Our news editors obtained a quote from the research from the University of Sussex, "PFS is frequently the primary outcome in licencing studies. As part of a longitudinal study Assessing the 'VALue' to patients of PROgression Free Survival (AVALPROFS), oncologists completed checklists at baseline following consultations with patients. Questions probed perceived clinical benefits of the drugs to populations in general. Patients completed study-specific interview schedules at baseline, 6 weeks into treatment, and at withdrawal due to toxicity or progression. Patients also completed tumour- and treatment-specific quality of life questionnaires monthly for their time in the study. Only baseline results are reported here. Thirty-two UK oncologists discussed management options with 90 patients with heterogeneous advanced cancers. Oncologists' estimates of medical benefit in general from treatment varied between 10 and 80 %. They expected 46/90 (51 %) of their patients to derive some clinical benefit from the prescribed treatment but were either unsure or expected none for 44/90 (49 %). Predictions of life expectancy were variable but 62 % (56/90) of patients were expected to survive longer with treatment. A majority of patients 51/90 (57 %) had 'no idea' or were 'unclear' what PFS meant and 45/90 (50 %) thought extension of life was the primary therapeutic aim of treatment. Discussions between doctors and patients with metastatic disease about future management plans and likely therapeutic gains are challenging."
According to the news editors, the research concluded: "Factors influencing decisions about putative benefits of novel drugs are often applied inconsistently can be overly optimistic and may even contradict published data."

For more information on this research see: Therapeutic aims of drugs offering only progression-free survival are misunderstood by patients, and oncologists may be overly optimistic about likely benefits. Oncology - Breast Cancer

Findings from University of Sydney in the Area of Breast Cancer Reported (The Role of Socially Embedded Concepts in Breast Cancer Screening: An Empirical Study with Australian Experts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting out of Sydney, Australia, by NewsRx editors, research stated, "It is not clear whether breast cancer screening is a public health intervention or an individual clinical service. The question is important because the concepts best suited for ethical reasoning in public health might be different to the concepts commonly employed in biomedical ethics."

Our news journalists obtained a quote from the research from the University of Sydney, "We consider it likely that breast screening has elements of a public health intervention and used an empirical ethics approach to explore this further. If breast screening has public health characteristics, it is probable that policy and practice experts will employ socially embedded concepts when reasoning about it. We gathered data on whether and how these concepts existed in the discussion and reasoning of Australian breast screening experts. We found that experts employed these concepts when talking about the purpose and practices of breast screening, and the behaviour of breast screening professionals and consumers. Experts gave varied judgements about breast screening based on reasoning with these concepts, considering it to be more or less successful in contributing to the public interest and in incorporating socially embedded concepts into its operational agenda. Our findings are compatible with breast screening having public health characteristics."

According to the news editors, the research concluded: "We advocate for the incorporation of socially embedded concepts in breast screening policy and practice."

Our news journalists report that additional information may be obtained by contacting L.M. Parker, University of Sydney, Center Values Eth & Law Med VELiM, Sydney Sch Public Hlth, Sydney, NSW 2006, Australia.

**Oncology - Prostate Cancer**

**Findings from University of Tampere Broaden Understanding of Prostate Cancer (Additive inhibitory effects of simvastatin and enzalutamide on androgen-sensitive LNCaP and VCaP prostate cancer cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting out of Tampere, Finland, by NewsRx editors, research stated, "We evaluated the effects of simvastatin and antiandrogen enzalutamide on growth and androgen signaling in androgen-sensitive LNCaP and VCaP prostate cancer cells."

Our news journalists obtained a quote from the research from the University of Tampere, "Simvastatin alone abolished androgen-induced growth in both cell lines but decreased androgen receptor (AR) and prostate-specific antigen protein expression only in LNCaP, indicating that statin-induced growth inhibition is beyond AR transcriptional activity in VCaP. Combination of simvastatin and enzalutamide exerted additive growth inhibition in both cell lines accompanied with strong induction of autophagy in LNCaP."

According to the news editors, the research concluded: "The data provide new insight into statins' effects on androgen signaling and their proposed role in enhancing androgen deprivation therapy in prostate cancer."

For more information on this research see: Additive inhibitory effects of simvastatin and enzalutamide on androgen-sensitive LNCaP and VCaP prostate cancer cells. Biochemical and Biophysical Research Communications, 2016;481(1-2):46-50. Connective Tissue Cells

Findings from University of Tehran Provides New Data on Connective Tissue Cells (Inhibition of MicroRNA-21 induces apoptosis in dermal fibroblasts of patients with systemic sclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Connective Tissue Cells. According to news reporting out of Tehran, Iran, by NewsRox editors, research stated, "Prolonged activation of dermal fibroblasts is the main cause of progressive fibrosis in systemic sclerosis (SSc). It seems that inhibition of apoptosis in SSc fibroblasts deregulates fibrosis."

Funders for this research include Iran National Science Foundation, Tehran University of Medical Sciences and Health Services.

Our news journalists obtained a quote from the research from the University of Tehran, "MicroRNA-21 (miR-21) is a pro-fibrotic factor with high expression in lesional areas of SSc skin and fibroblasts. The effects of miR-21 on expression of Bcl-2 and Bax, two apoptotic genes, in dermal fibroblasts of SSc patients were evaluated using real-time polymerase chain reaction and Western blot analysis. Apoptotic cells were detected using flow cytometry and Hoechst 33258 staining assays. Overexpression of miR-21 using synthetic miR-21 RNA increased expression of Bcl-2, an inhibitor of apoptosis, and decreased the Bax: Bcl-2 expression ratio, a cell fate determinant, in SSc fibroblasts. Antisense inhibition of miR-21 induced a high rate of apoptosis in SSc fibroblasts. We propose that this may be associated with a decrease in Bcl-2 expression and a shift in the Bax: Bcl-2 ratio."

According to the news editors, the research concluded: "Although further studies are necessary to determine the underlying apoptotic pathway, we propose that inhibition of miR-21 in dermal fibroblasts from lesional skin may be useful in harnessing progressive fibrosis in SSc."

Our news journalists report that additional information may be obtained by contacting A. Farazmand, Univ Tehran, Dept. of Cell & Mol Biol, Tehran, Iran. Additional authors for this research include A. Farazmand, F. Gharibdoost, E. Karimizadeh, F. Noorbakhsh, H. Faridani, M. Mahmoudi and A.R. Jamshidi.

Oncology - Prostate Cancer

Findings from University of Texas Broaden Understanding of Prostate Cancer (Tissue-scale, personalized modeling and simulation of prostate cancer growth)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting from Austin, Texas, by NewsRx journalists, research stated, "Recently, mathematical modeling and simulation of diseases and their treatments have enabled the prediction of clinical outcomes and the design of optimal therapies on a personalized (i.e., patient-specific) basis. This new trend in medical research has been termed 'predictive medicine.' Prostate cancer (PCa) is a major health problem and an ideal candidate to explore tissue-scale, personalized modeling of cancer growth for two main reasons: First, it is a small organ, and, second, tumor growth can be estimated by measuring serum prostate-specific antigen (PSA, a PCa biomarker in blood), which may enable in vivo validation."

Financial support for this research came from EC | European Research Council (ERC).

The news correspondents obtained a quote from the research from the University of Texas, "In this paper, we present a simple continuous model that reproduces the growth patterns of PCa. We use the phase-field method to account for the transformation of healthy cells to cancer cells and use diffusion-reaction equations to compute nutrient consumption and PSA production. To accurately and efficiently compute tumor growth, our simulations leverage isogeometric analysis (IGA). Our model is shown to reproduce a known shape instability from a spheroidal pattern to fingered growth. Results of our computations indicate that such shift is a tumor response to escape starvation, hypoxia, and, eventually, necrosis. Thus, branching enables the tumor to minimize the distance from inner cells to external nutrients, contributing to cancer survival and further development. We have also used our model to perform tissue-scale, personalized simulation of a PCa patient, based on prostatic anatomy extracted from computed tomography images."

According to the news reporters, the research concluded: "This simulation shows tumor progression similar to that seen in clinical practice."

Our news journalists report that additional information may be obtained by contacting T.J.R. Hughes, Univ Texas Austin, Inst Computat Engn & Sci, Austin, TX 78712, United States. Additional authors for this research include M.A. Scott, K. Tew, T.J.R. Hughes, Y.J. Zhang, L. Liu, G. Vilanova and H. Gomez.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1073/pnas.1615791113. This DOI is a link to an online electronic document that is either free or for purchase.

Transplant Medicine - Liver Transplants
Findings from University of Texas Medical Branch Update Understanding of Liver Transpals (Increased Risk of Death for Patients on the Waitlist for Liver Transplant Residing at Greater Distance From Specialized Liver Transplant Centers in the ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transplant Medicine - Liver Transplants. According to news reporting originating from Galveston, Texas, by NewsRx correspondents, research stated, "We have previously shown that patients listed for orthotopic liver transplantation (OLT) in United Network for Organ Sharing Region 4 (Texas and Oklahoma) have higher waitlist mortality rates when residing more than 30 miles from specialized liver transplant centers (LTC). Considering that findings might only be exclusive for this region with its peculiarities in terms of having the highest land surface extensions, lowest population densities, and largest rural populations."

Our news editors obtained a quote from the research from the University of Texas Medical Branch, "We investigated the entire OLT patient population in the United States to assess if our previous regional findings are nationally validated and if a rural, micropolitan, or metropolitan residence location affects outcome of waitlisted OLT patients in the nation. Patients waiting for OLT in the United States from 2002 to 2012 were stratified by distance from the patients' residence to LTC and by Rural Urban Commuting Area (RUCA) codes classification. Statistical analyses were performed to evaluate risk of mortality on the waitlist and the likelihood to receive an OLT using a Cox proportional hazards model and a generalized additive model with a logistic link. Survival time and probability of death while on the waitlist for OLT using distance to LTC showed significant increased risk with the distance (P = 0.001 and P< 0.0001, respectively). At the same time, using RUCA classification as the variable did not show significance (P = 0.14 and P = 0.73, respectively)."

According to the news editors, the research concluded: "Distance from an LTC is a risk factor of mortality on the waitlist for OLT, whereas RUCA classification is not a significant factor."

For more information on this research see: Increased Risk of Death for Patients on the Waitlist for Liver Transplant Residing at Greater Distance From Specialized Liver Transplant Centers in the United States. Transplantation, 2016;100(10):2146-2152. Transplantation can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001
Findings from University of Texas Provides New Data on Thyroid Cancer (Spine Stereotactic Radiosurgery for Patients with Metastatic Thyroid Cancer: Secondary Analysis of Phase I/II Trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Thyroid Cancer. According to news reporting originating from Houston, Texas, by NewsRx correspondents, research stated, "Metastatic deposits to the spine in thyroid cancer patients represent the most common site of bone involvement and can contribute to pain, neurologic deficits, and death. This study sought to determine the efficacy and safety of spine stereotactic radiosurgery (SSRS) for thyroid cancer patients."

Our news editors obtained a quote from the research from the University of Texas, "Thyroid cancer patients with spine metastases were selected and analyzed from a cohort of patients who were prospectively enrolled in two single-institution Phase I/II studies. SSRS was delivered in single or multi-fraction schedules. Dose regimens ranged from 16-18 Gy in one fraction to 27-30 Gy in three to five fractions. Toxicity was graded according to the NCI-CTC toxicity scale. Local control was determined by serial post-treatment magnetic resonance imaging scans showing no evidence of progressive disease. Patients were followed until date of death or date of last known visit for survival analyses. Local control and overall survival rates were carried out using Kaplan-Meier estimates. The log-rank test was used to assess the equality of the survivor function across groups. A p-value of <= 0.05 was considered to be statistically significant. A total of 27 spine lesions were treated in 23 patients over a six-year period. Median follow-up was 28.9 months (range 5-93 months). Local control was 88% at two years and 79% at three years. In patients with progressive disease following conventional radiation therapy, local control for salvage SSRS remained at 88% at three years. Patients requiring upfront surgical intervention and treated with adjuvant SSRS achieved sustained control rates of 86% at three years. Overall survival rates were 85% and 67% at one and two years, respectively. In patients classified with oligoprogression and controlled extra-spinal disease, overall survival was significantly higher than those with evidence of systemic progression (81% vs. 45% at two years; p = 0.01). Univariate analysis did not show significant correlations between local control and age, systemic disease status, prior 131 I therapy, SSRS fraction regimen, spine location, histological subtype, or time from initial diagnosis to evidence of spinal metastasis. No patient experienced any grade 3-5 toxicity. Pain flare was reported in 30% of patients, with only three patients (13%) requiring narcotics or short-course steroids. There was no evidence of vertebral
According to the news editors, the research concluded: "SSRS for thyroid metastases as a primary or adjuvant/salvage therapy is well tolerated and yields high rates of local control."

For more information on this research see: Spine Stereotactic Radiosurgery for Patients with Metastatic Thyroid Cancer: Secondary Analysis of Phase I/II Trials. *Thyroid*, 2016;26(9):1269-1275. *Thyroid* can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. **Drugs and Therapies - Therapeutic Drug Monitoring**

**Findings from University of Texas School of Medicine Provide New Insights into Therapeutic Drug Monitoring (Suitability of the DRI Hydrocodone/Hydromorphone Immunoassay in the Clinical Environment at a Lower Cutoff: Validation With LC-MS/MS ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Therapeutic Drug Monitoring are discussed in a new report. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "We evaluated the analytical performance of the DRI hydrocodone/hydromorphone assay by comparing semi-quantitative values obtained by this assay with values obtained by a liquid chromatography combined with tandem mass spectrometry (LC-MS/MS) method. We also evaluated the possibility of lowering the cutoff of the DRI assay from 300 to 100 ng/mL."

The news reporters obtained a quote from the research from the University of Texas School of Medicine, "We compared semiquantitative values obtained by the DRI assay in 97 specimens with values obtained by the LC-MS/MS method including 10 specimens containing hydrocodone and/or hydromorphone concentrations between 105.0 and 145.0 ng/mL (determined by LC-MS/MS) to determine the sensitivity at 100 ng/mL. In addition, several opioids at a concentration of 5000 ng/mL were also analyzed by the DRI assay to determine its specificity. We observed no false-negative result using the DRI immunoassay in 96 specimens that showed semiquantitative values at 100 ng/mL or higher. However, one specimen containing 110 ng/mL of hydrocodone was false negative with the DRI assay (semiquantitative value 88
The semiquantitative values produced by DRI showed poor correlation with values determined by the LC-MS/MS method. The sensitivity of the DRI assay at 100 ng/mL was 90%, and the assay was very specific showing minimal cross-reactivity only with oxycodone and oxymorphone.

According to the news reporters, the research concluded: "DRI immunoassay for hydrocodone/hydromorphone is a cost-effective method of screening urine specimens in the clinical environment at a lower cutoff of 100 ng/mL."

For more information on this research see: Suitability of the DRI Hydrocodone/Hydromorphone Immunoassay in the Clinical Environment at a Lower Cutoff: Validation With LC-MS/MS Analysis. Therapeutic Drug Monitoring, 2016;38(6):787-790.

Therapeutic Drug Monitoring can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Therapeutic Drug Monitoring - journals.lww.com/drug-monitoring/pages/default.aspx)

### Aortic Aneurysms

**Findings from University of Texas Southwestern Has Provided New Data on Aortic Aneurysms (Safety and effectiveness of total percutaneous access for fenestrated endovascular aortic aneurysm repair)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Aortic Aneurysms are discussed in a new report. According to news reporting originating in Dallas, Texas, by NewsRx journalists, research stated, "Percutaneous femoral vascular access is frequently used for aortic endovascular procedures, with a local access complication rate of 5% to 16%. Fenestrated endovascular aneurysm repair (FEVAR) has recently emerged as a new technique for the repair of short-neck and juxtarenal abdominal aortic aneurysms."

The news reporters obtained a quote from the research from the University of Texas Southwestern, "The safety and effectiveness of percutaneous access for FEVAR has not been established to date. Since United States Food and Drug Administration approval of the Zenith fenestrated aortic endograft (Cook Medical, Bloomington, Ind), 94 patients (60 Zenith fenestrated, 6 p-Branch, and 28 custom-made devices) have undergone FEVAR. Percutaneous access was performed using the 'preclose' technique with the Perclose Proglide device (Abbott Vascular, Redwood City, Calif). Open access was performed when severely disease or calcified femoral arteries prevented percutaneous access. Based analysis was performed assessing outcomes for the access site used for the larger profile sheath of the main device. Percutaneous access was used in 90 patients (177 common femoral arteries) and open access in four (11
common femoral arteries). Arm access was used in 41 patients (44%). The median sheath size was 20F (interquartile range [IQR], 20F-22F). Median operative time was 207 minutes (IQR, 160-270 minutes), with a median blood loss of 500 mL (IQR, 300-700 mL). The percutaneous access success rate was 92%. No preoperative factors predicted technical failure. No 30-day deaths occurred. Patients with failed percutaneous closure and who required conversion to open repair had higher estimated median blood loss of 800 (IQR, 600-1200) vs 500 (IQR, 300-600) mL (P = .01) and a longer median time to start ambulation of 4 (IQR, 2-7) vs 2 (IQR, 1-3) days (P = .03). Patients undergoing percutaneous closure had lower median blood loss (500 mL; IQR, 300-600 mL) than patients who underwent open surgical access (800 mL; IQR, 750-800 mL). Postoperative complications related to vascular access occurred in 11 patients (12%).

Percutaneous femoral access is a safe and effective alternative to open access for FEVAR."

According to the news reporters, the research concluded: "Operative blood loss and longer time to ambulation are significantly increased after failed percutaneous closure."

Our news correspondents report that additional information may be obtained by contacting D.E. Timaran, Univ Texas Southwestern Med Center Dallas, Dept. of Surg, Div Vasc & Endovasc Surg, Dallas, TX 75390, United States. Additional authors for this research include M. Soto, M. Knowles, J.G. Modrall, J.E. Rectenwald and C.H. Timaran.

Oncology - Gliomas

**Findings from University of Texas Southwestern Medical Center Provides New Data on Gliomas (Phase I study of RO4929097 with bevacizumab in patients with recurrent malignant glioma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Gliomas is the subject of a report. According to news reporting from Dallas, Texas, by NewsRx journalists, research stated, "Antiangiogenic therapies for malignant gliomas often result in transient response, and recurrent disease is characterized by adoption of invasive and hypoxic phenotype. The notch signaling pathway is activated in gliomas, and augments cell migration and hypoxic response."

Financial support for this research came from National Institutes of Health.

The news correspondents obtained a quote from the research from the University of
Texas Southwestern Medical Center, "Here we report a clinical study of the combination of bevacizumab and RO4929097, an inhibitor of the notch signaling cascade. A phase I clinical trial was conducted through the Adult Brain Tumor Consortium in subjects with recurrent malignant glioma. Primary objectives were to assess safety and to define the maximum tolerated dose of RO4929097 in combination with bevacizumab. Secondary objectives were to determine overall survival, progression free survival, radiographic response, pharmacokinetic evaluation, and tissue biomarker analysis. Thirteen subjects were enrolled. Of the three subjects treated with the highest dose of RO4929097, one grade 3 toxicity and one grade 2 toxicity were observed. Definitive maximum tolerated dose of RO4929097 in combination with bevacizumab was not identified due to manufacturer's decision to halt drug production. 2 of 12 evaluable subjects demonstrated radiographic response; one subject experienced CR and the second PR. The median overall survival was 10.9 months with a median progression-free survival of 3.7 months. Two subjects remained free of disease progression at 6 months from treatment initiation. PK evaluation did not identify clinically significant drug-drug interactions. All analyzed tissue specimens revealed activation of notch signaling. Combination of RO4929097 and bevacizumab was well-tolerated."

According to the news reporters, the research concluded: "Given the compelling scientific rationale, additional studies of antiangiogenic and notch signaling inhibitors should be considered."

For more information on this research see: Phase I study of RO4929097 with bevacizumab in patients with recurrent malignant glioma. Journal of Neuro-Oncology, 2016;130(3):571-579. Journal of Neuro-Oncology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Journal of Neuro-Oncology - www.springerlink.com/content/0167-594x/)

Autoimmune Diseases and Conditions - Multiple...

Findings from University of Texas Southwestern Yields New Findings on Multiple Sclerosis (CD40-Mediated NF-kappa B Activation in B Cells Is Increased in Multiple Sclerosis and Modulated by Therapeutics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions
Multiple Sclerosis. According to news originating from Dallas, Texas, by NewsRx correspondents, research stated, "CD40 interacts with CD40L and plays an essential role in immune regulation and homeostasis. Recent research findings, however, support a pathogenic role of CD40 in a number of autoimmune diseases."

Our news journalists obtained a quote from the research from the University of Texas Southwestern, "We previously showed that memory B cells from relapsing remitting multiple sclerosis (RRMS) patients exhibited enhanced proliferation with CD40 stimulation compared with healthy donors. In this study, we used a multiparameter phosflow approach to analyze the phosphorylation status of NF-kappa B and three major MAPKs (P38, ERK, and JNK), the essential components of signaling pathways downstream of CD40 engagement in B cells from MS patients. We found that memory and naive B cells from RRMS and secondary progressive MS patients exhibited a significantly elevated level of phosphorylated NF-kappa B (p-P65) following CD40 stimulation compared with healthy donor controls. Combination therapy with IFN-beta-1a (Avonex) and mycophenolate mofetil (Cellcept) modulated the hyperphosphorylation of P65 in B cells of RRMS patients at levels similar to healthy donor controls. Lower disease activity after the combination therapy correlated with the reduced phosphorylation of P65 following CD40 stimulation in treated patients."

According to the news editors, the research concluded: "Additionally, glatiramer acetate treatment also significantly reduced CD40-mediated P65 phosphorylation in RRMS patients, suggesting that reducing CD40-mediated p-P65 induction may be a general mechanism by which some current therapies modulate MS disease."

For more information on this research see: CD40-Mediated NF-kappa B Activation in B Cells Is Increased in Multiple Sclerosis and Modulated by Therapeutics. *Journal of Immunology*, 2016;197(11):4257-4265. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. (The American Association of Immunologists - www.aai.org; Journal of Immunology - www.jimmunol.org)

**Oncology - Pancreatic Cancer**

Findings from University of Texas Update Knowledge of Pancreatic Cancer (Identification of KIAA1199 as a Biomarker for Pancreatic Intraepithelial Neoplasia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Pancreatic Cancer are presented in a new report.
According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Pancreatic cancer is one of the most aggressive cancers and has an extremely poor prognosis. Despite recent progress in both basic and clinical research, most pancreatic cancers are detected at an incurable stage owing to the absence of disease-specific symptoms."

The news correspondents obtained a quote from the research from the University of Texas, "Thus, developing novel approaches for detecting pancreatic cancer at an early stage is imperative. Our in silico and immunohistochemical analyses showed that KIAA1199 is specifically expressed in human pancreatic cancer cells and pancreatic intraepithelial neoplasia, the early lesion of pancreatic cancer, in a genetically engineered mouse model and in human patient samples. We also detected secreted KIAA1199 protein in blood samples obtained from pancreatic cancer mouse models, but not in normal mice. Furthermore, we found that assessing KIAA1199 autoantibody increased the sensitivity of detecting pancreatic cancer."

According to the news reporters, the research concluded: "These results indicate the potential benefits of using KIAA1199 as a biomarker for early-stage pancreatic cancer."

For more information on this research see: Identification of KIAA1199 as a Biomarker for Pancreatic Intraepithelial Neoplasia. Scientific Reports, 2016;6():1-10. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting J.I. Park, Univ Texas MD Anderson Canc Center, Program Canc Biol, Houston, TX 77030, United States. Oncology - Lung Cancer

Findings from University of Texas Update Understanding of Lung Cancer (The IASLC Mesothelioma Staging Project: Proposals for Revisions of the N Descriptors in the Forthcoming Eighth Edition of the TNM Classification for Pleural Mesothelioma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lung Cancer have been published. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "Nodal categories for malignant pleural mesothelioma are derived from the lung cancer staging system and have not been adequately validated. The International Association for the Study of Lung Cancer developed a multinational database to generate evidence-based recommendations to inform the eighth edition of the TNM classification of malignant pleural mesothelioma."

Financial support for this research came from National Institutes of Health/National Cancer Institute Cancer Center.

Our news journalists obtained a quote from the research from the University of...
Texas, "Data from 29 centers were entered prospectively (n = 1566) or by transfer of retrospective data (n = 1953). Survival according to the seventh edition N categories was evaluated using Kaplan-Meier survival curves and Cox proportional hazards regression analysis. Survival was measured from the date of diagnosis. There were 2432 analyzable cases: 1603 had clinical (c) staging, 1614 had pathologic (p) staging, and 785 had both. For clinically staged tumors there was no separation in Kaplan-Meier curves between cNO, cN1 or cN2 (cN1 versus cNO hazard ratio [HR] = 1.06, p = 0.77 and cN2 versus cN1 HR = 1.04, p = 0.85). For pathologically staged tumors, patients with pN1 or pN2 tumors had worse survival than those with pN0 tumors (HR = 1.51, p< 0.0001) but no survival difference was noted between those with pN1 and pN2 tumors (HR = 0.99, p = 0.99). Patients with both pN1 and pN2 nodal involvement had poorer survival than those with pN2 tumors only (HR = 1.60, p = 0.007) or pN0 tumors (HR = 1.62, p< 0.0001). A recommendation to collapse both clinical and pN1 and pN2 categories into a single N category comprising ipsilateral, intrathoracic nodal metastases (N1) will be made for the eighth edition. staging system."

According to the news editors, the research concluded: "Nodes previously categorized as N3 will be reclassified as N2."

The news correspondents report that additional information may be obtained from D. Rice, Univ Texas MD Anderson Canc Center, Houston, TX, United States. Additional authors for this research include K. Chansky, A. Nowak, H. Pass, H. Kindler, L. Shemanski, I. Opitz, S. Call, S. Hasegawa, K. Kernstine, C. Atinkaya, F. Rea, P. Nafteux and V.W. Rusch.

Drugs and Therapies - Central Nervous System Agents

Findings from University of Texas in the Area of Central Nervous System Agents Described (Effects of Lorcaserin on Cocaine and Methamphetamine Self-Administration and Reinstatement of Responding Previously Maintained by Cocaine in Rhesus Monkeys)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Central Nervous System Agents. According to news reporting from San Antonio, Texas, by NewsRx journalists, research stated, "Stimulant abuse is a serious public health issue for which there is no effective pharmacotherapy. The serotonin(2C) [5-hydroxytryptamine(2C) (5-HT2C)] receptor agonist
lorcaserin decreases some abuse-related effects of cocaine in monkeys and might be useful for treating stimulant abuse."

The news correspondents obtained a quote from the research from the University of Texas, "The current study investigated the effectiveness of lorcaserin to reduce self-administration of either cocaine or methamphetamine and cocaine-induced reinstatement of extinguished responding. Four rhesus monkeys responded under a progressive-ratio (PR) schedule in which the response requirement increased after each cocaine infusion (32-320 µg/kg/infusion). A separate group of four monkeys responded under a fixed-ratio (FR) schedule for cocaine (32 µg/kg/infusion) and reinstatement of extinguished responding was examined following administration of noncontingent infusions of cocaine (0.1-1 mg/kg) that were combined with response-contingent presentations of the drug-associated stimuli. Finally, three monkeys responded under a FR schedule for methamphetamine (0.32-100 µg/kg/infusion). Lorcaserin (3.2 mg/kg) significantly decreased the final ratio completed (i.e., decreased break point) in monkeys responding under the PR schedule and reduced the reinstatement of responding for drug-associated stimuli following a noncontingent infusion of cocaine; these effects did not appear to change when lorcaserin was administered daily. The same dose of lorcaserin decreased responding for methamphetamine in two of the three monkeys, and the effect was maintained during daily lorcaserin administration; larger doses given acutely (10-17.8 mg/kg) significantly decreased responding for methamphetamine, although that effect was not sustained during daily lorcaserin administration."

According to the news reporters, the research concluded: "Together, these results indicate that lorcaserin might be effective in reducing cocaine and methamphetamine abuse and cocaine relapse at least in some individuals."

Our news journalists report that additional information may be obtained by contacting C.P. France, Univ Texas Hlth Sci Center San Antonio, Dept. of Psychiat, San Antonio, TX 78229, United States. Additional authors for this research include G.T. Collins and C.P. France.

Gram-Negative Bacteria - Pseudomonas putida

Findings from University of Tokyo in the Area of Pseudomonas putida Reported (Effects of carbazole-degradative plasmid pCAR1 on biofilm morphology in Pseudomonas putida KT2440)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Pseudomonas putida are presented in a new report. According to news reporting originating in Bunkyo ku, Japan, by NewsRx journalists, research stated, "Bacteria typically form biofilms under natural conditions. To elucidate the effect of the carriage of carbazole-degradative plasmid pCAR1 on biofilm formation by host bacteria, we compared the biofilm morphology, using confocal laser scanning microscopy, of three pCAR1-free and pCAR1-carrying Pseudomonas hosts: P. putida KT2440, P. aeruginosa PAO1 and P. fluorescens Pf0-1."

Financial support for this research came from JSPS KAKENHI.

The news reporters obtained a quote from the research from the University of Tokyo, "Although pCAR1 did not significantly affect biofilm formation by PAO1 or Pf0-1, pCAR1-carrying KT2440 became filamentous and formed flat biofilms, whereas pCAR1-free KT2440 formed mushroom-like biofilms. pCAR1 contains three genes encoding nucleoid-associated proteins (NAPs), namely, Pmr, Pnd and Phu. The enhanced filamentous morphology was observed in two double mutants [KT2440(pCAR1DpmrDpnd) and KT2440 (pCAR1DpmrDphu)], suggesting that these NAPs are involved in modulating the filamentous phenotype. Transcriptome analyses of the double mutants identified 32 candidate genes that may be involved in filamentation of KT2440. Overexpression of PP_2193 in KT2440 induced filamentation and overexpression of PP_0308 or PP_0309 in KT2440(pCAR1) enhanced filamentation of cells over time. This suggests that pCAR1 induces development of an abnormal filamentous morphology by KT2440 via a process involving overexpression of several genes, such as PP_2193."

According to the news reporters, the research concluded: "In addition, pCAR1-encoded NAPs partly suppress too much filamentation of KT2440(pCAR1) by repressing transcription of some genes, such as PP_0308 and PP_0309."

Our news correspondents report that additional information may be obtained by contacting S. Lee, Biotechnology Research Center, The University of Tokyo, 1-1-1 Yayoi, Bunkyo-ku, Tokyo, 113-8657, Japan. Additional authors for this research include Y. Takahashi, H. Oura, C. Suzuki-Minakuchi, K. Okada, H. Yamane, N. Nomura and H. Nojiri.

Steatosis

Findings from University of Toledo Yields New Findings on Steatosis [Glucocorticoid Receptor beta Induces Hepatic Steatosis by Augmenting Inflammation and Inhibition of the Peroxisome Proliferator-activated Receptor (PPAR) alpha]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Steatosis have been published. According to news reporting out of Toledo, Ohio, by NewsRx editors, research stated, "Glucocorticoids (GCs) regulate energy supply in response to stress by increasing hepatic gluconeogenesis during fasting. Long-term GC treatment induces hepatic steatosis and weight gain."

Our news journalists obtained a quote from the research from the University of Toledo, "GC signaling is coordinated via the GC receptor (GR) GR alpha, as the GR beta isoform lacks a ligand-binding domain. The roles of the GR isoforms in the regulation of lipid accumulation is unknown. The purpose of this study was to determine whether GR beta inhibits the actions of GCs in the liver, or enhances hepatic lipid accumulation. We show that GR beta expression is increased in adipose and liver tissues in obese high-fat fed mice. Adenovirus-mediated delivery of hepatic GR beta overexpression (GR beta-Ad) resulted in suppression of gluconeogenic genes and hyperglycemia in mice on a regular diet. Furthermore, GR beta-Ad mice had increased hepatic lipid accumulation and serum triglyceride levels possibly due to the activation of NF-kappa B signaling and increased tumor necrosis factor alpha (TNF alpha) and inducible nitric-oxide synthase expression, indicative of enhanced M1 macrophages and the development of steatosis. Consequently, GR beta-Ad mice had increased glycogen synthase kinase 3 beta (GSK3 beta) activity and reduced hepatic PPAR alpha and fibroblast growth factor 21 (FGF21) expression and lower serum FGF21 levels, which are two proteins known to increase during fasting to enhance the burning of fat by activating the beta-oxidation pathway."

According to the news editors, the research concluded: "GR beta antagonizes the GC-induced signaling during fasting via GR alpha and the PPAR alpha-FGF21 axis that reduces fat burning. Furthermore, hepatic GR beta increases inflammation, which leads to hepatic lipid accumulation."

Our news journalists report that additional information may be obtained by contacting T.D. Hinds, University of Toledo, Coll Med, Center Hypertens & Personalized Med, Dept. of Physiol & Pharmacol, Toledo, OH 43614, United States. Additional authors for this research include L.A. Stechschulte, D.E. Stec, A. Nestor-Kalinoski, S. Coleman and T.D. Hinds.

Findings from University of Toronto Broaden Understanding of Clinical Trials and Studies (Integrated safety of levodopa-carbidopa intestinal gel from prospective clinical trials)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Research - Clinical Trials and Studies. According to news reporting out of Toronto, Canada, by NewsRx editors, research stated, "Continuous administration of levodopa-carbidopa intestinal gel (carbidopa-levodopa enteral suspension) through a percutaneous endoscopic gastrojejunostomy is a treatment option for advanced Parkinson disease (PD) patients with motor fluctuations resistant to standard oral medications. Safety data from 4 prospective studies were integrated to assess the safety of this therapy.”

Financial support for this research came from AbbVie Inc.

Our news journalists obtained a quote from the research from the University of Toronto, "Safety data from 4 studies were summarized using 2 overlapping data sets, permitting the separation of procedure/device-associated (n=395) from non-procedure/device adverse events (n=412). At the data cutoff, median exposure to levodopa-carbidopa intestinal gel was 911 days (range, 1-1980 days) with 963 total patient-years of exposure. Procedure/device adverse events occurred in 300 patients (76%), and serious adverse events occurred in 68 (17%); most frequently reported procedure/device adverse events and serious adverse events were complications of device insertion (41% and 8%, respectively) and abdominal pain (36% and 4%, respectively). Non-procedure/device adverse events occurred in 92% (379), with most frequently reported being insomnia (23%) and falls (23%); 42% (171) had non-procedure/device serious adverse events, with most frequently reported being pneumonia (5%) and PD symptoms (2%). Adverse events led to discontinuation in 17% (72), most frequently because of complication of device insertion (2.4%). There were 34 treatment-emergent deaths (8.3%) in the overlapping data sets, 2 of which (0.5%) were considered 'possibly related' to the treatment system. In the largest collection of levodopa-carbidopa intestinal gel safety data from prospective clinical studies, procedure/device events were frequently reported and occasionally life threatening. Most non-procedure/device events were typical for levodopa treatment and an elderly population."  

According to the news editors, the research concluded: "These factors combined with high treatment efficacy led to a relatively low discontinuation rate in advanced PD patients."

Our news journalists report that additional information may be obtained by contacting A.E. Lang, Morton and Gloria Shulman Movement Disorders Clinic and the Edmond
Hematologic Diseases and Conditions - Sickle Cell...

Findings from University of Toronto Broaden Understanding of Sickle Cell Anemia (MRI-based cerebrovascular reactivity using transfer function analysis reveals temporal group differences between patients with sickle cell disease and healthy ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematologic Diseases and Conditions - Sickle Cell Anemia. According to news reporting from Toronto, Canada, by NewsRx journalists, research stated, "Cerebrovascular reactivity (CVR) measures the ability of cerebral blood vessels to change their diameter and, hence, their capacity to regulate regional blood flow in the brain. High resolution quantitative maps of CVR can be produced using blood-oxygen level-dependent (BOLD) magnetic resonance imaging (MRI) in combination with a carbon dioxide stimulus, and these maps have become a useful tool in the clinical evaluation of cerebrovascular disorders."

Financial supporters for this research include Canadian Institutes of Health Research, Canada Research Chairs.

The news correspondents obtained a quote from the research from the University of Toronto, "However, conventional CVR analysis does not fully characterize the BOLD response to a stimulus as certain regions of the brain are slower to react to the stimulus than others, especially in disease. Transfer function analysis (TFA) is an alternative technique that can account for dynamic temporal relations between signals and has recently been adapted for CVR computation. We investigated the application of TFA in data on children with sickle cell disease (SCD) and healthy controls, and compared them to results derived from conventional CVR analysis. Data from 62 pediatric patients with SCD and 34 age-matched healthy controls were processed using conventional CVR analysis and TFA. BOLD data were acquired on a 3 Tesla MRI scanner while a carbon dioxide stimulus was quantified by sampling the end-tidal partial pressures of each exhaled breath. In addition, T1 weighted structural imaging was performed to identify grey and white matter regions for analysis. The TFA method generated maps representing both the relative magnitude change of the BOLD signal in response to the stimulus..."
(Gain), as well as the BOLD signal speed of response (Phase) for each subject. These were compared to CVR maps calculated from conventional analysis. The effect of applying TFA on data from SCD patients versus controls was also examined. The Gain measures derived from TFA were significantly higher than CVR values based on conventional analysis in both SCD patients and healthy controls, but the difference was greater in the SCD data. Moreover, while these differences were uniform across the grey and white matter regions of controls, they were greater in white matter than grey matter in the SCD group. Phase was also shown to be significantly correlated with the amount that TFA increases CVR estimates in both the grey and white matter. We demonstrated that conventional CVR analysis underestimates vessel reactivity and this effect is more prominent in patients with SCD. By using TFA, the resulting Gain and Phase measures more accurately characterize the BOLD response as it accounts for the temporal dynamics responsible for the CVR underestimation.”

According to the news reporters, the research concluded: "We suggest that the additional information offered through TFA can provide insight into the mechanisms underlying CVR compromise in cerebrovascular diseases."

Our news journalists report that additional information may be obtained by contacting A. Kassner, University of Toronto, Dept. of Med Imaging, Toronto, ON, Canada. Additional authors for this research include J. Duffin, J.A. Fisher and A. Kassner.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.nicl.2016.09.009. This DOI is a link to an online electronic document that is either free or for purchase.

Health and Medicine - Clinical Epidemiology

Findings from University of Toronto in the Area of Clinical Epidemiology Described (A third of systematic reviews changed or did not specify the primary outcome: a PROSPERO register study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Health and Medicine - Clinical Epidemiology. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "To examine outcome reporting bias of systematic reviews registered in PROSPERO. Retrospective cohort study."

Our news editors obtained a quote from the research from the University of Toronto, "The primary outcomes from systematic review publications were compared with those reported in the corresponding PROSPERO records; discrepancies in the primary outcomes were assessed as upgrades, additions, omissions, or downgrades. Relative risks (RRs) and 95% confidence
intervals (CI) were calculated to determine the likelihood of having a change in primary outcome when the meta-analysis result was favorable and statistically significant. Ninety-six systematic reviews were published. A discrepancy in the primary outcome occurred in 32% of the included reviews and 39% of the reviews did not explicitly specify a primary outcome(s); 6% of the primary outcomes were omitted. There was no significant increased risk of adding/upgrading (RR, 2.14; 95% CI: 0.53, 8.63) or decreased risk of downgrading (RR, 0.76; 95% CI: 0.27, 2.17) an outcome when the meta-analysis result was favorable and statistically significant As well, there was no significant increased risk of adding/upgrading (RR, 0.89; 95% CI: 0.31, 2.53) or decreased risk of downgrading (RR, 0.56; 95% CI: 0.29, 1.08) an outcome when the conclusion was positive."

According to the news editors, the research concluded: "We recommend review authors carefully consider primary outcome selection, and journals are encouraged to focus acceptance on registered systematic reviews." For more information on this research see: A third of systematic reviews changed or did not specify the primary outcome: a PROSPERO register study. Journal of Clinical Epidemiology, 2016;79():46-54. Journal of Clinical Epidemiology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Oncology - Breast Cancer

Findings from University of Turin Broadens Understanding of Breast Cancer (Luminal long non-coding RNAs regulated by estrogen receptor alpha in a ligand-independent manner show functional roles in breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting out of Turin, Italy, by NewsRx editors, research stated, "Estrogen Receptor alpha (ERa) activation by estrogenic hormones induces luminal breast cancer cell proliferation. However, ERa plays also important hormone-independent functions to maintain breast tumor cells epithelial phenotype."

Our news journalists obtained a quote from the research from the University of Turin, "We reported previously by RNA-Seq that in MCF-7 cells in absence of hormones ERa
down-regulation changes the expression of several genes linked to cellular development, representing a specific subset of estrogen-induced genes. Here, we report regulation of long non-coding RNAs from the same experimental settings. A list of 133 Apo-ERα-Regulated IncRNAs (AER-IncRNAs) was identified and extensively characterized using published data from cancer cell lines and tumor tissues, or experiments on MCF-7 cells. For several features, we ran validation using cell cultures or fresh tumor biopsies. AER-IncRNAs represent a specific subset, only marginally overlapping estrogen-induced transcripts, whose expression is largely restricted to luminal cells and which is able to perfectly classify breast tumor subtypes. The most abundant AER-IncRNA, DSCAM-AS1, is expressed in ERα+ breast carcinoma, but not in pre-neoplastic lesions, and correlates inversely with EMT markers. Down-regulation of DSCAM-AS1 recapitulated, in part, the effect of silencing ERα, i.e. growth arrest and induction of EMT markers."

According to the news editors, the research concluded: "We report an ERα-dependent IncRNA set representing a novel luminal signature in breast cancer cells."

For more information on this research see: Luminal long non-coding RNAs regulated by estrogen receptor alpha in a ligand-independent manner show functional roles in breast cancer. Oncotarget, 2016;7(3):3201-16.

Our news journalists report that additional information may be obtained by contacting V. Miano, Center for Molecular Systems Biology, University of Turin, Turin, Italy. Additional authors for this research include G. Ferrero, S. Reineri, L. Caizzi, L. Annaratone, L. Ricci, S. Cutrupi, I. Castellano, F. Cordero and M. De Bortoli.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.18632/oncotarget.6420. This DOI is a link to an online electronic document that is either free or for purchase.

Neurodegenerative Diseases and Conditions -...

Findings from University of Ulm Broaden Understanding of Creutzfeldt-Jakob Disease (Neurofilaments in blood and CSF for diagnosis and prediction of onset in Creutzfeldt-Jakob disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Creutzfeldt-Jakob Disease. According to news reporting from Ulm, Germany, by NewsRx journalists, research stated, "While cerebrospinal fluid (CSF) biomarkers for Creutzfeldt-Jakob disease (CJD) are established and partly included in the diagnostic criteria, no blood biomarkers are available. Here, we assessed the utility of serum neurofilament light chain (NF-L) and tau protein in comparison to CSF markers (NF-L and phosphorylated NF heavy chain (pNF-H), tau, S100B, 14-3-3) and prion conversion assay (realtime quaking induced conversion (RT-QuIC)) for sporadic and genetic CJD."

The news correspondents obtained a quote from the research from the University of Ulm, "Importantly, a Gerstmann-Straussler-Scheinker mutation carrier in the asymptomatic
phase and at disease onset was included as well. Both NF-L and tau were markedly increased in CJD serum, reaching similar or even better performance as in CSF (sensitivity and specificity for serum NF-L 100% and 85.5%, and for serum tau 84.6% and 96.2%, respectively). Serum S100B showed high sensitivity as well (84.2%), but lower specificity (63%). CSF neurofilaments were increased before symptom onset, while prion seeding assay was negative. Just before a clinical diagnosis could be made, all CSF markers and NF-L in the serum were increased and CSF prion conversion assay was positive."

According to the news reporters, the research concluded: "The data suggest that neurofilaments are sensitive and specific blood markers for the diagnosis of genetic and sporadic CJD and might represent promising tools to predict disease onset."

Our news journalists report that additional information may be obtained by contacting M. Otto, Univ Ulm, Dept. of Neurol, Ulm, Germany. Additional authors for this research include K. Blennow, S. Hallgebauer, S. Shi, V. Ruf, P. Oeckl, A. Giese, J. Kuhle, D. Slivarichova, H. Zetterberg and M. Otto.

Keywords for this news article include: Ulm, Germany, Europe, Neurodegenerative Diseases and Conditions, Diagnostics and Screening, Central Nervous System Diseases and Conditions, Central Nervous System Infections, Prion Diseases and Conditions, Creutzfeldt-Jakob Disease, Genetics, University of Ulm.

Drugs and Therapies - Testosterone Congeners

Findings from University of Utrecht Update Knowledge of Testosterone Congeners (Where does hydrolysis of nandrolone decanoate occur in the human body after release from an oil depot?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Testosterone Congeners have been published. According to news reporting from Utrecht, Netherlands, by NewsRx journalists, research stated, "Long-term therapy of nandrolone (N) is recommended to increase mineral density and muscle strength. Using a parenteral sustained release drug formulation with nandrolone decanoate (ND), therapeutic N levels can be achieved and maintained."

The news correspondents obtained a quote from the research from the University of Utrecht, "Until now, it is unknown if hydrolysis of ND into N occurs in tissue at the injection site or after systemic absorption. Therefore, hydrolysis studies were conducted to investigate the location and rate of ND hydrolysis after its release from the oil depot. ND hydrolysis was studied in porcine tissues, to mimic the human muscular and subcutaneous tissues. Additionally, the ND hydrolysis was studied in human whole blood, plasma and serum at a concentration range of 23.3-233.3 μM. ND hydrolysis only occurred in human whole blood. The hydrolysis did not start immediately, but after a lag time. The mean lag time for all studied concentrations was 34.9 +/- 2.5 min. Because of a slow penetration into tissue, hydrolysis of ND is found to be
very low in surrounding tissue. Therefore the local generation of the active compound is clinically irrelevant. It is argued that after injection of the oil depot, ND molecules will be transported via the lymphatic system towards lymph nodes."

According to the news reporters, the research concluded: "From here, it will enter the central circulation and within half an hour it will hydrolyse to the active N compound."

For more information on this research see: Where does hydrolysis of nandrolone decanoate occur in the human body after release from an oil depot? Central Nervous System Diseases and Conditions -…

Findings from University of Verona Has Provided New Data on Epilepsy (Melatonin as add-on treatment for epilepsy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting from Verona, Italy, by NewsRx journalists, research stated, "This is an updated version of the original Cochrane review published in Issue 6, 2012. Epilepsy is one of the most common chronic neurological disorders."

The news correspondents obtained a quote from the research from the University of Verona, "Despite the plethora of antiepileptic drugs (AEDs) currently available, 30% of people continue having seizures. This group of people requires a more aggressive treatment, since monotherapy, the first choice scheme, fails to control seizures. Nevertheless, polytherapy often results in a number of unwanted effects, including neurological disturbances (somnolence, ataxia, dizziness), psychiatric and behavioural symptoms, andmetabolic alteration (osteoporosis, induction or inhibition of hepatic enzymes, etc.). The need for better tolerated AEDs is even more urgent in this group of people. Reports have suggested an antiepileptic role of melatonin with a good safety profile. To assess the efficacy and tolerability of melatonin as add-on treatment for epilepsy. Search methods For the latest update, we searched the Cochrane Epilepsy Group's Specialized Register (12 January 2016), the Cochrane Central Register of Controlled Trials (CENTRAL) via the Cochrane Register of Studies Online (CRSO, 12 January 2016), and MEDLINE (Ovid, 11 January 2016). We searched the bibliographies of any identified study for further references. We handsearched selected journals and conference
proceedings. We applied no language restrictions. In addition, we contacted melatonin manufacturers (i.e. Nathura) and original investigators to identify any unpublished studies. Selection criteria Randomized controlled trials; double, single, or unblinded trials; parallel group or cross-over studies. People with epilepsy regardless of age and gender, including children and adults with disabilities. Administration of melatonin as add-on treatment to any AED(s) compared to add-on placebo or no add-on treatment. Data collection and analysis Review authors independently selected trials for inclusion according to pre-defined criteria, extracted relevant data, and evaluated the methodological quality of trials. We assessed the following outcomes: at least 50% seizure reduction, seizure freedom, adverse events, and quality of life. We included six publications, with 125 participants (106 aged under 18 years). Two different comparisons were available: melatonin versus placebo and melatonin 5 mg versus melatonin 10 mg. Despite our primary intention, due to insufficient information on outcomes, we were unable to perform any meta-analyses, but summarized data narratively. Four studies were randomized, double-blind, cross-over, placebo-controlled trials and two were randomized, double-blind, parallel, placebo-controlled trials. Only two studies provided the exact number of seizures during the trial compared to the baseline: none of the participants with seizures during the trial had a change in seizure frequency compared with the baseline. Two studies systematically evaluated adverse effects (worsening of headache was reported in a child with migraine under melatonin treatment). Only one study systematically evaluated quality of life, showing no statistically significant improvement in quality of life in the add-on melatonin group. Authors' conclusions Included studies were of poor methodological quality, and did not systematically evaluate seizure frequency and adverse events, so that it was impossible to summarize data in a meta-analysis."

According to the news reporters, the research concluded: "It is not possible to draw any conclusion about the role of melatonin in reducing seizure frequency or improving quality of life in people with epilepsy."

For more information on this research see: Melatonin as add-on treatment for epilepsy. *Cochrane Database of Systematic Reviews*, 2016;(8):2144-2172. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

*Findings from University of Verona in the Area of Type 2 Diabetes Reported (Evidence of left atrial remodeling and left ventricular diastolic dysfunction in type 2 diabetes mellitus with preserved systolic function)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting originating from Verona, Italy, by NewsRx correspondents, research stated, "Prognosis of type 2 diabetes is associated with the occurrence of cardiovascular diseases. Left atrial (LA) size is a predictor of outcome in several diseases, including diabetes."

Our news editors obtained a quote from the research from the University of Verona, "Long duration of diabetes is an established risk factor of poor prognosis. No data are available on the relationship between LA size and duration of diabetes. The present study was aimed to investigate the relationship between LA volume index (LAVI) and the duration of diabetes to test the hypothesis that LA volume will increase as a function of diabetes duration. Forty-four male patients with newly diagnosed and 172 male patients with established type 2 diabetes were recruited for this cross-sectional study. All patients were evaluated with a transthoracic echocardiographic Doppler. About 28.2% of patients had increased LAVI. Indices of both diastolic and systolic function were significantly lower in patients with larger left atrium. The values of LAVI increased across classes of duration of diabetes. In multivariable analysis, longer duration was a predictor of LAVI >= 34 ml/m2 (odds ratio 1.65, 95% CI 1.11 -2.46, p = 0.014) after adjusting for age, hemoglobin A1c, hypertension, microvascular complication status, and relevant echocardiographic parameters of systolic and diastolic function. These results indicate that duration of diabetes is strongly and positively associated with larger LAVI in type 2 diabetic men with preserved systolic function."

According to the news editors, the research concluded: "Future studies are needed to better elucidate the biological mechanisms underlying linking type 2 diabetes with abnormally increased LAVI in subjects with type 2 diabetes."

For more information on this research see: Evidence of left atrial remodeling and left ventricular diastolic dysfunction in type 2 diabetes mellitus with preserved systolic function. Nutrition Metabolism and Cardiovascular Diseases, 2016;26(11):1026-1032. Nutrition Metabolism and Cardiovascular Diseases can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England.

The news editors report that additional information may be obtained by contacting G. Zoppini, University of Verona, Azienda Osped Univ Integrata, Dept. of Med, Sect Endocrinol Diabet & Metab, Verona, Italy. Additional authors for this research include S. Bonapace, C. Bergamini, A. Rossi, M. Trombetta, L. Lanzoni, L. Bertolini, L. Zenari, E. Bonora and G. Targher.

Findings from University of Waikato Broaden Understanding of Breast Cancer (Urban Rural Differences in Breast Cancer in New Zealand)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting from Hamilton, New Zealand, by NewsRx journalists, research stated, "Many rural communities have poor access to health services due to a combination of distance from specialist services and a relative shortage of general practitioners. Our aims were to compare the characteristics of urban and rural women with breast cancer in New Zealand, to assess breast cancer-specific and all-cause survival using the Kaplan-Meier method and Cox proportional hazards model, and to assess whether the impact of rurality is different for Maori and New Zealand (NZ) European women."

The news correspondents obtained a quote from the research from the University of Waikato, "We found that rural women tended to be older and were more likely to be Maori. Overall there were no differences between urban and rural women with regards their survival. Rural Maori tended to be older, more likely to be diagnosed with metastatic disease and less likely to be screen detected than urban Maori. Rural Maori women had inferior breast cancer-specific survival and all-cause survival at 10 years at 72.1% and 55.8% compared to 77.9% and 64.9% for urban Maori."

According to the news reporters, the research concluded: "The study shows that rather than being concerned that more needs to be done for rural women in general it is rural Maori women where we need to make extra efforts to ensure early stage at diagnosis and optimum treatment."

Our news journalists report that additional information may be obtained by contacting R. Lawrenson, Univ Waikato, Natl Inst Demog & Econ Anal, Hamilton 3240, New Zealand. Additional authors for this research include C.H. Lao, M. Elwood, C. Brown, D. Sarfati and I. Campbell.

Findings from University of Waikato Yields New Data on Prostate Cancer (Communication networks of men facing a diagnosis of prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Prostate Cancer have been presented. According to news reporting out of Hamilton, New Zealand, by NewsRx editors, research
stated, "Aims and objectives. This study seeks to identify the factors that shape the communication networks of men who face a potential diagnosis of prostate cancer, and how these factors relate to their disclosure about their changing health status."

Financial support for this research came from University of Waikato and the Prostate Cancer Foundation of New Zealand.

Our news journalists obtained a quote from the research from the University of Waikato, "Men facing a potential diagnosis of prostate cancer are in a challenging situation; the support benefits of disclosing their changing health status to others in their communication networks is set against a backdrop of the potential stigma and uncertainty of the diagnosis. All men on a prostate biopsy waiting list were eligible for inclusion in an exploratory and interpretive study. Semi-structured interviews with 40 men explored their network structures and disclosure of health information. Thematic analysis highlighted the factors which contributed to their network structures and their disclosure about their health status. Four network factors shaped men's perspectives about disclosing their health status: (1) tie strength, comprising both strong and weak ties; (2) knowledgeable others, with a focus on medical professionals in the family; (3) homophily, which included other individuals with a similar medical condition; and (4) geographical proximity, with a preference for face-to-face communication. Communication networks influence men's disclosure of their health status and in particular weak ties with medical knowledge have an important role. Men who use the potential for support in their networks may experience improved psychosocial outcomes.

Relevance to clinical practice. Using these four network factors-tie strength, knowledgeable others, homophily or geographical proximity-to forecast men's willingness to disclose helps identify men who lack potential support and so are at risk of poor psychosocial health. Those with few strong ties or knowledgeable others in their networks may be in the at-risk cohort."

According to the news editors, the research concluded: "The support provided in communication networks complements formal medical care from nurses and other health professionals, and encouraging patients to use their communication networks improves the psychosocial health of the men themselves, their partners and their families."

Our news journalists report that additional information may be obtained by contacting D. Brown, Univ Waikato, Management Commun Department, Hamilton 3240, New Zealand. Additional authors for this research include J. Oetzel and A. Henderson.

Findings from University of Washington Broaden Understanding of Hyperglycemia (Blood-Brain Barrier Disruption and Neurovascular Unit Dysfunction in Diabetic Mice: Protection with the Mitochondrial Carbonic Anhydrase Inhibitor Topiramate)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Hyperglycemia. According to news reporting out of Seattle, Washington, by NewsRx editors, research stated, "All forms of diabetes mellitus are characterized by chronic hyperglycemia, resulting in the development of a number of microvascular and macrovascular pathologies. Diabetes is also associated with changes in brain microvasculature, leading to dysfunction and ultimately disruption of the blood-brain barrier (BBB)."

Our news journalists obtained a quote from the research from the University of Washington, "These changes are correlated with a decline in cognitive function. In diabetes, BBB damage is associated with increased oxidative stress and reactive oxygen species. This occurs because of the increased oxidative metabolism of glucose caused by hyperglycemia. Decreasing the production of bicarbonate with the use of a mitochondrial carbonic anhydrase inhibitor (mCAi) limits oxidative metabolism and the production of reactive oxygen species."

