J.R. Chen, Y.J. Yi, J.Y. Wang, Y.J. Li and S.Y. Xie.

Keywords for this news article include: Shandong, People's Republic of China, Asia, Multidrug Resistance, Myelogenous Leukemia, Drugs and Therapies, Drug Resistance, Hematology, Oncology, Binzhou Medical University.

Drugs and Therapies - Drug Delivery Systems

Findings from Birla Institute of Technology and Science Broaden Understanding of Drug Delivery Systems (Homogeneous carboxymethylated orange pulp cellulose: Characterization and evaluation in terms of drug delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Drug Delivery Systems. According to news reporting originating in Jharkhand, India, by NewsRx journalists, research stated, "The aim of the present study is to develop an environment-friendly method to convert orange pulp wastes to Carboxymethyl cellulose (CMC) by homogeneous substitution. Carboxymethylation of Orange pulp treated with alkaline PEG solutions was investigated and characterized by means of TGA, DSC, XRD and SEM and compared with commercial CMC."

The news reporters obtained a quote from the research from the Birla Institute of Technology and Science, "The TGA data reveals that shifting of peaks was observed towards lower temperature with increase in monochloroacetic acid (MCA). SEM studies showed greater blending of particulate powder with increasing MCA content. The crystallinity of synthesized CMC was found to be lower than the commercial CMC. Finally, the cellulosic materials were evaluated for the formulation and dissolution studies of prepared tablets. Dissolution release studies shows that synthesized cellulose (CMCOP5, CMCOP8, CMCOP11) release up to 70.1 +/- 0.04%, whereas the commercial CMC 78.184 +/- 0.07% in 8 h respectively and thereby suggests that it may be used in delayed drug delivery and targeting drugs to the colon."

According to the news reporters, the research concluded: "The synthesized CMC from orange pulp may be used as substitute for the commercial CMC."

Our news correspondents report that additional information may be obtained by contacting K.J. Kumar, Birla Inst Technol, Dept. of Pharmaceut Sci & Technol, Ranchî 835215, Jharkhand, India. Additional authors for this research include R.K. Koley, S. Singh, A.K. Sen and K.J. Kumar.

Immune System Diseases and Conditions - HIV/AIDS

Findings from Boston University Broaden Understanding of HIV/AIDS (A meta-analysis assessing all-cause mortality in HIV-exposed uninfected compared with HIV-unexposed uninfected infants and children)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Immune System Diseases and Conditions - HIV/AIDS are discussed in a new report. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Conduct a meta-analysis examining differential all-cause mortality rates between HIV-exposed uninfected (HEU) infants and children as compared with their HIV-unexposed uninfected (HUU) counterparts. Meta-analysis summarizing the difference in mortality between HEU and HUU infants and children."

The news reporters obtained a quote from the research from Boston University, "Reviewed studies comparing children in the two groups for all-cause mortality, in any setting, from 1994 to 2016 from six databases. Meta-analyses were done estimating overall mortality comparing the two groups, stratified by duration of follow-up time from birth (0-12, 12-24 and >24 months) and by year enrollment ended in each study: less than 2002 compared with at least 2002, when single-dose nevirapine for prevention of mother-to-child transmission (PMTCT) commenced in low-income and middle-income countries. Included 22 studies, for a total of 29 212 study participants [n = 8840 (30.3%) HEU; n = 20 372 (37.7%) HUU]. Random effects models showed HEU had a more than 70% increased risk of mortality vs. HUU. Stratifying by age showed that HEU vs. HUU had a significant 60-70% increased risk of death at every age strata. There was a significant 70% increase in the risk of mortality between groups before the implementation of PMTCT, which remained after 2002 [risk ratio: 1.46; 95% confidence interval (CI): 1.14-1.87], when the availability of PMTCT services was widespread, suggesting that prenatal antiretroviral therapy, and healthier mothers, does not fully eliminate this increased risk in mortality. We show a consistent increase risk of mortality for HEU vs. HUU infants and children."

According to the news reporters, the research concluded: "Longitudinal research is needed to elucidate underlying mechanisms, such as maternal and infant health status and breast feeding practices, which may help explain these differences in mortality."

For more information on this research see: A meta-analysis assessing all-cause mortality in HIV-exposed uninfected compared with HIV-unexposed uninfected infants and children. Aids, 2016;30(15):2351-2360. Aids can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Nutritional and Metabolic Diseases and Conditions - …

Findings from Boston University Reveals New Findings on Obesity (Validating a summary measure of weight history for modeling the health consequences of obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Data on weight history may enhance the predictive validity of epidemiologic models of the health risks of obesity, but collecting such data is often not feasible. In this study, we investigate the validity of a summary measure of weight history."

Funders for this research include National Center for Health Statistics, National Institute on Aging.

The news reporters obtained a quote from the research from Boston University, "We evaluated the quality of reporting of maximum weight in a sample of adults aged 50-84 years using data from the Health and Retirement Study. Recalled max body mass index (BMI, measured in kilogram per square meter) based on recalled weight in 2004 was compared with calculated max BMI based on self-reported weight collected biennially between 1992 and 2004. Logistic regression was used to assess similarity between the measures in predicting prevalent conditions. The correlation coefficient between recalled and calculated max weight in the overall sample was 0.95. Recalled max BMI value was within three BMI units of the calculated value 91.4% of the time. The proportions of individuals with obese I (BMI: 30.0-34.9), obese II (BMI: 35.0-39.9), and obese III (BMI: 40.0 and above) were 28.8%, 12.7%, and 6.6% using recalled values compared with 27.1%, 10.5%, and 4.9% using calculated values. In multivariate analyses, the two BMI measures similarly predicted disease prevalence across a number of chronic conditions."

According to the news reporters, the research concluded: "Recalled max BMI was strongly correlated with max BMI calculated over the 12-year period before recall, suggesting that this measure can serve as a reliable summary measure of recent weight status."

Our news correspondents report that additional information may be obtained by contacting A. Stokes, Boston University, Sch Public Hlth, Center Global Hlth & Dev, Boston, MA, United States.

Cysts

Findings from Boston University in the Area of Cysts Reported (Loss of Zeb2 in mesenchyme-derived nephrons causes primary glomerulocystic disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cysts. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Primary glomerulocystic kidney disease is a special form of renal cystic disorder characterized by Bowman's space dilatation in the absence of tubular cysts. ZEB2 is a SMAD-interacting transcription factor involved in Mowat-Wilson syndrome, a congenital disorder with an increased risk for kidney anomalies."

The news reporters obtained a quote from the research from Boston University, "Here we show that deletion of Zeb2 in mesenchyme-derived nephrons with either Pax2-cre or Six2-cre causes primary glomerulocystic kidney disease without tubular cysts in mice. Glomerulotubular junction analysis revealed many atubular glomeruli in the kidneys of Zeb2 knockout mice, which explains the presence of glomerular cysts in the absence of tubular dilatation. Gene expression analysis showed decreased expression of early proximal tubular markers in the kidneys of Zeb2 knockout mice preceding glomerular cyst formation, suggesting that defects in proximal tubule development during early nephrogenesis contribute to the formation of congenital atubular glomeruli. At the molecular level, Zeb2 deletion caused aberrant expression of Pkd1, Hnf1 beta, and Glis3, three genes causing glomerular cysts. Thus, Zeb2 regulates the morphogenesis of mesenchyme-derived nephrons and is required for proximal tubule development and glomerulotubular junction formation."

According to the news reporters, the research concluded: "Our findings also suggest that ZEB2 might be a novel disease gene in patients with primary glomerular cystic disease."

Our news correspondents report that additional information may be obtained by contacting W.N. Lu, Boston University, Sch Med, Div Grad Med Sci, Grad Program Genom & Genet, Boston, MA 02118, United States. Additional authors for this research include S. Kumar, S. Chan, A. Pisarek-Horowitz, R. Sharma, Q.C.J. Xi, Y. Nishizaki, Y. Higashi, D.J. Salant, R.L. Maas and W.N. Lu.

**Drugs and Therapies - Protease Inhibitors**

**Findings from Brussels Free University Provide New Insights into Protease Inhibitors [Limited HIV-1 Reactivation in Resting CD4(+) T cells from Aviremic Patients under Protease Inhibitors]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Protease Inhibitors. According to news reporting out of Gosselies, Belgium, by NewsRx editors, research stated, "A latent viral reservoir that resides in resting CD4(+) T cells represents a major barrier for eradication of HIV infection. We test here the impact of HIV protease inhibitor (PI) based combination anti-retroviral therapy (cART) over nonnucleoside reverse transcriptase inhibitor (NNRTI)-based cART on HIV-1 reactivation and integration in resting CD4(+) T cells."

Our news journalists obtained a quote from the research from Brussels Free University, "This is a prospective cohort study of patients with chronic HIV-1 infection treated with conventional cART with an undetectable viremia. We performed a seven-year study of 47 patients with chronic HIV-infection treated with cART regimens and with undetectable plasma HIV-1 RNA levels for at least 1 year. Of these 47 patients treated with cART, 24 were treated with a PI-based regimen and 23 with a NNRTI-based regimen as their most recent treatment for more than one year. We evaluated the HIV-1 reservoir using reactivation assay and integrated HIV-1 DNA, respectively, in resting CD4(+) T cells. Resting CD4(+) T cells isolated from PI-treated patients compared to NNRTI-treated patients showed a limited HIV-1 reactivation upon T-cell stimulation (p = 0.024) and a lower level of HIV-1 integration (p = 0.024)".

According to the news editors, the research concluded: "Our study indicates that PI-based cART could be more efficient than NNRTI-based cART for limiting HIV-1 reactivation in aviremic chronically infected patients."

For more information on this research see: Limited HIV-1 Reactivation in Resting CD4(+) T cells from Aviremic Patients under Protease Inhibitors. *Scientific Reports*, 2016;6():1-7. *Scientific Reports* can be contacted at: Nature Publishing Group, Macmillian Building, 4 Crinan St, London N1 9XW, England. Findings from C. Chamizo and Co-Researchers Advance Knowledge in Breast Cancer (Determination of True ERBB2 Gene Amplification in Breast Cancer by Quantitative PCR Using a Reference and a Novel Control Gene)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news reporting out of Madrid, Spain, by NewsRx editors, research stated, "Human epidermal growth factor receptor 2 (ERBB2/HER2) is amplified and overexpressed in 20% to 25% of breast carcinomas, correlates with poor outcome, and is an indication for treatment with trastuzumab. Accurate assessment of ERBB2 status is crucial for proper prognosis and to offer appropriate treatment for patients."

Our news journalists obtained a quote from the research, "ERBB2 status is generally determined by immunohistochemistry or fluorescence in situ hybridization (FISH), and sporadically by quantitative real-time polymerase chain reaction (PCR). We developed a new algorithm, termed quantitative PCR algorithm (QPA) score, and compared its performance with the gold standard FISH assay. The QPA is a computation of the relative number of copies of the ERBB2 gene with respect to a nonstandard, short-arm centromeric sequence on chromosome 17, and referenced to a single-copy gene, RPP30. This provides a more reliable determination of ERBB2 amplification, reducing the false polysomy 17 error. A total of 69 breast carcinoma samples were tested for quantitative real-time PCR and FISH, and the degree of concordance was analyzed. Sixty-two cases were in agreement between the 2 methods, and the contingency study assigned a k value of 0.729 for their correlation. A receiver operating characteristic analysis was used to determine the optimal cut-off point for ERBB2 amplification, which was estimated at a QPA=1.53 (sensitivity=0.863; specificity=0.944)."

According to the news editors, the research concluded: "Our data conclude that the QPA is able to determine ERBB2 gene status with high accuracy, while also overcoming the limitations of conventional techniques and providing better cost-effectiveness."

For more information on this research see: Determination of True ERBB2 Gene Amplification in Breast Cancer by Quantitative PCR Using a Reference and a Novel Control Gene. Applied Immunohistochemistry & Molecular Morphology, 2016;24(3):179-87. (Lippincott Williams and Wilkins - www.lww.com; Applied Immunohistochemistry & Molecular Morphology - journals.lww.com/appliedimmunohist/pages/default.aspx)

Gram-Positive Bacteria - Streptococcus

Findings from C. Das and Co-Authors Update Knowledge of Streptococcus (In silico dissection of Type VII Secretion System components across bacteria: New directions towards functional characterization)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - Streptococcus. According to news reporting from Pune, India, by NewsRx journalists, research stated, "Type VII Secretion System (T7SS) is one of the factors involved in virulence of Mycobacterium tuberculosis H37Rv. Numerous research efforts have been made in the last decade towards characterizing the components of this secretion system."

The news correspondents obtained a quote from the research, "An extensive genome-wide analysis through compilation of isolated information is required to obtain a global view of diverse characteristics and pathogenicity-related aspects of this machinery. The present study suggests that differences in structural components (of T7SS) between Actinobacteria and Firmicutes, observed earlier in a few organisms, is indeed a global trend. A few hitherto uncharacterized T7SS-like clusters have been identified in the pathogenic bacteria Enterococcus faecalis, Saccharomonospora viridis, Streptococcus equi, Streptococcus gordonii and Streptococcus sanguinis. Experimental verification of these clusters can shed lights on their role in bacterial pathogenesis. Similarly, verification of the identified variants of T7SS clusters consisting additional membrane components may help in unraveling new mechanism of protein translocation through T7SS."

According to the news reporters, the research concluded: "A database of various components of T7SS has been developed to facilitate easy access and interpretation of T7SS related data."

Our news journalists report that additional information may be obtained by contacting C. Das, Bio-Sciences R and D Division, TCS Innovation Labs, Tata Research Development and Design Centre, Tata Consultancy Service Ltd, Pune 411 013, India. Additional authors for this research include T.S. Ghosh and S.S Mande.

Drugs and Therapies - Immunotherapy

Findings from C. Gerard and Colleagues Provides New Insights into Immunotherapy (A Comprehensive Preclinical Model Evaluating the Recombinant PRAME Antigen Combined With the AS15 Immunostimulant to Fight Against PRAME-expressing Tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Immunotherapy are presented in a new report. According to news reporting out of Rixensart, Belgium, by NewsRx editors, research stated, "The PRAME tumor antigen is a potential target for immunotherapy. We assessed the immunogenicity, the antitumor activity, and the safety and the tolerability of a recombinant PRAME protein (recPRAME) combined with the AS15 immunostimulant (recPRAME+AS15) in preclinical studies in mice and Cynomolgus monkeys."

Our news journalists obtained a quote from the research, "Four groups of 12 CB6F1 mice received 4 injections of phosphate-buffered saline (PBS), recPRAME, AS15, or recPRAME+AS15. Immunized mice were injected with tumor cells expressing PRAME (CT26-PRAME) 2 weeks or 2 months after the last injection. The mean tumor surface was measured twice a week. Two groups of 10 monkeys received 7 injections of saline or recPRAME+AS15. T-cell responses were measured by flow cytometry using intracellular cytokine staining (ICS). In CB6F1 mice, repeated injections of recPRAME+AS15 induced high PRAME-specific antibody titers and mostly CD4+ T cells producing cytokines. This immune response was long-lasting in these animals and was associated with protection against a challenge with PRAME-expressing tumor cells (CT26-PRAME) applied either 2 weeks or 2 months after the last injection; these data indicate the induction of an immune memory. In HLA-A2.01/HLA-DR1 transgenic mice, recPRAME+AS15 induced both CD4+ and CD8+ T-cell responses, indicating that this antigen can be processed by the human leukocyte antigen and is potentially immunogenic in humans. In addition, a repeated-dose toxicity study in monkeys showed that 7 biweekly injections of recPRAME+AS15 were well tolerated, and induced PRAME-specific antibodies and T cells."

According to the news editors, the research concluded: "These preclinical data indicate that repeated injections of the PRAME cancer immunotherapeutic are immunogenic and have an acceptable safety profile."

For more information on this research see: A Comprehensive Preclinical Model Evaluating the Recombinant PRAME Antigen Combined With the AS15 Immunostimulant to Fight Against PRAME-expressing Tumors. Journal of Immunotherapy, 2015;38(8):311-20. (Lippincott Williams and Wilkins - www.lww.com; Journal of Immunotherapy - journals.lww.com/immunotherapy-journal/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting C. Gerard, GSK Vaccines, Rixensart, Belgium. Additional authors for this research include N. Baudson, T. Ory, L. Segal and J. Louahed.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1097/CJI.0000000000000095. This DOI is a link to an online electronic document that is either free or for purchase.
Findings from C. Pelat and Colleagues Update Understanding of Enterobacteriaceae (Hand Hygiene, Cohorting, or Antibiotic Restriction to Control Outbreaks of Multidrug-Resistant Enterobacteriaceae)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Enterobacteriaceae is now available. According to news reporting out of Paris, France, by NewsRx editors, research stated, "The best strategy for controlling extended-spectrum b-lactamase-producing Enterobacteriaceae (ESBL-PE) transmission in intensive care units (ICUs) remains elusive. We developed a stochastic transmission model to quantify the effectiveness of interventions aimed at reducing the spread of ESBL-PE in an ICU."

Our news journalists obtained a quote from the research, "We modeled the evolution of an outbreak caused by the admission of a single carrier in a 10-bed ICU free of ESBL-PE. Using data obtained from recent multicenter studies, we studied 26 strategies combining different levels of the following 3 interventions: (1) increasing healthcare worker compliance with hand hygiene before and after contact with a patient; (2) cohorting; (3) reducing antibiotic prevalence at admission with or without reducing antibiotherapy duration. Improving hand hygiene compliance from 55% before patient contact and 60% after patient contact to 80% before and 80% after patient contact reduced the nosocomial incidence rate of ESBL-PE colonization by 91% at 90 days. Adding cohorting to hand hygiene improvement intervention decreased the proportion of ESBL-PE acquisitions by an additional 7%. Antibiotic restriction had the lowest impact on the epidemic. When combined with other interventions, it only marginally improved effectiveness, despite strong hypotheses regarding antibiotic impact on transmission."

According to the news editors, the research concluded: "Our results suggest that hand hygiene is the most effective intervention to control ESBL-PE transmission in an ICU."

For more information on this research see: Hand Hygiene, Cohorting, or Antibiotic Restriction to Control Outbreaks of Multidrug-Resistant Enterobacteriaceae. Infection Control and Hospital Epidemiology, 2015;37(3):272-80. (University of Chicago Press - press.uchicago.edu; Infection Control and Hospital Epidemiology - /ucp/journals/journal/iche.html)

Our news journalists report that additional information may be obtained by contacting C. Pelat, 1INSERM, Infection, Antimicrobials, Modelization, Evolution (IAME), UMR 1137, F-75018 Paris, France. Additional authors for this research include L. Kardas-Sloma, G. Birgand, E. Ruppe, M. Schwarzinger, A. Andremont, J.C. Lucet and Y. Yazdanpanah.

Findings from C. Reyes and Colleagues Provides New Insights into Clinical Trials and Studies (Risks and Benefits of Bisphosphonate Therapies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news reporting originating in Barcelona, Spain, by NewsRx journalists, research stated, "Bisphosphonates are the mainstay of osteoporosis treatment but also play a fundamental role in treating other bone diseases such as Osteogenesis Imperfecta, Pagets’ disease, and in the prevention of adverse skeletal effects in certain cancers such as prostate cancer or multiple myeloma. In the last decades, the refinement of bisphosphonates and an increase in the number of new bisphosphonates commercialized has altered the clinical management of these diseases."

Financial supporters for this research include Novartis, Amgen, Bioiberica.

The news reporters obtained a quote from the research, "Despite differences between randomized controlled trials and observational studies, overall all bisphosphonates licensed have proven to reduce the risk of fracture through the inhibition of bone resorption. Other beneficial effects include pain reduction in bone metastasis and potentially a decrease in mortality. However, the chronic nature of most of these disorders implies long-term treatments, which can be associated with long-term adverse effects. Some of the adverse effects identified include an increased risk of atypical femur fractures, osteonecrosis of the jaw, gastrointestinal side effects, or atrial fibrillation. The harm/benefit thinking and the constant update regarding these medications are vital in the day-to-day decision-making in clinical practices."

According to the news reporters, the research concluded: "The aims of this review are to compile the basic characteristics of these drugs and outline the most important benefits and side effects and provide a clinical context as well as a research agenda to fill the gaps in our knowledge."

Our news correspondents report that additional information may be obtained by contacting C. Reyes, GREMPAL Research Group, Institut Universitari d'Investigacio en Atencio Primaria Jordi Gol (IDIAP Jordi Gol), Barcelona, Spain. Additional authors for this research include M. Hitz, D. Prieto-Alhambra and B. Abrahamsen.

Findings from C. Sitzia and Co-Authors in the Area of Cytoskeletal Proteins Reported (Adaptive Immune Response Impairs the Efficacy of Autologous Transplantation of Engineered Stem Cells in Dystrophic Dogs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Proteins - Cytoskeletal Proteins. According to news originating from Milan, Italy, by NewsRx correspondents, research stated, "Duchenne muscular dystrophy is the most common genetic muscular dystrophy. It is caused by mutations in the dystrophin gene, leading to absence of muscular dystrophin and to progressive degeneration of skeletal muscle."

Our news journalists obtained a quote from the research, "We have demonstrated that the exon skipping method safely and efficiently brings to the expression of a functional dystrophin in dystrophic CD133+ cells injected scid/mdx mice. Golden Retriever muscular dystrophic (GRMD) dogs represent the best preclinical model of Duchenne muscular dystrophy, mimicking the human pathology in genotypic and phenotypic aspects. Here, we assess the capacity of intra-arterial delivered autologous engineered canine CD133+ cells of restoring dystrophin expression in Golden Retriever muscular dystrophy. This is the first demonstration of five-year follow up study, showing initial clinical amelioration followed by stabilization in mild and severe affected Golden Retriever muscular dystrophy dogs."

According to the news editors, the research concluded: "The occurrence of T-cell response in three Golden Retriever muscular dystrophy dogs, consistent with a memory response boosted by the exon skipped-dystrophin protein, suggests an adaptive immune response against dystrophin."