According to the news editors, the research concluded: "In this study, we have demonstrated that 1) streptozotocin-induced diabetes resulted in BBB disruption, 2) ultrastructural studies showed a breakdown of the BBB and changes to the neurovascular unit (NVU), including a loss of brain pericytes and retraction of astrocytes, the two cell types that maintain the BBB, and 3) treatment with topiramate, a mCAi, attenuated the effects of diabetes on BBB disruption and ultrastructural changes in the neurovascular unit."

For more information on this research see: Blood-Brain Barrier Disruption and Neurovascular Unit Dysfunction in Diabetic Mice: Protection with the Mitochondrial Carbonic Anhydrase Inhibitor Topiramate. Journal of Pharmacology and Experimental Therapeutics, 2016;359(3):452-459. Heart Disorders and Diseases - Sinus Arrhythmia

Findings from University of Washington Provides New Data about Sinus Arrhythmia (Respiratory sinus arrhythmia as a potential measure in substance use treatment--outcome studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Sinus Arrhythmia have been published. According to news reporting from Seattle, Washington, by NewsRx journalists, research stated, "Dysfunction of physiological regulation systems may underlie the disrupted emotional and self-regulatory processes among people with substance use disorder (SUD). This paper reviews evidence as to whether or not respiratory sinus arrhythmia (RSA), as a psychophysiological index of emotional regulation, could provide useful information in treatment-outcome research to provide insights into recovery processes."

The news correspondents obtained a quote from the research from the University of Washington, "We reviewed the use of RSA in clinical research and studies on SUD treatment. Search terms for the review of RSA in clinical research included respiratory sinus arrhythmia, heart rate variability, vagal, cardiac vagal control, psychophysiology, intervention, treatment, mindfulness, mind-body, mental health, substance use, chemical dependence, regulation and emotion regulation. For the review of RSA in intervention studies, we included only those that provided adequate description of psychophysiological methods, and examined RSA in the context of an intervention study. RSA appears to be able to provide an index of self-regulatory capacity; however, it has been little used in either intervention or treatment research. Of the four intervention studies included in this review, all were mindfulness-based interventions. Two studies were with substance-using samples, and both showed pre-post increases in RSA and related improved substance use outcomes. Two of the three studies were randomized controlled trials (RCTs), and both showed significant increases in RSA in the experimental compared to comparison condition."

According to the news reporters, the research concluded: "Respiratory sinus arrhythmia may be a useful index of emotional regulation in people with substance use disorder, and a potential measure of underlying mechanisms for SUD treatment studies, particularly mindfulness-based interventions."

Our news journalists report that additional information may be obtained by contacting C.J. Price, Biobehavioral Nursing, University of Washington, Seattle, WA, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/add.13232. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from University of Waterloo Has Provided New Information about *Escherichia coli* (Cinnamaldehyde Characterization as an Antibacterial Agent toward *E. coli* Metabolic Profile Using 96-Blade Solid-Phase Microextraction Coupled to Liquid ...)
Findings from University of Waterloo in the Area of Breast Cancer Described (Identification of potential compensatory muscle strategies in a breast cancer survivor population: A combined computational and experimental approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Breast Cancer. According to news reporting originating in Waterloo, Canada, by NewsRx journalists, research stated, "Biomechanical models are often used to estimate the muscular demands of various activities. However, specific muscle dysfunctions typical of unique clinical populations are rarely considered."

Financial supporters for this research include Ontario Ministry of Research and Innovation, NSERC.

The news reporters obtained a quote from the research from the University of Waterloo, "Due to iatrogenic tissue damage, pectoralis major capability is markedly reduced in breast cancer population survivors, which could influence arm internal and external rotation muscular strategies. Accordingly, an optimization-based muscle force prediction model was systematically modified to emulate breast cancer population survivors through adjusting pectoralis capability and enforcing an empirical muscular co-activation relationship. Model permutations were evaluated through comparisons between predicted muscle forces and empirically measured muscle activations in survivors. Similarities between empirical data and model outputs were influenced by muscle type, hand force, pectoralis major capability and co-activation constraints. Differences in magnitude were lower when the co-activation constraint was enforced (-18.4% [31.9]) than unenforced (-23.5%[27.6]) (p < 0.0001). This research demonstrates that muscle dysfunction in breast cancer population survivors can be reflected through including a capability constraint for pectoralis major. Further refinement of the co-activation constraint for survivors could improve its generalizability across this population and activities."

According to the news reporters, the research concluded: "Improving biomechanical models to more accurately represent clinical populations can provide novel information that can help in the development of optimal treatment programs for breast cancer population survivors."

Our news correspondents report that additional information may be obtained by contacting C.R. Dickerson, University of Waterloo, Dept. of Kinesiol, Waterloo, ON N2L 3G1, Canada. Additional authors for this research include R.L. Brookham and C.R. Dickerson.

The direct object identifier (DOI) for that additional information is:
Findings from University of Western Australia Provide New Insights into Microcephaly (Reinforcing the association between distal 1q CNVs and structural brain disorder: A case of a complex 1q43-q44 CNV and a review of the literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Musculoskeletal Diseases and Conditions - Microcephaly have been presented. According to news reporting originating in Nedlands, Australia, by NewsRx journalists, research stated, "Copy Number Variations (CNVs) comprising the distal 1q region 1q43-q44 are associated with neurological impairments, structural brain disorder, and intellectual disability. Here, we report an extremely rare, de novo case of a 1q43-q44 deletion with an adjacent duplication, associated with severe seizures, microcephaly, agenesis of the corpus callosum, and pachygyria, a consequence of defective neuronal migration disorder."

Funders for this research include National Health and Medical Research Council (Australia), Telethon-Perth Children's Hospital Research Fund, Sunsuper Ride to Conquer Cancer.

The news reporters obtained a quote from the research from the University of Western Australia, "We conducted a literature survey to find that our patient is only the second case of such a 1q43-q44 CNV ever to be described. Our data support an association between 1q43-q44 deletions and microcephaly, as well as an association between 1q43-q44 duplications and macrocephaly. We compare and contrast our findings with previous studies reporting on critical 1q43-q44 regions and their constituent genes associated with seizures, microcephaly, and corpus callosum abnormalities [Ballif et al., 2012; Hum Genet 131:145-156; Nagamani et al., 2012; Eur J Hum Genet 20:176-179]." According to the news reporters, the research concluded: "Taken together, our study reinforces the association between 1q43-q44 CNVs and brain disorder."

Our news correspondents report that additional information may be obtained by contacting I.A. Hemming, The Harry Perkins Institute of Medical Research, QEII Medical Centre, Nedlands, Western Australia, Australia. Additional authors for this research include A.R. Forrest, P. Shipman, K.J. Woodward, P. Walsh, D.G. Ravine and J.I Heng.

Nutritional and Metabolic Diseases and Conditions - …

Findings from University of Western Australia Provides New Data on Obesity (Sun Exposure and Its Effects on Human Health: Mechanisms through Which Sun Exposure Could Reduce the Risk of Developing Obesity and Cardiometabolic Dysfunction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news originating from Perth, Australia, by NewsRx correspondents, research stated, "Obesity is a significant burden on global healthcare due to its high prevalence and associations with chronic health conditions. In our animal studies, ongoing exposure to low dose ultraviolet radiation (UVR, found in sunlight) reduced weight gain and the development of signs of cardiometabolic dysfunction in mice fed a high fat diet."

Our news journalists obtained a quote from the research from the University of Western Australia, "These observations suggest that regular exposure to safe levels of sunlight could be an effective means of reducing the burden of obesity. However, there is limited knowledge around the nature of associations between sun exposure and the development of obesity and cardiometabolic dysfunction, and we do not know if sun exposure (independent of outdoor activity) affects the metabolic processes that determine obesity in humans. In addition, excessive sun exposure has strong associations with a number of negative health consequences such as skin cancer. This means it is very important to 'get the balance right' to ensure that we receive benefits without increasing harm."

According to the news editors, the research concluded: "In this review, we detail the evidence around the cardiometabolic protective effects of UVR and suggest mechanistic pathways through which UVR could be beneficial."

For more information on this research see: Sun Exposure and Its Effects on Human Health: Mechanisms through Which Sun Exposure Could Reduce the Risk of Developing Obesity and Cardiometabolic Dysfunction. *International Journal of Environmental Research and Public Health, 2016;13(10):880-897.* *International Journal of Environmental Research and Public Health* can be contacted at: Mdp Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Findings from University of Western Australia Yields New Data on Lung Transplants (Successful Single-Lung Transplant for Severe Lung Graft-Versus-Host Disease Two Years After Sibling Allograft for Acute Lymphoblastic Leukemia: A Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Lung Transplants is now available. According to news originating from Perth, Australia, by NewsRx correspondents, research stated, "Bone marrow transplantation (BMT) has been performed as a successful life-saving treatment for hematological and neoplastic diseases."

Our news journalists obtained a quote from the research from the University of Western Australia, "Despite the predictable long-term survival rates in BMT, pulmonary complications reduce the survival rates significantly mainly because of chronic graft-versus-host disease (GVHD). This report briefly discusses a successful lung transplantation case for severe lung GVHD after allograft for acute lymphoblastic leukemia."

According to the news editors, the research concluded: "This case report supports the scarce evidence in the literature for the importance of lung transplantation as a therapeutic option for patients who develop respiratory failure secondary to BMT."

The news correspondents report that additional information may be obtained from J.P. Cooney, University of Western Australia, Fac Med Dental & Hlth Sci, Perth, WA, Australia. Additional authors for this research include M. Musk and J.P. Cooney.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.transproceed.2016.07.003. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from University of Western Ontario in Anxiolytics Sedatives and Hypnotics Provides New Insights (Relationships between Endogenous Plasma Biomarkers of Constitutive Cytochrome P450 3A Activity and Single-Time-Point Oral Midazolam ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Anxiolytics Sedatives and Hypnotics. According to news reporting originating from London, Canada, by NewsRx correspondents, research stated, "Due to high basal interindividual variation in cytochrome P450 3A (CYP3A) activity and susceptibility to drug interactions, there has been interest in the application of efficient probe drug phenotyping strategies, as well as endogenous biomarkers for assessment of in vivo CYP3A activity. The biomarkers 4b-hydroxycholesterol (4bHC) and 6b-hydroxycortisol (6bHCL) are sensitive to CYP3A induction and inhibition."

Financial support for this research came from Canadian Institutes of Health Research.

Our news editors obtained a quote from the research from the University of Western Ontario, "However, their utility for the assessment of constitutive CYP3A activity remains uncertain. We investigated whether endogenous plasma biomarkers (4bHC and 6bHCL) are associated with basal CYP3A metabolic activity in healthy subjects assessed by a convenient single-time-point oral midazolam (MDZ) phenotyping strategy. Plasma 4bHC and 6bHCL metabolic ratios (MRs) were analysed in 51 healthy adult participants. CYP3A activity was determined after administration of an oral MDZ microdose (100 mg). Simple linear and multiple linear regression analyses were performed to assess relationships between MDZ oral clearance, biomarkers and subject covariates. Among study subjects, basal MDZ oral clearance, 4bHC and 6bHCL MRs ranged 6.5-, 10-and 13-fold, respectively. Participant age and alcohol consumption were negatively associated with MDZ oral clearance (p=0.03 and p=0.045, respectively), while weight and female sex were associated with lower plasma 4bHC MR (p=0.0003 and p=0.032, respectively). Neither 4bHC nor 6bHCL MRs were associated with MDZ oral clearance."

According to the news editors, the research concluded: "Plasma 4bHC and 6bHCL MRs do not relate to MDZ single-time-point metabolic phenotype in the assessment of constitutive CYP3A activity among healthy individuals."

The news editors report that additional information may be obtained by contacting S.J. Woolsey, Dept. of Physiology & Pharmacology, Schulich School of Medicine and Dentistry, The University of Western Ontario, London, ON, Canada. Findings from University of Wisconsin Has Provided New Information about Prostate Cancer (Optimizing an 18F-NaF and 18F-FDG cocktail for PET assessment of metastatic castration-resistant prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news reporting originating from Madison, Wisconsin, by NewsRx correspondents, research stated, "PET/computed tomography (CT) imaging with the sodium-(F)-fluoride/2-(F)-fluoro-2-deoxy-D-glucose (F-NaF/F-FDG) cocktail has been proposed for patients with osseous metastases. This work aimed to optimize the cocktail composition for patients with metastatic castration-resistant prostate cancer (mCRPC)."

Our news editors obtained a quote from the research from the University of Wisconsin, "The study was carried out on six patients with mCRPC, with a total of 26 analyzed lesions. The patients were injected with F-NaF and F-FDG at separate time points. Dynamic PET/CT imaging recorded the uptake time course for both the tracers into osseous metastases. F-NaF and F-FDG uptakes were decoupled by kinetic analysis, which enabled calculation of F-NaF and F-FDG standardized uptake values (SUVs) images. Peak, mean, and total SUVs were evaluated for both tracers and all visible lesions. The F-NaF/F-FDG cocktail was optimized under the assumption that the contribution of both tracers to image formation is equal. SUV images from PET/CT imaging with a combination of F-NaF and F-FDG were generated for cocktail compositions with an F-NaF : F-FDG ratio varying from 1:8 to 1:2. The F-NaF peak and mean SUVs were on average four to five times higher than the F-FDG peak and mean SUVs, with an interlesion coefficient of variations of 20%. The total SUV for F-NaF was on average seven times higher than that for F-FDG. When the F-NaF : F-FDG ratio changed from 1:8 to 1:2, the typical SUV on the generated PET images increased by 50%, whereas the change in the uptake visual pattern was hardly noticeable. F-NaF and F-FDG in the cocktail contribute equally to image formation when the F-NaF : F-FDG ratio is 1:5. Therefore, we propose this ratio as the optimal cocktail composition for mCRPC patients."

According to the news editors, the research concluded: "We also urge to strictly control the cocktail composition during any F-NaF/F-FDG cocktail PET/CT examination."

For more information on this research see: Optimizing an 18F-NaF and 18F-FDG cocktail for PET assessment of metastatic castration-resistant prostate cancer. **Health and Medicine - Addiction Research**

**Findings from University of Wisconsin School of Medicine and Public Health Broaden Understanding of Addiction Research (Comparative effectiveness of motivation phase intervention components for use with smokers unwilling to quit: a factorial ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Addiction Research. According to news reporting originating in Madison, Wisconsin, by NewsRx journalists, research stated, "To screen promising intervention components designed to reduce smoking and promote abstinence in smokers initially unwilling to quit. A balanced, four-factor, randomized factorial experiment."

Financial support for this research came from National Cancer Institute to the University of Wisconsin Center for Tobacco Research and Intervention and by the Wisconsin Partnership Program.

The news reporters obtained a quote from the research from the University of Wisconsin School of Medicine and Public Health, "Eleven primary care clinics in southern Wisconsin, USA. A total of 517 adult smokers (63.4% women, 91.1% white) recruited during primary care visits who were willing to reduce their smoking but not quit. Four factors contrasted intervention components designed to reduce smoking and promote abstinence: (1) nicotine patch versus none; (2) nicotine gum versus none; (3) motivational interviewing (MI) versus none; and (4) behavioral reduction counseling (BR) versus none. Participants could request cessation treatment at any point during the study. The primary outcome was percentage change in cigarettes smoked per day at 26 weeks post-study enrollment; the secondary outcomes were percentage change at 12 weeks and point-prevalence abstinence at 12 and 26 weeks post-study enrollment. There were few main effects, but a significant four-way interaction at 26 weeks post-study enrollment (p=0.01, b=0.12) revealed relatively large smoking reductions by two component combinations: nicotine gum combined with BR and BR combined with MI. Further, BR improved 12-week abstinence rates (p=0.04), and nicotine gum, when used without MI, increased 26-week abstinence after a subsequent aided quit attempt (p=0.01)."

According to the news reporters, the research concluded: "Motivation-phase nicotine gum and behavioral reduction counseling are promising intervention components for smokers who are initially unwilling to quit."

Drugs and Therapies - Immunosuppressive Agents

Findings from University of Witwatersrand Has Provided New Data on Immunosuppressive Agents (Sirolimus-induced lymphoedema)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Immunosuppressive Agents is now available. According to news originating from Johannesburg, South Africa, by NewsRx correspondents, research stated, "Sirolimus is an inhibitor of the mammalian target of rapamycin (mTOR), used as an immunosuppressant for solid-organ transplant recipients and patients with autoimmune disorders."

Our news journalists obtained a quote from the research from the University of Witwatersrand, "We report a case of lymphoedema, a rare complication of sirolimus, and discuss the mechanism of drug action, the adverse effects and the challenges of treating a kidney transplant recipient with this complication in a resource-limited environment. Lymphoedema is a rare complication of sirolimus, and the mechanisms are not completely understood; however, early recognition can prevent permanent disfigurement."

According to the news editors, the research concluded: "This case highlights the need for early recognition of adverse drug effects and further research into their pathophysiology and management."

For more information on this research see: Sirolimus-induced lymphoedema. SAMJ South African Medical Journal, 2016;106(9):53-54. Findings from University of Wollongong in the Area of Environmental Research and Public Health Described (Improving Precautionary Communication in the EMF Field? Effects of Making Messages Consistent and Explaining the Effectiveness of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Environmental Health - Environmental Research and Public Health have been presented. According to news originating from Wollongong, Australia, by NewsRx correspondents, research stated, "Many radiation health agencies communicate precautionary measures regarding the use of mobile communication devices, e.g. the use of a headset while talking on the phone. These precautionary messages have, however, been shown to unintentionally increase risk perceptions about radiofrequency electromagnetic fields (RF-EMFs)."

Our news journalists obtained a quote from the research from the University of Wollongong, "The current study tested two potential ways of amending precautionary messages in order to minimise this unintentional effect. Firstly, the messages' potential to be perceived as inconsistent and thereby raise suspicions was addressed; secondly, the effectiveness of the precautions was explained. An experimental design was applied in which a quota sample of 1717 Australian residents was randomly assigned to one of six message conditions. Three different risk perception measures served as dependent variables, two of them are conditional measures. The original effect of precautionary messages to amplify risk perceptions could not be replicated. Furthermore, amending precautionary messages in favour of more consistency had no effect, while explaining the effectiveness of the precautions increased conditional risk perception under the condition that no precautions are taken. This was contrary to our assumptions. We infer from these results that changing precautionary messages in terms of consistency and effectiveness in order to reduce risk perception is hardly possible. The use of conditional risk perception measures seems fruitful for studies looking at the effects of precautionary or protective messages, given that previous studies have only investigated effects on unconditional risk perception."

According to the news editors, the research concluded: "However, the present results should not be over-interpreted as the measures' validity in the EMF context still needs further investigation."

For more information on this research see: Improving Precautionary Communication in the EMF Field? Effects of Making Messages Consistent and Explaining the Effectiveness of Precautions. *International Journal of Environmental Research and Public Health*, 2016;13 (10):774-791. *International Journal of Environmental Research and Public Health* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Ebola Virus

Findings from University of Zambia Yields New Findings on Ebola Virus
[Development of an Immunochromatography Assay (QuickNavi-Ebola) to Detect Multiple Species of Ebolaviruses]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Ebola Virus have been presented. According to news originating from Lusaka, Zambia, by NewsRx correspondents, research stated, "The latest outbreak of Ebola virus disease (EVD) in West Africa has highlighted the urgent need for the development of rapid and reliable diagnostic assays. We used monoclonal antibodies specific to the ebolavirus nucleoprotein to develop an immunochromatography (IC) assay (QuickNavi-Ebola) for rapid diagnosis of EVD."

Funders for this research include Agency for Medical Research and Development, Japan International Cooperation Agency, Science and Technology Research Partnership for Sustainable Development, Health and Labor Sciences Research Grant, Division of Intramural Research, National Institute of Allergy and Infectious Diseases, National Institutes of Health.

Our news journalists obtained a quote from the research from the University of Zambia, "The IC assay was first evaluated with tissue culture supernatants of infected Vero E6 cells and found to be capable of detecting 10(3)-10(4) focus-forming units/mL of ebolaviruses. Using serum samples from experimentally infected nonhuman primates, we confirmed that the assay could detect the viral antigen shortly after disease onset. It was also noted that multiple species of ebolaviruses could be detected by the IC assay."

According to the news editors, the research concluded: "Owing to the simplicity of the assay procedure and absence of requirements for special equipment and training, QuickNavi-Ebola is expected to be a useful tool for rapid diagnosis of EVD."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/infdis/jiw252. This DOI is a link to an online electronic document that is either free or for purchase.

Findings from University of Zurich in Cell Transplants Reported (Blood Stem Cell Activity Is Arrested by Th1-Mediated Injury Preventing Engraftment following Nonmyeloablative Conditioning)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Transplant Medicine - Cell Transplants are presented in a new report. According to news reporting originating in Zurich, Switzerland, by NewsRx journalists, research stated, "T cells are widely used to promote engraftment of hematopoietic stem cells (HSCs) during an allogeneic hematopoietic cell transplantation. Their role in overcoming barriers to HSC engraftment is thought to be particularly critical when patients receive reduced doses of preparative chemotherapy and/or radiation compared with standard transplantations."

The news reporters obtained a quote from the research from the University of Zurich, "In this study, we sought to delineate the effects CD4(+) cells on engraftment and blood formation in a model that simulates clinical hematopoietic cell transplantation by transplanting MHC-matched, minor histocompatibility-mismatched grafts composed of purified HSCs, HSCs plus bulk T cells, or HSCs plus T cell subsets into mice conditioned with low-dose irradiation. Grafts containing conventional CD4(+) T cells caused marrow inflammation and inhibited HSC engraftment and blood formation. Posttransplantation, the marrows of HSCs plus CD4(+) cell recipients contained IL-12-secreting CD11c(+) cells and IFN-gamma-expressing donor Th1 cells. In this setting, host HSCs arrested at the short-term stem cell stage (G0). As a consequence, donor HSCs failed to engraft and hematopoiesis was suppressed. Our data show that Th1 cells included in a hematopoietic allograft can negatively impact HSC activity, blood reconstitution, and engraftment of donor HSCs. This potential negative effect of donor T cells is not considered in clinical transplantation in which bulk T cells are transplanted."

According to the news reporters, the research concluded: "Our findings shed new light on the effects CD4(+) T cells on HSC biology and are applicable to other pathogenic states in which immune activation in the bone marrow occurs such as aplastic anemia and certain infectious conditions."

For more information on this research see: Blood Stem Cell Activity Is Arrested by Th1-Mediated Injury Preventing Engraftment following Nonmyeloablative Conditioning. Findings from University of the West of Scotland Provides New Data about Down Syndrome (Investigating the Lived Experience of People with Down Syndrome with Dementia: Overcoming Methodological and Ethical Challenges)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Genetic Diseases and Conditions - Down Syndrome have been published. According to news reporting originating in Hamilton, United Kingdom, by NewsRx editors, the research stated, "Adults with Down syndrome are at increased risk of dementia at a significantly younger age and remain under-represented as participants in dementia-related research. Because little is known about their personal experiences either immediately postdiagnosis or as dementia progresses, there is little opportunity that shared individual experiences can shape future policy and practice."

The news reporters obtained a quote from the research from the University of the West of Scotland, "To remedy this omission, the author examined methodological and ethical challenges identified as part of a research study that included people with Down syndrome affected by dementia. It has been contended that traditional qualitative approaches are less effective when participants are affected by changing cognitive functioning and reduced verbal communication. To counteract this contention overt participant observation and an adapted narrative research method were used as part of a three-year longitudinal study to help better understand the lived experiences of three adults with Down syndrome affected by dementia. Methodological and ethical challenges were shown to collide, and factors contributing to this effect included identifying process consent, accurate representation of participants, the role of and relationship with the researcher, participants, lack of awareness of their diagnosis of dementia, and need to recognize the importance of social interaction while maintaining academic rigor. Reflections are proffered on two conceptual and practice issues, with a call for both to be recognized and addressed in terms of future policy and practice. First is a lack of awareness of a sense of 'self' or identity, resulting in individuals with Down syndrome and dementia being defined by their situation rather than individual preference or need."

According to the news reporters, the research concluded: "Second is the lack of information postdiagnosis about dementia being shared with people who have Down syndrome."

Central Nervous System Diseases and Conditions —...

Findings from Uppsala University Broaden Understanding of Epilepsy
(Novel SACS mutations associated with intellectual disability, epilepsy and widespread supratentorial abnormalities)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting originating from Uppsala, Sweden, by NewsRx correspondents, research stated, "We describe eight subjects from two consanguineous families segregating with autosomal recessive childhood onset spastic ataxia, peripheral neuropathy and intellectual disability. The degree of intellectual disability varied from mild to severe and all four affected individuals in one family developed aggressive behavior and epilepsy."

Funders for this research include Swedish Research Council, Uppsala University Hospital, Uppsala University, Science for Life Laboratory.

Our news editors obtained a quote from the research from Uppsala University, "Using exome sequencing, we identified two novel truncating mutations (c.2656C > T (p.Gln886*)) and (c.4756_4760delAATCA (p.Asn1586Tyrfs*3)) in the SACS gene responsible for autosomal recessive spastic ataxia of Charlevoix-Saguenay (ARSACS). MRI revealed typical cerebellar and pontine changes associated with ARSACS as well as multiple supratentorial changes in both families as likely contributing factors to the cognitive symptoms. Intellectual disability and behavioral abnormalities have been reported in some cases of ARSACS but are not a part of the characteristic triad of symptoms that includes cerebellar ataxia, spasticity and peripheral neuropathy."

According to the news editors, the research concluded: "Our combined findings bring further knowledge to the phenotypic spectrum, neurodegenerative changes and genetic variability associated with the SACS gene of clinical and diagnostic importance."

For more information on this research see: Novel SACS mutations associated with intellectual disability, epilepsy and widespread supratentorial abnormalities. *Journal of the Neurological Sciences*, 2016;371():105-111. *Journal of the Neurological Sciences* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of the Neurological Sciences - www.journals.elsevier.com/journal-of-the-neurological-sciences/)

The news editors report that additional information may be obtained by contacting Z. Ali, Uppsala University, Sci Life Lab, Dept. of Immunol Genet & Pathol, S-75108 Uppsala, Sweden. Additional authors for this research include J. Klar, M. Jameel, K. Khan, A. Fatima, R.
Findings from Uppsala University Broaden Understanding of Materials Science and Physical Chemistry (Partitioning into Colloidal Structures of Fasted State Intestinal Fluid Studied by Molecular Dynamics Simulations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science - Materials Science and Physical Chemistry. According to news reporting from Uppsala, Sweden, by NewsRx journalists, research stated, "We performed molecular dynamics (MD) simulations to obtain insights into the structure and molecular interactions of colloidal structures present in fasted state intestinal fluid. Drug partitioning and interaction were studied with a mixed system of the bile salt taurocholate (TCH) and 1,2-dilinoleoyl-sn-glycero-3-phosphocholine (DLiPC)."

Financial supporters for this research include Vetenskapsradet, European Research Council, Seventh Framework Programme, European Federation of Pharmaceutical Industries and Associations.

The news correspondents obtained a quote from the research from Uppsala University, "Spontaneous aggregation of TCH and DLiPC from unconstrained MD simulations at the united-atom level using the Berger/Gromos54A7 force fields demonstrated that intermolecular hydrogen bonding between TCH molecules was an important factor in determining the overall TCH and DLiPC configuration. In bilayered systems, these intermolecular hydrogen bonds resulted in embedded transmembrane TCH clusters. Free energy simulations using the umbrella sampling technique revealed that the stability of these transmembrane TCH clusters was superior when they consisted of 3 or 4 TCH per bilayer leaflet. All-atom simulations using the Slipids/GAFF force fields showed that the TCH embedded in the bilayer decreased the energy barrier to penetrate the bilayer (Delta G(pen)) for water, ethanol, and carbamazepine, but not for the more lipophilic felodipine and danazol. This suggests that diffusion of hydrophilic to moderately lipophilic molecules through the bilayer is facilitated by the embedded TCH molecules. However, the effect of embedded TCH on the overall lipid/water partitioning was significant for danazol, indicating that the incorporation of TCH plays a crucial role for the partitioning of lipophilic solutes into e.g. lipidic vesicles existing in fasted state intestinal fluids."

According to the news reporters, the research concluded: "To conclude, the MD simulations revealed important intermolecular interactions in lipidic bilayers, both between the bile components themselves and with the drug molecules."

For more information on this research see: Partitioning into Colloidal Structures of

Our news journalists report that additional information may be obtained by contacting C.A.S. Bergstrom, Uppsala University, Uppsala Biomed Center, Dept. of Pharm, SE-75123 Uppsala, Sweden. Additional authors for this research include P. Larsson, J. Anwar and C.A.S. Bergstrom.

**Gram-Negative Bacteria - Klebsiella pneumoniae**

**Findings from V. Szijarto et al Has Provided New Information about Klebsiella pneumoniae (Both clades of the epidemic KPC-producing Klebsiella pneumoniae clone ST258 share a modified galactan O-antigen type)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Klebsiella pneumoniae is now available. According to news originating from Vienna, Austria, by NewsRx correspondents, research stated, "Klebsiella pneumoniae ST258 is a globally disseminated, extremely drug resistant, nosocomial clone with limited treatment options. We show that the vast majority of ST258 isolates express modified d-galactan-I lipopolysaccharide O-antigen, termed hereinafter as D-galactan-III."

Financial support for this research came from Eurostars.

Our news journalists obtained a quote from the research, "The genetic determinant required for galactan-III synthesis was identified as a distinct operon adjacent to the rfb (wb) locus encoding D-galactan-I synthesis. The three genes within the operon encode predicted glycosyltransferases. Testing an isogenic transformant pair revealed that expression of D-galactan-III, in comparison to D-galactan-I, conferred improved survival in the presence of human serum. Eighty-three percent of the more than 200 ST258 draft genome sequences currently available carries the corresponding operon and hence these isolates are predicted to express galactan-III antigens. A D-galactan-III specific monoclonal antibody (mAb) was shown to bind to extracted LPS from a panel of ST258 isolates. The same mAb confirmed accessibility of galactan-III in surface staining of ST258 irrespective of the distinct capsular antigens expressed by both clades described previously."

According to the news editors, the research concluded: "Based on these data, the galactan-III antigen may represent an attractive target for active and passive immunization approaches against K."

For more information on this research see: Both clades of the epidemic KPC-producing Klebsiella pneumoniae clone ST258 share a modified galactan O-antigen type.

The news correspondents report that additional information may be obtained from V. Szijarto, Arsanis Biosciences GmbH, Vienna, Austria. Additional authors for this research include L.M. Guachalla, K. Hartl, C. Varga, P. Banerjee, K. Stojkovic, M. Kaszowska, E. Nagy, J. Lukasiewicz and G. Nagy.

Autoimmune Diseases and Conditions - Multiple ...

Findings from V.D. Nazarov et al Has Provided New Information about Multiple Sclerosis (Immunogenicity of human interferon-beta-containing pharmaceuticals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Autoimmune Diseases and Conditions - Multiple Sclerosis is the subject of a report. According to news reporting out of St. Petersburg, Russia, by NewsRx editors, research stated, "Multiple sclerosis is a severe autoimmune disease with inflammatory component that continues to be resistant to treatment. One of the approaches retarding its progression is based on using nonspecific therapy with human interferon-beta (IFN-beta)-containing pharmaceuticals."

Our news journalists obtained a quote from the research, "Neutralizing antibodies (NAbs) against genetically engineered pharmaceuticals developed by the patient's immune system, which reduce their therapeutic and biological activity, pose a serious problem. Cell lines sensitive to IFN-beta activity also quantifying NAb level are applied because direct measurement of IFN-beta antiviral activity is complicated."

According to the news editors, the research concluded: "This study was aimed at standardization and validation of a reporter cell system for measuring antihuman IFN-beta NAb titers, and evaluation data were obtained with samples from 33 patients with multiple sclerosis."

Our news journalists report that additional information may be obtained by contacting V.D. Nazarov, Pavlov First St Petersburg State Med Univ, Center Mol Med, St Petersburg 197022, Russia. Additional authors for this research include S.V. Lapin, A.V. Mazing, E.P. Evdoshenko and A.A. Totolian.

Nephrology

Findings from V.H. Thourani and Co-Authors Update Knowledge of Nephrology (Impact of Preoperative Chronic Kidney Disease in 2,531 High-Risk and Inoperable Patients Undergoing Transcatheter Aortic Valve Replacement in the PARTNER Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nephrology. According to news originating from Plano, Texas, by NewsRx correspondents, research stated, "Although preoperative renal dysfunction (RD) is associated with increased mortality and morbidity after surgical aortic valve replacement, its impact on clinical outcomes after transcatheter aortic valve replacement (TAVR) is less defined. TAVR patients in the PARTNER (Placement of Aortic Transcatheter Valves) trial with a calculable glomerular filtration rate (GFR) using the Modification of Diet in Renal Disease equation were included."

Our news journalists obtained a quote from the research, "Patients were divided into three groups: GFR >60 mL/min (none/mild RD), GFR 31 to 60 mL/min (moderate RD), and GFR <= 30 mL/min (severe RD). Operative characteristics and clinical outcomes were analyzed. Cox regression models were used to determine multivariable predictors of 1-year all-cause mortality. A total of 2,531 inoperable or high surgical risk patients from the PARTNER trial and continued access registries had a calculable GFR level: 767 (30%) had normal renal function or mild RD, 1,473 (58%) had moderate RD, and 291 (12%) presented with severe RD. The mean Society of Thoracic Surgeons Predicted Risk Mortality for the cohort was 11.5%, and it was highest in those with severe RD (13.8%). Patients with severe RD were more often women with a higher prevalence of diabetes. Patients with severe RD had the highest incidence of 30-day and 1-year all-cause mortality and ADULT CARDIAC rehospitalization. The 30-day rate of death from any cause was 10.7% in the severe RD group versus 6.0% in the moderate and mild RD groups (p = 0.01). The 1-year rate of death from any cause was 34.4% in the severe RD group versus 21.5% in the moderate RD and 20.8% in the none/mild RD groups (adjusted hazard ratio [HR] 2.24, p< 0.0001 for severe versus none/mild; adjusted HR 1.14, p = 0.24 for severe versus moderate). Other significant predictors of 1-year all-cause mortality included lower body mass index, frailty, the transapical approach, a lower ejection fraction, oxygen-dependent chronic obstructive pulmonary disease, liver disease, and male sex. Preoperative severe RD is a significant predictor for 1-year mortality in TAVR patients."

According to the news editors, the research concluded: "Careful risk stratification by the heart team is required in patients with severe preprocedural RD."

The news correspondents report that additional information may be obtained from V.H. Thourani, Baylor Scott & White Healthcare, Plano, TX, United States. **Cardiovascular Diseases**

**Findings from V.L. Mendy and Co-Authors Broaden Understanding of Cardiovascular Diseases (Decreasing prevalence of no known major risk factors for cardiovascular disease among Mississippi adults, Mississippi Behavioral Risk Factor Surveillance ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases are discussed in a new report. According to news reporting originating in Jackson, Mississippi, by NewsRx journalists, research stated, "Cardiovascular disease (CVD) is the leading cause of death in Mississippi. However, the prevalence of no known CVD risk factors among Mississippi adults and the change of prevalence in the past 9 years have not been described."

The news reporters obtained a quote from the research, "We assess changes in prevalence of no known CVD risk factors during 2001 and 2009. Prevalence of high blood pressure, high cholesterol, diabetes, physical inactivity, smoking, and obesity were investigated. Survey respondents who reported having none of these factors were defined as having no known CVD risk factors. Differences in prevalence and 95% confidence intervals were determined using t-test analysis. Overall, age-standardized prevalence of having no known CVD risk factors significantly decreased from 17.3% in 2001 to 14.5% in 2009 (p = 0.0091). The age-standardized prevalence of no known CVD risk factors were significantly lower in 2009 than in 2001 among blacks (8.9% vs. 13.2%, p = 0.008); males (13.5% vs. 17.9%, p = 0.0073); individuals with a college degree (25.2%, vs. 30.8%, p = 0.0483); and those with an annual household income of $20,000-$34,999 (11.6% vs. 16.9%, p = 0.0147); and $35,000-$49,999 (15.2% vs. 23.3%, p = 0.0135)."

According to the news reporters, the research concluded: "The prevalence of no known CVD risk factors among Mississippi adults significantly decreased from 2001 to 2009 with observed differences by race, age group, sex, and annual household income."

Our news correspondents report that additional information may be obtained by contacting V.L. Mendy, Mississippi Dept. of Hlth, Off Hlth Data & Res, Jackson, MS 39215, United States. Additional authors for this research include R. Vargas, L. El-Sadek and V.L. Short.

**Stem Cell Research - Embryonic Stem Cells**

**Findings from Venetian Institute of Molecular Medicine Provides New Data on Embryonic Stem Cells (Analysis of Calcium Transients and Uniaxial Contraction Force in Single Human Embryonic Stem Cell-Derived Cardiomyocytes on Microstructured ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Stem Cell Research - Embryonic Stem Cells have been presented. According to news originating from Padua, Italy, by NewsRx correspondents, research stated, "The mechanical activity of cardiomyocytes is the result of a process called excitation-contraction coupling (ECC). A membrane depolarization wave induces a transient cytosolic calcium concentration increase that triggers activation of calcium-sensitive contractile proteins, leading to cell contraction and force generation."

Funders for this research include Deutsche Forschungsgemeinschaft, Universita degli Studi di Padova, ASCM Onlus, Associazione Amici del Cuore di Montebelluna.

Our news journalists obtained a quote from the research from the Venetian Institute of Molecular Medicine, "An experimental setup capable of acquiring simultaneously all ECC features would have an enormous impact on cardiac drug development and disease study. In this work, we develop a microengineered elastomeric substrate with tailor-made surface chemistry to measure simultaneously the uniaxial contraction force and the calcium transients generated by single human cardiomyocytes in vitro. Microreplication followed by photocuring is used to generate an array consisting of elastomeric micropillars. A second photochemical process is employed to spatially control the surface chemistry of the elastomeric pillar. As result, human embryonic stem cell-derived cardiomyocytes (hESC-CMs) can be confined in rectangular cell-adhesive areas, which induce cell elongation and promote suspended cell anchoring between two adjacent micropillars. In this end-to-end conformation, confocal fluorescence microscopy allows simultaneous detection of calcium transients and micropillar deflection induced by a single-cell uniaxial contraction force. Computational finite elements modeling (FEM) and 3D reconstruction of the cell-pillar interface allow force quantification. The platform is used to follow calcium dynamics and contraction force evolution in hESC-CMs cultures over the course
of several weeks."

According to the news editors, the research concluded: "Our results show how a biomaterial-based platform can be a versatile tool for in vitro assaying of cardiac functional properties of single-cell human cardiomyocytes, with applications in both in vitro developmental studies and drug screening on cardiac cultures."

The news correspondents report that additional information may be obtained from N. Elvassore, Venetian Inst Mol Med, I-35129 Padua, Italy. Additional authors for this research include S. Martewicz, E. Serena, V. Le Houerou, J. Ruhe and N. Elvassore.

**Cardiovascular Diseases and Conditions**

**Findings from Vesalius Research Center Broaden Understanding of Atherosclerosis (Endothelial cell metabolism: A novel player in atherosclerosis? Basic principles and therapeutic opportunities)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Atherosclerosis have been presented. According to news originating from Leuven, Belgium, by NewsRx correspondents, research stated, "Atherosclerosis is a leading cause of morbidity and mortality in Western society. Despite improved insight into disease pathogenesis and therapeutic options, additional treatment strategies are required."

Our news journalists obtained a quote from the research from Vesalius Research Center, "Emerging evidence highlights the relevance of endothelial cell (EC) metabolism for angiogenesis, and indicates that EC metabolism is perturbed when ECs become dysfunctional to promote atherogenesis. In this review, we overview the latest insights on EC metabolism and discuss current knowledge on how atherosclerosis deregulates EC metabolism, and how maladaptation of deregulated EC metabolism can contribute to atherosclerosis progression."

According to the news editors, the research concluded: "We will also highlight possible therapeutic avenues, based on targeting EC metabolism."

Findings from Veterans Affairs Medical Center Broaden Understanding of Melanoma (Primary and Secondary Chemoprevention of Malignant Melanoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Melanoma. According to news reporting from Denver, Colorado, by NewsRx journalists, research stated, "The incidence of malignant melanoma (MM) continues to rise in the United States. While sun protection and full body skin examinations remain the mainstay of preventative care, chemoprevention of the deadly disease has become an increasingly popular field of study."

The news correspondents obtained a quote from the research from Veterans Affairs Medical Center, "In this focused review, we discuss current findings and analyze the risks and benefits of various agents investigated for the primary and secondary chemoprevention of MM. Such agents include topical retinoids, vitamins, and supplements, Polypodium leucotomos extracts, non-steroidal anti-inflammatory agents (NSAIDs), statins, sunscreens, and field therapy with topical imiquimod for primary and secondary chemoprevention."

According to the news reporters, the research concluded: "We further identify a need for expanded high quality human research on the topic."

Our news journalists report that additional information may be obtained by contacting R.P. Dellavalle, Denver VA Med Center, Dept. of Dermatol, Denver, CO 80220, United States. Additional authors for this research include T. Buntinx-Krieg, R. Qin, C.A. Dunnick and R.P. Dellavalle.

Physiology - Applied Physiology

Findings from Victoria University in the Area of Applied Physiology Described (Salbutamol effects on systemic potassium dynamics during and following intense continuous and intermittent exercise)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Physiology - Applied Physiology. According to news reporting originating from Melbourne, Australia, by NewsRx correspondents, research stated, "Salbutamol inhalation is permissible by WADA in athletic competition for asthma management and affects potassium regulation, which is vital for muscle function. Salbutamol effects on arterial potassium concentration ([K+]a) during and after high-intensity continuous exercise (HIcont) and intermittent exercise comprising repeated, brief sprints (HIint), and on performance during HIint are unknown and were investigated."

Our news editors obtained a quote from the research from Victoria University, "Seven recreationally active men participated in a double-blind, randomised, cross-over design, inhaling 1000 µg salbutamol or placebo. Participants cycled continuously for 5 min at 40 % O-2peak and 60 % O-2peak, then HIcont (90 s at 130 % O-2peak), 20 min recovery, and then HIint (3 sets, 5 x 4 s sprints), with 30 min recovery. Plasma [K+]a increased throughout exercise and subsequently declined below baseline (P < 0.001). Plasma [K+]a was greater during HIcont than HIint (P < 0.001, HIcont 5.94 +/- 0.65 vs HIint set 1, 4.71 +/- 0.40 mM); the change in [K+]a from baseline (Δ[K+]a) was 2.6-fold greater during HIcont than HIint (P < 0.001). The Δ[K+]a throughout the trial was less with salbutamol than placebo (P < 0.001, treatment main effect, 0.03 +/- 0.67 vs 0.22 +/- 0.69 mM, respectively); and remained less after correction for fluid shifts (P < 0.001). The Δ[K+] during HIcont was less after salbutamol (P < 0.05), but not during HIint. Blood lactate, plasma pH, and the work output during HIint did not differ between trials. Inhaled salbutamol modulated the [K+]a rise across the trial, comprising intense continuous and intermittent exercise and recovery, lowering Δ[K+] during HIcont."

According to the news editors, the research concluded: "The limited [K+]a changes during HIint suggest that salbutamol is unlikely to influence systemic [K+] during periods of intense effort in intermittent sports."

For more information on this research see: Salbutamol effects on systemic potassium dynamics during and following intense continuous and intermittent exercise. European Journal of Applied Physiology, 2016;116(11-12):2389-2399. European Journal of Applied Physiology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Bacterial Infections and Mycoses - Endotoxemia

Findings from Virginia Commonwealth University Broaden Understanding of Endotoxemia (Chronic opioid use is associated with altered gut microbiota and predicts readmissions in patients with cirrhosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Bacterial Infections and Mycoses - Endotoxemia. According to news reporting from Richmond, Virginia, by NewsRx journalists, research stated, "Opioid use is epidemic in cirrhosis, which could precipitate hepatic encephalopathy (HE) potentially through gut dysbiosis and inflammation. To define the effect of opioids on readmissions and gut microbiota composition and functionality."

Financial support for this research came from U.S. Department of Veterans Affairs. The news correspondents obtained a quote from the research from Virginia Commonwealth University, "Cohort 1 had 200 cirrhotic in-patients (with/without opioid use) followed prospectively through the index hospitalisation and 6 months post discharge. Readmissions (HE-related/unrelated) were compared between patients discharged on opioids compared to the rest, including using a multi-variable analysis. Cohort 2 consisted of 72 cirrhotics on chronic opioids who were age/model for end-stage liver disease (MELD) and prior HE-balanced with 72 cirrhotics not on opioids. Stool microbiota composition (multi-tagged sequencing), predicted functionality (PiCRUST), endotoxemia and systemic inflammation (IL-6, IL-17) were compared. Cohort 1: Chronic opioid use was statistically similar between those admitted with/without HE, and was judged to be an HE precipitant in <5% of cases during the index hospitalisation. Of the 144 patients alive at 6 months, 82 were readmitted. The opioid users had a significantly higher all cause (69% vs. 48%, P = 0.008), but not HE-related readmissions (30% vs. 41%, P = 0.30). On regression, opioid therapy and female gender were predictive of readmission independent of MELD score and previous HE. Cohort 2: Significant dysbiosis was noted in the opioid cohort, especially in HE+opioid patients with lower autochthonous taxa and Bacteroidaceae relative abundance. PiCRUST showed highest aromatic amino acid and endotoxin production in opioid users. Opioid users also had higher endotoxemia and IL-6 but not IL-17."

According to the news reporters, the research concluded: "Chronic opioid use in cirrhosis is associated with increased endotoxemia, dysbiosis and all-cause readmissions."

Our news journalists report that additional information may be obtained by contacting J.S. Bajaj, Virginia Commonwealth University, Medical Center, Richmond, VA 23249, United States. Science

Findings from Virginia Polytechnic Institute and State University Provides New Data about Science (Convex Analysis of Mixtures for Separating Non-negative Well-grounded Sources)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science. According to news originating from Arlington, Virginia, by NewsRx correspondents, research stated, "Blind Source Separation (BSS) is a powerful tool for analyzing composite data patterns in many areas, such as computational biology. We introduce a novel BSS method, Convex Analysis of Mixtures (CAM), for separating non-negative well-grounded sources, which learns the mixing matrix by identifying the lateral edges of the convex data scatter plot."

Our news journalists obtained a quote from the research from Virginia Polytechnic Institute and State University, "We propose and prove a sufficient and necessary condition for identifying the mixing matrix through edge detection in the noise-free case, which enables CAM to identify the mixing matrix not only in the exact-determined and over-determined scenarios, but also in the under-determined scenario. We show the optimality of the edge detection strategy, even for cases where source well-groundedness is not strictly satisfied. The CAM algorithm integrates plug-in noise filtering using sector-based clustering, an efficient geometric convex analysis scheme, and stability-based model order selection. The superior performance of CAM against a panel of benchmark BSS techniques is demonstrated on numerically mixed gene expression data of ovarian cancer subtypes."

According to the news editors, the research concluded: "We apply CAM to dissect dynamic contrast-enhanced magnetic resonance imaging data taken from breast tumors and time-course microarray gene expression data derived from in-vivo muscle regeneration in mice, both producing biologically plausible decomposition results."

The news correspondents report that additional information may be obtained from Y. Wang, Virginia Polytechnic Institute & State Univ, Bradley Dept. of Elect & Comp Engn, Arlington, VA 22203, United States. Additional authors for this research include N.T. Wang, D.J. Miller and Y. Wang.

Oncology - Prostate Cancer

Findings from Virginia University Medical Center Broaden Understanding of Prostate Cancer (Development of a patient decision aid for the treatment of localised prostate cancer: a participatory design approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Prostate Cancer have been presented. According to news reporting out of Amsterdam, Netherlands, by NewsRx editors, research stated, "To develop a patient decision aid and to prepare an overview of requirements for implementation. We developed a decision aid that fits the preferences of patients and health care professionals to ensure adequate uptake in clinical practice."

Our news journalists obtained a quote from the research from Virginia University Medical Center, "A participatory design approach was used to acquire insight into preferences regarding the content and design of a decision aid and into barriers and aspects of the decision aid that facilitate implementation in clinical practice. Three focus group interviews with patients, their partners and health care professionals were conducted. A prototype of the decision aid was developed and presented to patients (n=14) and health care professionals (n=13) in semi-structured interviews. Patients (n=5) participated in a usability study. Data were analysed by two independent coders. Health care professionals considered medical information on treatments and side effects as the most important aspect to be included in the decision aid. Patients also focused on nonmedical considerations, such as location. Both expected the decision aid to support patients in making a treatment choice. According to health care professionals, the oncology nurse was the most suitable to discuss the decision aid with patients, while some patients preferred to discuss the patient decision aid with the urologist. The main barrier to implementation of the decision aid was said to be the expectation that it is time and money consuming, while the incorporation of the decision aid into clinical guidelines and basing the content on these guidelines, would promote implementation. By using a participatory design approach a patient decision aid was designed to meet patients' and health care professionals' needs. Insight was also gained on requirements for implementation. Wide-scale implementation of decision aids is desirable."

According to the news editors, the research concluded: "An overview is provided of requirements for implementation to successfully incorporate a decision aid into clinical practice."

Findings from W. Zhou and Co-Researchers Provides New Data on Atherosclerosis (Study on material base and action mechanism of compound Danshen dripping pills for treatment of atherosclerosis based on modularity analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Cardiovascular Diseases and Conditions - Atherosclerosis are discussed in a new report. According to news reporting originating in Guangdong, People's Republic of China, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Traditional Chinese medicine (TCM) has been widely used in China and its surrounding countries in clinical treatments for centuries-long time. However, due to the complexity of TCM constituents, both action mechanism and material base of TCM remain nearly unknown."

Financial supporters for this research include National Natural Science Foundation of China, Natural Science Foundation of Guangdong Province, The Pearl River Young Talents Program of the Bureau of Science and Technology of Guangzhou City, Excellent Young Teachers Program of the Department of Education of Guangdong Province.

The news reporters obtained a quote from the research, "Aim of the study: The present study was designed to uncover the action mechanism and material base of TCM in a low-cost manner. Compound Danshen dripping pills (DSP) is a widely used TCM for treatment of atherosclerosis, and was researched here to demonstrate the effectiveness of our method. We constructed a heterogeneous network for DSP, identified the significant network module, and analyzed the primary pharmacological units by performing GO and pathways enrichment analysis. Two significant network modules were identified from the heterogeneous network of DSP, and three compounds out of four hub nodes in the network were found to intervene in the process of atherosclerosis. Moreover, 13 out of 20 enriched pathways that were ranked in top 10 corresponding to both the two pharmacological units were found to be involved in the process of atherosclerosis. Quercetin, luteolin and apigenin may be the main active compounds which modulate the signaling pathways, such as metabolism of xenobiotics by cytochrome P450, retinol metabolism, etc."

According to the news reporters, the research concluded: "The present method helps reveal the action mechanism and material base of DSP for treatment of atherosclerosis."

Our news correspondents report that additional information may be obtained by contacting C. Chen, Res Center Qual Engn Technol Tradit Chinese Med Guan, Guangzhou 510006, Guangdong, People's Republic of China. Additional authors for this research include W.F. Yuan, C. Chen, S.M. Wang and S.W. Liang.

**Oncology - Prostate Cancer**

**Findings from Wayne State University Has Provided New Data on Prostate Cancer (Appropriateness Criteria for Active Surveillance of Prostate Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Prostate Cancer. According to news reporting originating in Detroit, Michigan, by NewsRx journalists, research stated, "The adoption of active surveillance varies widely across urological communities, which suggests a need for more consistency in the counseling of patients. To address this need we used the RAND/UCLA Appropriateness Method to develop appropriateness criteria and counseling statements for active surveillance."

The news reporters obtained a quote from the research from Wayne State University, "Panelists were recruited from MUSIC urology practices. Combinations of parameters thought to influence decision making were used to create and score 160 theoretical clinical scenarios for appropriateness of active surveillance. Recent rates of active surveillance among real patients across the state were assessed using the MUSIC registry. Low volume Gleason 6 was deemed highly appropriate for active surveillance whereas high volume Gleason 6 and low volume Gleason 3+4 were deemed appropriate to uncertain. No scenario was deemed inappropriate or highly inappropriate. Prostate specific antigen density, race and life expectancy impacted scores for intermediate and high volume Gleason 6 and low volume Gleason 3+4. The greatest degree of score dispersion (disagreement) occurred in scenarios with long life expectancy, high volume Gleason 6 and low volume Gleason 3+4. Recent rates of active surveillance use among real patients ranged from 0% to 100% at the provider level for low or intermediate biopsy volume Gleason 6, demonstrating a clear opportunity for quality improvement. By virtue of this work urologists have the opportunity to present specific recommendations from the panel to their individual patients."
According to the news reporters, the research concluded: "Community-wide efforts aimed at increasing rates of active surveillance and reducing practice and physician level variation in the choice of active surveillance vs treatment are warranted."

Our news correspondents report that additional information may be obtained by contacting M.L. Cher, Wayne State University, Dept. of Urol, Detroit, MI, United States. Additional authors for this research include A. Dhir, G.B. Auffenberg, S. Linsell, Y. Gao, B. Rosenberg, S.M. Jafri, L. Klotz, D.C. Miller, K.R. Ghani, S.J. Bernstein, J.E. Montie and B.R. Lane.

**Otolaryngology**

**Findings from Wayne State University Provides New Data about Otolaryngology (Otolaryngology Concerns for Illicit and Prescription Drug Use)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Otolaryngology. According to news reporting out of Detroit, Michigan, by NewsRx editors, research stated, "Concern for illicit and restricted drug use in otolaryngology is similar to other surgical specialties with a few notable exceptions. Many illicit drugs are consumed transnasally."

Our news journalists obtained a quote from the research from Wayne State University, "Repeated nasal exposure to stimulants or narcotics can cause local tissue destruction that can present as chronic rhinosinusitis or nasoseptal perforation. Further, the Food and Drug Administration has taken a stance against codeine for pediatric patients undergoing adenotonsillectomy. They have identified an increased risk of death postoperatively with these medications."

According to the news editors, the research concluded: "Because codeine has been the most commonly prescribed narcotic, this has shifted the standard practice."

Our news journalists report that additional information may be obtained by contacting N.J. Gonik, Wayne State University, Sch Med, Dept. of Otolaryngol Head & Neck Surg, ENT ClinChildrens Hosp Michigan, Detroit, MI 48201, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cll.2016.07.012. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Hepatitis C Virus

Findings from Weill Cornell Medical College Update Understanding of Hepatitis C Virus (Treatment adherence and virological response rates in hepatitis C virus infected persons treated with sofosbuvir-based regimens: results from ERCHIVES)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Hepatitis C Virus have been published. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "Role of non-adherence upon virological success with newer oral regimens is unknown. We sought to determine the impact of treatment adherence upon virological outcomes in hepatitis C virus (HCV) infected persons on sofosbuvir (SOF)-based regimens, using pharmacy prescription data as a measure of adherence."

The news correspondents obtained a quote from the research from Weill Cornell Medical College, "We analysed HCV infected persons in Electronically Retrieved Cohort of HCV Infected Veterans, who were initiated on SOF-based regimens, excluding those with human immunodeficiency virus, positive hepatitis-B surface antigen, hepatocellular carcinoma and missing HCV RNA. The final dataset included following regimens: SOF+simeprevir (SIM) (n = 1050), SOF+ledipasvir (LDV) (n = 974), SOF+ribavirin (RBV) (n = 663, genotype 2 or 3), and SOF+pegylated interferon (PEG)+RBV (n = 519, genotype 1 or 4). Those treated with a SOF-based regimen were older and more likely to have cirrhosis, diabetes, chronic kidney disease, higher HCV RNA levels, higher body mass index, compared with 1652 controls receiving a boceprevir-based (BOC) regimen. Sustained virological response (SVR12) rates for the SOF+SIM and SOF+LDV groups did not decline significantly even when as low as 50% of the full course was prescribed (except SOF+LDV, 90-99% prescriptions had SVR12 of 84.6%; n = 13). SOF+RBV for genotype 2/3 who received 50-80% of the prescriptions, 23/34 (67.6%) achieved SVR12. For persons with genotype 1/4 infection treated with SOF+PEG+RBV, no declines in SVR12 were seen with lower rates of prescriptions (40/43, or 93% SVR12 rate). Sofosbuvir-based treatment regimens are highly effective in achieving SVR12."