For more information on this research see: Adaptive Immune Response Impairs the Efficacy of Autologous Transplantation of Engineered Stem Cells in Dystrophic Dogs. *Molecular Therapy*, 2016;24(11):1949-1964. *Molecular Therapy* can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. (Elsevier - www.nature.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

Heart Disorders and Diseases - Atrial Fibrillation

Findings from C.A. McHorney et al in Atrial Fibrillation Reported (Comparison of Adherence to Rivaroxaban Versus Apixaban Among Patients With Atrial Fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Atrial Fibrillation are discussed in a new report. According to news reporting originating in Montreal, Canada, by NewsRx journalists, research stated, "Non-vitamin K antagonist oral anticoagulant medications are increasingly used for stroke prophylaxis in patients with nonvalvular atrial fibrillation (NVAF). This study aimed to compare adherence with rivaroxaban and apixaban among patients with NVAF in routine clinical practice."

The news reporters obtained a quote from the research, "Using pharmacy and medical claims from Truven Health Analytics MarketScan databases, we identified NVAF patients aged >= 18 years treated with rivaroxaban or apixaban. Baseline demographic and clinical features were balanced using 1:1 propensity score matching. Adherence to therapy was measured at 90 and 180 days post-index date and was defined by the proportion of days covered (PDC) >= 0.80 and PDC >= 0.90. 'Gaps in care,' defined as those with 10 or more day gaps in supply, were also evaluated. Between June 2012 and April 2014, 11,477 rivaroxaban and 2992 apixaban users were identified. Baseline characteristics for rivaroxaban and apixaban users were well matched. Relative to apixaban users, rivaroxaban users were more likely to have a PDC >= 0.80 at both 90 days (85.3% vs 79.9%; P< 0.001) and 180 days (75.8% vs 72.2%; P = 0.001). Similar results were observed with PDC >= 0.90. The proportion of patients with at least one 5+ and 10+ day gap in prescriptions was significantly lower in the rivaroxaban versus apixaban cohorts: 54.2% versus 62.4% (P < 0.001) and 40.0% versus 49.2% (P < 0.001), respectively. Adherence to non-vitamin K antagonist oral anticoagulants among NVAF patients is less than ideal, and gaps in treatment are common. Those on once-a-day rivaroxaban had significantly higher adherence and fewer gaps in treatment compared with twice-a-day apixaban."

According to the news reporters, the research concluded: "Future studies are needed to explore whether these treatment differences affect comparative patient outcomes."

For more information on this research see: Comparison of Adherence to Rivaroxaban Versus Apixaban Among Patients With Atrial Fibrillation. Clinical Therapeutics, 2016;37(11):2477-2488. Clinical Therapeutics can be contacted at: Elsevier, 685 Route 202-206, Bridgewater, NJ 08807, USA. Liver Diseases and Conditions - Hepatitis C Virus

Findings from C.M. Owens and Co-Authors Update Knowledge of Hepatitis C Virus (Preclinical Profile and Clinical Efficacy of a Novel Hepatitis C Virus NS5A Inhibitor, EDP-239)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Hepatitis C Virus have been published. According to news reporting from Watertown, Massachusetts, by NewsRx journalists, research stated, "EDP-239, a novel hepatitis C virus (HCV) inhibitor targeting nonstructural protein 5A (NS5A), has been investigated in vitro and in vivo. EDP-239 is a potent, selective inhibitor with potency at picomolar to nanomolar concentrations against HCV genotypes 1 through 6. In the presence of human serum, the potency of EDP-239 was reduced by less than 4-fold."

The news correspondents obtained a quote from the research, "EDP-239 is additive to synergistic with other direct-acting antivirals (DAAs) or host-targeted antivirals (HTAs) in blocking HCV replication and suppresses the selection of resistance in vitro. Furthermore, EDP-239 retains potency against known DAA- or HTA-resistant variants, with half-maximal effective concentrations (EC(50)s) equivalent to those for the wild type. In a phase I, single-ascending-dose, placebo-controlled clinical trial, EDP-239 demonstrated excellent pharmacokinetic properties that supported once daily dosing."

According to the news reporters, the research concluded: "A single 100-mg dose of EDP-239 resulted in reductions in HCV genotype 1a viral RNA of >3 log(10) IU/ml within the first 48 h after dosing and reductions in genotype 1b viral RNA of >4-log(10) IU/ml within 96 h."

For more information on this research see: Preclinical Profile and Clinical Efficacy of a Novel Hepatitis C Virus NS5A Inhibitor, EDP-239. Antimicrobial Agents and Chemotherapy, 2016;60(10):6207-6215. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Findings from CONICET Provides New Data on Estradiol Congeners
(17-Estradiol Protects Skeletal Myoblasts From Apoptosis Through p53, Bcl-2, and FoxO Families)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hormones - Estradiol Congeners. According to news reporting out of Bahia Blanca, Argentina, by NewsRx editors, research stated, "17-Estradiol (E-2) protects several nonreproductive tissues from apoptosis, including skeletal muscle. Previously, we showed that E-2 at physiological concentrations prevented apoptosis induced by H2O2 in skeletal myoblasts, reverting PKC, JNK, and p66Shc activation and exerting a beneficial action over mitochondria."

Our news journalists obtained a quote from the research from CONICET, "Since genomic actions underlying the regulation of nuclear gene transcription are a common property of this steroid, the present work characterizes the transcriptional activity modulated by E-2 to exert its antiapoptotic effect. We report that E-2 protects skeletal myoblasts against apoptosis induced by H2O2 modulating p53 and FoxO transcription factors and then their target genes Bcl-2, Bim, Puma, PERP, and MDM2, without affecting Noxa gene."

According to the news editors, the research concluded: "The results presented in this work support the notion that the transcription factors FoxO and p53 coordinate apoptosis in C2C12 cells, and deepens our knowledge about a putative molecular mechanism by which E-2 exerts beneficial effects against oxidative stress in skeletal myoblasts. J. Cell. Biochem. 118:104-115, 2017."

Our news journalists report that additional information may be obtained by contacting A. Vasconsuelo, INBIOSUR CONICET, RA-8000 Bahia Blanca, Buenos Aires, Argentina. Additional authors for this research include A. Vasconsuelo, L. Milanesi and L. Pronsato.

Keywords for this news article include: Bahia Blanca, Argentina, South America, Estradiol Congeners, Gonadal Hormones, Myoblasts, Apoptosis, Genetics, p53 Gene, Cells, CONICET.

DNA Research

Findings from CREST Research Project Update Knowledge of DNA Research (DNA recovery from a single bacterial cell using charge-reversible magnetic nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on DNA Research are discussed in a new report. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Highly efficient DNA recovery from a single bacterial cell was performed by means of imidazole-modified magnetic nanoparticles (Imi-MNPs). The modification by imidazole was confirmed by Fourier transform infrared spectroscopy."

Financial support for this research came from Japan Science and Technology Agency (JST), CREST.

Our news journalists obtained a quote from the research from CREST Research Project, "The Imi-MNPs were highly efficient at DNA extraction owing to the charge reversible properties of Imi-MNPs, whereby DNA is attached to the particles at low pH and eluted at high pH because of electrostatic interactions. The DNA recovery ratio was determined by real-time PCR, and it revealed that complete recovery was guaranteed at >= 10^3 genome copies of Bacillus subtilis. Extraction of DNA from single bacterial cells was followed by PCR amplification of 16S rDNA and capillary electrophoresis. We achieved detection of single bacterial cells with a detection rate of 80%.

According to the news editors, the research concluded: "We believe that our DNA recovery strategy may serve as a powerful tool for efficient DNA extraction and should be useful for quality control of cosmetics, foods, and pharmaceutical products."

For more information on this research see: Colloids and Surfaces B-Biointerfaces, 2016;139():117-122. Colloids and Surfaces B-Biointerfaces can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands.

The news correspondents report that additional information may be obtained from T. Tanaka, JST, CREST, Tokyo, Japan. Additional authors for this research include T. Toyoda, T. Mogi, T. Taguchi, T. Tanaami, T. Yoshino, T. Matsunaga and T. Tanaka.

Nephrology

Findings from Cambridge Institute for Medical Research Broadens Understanding of Nephrology (HIF prolyl hydroxylase inhibitors for the treatment of renal anaemia and beyond)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nephrology are discussed in a new report. According to news originating from Cambridge, United Kingdom, by NewsRx correspondents, research stated, "Small-molecule stabilizers of hypoxia inducible factor (HIF) are being developed for the treatment of renal anaemia. These molecules inhibit prolyl hydroxylase domain-containing (PHD) enzymes, resulting in HIF activation and increased production of erythropoietin."

Our news journalists obtained a quote from the research from Cambridge Institute for Medical Research, "Currently, renal anaemia is treated with recombinant human erythropoietin or related analogues, referred to as conventional erythropoiesis stimulating agents (ESAs). Advantages of PHD enzyme inhibitors over conventional ESAs include their oral administration and their simpler -and potentially cheaper -production. Importantly, inhibition of PHD enzymes is likely to have a range of consequences other than increasing levels of erythropoietin, and these effects could be beneficial -for instance by reducing the need for parenteral iron -but might in some instances be harmful. Several companies are currently testing PHD enzyme inhibitors in patients with renal anaemia and have reported clear evidence of efficacy without serious safety concerns. A central question that current studies are beginning to address is whether using PHD enzyme inhibitors will influence hard end points, including mortality and the rate of cardiovascular events. In terms of approaches to therapy, the exquisite specificity of conventional ESAs is a striking contrast to the pleiotropic effects of activating HIF."

According to the news editors, the research concluded: "Excitingly, PHD inhibitors could also be useful for conditions besides renal anaemia, such as protection from ischaemic injury."

The news correspondents report that additional information may be obtained from P.H. Maxwell, Cambridge Institute for Medical Research, Cambridge Biomedical Campus, Cambridge CB2 0XY, UK.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrneph.2015.193. This DOI is a link to an online electronic document that is either free or for purchase.

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news reporting out of Cambridge, United Kingdom, by NewsRx editors, research stated, "We compared clinical characteristics and cancer specific mortality in men diagnosed with prostate cancer before vs after age 50 years. A total of 919 men 35 to 49 years old and 45,098 men 50 to 66 years old who were diagnosed with prostate cancer between 1998 and 2012 were identified in PCBaSe (Prostate Cancer data Base Sweden)."

Our news journalists obtained a quote from the research from Cambridge University Hospitals NHS Trust, "Cancer specific mortality was compared among age groups (35 to 49, 50 to 59, 60 to 63 and 64 to 66 years) with and without adjusting for cancer characteristics, comorbidity and education in a multivariable Cox proportional hazards model. Clinical cancer characteristics indicated that most nonmetastatic cancer in men younger than 50 years was detected after prostate specific antigen testing. The proportion of nonmetastatic vs metastatic disease at diagnosis was similar in all age groups. A strong association between younger age and poor prognosis was apparent in men in whom metastatic disease was diagnosed before age 50 to 55 years. The crude and adjusted HRs of cancer specific mortality were 1.41 (95% CI 1.12-1.79) and 1.28 (95% CI 1.01-1.62) in men diagnosed before age 50 and at age 50 to 59 years, respectively. In men with nonmetastatic disease crude cancer specific mortality increased with older age but adjusted cancer specific mortality was similar in all age groups. Our findings suggest that an aggressive form of metastatic prostate cancer is particularly common in men younger than 50 to 55 years."

According to the news editors, the research concluded: "Genetic studies and trials of intensified systemic treatment are warranted in this patient group."

Our news journalists report that additional information may be obtained by contacting O. Bratt, Cambridge Univ Hosp, CamPARI Clin, Dept. of Urol, Cambridge, United Kingdom. Additional authors for this research include H. Garmo, J. Adolfsson and O. Bratt.

**Nutritional and Metabolic Diseases and Conditions -…**

**Findings from Cancer Institute in Hyperglycemia Reported**

[Management of hyperglycemia from epidermal growth factor receptor (EGFR) tyrosine kinase inhibitors (TKIs) targeting T790M-mediated resistance]
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Hyperglycemia. According to news originating from Charlotte, North Carolina, by NewsRx correspondents, research stated, "Epidermal growth factor receptor (EGFR) mutations in non-small cell lung cancer (NSCLC) patients are associated with sensitivity to small molecule tyrosine kinase inhibitors (TKIs) such as erlotinib, gefitinib, and afatinib. Although studies show an increased progression free survival (PFS) with use of EGFR TKIs in the first-line setting, most patients will develop resistance to therapy after the first 8-16 months."

Our news journalists obtained a quote from the research from Cancer Institute, "T790M is an acquired resistance mutation reported in 60-70% of patients who initially responded to a prior EGFR TKI. Recently, EGFR TKIs targeting T790M have been developed to overcome resistance with positive results in PFS and objective response rate in patients who have had disease progression on at least one TKI. Two EGFR TKIs targeting T790M, AZD9291 and rociletinib, are new active treatment options for NSCLC but differ in adverse effect profiles. Dose-limiting hyperglycemia has been reported with rociletinib and has required dose reduction, an oral antihyperglycemic, or both, without discontinuation of therapy. This suggests that patients may be effectively treated chronically for hyperglycemia associated with EGFR TKIs targeting T790M, however, guidelines for treatment of hyperglycemia in this setting have not been published."

According to the news editors, the research concluded: "We discuss mechanisms of hyperglycemia associated with TKIs and initial management of hyperglycemia, including benefits and limitations of oral antihyperglycemic options, adjustment of therapy based on grade of hyperglycemia, and recommendations for follow-up glucose monitoring."

For more information on this research see: Management of hyperglycemia from epidermal growth factor receptor (EGFR) tyrosine kinase inhibitors (TKIs) targeting T790M-mediated resistance. Translational Lung Cancer Research, 2015;4(5):576-83.

The news correspondents report that additional information may be obtained from J. Digestive System Diseases and Conditions - Colitis

Findings from Capital Medical University Broaden Understanding of Colitis [Increased CD4(+)CD45RA(-)FoxP3(low) cells alter the balance between Treg and Th17 cells in colitis mice]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and
Conditions - Colitis. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "To investigate the role of regulatory T cell (Treg) subsets in the balance between Treg and T helper 17 (Th17) cells in various tissues from mice with dextran sulfate sodium-induced colitis. Treg cells, Treg cell subsets, Th17 cells, and CD4(+)CD25(+)FoxP3(+)IL-17(+) cells from the lamina propria of colon (LPC) and other ulcerative colitis (UC) mouse tissues were evaluated by flow cytometry."

Our news editors obtained a quote from the research from Capital Medical University, "Forkhead box protein 3 (FoxP3), interleukin 17A (IL-17A), and RORC mRNA levels were assessed by real-time PCR, while interleukin-10 (IL-10) and IL-17A levels were detected with a Cytometric Beads Array. In peripheral blood monocytes (PBMC), mesenteric lymph node (MLN), lamina propria of jejunum (LPJ) and LPC from UC mice, Treg cell numbers were increased (P < 0.05), and FoxP3 and IL-10 mRNA levels were decreased. Th17 cell numbers were also increased in PBMC and LPC, as were IL-17A levels in PBMC, LPJ, and serum. The number of FrI subset cells (CD4(+)CD45RA(+)FoxP3(low)) was increased in the spleen, MLN, LPJ, and LPC. FrII subset cells (CD4(+)CD45RA-FoxP3(high)) were decreased among PBMC, MLN, LPJ, and LPC, but the number of FrIII cells (CD4(+)CD45RA(-)FoxP3(low)) and CD4(+)CD25(+)FoxP3(+)IL-17A(+) cells was increased. FoxP3 mRNA levels in CD4(+)CD45RA(-)FoxP3(low) cells decreased in PBMC, MLN, LPJ, and LPC in UC mice, while IL-17A and RORC mRNA increased. In UC mice the distribution of Treg, Th17 cells, CD4(+)CD45RA(-)FoxP3(high), and CD4(+)CD45RA(-)FoxP3(low) cells was higher in LPC relative to other tissues."

According to the news editors, the research concluded: "Increased numbers of CD4 (+)CD45RA(-)FoxP3(low) cells may cause an imbalance between Treg and Th17 cells that is mainly localized to the LPC rather than secondary lymphoid tissues."

The news editors report that additional information may be obtained by contacting X.J. Liu, Capital Med Univ, Beijing Chaoyang Hosp, Dept. of Gastroenterol, Beijing 100020, People's Republic of China. Additional authors for this research include J. Zhang, X. Chen, Y.F. Xie, Y.H. Pang and X.J. Liu.

Keywords for this news article include: Beijing, People's Republic of China, Asia, Digestive System Diseases and Conditions, Gastrointestinal Diseases and Conditions, Colonic Diseases and Conditions, Ulcerative Colitis, Gastroenterology, Gastroenteritis, Genetics, Capital Medical University.

Proteins - DNA-Binding Proteins

Findings from Capital Medical University in DNA-Binding Proteins Reported (Zinc-Doped Copper Oxide Nanocomposites Inhibit the Growth of Human Cancer Cells through Reactive Oxygen Species-Mediated NF-kappa B Activations)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Proteins - DNA-Binding Proteins is now available. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Zinc-doped copper oxide nanocomposites (nZn-CuO NPs) are novel nanoparticles synthesized by our group. In the present study, the antitumor effects and the underlying molecular mechanisms of the nZn-CuO NPs were investigated."

The news correspondents obtained a quote from the research from Capital Medical University, "The cytotoxicity of nZn-CuO NPs against several types of cancer cell lines was studied using 3-(4,5-dimethylthiazol-2-yl)-5-(3-carboxymethoxyphenyl)-2-(4-sulfophenyl)-2H-tetrazolium (MTS)/phenazinemethosulfate (PMS) assay. Results showed that nZn-CuO NPs exerted obvious antiproliferation effects on cancer cells and relatively weak antiproliferation effects on normal cells. The antitumor mechanisms of nZn-CuO NPs were further investigated using human liver cancer HepG2 cells and human pancreatic cancer Panc28 cells. Hoechst 33342 staining and FITC-Annexin V/PI staining showed that nZn-CuO NPs could induce cell apoptosis in a dose dependent manner. Cell-cycle analysis using flow cytometry revealed that nZn-CuO NPs were able to arrest the cell cycle in the G2/M phase. Also, nZn-CuO NPs were found to induce reactive oxygen species (ROS) generation. Further studies confirmed that nZn-CuO NPs could increase p-IKK alpha/beta and nucleus p-NF-kappa B p65 expressions and decrease IKK alpha, IKK beta, I kappa B alpha, and nucleus NF-kappa B p65 expressions in both cell lines. Overall, our data demonstrated that nZn-CuO NPs could selectively inhibit the growth of cancer cells via ROS-mediated NF-kappa B activation."

According to the news reporters, the research concluded: "The current study provides primary evidence that nZn-CuO NPs possess the potential to be developed as a novel anticancer agent."

For more information on this research see: Zinc-Doped Copper Oxide Nanocomposites Inhibit the Growth of Human Cancer Cells through Reactive Oxygen Species-Mediated NF-kappa B Activations. ACS Applied Materials & Interfaces, 2016;8(46):31806-31812. ACS Applied Materials & Interfaces can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. Oncology - Multiple Myeloma

Findings from Capital Medical University in Multiple Myeloma Reported (Bortezomib-based treatment for multiple myeloma patients with renal impairment A systematic review and meta-analysis of observational studies)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Multiple Myeloma is the subject of a report. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "Renal insufficiency is a common and severe complication of patients with multiple myeloma. The aim of this study was to evaluate bortezomib-based treatment for multiple myeloma patients with renal insufficiency."

Our news journalists obtained a quote from the research from Capital Medical University, "The Cochrane Library, Embase, PubMed, ISI, China National Knowledge Infrastructure, Chinese Biomedical Literature Service System, Chongqing VIP Database, and Wan Fang Data were systematically searched to identify observational studies from January 1, 2001, to December 31, 2015. Myeloma response rate and renal remission rate were pooled by using risk ratio and 95% confidence interval (CI). The Cochran Q and I statistics were used to assess heterogeneity. Sensitivity analysis was performed to test the feasibility of pooled results. Publication bias was conducted when included studies were >= 9. Furthermore, grades of evidence were performed to evaluate study quality. Eleven retrospective cohort studies were included in the final analysis. The number of available studies and risk ratios (95% CI) were, respectively, 10 and 1.48 (95% CI: 1.28-1.71) for myeloma overall response, 6 and 3.69 (95% CI: 2.22-6.13) for myeloma complete response, 9 and 1.47 (95% CI: 1.28-1.69) for renal overall remission, and 8 and 1.49 (95% CI: 1.26-1.75) for renal complete remission. No significant publication bias was observed and sensitivity analysis confirmed the stability of results. The overall qualities of evidence were high for myeloma complete response and medium for the other 3 outcomes based on the Grading of Recommendations, Assessment, Development and Evaluation system."

According to the news editors, the research concluded: "Current evidence indicated that bortezomib-based treatment could improve myeloma overall response (especially myeloma complete response) and renal overall remission (including renal complete remission)."

For more information on this research see: Bortezomib-based treatment for multiple myeloma patients with renal impairment A systematic review and meta-analysis of observational studies. Medicine, 2016;95(46):92-101. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Gram-Negative Bacteria - Helicobacter pylori

Findings from Capital Medical University in the Area of Helicobacter pylori Described (High antibiotic resistance rate: A difficult issue for Helicobacter pylori eradication treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Helicobacter pylori have been published. According to news reporting originating in Beijing, People's Republic of China, by NewsRx editors, the research stated, "Helicobacter pylori (H. pylori) infection is associated with a variety of upper gastrointestinal diseases, including gastric cancer. With the wide application of antibiotics in H. pylori eradication treatment, drug-resistant strains of H. pylori are increasing. H. pylori eradication treatment failure affects the outcome of a variety of diseases of the upper gastrointestinal tract."

The news reporters obtained a quote from the research from Capital Medical University, "Therefore, antibiotic resistance that affects H. pylori eradication treatment is a challenging situation for clinicians. The ideal H. pylori eradication therapy should be safe, effective, simple, and economical. The eradication rate of triple antibiotic therapy is currently less than 80% in most parts of the world."