According to the news reporters, the research concluded: "This efficacy is not significantly affected when treated persons receive less than a full prescribed course of treatment."

For more information on this research see: Treatment adherence and virological response rates in hepatitis C virus infected persons treated with sofosbuvir-based regimens:
Inflammation

Findings from Weill Cornell Medical College Yields New Findings on Inflammation (The Microbiome and the Liver: The Basics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Inflammation. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "The relationships between the microbiota and other aspects of normal human biology continue to be explored. Indeed, the volume of information relating to the interplay between the host and the microbiota has grown exponentially especially with the advent of ever-improving techniques for rapidly sequencing and identifying bacterial populations and their functions."

Our news journalists obtained a quote from the research from Weill Cornell Medical College, "The gut is initially sterile at birth and colonization and dynamic changes occur during infancy and early childhood in order to establish a mature microbiome. The mature microbiome has direct and important interactions with host metabolism. Bacterial translocation from the gut microbiome is thought to be a key driver of inflammation in liver disease and changes in tolerance to these bacteria drive inflammation in the liver and elsewhere in the host."

According to the news editors, the research concluded: "As we are better able to describe the composition and functional properties of the microbiome, the range of its impact on the homeostatic functions of the human body and implications for disease continue to be extended."

For more information on this research see: The Microbiome and the Liver: The Basics. Seminars in Liver Disease, 2016;36(4):299-305. Seminars in Liver Disease can be contacted at: Thieme Medical Publ Inc, 333 Seventh Ave, New York, NY 10001, USA. (Thieme - www.thieme.com)

**Oncology - Breast Cancer**

**Findings from Wroclaw University Broaden Understanding of Breast Cancer (Expression of metallothionein 3 in ductal breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating in Wroclaw, Poland, by NewsRx journalists, research stated, "Metallothionein 3 (MT-3) has the ability to regulate the growth of nerve cells, but the significance of MT-3 expression outside the central nervous system and its participation in carcinogenesis have not yet been clarified. The aim of our study was to investigate the expression of MT-3 in ductal breast cancer and to determine its relationship with well-defined clinicopathological factors in this type of tumor."

The news reporters obtained a quote from the research from Wroclaw University, "The study was conducted on 134 cases of invasive ductal breast carcinoma (IDC), 42 samples of non-malignant breast tissue (NMBT), and 26 cases of mastopathy. Moreover, selected breast cancer cell lines (MCF-7, SKBR-3, MDA-MB-231, BO2) and normal human breast epithelial cells (hTERT-HME1) were used. The expression of MT-3 was examined on the protein level using immunohistochemistry and on the mRNA level using real-time PCR. It was shown that the MT-3 protein in cells of IDC and mastopathy appeared in the cytoplasm as well as in the cell nuclei. Both the cytoplasmic and nuclear expression of MT-3 was significantly lower in IDC than in the mastopathies (p <0.0001 and p<0.001). However, no significant correlation was demonstrated between the level of MT-3 protein and the studied clinicopathological factors. The mRNA expression of MT-3 in IDC was also lower than in non-malignant breast tissue (p <0.0001). Furthermore, in the cases of IDC with lymph node metastasis, the level of MT-3 mRNA was significantly lower than in the cases without metastasis (p<0.0199). The expression of MT-3 mRNA in breast cancer cell lines was significantly lower than in the normal human breast epithelial cell line (p <0.001)."

According to the news reporters, the research concluded: "These results suggest that MT-3 may play a role in the malignant transformation of breast epithelial cells and in tumor progression."

Transfusion Medicine - Blood Transfusion

Findings from Wuhan University Broaden Understanding of Blood Transfusion (Associations between autophagy, the ubiquitin-proteasome system and endoplasmic reticulum stress in hypoxia-deoxygenation or ischemia-reperfusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transfusion Medicine - Blood Transfusion. According to news reporting out of Wuhan, People's Republic of China, by NewsRx editors, research stated, "The activation of autophagy has been demonstrated to exert protective roles during hypoxia-reoxygenation (H/R)-induced brain injuries. This study aimed to investigate whether and how preconditioning with a proteasome inhibitor (MG-132), a proteasome promoter (Adriamycin, ADM), an autophagy inhibitor (3-methyladenine, 3-MA) and an autophagy promoter (Rapamycin, Rap) affected endoplasmic reticulum stress (ERS), the ubiquitin-proteasome system (UPS), autophagy, inflammation and apoptosis."

Funders for this research include National Natural Science Foundation of China, Wuhan University.

Our news journalists obtained a quote from the research from Wuhan University, "Ubiquitin protein and 26S proteasome activity levels were decreased by MG-132 pretreatment but increased by ADM pretreatment at 2 h, 4 h and 6 h following H/R treatment. MG-132 pretreatment led to the increased expression of autophagy-related genes, ER stress-associated genes and I kappa B but decreased the expression levels of NF-kappa B and caspase-3. ADM pretreatment led to the decreased expression of autophagy-related genes, ERS-associated genes and I kappa B but increased the expression of NF-kappa B and caspase-3. Pretreatment with 3-MA reduced the expression of autophagy-related genes, autophagy and UPS co-related genes, as well as apoptosis-related although the latter was increased by Rap pretreatment at 2 h, 4 h and 6 h following H/R treatment. In vivo, pretreatment of rats with ADM, MG-132, 3-MA or Rap followed by ischemia-reperfusion (PR) treatment resulted in similar changes. Proteasome inhibition preconditioning strengthened autophagy and ER stress but decreased apoptosis and inflammation. Autophagy promotion preconditioning exhibited similar changes."

According to the news editors, the research concluded: "The combination of a proteasome inhibitor and an autophagy promoter might represent a new possible therapy to treat H/R or I/R injury-related diseases."

For more information on this research see: Associations between autophagy, the ubiquitin-proteasome system and endoplasmic reticulum stress in hypoxia-deoxygenation or ischemia-reperfusion. European Journal of Pharmacology, 2016;791():157-167. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Findings from Wuhan University Broaden Understanding of Breast Cancer (Progress in the clinical detection of heterogeneity in breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Breast Cancer are discussed in a new report. According to news reporting from Hubei, People's Republic of China, by NewsRx journalists, research stated, "Breast cancer is currently the most common form of cancer and the second-leading cause of death from cancer in women. Though considerable progress has been made in the treatment of breast cancer, the heterogeneity of tumors (both inter- and intratumor) remains a considerable diagnostic and prognostic challenge."

Funders for this research include National Key Scientific Instrument and Equipment Development Project, Natural Science Foundation of Hubei Province, National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from Wuhan University, "From clinical observation to genetic mutations, the history of understanding the heterogeneity of breast cancer is lengthy and detailed. Effectively detecting heterogeneity in breast cancer is important during treatment. Various methods of depicting this heterogeneity are now available and include genetic, pathologic, and imaging analysis. These methods allow characterization of the heterogeneity of breast cancer on a genetic level, providing greater insight during the process of establishing an effective therapeutic plan."

According to the news reporters, the research concluded: "This study reviews how the understanding of tumor heterogeneity in breast cancer evolved, and further summarizes recent advances in the detection and monitoring of this heterogeneity in patients with breast cancer."

Our news journalists report that additional information may be obtained by contacting S.R. Sun, Wuhan University, Dept. of Breast & Thyroid Surg, Renmin Hosp, Wuhan
Diseases and Conditions - Birt-Hogg-Dube Syndrome

Findings from Y. Gunji-Niitsu and Co-Authors Broaden Understanding of Birt-Hogg-Dube Syndrome (Benign clear cell "sugar" tumor of the lung in a patient with Birt-Hogg-Dube syndrome: a case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Diseases and Conditions - Birt-Hogg-Dube Syndrome. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "Birt-Hogg-Dube (BHD) syndrome is a rare inherited autosomal genodermatosis and caused by germline mutation of the folliculin (FLCN) gene, a tumor suppressor gene of which protein product is involved in mechanistic target of rapamycin (mTOR) signaling pathway regulating cell growth and metabolism. Clinical manifestations in BHD syndrome is characterized by fibrofolliculomas of the skin, pulmonary cysts with or without spontaneous pneumothorax, and renal neoplasms."

The news reporters obtained a quote from the research, "There has been no pulmonary neoplasm reported in BHD syndrome, although the condition is due to deleterious sequence variants in a tumor suppressor gene. Here we report, for the first time to our knowledge, a patient with BHD syndrome who was complicated with a clear cell 'sugar' tumor (CCST) of the lung, a benign tumor belonging to perivascular epithelioid cell tumors (PEComas) with frequent causative relation to tuberous sclerosis complex 1 (TSC1) or 2 (TSC2) gene. Case presentation: In a 38-year-old Asian woman, two well-circumscribed nodules in the left lung and multiple thin-walled, irregularly shaped cysts on the basal and medial area of the lungs were disclosed by chest roentgenogram and computer-assisted tomography (CT) during a preoperative survey for a bilateral faucial tonsillectomy. Analysis of the resected tumor showed large polygonal cells with clear cytoplasm proliferating in a solid pattern. Immunohistochemistry revealed that these tumor cells were positive for microphthalmia-transcription factor, S100, and CD1a but negative for HMB45, indicating that the tumor was a CCST. Genetic testing indicated that the patient had a germline mutation on exon 12 of the FLCN gene, i.e., insertion of 7 nucleotides (CCACCCT) (c.1347_1353dupCCACCCT). Direct sequencing of the FLCN exon 12 using genomic DNA obtained from her microdissected CCST cells clearly revealed loss of the wild-type FLCN sequence, which confirmed complete functional loss of the FLCN gene. On the other hand, no loss of heterozygosity around TCS1- or TSC2-associated genetic region was demonstrated."

According to the news reporters, the research concluded: "To our knowledge, this is the first report of CCST of the lung in a patient with BHDS, indicating that CCST should be
added to the spectrum of pulmonary manifestations of BHDS.

For more information on this research see: Benign clear cell "sugar" tumor of the lung in a patient with Birt-Hogg-Dube syndrome: a case report. BMC Medical Genetics, 2016;17():1-8. Connective Tissue Cells

Findings from Y. Huang and Colleagues Provides New Insights into Connective Tissue Cells (CRISPR/Cas9 knockout of HAS2 in rat chondrosarcoma chondrocytes demonstrates the requirement of hyaluronan for aggrecan retention)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Connective Tissue Cells is the subject of a report. According to news reporting from Greenville, North Carolina, by NewsRx journalists, research stated, "Hyaluronan (HA) plays an essential role in cartilage where it functions to retain aggrecan. Previous studies have suggested that aggrecan is anchored indirectly to the plasma membrane of chondrocytes via its binding to cell-associated HA."

Financial supporters for this research include Brody School of Medicine Seed Grant Program (EBA), National Institute of Arthritis and Musculoskeletal and Skin Diseases of the National Institutes of Health.

The news correspondents obtained a quote from the research, "However, reagents used to test these observations such as hyaluronidase and HA oligosaccharides are short term and may have side activities that complicate interpretation. Using the CRISPR/Cas9 gene editing approach, a model system was developed by generating HA-deficient chondrocyte cell lines. HA synthase-2 (Has2)-specific single guide RNA, was introduced into two different variant lines of rat chondrosarcoma chondrocytes; knockout clones were isolated and characterized. Two other members of the HA synthase gene family were expressed at very low relative copy number but showed no compensatory response in the Has2 knockouts. Wild type chondrocytes of both variants exhibited large pericellular matrices or coats extending from the plasma membrane. Addition of purified aggrecan monomer expanded the size of these coats as the proteoglycan became retained within the pericellular matrix. Has2 knockout chondrocytes lost all capacity to assemble a particle-excluding pericellular matrix and more importantly, no matrices formed around the knockout cells following the addition of purified aggrecan. When grown as pellet cultures so as to generate a bioengineered neocartilage tissue, the Has2 knockout chondrocytes assumed a tightly-compacted morphology as compared to the wild type cells.
When knockout chondrocytes were transduced with Adeno-ZsGreen1-mycHas2, the cell-associated pericellular matrices were restored including the capacity to bind and incorporate additional exogenous aggrecan into the matrix."

According to the news reporters, the research concluded: "These results suggest that HA is essential for aggrecan retention and maintaining cell separation during tissue formation."

For more information on this research see: CRISPR/Cas9 knockout of HAS2 in rat chondrosarcoma chondrocytes demonstrates the requirement of hyaluronan for aggrecan retention. *Matrix Biology*, 2016;56():74-94. *Matrix Biology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Lung Diseases and Conditions - Chronic Obstructive...**

**Findings from Y. Li and Colleagues Update Understanding of Chronic Obstructive Pulmonary Disease (Bufei Yishen granules combined with acupoint sticking therapy suppress oxidative stress in chronic obstructive pulmonary disease rats: Via ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease are discussed in a new report. According to news reporting originating from Zhengzhou, People's Republic of China, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: Traditional Chinese medicine (TCM) is clinically used under the guidance of its unique theory system. Bufei Yishen (BY) granules, an oral Chinese herbal formula, is confirmed effective for treating the syndrome of lung-kidney qi deficiency in chronic obstructive pulmonary disease (COPD) patients."

Funders for this research include National Natural Science Foundation, Basic Research Program of Scientific and Technological Research Key Program of Henan Province Department of Education.

Our news editors obtained a quote from the research, "Shu-Fei Tie ointment is another prescription for acupoint sticking (AS) therapy based on the theory of treating an internal disease by external treatment on proper acupoints. The beneficial effects of BY granules combined with Shu-Fei Tie have been proved in previous clinical trials. However, the underlying mechanism remains unclear. The present study was initiated to explore the..."
antioxidative mechanism of the integrated therapy of BY granules and acupoint sticking via regulating by peroxisome proliferator activated receptor-gamma (PPAR gamma) signaling in a cigarette-smoke/bacterial exposure induced COPD rat model. Rats were randomized into Control, Model, BY, AS, BY+AS and aminophylline (APL) groups. COPD rats were induced by cigarette-smoke and bacterial exposures, and were administrated with normal saline, BY granules, AS, BY+AS or aminophylline from week 9 and sacrificed at week 20. Activity of superoxide dismutase (SOD) and levels of methane dicarboxylic aldehyde (MDA) in peripheral blood and bronchoalveolar lavage fluid (BALF) were determined by hydroxylamine and thiobarbituric acid methods. The gene and protein expressions of PPARy in the lung tissues were analyzed by quantitative polymerase chain reaction and western blot. Serum and BALF SOD decreased significantly in Model group (P < 0.01), while MDA increased (P < 0.01). Compared to COPD rats, serum SOD was higher in all treatment groups (P < 0.01), and BALF SOD was higher in BY and BY+AS groups (P < 0.01); serum and BALF MDA was lower in all treatment groups (P < 0.01). Serum and BALF SOD was higher in BY+AS group than in AS group, while MDA was lower (P < 0.05). BALF SOD increased in BY+AS group compared with APL group, while MDA decreased (P < 0.05). PPAR gamma mRNA and protein and the phosphorylation of PPAR gamma (p-PPAR gamma) decreased in COPD rats (P < 0.01), and increased in all treatment groups (P < 0.01). PPAR gamma mRNA was higher in BY+AS group than in AS group (P < 0.05), PPAR gamma and p-PPAR gamma were higher in BY+AS group than in AS and APL groups (P < 0.05, P < 0.01); PPAR gamma protein was higher in BY group than in APL group (P < 0.05).

According to the news editors, the research concluded: "Bufei Yishen granules, Shu-Fei Tie and their combination have beneficial effects in stable COPD, and can attenuate the oxidative stress, and the activation of PPAR gamma signaling might be involved in."

The news editors report that additional information may be obtained by contacting Y. Li, Collaborat Innovat Center Resp Dis Diagnost Treatmen, Zhengzhou 450046, Henan, People's Republic of China. Additional authors for this research include Y.G. Tian, J.S. Li, Y.Q. Dong, M.H. Wang, S.X. Feng, L.L. Li, J. Mao, L.L. Wang and S. Luo.

Findings from Y.J. Li and Co-Authors Broaden Understanding of Adipogenesis (Berberine Alleviates Olanzapine-Induced Adipogenesis via the AMPK alpha-SREBP Pathway in 3T3-L1 Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Adipogenesis. According to news reporting out of Chongqing, People's Republic of China, by NewsRx editors, research stated, "The aim of this study was to investigate the mechanisms underlying the inhibitory effects of berberine (BBR) on olanzapine (OLZ)-induced adipogenesis in a well-replicated 3T3-L1 cell model. Oil-Red-O (ORO) staining showed that BBR significantly decreased OLZ-induced adipogenesis."

Our news journalists obtained a quote from the research, "Co-treatment with OLZ and BBR decreased the accumulation of triglyceride (TG) and total cholesterol (TC) by 55.58% +/- 3.65% and 49.84% +/- 8.31%, respectively, in 3T3-L1 adipocytes accompanied by reduced expression of Sterol regulatory element binding proteins 1 (SREBP1), fatty acid synthase (FAS), peroxisome proliferator activated receptor-gamma (PPAR gamma), SREBP2, low-density lipoprotein receptor (LDLR), and hydroxymethylglutaryl-coenzyme A reductase (HMGR) genes compared with OLZ alone. Consistently, the co-treatment downregulated protein levels of SREBP1, SREBP2, and LDLR by 57.71% +/- 9.42%, 73.05% +/- 11.82%, and 59.46% +/- 9.91%, respectively. In addition, co-treatment reversed the phosphorylation level of AMP-activated protein kinase-alpha (AMPK alpha), which was reduced by OLZ, determined via the ratio of pAMPK alpha: AMPK alpha (94.1%) compared with OLZ alone. The results showed that BBR may prevent lipid metabolism disorders caused by OLZ by reversing the degree of SREBP pathway upregulated and the phosphorylation of AMPK alpha downregulated."

According to the news editors, the research concluded: "Collectively, these results indicated that BBR could be used as a potential adjuvant to prevent dyslipidemia and obesity caused by the use of second-generation antipsychotic medication."

For more information on this research see: Berberine Alleviates Olanzapine-Induced Adipogenesis via the AMPK alpha-SREBP Pathway in 3T3-L1 Cells. Eye Diseases and Conditions - Retinal Vein Occlusion

Findings from Yonsei University Update Understanding of Retinal Vein Occlusion (Central Retinal Vein Occlusion Associated with Ulcerative Colitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Eye Diseases and Conditions - Retinal Vein Occlusion are discussed in a new report. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "To report a case of central retinal vein occlusion without macular edema associated with ulcerative colitis and its novel treatment with intravitreal dexamethasone. A 40-year-old man with ulcerative colitis presented with sudden visual disturbances."

The news reporters obtained a quote from the research from Yonsei University, "An initial fundus examination showed subtle yellow-to-white patches within the inner retina of the right eye superotemporal to the fovea. There were intraretinal hemorrhages and cotton-wool spots within the superior vascular arcade and nasal to the optic disc. Despite initiation of systemic corticosteroids, 2 weeks later there was an increase in retinal hemorrhages, formation of cotton wool spots, and development of optic disc swelling in the right eye. The patient was eventually diagnosed with nonischemic central retinal vein occlusion associated with ulcerative colitis. He received sustained-release intravitreal dexamethasone, which led to the resolution of retinal hemorrhage, optic disc swelling, and cotton-wool spots. Three months after the injection, retinal hemorrhages were not detectable. However, ocular coherence imaging showed marked thinning of the inner retina at the locations that were previously hyper-reflective. Central retinal vein occlusion is an uncommon ophthalmologic manifestation associated with ulcerative colitis."

According to the news reporters, the research concluded: "Injection of intravitreal dexamethasone could be a viable treatment option in these patients even without the presence of macular edema."

For more information on this research see: Central Retinal Vein Occlusion Associated with Ulcerative Colitis. *Optometry and Vision Science, 2016;93(12):1567-1570. Optometry and Vision Science* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Nutritional and Metabolic Diseases and Conditions - …

Findings from Yonsei University Yields New Findings on Type 2 Diabetes (Mitochondria and the NLRP3 inflammasome: physiological and pathological relevance)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting originating in Seoul, South Korea, by NewsRx journalists, research stated, "The NLRP3 inflammasome is assembled and activated in certain types of myeloid cells upon sensing microbe-derived toxins or host-derived danger signals. Activation of the NLRP3 inflammasome by endogenous ligands has been discovered in various disorders, including metabolic syndrome, type 2 diabetes, atherosclerosis, gout, reperfusion injury of the heart, neurodegeneration, such as Alzheimer's disease, chronic kidney diseases, and macular degeneration of the eyes."

Financial support for this research came from National Research Foundation of Korea.

The news reporters obtained a quote from the research from Yonsei University, "Despite the potential significance of the NLRP3 inflammasome in the pathogenesis of several diseases, details on the activation mechanism of the NLRP3 inflammasome by a variety of stimulators have yet to be reported. Emerging evidence suggests that mitochondrial events are associated with NLRP3 activation in disease conditions. Mitochondrial dysfunction acts upstream of NLRP3 activation by providing reactive oxygen species (ROS) to trigger NLRP3 oligomerization or by inducing alpha-tubulin acetylation to relocate mitochondria to the proximity of NLRP3. In addition, mitochondria work as a platform for inflammasome assembly. Mitochondrial events may also lie downstream of NLRP3 activation. While the molecular mechanisms of mitochondrial dysfunction associated with NLRP3 activation are still unclear, they may involve the perturbation of mitochondria by K+ efflux and subsequent intracellular disequilibrium."

According to the news reporters, the research concluded: "Thus, mitochondria and NLRP3 machinery appear to be closely interwoven at multiple levels."

Our news correspondents report that additional information may be obtained by contacting M.S. Lee, Yonsei University, Coll Med, Dept. of Internal Med, Seoul 03722, South Korea.

Findings from Z.P. Yang and Co-Authors Broaden Understanding of Gastric Cancer (Equol Induces Mitochondria-Dependent Apoptosis in Human Gastric Cancer Cells via the Sustained Activation of ERK1/2 Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news originating from Fujian, People's Republic of China, by NewsRx correspondents, research stated, "The cancer chemo-preventive effects of equol have been demonstrated for a wide variety of experimental tumours. In a previous study, we found that equol inhibited proliferation and induced apoptotic death of human gastric cancer MGC-803 cells."

Our news journalists obtained a quote from the research, "However, the mechanisms underlying equol-mediated apoptosis have not been well understood. In the present study, the dual AO (acridine orange)/EB (ethidium bromide) fluorescent assay, the comet assay, MTS, western blotting and flow cytometric assays were performed to further investigate the pro-apoptotic effect of equol and its associated mechanisms in MGC-803 cells. The results demonstrated that equol induced an apoptotic nuclear morphology revealed by AO/EB staining, the presence of a comet tail, the cleavage of caspase-3 and PARP and the depletion of cIAP1, indicating its pro-apoptotic effect. In addition, equol-induced apoptosis involves the mitochondria-dependent cell-death pathway, evidenced by the depolarization of the mitochondrial membrane potential, the cleavage of caspase-9 and the depletion of Bcl-xL and full-length Bid. Moreover, treating MGC-803 cells with equol induced the sustained activation of extracellular signal-regulated kinase (ERK), and inhibiting ERK by U0126, a MEK/ERK pathway inhibitor, significantly attenuated the equol-induced cell apoptosis. These results suggest that equol induces mitochondria-dependent apoptosis in human gastric cancer MGC-803 cells via the sustained activation of the ERK1/2 pathway."

According to the news editors, the research concluded: "Therefore, equol may be a novel candidate for the chemoprevention and therapy of gastric cancer."

For more information on this research see: Equol Induces Mitochondria-Dependent Apoptosis in Human Gastric Cancer Cells via the Sustained Activation of ERK1/2 Pathway. Molecules and Cells, 2016;39(10):742-749. Molecules and Cells can be contacted at: Korean Soc Molecular & Cellular Biology, 635-4, Yucksam-Dong, Gangnam-Gu, Seoul 135-703, South Korea. Findings from Zagazig University in the Area of Type 2 Diabetes Reported (PARP-1 inhibition alleviates diabetic cardiac complications in experimental animals)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes. According to news reporting from Zagazig, Egypt, by NewsRx journalists, research stated, "Cardiovascular complications are the major causes of mortality among diabetic population. Poly(ADPribose) polymerase-1 enzyme (PARP-1) is activated by oxidative stress leading to cellular damage."

Funders for this research include Egyptian Ministry for Higher Education Funding Agency (grant number 1024), Science and Technology Development.

The news correspondents obtained a quote from the research from Zagazig University, "We investigated the implication of PARP-1 in diabetic cardiac complications. Type 2 diabetes was induced in rats by high fructose-high fat diet and low streptozotocin dose. PARP inhibitor 4-aminobenzamide (4-AB) was administered daily for ten weeks after diabetes induction. At the end of study, surface ECG, blood pressure and vascular reactivity were studied. PARP-1 activity, reduced glutathione (GSH) and nitrite contents were assessed in heart muscle. Fasting glucose, fructosamine, insulin, and tumor necrosis factor alpha (TNIF-alpha) levels were measured in serum. Finally, histological examination and collagen deposition detection in rat ventricular and aortic sections were carried out. Hearts isolated from diabetic animals showed increased PARP-1 enzyme activity compared to control animals while significantly reduced by 4-AB administration. PARP-1 inhibition by 4-AB alleviated cardiac ischemia in diabetic animals as indicated by ECG changes. PARP-1 inhibition also reduced cardiac inflammation in diabetic animals as evidenced by histopathological changes. In addition, 4-AB administration improved the elevated blood pressure and the associated exaggerated vascular contractility, endothelial destruction and vascular inflammation seen in diabetic animals. Moreover, PARP-1 inhibition decreased serum levels of TNIF-alpha and cardiac nitrite but increased cardiac GSH contents in diabetic animals. However, PARP-1 inhibition did not significantly affect the developed hyperglycemia."

According to the news reporters, the research concluded: "Our findings prove that PARP-1 enzyme plays an important role in diabetic cardiac complications through combining inflammation, oxidative stress, and fibrosis mechanisms."

For more information on this research see: PARP-1 inhibition alleviates diabetic cardiac complications in experimental animals. European Journal of Pharmacology, 2016;791 (1):444-454. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; European Journal
Findings from Zhejiang University Broaden Understanding of Medicinal Chemistry [Discovery of 4-chloro-3-(5-(pyridin-3-yl)-1,2,4-oxadiazole-3-yl) benzamides as novel RET kinase inhibitors]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Health and Medicine - Medicinal Chemistry. According to news reporting out of Hangzhou, People's Republic of China, by NewsRx editors, research stated, "A series of novel 4-chloro-benzamides derivatives containing substituted five-membered heteroaryl ring were designed, synthesized and evaluated as RET kinase inhibitors for cancer therapy. Most of compounds exhibited moderate to high potency in ELISA-based kinase assay."

Our news journalists obtained a quote from the research from Zhejiang University, "In particular, compound I-8 containing 1,2,4-oxadiazole strongly inhibited RET kinase activity both in molecular and cellular level. In turn, I-8 inhibited cell proliferation driven by RET wildtype and gatekeeper mutation."

According to the news editors, the research concluded: "The results implied that 4-chloro-3-(5-(pyridin-3-yl)-1,2,4-oxadiazole-3-yl) benzamides are promising lead compounds as novel RET kinase inhibitor for further investigation."

Findings from Zhejiang University Provides New Data on Cytokines
(RKIP and TBK1 form a positive feedback loop to promote type I interferon production in innate immunity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Intercellular Signaling Peptides and Proteins - Cytokines. According to news reporting originating in Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "TANK-binding kinase 1 (TBK1) activation is a central event in type I interferon production in anti-virus innate immunity. However, the regulatory mechanism underlying TBK1 activation remains unclear."

The news reporters obtained a quote from the research from Zhejiang University, "Here we report that Raf kinase inhibitory protein (RKIP) is essential for TBK1 activation and type I interferon production triggered by viral infection. Upon viral infection, RKIP is phosphorylated at serine 109 (S109) by TBK1. Phosphorylation of RKIP enhances its interaction with TBK1 and in turn promotes TBK1 autophosphorylation. Mutation of RKIP S109 to alanine abrogates the interaction between RKIP and TBK1, and the anti-viral function of RKIP. RKIP deficiency inhibits intracellular double-stranded RNA- or DNA-induced type I interferon production. Consistently, RKIP deficiency renders the mice more susceptible to vesicular stomatitis virus (VSV) and herpes simplex virus (HSV) infections."

According to the news reporters, the research concluded: "This study reveals a previously unrecognized positive feedback loop between RKIP and TBK1 that is essential for type I interferon production in anti-viral innate immunity."

For more information on this research see: RKIP and TBK1 form a positive feedback loop to promote type I interferon production in innate immunity. *Embo Journal*, 2016;35(23):2553-2565. *Embo Journal* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Findings from Zhejiang University Provides New Data on Nanoparticles (Tetraphenylethene-based highly emissive metallacage as a component of theranostic supramolecular nanoparticles)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nanotechnology - Nanoparticles. According to news reporting from Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "A theranostic agent combines diagnostic reporter with therapeutic activity in a single entity, an approach that seeks to increase the efficacy of cancer treatment. Herein, we describe the synthesis of a highly emissive tetraphenylethene-based metallacage using multicomponent coordination-driven self-assembly that exhibits a coordination-triggered aggregation-induced emission (AIE) enhancement."

Financial supporters for this research include National Science Foundation (NSF), National Basic Research Program, National Natural Science Foundation of China (NSFC), Key Science Technology Innovation Team of Zhejiang Province, Open Project of State Key Laboratory of Supramolecular Structure and Materials.

The news correspondents obtained a quote from the research from Zhejiang University, "The formation of metallacage-loaded nanoparticles (MNPs) occurs when the assembly is treated with two variants of a 1,2-distearoyl-phosphatidylethanolamine (DSPE)/polyethylene glycol (PEG) conjugate, mPEG-DSPE, and biotin-PEG-DSPE. This combination endows the resultant MNPs with excellent stability and targeting ability, specifically enabling selective delivery of the metallacages to cancer cells that overexpress biotin receptors via receptor-mediated endocytosis. Although the mechanism of activity is based on existing Pt(II) anticancer drugs such as oxaliplatin, carboplatin, and cisplatin, in vitro and in vivo studies indicate that the MNPs are more active and show low systemic activity while also possessing emissive properties that allow for fluorescence-based imaging."

According to the news reporters, the research concluded: "This pioneering example of a metallacage that combines biologically active components with AIE imaging establishes supra-molecular coordination complexes imbedded within nanoparticles as a promising potential theranostic platform for cancer treatment."

Genetics - Human Mutation

Findings from Ziv Medical Center Update Understanding of Human Mutation (Systematic Analysis of CCNO Variants in a Defined Population: Implications for Clinical Phenotype and Differential Diagnosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Genetics - Human Mutation. According to news reporting from Safed, Israel, by NewsRx journalists, research stated, "Reduced generation of multiple motile cilia (RGMC) is a novel chronic destructive airway disease within the group of mucociliary clearance disorders with only few cases reported. Mutations in two genes, CCNO and MCIDAS, have been identified as a cause of this disease, both leading to a greatly reduced number of cilia and causing impaired mucociliary clearance."

The news correspondents obtained a quote from the research from Ziv Medical Center, "This study was designed to identify the prevalence of CCNO mutations in Israel and further delineate the clinical characteristics of RGMC. We analyzed 170 families with mucociliary clearance disorders originating from Israel for mutations in CCNO and identified two novel mutations (c.165delC, p.Gly56Alafs*38; c.638T >C, p.Leu213Pro) and two known mutations in 15 individuals from 10 families (6% prevalence). Pathogenicity of the missense mutation (c.638T>C, p.Leu213Pro) was demonstrated by functional analyses in Xenopus. Combining these 15 patients with the previously reported CCNO case reports revealed rapid deterioration in lung function, an increased prevalence of hydrocephalus (10%) as well as increased female infertility (22%). Consistent with these findings, we demonstrate that CCNO expression is present in murine ependyma and fallopian tubes."

According to the news reporters, the research concluded: "CCNO is mutated more frequently than expected from the rare previous clinical case reports, leads to severe clinical manifestations, and should therefore be considered an important differential diagnosis of mucociliary clearance disorders."

Our news journalists report that additional information may be obtained by contacting I. Amirav, Ziv Medical Center, Faculty of Medicine, Bar Ilan University, Safed 13100, Israel. Additional authors for this research include J. Wallmeier, N.T. Loges, T. Menchen, P. Pennekamp, H. Mussaffi, R. Abitbul, A. Avital, L. Bentur, G.W. Dougherty, E. Nael, M. Lavie, H. Olbrich, C. Werner, C. Kintner and H. Omran.

Oncology - Acute Lymphoblastic Leukemia

Findings in Acute Lymphoblastic Leukemia Reported from University of Southern California [Expression and polymorphism (rs4880) of mitochondrial superoxide dismutase (SOD2) and asparaginase induced hepatotoxicity in adult patients with acute ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Lymphoblastic Leukemia. According to news reporting originating in Los Angeles, California, by NewsRx journalists, research stated, "Asparaginase, which depletes asparagine and glutamine, activates amino-acid stress response. Oxidative stress mediated by excessive reactive oxygen species (ROS) causes enhanced mitochondrial permeabilization and subsequent cell apoptosis and is considered as a plausible mechanism for drug-induced hepatotoxicity, a common toxicity of asparaginase in adults with acute lymphoblastic leukemia (ALL)."

The news reporters obtained a quote from the research from the University of Southern California, "Studies investigating the pharmacogenetics of asparaginase in ALL are limited and focused on asparaginase-induced allergic reaction common in pediatric patients. Here, we sought to determine a potential association between the variant rs4880 in SOD2 gene, a key mitochondrial enzyme that protects cells against ROS, and hepatotoxicity during asparaginase-based therapy in 224 patients enrolled on CALGB-10102, a treatment trial for adults with ALL. We report that the CC genotype of rs4880 is associated with increased hepatotoxicity following asparaginase-based treatment."

According to the news reporters, the research concluded: "Thus, rs4880 likely contributes to asparaginase-induced hepatotoxicity, and functional studies investigating this single-nucleotide polymorphism (SNP) are needed to develop therapeutic approaches that mitigate this toxicity. The Pharmacogenomics Journal advance online publication, 29 March."

For more information on this research see: Expression and polymorphism (rs4880) of mitochondrial superoxide dismutase (SOD2) and asparaginase induced hepatotoxicity in adult patients with acute lymphoblastic leukemia. The Pharmacogenomics Journal, 2016;():.

Our news correspondents report that additional information may be obtained by contacting H. Alachkar, Dept. of Pharmacy, USC School of Pharmacy, University of Southern California, Los Angeles, CA, United States. Additional authors for this research include N. Fulton, B. Sanford, G. Malnassy, M. Mutonga, R.A. Larson, C.D. Bloomfield, G. Marcucci, Y. Nakamura and W. Stock.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/tpj.2016.7. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Antineoplastics, Pharmaceuticals, Genetics, Oncology, Dismutase, California, Hematology, Los Angeles, United States, Amidohydrolases, Gastroenterology, Drugs and Therapies, Asparaginase Therapy, Enzymes and Coenzymes, North and Central America, Acute Lymphoblastic Leukemia.
Findings in Acute Myeloid Leukemia Reported from Wroclaw Medical University (Variations in genes involved in regulation of the nuclear factor - kB pathway and the risk of acute myeloid leukaemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Acute Myeloid Leukemia have been published. According to news reporting originating from Wroclaw, Poland, by NewsRx correspondents, research stated, "Genes involved in regulation of the nuclear factor -kappa B (NF-kB) pathway are suggested to play a role in the pathogenesis of acute myeloid leukaemia (AML). The present study aimed to assess the association between the NF-kB1, TRAF3 and TLRs genes single nucleotide polymorphisms (SNPs) and disease susceptibility as well as progression in patients with AML."

Financial support for this research came from Wroclaw Medical University. Our news editors obtained a quote from the research from Wroclaw Medical University, "For this purpose 62 patients and 126 healthy individuals were genotyped for NF-kB1 (rs28362491), TRAF3 (rs11160707; rs12147254), TLR2 (rs201786064), TLR4 (rs4986790; rs4986791) and TLR9 (rs5743836; rs187084) alleles. Three SNPs were found to be associated with the risk for the AML development. The TRAF3 (rs12147254) AA homozygosity (RR=2.770, p=0.0392), TLR9 (rs5743836) C wild-type allele (RR=2.542, p=0.0096) as well as TLR9 (rs187084) T allele (RR=13.396, p<0.0001) and its homozygosity (RR=11.805, p<0.0001) were more frequent among patients with AML than healthy individuals. The associations of the rs187084 SNP were significant for both sexes. Moreover, patients who relapsed were more frequently characterized with the presence of the rs187084 TLR9 TT genotype (p=0.045) or the rs12147254 TRAF3 A variant (p=0.066)."

According to the news editors, the research concluded: "Polymorphisms within the TLR9 and TRAF3 genes are associated with predisposition to AML and may affect the progression of the disease in the Polish population."

The news editors report that additional information may be obtained by contacting J. Rybka, Dept. of Haematology, Blood Neoplasms and Bone Marrow Transplantation, Wroclaw Medical University, Wroclaw, Poland. Additional authors for this research include K. Gebura, T. Wrobel, B. Wysoczanska, E. Stefanko, K. Kuliczkowski and K. Bogunia-Kubik.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/iji.12255. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Poland, Europe, Wroclaw, Genetics, Oncology, Hematology, Acute Myeloid Leukemia.

Adenocarcinomas

Findings in Adenocarcinomas Reported from Gazi University (Unusual Presentation of an Adenocarcinoma of the Lung Metastasizing to the Mandible, Including Molecular Analysis and a Review of the Literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Adenocarcinomas is now available. According to news reporting out of Ankara, Turkey, by NewsRx editors, research stated, "Lung cancer is the most frequent cause of cancer-related death worldwide. Metastases of non-small cell lung carcinoma to the oral and maxillofacial region are rare."

Our news journalists obtained a quote from the research from Gazi University, "Thus, the diagnosis of a metastatic lesion in the oral cavity is challenging to the clinician and to the pathologist. This report presents a case of a 72-year-old man with metastatic lung adenocarcinoma located in the posterior mandibular region."

According to the news editors, the research concluded: "Next-generation sequencing analysis showed no important mutations in the relevant genes except in the TP53 tumor suppressor gene."

Our news journalists report that additional information may be obtained by contacting B. Senguven, Gazi University, Fac Dental, Dept. of Oral Pathol, TR-06510 Ankara, Turkey. Additional authors for this research include B. Senguven, I.I. Gonul, B. Okur and R. Buettner.

Pediatrics - Adolescent Medicine

Findings in Adolescent Medicine Reported from University of Miami (Substance Use and Sexual Risk Behavior in Sexual Minority Hispanic Adolescents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Pediatrics - Adolescent Medicine are presented in a new report. According to news reporting out of Miami, Florida, by NewsRx editors, research stated, "This study examines substance use and sexual risk in sexual minority Hispanic adolescents..."
(SMHAs) relative to their heterosexual counterparts. Baseline data (total, n = 1,632; SMHA, n = 195) from five completed trials of a family-based intervention for Hispanic adolescents were synthesized.

Our news journalists obtained a quote from the research from the University of Miami, "SMHA were identified by self-reported anal/vaginal/oral sex with a partner of the same gender (SMHA vs. non-SMHA). Dichotomous outcomes were lifetime and past 90-day cigarette, alcohol and illicit drug use, past 90-day condomless sex, and condom use at last sex. Logistic regression models controlled for sociodemographic and study-level characteristics testing the association between sexual minority status and each outcome. SMHA reported significantly more substance use than non-SMHA, including lifetime cigarette and illicit drug use. Adjusted odds of lifetime use for all substances and past 90-day cigarette use (AOR = 3.07; 95% confidence interval: 1.50-6.31) were significantly higher in SMHA."

According to the news editors, the research concluded: "SMHA substance use etiology should be explored to inform tailored intervention development."

Our news journalists report that additional information may be obtained by contacting M.A. Ocasio, University of Miami, Miller Sch Med, Dept. of Public Hlth Sci, Miami, FL 33136, United States. Additional authors for this research include D.J. Feaster and G. Prado.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jadohealth.2016.07.008. This DOI is a link to an online electronic document that is either free or for purchase.

### Amino Acids

**Findings in Amino Acids Reported from Baylor University College of Medicine (Whole genome sequence analysis of serum amino acid levels)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Amino Acids have been published. According to news reporting originating in Houston, Texas, by NewsRx journalists, research stated, "Blood levels of amino acids are important biomarkers of disease and are influenced by synthesis, protein degradation, and gene-environment interactions. Whole genome sequence analysis of amino acid levels may establish a paradigm for analyzing quantitative risk factors."

The news reporters obtained a quote from the research from the Baylor University College of Medicine, "In a discovery cohort of 1872 African Americans and a replication cohort of 1552 European Americans we sequenced exons and whole genomes and measured serum levels of 70 amino acids. Rare and low-frequency variants (minor allele frequency <= 5%) were analyzed by three types of aggregating motifs defined by gene exons, regulatory regions, or
genome-wide sliding windows. Common variants (minor allele frequency >5%) were analyzed individually. Over all four analysis strategies, 14 gene-amino acid associations were identified and replicated. The 14 loci accounted for an average of 1.8% of the variance in amino acid levels, which ranged from 0.4 to 9.7%. Among the identified locus-amino acid pairs, four are novel and six have been reported to underlie known Mendelian conditions. These results suggest that there may be substantial genetic effects on amino acid levels in the general population that may underlie inborn errors of metabolism. We also identify a predicted promoter variant in AGA (the gene that encodes aspartyglucosaminidase) that is significantly associated with asparagine levels, with an effect that is independent of any observed coding variants. These data provide insights into genetic influences on circulating amino acid levels by integrating -omic technologies in a multi-ethnic population."

According to the news reporters, the research concluded: "The results also help establish a paradigm for whole genome sequence analysis of quantitative traits."

For more information on this research see: Whole genome sequence analysis of serum amino acid levels. Genome Biology, 2016;17():21-30. Genome Biology can be contacted at: Biomed Central Ltd, 236 Grays Inn Rd, Floor 6, London WC1X 8HL, England. (BioMed Central - www.biomedcentral.com; Genome Biology - genomebiology.com)

Our news correspondents report that additional information may be obtained by contacting E. Boerwinkle, Baylor College of Medicine, Human Genome Sequencing Center, Houston, TX 77030, United States. Additional authors for this research include P.S. de Vries, G.A. Metcalf, Z. Wang, E.V. Feofanova, X.M. Liu, D.M. Muzny, L.E. Wagenknecht, R.A. Gibbs, A.C. Morrison and E. Boerwinkle.

**Drugs and Therapies - Androgens**

**Findings in Androgens Reported from University of Ulster (Androgen deprivation in LNCaP prostate tumour xenografts induces vascular changes and hypoxic stress, resulting in promotion of epithelial-to-mesenchymal transition)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Androgens is the subject of a report. According to news reporting originating from Coleraine, United Kingdom, by NewsRx correspondents, research stated, "When single-agent androgen deprivation therapy (ADT) is administered for locally advanced prostate cancer, men usually relapse within 1-2 years with more malignant castrate-resistant disease. The reason for this is currently unknown."

Our news editors obtained a quote from the research from the University of Ulster, "We now hypothesise that an initial treatment response that increases tumor hypoxia drives selection of more malignant tumours. The LNCaP prostate tumor xenografts were analysed for physiological (oxygen and vasculature) and genetic (PCR array) changes during longitudinal treatment with ADT (bicalutamide, 6 or 2 mg kg^-1 daily for 28 days). Bicalutamide caused an immediate (within 24 h) dose-dependent fall in oxygenation in LNCaP-luc prostate
tumours with a nadir of (<=) 0.1% oxygen within 3-7 days; this was attributed to a significant loss of tumor microvessels (window chamber study). The hypoxic nadir persisted for 10-14 days. During the next 7 days, tumours regrew, oxygenation improved and the vasculature recovered; this was inhibited by the VEGF inhibitor B20.4.1.1. Gene expression over 28 days showed marked fluctuations consistent with the physiological changes. Accompanying the angiogenic burst (day 21) was a particularly striking increase in expression of genes associated with epithelial-to-mesenchymal transition (EMT). In particular, insulin-like growth factor 1 (IGF-1) showed increases in mRNA and protein expression."

According to the news editors, the research concluded: "Hypoxic stress caused by ADT promotes EMT, providing a mechanism for the cause of malignant progression in prostate cancer."

For more information on this research see: Androgen deprivation in LNCaP prostate tumour xenografts induces vascular changes and hypoxic stress, resulting in promotion of epithelial-to-mesenchymal transition. British Journal of Cancer, 2016;114(6):659-68. (Nature Publishing Group - www.nature.com/bjc/)

The news editors report that additional information may be obtained by contacting N.M. Byrne, Biomedical Science Research Institute, University of Ulster, Cromore Road, Coleraine, BT52 1SA Northern Ireland UK, UK. Additional authors for this research include H. Nesbitt, L. Ming, S.R. McKeown, J. Worthington and D.J McKenna.

Angiography

Findings in Angiography Reported from Second Military Medical University (Dynamic contrast-enhanced MRI for the assessment of spinal tumor vascularity: correlation with angiography)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Angiography. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "To determine if dynamic contrast-enhanced MRI (DCE-MRI) could correlate well with invasive angiography in the characterization of spinal tumor vascularity. Totally 40 patients with untreated spinal tumors underwent MRI before preoperative angiography and embolization."

Our news journalists obtained a quote from the research from Second Military Medical University, "Tumors were assigned to hypervascular, moderate, or hypovascular groups based on angiographic appearance. Tumor vascularity was also evaluated with enhancement degree on standard MR and with DCE-MRI parameters via ROI analysis of enhanced tumor area. The Spearman correlation coefficient was calculated to determine the correlation between the degree of angiographic vascularity and enhancement on MRI and DCE-MRI parameters. ROC analysis was conducted to assess the appropriate cut-off value. There were 12 hypervascular, 12 moderate, and 16 hypovascular tumors, respectively. The Spearman
correlation coefficient between DCE-MRI parameter and the degree of angiographic vascularity was 0.899 (RSlope(max)), 0.847 (Slope(max)), 0.697 (E (max)), 0.694 (ERmax), and -0.587 (TTP), respectively, which showed excellent-to-moderate relationships. The RSlope(max) cut-off value of 1.325 provided the highest specificity of 100 % and sensitivity of 87.5 % in predicting hypovascular tumors and the value of 1.85 provided the highest sensitivity of 100 % and specificity of 96.4 % in characterizing hypervascular ones."

According to the news editors, the research concluded: "DCE-MRI is an accurate technique for the assessment of spinal tumor vascularity, which may have a potential value in the decision-making of preoperative embolization."

For more information on this research see: Dynamic contrast-enhanced MRI for the assessment of spinal tumor vascularity: correlation with angiography. European Spine Journal, 2016;25(12):3952-3961. Drugs and Therapies - Antibiotics

Findings in Antibiotics Reported from Institute of Surgery Research
(Ciprofloxacin-loaded keratin hydrogels reduce infection and support healing in a porcine partial-thickness thermal burn)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antibiotics are presented in a new report. According to news reporting out of Fort Sam Houston, Texas, by NewsRx editors, research stated, "Infection is a leading cause of morbidity and mortality in burn patients. Current therapies include silver-based creams and dressings, which display limited antimicrobial effectiveness and impair healing."

Our news journalists obtained a quote from the research from the Institute of Surgery Research, "The need exists for a topical, point-of-injury antibiotic treatment that provides sustained antimicrobial activity without impeding wound repair. Fitting this description are keratin-based hydrogels, which are fully biocompatible and support the slow-release of antibiotics. Here we develop a porcine model of an infected partial-thickness burn to test the effects of ciprofloxacin-loaded keratin hydrogels on infection and wound healing. Partial-thickness burns were inoculated with either Pseudomonas aeruginosa or Methicillin-resistant Staphylococcus aureus, resulting in infections that persisted for >2 weeks that exceeded 10(5) and 10(6) cfu per gram of tissue, respectively. Compared to silver sulfadiazine, ciprofloxacin-
loaded keratin hydrogel treatment significantly reduced the amount of P. aeruginosa and S. aureus in the burn by >99% on days 4, 7, 11, and 15 postinjury. Further, burns treated with ciprofloxacin-loaded keratin hydrogels exhibited similar healing patterns as uninfected burns with regards to reepithelialization, macrophage recruitment, and collagen deposition and remodeling.

According to the news editors, the research concluded: "The ability of keratin hydrogels to deliver antibiotics to fight infection and support healing of partial-thickness burns make them a strong candidate as a first-line burn therapy."

Our news journalists report that additional information may be obtained by contacting R.J. Christy, US Army, Inst Surg Res, Fort Sam Houston, TX, United States. Additional authors for this research include S. Tomblyn, K.M. Isaac, C.J. Kowalczewski, D.M. Burmeister, L.R. Burnett and R.J. Christy.

the efficiency of pulmonary drug delivery in both nebulizers. Population pharmacokinetic analysis of ipratropium bromide was performed. Additionally, the noise level during the nebulizer operation and the aerosol particle size for each device were measured. The dose-normalized AUC(last) was 0.10 min/L for both nebulizers. The pharmacokinetics of nebulized ipratropium bromide can be described best by a one-compartment model with first-order absorption. The apparent volume of distribution and metabolic clearance were 1340 L and 6.78 L/min, respectively. Type of nebulizer was a significant covariate for absorption rate constant. The equivalent sound level and median aerosol particle diameter were 35.0 dB and 4.52 mm for the test nebulizer, and 60.2 dB and 3.85 mm for the control nebulizer, respectively."

According to the news reporters, the research concluded: "From the standpoint of the dose-normalized AUC(last), a new vibrating mesh-type nebulizer shows similar performance in the intrapulmonary delivery of ipratropium bromide to that of a jet-type nebulizer in surgical patients."

For more information on this research see: Efficiency of a New Mesh-Type Nebulizer (NE-SM1 NEPLUS) for Intrapulmonary Delivery of Ipratropium Bromide in Surgical Patients. Basic & Clinical Pharmacology & Toxicology, 2015;118(4):313-9. (Wiley-Blackwell - www.wiley.com; Basic & Clinical Pharmacology & Toxicology - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1742-7843)

Drugs and Therapies - Antiinfectives

Findings in Antiinfectives Reported from Ehime University (The antibacterial activity of levofloxacin eye drops against staphylococci using an in vitro pharmacokinetic model in the bulbar conjunctiva)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiinfectives have been published. According to news reporting originating in Ehime, Japan, by NewsRx journalists, research stated, "The incidence of fluoroquinolone-resistant staphylococcal isolates from the conjunctival sac is increasing. We compared pharmacological effects of levofloxacin (LVFX) against Staphylococcus epidermidis using an in vitro pharmacokinetic (PK) model simulating the concentration in the bulbar conjunctiva after applying eye drops of 0.5% and 1.5% LVFX. We used S. epidermidis conjunctival sac isolates [minimum inhibitory concentrations (MICs) of
LVFX, 0.125 µg/mL]."

The news reporters obtained a quote from the research from Ehime University, "LVFX-resistant strains were obtained from parental strains after culture with LVFX. The in vitro PK model simulated the concentration in the bulbar conjunctiva following three topical applications of 0.5% or 1.5% LVFX ophthalmic solution (0, 4, and 8 h) to rabbit eyes. Parental and LVFX-resistant strains were exposed to LVFX in the in vitro PK model, and changes in viable bacterial counts were evaluated for 12 h. The MICs of LVFX for the resistant isolates were 2-32 times higher than the parental strain, and those with MICs >= 2 µg/mL had mutations in the quinolone resistance-determining region. The PK model simulation predicts that 1.5% LVFX exerts bactericidal and bacteriostatic effects against strains with MICs of 0.125-2 and 4 µg/mL, respectively, whereas 0.5% LVFX would only be effective against strains with MICs of 0.125-1 µg/mL."

According to the news reporters, the research concluded: "The PK model predicts that the 1.5% LVFX ophthalmic solution exhibits a stronger bactericidal effect against resistant staphylococci in the bulbar conjunctiva than the 0.5% LVFX ophthalmic solution."

For more information on this research see: The antibacterial activity of levofloxacin eye drops against staphylococci using an in vitro pharmacokinetic model in the bulbar conjunctiva. *Journal of Infection and Chemotherapy*, 2016;22(6):360-365. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Lung Diseases and Conditions - Asthma**

**Findings in Asthma Reported from Queensland University of Technology (Exhaled nitric oxide levels to guide treatment for adults with asthma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Asthma have been published. According to news reporting originating from Brisbane, Australia, by NewsRx correspondents, research stated, "Asthma guidelines aim to guide health practitioners to optimise treatment for patients so as to minimise symptoms, improve or maintain good lung function, and prevent acute exacerbations or flare-ups. The principle of asthma guidelines is based on a step-up or step-down regimen of asthma medications to maximise good health outcomes using minimum medications."

Our news editors obtained a quote from the research from the Queensland University of Technology, "Asthma maintenance therapies reduce airway inflammation that is usually eosinophilic. Tailoring asthma medications in accordance with airway eosinophilic levels may
improve asthma outcomes such as indices of control or reduce exacerbations or both. Fractional exhaled nitric oxide (FeNO) is a marker of eosinophilic inflammation, and as it is easy to measure, has an advantage over other measurements of eosinophilic inflammation (for example sputum eosinophils). To evaluate the efficacy of tailoring asthma interventions based on exhaled nitric oxide (FeNO), in comparison to not using FeNO, that is management based on clinical symptoms (with or without spirometry/peak flow) or asthma guidelines or both, for asthma-related outcomes in adults. Search methods We searched the Cochrane Airways Group Specialised Register of Trials, the Cochrane Central Register of Controlled Trials (CENTRAL), MEDLINE, EMBASE, and reference lists of articles. The last searches were undertaken in June 2016. Selection criteria All randomised controlled trials (RCTs) comparing adjustment of asthma medications based on exhaled nitric oxide levels compared to not using FeNO, that is management based on clinical symptoms (with or without spirometry/peak flow) or asthma guidelines or both. Data collection and analysis We reviewed results of searches against predetermined criteria for inclusion. We independently selected relevant studies in duplicate. Two review authors independently assessed trial quality and extracted data. We contacted study authors for further information, receiving responses from four. We included seven adult studies; these studies differed in a variety of ways including definition of asthma exacerbations, FeNO cutoff levels used (15 to 35 ppb), the way in which FeNO was used to adjust therapy, and duration of study (4 to 12 months). Of 1700 randomised participants, 1546 completed the trials. The mean ages of the participants ranged from 28 to 54 years old. The inclusion criteria for the participants in each study varied, but all had a diagnosis of asthma and required asthma medications. In the meta-analysis, there was a significant difference in the primary outcome of asthma exacerbations between the groups, favouring the FeNO group. The number of people having one or more asthma exacerbations was significantly lower in the FeNO group compared to the control group (odds ratio (OR) 0.60, 95% confidence interval (CI) 0.43 to 0.84). The number needed to treat to benefit (NNTB) over 52 weeks was 12 (95% CI 8 to 32). Those in the FeNO group were also significantly more likely to have a lower exacerbation rate than the controls (rate ratio 0.59, 95% CI 0.45 to 0.77). However, we did not find a difference between the groups for exacerbations requiring hospitalisation (OR 0.14, 95% CI 0.01 to 2.67) or rescue oral corticosteroids (OR 0.86, 95% CI 0.50 to 1.48). There was also no significant difference between groups for any of the secondary outcomes (FEV1, FeNO levels, symptoms scores, or inhaled corticosteroid doses at final visit). We considered three included studies that had inadequate blinding to have a high risk of bias. However, when these studies were excluded from the meta-analysis, the difference between the groups for the primary outcomes (exacerbations) remained statistically significant. The GRADE quality of the evidence ranged from moderate (for the outcome 'exacerbations') to very low (for the outcome 'inhaled corticosteroid dose at final visit') based on the lack of blinding and statistical heterogeneity. Six of the seven studies were industry supported, but the company had no role in the study design or data analyses. Authors’ conclusions With new studies included since the last version of this review, which included adults and children, this updated meta-analysis in adults with asthma showed that tailoring asthma medications based on FeNO levels (compared with primarily on clinical symptoms) decreased the frequency of asthma exacerbations but did not impact on day-to-day clinical symptoms, end-of-study FeNO levels, or inhaled corticosteroid dose. Thus, the universal use of FeNO to help guide therapy in adults with asthma cannot be advocated. As the main benefit shown in the studies in this review was a reduction in asthma exacerbations, the intervention may be most useful in adults who have frequent exacerbations.