According to the news reporters, the research concluded: "Antibiotic resistance is the main reason for treatment failure, therefore the standard triple regimen is no longer suitable as a first-line treatment in most regions. H. pylori eradication treatment may fail for a number of reasons, including H. pylori strain factors, host factors, environmental factors, and inappropriate treatment."

Our news correspondents report that additional information may be obtained by contacting M. Zhang, Mei Zhang, Dept. of Gastroenterology, Xuanwu Hospital, Capital Medical University, Beijing 100053, People's Republic of China.

Atrial Septal Defects

Findings from Cardiology Clinic Broaden Understanding of Atrial Septal Defects (Percutaneous closure of isolated ostium secundum-type atrial septal defect in a patient with Mayer-Rokitansky-Kuster-Hauser syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Atrial Septal Defects is now available. According to news reporting originating in Samsun, Turkey, by NewsRx journalists, research stated, "Mayer-Rokitansky-Kuster-Hauser (MRKH) syndrome is a rare congenital anomaly characterized by complete or partial aplasia of the uterus and the upper part of the vagina."

The news reporters obtained a quote from the research from Cardiology Clinic, "It is reported to be associated with cardiovascular disorders including atrial septal defect, anomalous pulmonary venous return, aortopulmonary window, pulmonary valve stenosis, mitral valve prolapse, tetralogy of Fallot, truncus arteriosus, and patent ductus arteriosus."

According to the news reporters, the research concluded: "Herein, for the first time in the medical literature, we present percutaneous closure of an isolated ostium secundum atrial septal defect in this syndrome."

Our news correspondents report that additional information may be obtained by contacting M. Akcay, Terme State Hosp, Cardiol Clin, Samsun, Turkey. Additional authors for this research include O. Gulel, K. Soylu, M. Meric and M. Elmali.

Keywords for this news article include: Samsun, Turkey, Eurasia, Atrial Septal Defects, Atrial Septal Defect, Cardiology, Cardiology Clinic.

Nutritional and Metabolic Diseases and Conditions

Findings from Catholic University of Korea Provide New Insights into Type 2 Diabetes (The Paradoxical Effects of AMPK on Insulin Gene Expression and Glucose-Induced Insulin Secretion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting originating from Seoul, South Korea, by NewsRx correspondents, research stated, "The activation of AMP-activated protein kinase (AMPK) is known to repress the expression of the insulin gene and glucose-stimulated insulin secretion (GSIS). However, the mechanisms by which this occurs, as well as the effects of AMPK activation on glucolipotoxicity-induced b-cell dysfunction, have
not been elucidated."

Funders for this research include Korean Healthcare Technology R&D Project, Ministry of Health, Welfare & Family Affairs, Ministry of Education, Science and Technology. Our news editors obtained a quote from the research from the Catholic University of Korea, "To investigate the effects of 5-amino-4-imidazolecarboxamide ribonucleotide (AICAR) and peroxisome proliferator-activated receptor-coactivator-1a (PGC-1a) on b-cell-specific genes under glucolipotoxic conditions, we performed real-time PCR and measured insulin secretion by primary islets. To study these effects in vivo, we administered AICAR for 10 days (1 mg/g body weight) to 90% pancreatectomized hyperglycemic mice. The exposure of isolated rat and human islets to glucolipotoxic conditions and the overexpression of PGC-1a suppressed insulin and NEUROD1 mRNA expression. However, the expression of these genes was preserved by AICAR treatment and by PGC-1a inhibition. Exposure of isolated islets to glucolipotoxic conditions for 3 days decreased GSIS, which was also well maintained by AICAR treatment and by PGC-1a inhibition. The administration of AICAR to 90% pancreatectomized hyperglycemic mice improved glucose tolerance and insulin secretion. These results indicate that treatment of islets with an AMPK agonist under glucolipotoxic conditions protects against glucolipotoxicity-induced b-cell dysfunction."

According to the news editors, the research concluded: "A better understanding of the functions of molecules such as PGC-1a and AMPK, which play key roles in intracellular fuel regulation, could herald a new era for the treatment of patients with type 2 diabetes mellitus by providing protection against glucolipotoxicity."

The news editors report that additional information may be obtained by contacting J.W. Kim, Dept. of Endocrinology & Metabolism, The Catholic University of Korea, Seoul, 137-040, South Korea. Additional authors for this research include Y.H. You, D.S. Ham, H.K. Yang and K.H Yoon.

**Oncology - Bladder Cancer**

**Findings from Catholic University of Leuven in the Area of Bladder Cancer Reported (Phase III randomised chemoprevention study with selenium on the recurrence of non-invasive urothelial carcinoma. The SELEnium and BLAdder cancer Trial)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Bladder Cancer.
According to news reporting from Leuven, Belgium, by NewsRx journalists, research stated, "In Belgium, bladder cancer (BC) is the fifth most common cancer in men. The per-patient lifetime cost is high."

Financial support for this research came from Science and Technology Belgium (IWT).

The news correspondents obtained a quote from the research from the Catholic University of Leuven, "Previous epidemiological studies have consistently reported that selenium concentrations were inversely associated with the risk of BC. We therefore hypothesised that selenium may be suitable for chemoprevention of recurrence of BC. The Selenium and Bladder Cancer Trial (SELEBLAT) was an academic phase III placebo-controlled, double-blind, randomised clinical trial designed to determine the effect of selenium on recurrence of non-invasive urothelial carcinoma conducted in 14 Belgian hospitals. Patients were randomly assigned by a computer program to oral selenium yeast 200 μg once a day or placebo for three years, in addition to standard care. All study personnel and participants were blinded to treatment assignment for the duration of the study. All randomised patients were included in the intention to treat (ITT) and safety analyses. Per protocol analyses (PPAs) included all patients in the study three months after start date. Between September 18, 2009 and April 18, 2013, 151 and 141 patients were randomised in the selenium and placebo group. Patients were followed until December 31, 2015. The ITT analysis resulted in 43 (28%; 95% CI, 0.21-0.35) and 45 (32%; 95% CI, 0.24-0.40) recurrences in the selenium and placebo group. The hazard ratio (HR) was 0.85 (95% CI, 0.56-1.29; p = 0.44) while the HR for the PPA resulted in 42 and 39 (28%; 95% CI, 0.20-0.35) recurrences in the selenium and placebo group (HR = 0.96 [95% CI, 0.62 -1.48]; p = 0.93)."

According to the news reporters, the research concluded: "Selenium supplementation does not lower the probability of recurrence in BC patients."

Nervous System Diseases and Conditions - Narcolepsy

Findings from Center for Integrative Genomics Provide New Insights into Narcolepsy (Narcolepsy-Associated HLA Class I Alleles Implicate Cell-Mediated Cytotoxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nervous System Diseases and Conditions - Narcolepsy. According to news reporting from Lausanne, Switzerland, by NewsRx journalists, research stated, "Narcolepsy with cataplexy is tightly associated with the HLA class II allele DQB1*06:02. Evidence indicates a complex contribution of HLA class II genes to narcolepsy susceptibility with a recent independent association with HLA-DPB1."

The news correspondents obtained a quote from the research from Center for Integrative Genomics, "The cause of narcolepsy is supposed be an autoimmune attack against hypocretin-producing neurons. Despite the strong association with HLA class II, there is no evidence for CD4+ T-cell-mediated mechanism in narcolepsy. Since neurons express class I and not class II molecules, the final effector immune cells involved might include class I-restricted CD8+ T-cells. HLA class I (A, B, and C) and II (DQB1) genotypes were analyzed in 944 European narcolepsy with cataplexy patients and in 4,043 control subjects matched by country of origin. All patients and controls were DQB1*06:02 positive and class I associations were conditioned on DQB1 alleles. HLA-A*11:01 (OR=1.49 [1.18-1.87] p=7.0*10(-4)), C*04:01 (OR=1.34 [1.10-1.63] p=3.23*10(-3)), and B*35:01 (OR=1.46 [1.13-1.89] p=3.64*10(-3)) were associated with susceptibility to narcolepsy. Analysis of polymorphic class I amino-acids revealed even stronger associations with key antigen-binding residues HLA-A-Tyr(9) (OR=1.32 [1.15-1.52] p=6.95*10(-5)) and HLA-C-Ser(11) (OR=1.34 [1.15-1.57] p=2.43*10(-4))."

According to the news reporters, the research concluded: "Our findings provide a genetic basis for increased susceptibility to infectious factors or an immune cytotoxic mechanism in narcolepsy, potentially targeting hypocretin neurons."

Our news journalists report that additional information may be obtained by contacting M. Tafti, Center for Integrative Genomics (CIG) University of Lausanne, Lausanne, Switzerland. Additional authors for this research include G.J. Lammers, Y. Dauvilliers, S. Overeem, G. Mayer, J. Nowak, C. Pfizer, V. Dubois, J.F. Eliaou, H.P. Eberhard, R. Liblau, A. Wierzbicka, P. Geisler, C.L. Bassetti, J. Mathis, M. Lecendreux, R. Khatami and R Heinzer.

**Oncology - Esophageal Cancer**

**Findings from Central South University in the Area of Esophageal Cancer Reported (Using aptamers to elucidate esophageal cancer clinical samples)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Esophageal Cancer have been published. According to news reporting originating from Changsha, People's Republic of China, by NewsRx correspondents, research stated, "The epithelial cell adhesion molecule (EpCAM) is closely correlated with the occurrence and development of various cancers of epithelial origin. This study tested, for the first time, the ability of EpCAM aptamer SYL3C to detect EpCAM expression in 170 cases of esophageal cancer (EC) and precancerous lesions, as well as 20 cases of EC series samples, using immunofluorescence imaging analysis."

Our news editors obtained a quote from the research from Central South University, "Corresponding antibodies were used as control. EpCAM overexpression was 98% in both esophageal squamous cell carcinoma (ESCC) and esophageal adenocarcinoma (EACA) and 100% in metastasis, but no EpCAM overexpression was detected in undifferentiated EC (UEC). Significant differences were noted among various stages of differentiation (p <0.05) with the degree of differentiation inversely correlated with the expression of EpCAM. Overexpressed EpCAM was detected in severe dysplasia, but negative in mild to moderate dysplasia and benign esophageal lesions. In a competitive binding experiment, EpCAM aptamer generated a staining pattern similar to that of antibody, but the binding sites with EpCAM were different."

According to the news editors, the research concluded: "Based on these results, it can be concluded that EpCAM is suitable for use as an EC biomarker, therapeutic target, and effective parameter for tumor transfer and prognosis evaluation by aptamer SYL3C staining."

For more information on this research see: Using aptamers to elucidate esophageal cancer clinical samples. *Scientific Reports*, 2015;5():18516. (Nature Publishing Group - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting Z. Liu, Xiangya Hospital, Central South University, Changsha, Hunan 410008, People's Republic of China. Nephrology

Findings from Chaim Sheba Medical Center Yields New Data on Nephrology (Acute renal artery occlusion: Presentation, treatment, and outcome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nephrology have been presented. According to news reporting out of Tel Hashomer, Israel, by NewsRx editors, research stated, "Acute renal artery occlusion is an uncommon disease requiring rapid diagnosis for prevention of kidney loss or permanent kidney damage. The purpose of this study was to identify patients with acute kidney infarction; to characterize their presentation, imaging, and treatment; and to compare the subgroup of patients who underwent catheter-directed thrombolysis (CDT) with those who were treated without intervention."

Our news journalists obtained a quote from the research from Chaim Sheba Medical Center, "Hospital records between 2005 and 2015 were queried for keywords suggestive of kidney infarction. Patients were divided into two groups: the CDT group and the noninterventional group. Data collected included demographics, comorbidities, methods of diagnosis, and time from presentation to diagnosis. For patients treated with CDT, additional data collected included details of thrombolytic therapy and follow-up studies. The two groups were compared regarding their clinical characteristics and outcome. Forty-two patients were diagnosed with acute kidney infarction; 13 (31%) were treated with CDT and 29 (69%) were treated conservatively. Median time from presentation to diagnosis was 42 hours in the CDT group and 32 hours in the untreated group. Among the CDT group, complete or partial resolution of the thrombus was seen in all patients. Two required permanent dialysis, both renal transplant patients. Median follow-up was 30 months (interquartile range, 2.7-46.2) in the CDT group and 13 months (interquartile range, 0.11-16) in the noninterventional group. Mean creatinine clearance at diagnosis and at last follow-up was 74.3 and 54.6 mL/min, respectively, in the CDT group (a decrease of 27%; P = .032) and 66.1 and 60 mL/min in the conservatively treated group (a decrease of 9%; P = .04). Follow-up imaging was available in nine patients treated with CDT. Mean interval from treatment to follow-up imaging was 13 months (range, 1-35 months) and consistently showed a functional but smaller treated kidney. (Mean pole-to-pole kidney length at baseline and late follow-up: 10.4 cm and 8.5 cm, respectively). Most patients presenting with acute kidney infarction are managed conservatively. A subset of patients with complete occlusion of the renal artery undergo CDT with good angiographic results. The treated kidney is expected to decrease in size over time, and overall kidney function is expected to decrease compared with baseline. Deterioration in renal function appears to stabilize and does not continue over time."

According to the news editors, the research concluded: "CDT for acute renal artery occlusion is a safe modality of therapy and should be attempted for the purpose of kidney salvage, even in the setting of prolonged ischemia."

Our news journalists report that additional information may be obtained by contacting D. Silverberg, Chaim Sheba Med Center, Dept. of Vasc Surg, Tel Hashomer, Israel.
Additional authors for this research include T. Meser, U. Rimon, O. Salomon and M. Halak.

Musculoskeletal Diseases and Conditions —

Findings from Chang Gung University Provides New Data about Necrotizing Fasciitis (Synchronous multifocal necrotizing fasciitis prognostic factors: a retrospective case series study in a single center)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Necrotizing Fasciitis have been published. According to news reporting out of Taoyuan, Taiwan, by NewsRx editors, research stated, "No reports have been published on synchronous multifocal necrotizing fasciitis (SMNF), a multifocal presence of necrotizing fasciitis in different extremities. We evaluated the clinical characteristics and outcomes of SMNF."

Our news journalists obtained a quote from the research from Chang Gung University, "Eighteen patients (14 men, 4 women; mean age: 59 years) diagnosed with SMNF of the extremities between January 2004 to December 2012 were enrolled and evaluated. Vibrio species were the most commonly (78%; n = 14) isolated; others were two cases (11%) of Aeromonas spp., one case (6%) of group A beta-hemolytic streptococcus, and one case of coagulase-negative staphylococcus. SMNF was in the bilateral lower limbs (72%; n = 13), bilateral upper limbs (17%; n = 3), and one patient with one upper and one lower limb (11%). Non-surviving patients had more bilateral lower limb involvement and thrombocytopenia. Most patients with SMNF were male and had bilateral lower limb and marine Gram-negative bacteria involvement."

According to the news editors, the research concluded: "The mortality of SMNF remained extremely high in patients with involvement of bilateral lower limb and initial thrombocytopenia."

For more information on this research see: Synchronous multifocal necrotizing fasciitis prognostic factors: a retrospective case series study in a single center. Infection, 2016;44(6):757-763. Infection can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. (Springer - www.springer.com; Infection - www.springerlink.com/content/0300-8126/)

Our news journalists report that additional information may be obtained by contacting K.C. Huang, Chang Gung University, Grad Inst Clin Med Sci, Coll Med, Taoyuan, Taiwan. Additional authors for this research include Y.Y. Li, T.W. Huang, T.Y. Huang, W.H. Hsu, Y.H. Tsai, J.C. Huang and K.C. Huang.

Heart Disorders and Diseases - Cardiogenic Shock

Findings from Chang Gung University Update Understanding of Cardiogenic Shock (Associations with 30-day survival following extracorporeal membrane oxygenation in patients with acute ST segment elevation myocardial infarction and profound ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Heart Disorders and Diseases - Cardiogenic Shock is now available. According to news reporting from Kaohsiung, Taiwan, by NewsRx journalists, research stated, "Limited data are available regarding the role of percutaneous cardiopulmonary support for the treatment of ST segment elevation myocardial infarction (STEMI) with profound cardiogenic shock (CS). The aim of this study is to identify the determinant factors for survival of patients with STEMI who underwent extracorporeal membrane oxygenation (ECMO) support."

The news correspondents obtained a quote from the research from Chang Gung University, "From January 2005 to December 2013, 192 patients experienced STEMI with CS needed intraaortic balloon pumping and support with vasoactive agents at our hospital. Among them, 51 patients experienced profound CS and needed ECMO support. Higher body mass index (BMI) level, longer door-to-balloon time, higher serum blood urea nitrogen (BUN) level, and lower 24 h lactic acid clearance were associated with 30-day mortality postECMO."

According to the news reporters, the research concluded: "Longer door-to-balloon time, higher BMI, higher serum BUN level, and poorer lactic acid clearance following ECMO placement for patients with STEMI and profound CS could predict 30-day clinical outcomes."

Our news journalists report that additional information may be obtained by contacting C.J. Wu, Chang Gung University, Coll Med, Kaohsiung Chang Gung Memorial Hospital, Div CardiolDept Internal Med, Kaohsiung, Taiwan. Additional authors for this research include C.Y. Fang, H.C. Chen, C.J. Nutritional and Metabolic Diseases and Conditions – …

Findings from Charite University Hospital and School of Medicine
Update Knowledge of Diabetic Angiopathies (The TetO rat as a new translational model for type 2 diabetic retinopathy by inducible insulin receptor knockdown)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Diabetic Angiopathies is the subject of a report. According to news reporting from Berlin, Germany, by NewsRx journalists, research stated, "Although the renin-angiotensin system plays an important role in the progression of diabetic retinopathy, its influence therein has not been systematically evaluated. Here we test the suitability of a new translational model of diabetic retinopathy, the TetO rat, for addressing the role of angiotensin-II receptor 1 (AT1) blockade in experimental diabetic retinopathy."

Financial supporters for this research include Novartis, Marie Curie Actions EU, Berlin Institute of Health.

The news correspondents obtained a quote from the research from the Charite University Hospital and School of Medicine, "Diabetes was induced by tetracycline-inducible small hairpin RNA (shRNA) knockdown of the insulin receptor in rats, generating TetO rats. Systemic treatment consisted of an AT1 blocker (ARB) at the onset of diabetes, following which, 4-5 weeks later the retina was analysed in vivo and ex vivo. Retinal function was assessed by Ganzfeld electroretinography (ERG). Retinal vessels in TetO rats showed differences in vessel calibre, together with gliosis. The total number and the proportion of activated mononuclear phagocytes was increased. TetO rats presented with loss of retinal ganglion cells (RGC) and ERG indicated photoreceptor malfunction. Both the inner and outer blood-retina barriers were affected. The ARB treated group showed reduced gliosis and an overall amelioration of retinal function, alongside RGC recovery, whilst no statistically significant differences in vascular and inflammatory features were detected. The TetO rat represents a promising translational model for the early neurovascular changes associated with type 2 diabetic retinopathy."

According to the news reporters, the research concluded: "ARB treatment had an effect on the neuronal component of the retina but not on the vasculature."

For more information on this research see: The TetO rat as a new translational model for type 2 diabetic retinopathy by inducible insulin receptor knockdown. Diabetologica, 2017;60(1):202-211. Diabetologica can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Diabetologia - www.springerlink.com/content/0012-186x/)

Liver Diseases and Conditions - Hepatitis C Virus

Findings from Charite University Hospital and School of Medicine Yields New Data on Hepatitis C Virus (Apolipoprotein E allele frequencies in chronic and self-limited hepatitis C suggest a protective effect of APOE4 in the course of hepatitis C ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Liver Diseases and Conditions - Hepatitis C Virus are discussed in a new report. According to news reporting originating from Berlin, Germany, by NewsRx correspondents, research stated, "Infectious hepatitis C virus (HCV) particles bind to host lipoproteins such as low-density lipoproteins (LDLs). Low-density lipoprotein receptors (LDLR) have been termed candidate receptors for HCV-LDL complexes."

Financial support for this research came from German Network of Competence for Viral Hepatitis (Hep Net).

Our news editors obtained a quote from the research from the Charite University Hospital and School of Medicine, "Functional host genetic single nucleotide polymorphisms (SNPs) in the apolipoprotein E (APOE) gene encoding apolipoprotein E (apoE) - a major structural LDL component and natural ligand of LDLR - likely influence the course of HCV infection. We investigated the prevalence of APOE SNPs in two large and independent cohorts of patients with chronic HCV infection compared to respective controls. We genotyped 996 chronically HCV-infected patients; 179 patients with spontaneous HCV clearance; 283 individuals with non-HCV-associated liver disease; and 2234 healthy controls. APOE genotype proportions in patients with persistent HCV infection significantly differed from healthy controls (P = 0.007) primarily because of a substantial under-representation of APOE4 alleles in chronically HCV-infected patients (10.2%) compared to 13.0% in healthy controls (P = 0.001). The distribution of APOE4 allele positive genotypes (epsilon 2 epsilon 4, epsilon 3 epsilon 4, epsilon 4 epsilon 4) also significantly differed between chronically HCV-infected patients and healthy controls (1.4%, 17%, 1% vs. 2.4%, 20.5%, 1.7%; P = 0.001), suggesting a protective effect of the APOE4 allele in HCV infection. This was confirmed by a significant over-representation of the APOE4 allele in patients with spontaneous HCV clearance (17.6%; P = 0.00008). The APOE4 allele distribution in patients with non-HCV-associated liver disease (14.0%) was very similar to healthy controls and also differed from chronically HCV-infected patients (P = 0.012), suggesting HCV specificity."

According to the news editors, the research concluded: "Our findings suggest that the APOE4 allele may confer a protective effect in the course of HCV infection."

The news editors report that additional information may be obtained by contacting T. Mueller, Charite, Campus Virchow Klinikum, Medical Klin mS Hepatol & Gastroenterol, Berlin, Germany. Additional authors for this research include J. Fischer, R. Gessner, J. Rosendahl, S. Bohm, F. van Bommel, V. Knop, C. Sarrazin, H. Witt, A.M. Marques, P. Kovacs, D. Schleinitz, M. Stumvoll, M. Bluher, P. Bugert, E. Schott and T. Berg.