According to the news editors, the research concluded: "Further RCTs encompassing different asthma severity, ethnic groups in less affluent settings, and taking into account different FeNO cutoffs are required."
For more information on this research see: Exhaled nitric oxide levels to guide treatment for adults with asthma. *Cochrane Database of Systematic Reviews*, 2016;(9):1473-1525. *Cochrane Database of Systematic Reviews* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

**Cardiovascular Diseases and Conditions --**

**Findings in Atherosclerosis Reported from Peking Union Medical College (Association of BMI with total mortality and recurrent stroke among stroke patients: A meta-analysis of cohort studies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Studies of the association between obesity and total mortality and recurrent stroke events have shown contradictory results. Therefore, we aimed to conduct a meta-analysis to examine the association of body mass index (BMI) with total mortality and recurrent stroke events among patients after stroke onset."

Our news journalists obtained a quote from the research from Peking Union Medical College, "We performed an electronic search of PubMed, EMBASE and the Cochrane Library Database, as well as a bibliography review to identify relevant cohort studies published prior to 15th December 2015. Estimates of relative risks (RRs) and corresponding 95% confidence intervals (CIs) comparing underweight, overweight and obese groups with normal weight were pooled using random effects models. In total, 15 studies with 122,472 stroke patients were eligible for inclusion in the meta-analysis. Compared with the normal weight group, obese stroke patients had a significant decreased risk for total mortality (RR - 0.83, 95% CI, 0.73-0.93, p - 0.002), while underweight patients had a significant increased risk for total mortality (RR = 1.54, 95% CI, 1.31-1.82, p = 3.66 x 10(7)). A similar, but not significant, association of BMI categories with recurrent stroke events was also observed. Furthermore, the dose-response meta-analysis identified a nonlinear trend for total mortality and a linear trend for recurrent stroke events, associated with BMI."

According to the news editors, the research concluded: "Our results suggested that obesity may have a protective effect on total mortality and recurrent stroke events among patients with established stroke."

For more information on this research see: Association of BMI with total mortality

**Cardiovascular Diseases and Conditions -…**

**Findings in Atherosclerosis Reported from University of Heidelberg**

[Reduced glyoxalase 1 activity in carotid artery plaques of nondiabetic patients with increased hemoglobin A(1c) level]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Atherosclerosis have been published. According to news reporting originating in Heidelberg, Germany, by NewsRx journalists, research stated, "Glyoxalase 1 (GLO1) is ubiquitously expressed in the cytosol of the cell and is the major opponent against the reactive metabolite methylglyoxal, which is involved in the development of atherosclerosis. Nondiabetic individuals with an increased hemoglobin A(1c) (HbA(1c)) level are at higher risk for development of cardiovascular diseases."

The news reporters obtained a quote from the research from the University of Heidelberg, "As such, this study investigated whether there was an association between reduced GLO1 activity in atherosclerotic lesions of nondiabetic patients with an increased HbA(1c) level. HbA(1c) level was determined in venous blood of patients with carotid artery disease. Protein level of GLO1 was measured in endarterectomy-derived carotid artery plaques by Western blotting. Activity was measured by spectrophotometric assay in the plaques as well as in the erythrocytes; GLO1 activity in erythrocytes was compared with that in a cohort of healthy individuals (n = 15; 33% men; average age, 60 years). There were 36 patients with carotid artery disease (69% men; average age, 69 years) included in this study and divided into two equal groups: group I, HbA(1c) < 5.7% (< 39 mmol/mol); and group II, 5.7% <= HbA(1c) < 6.5% (39 mmol/mol <= HbA(1c) < 48 mmol/mol). GLO1 activity in carotid plaques was reduced by 29% in group II compared with group I (P = .048), whereas protein expression was unchanged (P = .25). Analysis of GLO1 activity in erythrocytes revealed no difference between the groups (P = .36) or in comparison to healthy controls (P = .15). Examination of clinical parameters showed an increased amount of patients with concomitant peripheral arterial disease in group II (44% vs 10%; P = .020). Reduction of GLO1 activity in atherosclerotic lesions of nondiabetic patients with increased HbA(1c) is associated with a functional involvement of this protective enzyme in
According to the news reporters, the research concluded: "Systemic GLO1 activity seems to be independent of both HbA(1c) and localized atherosclerosis as it was unchanged between group I and group II as well as compared with healthy controls, respectively."

Our news correspondents report that additional information may be obtained by contacting A.S. Peters, Heidelberg Univ, Vaskulare Biomat Bank Heidelberg Vasc Biobank Hei, Heidelberg, Germany. Atrial Fibrillation

Findings in Atrial Fibrillation Reported from University of Tokushima (Relationship between local production of microRNA-328 and atrial substrate remodeling in atrial fibrillation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Atrial Fibrillation. According to news reporting originating from Tokushima, Japan, by NewsRx correspondents, research stated, "The underlying mechanism of atrial substrate remodeling in atrial fibrillation (AF) remains unknown. In this study, we investigated whether local and systemic levels of microRNA (miR) might be associated with the presence of AF and with left atrial (LA) substrate properties."

Our news editors obtained a quote from the research from the University of Tokushima, "Blood from the periphery, pulmonary vein (PV), and left atrial appendage (LAA) was sampled from 30 patients with AF undergoing PV isolation, and from 10 control subjects with Wolff-Parkinson White syndrome and without AF. We measured peripheral, PV, and LAA plasma levels of miR-1,-26, -133a, -328, and -590 by reverse transcription-polymerase chain reaction. LA global contact mapping during sinus rhythm was performed before PV isolation. Plasma levels of miR-328 were higher in patients with AF than in control subjects. Plasma miR-328 levels were significantly higher in the LAA than in the periphery and PV in patients with AF, but not in control subjects. Plasma miR-1 levels were also higher in the LAA than in the PV in AF patients. Interestingly, LAA plasma levels of miR-328 showed a positive correlation with the LA voltage zone index (area with voltage <0.5 mV divided by total LA surface area) and a
weak correlation with LA volume."

According to the news editors, the research concluded: "Local production of miR-328 in the left atrium may be involved in the process of atrial remodeling in patients with AF."

For more information on this research see: Relationship between local production of microRNA-328 and atrial substrate remodeling in atrial fibrillation. *Journal of Cardiology*, 2016;68(5-6):472-477. *Journal of Cardiology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Biguanides**

**Findings in Biguanides Reported from Dana-Farber Cancer Institute (Environment Dictates Dependence on Mitochondrial Complex I for NAD plus and Aspartate Production and Determines Cancer Cell Sensitivity to Metformin)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Biguanides have been published. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Metformin use is associated with reduced cancer mortality, but how metformin impacts cancer outcomes is controversial. Although metformin can act on cells autonomously to inhibit tumor growth, the doses of metformin that inhibit proliferation in tissue culture are much higher than what has been described in vivo."

The news reporters obtained a quote from the research from Dana-Farber Cancer Institute, "Here, we show that the environment drastically alters sensitivity to metformin and other complex I inhibitors. We find that complex I supports proliferation by regenerating nicotinamide adenine dinucleotide (NAD)+, and metformin's anti-proliferative effect is due to loss of NAD+/NADH homeostasis and inhibition of aspartate biosynthesis. However, complex I is only one of many inputs that determines the cellular NAD+/NADH ratio, and dependency on complex I is dictated by the activity of other pathways that affect NAD+ regeneration and aspartate levels."

According to the news reporters, the research concluded: "This suggests that cancer drug sensitivity and resistance are not intrinsic properties of cancer cells, and demonstrates that
the environment can dictate sensitivity to therapies that impact cell metabolism."

For more information on this research see: Environment Dictates Dependence on Mitochondrial Complex I for NAD plus and Aspartate Production and Determines Cancer Cell Sensitivity to Metformin. *Cell Metabolism*, 2016;24(5):716-727. *Cell Metabolism* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. **Blood Pressure**

**Findings in Blood Pressure Reported from Capital Medical University (Cumulative systolic blood pressure exposure in relation to cognitive function in middle-aged and elderly adults A prospective, population-based study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Blood Pressure is the subject of a report. According to news reporting out of Beijing, People's Republic of China, by NewsRx editors, research stated, "The association between systolic blood pressure (SBP) and cognitive function is controversial in elderly adults. In addition, few studies focused on the cumulative effect of SBP."

Our news journalists obtained a quote from the research from Capital Medical University, "We aimed to investigate the association between cumulative SBP exposure and cognitive function among middle-aged and elderly adults. The analysis was based on the Asymptomatic Polyvascular Abnormalities Community (APAC) study. The primary predictor was the cumulative SBP calculated by consecutive SBP values measured through baseline (2006-2007) up to the fourth examination (2012-2013). The cognitive function was estimated by mini-mental state examination (MMSE) in the fourth examination. Linear regression and logistic regression analyses were used to investigate the association between cumulative SBP and cognitive function. Among 2211 participants (41.4 % female, aged 40-94 years). 167 (7.55%) were diagnosed with cognitive impairment (MMSE score < 24). Higher cumulative exposure to SBP (per SD increment) was independently associated with poor cognitive performance after controlling for multiple factors (P < 0.001). We observed nondifferential association between men and women. However, higher cumulative SBP in the adults aged >= 60 years had a stronger association with poor cognitive performance compared with that in adults aged 40 to 60 years. Greater exposure to cumulative SBP is associated with worse cognitive performance among middle-aged and elderly adults."

According to the news editors, the research concluded: "This association is similar between men and women, but stronger in elderly adults."
For more information on this research see: Cumulative systolic blood pressure exposure in relation to cognitive function in middle-aged and elderly adults A prospective, population-based study. *Medicine*, 2016;95(48):223-227. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Bone Research**

**Findings in Bone Research Reported from University of Oxford (The Effects of Age, Adiposity, and Physical Activity on the Risk of Seven Site-Specific Fractures in Postmenopausal Women)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Bone Research. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "Risk factors for fracture of the neck of the femur are relatively well established, but those for fracture at other sites are little studied. In this large population study we explore the role of age, body mass index (BMI), and physical activity on the risk of fracture at seven sites in postmenopausal women."

Our news journalists obtained a quote from the research from the University of Oxford, "As part of the Million Women Study, 1,154,821 postmenopausal UK women with a mean age of 56.0 (SD 4.8) years provided health and lifestyle data at recruitment in 1996 to 2001. All participants were linked to National Health Service (NHS) hospital records for day-case or overnight admissions with a mean follow-up of 11 years per woman. Adjusted absolute and relative risks for seven site-specific incident fractures were calculated using Cox regression models. During follow-up, 4931 women had a fracture of the humerus; 2926 of the forearm; 15,883 of the wrist; 9887 of the neck of the femur; 1166 of the femur (not neck); 3199 a lower leg fracture; and 10,092 an ankle fracture. Age-specific incidence rates increased gradually with age for fractures of forearm, lower leg, ankle, and femur (not neck), and steeply with age for fractures of neck of femur, wrist, and humerus. When compared to women with desirable BMI (20.0 to 24.9 kg/m(2)), higher BMI was associated with a reduced risk of fracture of the neck of femur, forearm, and wrist, but an increased risk of humerus, femur (not neck), lower leg, and ankle fractures (p < 0.001 for all). Strenuous activity was significantly associated with a decreased risk of fracture of the humerus and femur (both neck and remainder of femur) (p < 0.001), but was not significantly associated with lower leg, ankle, wrist, and forearm fractures. Postmenopausal women are at a high lifetime risk of fracture."

According to the news editors, the research concluded: "BMI and physical activity are modifiable risk factors for fracture, but their associations with fracture risk differ
substantially across fracture sites."

The news correspondents report that additional information may be obtained from M.E.G. Armstrong, University of Oxford, Canc Epidemiol Unit, Oxford OX3 7LF, United Kingdom. Additional authors for this research include B.J. Cairns, J. Green, G.K. Reeves, V. Beral and M.E.G. Armstrong.

**Drugs and Therapies - Cancer Therapy**

**Findings in Cancer Therapy Reported from Chonbuk National University (Nano-Fenton Reactors as a New Class of Oxidative Stress Amplifying Anticancer Therapeutic Agents)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cancer Therapy have been published. According to news originating from Chonbuk, South Korea, by NewsRx correspondents, research stated, "Cancer cells, compared to normal cells, are under oxidative stress associated with an elevated level of reactive oxygen species (ROS) and are more vulnerable to oxidative stress induced by ROS generating agents. Thus, manipulation of the ROS level provides a logical approach to kill cancer cells preferentially, without significant toxicity to normal cells, and great efforts have been dedicated to the development of strategies to induce cytotoxic oxidative stress for cancer treatment."

Financial supporters for this research include Ministry of Health and Welfare, Korea Research Institute of Bioscience and Biotechnology.

Our news journalists obtained a quote from the research from Chonbuk National University, "Fenton reaction is an important biological reaction in which irons convert hydrogen peroxide (H₂O₂) to highly toxic hydroxyl radicals that escalate ROS stress. Here, we report Fenton reaction-performing polymer (PolyCAFe) micelles as a new class of ROS-manipulating anticancer therapeutic agents. Amphiphilic PolyCAFe incorporates H₂O₂-generating benzoyloxyccinnamaldehyde and iron-containing compounds in its backbone and self-assembles to form micelles that serve as Nano-Fenton reactors to generate cytotoxic hydroxyl radicals, killing cancer cells preferentially. When intravenously injected, PolyCAFe micelles could accumulate in tumors preferentially to remarkably suppress tumor growth, without toxicity to normal tissues."

According to the news editors, the research concluded: "This study demonstrates the tremendous translatable potential of Nano-Fenton reactors as a new class of anticancer drugs."

For more information on this research see: Nano-Fenton Reactors as a New Class of Oxidative Stress Amplifying Anticancer Therapeutic Agents. *Acs Applied Materials &

Tumor Markers - Carcinoembryonic Antigens

Findings in Carcinoembryonic Antigens Reported from University of Jinan (Amperometric sandwich immunoassay for the carcinoembryonic antigen using a glassy carbon electrode modified with iridium nanoparticles, polydopamine and reduced graphene ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Tumor Markers - Carcinoembryonic Antigens have been published. According to news reporting from Jinan, People's Republic of China, by NewsRx journalists, research stated, "The authors describe a sandwich-type electrochemical immunoassay for sensitive determination of the carcinoembryonic antigen (CEA). It is based on the use of iridium nanoparticles (Ir NPs) acting as electrochemical signal amplifier on the surface of a glassy carbon electrode."

The news correspondents obtained a quote from the research from the University of Jinan, "At first, polydopamine-reduced graphene oxide (PDA-rGO) was employed to immobilize primary antibody (Ab(1)) against CEA. Secondly, Ir-NPs were used as a support for the immobilization of secondary antibody (Ab(2)) to afford signal labels. The large surface area of PDA-rGO and the excellent electro-oxidative H2O2-sensing properties of Ir NPs result in a sensitive assay for CEA. Operated best at a working voltage of -0.6 V (vs. SCE), the assay has a linear range that extends from 0.5 pgai...mL(-1) to 5 ng center dot mL(-1), and the lower detection limit is 0.23 pgai...mL(-1). The immunosensor displays satisfactory reproducibility and stability, thus demonstrating a reliable immunoassay strategy for tumor biomarkers."

According to the news reporters, the research concluded: "It was applied to the determination of CEA in spiked serum samples."

For more information on this research see: Amperometric sandwich immunoassay for the carcinoembryonic antigen using a glassy carbon electrode modified with iridium nanoparticles, polydopamine and reduced graphene oxide. Eye Diseases and Conditions - Cataracts

Findings in Cataracts Reported from Peking Union Medical College Hospital (Novel mutations in CRYGD are associated with congenital cataracts in Chinese families)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Cataracts. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Congenital cataract disease is a clinically and genetically heterogeneous lens disorder. The purpose of this study was to identify the genetic defects and to investigate the relationships between disease-causing genes and lens morphology in congenital cataracts."

The news correspondents obtained a quote from the research from Peking Union Medical College Hospital, "Patients were given a physical examination, and their blood samples were collected for DNA extraction. Mutation analysis was performed by direct sequencing of the following candidate genes: CRYGC, CRYGD, CRYGS, GJA8, GJA3 and CRYAA. Mutational analysis of CRYGD identified a recurrent (p.P24T) mutation in two unrelated families with congenital coralliform cataracts and three novel (p.Q101X, p.E104fsX4 and p.E135X) mutations in three families with congenital nuclear cataracts. The p.E135X mutation is a de novo mutation. Haplotype analysis showed patients inherited the same CRYGD allele originated from father."

According to the news reporters, the research concluded: "The p.E135X mutation seen in two siblings suggests a mechanism of gonadal mosaicism in the father."

For more information on this research see: Novel mutations in CRYGD are associated with congenital cataracts in Chinese families. Scientific Reports, 2016;6():18912. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting G. Yang, Dept. of Ophthalmology, Peking Union Medical College Hospital, Chinese Academy of Medical Sciences &Peking Union Medical College, Beijing, People’s Republic of China. Additional authors for this research include Z. Chen, W. Zhang, Z. Liu and J. Zhao.

Findings in Chronic Obstructive Pulmonary Disease Reported from China Pharmaceutical University (Liujunzi Tang, a famous traditional Chinese medicine, ameliorates cigarette smoke-induced mouse model of COPD)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease. According to news reporting originating in Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Ethnopharmacological relevance: Liujunzi Tang is a traditional herbal medicine widely used in East Asia and clinically applied to treat Phlegm-Heat Syndrome. The purpose of the present study was to investigate the protective effects of Liujunzi Tang on cigarette smoke-induced (CS) mouse model of chronic obstructive pulmonary disease (COPD) and explore its potential molecular mechanism."

Financial support for this research came from Jiangsu Province Program for Culture and Creation Project.

The news reporters obtained a quote from the research from China Pharmaceutical University, "The mice received 1 h of cigarette smoke for 8 weeks. The serum levels of tumor necrosis factor-alpha (TNF-alpha), interleukin (IL)-1 beta and IL-6 were determined by enzyme-linked immunosorbent assay (ELISA) kits. Superoxide dismutase (SOD) and malondialdehyde (MDA) were tested by biochemical methods. Histopathological alteration was observed by hematoxylin-eosin (H & E) staining. Additionally, the expressions of nuclear transcription factor-kappa B (NF-kappa Bp65) and (inhibitor of NF-kappa B)I kappa B-alpha were determined by western blot and immunohistochemistry analysis."

According to the news reporters, the research concluded: "Liujunzi Tang enhanced the activities of antioxidant enzymes and attenuated the levels of lipid oxidative production, meanwhile significantly inhibited the generations of inflammatory cytokines by inhibiting the phosphorylation of I kappa B-alpha and NF-kappa B. Our findings indicated that Liujunzi Tang exhibited the protective effect on cigarette smoke induced COPD mice by anti-inflammatory and anti-oxidative properties through the inhibition of NF-kappa B activation."

Our news correspondents report that additional information may be obtained by contacting T.H. Yan, China Pharmaceutical University, Dept. of Physiol & Pharmacol, Nanjing 210009, Jiangsu, People's Republic of China. Additional authors for this research include F. Luo, H. Lei, K. Zhang, J.Y. Liu, H. He, J. Gao, X.Y. Chang, L. He, H. Ji, T.H. Yan and T. Chen.

Cloning

Findings in Cloning Reported from Z.M. Xiang and Co-Researchers (Cloning, characterization and comparative analysis of four death receptor TNFRs from the oyster Crassostrea hongkongensis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cloning have been presented. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Apoptosis plays an important role in homeostasis of the immune systems. The tumor necrosis factor receptors (TNFRs) play critical roles in the extrinsic apoptosis pathways and in determining cell fate."

Funders for this research include National Basic Research Program of China, National Natural Science Foundation of China, Science and Technology Planning Project of Guangdong Province, China.

Our news journalists obtained a quote from the research, "In this study, four death receptors (DR) named ChEDAR, ChTNFR27, ChTNFR5, and ChTNFR16 were identified from the oyster Crassostrea hongkongensis. These ChDRs proteins had 382, 396, 414 and 384 amino acids, respectively, with the typical domains of death receptors, such as the signal peptide (SP), transmembrane helix region TM and death domains. Phylogenetic analysis showed that the ChDR proteins clustered into three distinct groups, indicating that these subfamilies had common ancestors. mRNA expression of the ChDRs were detected in all 8 of the selected oyster tissues and at different stages of development. Furthermore, expression of all the genes was increased in the hemocytes of oysters challenged with pathogens or air stress. Fluorescence microscopy revealed that the full-length proteins of the ChDRs were located in the plasma membrane of HEK293T cells. Over-expression of the ChDRs activated the NF-kappa B-Luc reporter in HEK293T cells in a dose-dependent manner."

According to the news editors, the research concluded: "These results indicate that the ChDRs may play important roles in the extrinsic apoptotic pathways in oysters."

For more information on this research see: Cloning, characterization and comparative analysis of four death receptor TNFRs from the oyster Crassostrea hongkongensis. Fish & Shellfish Immunology, 2016;59():288-297. Fish & Shellfish Immunology can be contacted at: Academic Press Ltd- Elsevier Science Ltd, 24-28 Oval Rd, London NW1 7DX, England. Findings in Colon Cancer Reported from Chonnam National University (Association between the TCF7L2 polymorphism and colorectal cancer does not differ by diabetes and obesity statuses)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Jeonnam, South Korea, by NewsRx journalists, research stated, "This study evaluated the association between polymorphism in a newly identified locus, rs11196172, located in transcription factors 7-like 2 (TCF7L2) and colorectal cancer (CRC) risk according to diabetes and obesity statuses. A study enrolled 6138 CRC patients and 4367 community controls."

The news reporters obtained a quote from the research from Chonnam National University, "The adjusted odds ratios (aORs) with age, sex, smoking, and body mass index of the A allele, compared with the G allele, was 1.08 (95% CI 1.01-1.16). The significantly higher risk of CRC with the A allele remained after adjusting for diabetic status (aOR 1.07, 95% CI 1.01-1.15). When stratified by diabetic or obesity status, significant associations between TCF7L2 polymorphism and CRC risk were limited to non-diabetic or normal-weight subjects. No significant interactions between the A/G allele and diabetes status or the A/G allele and overweight status were found."

According to the news reporters, the research concluded: "The results indicated that the TCF7L2 rs11196172 polymorphism increases the risk of CRC independently, with no evidence of an interaction with diabetes or obesity."

For more information on this research see: Association between the TCF7L2 polymorphism and colorectal cancer does not differ by diabetes and obesity statuses. Cancer Epidemiology, 2016;45():108-111. Cancer Epidemiology can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. Oncology - Colon Cancer

Findings in Colon Cancer Reported from Department of Surgery
(Synchronous polyps predict metachronous colorectal lesions after curative resection of colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news originating from Treviso, Italy, by NewsRx correspondents, research stated, "The principal aim of endoscopic follow-up programs after curative resection of colorectal cancer (CRC) is to improve survival and identify local recurrence and metachronous CRC. The aim of our study was to identify the possible predictors of metachronous colorectal lesions."

Our news journalists obtained a quote from the research from the Department of Surgery, "The records of 348 consecutive patients with CRC and who completed at least 1 year of endoscopic follow-up after surgery were analyzed. In this group, 336 patients underwent surgery for primitive CRC and 12 for metachronous cancer. Patients' characteristics, operative details, and endoscopical follow-up findings were retrieved. Multivariate survival analyses were used to identify patient categories at risk of metachronous colonic lesions. 128 patients presented a metachronous lesion: 118 adenomas and 10 adenocarcinomas. At multivariate analysis, active smoke (HR = 1.84, p = 0.03), neoadjuvant therapy (HR = 0.24, p = 0.01), and presence of synchronous polyps (HR = 1.55, p = 0.04) resulted independent predictors of metachronous adenoma after CRC removal while neoadjuvant therapy (HR = 0.25, p = 0.02), active smoke (HR = 1.54, p = 0.04), and presence of synchronous polyps (HR = 1.86, p = 0.02) resulted independent predictors of metachronous lesions after CRC removal. This study demonstrated a high rate of metachronous lesions in the early follow-up after curative CRC resection."

According to the news editors, the research concluded: "The negative effects of synchronous polyps should be carefully evaluated when planning patients' follow-up."

The news correspondents report that additional information may be obtained from C. Ruffolo, Reg Hosp Ca Foncello, Dept. of Surg 2, Unit 4, I-31100 Treviso, Italy. Additional authors for this research include C. Ruffolo, A. Fiorot, L. Padoan, F. Erroi, M. Massani, E. Caratozzolo, L. Bonariol, F. Ferrara, L. Norberto, C. Castoro, N. Bassi and M. Scarpa.

Oncology - Colon Cancer

Findings in Colon Cancer Reported from Osaka University (BRAF V600E inhibition stimulates AMP-activated protein kinase-mediated autophagy in colorectal cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting out of Osaka, Japan, by NewsRx editors, research stated, "Although BRAF (V600E) mutation is associated with adverse clinical outcomes in patients with colorectal cancer (CRC), response and resistance mechanisms for therapeutic BRAF(V600E) inhibitors remains poorly understood. In the present study, we demonstrate that selective BRAF(V600E) inhibition activates AMP-activated protein kinase (AMPK), which induces autophagy as a mechanism of therapeutic resistance in human cancers."

Our news journalists obtained a quote from the research from Osaka University, "The present data show AMPK-dependent cytoprotective roles of autophagy under conditions of therapeutic BRAF(V600E) inhibition, and AMPK was negatively correlated with BRAF (V600E)-dependent activation of MEK-ERK-RSK signaling and positively correlated with unc-51-like kinase 1 (ULK1), a key initiator of autophagy. Furthermore, selective BRAF(V600E) inhibition and concomitant suppression of autophagy led to the induction of apoptosis."

According to the news editors, the research concluded: "Taken together, present experiments indicate that AMPK plays a role in the survival of BRAF(V600E) CRC cells by selective inhibition and suggest that the control of autophagy contributes to overcome the chemoresistance of BRAF(V600E) CRC cells."

For more information on this research see: BRAF V600E inhibition stimulates AMP-activated protein kinase-mediated autophagy in colorectal cancer cells. Scientific Reports, 2016;6():18949. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Our news journalists report that additional information may be obtained by contacting T. Sueda, Dept. of Frontier Science for Cancer and Chemotherapy, Osaka University, Graduate School of Medicine, 2-2, Yamadaoka, Suita, Osaka, 565-0871, Japan. Findings in Colon Cancer Reported from Zhengzhou University [Stage dependent expression and tumor suppressive function of FAM134B (JK1) in colon cancer]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news originating from Zhengzhou, People's Republic of China, by NewsRx correspondents, research stated, "The aims of the present study are to investigate sub-cellular location, differential expression in different cancer stages and functional role of FAM134B in colon cancer development. FAM134B expression was studied and quantified at protein and mRNA levels in cell lines using immunocytochemistry, Western blot and real-time PCR."

Our news journalists obtained a quote from the research from Zhengzhou University, "In vitro functional assays and an in vivo xenotransplantation mouse models were used to investigate the molecular role of FAM134B in cancer cell biology in response to FAM134B silencing with shRNA lentiviral particles. FAM134B protein was noted in both cytoplasm and nuclei of cancer cells. In cancer cells derived from stage IV colon cancer, FAM134B expression was remarkably reduced when compared to non-cancer colon cells and cancer cells derived from stage II colon cancer. FAM134B knockdown significantly (P <0.05) increased the proliferation of colon cancer cells following lentiviral transfection. Furthermore, FAM134B suppression significantly increased (34-52%; P<0.05) the clonogenic capacity, wound healing potential of and increases the proportion of cells performing DNA synthesis (P <0.01). Xenotransplantation model showed that larger and higher-grade tumors were formed in mice receiving FAM134B knockdown cells."

According to the news editors, the research concluded: "To conclude, expression analysis, in vitro and in vivo indicated that FAM134B acts as a cancer suppressor gene in colon cancer."

The news correspondents report that additional information may be obtained from A.K.Y. Lam, Zhengzhou Univ, Affiliated Hosp 1, Dept. of Stomatol, Zhengzhou, Henan Province, People's Republic of China. Additional authors for this research include V. Gopalan, R. Wahab, R.A. Smith, B. Qiao and A.K.Y. Lam.

Findings in Crohn's Disease Reported from All India Institute of Medical Sciences (Endoscopic and clinical responses to anti-tubercular therapy can differentiate intestinal tuberculosis from Crohn's disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Digestive System Diseases and Conditions - Crohn's Disease are presented in a new report. According to news reporting from New Delhi, India, by NewsRx journalists, research stated, "Differentiation between intestinal tuberculosis and Crohn's disease is difficult and may require therapeutic trial with anti-tubercular therapy in tuberculosis-endemic regions. To evaluate the role of therapeutic trial with anti-tubercular therapy in patients with diagnostic confusion between intestinal tuberculosis and Crohn's disease."

Financial supporters for this research include Amgen, Merck, National Institutes of Health.

The news correspondents obtained a quote from the research from the All India Institute of Medical Sciences, "We performed retrospective-comparative (n = 288:131 patients who received anti-tubercular therapy before being diagnosed as Crohn's disease and 157 intestinal tuberculosis patients) and prospective-validation study (n = 55 patients with diagnostic confusion of intestinal tuberculosis/Crohn's disease). Outcomes assessed were global symptomatic response and endoscopic mucosal healing. In the derivation cohort, among those eventually diagnosed as Crohn's disease, global symptomatic response with anti-tubercular therapy was seen in 38% at 3 months and in 37% who completed 6 months of anti-tubercular therapy. Ninety-four per cent of intestinal tuberculosis patients showed global symptomatic response by 3 months. Endoscopic mucosal healing was seen in only 5% of patients with Crohn's disease compared with 100% of intestinal tuberculosis patients. In the validation cohort, all the patients with intestinal tuberculosis had symptomatic response and endoscopic mucosal healing after 6 months of antitubercular therapy. Among the patients with an eventual diagnosis of Crohn's disease, symptomatic response was seen in 64% at 2 months and in 31% who completed 6 months of anti-tubercular therapy, none had mucosal healing. Disproportionately lower mucosal healing rate despite an overall symptom response with 6 months of anti-tubercular therapy in patients with Crohn's disease suggests a need for repeat colonoscopy for diagnosing Crohn's disease."

According to the news reporters, the research concluded: "Patients with intestinal tuberculosis showing significant symptomatic response after 2-3 months of anti-tubercular therapy, suggest that symptom persistence after a therapeutic trial of 3 months of anti-tubercular therapy may indicate the diagnosis of Crohn's disease."

Our news journalists report that additional information may be obtained by contacting V. Ahuja, All India Inst Med Sci, Human Nutr Unit, New Delhi, India. DNA Research

Findings in DNA Research Reported from Tohoku University (DNA Garden: A Simple Method for Producing Arrays of Stretchable DNA for Single-Molecule Fluorescence Imaging of DNA-Binding Proteins)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on DNA Research. According to news reporting out of Miyagi, Japan, by NewsRx editors, research stated, "We developed a simple method for producing arrays of stretchable DNAs, called DNA garden, for single-molecule fluorescence measurements. The method is based on micro-contact printing of biotinylated bovine serum albumin (biotin-BSA) on a coverslip coated by 2-methacryloyloxyethyl phosphorylcholine (MPC) polymer and on the subsequent tethering of neutravidin and biotinylated DNA."

Our news journalists obtained a quote from the research from Tohoku University, "Without the need for a microfabricated substrate used for DNA tethering, it facilitates single-molecule investigations of DNA and DNA-binding proteins based on fluorescence microscopic imaging. The salient advantage of DNA garden is continuous observation of DNA in the repeated cycles of extension and relaxation by flow control, enabling the characterization of processes occurring in and on the relaxed DNA. The DNA garden was applied to the detection of cleavage sites of restriction enzymes and for the observation of the sliding dynamics of a tumor suppressor, p53, along extended DNA at the single-molecule level. Furthermore, experiments based on the repetitive extension and relaxation of DNA demonstrated that p53 causes looping of DNA, probably by connecting multiple regions of the relaxed DNA."

According to the news editors, the research concluded: "The DNA garden is expected to be a powerful tool for the single-molecule imaging assay of DNA and DNA-binding proteins."

Our news journalists report that additional information may be obtained by contacting S. Takahashi, Tohoku University, Grad Sch Sci, Dept. of Chem, Sendai, Miyagi

DNA Research

Findings in DNA Research Reported from University of California [In Vitro Lesion Bypass Studies of O(4)-Alkylthymidines with Human DNA Polymerase e]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in DNA Research. According to news reporting from Riverside, California, by NewsRx journalists, research stated, "Environmental exposure and endogenous metabolism can give rise to DNA alkylaion. Among alkylated nucleosides, O(4)-alkylthymidine (O(4)-alkyldT) lesions are poorly repaired in mammalian systems and may compromise the efficiency and fidelity of cellular DNA replication."

Financial support for this research came from National Institute of Environmental Health Sciences.

The news correspondents obtained a quote from the research from the University of California, "To cope with replication-stalling DNA lesions, cells are equipped with translesion synthesis DNA polymerases that are capable of bypassing various DNA lesions. In this study, we assessed human DNA polymerase e (Pol e)-mediated bypass of various O(4)-alkyldT lesions, with the alkyl group being Me, Et, nPr, iP r, nBu, iBu, ®-sBu, or (S)-sBu, in template DNA by conducting primer extension and steady-state kinetic assays. Our primer extension assay results revealed that human Pol e, but not human polymerases k and i or yeast polymerase z, was capable of bypassing all O(4)-alkyldT lesions and extending the primer to generate full-length replication products. Data from steady-state kinetic measurements showed that Pol e preferentially misincorporated dGMP opposite O(4)-alkyldT lesions with a straight-chain alkyl group. The nucleotide misincorporation opposite most lesions with a branched-chain alkyl group was, however, not selective, where dCMP, dGMP, and dTMP were inserted at similar efficiencies opposite O(4)-iPrdT, O(4)-iBudT, and O(4)-®-sBudT."

According to the news reporters, the research concluded: "These results provide important knowledge about the effects of the length and structure of the alkyl group in O(4)-alkyldT lesions on the fidelity and efficiency of DNA replication mediated by human Pol e."

For more information on this research see: In Vitro Lesion Bypass Studies of O(4)-Alkylthymidines with Human DNA Polymerase e. Chemical Research In Toxicology, 2016;29 (4):669-75. (American Chemical Society - www.acs.org; Chemical Research In Toxicology - www.pubs.acs.org/journal/crtoec)

Nervous System Diseases and Conditions - Delirium

Findings in Delirium Reported from J. Norbaek and Co-Researchers
(Delirium is seen in one-third of patients in an acute hospital setting. Identification, pharmacologic and non-pharmacologic treatment is inadequate)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nervous System Diseases and Conditions - Delirium are discussed in a new report. According to news reporting originating in Hvidovre, Denmark, by NewsRx journalists, research stated, "Delirium is an organically caused acute dysfunction of the brain associated with increased morbidity, mortality, cost of care and poor cognitive recovery. This point prevalence study of delirium was conducted at Hvidovre Hospital, Copenhagen, Denmark at two separate occasions."

The news reporters obtained a quote from the research, "Patients were examined with the Brief Confusion Assessment Method (bCAM) in both, but in the second survey bCAM was supplemented with a psychiatric assessment using the Diagnostic and Statistical Manual of Mental Disorders, fourth ed. In all, 126 patients were assessed and eight patients were excluded. The delirious patients' charts were examined. Out of the 118 patients included in the study, 38 (32%) were delirious and in 18 (47%) patients, the diagnosis was documented. Furthermore, in 18 (47%) patients, a pharmacological treatment plan for agitation was prepared (in 89% of those diagnosed with delirium and in 10% of those without the diagnosis). In 26 (68%), a plan to increase care existed (in 78% of those with a diagnosis of delirium and in 60% without the diagnosis). In 11 patients (29%), there was a plan for reducing stress (in 44% of those with a diagnosis of delirium and in 15% without the diagnosis). Delirium is a common phenomenon in a Danish acute hospital setting. Identification and treatment are inadequate."

According to the news reporters, the research concluded: "The diagnosis of delirium is a possible determinant for treatment and care; hence, as this study found that pharmacological treatment for agitation, optimised care and stress reduction were more frequently considered in patients with the delirium diagnosis than in patients who did not have the diagnosis."

For more information on this research see: Delirium is seen in one-third of patients in an acute hospital setting. Identiﬁcation, pharmacologic and non-pharmacologic treatment is inadequate. *Danish Medical Journal*, 2016;63(11):13-17. *Danish Medical Journal* can be contacted at: Danish Medical Assoc, Trondhjemsgade 9, Dk-2100 Copenhagen, Denmark.

Findings in Dermatology Reported from University of Connecticut
(Basics of Confocal Microscopy and the Complexity of Diagnosing Skin Tumors: New Imaging Tools in Clinical Practice, Diagnostic Workflows, Cost-Estimate, and New Trends)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Dermatology have been published. According to news reporting originating from Farmington, Connecticut, by NewsRx correspondents, research stated, "The use of reflectance confocal microscopy (RCM) and other noninvasive imaging devices can potentially streamline clinical care, leading to more precise and efficient management of skin cancer."

Our news editors obtained a quote from the research from the University of Connecticut, "This article explores the potential role of RCM in cutaneous oncology, as an adjunct to more established techniques of detecting and monitoring for skin cancer, such as dermoscopy and total body photography. Discussed are current barriers to the adoption of RCM, diagnostic workflows and standards of care in the United States and Europe, and medicolegal issues."

According to the news editors, the research concluded: "The potential role of RCM and other similar technological innovations in the enhancement of dermatologic care is evaluated."

Dermatologic Clinics can be contacted at: W B Saunders Co-Elsevier Inc, 1600 John F Kennedy Boulevard, Ste 1800, Philadelphia, PA 19103-2899, USA. (Elsevier - www.elsevier.com; Dermatologic Clinics - www.journals.elsevier.com/dermatologic-clinics/)

Diabetes

Findings in Diabetes Reported from Lund University (Nerve regeneration in chitosan conduits and in autologous nerve grafts in healthy and in type 2 diabetic Goto-Kakizaki rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Diabetes. According to news reporting originating from Malmo, Sweden, by NewsRx correspondents, research stated, "Knowledge about nerve regeneration after nerve injury and reconstruction in appropriate diabetic animal models is incomplete. Short-term nerve regeneration after reconstruction of a 10-mm sciatic nerve defect with either a hollow chitosan conduit or an autologous nerve graft was investigated in healthy Wistar and diabetic Goto-Kakizaki (GK) rats."

Financial supporters for this research include Seventh Framework Programme, Vetenskapsradet, Lunds Universitet.

Our news editors obtained a quote from the research from Lund University, "After 21 days, axonal outgrowth, the presence of activated and apoptotic Schwann cells and the thickness of the formed matrix in the conduits were measured. In general, nerve regeneration was superior in autologous nerve grafts. In chitosan conduits, a matrix, which was thicker in diabetic rats, was formed and was positively correlated with length of axonal outgrowth. Axonal outgrowth in conduits and in nerve grafts extended further in diabetic rats than in healthy rats. There was a higher percentage of activating transcription factor 3 (ATF3)-immunostained cells in nerve segments from healthy rats than in diabetic rats after autologous nerve graft reconstruction. In chitosan conduits, more cleaved caspase 3-stained Schwann cells were generally observed in the matrix from the diabetic rats than in healthy rats. However, there were fewer apoptotic cells in the distal segment in diabetic rats reconstructed with a chitosan conduit. Preoperative glucose levels were positively correlated with axonal outgrowth after both reconstruction methods. Axonal regeneration was better in autologous nerve grafts than in hollow chitosan conduits and was enhanced in diabetic GK rats compared to healthy rats after reconstruction."

According to the news editors, the research concluded: "This study provides insights into the nerve regeneration process in a clinically relevant diabetic animal model."

The news editors report that additional information may be obtained by contacting L. Stenberg, Dept. of Translational Medicine - Hand Surgery, Lund University, Jan Waldenstroms gata 5, 205 02, Malmo, Sweden. Additional authors for this research include A. Kodama, C. Lindwall-Blom and L.B Dahlin.

Findings in Drug Delivery Systems Reported from Institute of Macromolecular Chemistry (Multifunctional nanogels with dual temperature and pH responsiveness)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Delivery Systems have been published. According to news originating from Iasi, Romania, by NewsRx correspondents, research stated, 'Over the last 10 years, the development of intelligent biomaterials for medical and pharmaceutical applications has attracted growing interest by combining interdisciplinary efforts. Between them nanogels represent one of the most attractive carriers for innovative drug delivery systems.'

Financial support for this research came from Romanian National Authority for Scientific Research.

Our news journalists obtained a quote from the research from the Institute of Macromolecular Chemistry, 'In the present investigation new variants of multi-responsive nanogels have been synthesized by crosslinking poly (itaconic anhydride-co-3,9-divinyl-2,4,8,10-tetraoxaspiro [5.5] undecane) copolymer (having different molar ratios between comonomers) with 1,12-dodecandiol. The new structures were obtained by using modification of itaconic anhydride moieties in the copolymer. This is a convenient method for the preparation of a network with increased functionality, which further may ensure new strategies for coupling various bioactive compounds, especially owing to the behavior of the used copolymers, which present dual pH and temperature sensitive characteristics. The chemical structure of the new compounds was confirmed by FTIR and H-1 RMN spectra. Also, the evaluation of thermal stability by thermogravimetric analysis sustains the covalent bonds occurring between the copolymer and diol. The dual responsiveness of the nanogel structures to temperature and pH was put into evidence by DLS studies. This feature can be used for the development of drug delivery systems, which can mimic biological response behavior to a certain extent. The new synthesized nanogels were tested as drug delivery systems by using diclofenac as a model drug.'

According to the news editors, the research concluded: 'The results obtained from in vitro and in vivo investigation confirm the bioactivity of the nanogel networks.'

The news correspondents report that additional information may be obtained from A.P. Chiriac, PETRU PONI Inst Macromol Chem, RO-700487 Iasi, Romania. Additional authors for this research include A.P. Chiriac, A. Diaconu, N. Tudorachi and L. Mititelu-Tartau.

Findings in Drug Development Reported from GlaxoSmithKline (Epigenetic drug discovery: breaking through the immune barrier)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Drug Development have been published. According to news reporting originating in Herts, United Kingdom, by NewsRx journalists, research stated, "Immune-mediated diseases are clinically heterogeneous but they share genetic and pathogenic mechanisms. These diseases may develop from the interplay of genetic factors and environmental or lifestyle factors."

The news reporters obtained a quote from the research from GlaxoSmithKline, "Exposure to such factors, including infectious agents, is associated with coordinated changes in gene transcription owing to epigenetic alterations. A growing understanding of how epigenetic mechanisms control gene expression patterns and cell function has been aided by the development of small-molecule inhibitors that target these processes. These chemical tools have helped to reveal the importance of epigenetics in guiding cell fate decisions during immune responses and have also highlighted the potential for targeting epigenetic mechanisms for the treatment of inflammation and immune-mediated diseases. In this Review, we discuss the most advanced areas of epigenetic drug development for autoimmune and inflammatory diseases and summarize the promising preclinical data in this exciting and evolving field."

According to the news reporters, the research concluded: "These agents will inevitably begin to move into clinical trials for use in patients with immune-mediated diseases."

Our news correspondents report that additional information may be obtained by contacting R.K. Prinjha, GlaxoSmithKline, Epinova Epigenet Discovery Performance Unit, Immunoinflammat Therapy Area, Medical Res Center, Stevenage SG1 2NY, Herts, United Kingdom. Additional authors for this research include P.P. Tak, A. Tarakhovsky and R.K. Prinjha.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/nrd.2016.185. This DOI is a link to an online electronic document that is either free or for purchase.

Findings in Duchenne Muscular Dystrophy Reported from Stanford University (Telomere shortening and metabolic compromise underlie dystrophic cardiomyopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Duchenne Muscular Dystrophy. According to news reporting originating in Stanford, California, by NewsRx journalists, research stated, "Duchenne muscular dystrophy (DMD) is an incurable X-linked genetic disease that is caused by a mutation in the dystrophin gene and affects one in every 3,600 boys. We previously showed that long telomeres protect mice from the lethal cardiac disease seen in humans with the same genetic defect, dystrophin deficiency."

Funders for this research include California Institute for Regenerative Medicine (CIRM), HHS | National Institutes of Health (NIH), Gouvernement du Canada | Canadian Institutes of Health Research (Instituts de recherche en sante du Canada), American Heart Association (AHA).

The news reporters obtained a quote from the research from Stanford University, "By generating the mdx(4CV)/mTR(G2) mouse model with 'humanized' telomere lengths, the devastating dilated cardiomyopathy phenotype seen in patients with DMD was recapitulated. Here, we analyze the degenerative sequelae that culminate in heart failure and death in this mouse model. We report progressive telomere shortening in developing mouse cardiomyocytes after postnatal week 1, a time when the cells are no longer dividing. This proliferation-independent telomere shortening is accompanied by an induction of a DNA damage response, evident by p53 activation and increased expression of its target gene p21 in isolated cardiomyocytes. The consequent repression of Pgc1 alpha/beta leads to impaired mitochondrial biogenesis, which, in conjunction with the high demands of contraction, leads to increased oxidative stress and decreased mitochondrial membrane potential. As a result, cardiomyocyte respiration and ATP output are severely compromised. Importantly, treatment with a mitochondrial-specific antioxidant before the onset of cardiac dysfunction rescues the metabolic defects."

According to the news reporters, the research concluded: "These findings provide evidence for a link between short telomere length and metabolic compromise in the etiology of dilated cardiomyopathy in DMD and identify a window of opportunity for preventive interventions."

Our news correspondents report that additional information may be obtained by contacting H.M. Blau, Stanford University, Sch Med, Stanford Cardiovasc Inst, Stanford, CA 94305, United States. Additional authors for this research include S.G. Ong, E.L. LaGory, P.E. Kraft, A.J. Giaccia, J.C. Wu and H.M. Blau.
Environmental Research

Findings in Environmental Research Reported from State University of New York (Innovating e-waste management: From macroscopic to microscopic scales)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Environmental Research. According to news reporting from Oneonta, New York, by NewsRx journalists, research stated, "Waste electrical and electronic equipment (WEEE or e-waste) has become a global problem, due to its potential environmental pollution and human health risk, and its containing valuable resources (e.g., metals, plastics). Recycling for e-waste will be a necessity, not only to address the shortage of mineral resources for electronics industry, but also to decline environmental pollution and human health risk."

Funders for this research include China Postdoctoral Science Foundation, National Natural Science Foundation of China.

The news correspondents obtained a quote from the research from the State University of New York, "To systematically solve the e-waste problem, more attention of e-waste management should transfer from macroscopic to microscopic scales. E-waste processing technology should be significantly improved to diminish and even avoid toxic substance entering into downstream of material. The regulation or policy related to new production of hazardous substances in recycled materials should also be carried out on the agenda."

According to the news reporters, the research concluded: "All the findings can hopefully improve WEEE legislation for regulated countries and non-regulated countries."

For more information on this research see: Innovating e-waste management: From macroscopic to microscopic scales. Science of the Total Environment, 2017;575():1-5. Science of the Total Environment can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Science of the Total Environment - www.journals.elsevier.com/science-of-the-total-environment/)

Our news journalists report that additional information may be obtained by contacting J.F. Chiang, SUNY Coll Oneonta, Dept. of Chem & Biochem, Oneonta, NY 13820, United States. Additional authors for this research include C.R. Yang, J.F. Chiang and J.H. Li.

Enzymes and Coenzymes - Esterases

Findings in Esterases Reported from Affiliated Hospital (Reduced apurinic/apyrimidinic endonuclease activity enhances the antitumor activity of oxymatrine in lung cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Esterases have been published. According to news originating from Guangdong, People's Republic of China, by NewsRx correspondents, research stated, "Lung cancer is the leading cause of cancer-related deaths worldwide and is associated with a very poor outcome. Oxymatrine exerts antitumor effects by inducing apoptosis and inhibiting the proliferation of different cancer cells; however, the anticancer effects and mechanism of action of oxymatrine have not been evaluated sufficiently in human lung cancer cells."

Our news journalists obtained a quote from the research from Affiliated Hospital, "Thus, the present study aimed to investigate the anticancer effects of oxymatrine in human lung cancer cells and identify the molecular mechanisms underlying these effects. MTT assays demonstrated that oxymatrine significantly inhibited the proliferation of A549 and H1299 cells in a time and dose-dependent manner. In addition, flow cytometry and terminal deoxynucleotidyl transferase-mediated dUTP-biotin nick end-labeling assays suggested that oxymatrine treatment may induce lung cancer cell apoptosis in a dose-dependent manner. Furthermore, we detected that oxymatrine induced a significant increase in DNA damage and the expression of PARP and phosphorylated H2AX, and a significant decrease in that of nuclear APE1 and AP endonuclease activity in A549 cells. APE1 knockdown cells (APE1(shRNA)) plus oxymatrine treatment reduced cells proliferation and induced apoptosis more seriously than control shRNA cells. This appeared to be a consequence of an increase in the number of apurinic/apyrimidinic (AP) sites, DNA damage, PARP and H2AX phosphorylation, which together resulted in the induction of apoptosis. In contrast, the sensitizing effects of APE1 over expression plus oxymatrine treatment did not occur in APE(OE) cells."

According to the news editors, the research concluded: "These findings reveal a potential mechanism of action for oxymatrine-induced apoptosis and suggest that oxymatrine is a promising potential therapeutic agent for the treatment of lung cancer."

Findings in Follicular Lymphoma Reported from Okayama University
(CD10 down expression in follicular lymphoma correlates with gastrointestinal lesion involving the stomach and large intestine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Follicular Lymphoma have been published. According to news reporting out of Okayama, Japan, by NewsRx editors, research stated, "Follicular lymphoma (FL) shows co-expression of B-cell lymphoma 2 (BCL2) and CD10, whereas downexpression of CD10 is occasionally experienced in gastrointestinal (GI) FL with unknown significance. Gastrointestinal FL is a rare variant of FL, and its similarity with mucosa-associated lymphoid tissue lymphoma was reported."

Financial support for this research came from Japan Society for the Promotion of Science.

Our news journalists obtained a quote from the research from Okayama University, "We investigated the clinicopathological and genetic features of CD10 downexpressed (CD10 (down)) GI-FL. The diagnosis of CD10(down) FL was carried out with a combination of pathological and molecular analyses. The incidence of CD10(down) GI-FL was shown in 35/172 (20.3%) cases, which was more frequent than nodal FL (3.5%, P< 0.001). The difference was additionally significant between GI-FL and nodal FL when the analysis was confined to primary GI-FL (55.2% vs 3.5%, P< 0.001). Compared to CD10(+) GI-FL, CD10(down) GI-FL significantly involved the stomach or large intestine (P = 0.015), and additionally showed the downexpression of BCL6 (P < 0.001). The follicular dendritic cell meshwork often showed a duodenal pattern in the CD10(down) group (P = 0.12). Furthermore, a lymphoepithelial lesion was observed in 5/12 (40%) gastric FL cases, which indicated caution in the differentiation of mucosa-associated lymphoid tissue lymphoma. Molecular analyses were undertaken in seven cases of CD10(down) GI-FL, and an identical clone was found between CD10(down) follicles and CD10(+)BCL2(+) neoplastic follicles."

According to the news editors, the research concluded: "In the diagnosis of cases with CD10(down) BCL2(+) follicles, careful examination with molecular studies should be carried out."

Drugs and Therapies - Gliclazide Therapy

Findings in Gliclazide Therapy Reported from Department of Chemistry (Swelling behavior of cross-linked dextran hydrogels and preliminary Gliclazide release behavior)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Gliclazide Therapy is now available. According to news reporting from Jabalpur, India, by NewsRx journalists, research stated, "In this study, dextran (Dex) has been cross-linked with epichlorohydrin (Ech) to yield cross-linked hydro gels. These gels were characterized by Fourier transform infrared (FTIR) spectroscopy, X-ray diffraction (XRD) analysis, Thermogravimetric analysis (TGA), and Scanning electron microscopy (SEM)."

The news correspondents obtained a quote from the research from the Department of Chemistry, "The water absorption behavior of gels was studied in simulating gastric fluid (SGF) and simulating intestinal fluid (SIF) at 37 degrees C. The data was interpreted by various kinetic models. The swelling was found to be totally diffusion controlled. The equilibrium data was also used to calculate network parameters. The antidiabetic drug Gliclazide (Glz) was loaded to the gels and its release was investigated in the media of varying pH, to mimic transition from mouth to colon. Finally, the in-vivo study on 'Albino Wistar rats' was carried out to investigate the efficiency of the formulations."

According to the news reporters, the research concluded: "The drug-loaded hydrogel was found to be quite effective in reducing the glucose level at lower administration frequency as compared to the plain drug."

Our news journalists report that additional information may be obtained by contacting S.K. Bajpai, Govt Model Sci College, Dept. of Chem, Polymer Res Lab, Jabalpur 482001, MP, India. Additional authors for this research include N. Chand, S. Tiwari and S. Soni.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ijbiomac.2016.09.075. This DOI is a link to an online electronic document that is either free or for purchase.

Heart Disorders and Diseases - Heart Failure

Findings in Heart Failure Reported from Division of Nephrology (Pulmonary hypertension in patients on chronic hemodialysis and with heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Failure is the subject of a report. According to news reporting originating from Pingtung, Taiwan, by NewsRx correspondents, research stated, "Pulmonary hypertension (PH) is linked to chronic kidney disease. However, few studies have examined the prevalence, risk factors, or outcomes of PH in patients with chronic hemodialysis and concomitant heart failure."

Our news editors obtained a quote from the research from the Division of Nephrology, "This retrospective cohort study enrolled 160 patients with a history of acute decompensated heart failure after maintenance hemodialysis therapy. All patients were prospectively observed until December 2013 or death. PH was defined as pulmonary artery systolic pressure >35 mmHg, as determined through echocardiography. Fifty-one (32%) patients had PH, more of whom were female (70% vs. 52%, p=0.04). The patients with PH had a lower body mass index (21.8 vs. 23.0, p=0.03), higher cardiothoracic ratio (55% vs. 52%, p=0.006), larger left atrium (38.5 vs. 35.7 mm, p=0.01), and an increased proportion of mitral regurgitation (MR) (73% vs. 38%, p<0.001) compared with the patients who did not have PH. In the multivariate regression analysis, MR was associated most strongly with PH (odds ratio 3.75, 95% confidence interval [CI]: 1.67-8.43, p=0.001). In the multivariate Cox proportional hazard models, PH was related independently to all-cause mortality (hazard ratio [HR], 3.11; 95% CI, 1.53-6.31; p=0.002) and combined cardiovascular events (HR, 2.71; 95% CI, 1.66-4.44; p<0.001) after the model was adjusted for conventional cardiovascular risk factors."

According to the news editors, the research concluded: "PH is related to MR and independently associated with increased all-cause mortality and cardiovascular events in patients with chronic hemodialysis and heart failure."

The news editors report that additional information may be obtained by contacting C.W. Hsieh, Division of Nephrology, Dept. of Internal Medicine, Pingtung Christian Hospital, Pingtung, Taiwan. Additional authors for this research include C.T. Lee, C.C. Chen, L.P. Hsu, H.H. Hu and J.C Wu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/hdi.12380. This DOI is a link to an online electronic document that is either free or for purchase.

Findings in Heart Failure Reported from University of Pisa (Right ventricular recovery during follow-up is associated with improved survival in patients with chronic heart failure with reduced ejection fraction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting out of Pisa, Italy, by NewsRx editors, research stated, "A compromised tricuspid annular plane systolic excursion (TAPSE) is associated with worse survival in patients with chronic heart failure with reduced ejection fraction (HFrEF). However, it is not known whether a reversible abnormal TAPSE at follow-up predicts survival."

Our news journalists obtained a quote from the research from the University of Pisa, "Our aim was to evaluate whether a reversible abnormal TAPSE is associated with a better survival in patients with chronic HFrEF. A complete echocardiography was performed in 706 patients with chronic HFrEF (LVEF <= 45%) at baseline and after 6+/-3 months. Right ventricular (RV) systolic function was evaluated using TAPSE. The study endpoint was all-cause mortality. At baseline, TAPSE was severely reduced (<= 14 mm) in 89 (13%) patients, and slightly reduced (> 14 but < 18 mm) in 157 (22%) patients. During a median follow-up of 40 months, 152 patients reached the endpoint. The event rate (per 100 patients/year) was lower in patients with persistently normal TAPSE (>= 18 mm, n = 393) [3.3%, 95% confidence interval (CI) 2.5-4.3], and in those with reversible TAPSE (n = 120) (4.6%, 95% CI 3.1-7.0), compared with patients with worsening TAPSE (n = 90) (11.9%, 95% CI 8.7-16.3), and those with persistently reduced TAPSE (n = 103) (12.6%, 95% CI 9.3-17.1; log-rank 69.4, P<0.0001). A reversible abnormal TAPSE was associated with improved survival at multivariable Cox regression analysis (hazard ratio 0.48, 95% CI 0.29-0.79, P = 0.004)."

According to the news editors, the research concluded: "Patients with chronic HFrEF who have abnormal TAPSE at baseline but reverse their dysfunction during follow-up have better survival than patients with either worsened TAPSE or persistently abnormal TAPSE, and similar to that of patients with persistently normal TAPSE."

For more information on this research see: Right ventricular recovery during follow-up is associated with improved survival in patients with chronic heart failure with reduced ejection fraction. European Journal of Heart Failure, 2016;18(12):1462-1471. European Journal of Heart Failure can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Oxford University Press - www.oup.com/; European Journal of Heart Failure -eurjhf.oxfordjournals.org)

Our news journalists report that additional information may be obtained by contacting F.L. Dini, University of Pisa, Cardiac Thorac & Vasc Department, Pisa, Italy. Transplant Medicine - Kidney Transplants

Findings in Kidney Transplants Reported from Tel Aviv University
(Anemia and markers of erythropoiesis in pediatric kidney transplant recipients compared to children with chronic renal failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Transplant Medicine - Kidney Transplants have been presented. According to news reporting from Ramat Aviv, Israel, by NewsRx journalists, research stated, "PTA and anemia of CKD share a similar pathogenesis. However, PTA may be disproportionate to the reduction in the GFR."

The news correspondents obtained a quote from the research from Tel Aviv University, "Data relating to the mechanism of PTA are scarce. We evaluated the erythropoiesis parameters in pediatric kidney recipients compared to children with CKD. A total of 100 patients (54 post-kidney TX, 46 with CKD) were enrolled in the single-center cohort study. GFR was found to be significantly lower in the CKD group (49.7 +/- 22.4 vs 72.9 +/- 28.5 mL/min/1.73 m(2), P<.001); anemia was significantly more common in the TX patients (52% vs 41.3%, P<.001). Iron transferrin saturation and serum ferritin levels were lower in the CKD patients. In both groups, hemoglobin Z scores significantly correlated with GFR (R=.31, P=.07). This correlation was more prominent in the CKD group (R=.43, P=.008) compared to the TX group (R=.31, P=.04). Anemia was significantly more common in the TX patients than in the CKD patients despite a better GFR. The higher prevalence of anemia in the TX group could not be explained by an iron deficiency or reduced EPO production."

According to the news reporters, the research concluded: "We speculate that immunosuppressive therapy together with resistance to EPO may play a role in the pathogenesis of post-transplantation anemia."

Our news journalists report that additional information may be obtained by contacting I. Krause, Tel Aviv University, Sackler Fac Med, Ramat Aviv, Israel. Additional authors for this research include M. Davidovits, H. Tamary, M. Yutcis and A. Dagan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/petr.12792. This DOI is a link to an online electronic document that is either free or for purchase.

Lipid Research

Findings in Lipid Research Reported from UFCSPA (ESR1 polymorphisms and statin therapy: a sex-specific approach)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lipid Research are presented in a new report. According to news reporting originating from Porto Alegre, Brazil, by NewsRx correspondents, research stated, "Lipid-lowering therapy has shown a high degree of variability in clinical response and there is evidence that the variability in drug response between individuals is due to genetic factors. Thirteen single nucleotide polymorphisms (SNPs) within the ESR1 gene were evaluated with basal lipid and lipoprotein levels, as well as response to lipid-lowering therapy, in 495 hypercholesterolemic individuals of European descent receiving simvastatin or atorvastatin."

Our news editors obtained a quote from the research from UFCSPA, "Significant associations were detected between rs4870061 (P = 0.040, corrected P-value (PC) = 0.440), rs1801132 (P = 0.002, PC = 0.022) and the SNP rs3020314 (P = 0.013, PC = 0.143) with triglyceride (TG) baseline levels. The rs4870061 was also associated with high-density lipoprotein cholesterol (HDL-C) baseline levels (P = 0.045, PC = 0.495). Regarding statin efficacy, rs2234693 C/C was associated with greater HDL-C increase (P = 0.037; PC = 0.407) and rs3798577 T allele was associated with greater total cholesterol (TC) reduction (P = 0.019; PC = 0.209) and greater TG reduction (P = 0.026; PC = 0.286)."

According to the news editors, the research concluded: "These associations suggest that ESR1 polymorphisms are in part responsible for the TC, HDL-C and TG variation levels and this effect may be sex-specific."

The news editors report that additional information may be obtained by contacting S. Almeida, UFCSPA, Dept. of Ciencias Basicas Saude, Porto Alegre, RS, Brazil. Additional authors for this research include M. Fiegenbaum, M.H. Hutz, C.R. Van Der Sand, L.C. Van Der Sand, M.E.W. Ferreira, R.C. Pires and S. Almeida.

Findings in Lipopolysaccharides Reported from Northwestern University (Lipopolysaccharide Domains Modulate Urovirulence)

Financial supporters for this research include HHS | NIH | National Institute of Allergy and Infectious Diseases (NIAID), HHS | NIH | National Institute of General Medical Sciences (NIGMS), HHS | NIH | National Center for Complementary and Integrative Health (NCCIH).

The news correspondents obtained a quote from the research from Northwestern University, "However, modification of lipopolysaccharide (LPS) structure by deleting the O-antigen ligase gene (waaL) enhanced proinflammatory cytokine secretion. Vaccination with the Delta waaL mutant diminished NU14 reservoirs and protected against subsequent infections. Therefore, we hypothesized that LPS structural determinants shape immune responses. We evaluated the contribution of LPS domains to urovirulence corresponding to the inner core (waaP, waaY, and rfaQ), outer core (rfaG), and O-antigen (waaL, wzzE, and wzyE). Deletion of waaP, waaY, and rfaG attenuated adherence to urothelial cells in vitro. In a murine UTI model, the Delta rfaG mutant had the most severe defect in colonization. The mutation of rfaG, waaL, wzzE, and wzyE resulted in an inability to form reservoirs in mouse bladders. Infection with the LPS mutant panel resulted in various levels of urinary myeloperoxidase. Since the Delta waaL mutant promoted Th1-associated adaptive responses in previous studies (B. K. Billips, R. E. Yaggie, J. P. Cashy, A. J. Schaeffer, and D. J. Klumpp, J Infect Dis 200: 263-272, 2009, http://dx.doi.org/10.1086/599839), we assessed NU14 for Th2-associated cytokines. We found NU14 infection stimulated TLR4-dependent bladder interleukin-33 (IL-33) production. Inoculation with rfaG, waaL, wzzE, and wzyE mutants showed decreased IL-33 production. We quantified antigen-specific antibodies after infection and found significantly increased IgE and IgG1 in Delta waaP mutant-infected mice."

According to the news reporters, the research concluded: "Our studies show LPS structural constituents mediate multiple aspects of the UPEC life cycle, including the ability to acutely colonize bladders, form reservoirs, and evoke innate and adaptive immune responses."

Oncology - Liver Cancer

Findings in Liver Cancer Reported from Fourth Military Medical University (Dominant Suppression of beta 1 Integrin by Ectopic CD98-ICD Inhibits Hepatocellular Carcinoma Progression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting out of Xi'an, People's Republic of China, by NewsRx editors, research stated, "Hepatocellular carcinoma (HCC) is currently the third most common cause of cancer-related death in the Asia-Pacific region. Our previous work showed that knockdown of CD98 significantly inhibits malignant HCC cell phenotypes in vitro and in vivo."

Our news journalists obtained a quote from the research from Fourth Military Medical University, "The level of CD98 in the membrane is tightly regulated to mediate complex processes associated with cell-cell communication and intracellular signaling. In addition, the intracellular domain of CD98 (CD98-ICD) seems to be of vital importance for recycling CD98 to the membrane after it is endocytosed. The intracellular and transmembrane domains of CD98 associate with beta-integrins (primarily beta 1 but also beta 3), and this association is essential for CD98 mediation of integrin-like signaling and complements dominant suppression of beta 1-integrin. We speculated that isolated CD98-ICD would similarly suppress beta 1-integrin activation and inhibit the malignant behaviors of cancer cells. In particular, the exact role of CD98-ICD has not been studied independently in HCC. In this study, we found that ectopic expression of CD98-ICD inhibited the malignant phenotypes of HCC cells, and the mechanism possibly involves beta 1-integrin suppression. Moreover, the expression levels of CD98, beta 1-integrin-A (the activated form of beta 1-integrin) and Ki-67 were significantly increased in HCC tissues relative to those of normal liver tissues. Therefore, our preliminary study indicates that ectopic CD98-ICD has an inhibitory role in the malignant development of HCC, and shows that CD98-ICD acts as a dominant negative mutant of CD98 that attenuates beta 1-integrin activation."

According to the news editors, the research concluded: "CD98-ICD may emerge as a promising candidate for antitumor treatment."

For more information on this research see: Dominant Suppression of beta 1 Integrin by Ectopic CD98-ICD Inhibits Hepatocellular Carcinoma Progression. International Journal of Molecular Sciences, 2016;17(11):1808-1821. International Journal of Molecular Sciences can be contacted at: Mdp i Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Oncology - Lung Cancer

Findings in Lung Cancer Reported from J. Li and Co-Researchers (Microbial HSP70 peptide epitope 407-426 as adjuvant in tumor-derived autophagosome vaccine therapy of mouse lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Lung Cancer have been presented. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "Tumor-derived autophagosome (DRibble) is an effective therapeutic cancer vaccine inducing T cell recognition and death of tumor cells in mice. However, the potential for improved anti-tumor response still remains."

Our news journalists obtained a quote from the research, "Our previous study demonstrated that two repeats of a mycobacterial HSP70(407-426) (M2) peptide acted as adjuvant in improving anti-tumor efficacy of human umbilical vein endothelial cell (HUVEC) vaccine. Here, a DRibble vaccine conjugated with M2 (DRibble-M2) was designed as a novel vaccine to enhance anti-tumor activity. Compared with DRibble alone, DRibble-M2 vaccination more significantly inhibited the growth of mouse Lewis lung cancer both in a subcutaneous tumor model and in a lung metastasis model. Higher expression of antigen-specific CTL was induced by DRibble-M2. DRibble-M2 induced higher CD83 and CD86 expression in DC2.4 and also improved the internalization of DRibble antigen into DC2.4."

According to the news editors, the research concluded: "Our data indicated that DRibble-M2 is a potential vaccine for clinical cancer therapy."

For more information on this research see: Microbial HSP70 peptide epitope 407-426 as adjuvant in tumor-derived autophagosome vaccine therapy of mouse lung cancer. Tumor Biology, 2016;37(11):15097-15105. Tumor Biology can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. Findings in Macrolides Reported from Medical University
(Thermodynamics and kinetics of amphotericin B self-association in aqueous solution characterized in molecular detail)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Macrolides are presented in a new report. According to news reporting originating from Gdansk, Poland, by NewsRx correspondents, research stated, "Amphotericin B (AmB) is a potent but toxic drug commonly used to treat systemic mycoses. Its efficiency as a therapeutic agent depends on its ability to discriminate between mammalian and fungal cell membranes."

Our news editors obtained a quote from the research from Medical University, "The association of AmB monomers in an aqueous environment plays an important role in drug selectivity, as oligomers formed prior to membrane insertion -presumably dimers -are believed to act differently on fungal (ergosterol-rich) and mammalian (cholesterol-rich) membranes. In this work, we investigate the initial steps of AmB self-association by studying the structural, thermodynamic and spectral properties of AmB dimers in aqueous medium using molecular dynamics simulations. Our results show that in water, the hydrophobic aggregation of AmB monomers yields almost equiprobable populations of parallel and antiparallel dimers that rapidly interconvert into each other, and the dipole-dipole interaction between zwitterionic head groups plays a minor role in determining the drug's tendency for self-aggregation. A simulation of circular dichroism (CD) spectra indicates that in experimental measurements, the signature CD spectrum of AmB aggregates should be attributed to higher-order oligomers rather than dimers."

According to the news editors, the research concluded: "Finally, we suggest that oligomerization can impair the selectivity of AmB molecules for fungal membranes by increasing their hydrophobic drive for non-specific membrane insertion."

For more information on this research see: Thermodynamics and kinetics of amphotericin B self-association in aqueous solution characterized in molecular detail. Scientific Reports, 2016;6():19109. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting J. Zielinska, Dept. of Pharmaceutical Chemistry, Medical University of Gdansk, Gdansk, Poland. Additional authors for this research include M. Wieczor, T. Baczek, M. Gruszecki and J. Czub.

Findings in Nasopharyngeal Carcinoma Reported from University of Wisconsin (Radiation therapy for nasopharyngeal carcinoma: the predictive value of interim survival assessment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Nasopharyngeal Carcinoma. According to news reporting from Madison, Wisconsin, by NewsRx journalists, research stated, "Pretreatment characteristics are suggested as predictive and/or prognostic factors for nasopharyngeal carcinoma (NPC); however, individual tumor radiosensitivities have previously not been considered. As boost planning is recommended for NPC, we performed interim assessments of magnetic resonance (MR) images for boost planning and retrospectively evaluated their predictive value for the survival of NPC patients."

The news correspondents obtained a quote from the research from the University of Wisconsin, "Radiation therapy via elective nodal irradiation (median dose: 39.6 Gy) with/without chemotherapy was used to treat 63 NPC patients. Boost irradiation (median total dose: 70 Gy) was performed based on the interim assessment. The largest lymph node (LN) was measured on MR images acquired at the time of interim assessment. The site of first failure was local in 8 (12.7%), regional in 7 (11.1%), and distant in 12 patients (19.0%). All 7 patients with regional failure harbored LNs a parts per thousand yen15 mm at interim assessment. We divided the 63 patients into two groups based on LN size [large (a parts per thousand yen15 mm), n = 10 and small (< 15 mm), n = 53]. Univariate analysis showed that 5-year overall survival (OS) and cause-specific survival (CSS) rates for large LNs were significantly lower than for small LNs (OS: 12.5% vs 70.5%, P< 0.001 and CSS: 25.0% vs 80.0%, P< 0.001). Multivariate analysis showed that large LNs were a significantly unfavorable factor for both OS (hazard ratio = 4.543, P = 0.002) and CSS (hazard ratio = 6.020, P = 0.001)."

According to the news reporters, the research concluded: "The results suggest that LN size at interim assessment could predict survival in NPC patients."

Nephrology

Findings in Nephrology Reported from Zhengzhou University (Early initiation of renal replacement treatment in patients with acute kidney injury A systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nephrology. According to news reporting from Zhengzhou, People's Republic of China, by NewsRx journalists, research stated, "Acute kidney injury (AKI) is associated with a substantially increased risk of mortality for many hospitalized patients. It has been suggested that early initiation of renal replacement treatment has a favorable outcome in critically ill patients complicated with AKI."

The news correspondents obtained a quote from the research from Zhengzhou University, "However, results of studies evaluating the effect of early initiation strategy of renal replacement treatment on AKI have been controversial and contradictory. The aim of this meta-analysis is to examine the effect of early initiation of renal replacement treatment on patients with AKI. The authors searched relevant studies in PubMed, EMBASE, and the Cochrane Library through August 2016. We searched for all eligible randomized controlled trials with regard to the role of early initiation of renal replacement treatment in mortality among patients with AKI. We extracted the following information from each study: mortality, length of stay in intensive care unit (ICU), and length of stay in hospital. Random and fixed effect models were used for pooling data. Twelve trials including 1756 patients were included. The results of this meta-analysis showed that there was no significant difference between the mortality of early and delayed strategy for the initiation of renal replacement treatment using the random effect model (odds ratio = 0.78; 95% confidence interval [CI], 0.52-1.19; P = 0.25), with wild heterogeneity (chi(2) = 33.50; I-2 = 67%). Analyses from subgroup sepsis and postsurgery came to similar results. In addition, compared with delayed initiation strategy, early initiation showed no significant advantage in length of stay in ICU (mean difference = -0.80; 95% CI, -2.59 to 0.99; P = 0.56) and length of stay in hospital (mean difference = -7.69; 95% CI, -16.14 to 0.76; P = 0.07). According to the results from present meta-analysis, early initiation of renal replacement treatment showed no survival benefits in patients with AKI."

According to the news reporters, the research concluded: "To achieve optimal timing of renal replacement treatment, further large multicenter randomized trials, with widely accepted and standardized definition of early initiation, are still needed."

For more information on this research see: Early initiation of renal replacement treatment in patients with acute kidney injury A systematic review and meta-analysis. Medicine, 2016;95(46):374-380. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Findings in Oesophagitis Reported from K. Ashida and Co-Researchers (Randomised clinical trial: vonoprazan, a novel potassium-competitive acid blocker, vs. lansoprazole for the healing of erosive oesophagitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gastroenterology - Oesophagitis. According to news reporting from Kyoto, Japan, by NewsRx journalists, research stated, "Vonoprazan is a novel potassium-competitive acid blocker which may provide clinical benefit in acid-related disorders. To verify the non-inferiority of vonoprazan vs. lansoprazole in patients with erosive oesophagitis (EE), and to establish its long-term safety and efficacy as maintenance therapy."

Financial support for this research came from Takeda Pharmaceutical Company.

The news correspondents obtained a quote from the research, "In this multicentre, randomised, double-blind, parallel-group comparison study, patients with endoscopically confirmed EE (LA Classification Grades A-D) were randomly allocated to receive vonoprazan 20 mg or lansoprazole 30 mg once daily after breakfast. The primary endpoint was the proportion of patients with healed EE confirmed by endoscopy up to week 8. In addition, subjects who achieved healed EE in the comparison study were re-randomised into a long-term study to investigate the safety and efficacy of vonoprazan 10 or 20 mg as maintenance therapy for 52 weeks. Of the 409 eligible subjects randomised, 401 completed the comparison study, and 305 entered the long-term maintenance study. The proportion of patients with healed EE up to week 8 was 99.0% for vonoprazan (203/205) and 95.5% for lansoprazole (190/199), thus verifying the non-inferiority of vonoprazan (p <0.0001). Vonoprazan was also effective in patients with more severe EE (LA Classification Grades C/D) and CYP2C19 extensive metabolisers. In the long-term maintenance study, there were few recurrences (<10%) of EE in patients treated with vonoprazan 10 or 20 mg. Overall, vonoprazan was well-tolerated."

According to the news reporters, the research concluded: "The non-inferiority of vonoprazan to lansoprazole in EE was verified in the comparison study, and vonoprazan was well-tolerated and effective during the long-term maintenance study."

Our news journalists report that additional information may be obtained by contacting K. Ashida, Rakuwakai Otowa Hospital, Kyoto, Japan. Additional authors for this research include Y. Sakurai, T. Hori, K. Kudou, A. Nishimura, N. Hiramatsu, E. Umegaki and K. Iwakiri.

Findings in Oropharyngeal Cancer Reported from Churchill Hospital
(Long-term survival outcomes in patients with surgically treated oropharyngeal cancer and defined human papilloma virus status)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Oropharyngeal Cancer is the subject of a report. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "This study investigated long-term survival outcomes in surgically treated oropharyngeal cancer patients with known human papilloma virus status. A case note review was performed of all patients undergoing primary surgery for oropharyngeal cancer in a single centre over a 10-year period."

Our news journalists obtained a quote from the research from Churchill Hospital, "Human papilloma virus status was determined via dual modality testing. Associations between clinicopathological variables and survival were identified using a log-rank test. Of the 107 cases in the study, 40 per cent (n = 41) were human papilloma virus positive. The positive and negative predictive values of p16 immunohistochemistry for human papilloma virus status were 57 per cent and 100 per cent, respectively. At a mean follow up of 59.5 months, 5-year overall and disease-specific survival estimates were 78 per cent and 69 per cent, respectively. Human papilloma virus status (p = 0.014), smoking status (p = 0.021) and tumour stage (p = 0.03) were significant prognostic indicators. The long-term survival rates in surgically treated oropharyngeal cancer patients were comparable to other studies."

According to the news editors, the research concluded: "Variables including human papilloma virus status and tumour stage were associated with survival in patients treated with primary surgery; however, nodal stage and presence of extracapsular spread were non-prognostic."

The news correspondents report that additional information may be obtained from O.T. Dale, John Radcliffe & Churchill Hosp, Head & Neck Department, Oxford, United Kingdom. Additional authors for this research include S. Sood, K.A. Shah, C. Han, D. Rapozo, H. Mehanna and S.C. Winter.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1017/S0022215116009099. This DOI is a link to an online electronic document that is either free or for purchase.

Findings in Parkinson's Disease Reported from King's College

(Dementia in Parkinson's disease is associated with enhanced mitochondrial complex I deficiency)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Parkinson's disease. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Dementia is a common feature of Parkinson's disease (PD), but the neuropathological changes associated with the development of Parkinson's disease dementia (PDD) are only partially understood. Mitochondrial dysfunction is a hallmark of PD but has not been studied in PDD."

The news correspondents obtained a quote from the research from King's College, "Molecular and biochemical approaches were used to study mitochondrial activity and quantity in postmortem prefrontal cortex tissue. Tissues from pathologically confirmed PD and PDD patients and from age-matched controls were used to analyze the activity of mitochondrial enzyme complex nicotinamide adenine dinucleotide:ubiquinone oxidoreductase, or complex I (the first enzyme in the mitochondrial respiratory chain), mitochondrial DNA levels, and the expression of mitochondrial proteins. Complex I activity was significantly decreased (27% reduction; analysis of variance with Tukey's post hoc test; p<0.05) in PDD patients, and mitochondrial DNA levels were also significantly decreased (18% reduction; Kruskal-Wallis analysis of variance with Dunn's multiple comparison test; p<0.05) in PDD patients compared with controls, but neither was significantly reduced in PD patients. Overall, mitochondrial biogenesis was unaffected in PD or PDD, because the expression of mitochondrial proteins in patients was similar to that in controls. Patients with PDD have a deficiency in mitochondrial complex I activity and reduced mitochondrial DNA levels in the prefrontal cortex without a change in mitochondrial protein quantity."

According to the news reporters, the research concluded: "Therefore, mitochondrial complex I deficiency and reduced mitochondrial DNA in the prefrontal cortex may be a hallmark of dementia in patients with PD."

Our news journalists report that additional information may be obtained by contacting A.P. Gatt, Wolfson Center for Age-Related Diseases, King's College London, Guy's Campus, London, UK. Additional authors for this research include O.F. Duncan, J. Attems, P.T. Francis, C.G. Ballard and J.M Bateman.

Proteins - Peroxisome Proliferator-Activated Receptors

Findings in Peroxisome Proliferator-Activated Receptors Reported from Columbia University (Distinct functions of PPAR gamma isoforms in regulating adipocyte plasticity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - Peroxisome Proliferator-Activated Receptors. According to news reporting out of New York City, New York, by NewsRx editors, research stated, "A better understanding of the mechanisms underlying obesity and its comorbidities is key to designing new therapies and treatments. PPAR gamma is a master regulator of adipocyte biology but the functions of its isoforms are poorly distinguished."

Our news journalists obtained a quote from the research from Columbia University, "Here we demonstrated that PPAR gamma 1 is preferentially expressed in catabolic fat depots while PPAR gamma 2 presents itself at a higher level in browning-resistant depots. PPAR gamma 2, but not PPAR gamma 1, responds to endogenous ligands to induce adipogenesis, and the isoforms regulate distinct sets of white and brown adipocyte genes. Moreover, PPAR gamma 1 negatively correlates while PPAR gamma 2 positively correlates with adiposity in human subcutaneous and visceral fat."

According to the news editors, the research concluded: "These results together indicate that PPAR gamma 1 and PPAR gamma 2 have distinct functions in regulating adipocyte plasticity, and future research should take into account the binary roles of both isoforms in order to identify druggable gene targets and pathways relevant for treatment of metabolic disorders."

For more information on this research see: Distinct functions of PPAR gamma isoforms in regulating adipocyte plasticity. Biochemical and Biophysical Research Communications, 2016;481(1-2):132-138. Biochemical and Biophysical Research Communications can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Drugs and Therapies - Pharmacology

Findings in Pharmacology Reported from University of Florence (What is the evidence for the role of TRP channels in inflammatory and immune cells?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Pharmacology are presented in a new report. According to news reporting from Florence, Italy, by NewsRx journalists, research stated, "A complex network of many interacting mechanisms orchestrates immune and inflammatory responses. Among these, the cation channels of the transient receptor potential (TRP) family expressed by resident tissue cells, inflammatory and immune cells and distinct subsets of primary sensory neurons, have emerged as a novel and interrelated system to detect and respond to harmful agents."

The news correspondents obtained a quote from the research from the University of Florence, "TRP channels, by means of their direct effect on the intracellular levels of cations and/or through the indirect modulation of a large series of intracellular pathways, orchestrate a range of cellular processes, such as cytokine production, cell differentiation and cytotoxicity. The contribution of TRP channels to the transition of inflammation and immune responses from a defensive early response to a chronic and pathological condition is also emerging as a possible underlying mechanism in various diseases."

According to the news reporters, the research concluded: "This review discusses the roles of TRP channels in inflammatory and immune cell function and provides an overview of the effects of inflammatory and immune TRP channels on the pathogenesis of human diseases."

Our news journalists report that additional information may be obtained by contacting A. Parenti, Clinical Pharmacology and Oncology Unit, Dept. of Health Sciences, University of Florence, Florence, Italy. Additional authors for this research include F. De Logu, P. Geppetti and S. Benemei.

Drugs and Therapies - Phytotherapy

Findings in Phytotherapy Reported from British Columbia Institute of Technology (Single-Laboratory Validation for the Determination of Flavonoids in Hawthorn Leaves and Finished Products by LC-UV)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Phytotherapy is the subject of a report. According to news originating from Burnaby, Canada, by NewsRx correspondents, research stated, "Suitably validated analytical methods that can be used to quantify medicinally active phytochemicals in natural health products are required by regulators, manufacturers, and consumers. Hawthorn (Crataegus) is a botanical ingredient in natural health products used for the treatment of cardiovascular disorders."

Our news journalists obtained a quote from the research from the British Columbia Institute of Technology, "A method for the quantitation of vitexin-2 "-O-rhamnoside, vitexin, isovitexin, rutin, and hyperoside in hawthorn leaf and flower raw materials and finished products was optimized and validated according to AOAC International guidelines. A two-level partial factorial study was used to guide the optimization of the sample preparation. The optimal conditions were found to be a 60-minute extraction using 50: 48:2 methanol: water: acetic acid followed by a 25-minute separation using a reversed phased liquid chromatography column with ultraviolet absorbance detection. The single-laboratory validation study evaluated method selectivity, accuracy, repeatability, linearity, limit of quantitation, and limit of detection. Individual flavonoid content ranged from 0.05 mg/g to 17.5mg/g in solid dosage forms and raw materials. Repeatability ranged from 0.7 to 11.7% relative standard deviation corresponding to HorRat ranges from 0.2 to 1.6. Calibration curves for each flavonoid were linear within the analytical ranges with correlation coefficients greater than 99.9%. Herein is the first report of a validated method that is fit for the purpose of quantifying five major phytochemical marker compounds in both raw materials and finished products made from North American (Crataegus douglasii) and European (Crataegus monogyna and Crataegus laevigata) hawthorn species."

According to the news editors, the research concluded: "The method includes optimized extraction of samples without a prolonged drying process and reduced liquid chromatography separation time."

Findings in Prostate Cancer Reported from Fox Chase Cancer Center

(Men's health supplement use and outcomes in men receiving definitive intensity-modulated radiation therapy for localized prostate cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology-Prostate Cancer have been published. According to news reporting originating from Philadelphia, Pennsylvania, by NewsRx correspondents, research stated, "Approximately 50% of newly diagnosed cancer patients start taking dietary supplements. Men's health supplements (MHSs), which we define as supplements that are specifically marketed with the terms men's health and prostate health (or similar permutations), are often mislabeled as having potential anticancer benefits."

Our news editors obtained a quote from the research from Fox Chase Cancer Center, "We evaluated the effects of MHSs on patient outcomes and toxicities in patients who were undergoing definitive intensity modulated radiation therapy (IMRT) for localized prostate cancer. This retrospective analysis included patients who were being treated at a National Cancer Institute designated comprehensive cancer center and consented to have information stored in a prospective database. MHSs were queried online. Outcome measures were freedom from biochemical failure (FFBF) (biochemical failure was defined with the use of the prostate-specific antigen nadir + 2-ng/mL definition), freedom from distant metastasis (FFDM), cancer-specific survival (CSS), and overall survival (OS) as well as toxicities. Kaplan-Meier analysis, log-rank tests, Fine and Gray competing-risk regression (to adjust for patient and lifestyle factors), and Cox models were used. From 2001 to 2012, 2207 patients were treated with IMRT with a median dose of 78 Gy, and a median follow-up of 46 mo. Of these patients, 43% were low risk, 37% were intermediate risk, and 20% were high risk; 10% used MHSs. MHSs contained a median of 3 identifiable ingredients (range: 0-78 ingredients). Patients who were taking an MHS compared with those who were not had improved 5-y OS (97% compared with 92%, respectively; P = 0.01), but there were no differences in the FFBF (94% compared with 89%, respectively; P = 0.12), FFDM (96% compared with 97%, respectively; P = 0.32), or CSS (100% compared with 99%, respectively; P = 0.22). The unadjusted association between MHS use and improved OS was attenuated after adjustment for patient lifestyle factors and comorbidities. There was no difference in toxicities between the 2 groups (late-grade 3-4 genitourinary <3%; gastrointestinal <4%)."

According to the news editors, the research concluded: "The use of MHSs is not associated with outcomes or toxicities."

The news editors report that additional information may be obtained by contacting N.G. Zaorsky, Fox Chase Canc Center, Dept. of Radiat Oncol, Philadelphia, PA 19111, United States. Additional authors for this research include T.M. Churilla, K. Ruth, S.B. Hayes, M.L. Sobczak, M.A. Hallman, M.C. Smaldone, D.Y.T. Chen and E.M. Horwitz.

Findings in Prostate Cancer Reported from University of Catania
[Prevalence of Cardiovascular Disease and Osteoporosis During Androgen Deprivation Therapy Prescription Discordant to EAU Guidelines: Results From a Multicenter, Cross-sectional ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Prostate Cancer. According to news reporting from Catania, Italy, by NewsRx journalists, research stated, "To analyze the prevalence of cardiovascular disease (CVD) and osteoporosis in patients treated with androgen deprivation therapy (ADT) for prostate cancer (PCa) but not adherent to European Association of Urology (EAU) guidelines. The CHOosIng Treatment for Prostate CanCEr (CHOICE) study was an Italian multicenter, cross-sectional study conducted from December 2010 to January 2012."

The news correspondents obtained a quote from the research from the University of Catania, "A total of 1386 patients treated with ADT for PCa (first prescription or renewal of ADT) were selected. According to EAU guidelines, the cohort was categorized in discordant ADT (Group A) and concordant ADT (Group B). The prevalence of CVD and osteoporosis after ADT was recorded. The final cohort included 1075 patients. According to EAU guidelines adherence, 285 (26.51%) and 790 (73.49%) were considered discordant and concordant, respectively. The proportion of men with Charlson Comorbidity Index > 2 at baseline was statistically similar in Group A (81.8%) compared to Group B (80.8%) (P =.96). The number of complications reported at enrollment was as follows: cardiovascular in 351 (32.7%), endocrine in 166 (15.4%), sexual in 498 (46.3%), osteoporosis in 181 (16.8%), and gynecomastia in 274 (25.5%) subjects. At the multivariate logistic regression analysis adjusted for confounding factors, discordant ADT was associated with greater risk of cardiovascular complications (odds ratio: 2.07; P<.01) and osteoporosis (odds ratio: 1.75; P =.04). About one-third of patients with PCa received inappropriate ADT and showed a greater risk of CVD and osteoporosis."

According to the news reporters, the research concluded: "These results could be useful for setting better policy strategies to limit the inappropriateness of ADT prescription."

For more information on this research see: Prevalence of Cardiovascular Disease and Osteoporosis During Androgen Deprivation Therapy Prescription Discordant to EAU Guidelines: Results From a Multicenter, Cross-sectional Analysis From the CHOosIng Treatment for Prostate canCEr (CHOICE) Study. Urology, 2016;96():165-170. Urology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Urology - www.journals.elsevier.com/urology/)

Our news journalists report that additional information may be obtained by contacting G.I. Russo, University of Catania, Dept. of Urol, Catania, Italy. Findings in Pulmonary Embolism Reported from Department of Cardiology (Endosonography of a Pulmonary Artery Obstruction in Echinococcosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Pulmonary Embolism are discussed in a new report. According to news reporting from The Hague, Netherlands, by NewsRx journalists, research stated, "A 44-year-old woman with a history of pulmonary embolism and abdominal echinococcosis complained of sudden thoracic pain and shortness of breath. A D-dimer of 77.5 mg/l (reference <= 0.5 mg/l) was found."

The news correspondents obtained a quote from the research from the Department of Cardiology, "Chest CT scan revealed obstruction of the right lower and middle lobe pulmonary artery (PA). Anticoagulation therapy was initiated for the presumed diagnosis of recurrent pulmonary embolism. However, due to persistent symptoms of dyspnea, follow-up CT angiography of the chest was performed 3 months later. A persistent PA obstruction was found and the presumed diagnosis of embolism was questioned. Subsequently, endobronchial ultrasound (EBUS) imaging was performed to support an alternative diagnosis. EBUS imaging showed an inhomogeneous, sharply demarcated, intravascular lesion with round hypoechoic areas compatible with cysts. The diagnosis of embolism was rejected and treatment with albendazole was initiated for pulmonary echinococcosis. Echinococcosis is a parasitic disease and cystic spread in the PA is exceptional. The patient has remained stable for more than 4 years."

According to the news reporters, the research concluded: "In case of disease progression, including progressive PA obstruction or life-threatening hemoptysis, surgical resection will be considered."

Our news journalists report that additional information may be obtained by contacting M.J. Schuuring, Haga Teaching Hosp, Dept. of Cardiol, The Hague, Netherlands. Additional authors for this research include P.I. Bonta, M. van Vugt, F. Smithhuis, O.M. van Delden, J.T. Annema and K. Stijnis.

Science

Findings in Science Reported from University of Florida
(Spatiotemporal dynamics of androgen signaling underlie sexual differentiation and congenital malformations of the urethra and vagina)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Science. According to news reporting out of Gainesville, Florida, by NewsRx editors, research stated, "Disorders of sex development (DSDs) are congenital anomalies that affect sexual differentiation of genitourinary organs and secondary sex characters. A common cause of female genital virilization is congenital adrenal hyperplasia (CAH), in which excess androgen production during development of 46XX females can result in vaginal atresia, masculinization of the urethra, a single urogenital sinus, and clitoral hypertrophy or ambiguous external genitalia."

Financial supporters for this research include HHS | NIH | National Institute of Environmental Health Sciences (NIEHS), HHS | NIH | National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK).

Our news journalists obtained a quote from the research from the University of Florida, "Development of the vagina depends on sexual differentiation of the urogenital sinus ridge, an epithelial thickening that forms where the sex ducts attach to the anterior urethra. In females, the sinus ridge descends posteriorly to allow the vaginal opening to form in the vulva, whereas in males and in females with CAH, androgens inhibit descent of the sinus ridge. The mechanisms that regulate development of the female urethra and vagina are largely unknown. Here we show that the timing and duration of, and the cell population targeted by, androgen signaling determine the position of vaginal attachment to the urethra. Manipulations of androgen signaling in utero reveal a temporal window of development when sinus ridge fate is determined. Cell type-specific genetic deletions of androgen receptor (Ar) identify a subpopulation of mesenchymal cells that regulate sinus ridge morphogenesis."

According to the news editors, the research concluded: "These results reveal a common mechanism that coordinates development of the vagina and feminization of the urethra, which may account for development of a single urogenital sinus in females exposed to excessive androgen during a critical period of prenatal development."

For more information on this research see: Spatiotemporal dynamics of androgen signaling underlie sexual differentiation and congenital malformations of the urethra and vagina. Proceedings of the National Academy of Sciences of the United States of America, 2016;113 (47):E7510-E7517. Biomedical Engineering - Tissue Engineering

Findings in Tissue Engineering Reported from University of Maryland (Improving the clinical impact of biomaterials in cancer immunotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biomedical Engineering - Tissue Engineering. According to news reporting originating in College Park, Maryland, by NewsRx journalists, research stated, "Immunotherapies for cancer have progressed enormously over the past few decades, and hold great promise for the future. The successes of these therapies, with some patients showing durable and complete remission, demonstrate the power of harnessing the immune system to eradicate tumors."

The news reporters obtained a quote from the research from the University of Maryland, "However, the effectiveness of current immunotherapies is limited by hurdles ranging from immunosuppressive strategies employed by tumors, to inadequate specificity of existing therapies, to heterogeneity of disease. Further, the vast majority of approved immunotherapies employ systemic delivery of immunomodulators or cells that make addressing some of these challenges more difficult. Natural and synthetic biomaterials -such as biocompatible polymers, self-assembled lipid particles, and implantable biodegradable devices -offer unique potential to address these hurdles by harnessing the benefits of therapeutic targeting, tissue engineering, co-delivery, controlled release, and sensing. However, despite the enormous investment in new materials and nanotechnology, translation of these ideas to the clinic is still an uncommon outcome."

According to the news reporters, the research concluded: "Here we review the major challenges facing immunotherapies and discuss how the newest biomaterials and nanotechnologies could help overcome these challenges to create new clinical options for patients."

For more information on this research see: Improving the clinical impact of biomaterials in cancer immunotherapy. Oncotarget, 2016;7(13):15421-43.

Our news correspondents report that additional information may be obtained by contacting J.M. Gammon, Fischell Dept. of Bioengineering, University of Maryland, College Park, MD, United States. Additional authors for this research include N.M. Dold and C.M Jewell.

Coachtoday: "A total of 568 type 2 diabetic patients with normal albuminuria at baseline were followed up for a mean of 5.3 +/- 1.5 years. Urinary albumin-to-creatinine ratio (ACR) >= 30 mg/g in two consecutive urine tests were defined as progression to diabetic nephropathy (n = 143). Five polymorphisms of IL-6 gene, rs1800795, rs1800796, rs1524107, rs2069837, and rs2069840, were genotyped. Cox proportional hazard models were used to estimate hazard ratio (HR) and 95% CI of progression to diabetic nephropathy under different genetic models. Almost all patients (99.6%) carried the rs1800795 GG homozygous genotypes. In the Cox proportional models adjusted for multiple covariates, the HR under recessive model was 2.02 for rs1800796 GG (vs. CC + CG, 95% CI: 1.08-3.75, p = 0.027), 2.37 for rs2069837 GG (vs. AA + AG, 95% CI: 1.15-4.87, p = 0.019), and 2.08 for rs1524107 CC (vs. TT + TC, 95% CI: 1.12-3.89, p = 0.021). These associations remained significant for rs1800796 and rs1524107 after correction for multiple testing (alpha = 0.017). Overall, our results suggest that rs1800796 GG and rs1524107 CC homozygous genotypes may confer a greater risk for development of nephropathy in type 2 diabetes."

According to the news reporters, the research concluded: "IL-6 gene polymorphisms rs1800796 and rs1524107 may serve as predictors of progression of nephropathy in Chinese patients with type 2 diabetes."

For more information on this research see: Interleukin-6 gene polymorphisms correlate with the progression of nephropathy in Chinese patients with type 2 diabetes: A prospective cohort study. Diabetes Research and Clinical Practice, 2016;120():15-23.
Heart Disorders and Diseases - Acute Coronary...

Findings in the Area of Acute Coronary Syndrome Reported from Bellvitge University Hospital (Does anemia affect the predictive ability of bleeding risk scores in patients with acute coronary syndromes?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Heart Disorders and Diseases - Acute Coronary Syndrome. According to news originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Introduction and objective: Anemia is a common comorbidity in patients with acute coronary syndromes (ACS), and is associated with higher risk for both bleeding and ischemic complications. We aimed to assess the predictive ability of bleeding risk scores (Can Rapid risk stratification of Unstable angina patients Suppress ADverse outcomes with Early implementation of the ACC/AHA guidelines [CRUSADE], Mehran and Acute Coronary Treatment and Intervention Outcomes Network [ACTION]) in ACS patients with anemia."

Our news journalists obtained a quote from the research from Bellvitge University Hospital, "All consecutive ACS patients were prospectively included. The primary outcome was in-hospital major bleeding according to the CRUSADE, Mehran and ACTION definitions. Anemia was defined as hemoglobin <130 g/l in men and <120 g/l in women. The predictive ability of the bleeding risk scores was assessed by binary logistic regression, calculating receiver operating characteristic (ROC) curves and their corresponding area under the curve (AUC). We included 2255 patients, mean age 62.4 years. Anemia was present in 550 patients (24.4%). Patients with anemia had a significantly higher prevalence of comorbidities. The three bleeding risk scores adequately predicted major bleeding in the whole cohort. No significant differences were observed regarding the predictive ability of each of the scores in patients with and without anemia (CRUSADE: AUC 0.73 without anemia vs. 0.74 with anemia, p=0.913; ACTION: AUC 0.68 without anemia vs. 0.73 with anemia, p=0.353; Mehran: AUC 0.69 without anemia vs. 0.61 with anemia, p=0.210). Only the Mehran score showed significantly lower predictive
ability in patients with hemoglobin <11 g/dl (AUC 0.51, p=0.044). Anemia was a common comorbidity in patients with ACS from our series."

According to the news editors, the research concluded: "Currently available bleeding risk scores showed an adequate predictive ability in patients with mild anemia."

For more information on this research see:  Does anemia affect the predictive ability of bleeding risk scores in patients with acute coronary syndromes?

**Drugs and Therapies - Adverse Drug Reactions**

**Findings in the Area of Adverse Drug Reactions Reported from University of Chicago [Safety and efficacy of EMR for sporadic, nonampullary duodenal adenomas: a single US center experience (with video)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Adverse Drug Reactions have been published. According to news reporting from Chicago, Illinois, by NewsRx journalists, research stated, "EMR is increasingly used for resection of sporadic, nonampullary duodenal adenomas (SNDAs), but there are no guidelines for the management of these lesions. The aims of this study were to evaluate the safety and efficacy of EMR exclusively for SNDAs and to determine the factors predictive of outcomes."

The news correspondents obtained a quote from the research from the University of Chicago, "We performed a retrospective review of patients with SNDAs referred for endoscopic therapy from 2006 to 2013. The outcomes studied were successful endoscopic resection, major adverse events, early and late recurrences, and clinical remission. Sixty-eight patients with SNDAs were included and 51 (75%) underwent EMR. The mean adenoma size was 22.0 +/- 8.9 mm. Successful resection was achieved in 49 of 51 patients (96.1%), and major adverse events were noted in 8 of 51 patients (15.7%). Early and late recurrences were noted in 25.6% and 5.2% of patients, respectively, and were treated endoscopically. Clinical remission was achieved
in 89.7% of patients after a median follow-up of 15 months. Presence of villous histology was associated with increased recurrence (P = .019), but no association of recurrence was noted with other endoscopic features or resection technique. Large adenoma size (P = .0057) and need for intraprocedural hemostasis (P = .006) were associated with increased adverse events, but no association of adverse events was noted with location or resection technique. Large duodenal adenomas can be effectively managed with EMR at a referral center with experienced endoscopists. However, EMR has a significant recurrence rate, especially early recurrence, and the risk of adverse events is not negligible."

According to the news reporters, the research concluded: "Endoscopic therapy is successful in managing recurrent adenomas."

Our news journalists report that additional information may be obtained by contacting A. Singh, University Chicago, Center Endoscop Res & Therapeut, Dept. of Pathol, Chicago, IL, United States. Additional authors for this research include U.D. Siddiqui, V.J. Konda, E. Whitcomb, J. Hart, S.Y. Xiao, M.G. Ruiz, A. Koons and I. Waxman.

Cardiovascular Diseases and Conditions - Aneurysm

Findings in the Area of Aneurysm Reported from Health Science Center (A direct aspiration first pass technique for retrieval of a detached coil)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurysm. According to news reporting from Kochi, Japan, by NewsRx journalists, research stated, "A 64-year-old man was referred to our hospital for treatment of a cerebral aneurysm that was incidentally found. The aneurysm was 7 mm in size and located on the left anterior communicating artery."

The news correspondents obtained a quote from the research from Health Science Center, "Using a balloon assisted technique, we performed coil embolization. During the second coil insertion, the first coil was dislodged into the anterior communicating artery. We attempted coil retrieval using a snare, which was unsuccessful. We applied a direct aspiration first pass technique (ADAPT) and advanced a Penumbra 4MAX immediately proximal to the dislodged coil; the dislodged coil was then successfully retrieved."

According to the news reporters, the research concluded: "ADAPT is a simple procedure for retrieval of a detached coil, and it can be used as an alternative to the snare technique."

For more information on this research see: A direct aspiration first pass technique
Our news journalists report that additional information may be obtained by contacting T. Ohta, Kochi Hlth Sci Center, Dept. of Neurosurg, Kochi, Kochi 7818555, Japan. Additional authors for this research include T. Ohta, N. Fukui, T. Yanagawa, Y. Kondou, M. Morimoto and T. Ueba.

Musculoskeletal Diseases and Conditions –

Findings in the Area of Angelman Syndrome Reported from University of California (Protein Delivery of an Artificial Transcription Factor Restores Widespread Ube3a Expression in an Angelman Syndrome Mouse Brain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Musculoskeletal Diseases and Conditions - Angelman Syndrome are discussed in a new report. According to news reporting from Davis, California, by NewsRx journalists, research stated, "Angelman syndrome (AS) is a neurological genetic disorder caused by loss of expression of the maternal copy of UBE3A in the brain. Due to brain-specific genetic imprinting at this locus, the paternal UBE3A is silenced by a long antisense transcript."

The news correspondents obtained a quote from the research from the University of California, "Inhibition of the antisense transcript could lead to unsilencing of paternal UBE3A, thus providing a therapeutic approach for AS. However, widespread delivery of gene regulators to the brain remains challenging. Here, we report an engineered zinc finger-based artificial transcription factor (ATF) that, when injected i.p. or s.c., crossed the blood-brain barrier and increased Ube3a expression in the brain of an adult mouse model of AS. The factor displayed widespread distribution throughout the brain. Immunohistochemistry of both the hippocampus and cerebellum revealed an increase in Ube3a upon treatment. An ATF containing an alternative DNA-binding domain did not activate Ube3a. We believe this to be the first report of an injectable engineered zinc finger protein that can cause widespread activation of an endogenous gene in the brain."

According to the news reporters, the research concluded: "These observations have important implications for the study and treatment of AS and other neurological disorders."

For more information on this research see: Protein Delivery of an Artificial Transcription Factor Restores Widespread Ube3a Expression in an Angelman Syndrome Mouse Brain. Molecular Therapy, 2016;24(3):548-55. (Elsevier - www.elsevier.com; Molecular Therapy - www.journals.elsevier.com/molecular-therapy/)

Immunology - Antigen-Presenting Cells

Findings in the Area of Antigen-Presenting Cells Reported from University of Pittsburgh (Dendritic Cells Regulate Extrafollicular Autoreactive B Cells via T Cells Expressing Fas and Fas Ligand)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Antigen-Presenting Cells have been published. According to news reporting originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "The extrafollicular (EF) plasmablast response to self-antigens that contain Toll-like receptor (TLR) ligands is prominent in murine lupus models and some bacterial infections, but the inhibitors and activators involved have not been fully delineated. Here, we used two conventional dendritic cell (cDC) depletion systems to investigate the role of cDCs on a classical TLR-dependent autoreactive EF response elicited in rheumatoid-factor B cells by DNA-containing immune complexes."

Financial supporters for this research include NIH, Ruth L. Kirschstein National Research Service Award NIH, Arthritis Foundation Postdoctoral Fellowship.

Our news editors obtained a quote from the research from the University of Pittsburgh, "Contrary to our hypothesis, cDC depletion amplified rather than dampened the EF response in Fas-intact but not Fas-deficient mice. Further, we demonstrated that cDC-dependent regulation requires Fas and Fas ligand (FasL) expression by T cells, but not Fas expression by B cells. Thus, cDCs activate FasL-expressing T cells that regulate Fas-expressing extrafollicular helper T (Teff) cells."

According to the news editors, the research concluded: "These studies reveal a regulatory role for cDCs in B cell plasmablast responses and provide a mechanistic explanation for the excess autoantibody production observed in Fas deficiency."

For more information on this research see: Dendritic Cells Regulate Extrafollicular Autoreactive B Cells via T Cells Expressing Fas and Fas Ligand. Immunity, 2016;45(5):1052-1065. Immunity can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Immunity - www.journals.elsevier.com/immunity/)

The news editors report that additional information may be obtained by contacting M.J. Shlomchik, University of Pittsburgh, Sch Med. Dept. of Immunol, Pittsburgh, PA 15261, United States. Additional authors for this research include J.L. Cullen, A. Turqueti-Neves, J.
Giles and M.J. Shlomchik.

Arthroplasty

Findings in the Area of Arthroplasty Reported from University of Los Andes (Primary Joint Arthroplasty Surgery: Is the Risk of Major Bleeding Higher in Elderly Patients? A Retrospective Cohort Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Arthroplasty. According to news reporting from Bogota, Colombia, by NewsRx journalists, research stated, "Increased risk of bleeding after major orthopedic surgery (MOS) has been widely documented in general population. However, this complication has not been studied in elderly patients."

The news correspondents obtained a quote from the research from the University of Los Andes, "The purpose of this study is to determine whether the risk of major bleeding after MOS is higher in elderly patients, compared with those operated at a younger age. This retrospective cohort study included total hip and total knee arthroplasty patients operated during 5 consecutive years. The main outcome was the occurrence of major bleeding. Patients with other causes of bleeding were excluded. Relative risks (RRs) and confidence intervals (CIs) were calculated, and a multivariate analysis was performed. A total of 1048 patients were included, 56% of patients were hip arthroplasties. At the time of surgery, 553 (53%) patients were older than 70 years. Patients aged >70 years showed an increased risk of major bleeding (RR: 2.42 [95% CI: 1.54-3.81]). For hip arthroplasty, the RR of bleeding was 2.61 (95% CI: 1.50-4.53) and 2.25 (95% CI: 1.03-4.94) for knee arthroplasty. After multivariate analysis, age was found to be independently associated with higher risk of major bleeding. According to European Medicines Agency criteria, patients aged >= 70 years are at a higher risk of major bleeding after MOS, result of a higher frequency of blood transfusions in this group of patients."

According to the news reporters, the research concluded: "Standardized protocols for blood transfusion in these patients are still required."

Our news journalists report that additional information may be obtained by contacting G.A. Bonilla, Los Andes University, Sch Med, Bogota, Colombia. Additional authors for this research include L.L.C. Cardenas, M. Navas, M.P. Bautista, G.A. Bonilla and A.M. Llinas.

**Heart Disorders and Diseases - Atrial Fibrillation**

**Findings in the Area of Atrial Fibrillation Reported from Tianjin Medical University (Association between air pollution and development of atrial fibrillation: A meta-analysis of observational studies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Heart Disorders and Diseases - Atrial Fibrillation have been presented. According to news originating from Tianjin, People's Republic of China, by NewsRx correspondents, research stated, "Current evidence suggests that gaseous or particulate pollutants may increase the risk of atrial fibrillation (AF), although this association is still uncertain. We conducted a systematic review of literature using PubMed, Ovid, Embase and Web of Science to identify studies reporting on the association between gaseous (ozone, carbon monoxide, sulfur dioxide, and nitrogen dioxide) or particulate matter 2.5 (PM2.5) and AF risk published until March 2015."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from Tianjin Medical University, "The overall effect estimate was presented as the population-attributable risks with 95% CI. We used both, fix-effects and random effects models to calculate the overall effect estimate. We retrieved 4 studies, involving 461,441 participants. There was a statistically significant association between AF development and all gaseous pollutant as well as PM2.5 [NO: 1.19% (0.70-1.67%), CO: 0.60 (0.20-1.09), SO2: 0.90 (0.60-1.28), O3:1.09 (0.20-1.86), PM2.5: 0.89 (0.20-1.57)]."

According to the news editors, the research concluded: "Our comprehensive meta-analysis suggests that gaseous or particulate pollutants are associated with the increased risk of AF."

The news correspondents report that additional information may be obtained from T. Liu, Tianjin Med Univ, Tianjin Key Lab Ion Mol Funct Cardiovasc Dis, Dept. of Cardiol, Tianjin Inst CardiolHosp 2, Tianjin 300211, People's Republic of China. Additional authors for this research include T. Liu, P. Korantzopoulos, Z.W. Zhang, J.P. Zhao and G.P. Li.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.hrtlng.2016.08.001. This DOI is a link to an online electronic document that is either free or for purchase.
Findings in the Area of Blood Coagulation Factors Reported from Lerner Research Institute (Thrombin Cleavage of Inter-alpha-inhibitor Heavy Chain 1 Regulates Leukocyte Binding to an Inflammatory Hyaluronan Matrix)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hematology - Blood Coagulation Factors have been presented. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "Dynamic alterations of the extracellular matrix in response to injury directly modulate inflammation and consequently the promotion and resolution of disease. During inflammation, hyaluronan (HA) is increased at sites of inflammation where it may be covalently modified with the heavy chains (HC) of inter-alpha-trypsin inhibitor."

The news reporters obtained a quote from the research from Lerner Research Institute, "Deposition of this unique, pathological form of HA (HC-HA) leads to the formation of cable-like structures that promote adhesion of leukocytes. Naive mononuclear leukocytes bind specifically to inflammation-associated HA matrices but do not adhere to HA constitutively expressed under homeostatic conditions. In this study, we have directly investigated a role for the blood-coagulation protease thrombin in regulating the adhesion of monocytic cells to smooth muscle cells producing an inflammatory matrix. Our data demonstrate that the proteolytic activity of thrombin negatively regulates the adhesion of monocytes to an inflammatory HG-HA complex. This effect is independent of protease-activated receptor activation but requires proteolytic activity toward a novel substrate. Components of HC-HA complexes were predicted to contain conserved thrombin-susceptible cleavage sites based on sequence analysis, and heavy chain 1 (HC1) was confirmed to be a substrate of thrombin. Thrombin treatment is sufficient to cleave HC1 associated with either cell-surface HA or serum inter-alpha-trypsin inhibitor. Furthermore, thrombin treatment of the inflammatory matrix leads to dissolution of HC-HA cable structures and abolishes leukocyte adhesion."

According to the news reporters, the research concluded: "These data establish a novel mechanism whereby thrombin cleavage of HC1 regulates the adhesive properties of an inflammatory HA matrix."

Our news correspondents report that additional information may be obtained by contacting C.A. de la Motte, Cleveland Clinic, Lerner Res Inst, Dept. of Pathobiol, Cleveland, OH 44195, United States.
Drugs and Therapies - Botulinum Toxin Therapy

Findings in the Area of Botulinum Toxin Therapy Reported from Institute of Pharmacology (Participation of pro- and anti-nociceptive interleukins in botulinum toxin A-induced analgesia in a rat model of neuropathic pain)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Botulinum Toxin Therapy are discussed in a new report. According to news reporting out of Krakow, Poland, by NewsRx editors, research stated, "Botulinum neurotoxin serotype A (BoNT/A) shows antinociceptive properties, and its clinical applications in pain therapy are continuously increasing. BoNT/A specifically cleaves SNAP-25, which results in the formation of a non-functional SNARE complex, thereby potently inhibiting the release of neuro-transmitters and neuropeptides, including those involved in nociception."

Financial supporters for this research include National Science Centre of Poland, Institute of Pharmacology, Foundation of Polish Science, Ministry of Science and Higher Education.

Our news journalists obtained a quote from the research from the Institute of Pharmacology, "The aim of the present study was to determine the effects of BoNT/A (300 pg/paw) on pain-related behavior and the levels of glial markers and interleukins in the spinal cord and dorsal root ganglia (DRG) after chronic constriction injury (CCI) to the sciatic nerve in rats. Glial activity was also examined after repeated intraperitoneal injection of minocycline combined with a single BoNT/A injection. Our results show that a single intraplantar BoNT/A injection did not influence motor function but strongly diminished pain-related behaviors in naïve and CCI-exposed rats. Additionally, microglial inhibition using minocycline enhanced the analgesic effects of BoNT/A. Western blotting results suggested that CCI induces the upregulation of the pronociceptive proteins IL-18, IL-6 and IL-113 in the ipsilateral lumbar spinal cord and DRG, but no changes in the levels of the antinociceptive proteins IL-18BP, IL-IRA and IL-10 were observed. Interestingly, BoNT/A injection suppressed the CCI-induced upregulation of IL-18 and IL-113 in the spinal cord and/or DRG and increased the levels of IL-10 and IL-IRA in the DRG."

According to the news editors, the research concluded: "In summary, our results suggest that BoNT/A significantly attenuates pain-related behavior and microglial activation and restores the neuroimmune balance in a CCI model by decreasing the levels of pronociceptive factors (IL-1 beta and IL-18) and increasing the levels of antinociceptive factors (IL-10 and IL-IRA) in the spinal cord and DRG."

Findings in the Area of Breast Cancer Reported from Capital Medical University (Long non-coding RNA UCA1 enhances tamoxifem resistance in breast cancer cells through a miR-18a-HIF1 alpha feedback regulatory loop)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Breast Cancer. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Recent studies reported that long non-coding RNAs (lncRNAs) might play critical roles in regulating endocrine resistance of breast cancer. Urothelial carcinoma-associated 1 (UCA1) is an lncRNA with an oncogenic role in breast cancer."

Our news editors obtained a quote from the research from Capital Medical University. "This study aimed to investigate whether UCA1 is involved in acquired tamoxifen resistance in estrogen receptor (ER)-positive cancer cells. Our findings reveal that tamoxifen induces UCA1 upregulation in ER-positive breast cancer cells in a HIF1 alpha-dependent manner. UCA1 upregulation results in significantly enhanced tamoxifen resistance. The upregulated UCA1 sponges miR-18a, which is a negative regulator of HIF1 alpha. Therefore, UCA1 upregulation is further enhanced through a miR-18a-HIF1 alpha feedback loop. In addition, our data also showed that miR-18a is a modulator of tamoxifen sensitivity due to its regulative effect on cell cycle proteins. miR-18a inhibitor reduced the sensitivity of MCF-7 cells to tamoxifen, while miR-18a mimics sensitized BT474 cells to tamoxifen. Therefore, miR-18a downregulation also partly contributes to acquired tamoxifen resistance in the cancer cells."

According to the news editors, the research concluded: "These findings provide some useful information for future clinical treatment of tamoxifen resistance."

For more information on this research see: Long non-coding RNA UCA1 enhances tamoxifen resistance in breast cancer cells through a miR-18a-HIF1 alpha feedback regulatory loop.

**Oncology - Breast Cancer**

**Findings in the Area of Breast Cancer Reported from Sun Yat-Sen University (Estrogen receptor beta as a prognostic factor in breast cancer patients: A systematic review and meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Guangzhou, People's Republic of China, by NewsRx correspondents, research stated, "The prognostic role of estrogen receptor beta (ERb) in early-stage breast cancer is unclear. We performed a systematic review and meta-analysis to evaluate the prognostic value of ERb in early-stage breast cancer patients."

Our news journalists obtained a quote from the research from Sun Yat-Sen University, "We searched Medline, Embase, and the Web of Science for studies published between 1990 and 2015 that assessed ERb status in breast cancer patients. A total of 25 studies comprising 9919 patients fitting our inclusion and exclusion criteria were included. The hazard ratios of ERb status were extracted for disease-free survival (DFS) and overall survival (OS). Random or fixed-effects models were used when appropriate, and between-study heterogeneity was assessed. In the 20 studies that assessed ERb status using immunohistochemical (IHC) methods, we observed significantly improved DFS in patients positive for ERb-1 (HR=0.56, 95% CI 0.40-0.78, p=0.0007) and ERb-2 (HR=0.67, 95% CI 0.45-1.00, p=0.05). Improved OS was associated with a positive status for pan-ERb (HR=0.60, 95% CI 0.45-0.80, p=0.0004) and ERb-2 (HR=0.44, 95% CI 0.31-0.62, p<0.0001). In ERa-positive patients, ERb positivity was not associated with DFS (HR=0.77, 95% CI 0.46-1.27, p=0.31) or OS (HR=0.64, 95% CI 0.37-1.11, p=0.11). In contrast, ERb expression was significantly associated with increased DFS (HR=0.37, 95% CI 0.14-0.93, p=0.03) or OS (HR=0.44, 95% CI 0.30-0.65, p<0.0001) in ERa-negative patients. We did not observe an association between ERb mRNA levels and DFS and OS. In this study, we showed that IHC ERb status, rather than mRNA levels, is a prognostic factor that is associated with DFS and OS in breast cancer patients."

According to the news editors, the research concluded: "The prognostic value of ERb may be higher in ERa-negative patients than in ERa-positive patients."

For more information on this research see: Estrogen receptor beta as a prognostic factor in breast cancer patients: A systematic review and meta-analysis. Oncotarget, 2016;7 (9):10373-85.

Oncology - Breast Cancer

Findings in the Area of Breast Cancer Reported from University of Fudan (mTOR complex-2 stimulates acetyl-CoA and de novo lipogenesis through ATP citrate lyase in HER2/PIK3CA hyperactive breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "The mechanistic target of rapamycin (mTOR) is a major regulator of cell growth and is frequently dysregulated in cancer. While mTOR complex-1 (mTORC1) is a validated cancer target, the role of mTOR complex-2 (mTORC2) remains less defined."

The news reporters obtained a quote from the research from the University of Fudan, "Here, we reveal mTORC2 as a critical regulator of breast cancer metabolism. We showed that hyperphosphorylation in ATP citrate lyase (ACL) occurs frequently in human breast tumors and correlates well with HER2+ and/or PIK3CA-mutant (HER2+/PIK3CAmut) status in breast tumor cell lines. In HER2+/PIK3CAmut cells, mTORC2 controls Ser-455 phosphorylation of ACL thereby promoting acetyl-CoA production, de novo lipogenesis and mitochondrial physiology, all of which were inhibited by an mTORC1/mTORC2 kinase inhibitor (mTOR-KI) or cellular depletion of mTORC2 or ACL. mTOR-KI but not rapamycin blocked the IGF-1-induced ACL phosphorylation and glucose to lipid conversion. Depletion of mTORC2 but not mTORC1 specifically inhibited the ACL-dependent acetyl-CoA production. In the HER2+/PIK3CAmut MDA361, MDA453, BT-474 and T47D cells, depletion of mTORC2 or ACL led to growth inhibition and mitochondrial hyperpolarization, which were partially rescued by an alternate source of acetyl-CoA. These same changes were not apparent in mTORC2- or ACL-depleted HER2-/PIK3CAwt MDA231 and HCC1806 cells, highlighting a differential dependence of mTORC2-ACL for survival in these two cell types. Moreover, ACL Ser-455 mutants S455E (phosphomimetic) and S455A (non-phosphorylatable) each increased or decreased, respectively, the acetyl-CoA production, mitochondrial homeostasis and survival in ACL-depleted MDA453 cells."

According to the news reporters, the research concluded: "These studies define a new and rapamycin-resistant mechanism of mTORC2-ACL in lipogenesis and acetyl-CoA biology..."
and provide a rationale for targeting of mTORC1 and mTORC2 in HER2+/PIK3CAmut breast cancer."

For more information on this research see: mTOR complex-2 stimulates acetyl-CoA and de novo lipogenesis through ATP citrate lyase in HER2/PIK3CA-hyperactive breast cancer. Oncotarget, 2016;7(18):25224-40.

Our news correspondents report that additional information may be obtained by contacting Y. Chen, Dept. of Pharmacology, Fudan University School of Pharmacy, Shanghai, People's Republic of China. Oncology - Cancer Research

Findings in the Area of Cancer Research Reported from National University (Cancer-related fatigue in post-treatment cancer survivors: application of the common sense model of illness representations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Cancer Research is the subject of a report. According to news reporting out of Galway, Ireland, by NewsRx editors, research stated, "Cancer-related fatigue (CrF) is a common and disruptive symptom that may be experienced during and after cancer. Research into the subjective experience of fatigue in this group is required."

Our news journalists obtained a quote from the research from National University, "The common sense model of self-regulation of health and illness (SRM) addresses personal beliefs or mental representations—whether medically sound or unsubstantiated—that a person holds about a health issue. The current study assesses if the SRM could be used as a theoretical framework for organizing the experiences of people with CrF, with a view to identifying methods to address fatigue in cancer survivors. Four focus groups were held with a total of 18 cancer survivors who reported they experienced 'significant fatigue or reduced energy.' A thematic analysis was conducted within the framework of the SRM. Findings were aligned with the SRM, with participants discussing fatigue with reference to representation, coping, and appraisal of symptoms. In particular, the wider social context of CrF was frequently addressed. Perceived inadequacies in support available to those with lingering fatigue after the completion of cancer treatment were highlighted by the participants. This study explored the subjective experience of fatigue after cancer using the SRM. CrF should be approached as a complex psychosocial issue and considered from the patient perspective to facilitate better understanding and management of symptoms."

According to the news editors, the research concluded: "The SRM is an applicable framework for identifying modifiable factors that could lead to improved coping with CrF in post-treatment cancer survivors."

Our news journalists report that additional information may be obtained by contacting T. Corbett, Natl Univ Ireland Galway, Sch Psychol, Galway, Ireland. Additional authors for this research include A. Groarke, J.C. Walsh and B.E. McGuire.

Keywords for this news article include: Galway, Ireland, Europe, Cancer Research, Oncology, Cancer, National University.

Carcinogenesis

Findings in the Area of Carcinogenesis Reported from Dow Chemical

[Methyl isobutyl ketone-induced hepatocellular carcinogenesis in B6C3F(1) mice: A constitutive androstane receptor (CAR)-mediated mode of action]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Carcinogenesis. According to news reporting originating in Midland, Michigan, by NewsRx journalists, research stated, "In a National Toxicology Program (NTP) chronic inhalation study with methyl isobutyl ketone (MIBK), increases in hepatocellular adenomas and hepatocellular adenomas and carcinomas (combined) were observed in male and female B6C3F(1) mice at 1800 ppm. A DNA reactive Mode-of-Action (MOA) for this liver tumor response is not supported by the evidence as MIBK and its major metabolites lack genotoxicity in both in vitro and in vivo studies."

The news reporters obtained a quote from the research from Dow Chemical, "Constitutive androstane receptor (CAR) nuclear receptor mediated activation has been hypothesized as the MOA for MIBK-induced mouse liver tumorigenesis. To further investigate the MOA for MIBK-induced murine liver tumors, male and female B6C3F1, C57BL/6, and CAR/PXR Knockout (KO) mice were exposed to either 0 or 1800 ppm MIBK for 6 h/day, 5 days/week for a total of 10 days. On day 1, mice were implanted with osmotic mini-pumps containing 5-Bromo-2-deoxyuridine (BrdU) 1 h following exposure and humanely euthanized 1-3 h following the final exposure. B6C3F(1) and C57BL/6 mice had statistically significant increases in liver weights compared to controls that corresponded with hepatocellular hypertrophy and increased mitotic figures. Hepatocellular proliferation data indicated induction of S-phase DNA synthesis in B6C3F(1) and C57BL/6 mice exposed to 1800 ppm MIBK compared to control, and no increase was observed in MIBK exposed CAR/PXR KO mice. Liver gene expression changes indicated a maximally-induced Cyp2b10 (CAR-associated) transcript and a slight increase in Cyp3a11(PXR-associated) transcript in B6C3F(1) and C57BL/6 mice exposed to 1800 ppm MIBK compared to controls, but not in Cyp1a1 (AhR-associated) or Cyp4a10 (PPAR-alpha-associated) transcripts. CAR/PXR KO mice exposed to 1800 ppm MIBK showed no evidence of activation of AhR, CAR, PXR or PPAR-alpha nuclear receptors via their associated transcripts."

According to the news reporters, the research concluded: "MIBK induced hepatic
effects are consistent with a phenobarbital-like MOA where the initiating events are activation
of the CAR and PXR nuclear receptors and resultant hepatocellular proliferation leading to
rodent liver tumors."

For more information on this research see: Methyl isobutyl ketone-induced hepatocellular
carcinogenesis in B6C3F(1) mice: A constitutive androstane receptor (CAR)-

Cardiology

Findings in the Area of Cardiology Reported from Children's Hospital
(Acetylation of VGLL4 Regulates Hippo-YAP Signaling and Postnatal
Cardiac Growth)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Cardiology are discussed in a new report. According
to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated,
"Binding of the transcriptional co-activator YAP with the transcription factor TEAD stimulates
growth of the heart and other organs. YAP overexpression potently stimulates fetal
cardiomyocyte (CM) proliferation, but YAP's mitogenic potency declines postnatally."

Funders for this research include NIH, AHA Established, American Heart
Association Scientist Development.

The news reporters obtained a quote from the research from Children's Hospital,
"While investigating factors that limit YAP's postnatal mitogenic activity, we found that the CM
enriched TEAD1 binding protein VGLL4 inhibits CM proliferation by inhibiting TEAD1-YAP
interaction and by targeting TEAD1 for degradation. Importantly, VGLL4 acetylation at lysine
225 negatively regulated its binding to TEAD1. This developmentally regulated acetylation
event critically governs postnatal heart growth, since overexpression of an acetylation-refractory
VGLL4 mutant enhanced TEAD1 degradation, limited neonatal CM proliferation, and caused
CM necrosis. Our study defines an acetylation-mediated, VGLL4-dependent switch that
regulates TEAD stability and YAP-TEAD activity."

According to the news reporters, the research concluded: "These insights may
improve targeted modulation of TEAD-YAP activity in applications from cardiac regeneration
to cancer."

For more information on this research see: Acetylation of VGLL4 Regulates Hippo-
Findings in the Area of Cardiology Reported from Nagoya University
(Predictors of surgery-induced muscle proteolysis in patients undergoing cardiac surgery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiology are presented in a new report. According to news reporting out of Nagoya, Japan, by NewsRx editors, research stated, "Muscle proteolysis due to post-operative hypercatabolism is responsible for the functional decline observed in patients undergoing cardiac surgery. The aim of this study was to explore the factors underlying increased muscle proteolysis by measuring the urinary 3-methylhistidine/creatinine ratio (3-MH/Cr) in patients who had recently undergone cardiac surgery."

Our news journalists obtained a quote from the research from Nagoya University, "Sixty-nine patients undergoing elective cardiac surgery participated in this study. The 24-h urinary 3-MH/Cr was collected for 3 days after surgery. Serum levels of metabolic markers, amino acids, and skeletal muscle strength were measured before and after surgery. Cumulative 3-MH/Cr during 3 days after surgery (cum3-MH/Cr) was 676.7 +/- 169.0 nmol/g Cr, and was positively associated with the decrease in muscle strength. In multivariate analysis, factors associated with an increased cum3MH/Cr were preoperative grip strength (beta = -0.309, p = 0.003), body mass index (beta = -0.299, p = 0.001), hemoglobin (beta = -0.243, p = 0.007), cardiopulmonary bypass time (beta = 0.184, p = 0.049), and immediate post-operative interleukin-6 (beta = 0.295, p = 0.002). Our findings suggest that post-operative muscle proteolysis is facilitated by preoperative catabolic accelerators in patients undergoing cardiac surgery."

According to the news editors, the research concluded: "The factors of muscle proteolysis immediately after surgery may be a novel therapeutic target in rehabilitation intervention."

For more information on this research see: Predictors of surgery-induced muscle proteolysis in patients undergoing cardiac surgery. *Journal of Cardiology*, 2016;68(5-6):536-541. *Journal of Cardiology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae
Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Cardiology - www.journals.elsevier.comjournal-of-cardiology/)

**Cardiovascular Diseases**

**Findings in the Area of Cardiovascular Diseases Reported from Azienda Ospedaliera University (Hypolipidemic drugs in elderly subjects: Indications and limits)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases are presented in a new report. According to news reporting out of Ferrara, Italy, by NewsRx editors, research stated, "Cardiovascular disease is a major cause of death worldwide. Safety and efficacy of lipid lowering therapy have been clearly established for either primary and secondary prevention of cardiovascular events in adults."

Our news journalists obtained a quote from the research from Azienda Ospedaliera University, "Nevertheless, the use of hypolipidemic drugs in elderly individuals, especially in the oldest ones, still raises some concerns. Aim of this paper is to review indications and limits of lipid lowering in advanced age, furnishing a practical medical attitude tempered by clinical and geriatric competences. Data synthesis: While figures from randomized controlled trials and from observational studies seem to support the use of lipid lowering drugs for secondary prevention in the elderly, drawing inferences from primary prevention in old populations is far more challenging. Although these pharmacological agents seem to reduce the incidence of cardiovascular events, they do not prolong survival. In addition, there is some doubt about the cost-effectiveness of treatment because of a more delicate balance between benefit and potential adverse reactions. However, lipid-lowering drugs seem largely underutilized in older age, mainly due to safety concerns that must be reconsidered, at least in part, given the somewhat reassuring results deriving from specific cohort surveys. Data on the use and on the effects of lipid lowering drugs in elderly populations are incomplete, especially those concerning very old subjects without established cardiovascular disease."

According to the news editors, the research concluded: "Comprehensive guidelines for the management of dyslipidemias in this rapidly-growing population is a urgent need, and treatment should be based, besides the aforementioned considerations, on patient preferences, cognitive function and life expectancy."

For more information on this research see: Hypolipidemic drugs in elderly subjects: Indications and limits. *Nutrition Metabolism and Cardiovascular Diseases*, 2016;26(12):1064-
Findings in the Area of Cell Transplants Reported from Institute for Cancer Research and Treatment (IRCCS) (Treosulfan based reduced toxicity conditioning followed by allogeneic stem cell transplantation in patients with myelofibrosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Cell Transplants is now available. According to news reporting originating from Milan, Italy, by NewsRx correspondents, research stated, "Allogeneic transplantation is the only potentially curative strategy for myelofibrosis, even in the era of new drugs that so far only mitigate symptoms. The choice to proceed to allogeneic transplantation is based on several variables including age, disease phase, degree of splenomegaly, donor availability, comorbidities and iron overload."

Our news editors obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "These factors, along with conditioning regimen and time to transplantation, may influence the outcome of ASCT. We report 14 patients affected by myelofibrosis with a median age of 57 years (range, 41-76) receiving a treosulfan-fludarabine based reduced toxicity conditioning. Patients (pts) received a stem cell transplantation from an HLA identical (n = 10) or matched unrelated donor (n = 4). All pts had a complete myeloablation followed by engraftment and in 12 out of 13 evaluated pts donor chimerism was 100% at 1 month. In most cases a reduction of splenomegaly and a reduction (or resolution) of bone marrow fibrosis was observed. After a median follow-up of 39 months (range, 3-106), the 3-year probability of overall survival and disease free survival was 54 +/- 14% and 46 +/- 14%, respectively. The cumulative incidence of non-relapse mortality at 2 years was 39 +/- 15%. Causes of non-relapse mortality were: infection (n = 2), GvHD (n = 2) and haemorrhage (n = 1)."

According to the news editors, the research concluded: "We can conclude that a treosulfan and fludarabine based conditioning has a potent myeloablative and anti-disease activity although non-relapse mortality remains high in this challenging clinical setting."

For more information on this research see: Treosulfan based reduced toxicity conditioning followed by allogeneic stem cell transplantation in patients with myelofibrosis. *Hematological Oncology*, 2016;34(3):154-160. *Hematological Oncology* can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Wiley-Blackwell -
Findings in the Area of Chemotherapy Reported from University of Toronto (Approach to evaluation of fever in ambulatory cancer patients receiving chemotherapy: A systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Chemotherapy. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "To define the optimal model of care for patients receiving outpatient chemotherapy who experience a fever. Fever is a common symptom in patients receiving chemotherapy, but the approach to evaluation of fever is not standardized."

Our news editors obtained a quote from the research from the University of Toronto, "We conducted a search for existing guidelines and a systematic review of the primary literature from database inception to November 2015. Full-text reports and conference abstracts were considered for inclusion. The search focused on the following topics: the relationship between temperature and poor outcome; predictors for the development of febrile neutropenia (FN); the timing, location, and personnel involved in fever assessment; and the provision of information to patients receiving chemotherapy. Eight guidelines and 38 studies were included. None of the guidelines were directly relevant to the target population because they dealt primarily with the management of FN after diagnosis. The primary studies tended to include fever as one of many symptoms assessed in the setting of chemotherapy. Temperature level was a weak predictor of poor outcomes. We did not find validated prediction models for identifying patients at risk of FN among patients receiving chemotherapy. Several studies presented approaches to symptom management that included fever among the symptoms, but results were not mature enough to merit widespread adoption. Despite the frequency and risks of fever in the setting of chemotherapy, there is limited evidence to define who needs urgent assessment, where the assessment should be performed, and how quickly."

According to the news editors, the research concluded: "Future research in this area is greatly needed to inform new models of care."

For more information on this research see: Approach to evaluation of fever in ambulatory cancer patients receiving chemotherapy: A systematic review. Cancer Treatment Reviews, 2016;51():35-45. Cancer Treatment Reviews can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. (Elsevier -

Oncology - Chronic Lymphocytic Leukemia

Findings in the Area of Chronic Lymphocytic Leukemia Reported from University of Oslo (National trends in incidence and survival of chronic lymphocytic leukemia in Norway for 1953-2012: a systematic analysis of population-based data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Chronic Lymphocytic Leukemia have been published. According to news reporting originating in Oslo, Norway, by NewsRx journalists, research stated, "Chronic lymphocytic leukemia is a disease of the elderly, and despite major advances in treatment, remains incurable. The Cancer Registry of Norway has registered data on patients with chronic lymphocytic leukemia since 1953."

The news reporters obtained a quote from the research from the University of Oslo, "We aimed to analyze trends in incidence and survival of chronic lymphocytic leukemia in Norway. We identified 7664 patients reported with chronic lymphocytic leukemia to the registry between 1953 and 2012. We gathered information on sex, age at diagnosis, date of death and basis for diagnosis. The age-standardized incidence increased from 0.6/100,000 person-years in 1953 to 3.1/100,000 person-years in 2012. We found a significant decrease in median age between 1993-2002 and 2003-2012 (75 vs. 72 years, 95% CI: 2.52-3.98, P< 0.001). Men were diagnosed at a significantly younger age than women. Immunophenotyping has become the most important diagnostic method after 2002. Median observed survival increased from 3 years in 1952-1963 to 8.5 years in 2003-2012. Five- and 10-year age-standardized net survival increased throughout the whole period across age groups and reached 79% and 57%, respectively. Median observed survival was significantly shorter in men than in women in 1993-2002 (4.9 vs. 6.1 years, P< 0.001). The gap between survival rates for men and women was diminishing in 2003-2012 in patients younger than 60 years while it remained considerable in older patients. Despite an aging Norwegian population, chronic lymphocytic leukemia (CLL) patients become younger at diagnosis."

According to the news reporters, the research concluded: "A fourfold increase in incidence, a prolonged survival, and major changes in diagnostic methods in Norway were observed."

Our news correspondents report that additional information may be obtained by contacting A. Lenartova, University of Oslo, Inst Clin Med, Fac Med, Oslo, Norway. Additional authors for this research include T.B. Johannesen and G.E. Tjonnfjord.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cam4.849. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Oslo, Norway, Europe, Leukemia, Diagnostics and Screening, Chronic Lymphocytic Leukemia, Hematology, Oncology, University of Oslo.

Drugs and Therapies - Clinical Therapeutics

Findings in the Area of Clinical Therapeutics Reported from National University [The Internal Reliability of Family Crisis Oriented Personal Evaluation Scale (F-COPES) in Malay version among caregivers of individual with learning disabilities]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Clinical Therapeutics are presented in a new report. According to news reporting originating in Kuala Lumpur, Malaysia, by NewsRx journalists, research stated, "Caregivers face challenges to adapt while handling individual with learning disabilities (LD). The Family Crisis Oriented Personal Evaluation Scale (F-COPES) is a widely used instrument to measure coping strategies among caregivers."

The news reporters obtained a quote from the research from National University, "The current study performed cross cultural translation of F-COPES in Malay language. This study aims to examine the reliability by testing internal consistency of Malay version of F-COPES which is developed through back to back translation method from original English version. The Malay version of F-COPES was administered among 30 caregivers. The reliability of F-COPES in Malay version is good with Cronbach's alpha coefficient value of 0.79. The internal consistency on sub domains of F-COPES such as reframing, acquiring social support and seeking spiritual support also acceptable with Cronbach's alpha values 0.67, 0.74, and 0.80, respectively."

According to the news reporters, the research concluded: "The Malay version of F-COPES is a reliable tool to evaluate the coping strategies adopted by the caregivers of individual with LD."

For more information on this research see: The Internal Reliability of Family Crisis Oriented Personal Evaluation Scale (F-COPES) in Malay version among caregivers of individual with learning disabilities. La Clinica Terapeutica, 2015;166(6):e361-4.

Our news correspondents report that additional information may be obtained by
Findings in the Area of Clinical Trials and Studies Reported from China Medical University and Hospital (Subintimal angioplasty for lower limb arterial chronic total occlusions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news reporting from Shenyang, People's Republic of China, by NewsRx journalists, research stated, "In recent years subintimal angioplasty (SIA) has become an established percutaneous procedure for the treatment of symptomatic lower limb arterial chronic total occlusions. However, the clinical benefits of this practice remain unclear."

The news correspondents obtained a quote from the research from China Medical University and Hospital, "The aim of the review was to determine the effectiveness of SIA on clinical outcomes. This is an update of a review first published in 2013. To assess the effectiveness of SIA versus other treatment for people with lower limb arterial chronic total occlusions, determined by the effects on clinical improvement, technical success rate, patency rate, limb salvage rate, and morbidity rates. Search methods The Cochrane Vascular Information Specialist searched the Cochrane Vascular Specialised Register (last searched January 2016) and Cochrane Central Register of Controlled Trials (CENTRAL) (2015, Issue 12). We also searched clinical trials registries. Selection criteria We included data from randomized controlled trials comparing the effectiveness of SIA and any other management method in the treatment of lower limb arterial chronic total occlusions. The primary intervention of interest was SIA, with or without a stent, for the restoration of vessel patency in people with occlusions of a lower limb artery. We compared SIA against alternative modalities used to restore vessel patency, including conventional percutaneous transluminal angioplasty, surgical bypass, or any other treatments. We compared different SIA devices and techniques against each other. Data collection and analysis Two review authors independently selected trials, assessed trials for eligibility and methodological quality, and extracted data. The third review author resolved disagreements. Two studies, involving a total of 147 participants with TransAtlantic Inter-Society Consensus (TASC)-II D femoral-popliteal lesions, met our inclusion criteria and were included in the review. Both studies were small but otherwise of high methodological quality. However, the treatment techniques and control groups of the two studies differed, precluding the combining of study results and resulting in the evidence being less applicable. We therefore considered the quality of the evidence to be low. In one study, participants with TASC-II D lesions were randomized to receive either SIA with stenting of the superficial femoral artery or remote endarterectomy (RE) with stenting of the superficial femoral artery. Three-year follow-up results showed a Rutherford classification improvement of 64% in the SIA group compared to 80% in the RE group (risk ratio (RR) 0.79, 95% confidence interval (CI) 0.61 to 1.03; 95 participants; P = 0.079). Postexercise ankle brachial index improvements
(defined as an increased value of 0.2) were reported in 70% of participants in the SIA group compared to 82% in the RE group (RR 0.86, 95% CI 0.68 to 1.08; 95 participants; P = 0.18). The study reported the technical success rate was 93% for the SIA group and 96% for the RE group (RR 0.97, 95% CI 0.88 to 1.07; 95 participants; P = 0.91). Primary patency at 12 months was 59.1% in the SIA group compared to 78.4% in the RE group (RR 0.75, 95% CI 0.57 to 1.00; 95 participants; P = 0.05). Primary patency at 24 months was 56.8% in the SIA group compared to 76.5% in the RE group (RR 0.74, 95% CI 0.55 to 1.00; 95 participants; P = 0.05) and 47.7% in the SIA group and 62.7% in the RE group at 36 months (RR 0.76, 95% CI 0.52 to 1.11; 95 participants; P = 0.15). Assisted primary patency was 52.3% in the SIA group compared to 70.6% in the RE group (P = 0.01) at 36 months. Secondary patency was better for the RE group (P = 0.03) at 36 months. Limb salvage at three years' follow-up was 95% in the SIA group and 98% in the RE group (RR 0.97, 95% CI 0.90 to 1.05; 95 participants; P = 0.4).

There were no perioperative deaths, but complications occurred in two SIA participants (femoral pseudoaneurysm and pulmonary edema) and in three RE participants (seroma, femoral pseudoaneurysm, superficial femoral artery acute occlusion). In the second study, the effects of the SIA OUTBACK re-entry catheter device in people affected by TASC-II D superficial femoral artery chronic total occlusion were compared with the SIA manual re-entry technique. This study did not report clinical improvement and limb salvage. Technical success was achieved in all cases in both the OUTBACK device and manual groups. The primary 6-month patency rate was 100% in the OUTBACK group (26 of 26 participants) compared to 96.2% in the manual group (25 of 26 participants) (RR 1.04, 95% CI 0.94 to 1.15). The primary 12-month patency rate was 92.3% in the OUTBACK group (24 of 26 participants) compared to 84.6% in the manual group (22 of 26 participants) (RR 1.09, 95% CI 0.90 to 1.33). Patency rates at 24 and 36 months were not reported. The study reported that there were no complications. Authors' conclusions Using the GRADE approach, we classified the quality of the evidence presented by both studies in this review as low due to small study size and the small number of studies. In addition, the two included trials differed from each other in the techniques and control used, and we were therefore unable to combine the data. Consequently there is currently insufficient evidence to support SIA over other techniques."

According to the news reporters, the research concluded: "Evidence from more randomized controlled trials is needed to assess the role of SIA in people with chronic lower limb arterial total occlusions."

For more information on this research see: Subintimal angioplasty for lower limb arterial chronic total occlusions. Cochrane Database of Systematic Reviews, 2016;(11):350-388. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

**Gram-Positive Bacteria - Clostridium thermocellum**

**Findings in the Area of Clostridium thermocellum Reported from National Renewable Energy Laboratory (CO2-fixing one-carbon metabolism in a cellulose-degrading bacterium Clostridium thermocellum)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Positive Bacteria - Clostridium thermocellum are presented in a new report. According to news reporting originating from Golden, Colorado, by NewsRx correspondents, research stated, "Clostridium thermocellum can ferment cellululosic biomass to formate and other end products, including CO2. This organism lacks formate dehydrogenase (Fdh), which catalyzes the reduction of CO2 to formate."

Our news editors obtained a quote from the research from National Renewable Energy Laboratory, "However, feeding the bacterium C-13-bicarbonate and cellobiose followed by NMR analysis showed the production of C-13-formate in C. thermocellum culture, indicating the presence of an uncharacterized pathway capable of converting CO2 to formate. Combining genomic and experimental data, we demonstrated that the conversion of CO2 to formate serves as a CO2 entry point into the reductive one-carbon (C1) metabolism, and internalizes CO2 via two biochemical reactions: the reversed pyruvate: ferredoxin oxidoreductase (rPFOR), which incorporates CO2 using acetyl-CoA as a substrate and generates pyruvate, and pyruvate-formate lyase (PFL) converting pyruvate to formate and acetyl-CoA. We analyzed the labeling patterns of proteinogenic amino acids in individual deletions of all five putative PFOR mutants and in a PFL deletion mutant. We identified two enzymes acting as rPFOR, confirmed the dual activities of rPFOR and PFL crucial for CO2 uptake, and provided physical evidence of a distinct in vivo ‘rPFOR-PFL shunt' to reduce CO2 to formate while circumventing the lack of Fdh. Such a pathway precedes CO2 fixation via the reductive C1 metabolic pathway in C. thermocellum."

According to the news editors, the research concluded: "These findings demonstrated the metabolic versatility of C. thermocellum, which is thought of as primarily a cellulitic heterotroph but is shown here to be endowed with the ability to fix CO2 as well."

For more information on this research see: CO2-fixing one-carbon metabolism in a cellulose-degrading bacterium Clostridium thermocellum. *Proceedings of the National Academy of Sciences of the United States of America*, 2016;113(46):13180-13185.

Oncology - Colon Cancer

Findings in the Area of Colon Cancer Reported from University of Melbourne [Synthesis of an inositol hexakisphosphate (IP6) affinity probe to study the interactome from a colon cancer cell line]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news originating from Parkville, Australia, by NewsRx correspondents, research stated, "Inositol hexakisphosphate (InsP6 or IP6) is an important signalling molecule in vesicular trafficking, neurotransmission, immune responses, regulation of protein kinases and phosphatases, activation of ion channels, antioxidant functions and anticancer activities. An IP6 probe was synthesised from myo-inositol via a derivatised analogue, which was immobilised through a terminal amino group onto Dynabeads."

Our news journalists obtained a quote from the research from the University of Melbourne, "Systematic analysis of the IP6 interactome has been performed using the IP6 affinity probe using cytosolic extracts from the LIM1215 colonic carcinoma cell line. LC/MS/MS analysis identified 77 proteins or protein complexes that bind to IP6 specifically, including AP-2 complex proteins and b-arrestins as well as a number of novel potential IP6 interacting proteins."

According to the news editors, the research concluded: "Bioinformatic enrichment analysis of the IP6 interactome reinforced the concept that IP6 regulates a number of biological processes including cell cycle and division, signal transduction, intracellular protein transport, vesicle-mediated transport and RNA splicing."

For more information on this research see: Synthesis of an inositol hexakisphosphate (IP6) affinity probe to study the interactome from a colon cancer cell line. Integrative Biology, 2016;8(3):309-18. (Royal Society of Chemistry - www.rsc.org/; Integrative Biology - pubs.rsc.org/en/journals/journalissues/ib)

Health and Medicine - Cutaneous Medicine and...

Findings in the Area of Cutaneous Medicine and Surgery Reported from Research Institute (Cosmeceuticals in skin of color)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Cutaneous Medicine and
Surgery have been published. According to news reporting originating in Miami, Florida, by NewsRx editors, the research stated, "Patients with skin of color have similar skin care needs as lighter-skin patients."

The news reporters obtained a quote from the research from Research Institute, "However, they are less likely to use sun protection on a daily basis, which leads to an increased risk of dyschromia, skin cancer, and other disorders. This article discusses the importance of a correct and consistent skin care regimen and the various cutaneous issues that should be considered when prescribing a skin care regimen for patients with darker skin types."

According to the news reporters, the research concluded: "Adopting a standardized methodology to identify affordable, efficacious products and to streamline the process of skin-type diagnosis, skin care regimen prescribing, patient communication, and staff education will result in improved patient outcomes and increased patient satisfaction."

Our news correspondents report that additional information may be obtained by contacting L. Baumann, Baumann Cosmet & Res Inst, Miami, FL 33137, United States.

**Health and Medicine - Dermatology**

**Findings in the Area of Dermatology Reported from Philipps University (Research Techniques Made Simple: Mouse Models of Autoimmune Blistering Diseases)***

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Health and Medicine - Dermatology are discussed in a new report. According to news reporting from Marburg, Germany, by NewsRx journalists, research stated, "Autoimmune blistering diseases are examples of autoantibody-mediated, organ-specific autoimmune disorders. Based on a genetic susceptibility, such as a strong HLA-class II association, as yet unknown triggering factors induce the formation of circulating and tissue-bound autoantibodies that are mainly directed against adhesion structures of the skin and mucous membranes."

The news correspondents obtained a quote from the research from Philipps University, "Compared with other autoimmune diseases, especially systemic disorders, the pathogenicity of autoimmune blistering diseases is relatively well described. Several animal models of autoimmune blistering diseases have been established that helped to uncover the immunological and molecular mechanisms underlying the blistering phenotypes. Each in vivo
model focuses on specific aspects of the autoimmune cascade, from loss of immunological tolerance on the level of T and B cells to the pathogenic effects of autoantibodies upon binding to their target autoantigen."

According to the news reporters, the research concluded: "We discuss current mouse models of autoimmune blistering diseases, including models of pemphigus vulgaris, bullous pemphigoid, epidermolysis bullosa acquisita, and dermatitis herpetiformis."

Our news journalists report that additional information may be obtained by contacting R. Eming, Philipps Univ Marburg, Dept. of Dermatol & Allergol, D-35043 Marburg, Germany.

**Drug Development**

**Findings in the Area of Drug Development Reported from Motilal Nehru National Institute of Technology [Self-assembling N-(9-Fluorenylmethoxycarbonyl)-L-Phenylalanine hydrogel as novel drug carrier]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drug Development have been published. According to news reporting originating in Uttar Pradesh, India, by NewsRx journalists, research stated, "Supramolecular hydrogel as a novel drug carrier was prepared from N-(9-Fluorenylmethoxycarbonyl) (Fmoc) modified L-phenylalanine. Its different properties like stability at different pH, temperature and rheology were evaluated in reference to salicylic acid (SA) as a model drug, entrapped in the supramolecular hydrogel network."

The news reporters obtained a quote from the research from the Motilal Nehru National Institute of Technology, "The release behaviour of SA drug in supramolecular hydrogel was investigated by UV-vis spectroscopy. The influence of hydrogelator, pH values of the accepting media, temperature and concentration of SA drug on the release behaviour was investigated under static conditions. The results indicated that the release rate of SA in the supramolecular hydrogels was slightly retarded with an increase of the hydrogelator concentration. Also, the release rates of SA increased with an increase of temperature and its concentration. Furthermore, the release behaviour of SA was found to be different at various pH values in buffers."

According to the news reporters, the research concluded: "The study of the release kinetics indicated that the release behaviour of SA from the carrier was in accord with the Peppas model and the diffusion controlled mechanism involved in the Fickian model."

For more information on this research see: Self-assembling N-(9-Fluorenylmethoxycarbonyl)-L-Phenylalanine hydrogel as novel drug carrier. *International*

**Drugs and Therapies - Drug Targets**

**Findings in the Area of Drug Targets Reported from CNIO**

**Antiangiogenic Resistance and Cancer Metabolism: Opportunities for Synthetic Lethality**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Drug Targets are discussed in a new report. According to news reporting from Madrid, Spain, by NewsRx journalists, research stated, "Antiangiogenic resistance is a major problem in cancer therapeutics. Preclinical research has identified several compensatory proangiogenic pathways that arise upon vascular endothelial growth factor inhibition, several of which have led to the development of novel drugs."

The news correspondents obtained a quote from the research from CNIO, "However, the combination of two or more targeted agents in the angiogenesis system is hampered by toxicity, as the system is involved in normal physiology. We propose a different approach for improving the efficacy of this drug class, which takes advantage of aberrant cancer metabolism. Several features distinguish cancer metabolism from that of normal cells, including increased glycolysis, glutaminolysis, and pentose-phosphate shunt, as well as an anaplerotic shift of the Krebs cycle. In addition, these aberrations are driven by most of the common mutations that can be targeted by drugs. Antiangiogenics may hamper the ability of cancer to sustain aberrant metabolism due to their impacts on nutrient and oxygen supplies, and thus they may induce some metabolic pathways to become essential for tumor survival (induced essentiality or contextual lethality, a type of synthetic lethality). Thus, some metabolic and signaling pathways that are otherwise nonessential may induce synthetic lethality when inhibited in combination with antiangiogenics. The key problems, however, are interpatient and intratumor heterogeneity, as not all patients with the same tumor type show the same metabolic traits and the same metabolic reprogramming in response to antiangiogenics. With each cancer there are
heterogeneous hypoxic areas."

According to the news reporters, the research concluded: "Integrating dynamic tracking of metabolism may allow us to tailor our choices of companion drugs with antiangiogenics, taking advantage of window-of-opportunity designs."

**Gram-Positive Bacteria - Enterococcus faecalis**

**Findings in the Area of Enterococcus faecalis Reported from University of Zurich (The Heterodimeric ABC Transporter EfrCD Mediates Multidrug Efflux in Enterococcus faecalis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - Enterococcus faecalis. According to news reporting originating in Zurich, Switzerland, by NewsRx journalists, research stated, "Nosocomial infections with Enterococcus faecalis are an emerging health problem. However, drug efflux pumps contributing to intrinsic drug resistance are poorly studied in this Gram-positive pathogen."

Funders for this research include Gouvernement du Canada | Canadian Institutes of Health Research (CIHR), Schweizerischer Nationalfonds zur Forderung der Wissenschaftlichen Forschung (SNF).

The news reporters obtained a quote from the research from the University of Zurich, "In this study, we functionally investigated seven heterodimeric ABC transporters of E. faecalis that are annotated as drug efflux pumps. Deletion of ef0789-ef0790 on the chromosome of E. faecalis resulted in increased susceptibility to daunorubicin, doxorubicin, ethidium, and Hoechst 33342, and the corresponding transporter was named EfrCD. Unexpectedly, the previously described heterodimeric multidrug ABC transporter EfrAB contributes marginally to drug efflux in the endogenous context of E. faecalis. In contrast, heterologous expression in Lactococcus lactis revealed that EfrAB, EfrCD, and the product of ef2226-ef2227 (EfrEF) mediate the efflux of fluorescent substrates and confer resistance to multiple dyes and drugs, including fluoroquinolones. Four of seven transporters failed to exhibit drug efflux activity for the set of drugs and dyes tested, even upon overexpression in L. lactis. Since all seven transporters were purified as heterodimers after overexpression in L. lactis, a lack of drug efflux activity is not
attributed to poor expression or protein aggregation. Reconstitution of the purified multidrug transporters EfrAB, EfrCD, and EfrEF in proteoliposomes revealed functional coupling between ATP hydrolysis and drug binding."

According to the news reporters, the research concluded: "Our analysis creates an experimental basis for the accurate prediction of drug efflux transporters and indicates that many annotated multidrug efflux pumps might be incapable of drug transport and thus might fulfill other physiological functions in the cell."

For more information on this research see: The Heterodimeric ABC Transporter EfrCD Mediates Multidrug Efflux in Enterococcus faecalis. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5400-5411. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting M.A. Seeger, University of Zurich, Inst Med Microbiol, Zurich, Switzerland. Additional authors for this research include V. Corradi, M. Hohl, G.V. Bloemberg, D.P. Tieleman and M.A. Seeger.

Oncology - Esophageal Cancer

**Findings in the Area of Esophageal Cancer Reported from Department of Thoracic Surgery (LeNeoadjuvant chemoradiation treatment followed by surgery for esophageal cancer: there is much more than the Mandard tumor regression score)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Esophageal Cancer is now available. According to news reporting originating from Leuven, Belgium, by NewsRx correspondents, research stated, "Tumor regression grading (TRG) systems categorize residual tumor volume on the primary tumor after neoadjuvant treatment. Aim was to evaluate the impact of Mandard TRG, residual tumor depth (ypT) and residual lymph node status (ypN) and extent (ELNI) i.e. intracapsular versus extracapsular involvement on overall (OS) and disease-free survival (DFS) in esophageal carcinoma."

Our news editors obtained a quote from the research from the Department of Thoracic Surgery, "Between 2005 and 2014, 344 patients receiving R0-esophagectomy after neoadjuvant chemoradiation therapy (nCRT) were selected. Mandard TRG, ypTN and ELNI were prospectively recorded. Mandard TRG1 was found in 110 (32%); TRG2 in 120 (35%); TRG3 in 53 (15%); TRG4 in 54 (16%) and TRG5 in 7 (2%) patients. Both OS and DFS showed no significant difference between TRG1 and 2 (p = 0.059 and 0.105, respectively). Therefore,
TRG1/2 was classified together as `major response', TRG3/4 as 'minor response' and TRG5 as 'no response'. Multivariate analysis showed two independent prognosticators for OS (tumor regression response (TRR) and number of positive lymph nodes) and three independent prognosticators for DFS (TRR, ypT and ELNI). After nCRT followed by surgery for esophageal carcinoma, number of residual positive lymph nodes as well as TRR are prognosticators for OS."

According to the news editors, the research concluded: "Minor TRR, ypT and extracapsular lymph node invasion are prognosticators for recurrence."

For more information on this research see: leNeoadjuvant chemoradiation treatment followed by surgery for esophageal cancer: there is much more than the standard tumor regression score. *Acta Chirurgica Belgica*, 2016;116(3):149-155. *Acta Chirurgica Belgica* can be contacted at: Acta Medical Belgica, Avenue Circulaire 138 A, B-1180 Brussels, Belgium.

The news editors report that additional information may be obtained by contacting L. Depypere, UZ Leuven Gasthuisberg, Dept. of Thoracic Surg, Leuven, Belgium. Additional authors for this research include J. Moons, T. Lerut, G. De Hertogh, X. Sagaert, W. Coosemans, H. Van Veer, A. Renders and P. Naeftex.

Oncology - Esophageal Cancer

Findings in the Area of Esophageal Cancer Reported from Hubei University of Medicine (Tooth loss is associated with increased risk of esophageal cancer: evidence from a meta-analysis with dose-response analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Esophageal Cancer have been published. According to news reporting from Shiyan, People's Republic of China, by NewsRx journalists, research stated, "Epidemiological studies have revealed the association between tooth loss and the risk of esophageal cancer (EC); however, consistent results were not obtained from different single studies. Therefore, we conducted the present meta-analysis to evaluate the association between tooth loss and EC."

The news correspondents obtained a quote from the research from the Hubei University of Medicine, "We conducted electronic searches of PubMed until February 10, 2015 to identify relevant observational studies that examined the association between tooth loss and the risk of EC. Study selection and data extraction from eligible studies were independently performed by two authors. The meta-analysis was conducted using Stata 12.0 software. Finally eight eligible publications with ten studies involving 3 cohort studies, 5 case-control studies, and 1 cross-sectional study were yielded. Meta-analysis identified tooth loss increased risk of EC 1.30 times (Relative risk=1.30, 95% confidence interval=1.06-1.60, I(2)=13.5%). Dose-response analysis showed linear relationship between tooth loss and risk of EC (RR=1.01, 95% CI=1.00-1.03; P for non-linearity test was 0.45). Subgroup analysis proved similar results and publication bias was not detected."

According to the news reporters, the research concluded: "Tooth loss could be
considered to be a significant and dependent risk factor for EC based on the current evidence."

For more information on this research see: Tooth loss is associated with increased risk of esophageal cancer: evidence from a meta-analysis with dose-response analysis. *Scientific Reports*, 2016;6():18900. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

**Drugs and Therapies - Ethnopharmacology**

**Findings in the Area of Ethnopharmacology Reported from Department of Microbiology (Myrtus communis L. and its application in treatment of Recurrent Aphthous Stomatitis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Ethnopharmacology are presented in a new report. According to news reporting originating in Kashan, Iran, by NewsRx editors, the research stated, "Ethnopharmacological relevance: In Iranian Traditional Medicine, M. communis is a famous plant in treatment of oral ulcers and 'Gholaa'- the ancient name of aphthous. The aim of this review is to create a bridge between the traditional claims about the application of M. communis in treatment of 'Gholaa' and its prescription for aphthous, the current form of 'Gholaa' in modern medicine Methods: We extracted the information about the application of M. communis in treatment of aphthous from different resources including Google scholar, Pubmed, ScienceDirect, Springer, ethnobotanical, the traditional books from Traditional Medicine Tehran University of Medical Sciences."

Financial support for this research came from Medicinal Plants, Research Center of Barij, Kashan, Iran.

The news reporters obtained a quote from the research from the Department of Microbiology, "In Iranian traditional texts, 'Gholaa' was the corrosive diseases on the surface and inner layer of mouth and tongue and divided into three types of bloody, phlegmatic and burned black bile types. Recurrent Aphthous Stomatitis (RAS) is equal to the black bile and phlegmatic types and minor aphthous type can be matched with phlegmatic type. The corrosive propagated lesions can be herpetic aphthous. In modern medicine, M. communis essential oil and its decoction decreased the average time of pain relief and decreased the size of ulcers in patients with minor RAS without any adverse effects. The number of ulcers was not the subjects
of any different clinical trials. All patients were satisfied with M. communis topical essential oil (5%), and 81% patients were satisfied with M. communis topical decoctions (5%)."

According to the news reporters, the research concluded: "It appears the efficacy of M. communis is related to its analgesic, anti-inflammatory, antiseptic and wound healing effects. M. communis is effective in minor RAS as its traditional claims and confirming its efficacy in major and herpetiform RAS and comparing the efficacy of its decoction topical formulations or essential oil topical ones are required more and larger experimental and clinical investigations in future."

Liver Diseases and Conditions - Fatty Liver

Findings in the Area of Fatty Liver Reported from University of Pennsylvania (Nonalcoholic Fatty Liver Disease Pathophysiology and Management)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Liver Diseases and Conditions - Fatty Liver have been published. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Nonalcoholic fatty liver disease (NAFLD) is an important cause of morbidity and mortality worldwide and is rapidly becoming the leading cause of end stage liver disease and liver transplant. With a prevalence of 30% in the United States, it has reached epidemic proportions."

The news correspondents obtained a quote from the research from the University of Pennsylvania, "The clinical syndrome of NAFLD spans from bland steatosis to steatohepatitis, which can progress to fibrosis and cirrhosis. The pathogenesis includes the roles of hormones, nutritional and intestinal dysbiosis, insulin resistance, lipotoxicity, hepatic inflammation, and genes. Noninvasive testing and liver biopsy indications are reviewed."

According to the news reporters, the research concluded: "Approved and investigational therapies for NAFLD and nonalcoholic steatohepatitis are outlined in this article."

For more information on this research see: Nonalcoholic Fatty Liver Disease Pathophysiology and Management. Gastroenterology Clinics of North America, 2016;45
Findings in the Area of Head and Neck Cancer Reported from Columbia University College of Physicians and Surgeons (De-escalation of radiation dose for human papillomavirus-positive oropharyngeal head and neck squamous cell carcinoma: A case ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Head and Neck Cancer. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "Traditionally, head and neck squamous cell carcinoma (HNSCC) has been considered to be a relatively homogeneous disease. However, recent data have demonstrated that human papillomavirus (HPV)-positive and HPV-negative disease are two different clinical entities associated with different outcomes."

Our news editors obtained a quote from the research from the Columbia University College of Physicians and Surgeons, "Preclinical and clinical studies have reported a divergence in treatment strategies as well as prognostic outcomes for HNSCCs that are HPV-positive versus HPV-negative. The present study describes the case of a 52-year-old man who presented with stage IVB cT2N3M0 right tonsillar HPV-positive squamous cell carcinoma. Induction chemotherapy with docetaxel, cisplatin and 5-fluorouracil (TPF), followed by chemoradiation therapy with carboplatin and 70 Gray (Gy) radiation in daily fractions was recommended. The patient completed the TPF and carboplatin treatment; however, he was unable to tolerate the radiation course, receiving a final dose of 46 Gy. A 60-day follow-up right neck salvage dissection was subsequently performed. Despite having received a partial radiation treatment of 46 Gy, the patient had no pathological evidence of disease at 60 days post radiation treatment. Repeat positron emission tomography-computed tomography at 32 months after the right neck dissection revealed no evidence of disease. The present study also discusses the current preclinical and targets for HPV-positive HNSCC and the obstacles presented in advancing clinical treatment modalities. Previous preclinical models investigating radiation sensitivity have yielded mixed results. Thus, it is important to understand and establish representative preclinical models for studying HPV and HNSCC to improve clinical research and therapeutic development."

According to the news editors, the research concluded: "This review may guide future understanding of the role of HPV in HNSCC."
For more information on this research see: De-escalation of radiation dose for human papillomavirus-positive oropharyngeal head and neck squamous cell carcinoma: A case report and preclinical and clinical literature review. *Oncology Letters*, 2015;11(1):141-149.

The news editors report that additional information may be obtained by contacting C.C. Wu, Dept. of Radiation Oncology, Columbia University College of Physicians and Surgeons, New York, NY 10032, United States. Additional authors for this research include D.P. Horowitz, I. Deutsch, R. Rahmati, J.M. Schecter, A. Saqi and T.J Wang.

Keywords for this news article include: Viral, Oncology, Virology, New York City, United States, Head and Neck Cancer, Human Papillomavirus, Squamous Cell Carcinoma, North and Central America.

**Health and Medicine**

**Findings in the Area of Health and Medicine Reported from University of Pretoria (Sudden and unexpected childhood deaths investigated at the Pretoria Medico-Legal Laboratory, South Africa, 2007-2011)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Health and Medicine is now available. According to news reporting originating from Pretoria, South Africa, by NewsRx correspondents, research stated, "Sudden and unexpected death is well known to occur in infants, and although sudden deaths are less frequent after the first birthday, they still account for a significant proportion of childhood deaths. In 2009, 1.9% of the total deaths in the USA were childhood deaths."

Our news editors obtained a quote from the research from the University of Pretoria, "In South Africa (SA) this proportion was much higher at 11.85%. According to the law, sudden and unexpected deaths are generally investigated as unnatural deaths. Establishing an exact underlying anatomical cause of death will depend on available resources and can be difficult in a substantial proportion of cases. A retrospective descriptive case audit was conducted at the Pretoria Medico-Legal Laboratory (PMLL), SA, from 1 January 2007 through to 31 December 2011. All children aged 1 - 18 years who died suddenly and unexpectedly were included. Ninety-eight cases were identified, which constituted nearly 1% of total admissions to the PMLL. The majority of the deaths were of children aged 1 - 5 years, and the male/female ratio was 1.04:1. In the largest proportion of cases (n=28, 28.6%), the medicolegal investigation, including autopsy and ancillary investigations, did not establish an underlying anatomical cause of death. In the cases where a cause of death was established, pneumonia was the most common diagnosis (n=22, 22.4%). The fact that the cause of the largest proportion of deaths could not be ascertained emphasises the need for consideration of additional investigative techniques, such as molecular/genetic screening, which have provided an underlying cause of death in a significant number of cases in other countries."

According to the news editors, the research concluded: "There is a lack of published research on the causes and incidence of sudden unexpected deaths in children in SA, and further research in this area is needed."

Findings in the Area of Hemophilia Reported from Virginia Commonwealth University (Coated platelets and severe haemophilia A bleeding phenotype: Is there a connection?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Hematologic Diseases and Conditions - Hemophilia are discussed in a new report. According to news originating from Richmond, Virginia, by NewsRx correspondents, research stated, "Coated platelets are a subpopulation of platelets that possess highly prothrombotic properties. Previous observational data suggest that bleeding phenotype in severe haemophilia A is associated with coated platelet levels."

Financial support for this research came from Novo Nordisk.

Our news journalists obtained a quote from the research from Virginia Commonwealth University, "Haemophilia A patients with higher coated platelet levels may have a mild bleeding phenotype; those with lower levels may have a more severe bleeding phenotype. The aim of the study was to test the hypothesis that coated platelet levels are correlated with clinical bleeding phenotype. This cross-sectional, observational study enrolled 20 severe haemophilia A patients, including 15 with severe and five with a mild bleeding phenotype, and a control group of 12 healthy volunteers. The haemophilia bleeding phenotype was determined by the patient’s medical history and haemophilia treatment centre records. Blood was obtained from each patient by venipuncture and platelets were analysed by flow cytometry. Patients categorized as having a severe bleeding phenotype experienced a median eight bleeds per year compared to one bleed annually in the mild bleeding phenotype group. Both groups had similar total platelet counts and fibrinogen levels. There was no difference in coated platelet percentage between severe and mild bleeding phenotype (17 and 16% respectively), however, both groups had significantly lower % coated platelets compared to controls (44%, p<0.0001)."

According to the news editors, the research concluded: "Coated platelet levels were not associated with bleeding phenotype in this study; however, these data may suggest coated platelet levels are lower in haemophilia patients relative to healthy volunteers."

The news correspondents report that additional information may be obtained from K.K. Lastrapes, Dept. of Pediatric Hematology, Oncology, Children's Hospital of Richmond and
Findings in the Area of Human Herpesvirus 6 Reported from Osaka Medical College (Hippocampal signal abnormality on the first day of illness in acute encephalopathy with biphasic seizures and late reduced diffusion caused by HHV-6 infection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Human Herpesvirus Diseases and Conditions - Human Herpesvirus 6. According to news reporting out of Takatsuki, Japan, by NewsRx editors, research stated, "We report a 13-month-old girl who developed acute encephalopathy with biphasic seizures and late reduced diffusion (AESD) with transient reduced diffusion in the hippocampus and anterior commissure on diffusion-weighted imaging (DWI), which was performed on the first day after febrile status epilepticus (FSE) as the initial neurological symptom of AESD. DWI just after late seizures showed high signal intensity lesions in both left hippocampus and anterior commissure, and left extratemporal and occipital subcortical white matter."

Our news journalists obtained a quote from the research from Osaka Medical College, "HHV-6 DNA was positive in both blood and cerebrospinal fluid samples. DWI at two months after onset showed atrophy in the left mesial temporal lobe and extratemporal and occipital lobe without the signal abnormalities."

According to the news editors, the research concluded: "Although it has been reported that magnetic resonance images tend to show no acute abnormality during the first two days in typical AESD, transient reduced diffusion could be found on the DWI performed on the first day of AESD."

For more information on this research see: Hippocampal signal abnormality on the first day of illness in acute encephalopathy with biphasic seizures and late reduced diffusion caused by HHV-6 infection. *Brain & Development*, 2016;38(10):943-946. *Brain & Development* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Brain & Development - www.journals.elsevier.com/brain-and-development/)

Our news journalists report that additional information may be obtained by contacting S. Shimakawa, Osaka Medical College, Dept. of Pediat, Takatsuki, Osaka 5698686, Japan. Additional authors for this research include S. Shimakawa, H. Toshikawa, M. Hatanaka, M. Fukui, A. Mori and H. Tamai.

Findings in the Area of Human Immunodeficiency Virus Reported from Florida State University (Caring for Older Adults with the Human Immunodeficiency Virus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Human Immunodeficiency Virus have been published. According to news reporting originating from Tallahassee, Florida, by NewsRx correspondents, research stated, "Increasing proportions of older adults are living with the human immunodeficiency virus (HIV). It is estimated that more than 50% of individuals with HIV in the United States are aged 50 and older."

Our news editors obtained a quote from the research from Florida State University, "Part of this group consists of individuals who have aged with chronic HIV infection, but a large proportion also results from new HIV diagnosis, with approximately 17% of new HIV diagnoses in 2013 occurring in individuals aged 50 and older. Although many of the recommendations on management of HIV infection are not age-specific, individuals with HIV aged 50 and older differ from their younger counterparts in many aspects, including immune response to antiretroviral therapy, multimorbidity, antiretroviral toxicities, and diagnostic considerations."

According to the news editors, the research concluded: "This article outline these differences, offers a strategy on how to care for this unique population, and provides special considerations for problem-based management of individuals with HIV aged 50 and older."

The news editors report that additional information may be obtained by contacting J.S. Appelbaum, Florida State University, Dept. of Clin Sci, Coll Med, Tallahassee, FL 32306, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/jgs.14584. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Tallahassee, Florida, United States, North and Central America, Viral Sexually Transmitted Diseases and Conditions, Immune System Diseases and Conditions, Human Immunodeficiency Virus, Primate Lentiviruses, Vertebrate Viruses, HIV Infections, Retroviridae, RNA Viruses, HIV/AIDS, Florida State University.

Findings in the Area of Hypotension Reported from General Hospital

(Induction of endothelium-dependent constriction of mesenteric arteries in endotoxemic hypotensive shock)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Hypotension. According to news originating from Hualien, Taiwan, by NewsRx correspondents, research stated, "Effective management of hypotension refractory to vasoconstrictors in severe sepsis is limited. A new strategy to ameliorate endotoxemic hypotension by inducing endothelium-dependent constriction of large arteries was assessed."

Our news journalists obtained a quote from the research from General Hospital, "Endotoxemia in rats was induced by injection of LPS (10 mg?kg(-1), i.v.). Haemodynamics were measured in vivo, reactivity of isolated mesenteric arteries by myography and expression of proteins and enzyme activities by immunohistochemistry, biochemistry and molecular biology. Six hours after LPS, the hypotension was promptly reversed following injection (i.v. or i.p.) of oroxylin-A (OroA). In isolated LPS-treated but not normal mesenteric arteries, OroA (1-10 mM) induced endothelium-dependent, sustained constriction, blocked by endothelin-1 (ET-1) receptor antagonists. OroA further enhanced LPS-induced expression of endothelin-converting enzyme, ET-1 mRNA and proteins and ET-1 release, OroA also enhanced phosphorylation of Rho-associated protein kinase (ROCK) and reversed LPS-induced suppression of RhoA activities in smooth muscle of arteries with endothelium. Activated-phosphorylation of smooth muscle ROCK was blocked by ET-1-receptor antagonists and ROCK inhibitors. Moreover, OroA post-treatment suppressed, via inhibiting NF-kB activation, inducible NOS expression and circulating NO. Reversal of endotoxemic hypotensive by OroA was due to release of endothelial ET-1, upregulated by LPS, from mesenteric arteries, inducing prompt and sustained vasoconstriction via activation of vascular smooth muscle RhoA/ROCK-pathway. In late endotoxemia, OroA-induced vasoconstriction was partly due to decreased circulating NO."

According to the news editors, the research concluded: "Activation of endothelium-dependent constriction in large resistance arteries and suppression of systemic inflammation offer new strategies for acute management of endotoxemic hypotensive shock."

The news correspondents report that additional information may be obtained from T.L. Tseng, Dept. of Medical Research, Buddhist Tzu Chi General Hospital, Hualien, Taiwan. Additional authors for this research include M.F. Chen, C.H. Liu, C.Y. Pang, Y.H. Hsu and T.J Lee.

**Immunology - Immunoglobulins**

**Findings in the Area of Immunoglobulins Reported from Dana-Farber Cancer Institute (Paraprotein-Related Kidney Disease: Glomerular Diseases Associated with Paraproteinemias)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immunology - Immunoglobulins are presented in a new report. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "Paraproteins are monoclonal Igs that accumulate in blood as a result of abnormal excess production. These circulating proteins cause a diversity of kidney disorders that are increasingly being comanaged by nephrologists."

The news correspondents obtained a quote from the research from Dana-Farber Cancer Institute, "In this review, we discuss paraprotein-related diseases that affect the glomerulus. We provide a broad overview of diseases characterized by nonorganized deposits, such as monoclonal Ig deposition disease (MIDD), proliferative GN with monoclonal Ig deposits (PGNMID), and C3 glomerulopathy, as well as those characterized by organized deposits, such as amyloidosis, immunotactoid glomerulopathy, fibrillary GN, and cryoglobulinemic GN, and rarer disorders, such as monoclonal crystalline glomerulopathies, paraprotein related thrombotic microangiopathies, and membranous-like glomerulopathy with masked IgGt deposits."

According to the news reporters, the research concluded: "This review will provide the nephrologist with an up to date understanding of these entities and highlight the areas of deficit in evidence and future lines of research."

Our news journalists report that additional information may be obtained by contacting A.Q. Lam, Dana Farber Canc Inst, Adult Survivorship Program, Boston, MA 02115, United States. Additional authors for this research include L. Herlitz, D. Monga, K.D. Jhaveri and A.Q. Lam.

Findings in the Area of Immunoglobulins Reported from MedImmune (Critical Role of Alpha-Toxin and Protective Effects of Its Neutralization by a Human Antibody in Acute Bacterial Skin and Skin Structure Infections)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - Immunoglobulins have been presented. According to news originating from Gaithersburg, Maryland, by NewsRx correspondents, research stated, "Methicillin-resistant Staphylococcus aureus (MRSA) causes large-scale epidemics of acute bacterial skin and skin structure infections (ABSSSI) within communities across the United States. Animal models that reproduce ABSSSI as they occur in humans are urgently needed to test new therapeutic strategies."

Financial support for this research came from HHS | National Institutes of Health (NIH).

Our news journalists obtained a quote from the research from MedImmune, "Alpha-toxin plays a critical role in a variety of staphylococcal infection models in mice, but its role in the pathogenesis of ABSSSI remains to be elucidated in rabbits, which are similar to humans in their susceptibility to S. aureus superantigens and certain bicomponent pore-forming leukocidins. We report here a new rabbit model of ABSSSI and show that those infected with a mutant deficient in expression of alpha-toxin (Delta hla) developed a small dermonecrotic lesion, whereas those infected with isogenic USA300 MRSA wild-type or complemented Delta hla strains developed ABSSSI that mimic the severe infections that occur in humans, including the large central dermonecrotic core surrounded by erythema, induration, and marked subcutaneous hemorrhage. More importantly, immunoprophylaxis with MEDI4893*, an anti-alphatoxin human monoclonal antibody, significantly reduced the severity of disease caused by a USA300 wild-type strain to that caused by the Delta hla mutant, indicating that this toxin could be completely neutralized during infection. Thus, this study illustrates a potential high standard for the development of new immunotherapeutic agents in which a toxin-neutralizing antibody provides protection to the same degree achieved with a toxin gene knockout."

According to the news editors, the research concluded: "When MEDI4893* was administered as adjunctive therapy with a subtherapeutic dose of linezolid, the combination was significantly more efficacious than either agent alone in reducing the severity of ABSSSI."

Lung Diseases and Conditions - Interstitial Lung...

Findings in the Area of Interstitial Lung Disease Reported from Kansai Medical University (Clinicopathological, Immunohistochemical, and Genetic Features of Primary Lung Adenocarcinoma Occurring in the Setting of Usual Interstitial Pneumonia ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lung Diseases and Conditions - Interstitial Lung Disease are presented in a new report. According to news reporting out of Osaka, Japan, by NewsRx editors, research stated, "An association between usual interstitial pneumonia (UIP) and carcinogenesis has been well established. However, few detailed analyses have investigated the clinicopathological, immunohistochemical, and genetic features of patients with primary lung adenocarcinoma (ADC) with UIP (UIP-ADC)."

Financial supporters for this research include National Cancer Center Research and Development, MEXT KAKENHI.

Our news journalists obtained a quote from the research from Kansai Medical University, "We identified 44 patients with ADC in the setting of UIP (the UIP-ADC group) (1.9%) from 2309 patients with primary ADC and compared clinicopathological, immunohistochemical, and genetic features between the UIP-ADC group and patients with ADC Without UIP (the non-UIP-ADC group). Clinicopathological features of UIP-ADC included an older age at occurrence; male predominance; smoking history; predilection for the lower lobe; large tumor size; high incidence of lymph vessel invasion, pleural invasion, and lymph node metastasis; and poor survival rate. However, the cause of death of patients with UIP-ADC was largely influenced by respiratory complications. Histologically, patients in the UIP-ADC group could be stratified according to invasive mucinous-predominant subtype. Genetically, patients in the UIP-ADC group had lower EGFR and higher KRAS mutation rates compared with patients in the non-UIP-ADC group. UIP-ADC was associated with a poor prognosis owing to the high frequency of perioperative complications rather than the malignancy of the tumor itself. There was a high prevalence of the invasive mucinous-predominant subtype in cases of UIP-ADC. UIP-ADC also had a low prevalence of EGFR mutations and a high prevalence of KRAS mutations."

According to the news editors, the research concluded: "These findings suggest that UIPADC should be distinct from non-UIP-ADC."

For more information on this research see: Clinicopathological,

**Transplant Medicine - Kidney Transplants**

**Findings in the Area of Kidney Transplants Reported from University of Groningen (Urinary potassium excretion, renal ammoniagenesis, and risk of graft failure and mortality in renal transplant recipients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Transplant Medicine - Kidney Transplants. According to news reporting out of Groningen, Netherlands, by NewsRx editors, research stated, "Renal transplant recipients (RTRs) have commonly been urged to limit their potassium intake during renal insufficiency and may adhere to this principle after transplantation. Importantly, in experimental animal models, low dietary potassium intake induces kidney injury through stimulation of ammoniagenesis."

Our news journalists obtained a quote from the research from the University of Groningen, "In humans, low potassium intake is an established risk factor for high blood pressure. We hypothesized that low 24-h urinary potassium excretion [UKV; urinary potassium concentration X volume], the gold standard for assessment of dietary potassium intake, represents a risk factor for graft failure and mortality in RTRs. In secondary analyses, we aimed to investigate whether these associations could be explained by ammoniagenesis, plasma potassium, or blood pressure. In a prospective cohort of 705 RTRs, we assessed dietary potassium intake by a single 24-h UKV and food-frequency questionnaires. Cox regression analyses were used to investigate prospective associations with outcome. We included 705 stable RTRs (mean +/- SD age: 53 +/- 13 y; 57% men) at 5.4 y (IQR: 1.9-12.0 y) after transplantation and 253 kidney donors. Mean +/- SD UKV was 73 +/- 24 mmol/24 h in RTRs compared with 85 +/- 25 mmol/24 h in kidney donors. During follow-up for 3.1 y (IQR: 2.7-3.9 y), 45 RTRs developed graft failure and 83 died. RTRs in the lowest sex-specific tertile of UKV (women, <55 mmol/24 h; men, <65 mmol/24 h) had an increased risk of graft failure (HR: 3.70; 95% CI: 1.64, 8.34) and risk of mortality (HR: 2.66; 95% CI: 1.53, 4.61), independent of potential confounders. In causal path analyses, 24-h urinary ammonia excretion, plasma
potassium, and blood pressure did not affect these associations. Our results indicate that low UKV is associated with a higher risk of graft failure and mortality in RTRs.

According to the news editors, the research concluded: "Specific attention for adequate potassium intake after transplantation seems warranted."

Our news journalists report that additional information may be obtained by contacting M.F. Eisenga, University of Groningen, Groningen University Medical Center, Dept. of Nephrol, Groningen, Netherlands. Additional authors for this research include L.M. Kieneker, S.S. Soedamah-Muthu, E. van den Berg, P.E. Deetman, G.J. Navis, R.O.B. Gans, C. Gaillard, S.J.L. Bakker and M.M. Joosten.

Oncology - Liver Cancer

**Findings in the Area of Liver Cancer Reported from National Taiwan Normal University (An indolylquinoline derivative activates DNA damage response and apoptosis in human hepatocellular carcinoma cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Liver Cancer. According to news reporting originating from Taipei, Taiwan, by NewsRx correspondents, research stated, "Human liver cancer is one of the most frequently diagnosed cancers worldwide. The development of resistance to therapy limits the application against the disease."

Our news editors obtained a quote from the research from National Taiwan Normal University, "To improve treatment, new effective anticancer agents are constantly pursued. Previously, we reported that an indolylquinoiline, 3-((7-ethyl-1H-indol-3-yl)-methyl)-2-methylquinoline (EMMQ), is effective in suppressing the growth of human lung cancer by impairing mitochondria functions. The present study revealed that EMMQ inhibited cell growth and induced apoptosis in liver cancer cells, but not in normal cells. This study demonstrated that EMMQ induced DNA damage by activating p53 and gamma-H2AX and cell arrest by suppressing cyclin D1 and CDK2. Damaged DNA injured mitochondrial functions by lowering the membrane potential and producing reactive oxygen species. The subsequent mitochondrial cytochrome c release attenuated pro-survival signals and increased apoptotic characteristics. Introduction of p53 shRNA abrogated drug effects by reducing DNA damage while maintaining mitochondria integrity. In brief, the study demonstrates that the effectiveness of EMMQ"
accentuated apoptosis of hepatocarcinoma cells by activating p53."

According to the news editors, the research concluded: "Based on these collective findings, the study offered a new perspective of EMMQ that was shown to be a promising candidate to treat liver cancer."

The news editors report that additional information may be obtained by contacting K. Fang, National Taiwan Normal University, Dept. of Life Sci, Taipei 116, Taiwan. Additional authors for this research include C.H. Hsieh, S.H. Kim, J.P. Wang, Y.L. Ni, C.L. Su, C.F. Yao and K. Fang.

**Oncology - Liver Cancer**

**Findings in the Area of Liver Cancer Reported from University of Bologna (Relationship between indocyanine green retention test, decompensation and survival in patients with Child-Pugh A cirrhosis and portal hypertension)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting from Bologna, Italy, by NewsRx journalists, research stated, "Indocyanine green retention test (ICG-r15) is a non-invasive marker of functional hepatic reserve. Among patients with compensated cirrhosis, ICG-r15 correlates to the degree of portal hypertension (PH); however, its prognostic relationship with the occurrence of decompensation events still requires clarification."

The news correspondents obtained a quote from the research from the University of Bologna, "ICG-r15 was prospectively measured in 154 patients with compensated cirrhosis. Patients with hepatocellular carcinoma (HCC), Child-Pugh B-C, MELD > 15, bilirubin > 2 mg/dl, INR > 1.5 or portal vein thrombosis were excluded. All patients underwent laboratory tests, upper endoscopy and hepatic venous pressure gradient (HVPG). Decompensation, development of HCC, liver transplant and death were recorded and analysed through competing-risk analysis. The study group was composed of 134 patients who were followed for a median of 39 months. During follow-up, 46 patients (34.3%) developed liver decompensation. Hepatocellular carcinoma occurred in 18 patients and two patients died from non-liver-related causes. The 1-, 2-and 3-year cumulative incidences of decompensation were 9.7%, 28.4% and 33.4% respectively. Patients with ICG-r15 < 10% did not experience any decompensation events during follow-up, while the 3-year cumulative incidence of decompensation of patients with ICG-r15 between 10% and 22.9% was 29.2% and that of patients with ICG-r15 >= 23% was 70.0% (P < 0.001). ICG-r15 gave the lowest pseudo-log-likelihood value, in comparison to oesophageal varices present, MELD, low platelet count and HVPG."
According to the news reporters, the research concluded: "ICG-r15 appears to be strictly related to liver decompensation, longitudinally confirming the preliminary findings of its correlation with PH among patients with compensated cirrhosis, and can be used for patient prognostication."

Our news journalists report that additional information may be obtained by contacting A. Lisotti, University of Bologna, S Orsola Malpighi Hosp, Dept. of Med & Surg Sci DIMEC, Bologna, Italy. Additional authors for this research include F. Azzaroli, A. Cucchetti, F. Buonfiglioli, P. Cecinato, C. Calvanese, P. Simoni, R. Arena, M. Montagnani, R. Golfieri, A. Colecchia, D. Festi and G. **Magnesium Silicates**

**Findings in the Area of Magnesium Silicates Reported from University of Minnesota [A Review of Mortality Associated With Elongate Mineral Particle (EMP) Exposure in Occupational Epidemiology Studies of Gold, Talc, and Taconite Mining]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Magnesium Silicates. According to news originating from Minneapolis, Minnesota, by NewsRx correspondents, research stated, "Mining of gold, talc, and talc may involve exposure to elongate mineral particles (EMP). The involved EMPs are typically non-asbestiform, include dimensions that regulatory definitions exclude, and have been less studied."

Our news journalists obtained a quote from the research from the University of Minnesota, "A review of the literature was undertaken for this exposure and occupational epidemiological studies that occur in gold, talc, and talc mining. Quantitative EMP exposure information in these industries is incomplete. However, there are consistent findings of pneumoconiosis in each of these types of mining. A recent case-control study suggests a possible association between this exposure and mesothelioma. Lung cancer is inconsistently reported in these industries and is an unlikely outcome of non-asbestiform EMP exposure. There is evidence of cardiovascular mortality excess across all of these types of mining. Non-malignant respiratory disease and cardiovascular mortality have been consistently increased in these industries."
According to the news editors, the research concluded: "Further investigation, including additional insights for the role of non-asbestiform EMP, is warranted."

The news correspondents report that additional information may be obtained from J.H. Mandel, University of Minnesota, Sch Public Hlth, Div Environm Hlth Sci, Minneapolis, MN 55455, United States. Additional authors for this research include B.H. Alexander and G. Ramachandran.

**Mosquito-Borne Diseases - Malaria**

**Findings in the Area of Malaria Reported from Institute for Molecular Biology (Release of Plasmodium sporozoites requires proteins with histone-fold dimerization domains)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mosquito-Borne Diseases - Malaria have been published. According to news reporting out of Iraklion, Greece, by NewsRx editors, research stated, "The sporozoite, the stage of the malaria parasite transmitted by the mosquito, first develops for similar to 2 weeks in an oocyst. Rupture of the oocyst capsule is required for release of sporozoites, which then transfer to the salivary gland where they are injected into a new host."

Our news journalists obtained a quote from the research from Institute for Molecular Biology, "Here we identify two parasite proteins that we call oocyst rupture proteins 1 (ORP1) and ORP2. These proteins have a histone-fold domain (HFD) that promotes heterodimer formation in the oocyst capsule at the time of rupture. Oocyst rupture is prevented in mutants lacking either protein. Mutational analysis confirms the HFD as essential for ORP1 and ORP2 function, and heterodimer formation was verified in vitro."

According to the news editors, the research concluded: "These two proteins are potential targets for blocking transmission of the parasite in the mosquito."

Our news journalists report that additional information may be obtained by contacting I. Siden-Kiamos, Fdn Res & Technol Hellas, Inst Mol Biol & Biotechnol, GR-70013
Findings in the Area of Obesity Reported from Karolinska University Hospital (Impaired atrial natriuretic peptide-mediated lipolysis in obesity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting from Stockholm, Sweden, by NewsRx journalists, research stated, "Catecholamines and natriuretic peptides (NPs) are the only hormones with pronounced lipolytic effects in human white adipose tissue. Although catecholamine-induced lipolysis is well known to be impaired in obesity and insulin resistance, it is not known whether the effect of NPs is also altered."

The news correspondents obtained a quote from the research from Karolinska University Hospital, "Catecholamine-and atrial NP (ANP)-induced lipolysis was investigated in abdominal subcutaneous adipocytes in vitro and in situ by microdialysis. In a cohort of 122 women, both catecholamine-and ANP-induced lipolysis in vitro was markedly attenuated in obesity (n=87), but normalized after substantial body weight loss (n=52). The impairment of lipolysis differed between the two hormones when expressing lipolysis per lipid weight, the ratio of stimulated over basal (spontaneous) lipolysis rate or per number of adipocytes. Thus, while the response to catecholamines was lower when expressed as the former two measures, it was higher when expressed per cell number, a consequence of the significantly larger fat cell size in obesity. In contrast, although ANP-induced lipolysis was also attenuated when expressed per lipid weight or the ratio stimulated/basal, it was similar between non-obese and obese subjects when expressed per cell number suggesting that the lipolytic effect of ANP may be even more sensitive to the effects of obesity than catecholamines. Obesity was characterized by a decrease in the protein expression of the signaling NP A receptor (NPRA) and a trend toward increased levels of the clearance receptor NPRC. The impairment in ANP-induced lipolysis observed in vitro was corroborated by microdialysis experiments in situ in a smaller cohort of lean and overweight men. ANP-and catecholamine-induced lipolysis is reversibly attenuated in obesity."

According to the news reporters, the research concluded: "The pro-lipolytic effects of ANP are relatively more impaired compared with that of catecholamines, which may in part be due to specific changes in NP receptor expression."

Our news journalists report that additional information may be obtained by
Findings in the Area of Obesity Reported from Max-Planck-Institute
(Stopping at the sight of food - How gender and obesity impact on response inhibition)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nutritional and Metabolic Diseases and Conditions - Obesity are presented in a new report. According to news reporting out of Leipzig, Germany, by NewsRx editors, research stated, "Recent research indicates that reduced inhibitory control is associated with higher body mass index (BMI), higher food craving and increased food intake. However, experimental evidence for the relationship between response inhibition and weight status is inconsistent and to date has been investigated predominantly in women."

Our news journalists obtained a quote from the research from Max-Planck-Institute, "In the current study, 56 participants (26 obese, 30 lean; 27 female, 29 male) performed a Food Picture Rating Task followed by a Stop Signal Task where pictures of palatable high or low caloric food or non-food items were presented prior to the Go signal. We further assessed participants' self-reported eating behavior and trait impulsivity as potential factors influencing response inhibition, in particular within the food context. Independent of BMI, women showed significantly higher liking for low caloric food items than men. This was accompanied by shorter Stop Signal Reaction Times (SSRT) after high compared to low caloric food pictures for women, and shorter SSRT in women compared to men for high caloric food. No influence of gender on SSRT was observable outside of the food context. While SSRTs did not differ between obese and lean participants across the three picture categories, we found a moderating effect of trait impulsivity on the relationship between BMI and SSRT, specifically in the high caloric food context. Higher BMI was predictive of longer SSRT only for participants with low to normal trait impulsivity, pointing at a complex interplay between response inhibition, general impulsivity and weight status. Our results support the notion that individuals with obesity do not suffer from diminished response inhibition capacity per se."

According to the news editors, the research concluded: "Rather, the ability to withhold a response depends on context and social norms, and strongly interacts with factors like gender and trait impulsivity."

For more information on this research see: Stopping at the sight of food - How gender and obesity impact on response inhibition. Appetite, 2016;107():663-676. Appetite can
Findings in the Area of Osteomyelitis Reported from Aichi Medical University (Osteomyelitis caused by Veillonella species: Case report and review of the literature)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Musculoskeletal Diseases and Conditions - Osteomyelitis. According to news originating from Aichi, Japan, by NewsRx correspondents, research stated, "Previously, Veillonella species had been considered as nonpathogenic and rarely caused serious infections. We report a case of 25-year-old man with osteomyelitis caused by Veillonella species."

Our news journalists obtained a quote from the research from Aichi Medical University, "He was admitted to the hospital due to an open fracture to the left radial bone caused by industrial washing machine accident, and emergency surgery was performed. However, wound infections occurred one week after the operation. Although Acinetobacter baumannii and Serratia marcescens were cultured from the pus, obligate anaerobic bacteria were not detected at that point. Debridement was repeated and antibiotics were changed according to the result of bacterial culture and drug sensitivity. Despite this, the infection was poorly controlled. On the 5th debridement, granulomatous bone tissues on pseudarthrosis were found for the first time at the infection site. Although no bacteria was detected with aerobic culture, anaerobic incubation revealed Gram-negative cocci which was later identified as Veillonella species by 16S rRNA gene sequence analysis. His condition improved without any additional debridement after adding effective antibiotics against Veillonella species. It is well known that prolonged infection with aerobes consumes oxygen in the infection site and leads the environment to more favorable conditions for anaerobic bacteria, thus we speculated that prolonged infection with bacteria such as S. marcescens induced the favorable environment for Veillonella species. Physicians should realize the importance of anaerobic culture method in routine practice, especially in complicated cases such as the present case."

According to the news editors, the research concluded: "In this article, we reviewed case reports of Veillonella infection and summarized the clinical features of this organism."

For more information on this research see: Osteomyelitis caused by Veillonella species: Case report and review of the literature. *Journal of Infection and Chemotherapy*, 2016;22(6):417-420. *Journal of Infection and Chemotherapy* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Springer - www.springer.com;
Musculoskeletal Diseases and Conditions —

Findings in the Area of Osteoporosis Reported from Southern Medical University (Activation of mTORC1 in B Lymphocytes Promotes Osteoclast Formation via Regulation of beta-Catenin and RANKL/OPG)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Musculoskeletal Diseases and Conditions - Osteoporosis are presented in a new report. According to news reporting from Guangdong, People's Republic of China, by NewsRx journalists, research stated, "The cytokine receptor activator of nuclear factor-kappa B ligand (RANKL) induces osteoclast formation from monocyte/macrophage lineage cells. However, the mechanisms by which RANKL expression is controlled in cells that support osteoclast differentiation are still unclear."

The news correspondents obtained a quote from the research from Southern Medical University. "We show that deletion of TSC1 (tuberous sclerosis complex 1) in murine B cells causes constitutive activation of mechanistic target of rapamycin complex 1 (mTORC1) and stimulates RANKL but represses osteoprotegerin (OPG) expression and subsequently promotes osteoclast formation and causes osteoporosis in mice. Furthermore, the regulation of RANKL/OPG and stimulation of osteoclastogenesis by mTORC1 was confirmed in a variety of RANKL-expressing cells and in vivo. Mechanistically, mTORC1 controls RANKL/OPG expression through negative feedback inactivation of Akt, destabilization of beta-catenin mRNA, and downregulation of beta-catenin. Our findings demonstrate that mTORC1 activation-stimulated RANKL expression in B cells is sufficient to induce bone loss and osteoporosis."

According to the news reporters, the research concluded: "The study also established a link between mTORC1 and the RANKL/OPG axis via negative regulation of beta-catenin."

Surgery - Osteotomy
Findings in the Area of Osteotomy Reported from University Hospital (Mandibular Access Osteotomy for Tumor Ablation: Could a More Tissue-Preserving Technique Affect Healing Outcome?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Surgery - Osteotomy have been published. According to news originating from Lund, Sweden, by NewsRx correspondents, research stated, "Paramedial mandibulotomy facilitates access for the resection of tumors in the oral and oropharyngeal space; however, severe complications related to surgical techniques and radiotherapy have been reported for this procedure. This study evaluated whether preservation of the periosteum during a mandibulotomy would decrease postoperative complications owing to the increased healing capacity provided by preserving more tissue."

Our news journalists obtained a quote from the research from University Hospital, "Patients who underwent mandibulotomy for surgical tumor ablation from 2007 through 2012 were included in a retrospective controlled cohort study. The trial was comprised of 2 groups: 1 group underwent subperiosteal and 1 group underwent supraperiosteal surgical dissection in the area of the mandibulotomy. The primary predictor variable was surgical technique and the primary outcome variable was surgical complications. The groups were matched according to tumor type, age, and gender. Clinical and radiographic follow-up was performed 12 months after surgery. Complications regarding bone exposure, plate exposure, osteoradionecrosis, nonunion, infection of the soft tissue flap, abscesses, fistulas, and gingival necrosis were recorded. Recordings of other factors, such as age, smoking habits, and timing of radiotherapy and chemotherapy, were performed and the 2 groups were compared for postoperative complications. Data analysis used the chi(2) test (Fisher exact test) to compare the sub-and supraperiosteal groups for postoperative complications. Thirty-two patients were included (16 per group; 14 women and 18 men; mean age, 56 yr). Thirteen patients in the subperiosteal group and 7 in the supraperiosteal group showed complications during the first 12 months. Seven patients had complications that persisted to the 12-month follow-up (6 in the subperiosteal group and 1 in the supraperiosteal group); however, the difference was not statistically relevant."

According to the news editors, the research concluded: "This study found more persistent complications in the subperiosteal group compared with the supraperiosteal group at
12-month follow-up, which could imply that a more tissue-preserving surgical technique promotes mandibular healing in patients undergoing mandibular access osteotomy in combination with radiotherapy.

The news correspondents report that additional information may be obtained from M. Bengtsson, Univ Hosp Skane, Dept. of Oral & Maxillofacial Surg, SE-22185 Lund, Sweden. Additional authors for this research include M. Korduner, V. Campbell, P. Fransson and J. Becktor.

**Enzymes and Coenzymes - Phosphoprotein...**

**Findings in the Area of Phosphoprotein Phosphatases Reported from Institute for Clinical Chemistry (Analytical Validation and Cross-Validation of an NFAT-Regulated Gene Expression Assay for Pharmacodynamic Monitoring of Therapy With Calcineurin ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Enzymes and Coenzymes - Phosphoprotein Phosphatases have been published. According to news reporting originating from Stuttgart, Germany, by NewsRx correspondents, research stated, "Analysis of residual gene expression of the nuclear factor of activated T cell (NFAT)-regulated genes has been developed as a pharmacodynamic biomarker to monitor therapy with calcineurin inhibitors. The availability of commercial primer sets (Search-LC) and the well-established assay protocol makes this biomarker a promising candidate to be used clinically in different laboratories."

Our news editors obtained a quote from the research from Institute for Clinical Chemistry. "However, implementation of the method in routine practice requires analytical robustness and comparable results across laboratories. Therefore, a protocol originally established at the Institute of Immunology, Heidelberg was verified at the Institute of Laboratory Medicine, Klinikum Stuttgart, and a comparison study was conducted between the 2 laboratories. For the analytical verification, whole blood samples of healthy individuals were incubated with tacrolimus in vitro. Linearity, imprecision, and limit of quantification, as well as sample stability, were investigated. For interlaboratory comparison, samples of patients under cyclosporine A therapy were analyzed in Heidelberg and then reanalyzed in Stuttgart within 24 hours. Tacrolimus (6.25-50 mcg/L) decreased the expression of NFAT-regulated genes in vitro
dose dependently (15%-89%). Within- and between-assay coefficient of variations (n = 6 each) were <17%. The limit of quantification was,200 cDNA copies for each of the interleukin-2, interferon-g, and granulocyte-macrophage colony-stimulating factor genes. Samples were stable for 24 hours. Interlaboratory comparison using patient samples correlated well (r = 0.951) but showed an inconsistent bias depending on the magnitude of residual gene expression. The assay can be set up with a satisfactory analytical performance in a routine molecular biological laboratory and shows comparable results between laboratories."

According to the news editors, the research concluded: "The reproducibility of the NFAT-regulated gene expression assay across laboratories can facilitate the implementation of this assay for pharmacodynamic routine monitoring of calcineurin inhibitors in different centers."

For more information on this research see: Analytical Validation and Cross-Validation of an NFAT-Regulated Gene Expression Assay for Pharmacodynamic Monitoring of Therapy With Calcineurin Inhibitors. *Therapeutic Drug Monitoring*, 2016;38(6):711-716. *Therapeutic Drug Monitoring* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Liver Diseases and Conditions - Portal Hypertension**

**Findings in the Area of Portal Hypertension Reported from Medical University (Interferon-free regimens improve portal hypertension and histological necroinflammation in HIV/HCV patients with advanced liver disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Liver Diseases and Conditions - Portal Hypertension is the subject of a report. According to news originating from Vienna, Austria, by NewsRx correspondents, research stated, "HIV/HCV co-infected patients show accelerated fibrosis progression and higher risk for complications of portal hypertension (PHT). To assess the effects of interferon-free therapy on portal pressure, liver histology and plasma biomarkers in HIV/HCV-coinfected patients with PHT."

Financial support for this research came from Medical Scientific Fund of the Major of the City of Vienna.

Our news journalists obtained a quote from the research from Medical University, "Twenty-two patients with paired hepatic venous pressure gradient (HVPG) measurements prior
and after successful treatment (SVR) with interferon-free regimens were included. Liver stiffness was assessed by transient elastography and biopsies were scored according to METAVIR. Plasma biomarkers were determined by ELISA. Overall, HVPG decreased from 10.7 +/- 4.1 mmHg at baseline to 7.4 +/- 4.2 mmHg after HCV treatment (Delta:-3.3 +/- 2.7 mmHg; p< 0.001). In patients with clinically significant PHT (HVPG >= 10 mmHg, n = 11), HVPG decreased from 14.1 +/- 2.9 to 10.4 +/- 3.9 mmHg (Delta:-3.7 +/- 3.3 mmHg; p = 0.004) and a haemodynamic response (HVPG decrease >= 10%) was observed in 73%. In 64% of patients with subclinical PHT (HVPG 6-9 mmHg, n = 11), portal pressure normalised at SVR. Mean liver stiffness decreased from 20.8 kPa to 11.5 kPa (Delta:-8.8 +/- 7.4 kPa; p< 0.001). Fifty percent (7/14) of patients with cirrhosis were re-classified as METAVIR <= F3 and all patients with decompensated cirrhosis improved their Child-Pugh stage. After successful HCV treatment, 39% still had persistent histological necroinflammatory activity (METAVIR A1), which correlated with less HVPG response and more steatosis. While most biomarkers improved with SVR, METAVIR A1 patients had significantly higher plasma levels of fibrogenic (PDGF, TGF-beta) and angiogenic (VEGF, Angiopoietin1) biomarkers. Interferon-free therapy reduces PHT and halts histological necroinflammatory activity in the majority of HIV/HCV-coinfected patients after SVR, which may lead to re-compensation of liver function in cirrhosis."

According to the news editors, the research concluded: "Biomarkers could identify patients with persisting hepatic necroinflammation."

The news correspondents report that additional information may be obtained from T. Reiberger, Medical University of Vienna, Vienna HIV & Liver Study Grp, Vienna, Austria. Additional authors for this research include M. Mandorfer, S. Steiner, B. Scheiner, D. Chromy, M. Herac, T. Bucsics, H. Hayden, K. Grabmeier-Pfistershammer, A. Ferlitsch, G. Oberhuber, M. Trauner, M. Peck-Radosavljevic and T. Reiberger.

Findings in the Area of Prostate Cancer Reported from Technical University (Prevention of bisphosphonate-related osteonecrosis of the jaws in patients with prostate cancer treated with zoledronic acid - A prospective study over 6 years)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Prostate Cancer. According to news originating from Munich, Germany, by NewsRx correspondents, research stated, "To explore the preventive effect of a prophylactic oral and maxillofacial treatment to reduce bisphosphonate associated necrosis of the jaws (BRONJ) in metastatic prostate cancer (PC) patients treated with zoledronic acid (4.0 mg i.v./months). Materials and method: 253 PC patients with bone metastases were prospectively randomized."

Our news journalists obtained a quote from the research from Technical University, "All patients received baseline assessments including a dental panoramic tomogram. Group A was monitored and treated where deemed necessary by the patient's dentist and were re-evaluated once a year. In group B patients were monitored and treated where necessary by the authors at 12 week intervals. We compared the incidence rate per year (IR) and incidence proportion (IP) in both cohorts and assessed independent risk factors for BRONJ. Patients in group A were evaluated 3.2 (range 2-4) vs. 6.8 times (range 4-24) in group B. A significantly higher proportion of dental extractions was performed in group B vs. A (26.7% vs. 22.7%, p = 0.006). A BRONJ was detected with an IP of 23.3% vs. 2.2% in group A vs. B, revealing a 2.59 fold higher relative risk for group A (p = 0.01, 95% CI 0.01-0.56). The IR in group A was 0.073 cases/year while the IR in group B was significantly decreased by 82% to 0.0131 (p < 0.001). Extraction therapy was the only independent risk factor for BRONJ (p < 0.0001; 95% CI 21.22-189.06). Preventive oral and maxillofacial treatment before bisphosphonate application combined with 3-monthly dental follow-ups significantly reduces the occurrence and risk of BRONJ in PC patients."

According to the news editors, the research concluded: "Therefore this approach should be implemented in the specific treatment algorithms."

The news correspondents report that additional information may be obtained from T. Mucke, Technical University of Munich, Klinikum Rechts Isar, Dept. of Oral & Maxillofacial Surg, D-81675 Munich, Germany. Additional authors for this research include H. Deppe, J. Hein, K.D. Wolff, D.A. Mitchell, M.R. Kesting, M. Retz, J.E. Gschwend and M. Thalgott.

Keywords for this news article include: Munich, Germany, Europe, Dentistry, Surgery, Risk and Prevention, Musculoskeletal Diseases and Conditions, Bone Diseases and Conditions, Clinical Trials and Studies, Drugs and Therapies, Prostatic Neoplasms, Clinical Research, Zoledronic Acid, Bisphosphonates, Pharmaceuticals, Prostate Cancer, Osteonecrosis, Oncology, Hormones, Technical University.
Lung Diseases and Conditions - Pulmonary Fibrosis

Findings in the Area of Pulmonary Fibrosis Reported from University of Texas Medical Branch (BRD4 mediates NF-kappa B-dependent epithelial-mesenchymal transition and pulmonary fibrosis via transcriptional elongation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Lung Diseases and Conditions - Pulmonary Fibrosis are presented in a new report. According to news reporting from Galveston, Texas, by NewsRx journalists, research stated, "Chronic epithelial injury triggers a TGF-beta-mediated cellular transition from normal epithelium into a mesenchymal-like state that produces subepithelial fibrosis and airway remodeling. Here we examined how TGF-beta induces the mesenchymal cell state and determined its mechanism."

The news correspondents obtained a quote from the research from the University of Texas Medical Branch, "We observed that TGF-beta stimulation activates an inflammatory gene program controlled by the NF-kappa B/RelA signaling pathway. In the mesenchymal state, NF-kappa B-dependent immediate-early genes accumulate euchromatin marks and processive RNA polymerase. This program of immediate-early genes is activated by enhanced expression, nuclear translocation, and activating phosphorylation of the NF-kappa B/RelA transcription factor on Ser276, mediated by a paracrine signal. Phospho-Ser276 RelA binds to the BRD4/CDK9 transcriptional elongation complex, activating the paused RNA Pol II by phosphorylation on Ser2 in its carboxy-terminal domain. RelA-initiated transcriptional elongation is required for expression of the core epithelial-mesenchymal transition transcriptional regulators SNAI1, TWIST1, and ZEB1 and mesenchymal genes. Finally, we observed that pharmacological inhibition of BRD4 can attenuate experimental lung fibrosis induced by repetitive TGF-beta challenge in a mouse model. These data provide a detailed mechanism for how activated NF-kappa B and BRD4 control epithelial-mesenchymal transition initiation and transcriptional elongation in model airway epithelial cells in vitro and in a murine pulmonary fibrosis model in vivo."

According to the news reporters, the research concluded: "Our data validate BRD4 as an in vivo target for the treatment of pulmonary fibrosis associated with inflammation-coupled remodeling in chronic lung diseases."

Our news journalists report that additional information may be obtained by contacting B. Tian, Univ Texas Med Branch, Sealy Center Mol Med, Galveston, TX 77555, United States. Additional authors for this research include Y.X. Zhao, H. Sun, Y.Q. Zhang, J. Yang and A.R. Brasier.

**Science**

**Findings in the Area of Science Reported from Chinese Academy of Sciences (Elucidating the druggable interface of protein-protein interactions using fragment docking and coevolutionary analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Science. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Protein-protein interactions play a central role in cellular function. Improving the understanding of complex formation has many practical applications, including the rational design of new therapeutic agents and the mechanisms governing signal transduction networks."

Our news journalists obtained a quote from the research from the Chinese Academy of Sciences, "The generally large, flat, and relatively featureless binding sites of protein complexes pose many challenges for drug design. Fragment docking and direct coupling analysis are used in an integrated computational method to estimate druggable protein-protein interfaces. (i) This method explores the binding of fragment-sized molecular probes on the protein surface using a molecular docking-based screen. (ii) The energetically favorable binding sites of the probes, called hot spots, are spatially clustered to map out candidate binding sites on the protein surface. (iii) A coevolution-based interface interaction score is used to discriminate between different candidate binding sites, yielding potential interfacial targets for therapeutic drug design. This approach is validated for important, well-studied disease-related proteins with known pharmaceutical targets, and also identifies targets that have yet to be studied."

According to the news editors, the research concluded: "Moreover, therapeutic agents are proposed by chemically connecting the fragments that are strongly bound to the hot spots."

Our news journalists report that additional information may be obtained by contacting H.L. Jiang, Chinese Academy Sci, Shanghai Inst Mat Med, Drug Discovery & Design Center, State Key Lab Drug Res, Shanghai 201203, People's Republic of China. Additional authors for this research include F. Morcos, R.R. Cheng, H.L. Jiang and J.N. Onuchic.

Keywords for this news article include: Shanghai, People's Republic of China, Asia, Science, Therapy, Chinese Academy of Sciences.

Drugs and Therapies - Serum albumin Therapy

Findings in the Area of Serum albumin Therapy Reported from First Affiliated Hospital (Numb Protects Human Renal Tubular Epithelial Cells From Bovine Serum Albumin-Induced Apoptosis Through Antagonizing CHOP/PERK Pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Serum albumin Therapy have been published. According to news reporting from Zhengzhou, People's Republic of China, by NewsRx journalists, research stated, "In recent studies, we found that Numb is involved in oxidative stress-induced apoptosis of renal proximal tubular cells; however, its function on ER stress-induced apoptosis in proteinuric kidney disease remains unknown. The objective of the present study is to explore the role of Numb in urinary albumin-induced apoptosis of human renal tubular epithelial cells (HKCs)."

Funders for this research include National Natural Science Foundation of China, The Youth Innovation Fund of The First Affiliated Hospital of Zhengzhou University, The 5451 Project of Health Department of Henan Province.

The news correspondents obtained a quote from the research from First Affiliated Hospital, "In this study, we demonstrate that incubation of HKCs with bovine serum albumin (BSA) resulted in caspase three-dependent cell death. Numb expression was down-regulated by BSA in a time-and dose-dependent manner. Knockdown of Numb by siRNA sensitized HKCs to BSA-induced apoptosis, whereas overexpression of Numb protected HKCs from BSA-induced apoptosis. Moreover, BSA activated CHOP/PERK signaling pathway in a time-and dose-dependent manner as indicated by increased expression of CHOP, PERK, and P-PERK. Furthermore, knockdown of CHOP or PERK significantly attenuated the promoting effect of Numb on BSA-induced apoptosis, while overexpression of CHOP impaired the protective effect of Numb on BSA-induced apoptosis. Taken together, our findings demonstrate that Numb plays a protective role on BSA-induced apoptosis through inhibiting CHOP/PERK signaling pathway in human renal tubular epithelial cells."

According to the news reporters, the research concluded: "Therefore, the results from this study provides evidence that Numb is a new target of ER-associated apoptotic signaling networks and Numb may serve as a promising therapeutic target for proteinuric diseases."

Our news journalists report that additional information may be obtained by contacting X. Ding, Dept. of Neurology, The First Affiliated Hospital of Zhengzhou, Zhengzhou, 450052, Henan, People's Republic of China. Additional authors for this research include M. Ma, J. Teng, F. Shao, E. Wu and X. Wang.

Findings in the Area of Sexually Transmitted Diseases and Conditions (STDs) Reported from University College [Forming new sex partnerships while overseas: findings from the third British National Survey of Sexual Attitudes & Lifestyles ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Sexually Transmitted Diseases and Conditions (STDs) have been published. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "Travelling away from home presents opportunities for new sexual partnerships, which may be associated with sexually transmitted infection (STI) risk. We examined the prevalence of, and factors associated with, reporting new sexual partner(s) while overseas, and whether this differed by partners' region of residence."

Financial supporters for this research include Wellcome Trust, Medical Research Council.

Our news journalists obtained a quote from the research from University College, "We analysed data from 12 530 men and women aged 16-74 years reporting >= 1 sexual partner (s) in the past 5 years in Britain's third National Survey of Sexual Attitudes and Lifestyles (Natsal-3), a probability survey undertaken 2010-2012. Results 9.2% (95% CI 8.3% to 10.1%) of men and 5.3% (4.8% to 5.8%) of women reported new sexual partner(s) while overseas in the past 5 years. This was strongly associated with higher partner numbers and other sexual and health risk behaviours. Among those with new partners while overseas, 72% of men and 58% of women reported partner(s) who were not UK residents. Compared with those having only UK partners while abroad, these people were more likely to identify as 'White Other' or 'Non-White' (vs White British ethnicity), report higher partner numbers, new partners from outside the UK while in the UK and paying for sex (men only) all in the past 5 years. There was no difference in reporting STI diagnosis/es during this time period. Reporting new partners while overseas was associated with a range of sexual risk behaviours."

According to the news editors, the research concluded: "Advice on sexual health should be included as part of holistic health advice for all travellers, regardless of age, destination or reason for travel."

For more information on this research see: Forming new sex partnerships while overseas: findings from the third British National Survey of Sexual Attitudes & Lifestyles (Natsal-3). Sexually Transmitted Infections, 2016;92(6):415-423. Sexually Transmitted Infections can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. (BMJ Publishing Group - group.bmj.com/; Sexually Transmitted Infections - sti.bmj.com/)

The news correspondents report that additional information may be obtained from C. Tanton, UCL, Res Dept. of Infect & Populat Hlth, London WC1E 6JB, United Kingdom. Additional authors for this research include A.M. Johnson, W. Macdowall, J. Datta, S. Clifton, N. Field, K.R. Mitchell, K. Wellings, P. Sonnenberg and C.H. Mercer.

Oncology - Squamous Cell Carcinoma

Findings in the Area of Squamous Cell Carcinoma Reported from University of Athens School of Medicine (Novel therapies for advanced squamous cell carcinoma of the lung)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Squamous Cell Carcinoma is now available. According to news originating from Athens, Greece, by NewsRx correspondents, research stated, "Advanced squamous non-small-cell lung carcinoma (SqCC) has traditionally been considered the 'neglected sibling' compared with lung adenocarcinoma due to lack of effective targeted treatment options. Currently, limited progress has been made in the systemic treatment of advanced disease and combination chemotherapy remains the gold standard."

Our news journalists obtained a quote from the research from the University of Athens School of Medicine, "However, the recent completion of the molecular characterization of SqCC revealed an interestingly complex genomic profile, comprising various genetic alterations that can potentially function as molecular targets for the development of novel targeted agents. Recent encouraging results of the use of immune checkpoint inhibitors in several neoplasms has emerged as a promising novel treatment option for advanced SqCC."

According to the news editors, the research concluded: "Future personalized studies, enrolling SqCC patients according to specific driving mutations are underway."

The news correspondents report that additional information may be obtained from K. Koutsoukos, Medical Oncology Department, Alexandra Hospital, University of Athens School of Medicine, Athens, Greece.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.2217/fon.15.358. This DOI is a link to an online electronic document that is either free or for purchase.

Findings in the Area of Steatosis Reported from Capital Medical University (Akebia Saponin D Decreases Hepatic Steatosis through Autophagy Modulation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Steatosis. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Nonalcoholic fatty liver disease (NAFLD) is considered to be a hepatic manifestation of the metabolic syndrome, and the incidence of NAFLD is increasing rapidly. However, appropriate drugs for treatment of NAFLD are lacking."

Our news editors obtained a quote from the research from Capital Medical University, "This study aimed to elucidate the protective effects and mechanisms of Akebia saponin D (ASD) against NAFLD in ob/ob mice and Buffalo rat liver cells. ASD significantly decreased hepatic steatosis and hepatocyte apoptosis in ob/ob mice. ASD also significantly activated autophagic flux, as assessed by the decreased expression of light chain 3 (LC3)-II and P62 accumulation of autophagosomes. In Buffalo rat liver cells, ASD prevented oleic acid (OA)-induced lipid droplets and increased autophagic flux acting as increase the number of autolysosomes than autophagosomes in mTagRFP-mWasabi-LC3. ASD treatment also prevented OA-induced expression of LC3-II, P62, Beclin, and phospho-mammalian target of rapamycin. These effects were similar to those of cotreatment with rapamycin. ASD treatment could not prevent OA-increased, autophagy-related protein expression after treatment with chloroquine or small interfering RNA-mediated knockdown of atg7."

According to the news editors, the research concluded: "These results suggest that ASD alleviates hepatic steatosis targeted at the fusion of autophagosomes to lysosomes, and autophagy modulation via ASD may offer a new strategy for treating NAFLD."

The news editors report that additional information may be obtained by contacting L.H. Liu, Capital Med Univ, Beijing Chao Yang Hosp, Beijing 100020, People's Republic of China. Central Nervous System Diseases and Conditions —

Findings in the Area of Subarachnoid Hemorrhage Reported from Wenzhou Medical University (Aneurysm rebleeding after poor-grade aneurysmal subarachnoid hemorrhage: Predictors and impact on clinical outcomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage have been published. According to news reporting originating from Wenzhou, People's Republic of China, by NewsRx correspondents, research stated, "Aneurysm rebleeding is a major cause of morbidity and mortality after aneurysmal subarachnoid hemorrhage (aSAH) and more often occurs in patients with poor-grade aSAH. Limited data on predictors of rebleeding in these patients are available."

Our news editors obtained a quote from the research from Wenzhou Medical University, "To investigate predictors of aneurysm rebleeding after poor-grade aSAH and the association of rebleeding with clinical outcomes. A multicenter poor-grade aneurysm study was a prospective and observational registry of consecutive patients who presented with poor-grade aSAH defined as a World Federation of Neurosurgical Societies (WFNS) grade of IV or V. Rebleeding was defined as a new hemorrhage on computed tomography scan. Clinical outcomes were assessed with modified Rankin score. Multivariate logistic regression analyses were used to determine independent predictors of rebleeding and association between the rebleeding and clinical outcomes at 12 months. Of the 297 patients included in this study, 30 (10.1%) patients experienced rebleeding. Most rebleeding occurred within 24 h after ictus. 22 (73.3%) patients died at discharge. Aneurysm rebleeding was independently associated with poor outcome (odds ratio [OR] 36.37, p < 0.001) and associated with mortality (OR 25.03, p < 0.001) at 12 months. The multivariate analysis showed that a lower Fisher grade (OR 0.49, 95% CI 0.31-0.77; p = 0.002), ruptured anterior cerebral artery aneurysms (OR 4.26, 95% CI 1.07-16.90; p = 0.039), external ventricular drainage (OR 4.62, 95% CI 1.46-14.59; p = 0.009) were independently associated with aneurysm rebleeding. The outcome of aneurysm rebleeding remains very poor."

According to the news editors, the research concluded: "A lower Fisher grade, ruptured anterior cerebral artery aneurysms, external ventricular drainage were associated with increased risk of rebleeding."

For more information on this research see: Aneurysm rebleeding after poor-grade aneurysmal subarachnoid hemorrhage: Predictors and impact on clinical outcomes. Journal of the Neurological Sciences, 2016;371():62-66. Journal of the Neurological Sciences can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of the Neurological Sciences - www.journals.elsevier.com/journal-of-the-neurological-sciences/)

Proteins - Transcription Factor

Findings in the Area of Transcription Factor Reported from Mayo Clinic (Computational discovery of transcription factors associated with drug response)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Proteins - Transcription Factor is the subject of a report. According to news reporting out of Rochester, Minnesota, by NewsRx editors, research stated, "This study integrates gene expression, genotype and drug response data in lymphoblastoid cell lines with transcription factor (TF)-binding sites from ENCODE (Encyclopedia of Genomic Elements) in a novel methodology that elucidates regulatory contexts associated with cytotoxicity. The method, GENMi (Gene Expression in the Middle), postulates that single-nucleotide polymorphisms within TF-binding sites putatively modulate its regulatory activity, and the resulting variation in gene expression leads to variation in drug response."

Our news journalists obtained a quote from the research from Mayo Clinic, "Analysis of 161 TFs and 24 treatments revealed 334 significantly associated TF-treatment pairs. Investigation of 20 selected pairs yielded literature support for 13 of these associations, often from studies where perturbation of the TF expression changes drug response. Experimental validation of significant GENMi associations in taxanes and anthracyclines across two triple-negative breast cancer cell lines corroborates our findings. The method is shown to be more sensitive than an alternative, genome-wide association study-based approach that does not use gene expression."

According to the news editors, the research concluded: "These results demonstrate the utility of GENMi in identifying TFs that influence drug response and provide a number of candidates for further testing."

For more information on this research see: Computational discovery of transcription factors associated with drug response. Pharmacogenomics Journal, 2016;16(6):573-582. Pharmacogenomics Journal can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Pharmacogenomics Journal - www.nature.com/tpj/)

Findings in the Area of Type 2 Diabetes Reported from Juntendo University School of Medicine (Gut microbiota in health and disease: an overview focused on metabolic inflammation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes is the subject of a report. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "In concern to the continuously rising global prevalence of obesity, diabetes and associated diseases, novel preventive and therapeutic approaches are urgently required. However, to explore and develop such innovative strategies, a meticulous comprehension of the biological basis of these diseases is extremely important."

Our news editors obtained a quote from the research from the Juntendo University School of Medicine, "Past decade has witnessed an enormous amount of research investigation and advancement in the field of obesity, diabetes and metabolic syndrome, with the gut microbiota receiving a special focus in the triangle of nutrition, health and diseases. In particular, the role of gut microbiota in health and diseases has been one of the most vigorous and intriguing field of recent research; however, much still remains to be elucidated about its precise role in host metabolism and immune functions and its implication in the onset, progression as well as in the amelioration of metabolic ailments. Recent investigations have suggested a significant contribution of the gut microbiota in the regulation and impairment of energy homeostasis, thereby causing metabolic disorders, such as metabolic endotoxemia, insulin resistance and type 2 diabetes. Numerous inflammatory biomarkers have been found to be associated with obesity, diabetes and risk of other associated adverse outcomes, thereby suggesting that a persistent low-grade inflammatory response is a potential risk factor."

According to the news editors, the research concluded: "In this milieu, this review intends to discuss potential evidences supporting the disturbance of the gut microbiota balance and the intestinal barrier permeability as a potential triggering factor for systemic inflammation in the onset and progression of obesity, type 2 diabetes and metabolic syndrome."

For more information on this research see: Gut microbiota in health and disease: an overview focused on metabolic inflammation. Beneficial Microbes, 2015;7(2):181-94.

The news editors report that additional information may be obtained by contacting R. Nagpal, 1 Probiotics Research Laboratory, Juntendo University Graduate School of Medicine, Tokyo 113-0033, Japan. Findings in the Area of Vasculitis Reported from University of Kiel

[Myeloperoxidase-Antineutrophil Cytoplasmic Antibody (ANCA)-Positive Granulomatosis With Polyangiitis (Wegener's) Is a Clinically Distinct Subset of ANCA-Associated Vasculitis A ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Vasculitis have been published. According to news reporting originating from Kiel, Germany, by NewsRx correspondents, research stated, "To compare the phenotype, clinical course, and outcome of myeloperoxidase (MPO)-antineutrophil cytoplasmic antibody (ANCA)-positive granulomatosis with polyangiitis (Wegener's) (GPA) to proteinase 3 (PR3)-ANCA-positive GPA and to MPO-ANCA-positive microscopic polyangiitis (MPA). We characterized all MPO-ANCA-positive patients classified as having GPA by the European Medicines Agency algorithm who attended our center, in a retrospective chart review."

Our news editors obtained a quote from the research from the University of Kiel, "A second cohort of patients with PR3-ANCA-positive GPA matched for age and sex was characterized. Patients with MPO-ANCA-positive MPA from a recently published cohort were also included in the analysis. All patients were diagnosed and treated according to a standardized interdisciplinary approach at a vasculitis referral center. Comprehensive data were available for 59 patients with MPO-ANCA-positive GPA, and they were compared to 118 patients with PR3-ANCA-positive GPA and 138 patients with MPO-ANCA-positive MPA. We observed a distinct phenotype in MPO-ANCA-positive GPA as compared to the other 2 cohorts. Patients with MPO-ANCA-positive GPA frequently had limited disease without severe organ involvement, had a high prevalence of subglottic stenosis, and had less need for aggressive immunosuppressive therapy (cyclophosphamide/rituximab). The patients with MPO-ANCA-positive GPA were also younger than the MPA patients and were predominantly female (significantly different than the MPA cohort). While GPA patients had higher survival rates compared to MPA patients (due to a high prevalence of pulmonary fibrosis in MPA), patients with MPO-ANCA had significantly lower relapse rates than those with PR3-ANCA. Patients with MPO-ANCA2 positive GPA show significantly different clinical courses compared to those with PR3-ANCA2 positive GPA or MPO-ANCA positive MPA, which should be considered in their clinical management."

According to the news editors, the research concluded: "Classification according to ANCA specificity may improve the evaluation of relapse risk."

For more information on this research see: Myeloperoxidase-Antineutrophil Cytoplasmic Antibody (ANCA)-Positive Granulomatosis With Polyangiitis (Wegener's) Is a Clinically Distinct Subset of ANCA-Associated Vasculitis A Retrospective Analysis of 315 Patients From a German Vasculitis Referral. Arthritis & Rheumatology, 2016;68(12):2953-2963. Arthritis & Rheumatology can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Cardiovascular Diseases and Conditions - Venous…

Findings in the Area of Venous Thrombosis Reported from University of Cairo (Endothelial cell protein C receptor gene 6936A/G and 4678G/C polymorphisms as risk factors for deep venous thrombosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Venous Thrombosis. According to news originating from Giza, Egypt, by NewsRx correspondents, research stated, "Endothelial cell protein C receptor (EPCR) enhances the generation of activated protein C by the thrombin-thrombomodulin complex. A soluble form of EPCR (sEPCR) is present in plasma."

Our news journalists obtained a quote from the research from the University of Cairo, "Two polymorphisms in the EPCR gene (6936A/G and 4678G/C) have been reported to influence the risk of venous thromboembolism. We aimed to investigate the relation between EPCR gene polymorphisms (6936A/G and 4678C/G) and deep venous thrombosis (DVT) and their relations to sEPCR level. This study involved 90 patients with DVT and 90 age and sex-matched healthy controls. Plasma levels of sEPCR were measured in 45 cases of the primary DVT by ELISA. PCR-restriction fragment length polymorphism (RFLP) was used for detection of EPCR polymorphisms (6936A/G and 4678G/C). Regarding 6936A/G, our results demonstrated that mutant genotypes (AG, GG) were associated with an increased risk for DVT [p <0.001, odds ratio (OR) 4.125, 95% confidence interval (95% CI) 2.198-7.740] as well as its mutant allele G (p <0.001, OR 2.549, 95% CI 1.601-4.061). The mutant genotypes were associated with increased levels of sEPCR. Although in 4678G/C, our results demonstrated that the mutant genotype (CC) was considered as a protective factor against DVT (p=0.014, OR 0.289, 95% CI 0.108-0.776) as well as its mutant allele C (p=0.02, OR 0.600, 95% CI 0.388-0.927), but it had no effect on sEPCR level."

According to the news editors, the research concluded: "Our data suggest that 6936A/G polymorphism is a risk factor for DVT and is associated with elevated plasma levels of sEPCR, while 4678G/C polymorphism plays a role in protection against DVT."

The news correspondents report that additional information may be obtained from N. Zoheir, aDept. of Clinical and Chemical Pathology bDept. of General Surgery, Faculty of Medicine, Cairo University, Giza, Egypt. Additional authors for this research include N.
Eldanasouri, A.A. Abdel-Aal, K.A. Hosny and W.M Abd el-Ghany.

Abdominal Aortic Aneurysm

Findings on Abdominal Aortic Aneurysm Detailed by Investigators at University of Michigan (The use of pre-existing CT imaging in screening for abdominal aortic aneurysms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Abdominal Aortic Aneurysm are presented in a new report. According to news originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "Ultrasound screening for abdominal aortic aneurysm (AAA) is recommended for male smokers >65 years of age, but screening rates remain low. If computed tomography (CT) performed for other indications could be considered adequate for screening, one-third of ultrasounds would potentially be unnecessary, and overall screening rates would be substantially higher."

Our news journalists obtained a quote from the research from the University of Michigan, "The objective of this study was to evaluate the sensitivity of CT imaging of the abdomen for the detection of AAA when performed for other clinical indications. We performed a retrospective study of patients eligible for AAA screening who had undergone an abdominal ultrasound as well as an abdominal CT scan for other indications within 3 years prior to that study. The primary outcome was identification of an AAA, recorded in the findings narrative or impression of the CT scan report. Of 142 patients with both a CT scan and an AAA on ultrasound, 127 (89.4%) were noted to have an AAA in the report of a CT scan performed within the 3 years prior to the ultrasound. An additional 10 films demonstrated an AAA that was not mentioned in the report. The sensitivity of pre-existing CT scans for AAA screening was 97.2% (137/141) [95% CI: 93.4-99.0%]; 123 (86.6%) of these positive findings were reported in the radiologist's final impression. The sensitivity for AAA identification in the report of a pre-existing CT scan of the abdomen performed for alternate indications appears high enough to use as a screening test."

According to the news editors, the research concluded: "When radiologists note an AAA, they should be sure to include it in the final impression."

For more information on this research see: The use of pre-existing CT imaging in screening for abdominal aortic aneurysms. Vascular Medicine, 2016;21(6):515-519. Gram-Negative Bacteria - Acinetobacter baumannii

Findings on Acinetobacter baumannii Discussed by Investigators at University of Tehran (Carbapenem-resistant Acinetobacter baumannii Recovered from Burn Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Acinetobacter baumannii are presented in a new report. According to news originating from Tehran, Iran, by NewsRx correspondents, research stated, "Emergence of carbapenem-resistant Acinetobacter baumannii (CRAB) and their prolonged presence in burn units increases the risk of acquisition of CRAB. From November 2012 to September 2013, 1474 burn patients were screened for CRAB isolates through testing susceptibility to imipenem and its comparators meropenem, and doripenem."

Our news journalists obtained a quote from the research from the University of Tehran, "Furthermore, the in vitro activity of other antibiotics against CRAB was investigated. Three patients were infected with carbapenem-susceptible A. baumannii (CSAB) and 168 were infected with CRAB. Approximately one-fifth (n=32) of CRAB isolates were obtained from patients hospitalized in Burn Intensive Care Unit (BICU). Most of CRABs were isolated from wound. The mean length of stay (LOS) in hospital prior to A. baumannii isolation was significantly higher for CRAB compared to CSAB cases (P=0.04). Amongst the independent variables, percentage of total burn surface area (TBSA) significantly increased the mortality rate using multivariate logistic regression (P=0.001, OR=16.5; 95% CI: 4.72-57.7). The majority of tested isolates were resistant to imipenem (94.8%), and to its comparators, doripenem (97.7%), and meropenem (97.7%). The susceptibility of CRAB isolates was less than 10% to all tested antibiotics except for colistin (100%), doxycycline (61.9%), gentamicin (18.5%), and tigecycline (11.9%). Resistance to carbapenem reduces the number of effective antibiotics."

According to the news editors, the research concluded: "The coordinated and intensive efforts of healthcare personnel are required to meet the challenge of dissemination of CRAB."

The news correspondents report that additional information may be obtained from M. Douraghi, Univ Tehran Med Sci, Food Microbiol Res Center, Tehran, Iran. Additional authors for this research include M. Douraghi, H. Zeraati, F. Bazmi, M. Rahbar, M.R. Pourmand, M.S. Tabrizi, A. Aliramezani and S. Ghourichian.

Acrylates

Findings on Acrylates Discussed by J. Eisele and Co-Researchers
(Toxicological assessment of Anionic Methacrylate Copolymer: I. Characterization, bioavailability and genotoxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Acrylates have been published. According to news originating from Darmstadt, Germany, by NewsRx correspondents, research stated, "Anionic Methacrylate Copolymer (AMC) is a fully polymerized copolymer used in the pharmaceutical industry as an enteric/delayed-release coating to permit the pH-dependent release of active ingredients in the gastrointestinal tract from oral dosage forms. This function is of potential use for food supplements."

Our news journalists obtained a quote from the research, "Oral administration of radiolabeled copolymer to rats resulted in the detection of chemically unchanged copolymer in the feces, with negligible absorption (<0.1%). AMC is therefore determined not to be bioavailable. Within a genotoxicity test battery AMC did not show any evidence of genotoxicity in bacteria and mammalian cells. Furthermore, no genotoxic effects occurred in vivo within a micronucleus test."

According to the news editors, the research concluded: "There would therefore appear to be no safety concerns under intended conditions of oral use for the discussed toxicological endpoints."

For more information on this research see: Toxicological assessment of Anionic Methacrylate Copolymer: I. Characterization, bioavailability and genotoxicity. Regulatory Toxicology and Pharmacology, 2016;82():39-47. Findings on Acute Lung Injury Reported by Investigators at Tianjin Medical University (Heme Oxygenase-1/Carbon Monoxide-regulated Mitochondrial Dynamic Equilibrium Contributes to the Attenuation of Endotoxin-induced Acute Lung Injury in Rats ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Lung Diseases and Conditions - Acute Lung Injury have been presented. According to news reporting out of Tianjin, People's Republic of China, by NewsRx editors, research stated, "Sepsis-associated acute lung injury remains the major cause of mortality in critically ill patients and is characterized by marked oxidative stress and mitochondrial dysfunction. Mitochondrial dynamics are indispensable for functional integrity."

Our news journalists obtained a quote from the research from Tianjin Medical University, "Additionally, heme oxygenase (HO)-1/carbon monoxide conferred cytoprotection against end-organ damage during endotoxin shock. Herein, we tested the hypothesis that HO-1/carbon monoxide played a critical role in maintaining the dynamic process of mitochondrial fusion/fission to mitigate lung injury in Sprague-Dawley rats or RAW 264.7 macrophages exposed to endotoxin. The production of reactive oxygen species, the respiratory control ratio (RCR), and the expressions of HO-1 and mitochondrial dynamic markers were determined in macrophages. Concurrently, alterations in the pathology of lung tissue, lipid peroxidation, and the expressions of the crucial dynamic proteins were detected in rats. Endotoxin caused a 31% increase in reactive oxygen species and a 41% decrease in RCR levels (n = 5 per group). In parallel, the increased expression of HO-1 was observed in lipopolysaccharide-stimulated macrophages, concomitantly with excessive mitochondrial fission. Furthermore, carbon monoxide-releasing molecule-2 or hemin normalized mitochondrial dynamics, which were abrogated by zinc protoporphyrin IX. Additionally, impaired mitochondrial dynamic balance was shown in Sprague-Dawley rats that received lipopolysaccharide, accompanied by pathologic injury, elevated malondialdehyde contents, decreased manganese superoxide dismutase activities, and lowered RCR levels in rat lung mitochondria. However, the above parameters were augmented by zinc protoporphyrin IX and were in turn reversed by hemin."

According to the news editors, the research concluded: "The HO-1/carbon monoxide system modulated the imbalance of the dynamic mitochondrial fusion/fission process evoked by lipopolysaccharide and efficiently ameliorated endotoxin-induced lung injury in vivo and in vitro."

For more information on this research see: Heme Oxygenase-1/Carbon Monoxide-regulated Mitochondrial Dynamic Equilibrium Contributes to the Attenuation of Endotoxin-induced Acute Lung Injury in Rats and in Lipopolysaccharide-activated Macrophages. *Anesthesiology*, 2016;125(6):1190-1201. *Anesthesiology* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Oncology - Acute Myeloid Leukemia**

**Findings on Acute Myeloid Leukemia Detailed by Investigators at Broad Institute of MIT and Harvard (Development of ML390: A Human DHODH Inhibitor That Induces Differentiation in Acute Myeloid Leukemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Acute Myeloid Leukemia have been presented. According to news reporting from Cambridge, Massachusetts, by NewsRx journalists, research stated, "Homeobox transcription factor A9 (HoxA9) is overexpressed in 70% of patients diagnosed with acute myeloid leukemia (AML), whereas only a small subset of AML patients respond to current differentiation therapies. A cell line overexpressing HoxA9 was derived from the bone marrow of a lysozyme-GFP mouse."

Financial supporters for this research include Bayer, Amelia Peabody Charitable Fund, Harvard Catalyst, Harvard University, Fundacao de Amparo a Pesquisa do Estado de Sao Paulo, American Cancer Society, Alex's Lemonade Stand Foundation for Childhood Cancer, American Society of Hematology, Leukemia and Lymphoma Society, National Institutes of Health.

The news correspondents obtained a quote from the research from the Broad Institute of MIT and Harvard, "In this fashion, GFP served as an endogenous reporter of differentiation, permitting a high-throughput phenotypic screen against the MLPCN library. Two chemical scaffolds were optimized for activity yielding compound ML390, and genetic resistance and sequencing efforts identified dihydroorotate dehydrogenase (DHODH) as the target enzyme. The DHODH inhibitor brequinar works against these leukemic cells as well."

According to the news reporters, the research concluded: "The X-ray crystal structure of ML390 bound to DHODH elucidates ML390's binding interactions."

Our news journalists report that additional information may be obtained by contacting T.A. Lewis, Broad Inst, Center Sci Therapeut, Cambridge, MA 02142, United States. Additional authors for this research include D.B. Sykes, J.M. Law, B. Munoz, J.K. Rustiguel,

Oncology - Acute Myeloid Leukemia

Findings on Acute Myeloid Leukemia Reported by Investigators at University of California (RNA Splicing Modulation Selectively Impairs Leukemia Stem Cell Maintenance in Secondary Human AML)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Acute Myeloid Leukemia are presented in a new report. According to news reporting originating from La Jolla, California, by NewsRx correspondents, research stated, "Age-related human hematopoietic stem cell (HSC) exhaustion and myeloid-lineage skewing promote oncogenic transformation of hematopoietic progenitor cells into therapy-resistant leukemia stem cells (LSCs) in secondary acute myeloid leukemia (AML). While acquisition of clonal DNA mutations has been linked to increased rates of secondary AML for individuals older than 60 years, the contribution of RNA processing alterations to human hematopoietic stem and progenitor aging and LSC generation remains unclear."

Our news editors obtained a quote from the research from the University of California, "Comprehensive RNA sequencing and splice-isoform-specific PCR uncovered characteristic RNA splice isoform expression patterns that distinguished normal young and aged human stem and progenitor cells (HSPCs) from malignant myelodysplastic syndrome (MDS) and AML progenitors. In splicing reporter assays and pre-clinical patient-derived AML models, treatment with a pharmacologic splicing modulator, 17S-FD-895, reversed pro-survival splice isoform switching and significantly impaired LSC maintenance."

According to the news editors, the research concluded: "Therapeutic splicing modulation, together with monitoring splice isoform biomarkers of healthy HSPC aging versus LSC generation, may be employed safely and effectively to prevent relapse, the leading cause of leukemia-related mortality."

The news editors report that additional information may be obtained by contacting L.A. Crews, University of California, Sanford Consortium Regenerat Med, La Jolla, CA 92039, United States. Additional authors for this research include L. Balaian, N.P. Delos Santos, H.S. Leu, A.C. Court, E. Lazzari, A. Sadarangani, M.A. Zipeto, J.J. La Clair, R. Villa, A. Kulidjian, R. Storb, S.R. Oncology - Acute Myeloid Leukemia

Findings on Acute Myeloid Leukemia Reported by Investigators at University of Florida (Serum Uric Acid Exhibits Inverse Relationship with Estimated Glomerular Filtration Rate)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Acute Myeloid Leukemia have been published. According to news reporting from Gainesville, Florida, by NewsRx journalists, research stated, "In this study, we investigated the relationship between serum uric acid (SUA) and renal function in a unique patient cohort wherein SUA levels fluctuate during the course of standard care. Correlation coefficients between SUA and serum creatinine (SCr) and kinetic estimated GFR (KeGFR) were retrospectively investigated in acute myeloid leukemia (AML) patients, and statistically significant and clinically relevant determinants were studied in multiple regression models."

The news correspondents obtained a quote from the research from the University of Florida, "One hundred and twenty-six patients were included in the analysis. Baseline SUA was associated with an increased risk for acute kidney injury (AKI; OR 1.27, 95% CI 1.1-1.5, p = 0.003) and laboratory tumor lysis syndrome (OR 1.26, 95% CI 1.1-1.5, p = 0.005). Prophylactic uric acid-lowering therapy and hydration resulted in lower SUA values from baseline in 88.1% of the patients, the lowest values were observed on post-induction day 1 (20.4% reduction). Significant linear correlations were observed between SUA and SCr (r = 0.35, p<0.001) values with a significant inverse correlation between SUA and KeGFR on day 1 (r = -0.33, p<0.001) that persisted through day 4. By subgroup analysis, patients with primary AML (r = -0.49, p<0.001), baseline SUA >5.5 mg/dl (r = -0.41, p = 0.002) and baseline eGFR >60 ml/min/1.73 m(2) (r = -0.51, p<0.001) demonstrated robust relationships between SUA and KeGFR. The relationship was more robust when the groups were combined (primary AML plus baseline SUA >5.5 mg/dl plus baseline eGFR >60 ml/min/1.73 m(2), r = -0.52, p<0.001)."

According to the news reporters, the research concluded: "The demonstration of linear relationship between SUA and SCr and inverse relationship between SUA and KeGFR reinforces the emerging translational physiological evidence regarding the role of uric acid in AKI."

Our news journalists report that additional information may be obtained by
Enzymes and Coenzymes - Acyl-CoA Dehydrogenases

Findings on Acyl-CoA Dehydrogenases Detailed by Investigators at University of Pennsylvania (Morbidity and mortality among exclusively breastfed neonates with medium-chain acyl-CoA dehydrogenase deficiency)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Enzymes and Coenzymes - Acyl-CoA Dehydrogenases is the subject of a report. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "Despite greatly improved morbidity and mortality among infants with medium-chain acyl-CoA dehydrogenase deficiency (MCAD) since the implementation of universal newborn screening, (NBS), a population of neonates still becomes ill before their positive screen results are available. Exclusive breastfeeding is a proposed risk factor in this group."

Our news journalists obtained a quote from the research from the University of Pennsylvania, "Since initial studies of MCAD NBS, breastfeeding rates have increased substantially. In this study, we quantify the current risk of early decompensation in neonates with MCAD and identify factors associated with poor outcomes. We completed a retrospective analysis of neonates with MCAD referred to our center between 2010 and 2015. Of 46 infants with MCAD, 11 (23.9%) were symptomatic before the return of the NBS results. Four died or had cardiac arrest; the remaining seven had lethargy and hypoglycemia. All symptomatic patients were exclusively breastfed; only 40.6% of asymptomatic patients were exclusively breastfed. Breastfeeding rates increased from 45.5% in 2010-2011 to 64.7% in 2012-2013 and 87.5% in 2014-2015. Over these same periods, rates of early decompensation increased from 9.09% to 23.5% and 75%, respectively. Exclusively breastfed neonates with MCAD are at risk for early metabolic decompensation."

According to the news editors, the research concluded: "As breastfeeding rates increase, close management of feeding difficulties is essential for all neonates awaiting NBS results."

For more information on this research see: Morbidity and mortality among exclusively breastfed neonates with medium-chain acyl-CoA dehydrogenase deficiency. Genetics in Medicine, 2016;18(12):1315-1319. Genetics in Medicine can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA. **Drugs and Therapies - Adrenal Cortical Steroids**

**Findings on Adrenal Cortical Steroids Detailed by Investigators at Free University (Core-multishell nanocarriers: Transport and release of dexamethasone probed by soft X-ray spectromicroscopy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Adrenal Cortical Steroids. According to news originating from Berlin, Germany, by NewsRx correspondents, research stated, "Label-free detection of core-multishell (CMS) nanocarriers and the anti-inflammatory drug dexamethasone is reported. Selective excitation by tunable soft X-rays in the O 1s-regime is used for probing either the CMS nanocarrier or the drug."

Funders for this research include German Research Foundation, Freie Universitat Berlin.

Our news journalists obtained a quote from the research from Free University, "Furthermore, the drug loading efficiency into CMS nanocarriers is determined by X-ray spectroscopy. The drug-loaded nanocarriers were topically applied to human skin explants providing insights into the penetration and drug release processes. It is shown that the core-multishell nanocarriers remain in the stratum corneum when applied for 100 min to 1000 min. Dexamethasone, if applied topically to human ex vivo skin explants using different formulations, shows a vehicle-dependent penetration behavior. Highest local drug concentrations are found in the stratum corneum as well as in the viable epidermis. If the drug is loaded to core-multishell nanocarriers, the concentration of the free drug is low in the stratum corneum and is enhanced in the viable epidermis as compared to other drug formulations. The present results provide insights into the penetration of drug nanocarriers as well as the mechanisms of controlled drug release from CMS nanocarriers in human skin."

According to the news editors, the research concluded: "They are also compared to related work using dye-labeled nanocarriers and dyes that were used as model drugs."

For more information on this research see: Core-multishell nanocarriers: Transport and release of dexamethasone probed by soft X-ray spectromicroscopy. *Journal of Controlled Release*, 2016;242():64-70. *Journal of Controlled Release* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Drugs and Therapies - Adverse Drug Reactions

Findings on Adverse Drug Reactions Reported by Investigators at University of California (Root Cause Analysis of Ambulatory Adverse Drug Events That Present to the Emergency Department)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Adverse Drug Reactions have been published. According to news reporting from San Francisco, California, by NewsRx journalists, research stated, "Adverse drug events (ADEs) among patients self-administering medications in home/community settings are a common cause of emergency department (ED) visits, but the causes of these ambulatory ADEs remain unclear. Root cause analysis, rarely applied in outpatient settings, may reveal the underlying factors that contribute to adverse events."

The news correspondents obtained a quote from the research from the University of California, "To elicit patient and provider perspectives on ambulatory ADEs and apply root cause analysis methodology to identify cross-cutting themes among these events. Emergency department clinical pharmacists screened, identified, and enrolled a convenience sample of adult patients 18 years or older who presented to a single, urban, academic ED with symptoms or diagnoses consistent with suspected ADEs. Semistructured phone interviews were conducted with the patients and their providers. We conducted a qualitative analysis. We applied a prespecified version of the injury prevention framework (deductive coding), identifying themes relating to the agent (drug), host (patient), and environment (social and health systems). These themes were used to construct a root cause analysis for each ADE. From 18 interviews overall, we identified the following themes within the injury prevention framework. Agent factors included high-risk drugs, narrow therapeutic indices, and uncommon severe effects. Host factors included patient capacity or understanding of how to use medications, awareness of side effects, mistrust of the medical system, patients with multiple comorbidities, difficult risk-benefit assessments, and high health-care users. Environmental factors included lack of social support, and health systems issues included access to care, encompassing medication availability, access to specialists, and a lack of continuity and communication among prescribing physicians. Root cause analysis revealed multiple underlying factors relating to agent, host, and environment for each event. Patient and physician perspectives can inform a root cause analysis of ambulatory
ADEs."

According to the news reporters, the research concluded: "Such methodology may be applied to understand the factors that contribute to ambulatory ADEs and serve as the formative work for future interventions improving home/community medication use."

Our news journalists report that additional information may be obtained by contacting U. Sarkar, University of California, Div Gen Internal Med, San Francisco, CA 94143, United States. Additional authors for this research include Z. Coralic, A. Lopez, J.C. Stein and U. Sarkar.

**Immune System Diseases and Conditions - Allergies**

**Findings on Allergies Reported by Researchers at University of Salzburg (Prophylactic mRNA Vaccination against Allergy Confers Long-Term Memory Responses and Persistent Protection in Mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Immune System Diseases and Conditions - Allergies. According to news reporting originating in Salzburg, Austria, by NewsRx journalists, research stated, "Recently, mRNA vaccines have been introduced as a safety-optimized alternative to plasmid DNA-based vaccines for protection against allergy. However, it remained unclear whether the short persistence of this vaccine type would limit memory responses and whether the protective immune response type would be maintained during recurrent exposure to allergen."

Funders for this research include Austrian Science Fund, Christian Doppler Research Association, Biomay AG, Vienna, Austria.

The news reporters obtained a quote from the research from the University of Salzburg, "We tested the duration of protective memory responses in mice vaccinated with mRNA encoding the grass pollen allergen Phi p 5 by challenging them with recombinant allergen, 3.5, 6, and 9 months after vaccination. In a second experiment, vaccinated mice were repeatedly challenged monthly with aerosolized allergen over a period of 7 months. Antibody and cytokine responses as well as lung inflammation and airway hyperresponsiveness were assessed. mRNA vaccination induced robust TH1 memory responses for at least 9 months. Vaccination efficiently suppressed TH2 cytokines, IgE responses, and lung eosinophilia. Protection was maintained after repeated exposure to aerosolized allergen and no TH1 associated pathology was observed. Lung function remained improved compared to nonvaccinated controls."
According to the news reporters, the research concluded: "Our data clearly indicate that mRNA vaccination against Phl p 5 induces robust, long-lived memory responses, which can be recalled by allergen exposure without side effects. mRNA vaccines fulfill the requirements for safe prophylactic vaccination without the need for booster immunizations."

For more information on this research see: Prophylactic mRNA Vaccination against Allergy Confers Long-Term Memory Responses and Persistent Protection in Mice. *Journal of Immunology Research*, 2015;2015():797421.

Our news correspondents report that additional information may be obtained by contacting E. Hattinger, Dept. of Molecular Biology, University of Salzburg, 5020 Salzburg, Austria. Additional authors for this research include S. Scheiblhofer, E. Roesler, T. Thalhamer, J. Thalhamer and R. Weiss.

**Health and Medicine - Allergy and Rhinology**

**Findings on Allergy and Rhinology Reported by Researchers at University of Adelaide (The bacterial microbiome in chronic rhinosinusitis: Richness, diversity, postoperative changes, and patient outcomes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Health and Medicine - Allergy and Rhinology are discussed in a new report. According to news originating from Adelaide, Australia, by NewsRx correspondents, research stated, "The bacterial microbiome in chronic rhinosinusitis (CRS) remains poorly understood. Microorganisms are believed to be important contributors to the inflammatory response seen in these patients."

Our news journalists obtained a quote from the research from the University of Adelaide, "To examine the bacterial CRS microbiome by using a pyrosequencing technique and determine the diversity, richness, prevalence, and abundance of bacterial species in these patients. Furthermore, the postoperative changes that occur in the microbiome and correlations with patient outcomes are assessed. Swabs were collected from 23 patients with CRS and 11 controls during surgery. Further postoperative swabs were collected in the CRS group. Bacterial DNA was extracted from the swabs and then sequenced by using 16S ribosomal DNA bacterial tag-encoded FLX amplicon pyrosequencing. A total of 456 unique bacterial species were detected. No difference was seen for richness or diversity between the study groups (p >0.05). Diversity declined after surgery in the CRS group (p=0.01). Propionibacterium acnes and *Staphylococcus epidermidis* were the most prevalent species. Several significant differences were determined for prevalence and mean relative abundance (MRA) between the study groups. In particular, *Acinetobacter johnsonii* was more prevalent and had a higher MRA in the controls. Furthermore, the MRA of this species increased after surgery and was associated with improved
quality of life. This study characterized the sinonasal microbiome in a group of controls and patients with CRS. Important differences in diversity, prevalence, abundance, and temporal changes were described. Of great interest is the potential association between A. johnsonii and health."

According to the news editors, the research concluded: "These findings provide new insights into the interplay between the microbiome and health in the paranasal sinuses."

The news correspondents report that additional information may be obtained from E.J. Cleland, Dept. of Surgery-Otorhinolaryngology, Head and Neck Surgery, University of Adelaide, Adelaide, South Australia, Australia. Additional authors for this research include A. Bassioumi, S. Vreugde and P.J Wormald.

**Enzymes and Coenzymes - Amidohydrolases**

**Findings on Amidohydrolases Reported by Investigators at University of Bristol (Structural and Biochemical Characterization of Rm3, a Subclass B3 Metallo-beta-Lactamase Identified from a Functional Metagenomic Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Enzymes and Coenzymes - Amidohydrolases. According to news reporting originating in Bristol, United Kingdom, by NewsRx journalists, research stated, "Beta-Lactamase production increasingly threatens the effectiveness of beta-lactams, which remain a mainstay of antimicrobial chemotherapy. New activities emerge through both mutation of previously known beta-lactamases and mobilization from environmental reservoirs."

The news reporters obtained a quote from the research from the University of Bristol, "The spread of metallo-beta-lactamases (MBLs) represents a particular challenge because of their typically broad-spectrum activities encompassing carbapenems, in addition to other beta-lactam classes. Increasingly, genomic and metagenomic studies have revealed the distribution of putative MBLs in the environment, but in most cases their activity against clinically relevant beta-lactams and, hence, the extent to which they can be considered a resistance reservoir remain uncharacterized. Here we characterize the product of one such gene, bla(Rm3), identified through functional metagenomic sampling of an environment with high levels of biocide exposure. bla(Rm3) encodes a subclass B3 MBL that, when expressed in a recombinant Escherichia coli strain, is exported to the bacterial periplasm and hydrolyzes clinically used penicillins, cephalosporins, and carbapenems with an efficiency limited by high K-m values. An Rm3 crystal structure reveals the MBL superfamily alpha beta/beta alpha fold, which more
closely resembles that in mobilized B3 MBLs (AIM-1 and SMB-1) than other chromosomal enzymes (L1 or FEZ-1). A binuclear zinc site sits in a deep channel that is in part defined by a relatively extended N terminus. Structural comparisons suggest that the steric constraints imposed by the N terminus may limit its affinity for beta-lactams. Sequence comparisons identify Rm3-like MBLs in numerous other environmental samples and species.

According to the news reporters, the research concluded: "Our data suggest that Rm3-like enzymes represent a distinct group of B3 MBLs with a wide distribution and can be considered an environmental reservoir of determinants of beta-lactam resistance."

For more information on this research see: Structural and Biochemical Characterization of Rm3, a Subclass B3 Metallo-beta-Lactamase Identified from a Functional Metagenomic Study. Antimicrobial Agents and Chemotherapy, 2016;60(10):5828-5840. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Nutritional and Metabolic Diseases and Conditions - …**

**Findings on Amyloidosis Reported by Investigators at Chinese Academy of Medical Sciences (Clinical correlates and prognostic values of pseudoinfarction in cardiac light-chain amyloidosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Amyloidosis have been published. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Pseudoinfarction is one of the most common electrocardiographic characteristics in cardiac light-chain (AL) amyloidosis. The aim of the present study was to analyze the prognostic significance of pseudoinfarction and define the relation between pseudoinfarction and clinical parameters in cardiac AL amyloidosis."

Our news editors obtained a quote from the research from the Chinese Academy of Medical Sciences, "A total 110 consecutive patients who presented with a diagnosis of cardiac AL amyloidosis and without a positive history of coronary disease between 2010 and 2014 were enrolled. Patients were divided into two groups according to the presence (n = 40) or absence (n = 70) of pseudoinfarction on electrocardiography (ECG). Clinical parameters including laboratory tests, echocardiography, and follow-up were collected and analyzed. Patients with pseudoinfarction had higher N-terminal pro-brain natriuretic peptide levels (9131 pg/ml vs 4644 pg/ml, p = 0.02) and a worse New York Heart Association (NYHA) function (p < 0.001). The pseudoinfarction group also had a larger left atrium size (44 mm vs 41 mm, p = 0.03), a thicker
ventricular wall (septum 14 mm vs 13 mm, p = 0.005 and posterior wall 14 mm vs 13 mm, p = 0.01), a lower left ventricular ejection fraction (50% vs 58%, p = 0.013), and higher early-to-atrial transmitral flow velocity ratio (p = 0.001). Also, the pseudoinfarction group was closely associated with a lower voltage (70% vs 38.6%, p = 0.002), poor precordial R wave progression (78.4% vs 43.9%, p = 0.001), lower Sokolow-Lyon index (13 mm vs 9 mm, p< 0.001), and lower voltage to mass ratio (0.521 vs 0.442, p = 0.028) on the ECG. After a median follow-up of 39 months, Kaplan-Meier survival analysis showed that lifetime was significantly shorter in the pseudoinfarction group (median 4 months vs 17 months, p< 0.001). By adopting the multivariate Cox proportional model, NYHA heart failure III to IV and the presence of pseudoinfarction remained the only two independent prognostic determinants with death hazard ratio of 3.16 and 1.9, respectively."

According to the news editors, the research concluded: "The presence of pseudoinfarction on the ECG has a negative prognostic effect on AL patients with cardiac involvement."

For more information on this research see: Clinical correlates and prognostic values of pseudoinfarction in cardiac light-chain amyloidosis. *Journal of Cardiology*, 2016;68(5-6):426-430. *Journal of Cardiology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Cardiology - www.journals.elsevier.com/journal-of-cardiology/)

**Findings on Anaphylaxis Reported by Investigators at Vanderbilt University (Intraoperative medications associated with hemodynamically significant anaphylaxis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immune System Diseases and Conditions - Anaphylaxis have been presented. According to news reporting out of Nashville, Tennessee, by NewsRx editors, research stated, "To facilitate the identification of drugs and patient factors associated with hemodynamically significant anaphylaxis. Using an existing database containing complete perioperative records, instances of hemodynamically significant anaphylaxis were identified using a physiologic and treatment-based screening algorithm."

Our news journalists obtained a quote from the research from Vanderbilt University, "All cases were manually reviewed by 2 clinicians, with a third adjudicating disagreements, and confirmed cases were matched 3:1 with control cases. Intraoperative medications given in
instances of hemodynamically significant anaphylaxis and patient risk factors were compared with control cases. University of Michigan Hospital, a large, tertiary care hospital. All adult patients undergoing surgery between January 1, 2004, and January 5, 2015. None. Incidence of hemodynamically significant anaphylaxis during anesthesia. Patient risk factors and intraoperative medications associated with hemodynamically significant anaphylaxis. Hemodynamically significant anaphylaxis occurred in 55 of 461 986 cases (1 in 8400). Hemodynamically significant anaphylaxis occurred in 52 patients, with 1 patient experiencing 3 instances and another patient 2 instances. Only 1 drug was associated with an increased risk of hemodynamically significant anaphylaxis: protamine (odds ratio, 11.78; 95% confidence interval, 1.40-99.26; P = .0233). No category of drugs was associated with increased risk. Of patient risk factors, only personal history of anaphylaxis was associated with an increased risk (odds ratio, 77.1; 95% confidence interval, 10.46-567.69; P =<.0001). Postoperative follow-up and evaluation of patients were low at our institution. A serum tryptase level was sent in only 49% of cases, and 41% of levels were positive, an overall positive rate of 20% of cases. Following instances of hemodynamically significant anaphylaxis, only 29% of patients were seen and evaluated by an allergist at our institution. Hemodynamically significant anaphylaxis is a rare complication of anesthesia, with an incidence consistent with the existing literature. Contrary to most existing literature, only protamine was associated with increased risk."

According to the news editors, the research concluded: "A personal history of anaphylaxis appears to best predict risk of hemodynamically significant anaphylaxis."

Our news journalists report that additional information may be obtained by contacting R.E. Freundlich, Vanderbilt University, Medical Center, Dept. of Anesthesiol, Nashville, TN 37212, United States. Additional authors for this research include N.M. Duggal, M. Housey, T.T. Tremper, M.C. Engoren and S. Kheterpal.

**Hematologic Diseases and Conditions - Anemia**

**Findings on Anemia Reported by Investigators at Division of Cardiovascular (Possible Inhibitory Effect of Erythropoiesis-Stimulating Agents at the Predialysis Stage on Early-Phase Coronary Events after Hemodialysis Initiation)**
Researchers detail new data in Hematologic Diseases and Conditions - Anemia. According to news reporting originating in Kyoto, Japan, by NewsRx journalists, research stated, "We examined whether the use of erythropoiesis-stimulating agents (ESAs) to correct anemia at the predialysis stage could inhibit early-phase coronary events after hemodialysis initiation. We enrolled 242 patients with chronic kidney disease who had received continued medical treatments and initiated maintenance hemodialysis from 1 September 2000 to 31 December 2014 at Toujinkai Hospital."

The news reporters obtained a quote from the research from the Division of Cardiovascular, "Patients with a previous history of blood transfusion or any cardiovascular events or interventions were excluded. The coronary events were followed for 1 year after initiation of hemodialysis. Coronary events occurred in 51 of 242 patients: 10 patients had acute coronary syndrome [9 with percutaneous coronary intervention (PCI), 1 without intervention], and 41 had elective coronary revascularization (38 PCI and 3 coronary artery bypass graft). ESA was administered in 118 of 242 patients (48.8%). In stepwise logistic analysis, coronary events were positively associated with nonuse of ESA at the predialysis stage (odds ratio 2.66, p = 0.005) and diabetes mellitus (odds ratio 5.33, p< 0.001). When dividing the patients into 4 subgroups by blood hemoglobin (Hb) level (8.5 g/dl) and the use/nonuse of ESA, coronary event-free survival rates were higher (p = 0.005) in those with Hb >= 8.5 g/dl, ESA+ (86.6%, n = 82) and tended to be higher (p = 0.055) in those with Hb <8.5 g/dl, ESA+ (86.1%, n = 36) than in patients with Hb < 8.5 g/dl, ESA- (68.6%, n = 86) in a Kaplan-Meier analysis."

According to the news reporters, the research concluded: "The use of ESA to correct anemia at the predialysis stage may inhibit early-phase coronary events after hemodialysis initiation."

Our news correspondents report that additional information may be obtained by contacting M. Nishimura, Toujinkai Hosp, Div Cardiovasc, Kyoto, Japan. Additional authors for this research include K. Watanabe, Y. Kitamura, T. Nagashima, T. Tokoro, T. Takatani, N. Sato, S. Yamazaki, T. Hashimoto, H. Kobayashi and T. Ono.

Cardiovascular Diseases and Conditions - Aneurysm

Findings on Aneurysm Described by M. Razavian and Colleagues (Optical imaging of MMP-12 active form in inflammation and aneurysm)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Aneurysm have been published. According to news reporting originating in West Haven, Connecticut, by NewsRx journalists, research stated, "Matrix metalloproteinase (MMP)-12 plays a key role in the development of aneurysm. Like other members of MMP family, MMP-12 is produced as a proenzyme, mainly by macrophages, and undergoes proteolytic activation to generate an active form."

The news reporters obtained a quote from the research, "Accordingly, molecular imaging of the MMP-12 active form can inform of the pathogenic process in aneurysm. Here, we developed a novel family of fluorescent probes based on a selective MMP-12 inhibitor, RXP470.1 to target the active form of MMP-12. These probes were stable in complex media and retained the high affinity and selectivity of RXP470.1 for MMP-12. Amongst these, probe 3 containing a zwitterionic fluorophore, ZW800-1, combined a favorable affinity profile toward MMP-12 and faster blood clearance. In vivo binding of probe 3 was observed in murine models of sterile inflammation and carotid aneurysm. Binding specificity was demonstrated using a non-binding homolog. Co-immunostaining localized MMP-12 probe binding to MMP-12 positive areas and F4/80 positive macrophages in aneurysm."

According to the news reporters, the research concluded: "The active form of MMP-12 can be detected by optical imaging using RXP470.1-based probes. This is a valuable adjunct for pathophysiology research, drug development, and potentially clinical applications."

For more information on this research see: Optical imaging of MMP-12 active form in inflammation and aneurysm. Scientific Reports, 2016;6():1-10. Ankylosing Spondylitis

Findings on Ankylosing Spondylitis Reported by Investigators at University of Oxford (An ankylosing spondylitis-associated genetic variant in the IL23R-IL12RB2 intergenic region modulates enhancer
activity and is associated with increased ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Ankylosing Spondylitis. According to news originating from Oxford, United Kingdom, by NewsRx correspondents, research stated, "To explore the functional basis for the association between ankylosing spondylitis (AS) and single-nucleotide polymorphisms (SNPs) in the IL23R-IL12RB2 intergenic region. We performed conditional analysis on genetic association data and used epigenetic data on chromatin remodelling and transcription factor (TF) binding to identify the primary AS-associated IL23R-IL12RB2 intergenic SNP."

Our news journalists obtained a quote from the research from the University of Oxford, "Functional effects were tested in luciferase reporter assays in HEK293T cells and allele-specific TF binding was investigated by electrophoretic mobility gel shift assays. IL23R and IL12RB2 mRNA levels in CD4+ T cells were compared between cases homozygous for the AS-risk 'A' allele and the protective 'G' allele. The proportions of interleukin (IL)-17A+ and interferon (IFN)-gamma+ CD4+ T-cells were measured by fluorescence-activated cell sorting and compared between these AS-risk and protective genotypes. Conditional analysis identified rs11209032 as the probable causal SNP within a 1.14 kb putative enhancer between IL23R and IL12RB2. Reduced luciferase activity was seen for the risk allele (p <0.001) and reduced H3K4me1 methylation observed in CD4+ T-cells from 'A/A' homozygotes (p=0.02). The binding of nuclear extract to the risk allele was decreased similar to 3.5-fold compared with the protective allele (p <0.001). The proportion of IFN-gamma+ CD4+ T-cells was increased in 'A/A' homozygotes (p=0.004), but neither IL23R nor IL12RB2 mRNA was affected. The rs11209032 SNP downstream of IL23R forms part of an enhancer, allelic variation of which may influence Th1-cell numbers. Homozygosity for the risk 'A' allele is associated with more IFN-gamma-secreting (Th1) cells."

According to the news editors, the research concluded: "Further work is necessary to explain the mechanisms for these important observations."

The news correspondents report that additional information may be obtained from B.P. Wordsworth, University of Oxford, Botnar Res Center, Nuffield Dept. of Orthopaed Rheumatol & Musculoskelet, Oxford, United Kingdom. Additional authors for this research include M. Vecellio, L.Y. Chen, A. Ridley, A. Cortes, J.C. Knight, P. Bowness, C.J. Cohen and B.P. Wordsworth.

Anterior Cruciate Ligament

Findings on Anterior Cruciate Ligament Reported by Investigators at Department of Orthopedic Surgery (Predictors of Revision Surgery After Anterior Cruciate Ligament Reconstruction)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Anterior Cruciate Ligament is the subject of a report. According to news reporting from Portsmouth, Virginia, by NewsRx journalists, research stated, "Arthroscopically assisted anterior cruciate ligament (ACL) reconstruction is a common orthopaedic procedure. Graft failure after reconstruction remains a devastating complication, often requiring revision surgery and less aggressive or modified rehabilitation."

The news correspondents obtained a quote from the research from the Department of Orthopedic Surgery, "Worse functional and patient-reported outcomes are reported compared with primary reconstruction. Moreover, both rates and risk factors for revision are variable and inconsistent within the literature. To determine the rate of revision surgery after ACL reconstruction in a large cohort of patients, to assess the influence of patient characteristics on the odds of revision, and to compare revision rates between active-duty military members and non-active-duty beneficiaries. Descriptive epidemiology study. Using administrative data from the Military Health System, a retrospective study was designed to characterize the rate of ACL revision surgery among patients treated within a military facility. All patients 18 years at the time of ACL reconstruction were identified using the American Medical Association Current Procedural Terminology (CPT) for ACL reconstruction (CPT code 29888) over 7 years (2005-2011). Revision ACL reconstructions were identified as having 2 ACL reconstruction procedure codes on the ipsilateral knee at least 90 days apart. Univariate analysis was performed to calculate odds ratios (ORs) for demographic, perioperative medication use, and concomitant procedure-related risk factors. A multivariate logistic regression model determined risk covariates in the active-duty cohort. The study population consisted of 17,164 ACL reconstructions performed among 16,336 patients, of whom 83.3% were male with a mean SD age of 28.9 +/- 7.6 years for the nonrevision group, and was predominantly active duty (89.2%). Patients undergoing ACL reconstruction on both knees only contributed their index knee for analyses. There were 587 patients who underwent revision surgery, corresponding to an overall revision rate of 3.6%. The median time from the index surgery to revision surgery was 500 days (interquartile range, 102-2406 days). Revision rates were higher in the active-duty cohort as compared with non-active-duty beneficiaries (3.8% vs 1.8%, respectively; OR, 2.14; 95% CI, 1.49-3.07). Based on multivariate logistic regression in the active-duty cohort, age 35 years (OR, 0.44; 95% CI, 0.33-0.58) and concomitant meniscal repair (OR, 0.69; 95% CI, 0.53-0.91) were found to be protective with regard to the odds of revision surgery. Perioperative medication use of nonsteroidal anti-inflammatory drugs (NSAIDs) (OR, 1.33; 95% CI, 1.12-1.58; number needed to harm [NNH], 100) and COX-2 inhibitors (OR, 1.31; 95% CI, 1.04-1.66; NNH, 333) was associated with increased odds of revision surgery. No significant findings were detected among sex, race, nicotine use, body mass index, or other concomitant procedures of interest. In this large cohort study, the rate of revision ACL reconstruction was 3.6%, which is consistent with the existing literature. Increased odds of revision surgery among active-duty personnel were associated with the perioperative use of NSAIDs and COX-2 inhibitors."

According to the news reporters, the research concluded: "Age 35 years and concomitant meniscal repair were found to be protective against ACL revision."

For more information on this research see: Predictors of Revision Surgery After

Our news journalists report that additional information may be obtained by contacting B. Bryant, Naval Med Center Portsmouth, Dept. of Orthopaed Surg, Portsmouth, VA 23703, United States. Additional authors for this research include B. Bryant, T. Gaskill, N. Sicignano, A.M. Evans and M. DeMaio.

Drugs and Therapies - Antibiotics

Findings on Antibiotics Discussed by Investigators at University of Kebangsaan (Doxorubicin and siRNA Codelivery via Chitosan-Coated pH-Responsive Mixed Micellar Polyplexes for Enhanced Cancer Therapy in Multidrug-Resistant Tumors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antibiotics. According to news reporting originating in Kuala Lumpur, Malaysia, by NewsRx journalists, research stated, "This study investigated the potential of chitosan-coated mixed micellar nanocarriers (polyplexes) for codelivery of siRNA and doxorubicin (DOX). DOX-loaded mixed micelles (serving as cores) were prepared by thin film hydration method and coated with chitosan (CS, serving as outer shell), and complexed with multidrug resistance (MDR) inhibiting siRNA."

Funders for this research include Universiti Kebangsaan Malaysia, Kementerian Sains, Teknologi dan Inovasi.

The news reporters obtained a quote from the research from the University of Kebangsaan, "Selective targeting was achieved by folic acid conjugation. The polyplexes showed pH-responsive enhanced DOX release in acidic tumor pH, resulting in higher intracellular accumulation, which was further augmented by downregulation of mdr-1 gene after treatment with siRNA-complexed polyplexes. In vitro cytotoxicity assay demonstrated an enhanced cytotoxicity in native 4T1 and multidrug-resistant 4T1-mdr cell lines, compared to free DOX. Furthermore, in vivo, polyplexes codelivery resulted in highest DOX accumulation and significantly reduced the tumor volume in mice with 4T1 and 4T1-mdr tumors as compared to the free DOX groups, leading to improved survival times in mice."

According to the news reporters, the research concluded: "Codelivery of siRNA and DOX via polyplexes has excellent potential as targeted drug nanocarriers for treatment of MDR cancers."

For more information on this research see: Doxorubicin and siRNA Codelivery via

Drugs and Therapies - Antibiotics

**Findings on Antibiotics Reported by Investigators at Hunan University**

**[Voltammetric determination of levofloxacin using a glassy carbon electrode modified with poly(o-aminophenol) and graphene quantum dots]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antibiotics are discussed in a new report. According to news reporting originating from Changsha, People's Republic of China, by NewsRx correspondents, research stated, "A strategy was developed for the voltammetric determination of the antibiotic drug levofloxacin (LV) based on a glassy carbon electrode modified with a composite consisting of poly(o-aminophenol) and graphene quantum dots (PoAP/GQD) that was fabricated by electropolymerization."

Financial supporters for this research include National Natural Science Foundation of China, National Natural Science Foundation of China (CN).

Our news editors obtained a quote from the research from Hunan University, "The PoAP/GQD composite provides a large surface area and sensing interface and strongly promotes the oxidation current of LV. Under optimal conditions, the modified GCE displays an oxidation peak current (best measured at a working voltage of 1.05 V vs. SCE) that is linearly related to the levofloxacin concentration in the range from 0.05 to 100 μM, and the detection limit is 10 nM (at an S/N of 3)."

According to the news editors, the research concluded: "The method was applied to the determination of levofloxacin in spiked milk samples where is gave recoveries between 96.0 and 101.0 %." For more information on this research see: Voltammetric determination of levofloxacin using a glassy carbon electrode modified with poly(o-aminophenol) and graphene

The news editors report that additional information may be obtained by contacting W. Wen, Hunan Univ, State Key Lab Chemo Biosensing & Chemometr, Changsha 410082, Hunan, People's Republic of China. Additional authors for this research include T. Bao, T.X. Hu, W. Wen, X.H. Zhang and S.F. Wang.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s00604-016-1982-5. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Antihyperlipidemic Agents**

**Findings on Antihyperlipidemic Agents Discussed by P. Partani and Co-Researchers (Development and Validation of an LC-MS-MS Method for Determination of Simvastatin and Simvastatin Acid in Human Plasma: Application to a Pharmacokinetic Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antihyperlipidemic Agents have been published. According to news originating from Gurgaon, India, by NewsRx correspondents, research stated, "A liquid chromatography-tandem mass spectrometry method was developed and validated for the simultaneous determination of simvastatin (SV) and simvastatin acid (SVA) in human plasma. To improve assay sensitivity and achieve simultaneous analysis, SVA monitored in (-) ESI (electrospray ionization) mode within the first 4.5 min and SV thereafter in (+) ESI mode."

Our news journalists obtained a quote from the research, "The separation of all compounds was achieved in about 6.2 min using a C-18 reverse-phase fused-core © column (Ascentis ® Express C-18) and a mobile phase, which was composed of 2.00 +/- 0.05 mMammonium acetate buffer titrated to pH 3.8 with glacial acetic acid-acetonitrile (25:75, v/v), in isocratic mode at a flow rate of 0.500 mL/min. Additionally, a solid-phase extraction step was performed to reduce any ion-suppression and/or enhancement effects. The developed method was linear in the concentration range of 0.100-74.626 ng/mL for SV, and 0.100-48.971 ng/mL for SVA, with correlation coefficient greater than 0.99 for both analytes. The method has shown tremendous reproducibility, with intra- and inter-day precision <7.6%, and intra- and interday accuracy within +/- 10.9% of nominal values, for the both analytes."

According to the news editors, the research concluded: "The method was successfully applied to characterize the pharmacokinetic profiles of SV and SVA following an oral administration of 40 mg SV tablet to healthy human volunteers."

For more information on this research see: Development and Validation of an LC-MS-MS Method for Determination of Simvastatin and Simvastatin Acid in Human Plasma:

The news correspondents report that additional information may be obtained from P. Partani, Sun Pharmaceut Ind Ltd, Dept. of Clin Pharmacol & Pharmacokinet, Gurgaon 122015, Haryana, India. Additional authors for this research include S.M. Verma and T. Monif.

**Drugs and Therapies - Antiinfectives**

**Findings on Antiinfectives Described by Researchers at University of Leipzig (Effects of minocycline on parameters of cardiovascular recovery after cardioplegic arrest in a rabbit Langendorff heart model)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antiinfectives. According to news reporting from Leipzig, Germany, by NewsRx journalists, research stated, "Pharmacological cardiac organ protection during cardiopulmonary bypass presents an opportunity for improvement. A number of different strategies have been established to minimize ischemia/reperfusion-induced damage to the heart."

The news correspondents obtained a quote from the research from the University of Leipzig, "Among these, cardioplegia with histidine-tryptophan-ketoglutarate solution and hypothermia are the most frequently used regimens. The antibiotic minocycline has been used in this context for neuroprotection. The aim of the current study was to evaluate whether the application of minocycline prior to cardioplegia exerts a protective effect on cardiac muscle. For this purpose, this study investigated six rabbit hearts with minocycline treatment (1 mmol/L) and six without in a Langendorff model of 90 min cold cardioplegic arrest using Custodiol followed by a 30 min recovery phase. Histological analysis of cardiac muscle revealed that markers of apoptosis, oxidative and nitrosative stress were significantly lower in the minocycline group, whereas adenosine triphosphate (ATP)-and malondialdehyde (MDA)-levels and O2-consumption were not affected by minocycline. Functionally, recovery of dP/dt (max) and dP/dt (min) was significantly faster in the minocycline group than in control."

According to the news reporters, the research concluded: "This leads to the conclusion that adding minocycline to the cardioplegic solution may improve left ventricular recovery after cardioplegic arrest involving reduced pro-apoptotic effects."

Our news journalists report that additional information may be obtained by contacting A. Salameh, Clinic for Pediatric Cardiology, Heart Centre, University of Leipzig,
Leipzig, Germany. Additional authors for this research include M. Halling, T. Seidel and S. Dhein.

Drugs and Therapies - Antiinflammatory Agents

Findings on Antiinflammatory Agents