**Heart Disorders and Diseases - Heart Disease**

**Findings from Chengde Medical College Provides New Data about Heart Disease (Elevated serum uric acid and risk of cardiovascular or all-cause mortality in people with suspected or definite coronary artery disease: A meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Heart Disease. According to news reporting originating from Chengde, People's Republic of China, by NewsRx correspondents, research stated, "Serum uric acid (SUA) has been recognized as an independent risk factor for mortality in the general population. We performed this meta-analysis to determine whether elevated SUA levels are associated with greater risk of cardiovascular or all-cause mortality in people with suspected or definite coronary artery disease (CAD)."

Financial support for this research came from National Natural Science Foundation of China.

Our news editors obtained a quote from the research from Chengde Medical College, "The Pubmed and Embase databases were searched up to April 1, 2016 for the longitudinal studies that investigated the association between the elevated SUA and cardiovascular or all-cause mortality risk in people with suspected or definite CAD. Pooled adjusted risk ratio (RR) and corresponding 95% confidence interval (CI) were calculated for the highest vs. the lowest SUA category or each 1 mg/ml SUA rise. Nine studies enrolling 25,229 participants were included in the analyses. The highest vs. lowest SUA category was associated with greater risk of cardiovascular mortality (RR 2.09; 95% CI: 1.45-3.02) and all-cause mortality (RR 1.80; 95% CI: 1.39-2.34) after adjustment for potential confounders in a random effects model. Moreover,
each 1 mg/ml SUA rise significantly increased by 12% cardiovascular mortality and by 20% all-cause mortality."

According to the news editors, the research concluded: "Elevated SUA levels are strongly and independently associated with greater risk of cardiovascular and all-cause mortality in people with suspected or definite CAD."

For more information on this research see: Elevated serum uric acid and risk of cardiovascular or all-cause mortality in people with suspected or definite coronary artery disease: A meta-analysis. *Atherosclerosis*, 2016;254():193-199. *Atherosclerosis* can be contacted at: Elsevier Ireland Ltd, Elsevier House, Brookvale Plaza, East Park Shannon, Co, Clare, 00000, Ireland. **Bacterial Infections and Mycoses - Bacteremia**

**Findings from Chiba University Broaden Understanding of Bacteremia (Clinical and bacteriological analyses of bacteremia due to Corynebacterium striatum)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Bacterial Infections and Mycoses - Bacteremia. According to news reporting originating in Chiba, Japan, by NewsRx journalists, research stated, "Corynebacterium striatum was recently recognized as a potential pathogen of various infectious diseases. However, the clinical entity of this microorganism has not been clearly identified."

The news reporters obtained a quote from the research from Chiba University, "Therefore, we analyzed C. striatum isolates from blood culture and explored their clinical determinants. We reviewed the medical records of all patients from whom C. striatum isolates were recovered from blood culture for analysis of the patients' backgrounds and clinical course including response to antimicrobial therapy and prognosis. During the 5-year study period (January 2010 to December 2014), 24 C. striatum strains were isolated from blood samples, and the frequency of C. striatum bacteremia increased. The majority of the strains were multidrug resistant. All of the tested strains were susceptible to only vancomycin. The age at onset of C. striatum bacteremia encompassed all adult age groups, and at least one underlying condition was documented in all patients. Thirteen of the 24 patients were cured using appropriate antibiotics
(true infection group); however, 11 of the 24 patients were cured using inappropriate antibiotic therapy or no antibiotics (contamination group). Malignancy and neutropenia significantly increased the odds of true C. striatum bloodstream infection. The Corynebacterium species is often considered a contaminant when isolated in culture."

According to the news reporters, the research concluded: "Instead, particularly when the strain is isolated from blood, the species should be considered clinically relevant and identified to the species level; in addition, antimicrobial susceptibility testing is recommended."

For more information on this research see: Clinical and bacteriological analyses of bacteremia due to Corynebacterium striatum. *Journal of Infection and Chemotherapy*, 2016;22 (12):790-793. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Cardiovascular Diseases and Conditions - Hyperemia**

**Findings from Chiba University Update Understanding of Hyperemia (Efficacy of combined administration of intracoronary papaverine plus intravenous adenosine 5'-triphosphate in assessment of fractional flow reserve)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hyperemia have been published. According to news originating from Chiba, Japan, by NewsRx correspondents, research stated, "Inducing maximal coronary hyperemia is important to measure fractional flow reserve (FFR) accurately. Intravenous adenosine and adenosine 5'-triphosphate (ATP) have been used to achieve maximal hyperemia."

Our news journalists obtained a quote from the research from Chiba University, "However, they may not induce maximal hyperemia in all patients. The present study evaluated the combined effect of intracoronary papaverine and intravenous ATP on FFR measurements. FFR measurements with administration of intracoronary papaverine (12 mg in the left coronary artery and 8 mg in the right coronary artery), intravenous ATP (140 μg/kg/min), and combined administration of intracoronary papaverine and intravenous ATP were performed in 51 patients with 57 intermediate lesions. The mean FFR after intravenous ATP was higher compared to intracoronary papaverine and intravenous ATP plus intracoronary papaverine (0.76
+/- 0.13 vs. 0.75 +/- 0.13 vs. 0.75 +/- 0.13, p = 0.01). FFR-positive lesions (FFR <= 0.80) were observed more frequently with intravenous ATP plus intracoronary papaverine compared to intravenous ATP (64.9% vs. 47.4%, p = 0.02). Of 32 and 25 FFR-negative lesions with intravenous ATP and intracoronary papaverine, 11 (34%) and 7 (28%) had positive FFR after administration of intravenous ATP plus intracoronary papaverine. No ventricular tachycardia or ventricular fibrillation was observed after administration of intracoronary papaverine. Maximal hyperemia may not be induced with intravenous ATP in all lesions."

According to the news editors, the research concluded: "When sufficient hyperemia is doubtful during intravenous infusion of ATP, additional intracoronary administration of papaverine may be a possible option."

For more information on this research see: Efficacy of combined administration of intracoronary papaverine plus intravenous adenosine 5'-triphosphate in assessment of fractional flow reserve. Journal of Cardiology, 2016;68(5-6):512-516. Journal of Cardiology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Pediatrics**

**Findings from Children's Hospital Broaden Understanding of Pediatrics (Fifteen-minute consultation: the agar plates your microbiology colleagues want you to be scared about)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Pediatrics. According to news reporting originating from Birmingham, United Kingdom, by NewsRx correspondents, research stated, "The WHO has recognised antibiotic resistance as one of the greatest threats to human health. As a microbiologist, antibiotic resistance is a problem that keeps me awake at night and inevitably the impact of antibiotic resistance on paediatricians is a matter of when, and not if."

Our news editors obtained a quote from the research from Children's Hospital, "I fear for the future of paediatric services such as neonatology, oncology and elective surgery. A recent US study found that 26.8% of post chemotherapy infections and 38.7-50.9% of post-operative infections were caused by bacteria resistant to standard antibiotic prophylaxis. The authors predicted that this will lead to an additional 6300 infection-related deaths in the USA each year. Closer to home, David Cameron commissioned a review into antimicrobial resistance in 2014 and the findings were extremely worrying. The report predicted that by 2050, 10 million annual worldwide deaths will be attributable to antimicrobial resistance. More than annual predicted cancer-associated and diabetes-associated mortality combined. The golden antibiotic era is certainly over. Selecting the most appropriate antibiotic to treat an infection depends on many factors, including route of administration, penetration to site of infection and pathogen
susceptibility. Most clinicians do not need an in-depth understanding of bacterial resistance mechanisms as local microbiologists can provide expertise and advice."

According to the news editors, the research concluded: "However, in an era of increasing antibiotic resistance, an insight into the organism factors that affect antibiotic selection can prove useful."

The news editors report that additional information may be obtained by contacting G. Winzor, Birmingham Childrens Hosp NHS Fdn Trust, Dept. of Microbiol, Birmingham B4 6NH, W Midlands, United Kingdom. Additional authors for this research include J. Gray and M. Patel.

Oncology - Non-Small Cell Lung Cancer

Findings from Children's Hospital Provides New Data on Non-Small Cell Lung Cancer (miR-543 is up-regulated in gefitinib-resistant non-small cell lung cancer and promotes cell proliferation and invasion via phosphatase and tensin homolog)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Non-Small Cell Lung Cancer. According to news reporting out of Weihai, People's Republic of China, by NewsRx editors, research stated, "MicroRNAs (miRNAs) play important roles in the pathogenesis of many types of cancers by negatively regulating gene expression at posttranscriptional level. Here, we identified that miR-543 is up-regulated in gefitinib-resistant non-small cell lung cancer (NSCLC) patients comparing gefitinib-sensitive ones."

Financial support for this research came from Weihai Science and Technology Bureau.

Our news journalists obtained a quote from the research from Children's Hospital, "It promotes NSCLC cell proliferation by negatively regulates its target gene PTEN. In NSCLC cell lines, CCK-8 proliferation assay indicated that the cell proliferation is promoted by miR-543 mimics. Transwell assay showed that miR-543 mimics promotes the invasion and migration of NSCLC cells. Luciferase assays confirmed that miR-543 directly binds to the 3'untranslated region of PTEN, and western blotting showed that miR-543 suppresses the expression of PTEN at the protein level. This study indicates that miR-543 promotes proliferation and invasion of NSCLC cell lines by PTEN."
According to the news editors, the research concluded: "The miR-543 may represent a potential therapeutic target for gefitinib-resistant NSCLC intervention."

For more information on this research see: miR-543 is up-regulated in gefitinib-resistant non-small cell lung cancer and promotes cell proliferation and invasion via phosphatase and tensin homolog. Biochemical and Biophysical Research Communications, 2016;480(3):369-374. Biotechnology - Pharmacogenomics

Findings from Children's Hospital Update Understanding of Pharmacogenomics (Statin-induced expression change of INSIG1 in lymphoblastoid cell lines correlates with plasma triglyceride statin response in a sex-specific manner)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Biotechnology - Pharmacogenomics are discussed in a new report. According to news reporting originating in Oakland, California, by NewsRx journalists, research stated, "Statins are widely prescribed to lower plasma low-density lipoprotein (LDL) cholesterol levels. They also modestly reduce plasma triglyceride (TG), an independent cardiovascular disease risk factor, in most people."

The news reporters obtained a quote from the research from Children's Hospital, "The mechanism and inter-individual variability of TG statin response is poorly understood. We measured statin-induced gene expression changes in lymphoblastoid cell lines derived from 150 participants of a simvastatin clinical trial and identified 23 genes (false discovery rate, FDR=15%) with expression changes correlated with plasma TG response. The correlation of insulin-induced gene 1 (INSIG1) expression changes with TG response (rho=0.32, q=0.11) was driven by men (interaction p=0.0055), rs73161338 was associated with INSIG1 expression changes (p=5.4 ? 10) and TG response in two statin clinical trials (p=0.0048), predominantly in men. A combined model including INSIG1 expression level and splicing changes accounted for 29.5% of plasma TG statin response variance in men (p=5.6 ? 10)."
According to the news reporters, the research concluded: "Our results suggest that INSIG1 variation may contribute to statin-induced changes in plasma TG in a sex-specific manner. The Pharmacogenomics Journal advance online publication, 1 March."

For more information on this research see: Statin-induced expression change of INSIG1 in lymphoblastoid cell lines correlates with plasma triglyceride statin response in a sex-specific manner. The Pharmacogenomics Journal, 2016;().

Vascular Diseases

Findings from Children's Hospital Yields New Data on Vascular Diseases (The effect of physical activity on cardiometabolic health and inflammation in treated HIV infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Vascular Diseases is the subject of a report. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "In HIV-uninfected populations, physical activity decreases mortality and inflammation. Inflammation is a potential cause of comorbidities in HIV+ adults, the evidence examining the effect of physical activity on cardiometabolic health is limited."

The news reporters obtained a quote from the research from Children's Hospital, "This analysis examines the relationship between physical activity, cardiometabolic health and inflammation. We conducted a nested study within the SATURN-HIV trial in which 147 HIV+ adults were randomized to 10 mg daily rosvastatin or placebo. Measures of physical activity, cardiometabolic health, inflammation and vascular disease (carotid artery intima media thickness and computed tomography-acquired measures pericardial fat volume) were assessed at baseline and through 96 weeks. Spearman correlations and multivariable analyses were used to explore relationships between physical activity, cardiometabolic health and inflammation. Median age (Q1, Q3) was 46 (40.4, 52.7) years, 80% were male, 69% were African American and 46% were on protease inhibitors. Baseline median physical activity was 44 min per week (0, 150), 24% of participants performed greater than 150 min per week. At baseline, physical activity correlated with several markers of cardiometabolic health and inflammation (all P<= 0.05). Over all time points median physical activity was independently associated with carotid distensibility (beta=2.53; P=0.008), pericardial fat volume (beta=-6.13; P=0.001) and interleukin-6 (beta=-0.468; P<0.001). Physical activity is associated with vascular disease, endothelial function, and may be an adjuvant to decreasing comorbidities in HIV+ adults."

According to the news reporters, the research concluded: "Further studies should
examine long-term effects of physical activity on cardiometabolic health and inflammation in this population. Clinicaltrials.gov NCT01218802."

Our news correspondents report that additional information may be obtained by contacting G.A. McComsey, Rainbow Babies & Children's Hosp, Div Pediat Infect Dis & Rheumatol, Cleveland, OH 44106, United States. Additional authors for this research include A.R. Webel, C.T. Longenecker, B. Kinley, D. Labbato, A. Sattar and G.A. McComsey.

**Heart Valves**

**Findings from Children's Hospital Yields New Findings on Heart Valves (Hybrid pulmonary artery plication followed by transcatheter pulmonary valve replacement: Comparison with surgical PVR)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Valves have been presented. According to news originating from Dublin, Ireland, by NewsRx correspondents, research stated, "Objective/Background Historically, the sole option for patients with a dysfunctional native right ventricular outflow tract (RVOT) requiring re-establishment of pulmonary competence has been surgical PVR. We sought to compare early outcomes of hybrid pulmonary valve replacement (PVR) combining surgical plication of the main pulmonary artery followed by transcatheter PVR, with a contemporary cohort of surgical PVR patients."

Our news journalists obtained a quote from the research from Children's Hospital, "Retrospective chart analysis of all patients with a dilated native RVOT eligible for surgical PVR over 36 months was performed. The cohorts included patients with previous tetralogy of Fallot repair (n=14), and previous intervention for congenital abnormality of the pulmonary valve (n=7). Twenty-one patients with a dysfunctional native RVOT met criteria for PVR; 8 using the hybrid procedure (group 1: age, 31.5 +/- 17.4 years) and 13 with cardiopulmonary bypass (CPB) (group 2: age, 31 +/- 18.4 years). Valve delivery was successful in all patients with no procedural mortality. Group 1 had a lesser requirement for blood products (P =< 0.001) and a trend toward shorter hospital stay and higher post-operative hemoglobin. No patients in group 1 received inotropic support post-operatively compared to 54% of patients in group 2. Mean follow-up was 3.4 months for group 1 and 13.6 months for group 2 with the average peak gradient across the RVOT of 20.1 and 15.1 mm Hg respectively (P=0.12), all with no more than mild PI."

According to the news editors, the research concluded: "Transcatheter hybrid PVR
following RVOT plication provides a reasonable alternative to surgical PVR particularly in higher risk cohorts, reducing possible longer-term consequences of repeated runs of CPB."

The news correspondents report that additional information may be obtained from D. Kenny, Our Ladys Childrens Hosp, Dept. of Cardiol, Dublin, Ireland. Additional authors for this research include T. Matella, L. Fogg, M. Ilbawi, H. Nagaraj, C. Kavinsky, A.R. Wolf, K. Diab, M. Caputo and D. Kenny.

Keywords for this news article include: Dublin, Ireland, Europe, Pulmonary Artery, Pulmonary Valve, Heart Valves, Angiology, Arteries, Children's Hospital.

**Cardiovascular Diseases and Conditions - Venous**

**Findings from Children's Hospital in Venous Thrombosis Reported**

*(Neutrophil elastase-deficient mice form neutrophil extracellular traps in an experimental model of deep vein thrombosis)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Venous Thrombosis. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "ESSENTIALS: Neutrophil elastase (NE) plays a role in extracellular trap formation (NETosis) triggered by microbes. The contribution of NE was evaluated in mouse NETosis models of sterile inflammation and thrombosis."

Financial supporters for this research include National Heart, Lung, and Blood Institute, National Institute of Allergy and Infectious Diseases, Deutsche Gesellschaft fuer Kardiologie.

Our news journalists obtained a quote from the research from Children's Hospital, "NE is not required for mouse neutrophil NET production in vitro with non-infectious stimuli. NE deficiency had no significant effect on thrombosis in the inferior vena cava stenosis model. Neutrophil serine proteases have been implicated in coagulation and neutrophil extracellular trap (NET) formation. In human neutrophils, neutrophil elastase (NE) translocates to the nucleus during NETosis and cleaves histones, thus aiding in chromatin decondensation. NE(-/-) mice were shown not to release NETs in response to microbes. However, mouse studies evaluating the role of NE in NET formation in sterile inflammation and thrombosis are lacking. We wished to establish if neutrophils from NE(-/-) mice have a defect in NETosis, similar to peptidylarginine deiminase 4 (PAD4(-/-)) mice, and how this might have an impact on venous thrombosis, a model where NETs are produced and are crucial to thrombus development. We performed in vitro NET assays using neutrophils from wild-type (WT), NE(-/-), SerpinB1 (SB1) (-/-) and NE(-/-) SB1(-/-) mice. We compared WT and NE(-/-) animals using the inferior vena cava stenosis model of deep vein thrombosis (DVT). Neutrophil elastase deficiency resulted in a small reduction in ionomycin-induced NET formation in vitro without affecting histone
citrullination. However, NET production in response to phorbol 12-myristate 13-acetate or platelet activating factor was normal in neutrophils from two independent NE-deficient mouse lines, and in NE(-/-) SB1(-/-) as compared with SB1(-/-) neutrophils. NE deficiency or inhibition did not prevent NETosis in vivo or DVT outcome. Neutrophil elastase is not required for NET formation in mice. NE(-/-) mice, which form pathological venous thrombi containing NETs, do not phenocopy PAD4(-/-) mice in in vitro NETosis assays or experimental venous thrombosis.

According to the news editors, the research concluded: "Our study suggests that NET-targeted therapies need to be highly effective to have an impact on DVT."

Our news journalists report that additional information may be obtained by contacting K. Martinod, Program in Cellular and Molecular Medicine, Boston Children's Hospital, Boston, MA, United States. Additional authors for this research include T. Witsch, K. Farley, M. Gallant, E. Remold-O'Donnell and D.D Wagner.

**Respiratory Tract Diseases and Conditions**

**Findings from Children's Hospital in the Area of Obstructive Sleep Apnea Described (Sleep Architecture Linked to Airway Obstruction and Intracranial Hypertension in Children with Syndromic Craniosynostosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea have been presented. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Children with syndromic craniosynostosis often have obstructive sleep apnea and intracranial hypertension. The authors aimed to evaluate (1) sleep architecture, and determine whether this is influenced by the presence of obstructive sleep apnea and/or intracranial hypertension; and (2) the effect of treatment on sleep architecture."

Our news editors obtained a quote from the research from Children's Hospital, "This study included patients with syndromic craniosynostosis treated at a national referral center, undergoing screening for obstructive sleep apnea and intracranial hypertension. Obstructive sleep apnea was identified by polysomnmography, and categorized into no, mild, moderate, or severe. Intracranial hypertension was identified by the presence of papilledema on funduscopic,
supplemented by optical coherence tomography and/or intracranial pressure monitoring. Regarding sleep architecture, sleep was divided into rapid eye movement or non-rapid eye movement sleep; respiratory effort-related arousals and sleep efficiency were scored. The authors included 39 patients (median age, 5.9 years): 19 with neither obstructive sleep apnea nor intracranial hypertension, 11 with obstructive sleep apnea (four moderate/severe), six with intracranial hypertension, and three with obstructive sleep apnea and intracranial hypertension. Patients with syndromic craniosynostosis, independent of the presence of mild obstructive sleep apnea and/or intracranial hypertension, have normal sleep architecture compared with age-matched controls. Patients with moderate/severe obstructive sleep apnea have a higher respiratory effort-related arousal index (p < 0.01), lower sleep efficiency (p = 0.01), and less rapid eye movement sleep (p = 0.04). An improvement in sleep architecture was observed following monobloc surgery (n = 5; rapid eye movement sleep, 5.3 percent; p = 0.04). Children with syndromic craniosynostosis have in principle normal sleep architecture."

According to the news editors, the research concluded: "However, moderate/severe obstructive sleep apnea does lead to disturbed sleep architecture, which fits within a framework of a unifying theory for obstructive sleep apnea, intracranial hypertension, and sleep."

For more information on this research see: Sleep Architecture Linked to Airway Obstruction and Intracranial Hypertension in Children with Syndromic Craniosynostosis. Plastic and Reconstructive Surgery, 2016;138(6):1019E-1029E. Breast Diseases and Conditions - Mastitis

Findings from China Agricultural University Provide New Insights into Mastitis (An Investigation of the Innate Immune Response in Bovine Mammary Epithelial Cells Challenged by Prototheca zopfii)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Breast Diseases and Conditions - Mastitis have been published. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Prototheca zopfii is an important bovine mastitis pathogen, which could result in severe mammary infection. However, the innate
immune response in bovine mastitis associated with P. zopfii was not clear."

Financial supporters for this research include Chinese Twelfth Five-year National Science and Technology Support Project, National Education Ministries Major Project, Specialized Research Fund for the Doctoral Program of Higher Education (SRFDP) State Education Ministry, High-end Foreign Experts Recruitment Program, National Natural Science Foundation of China.
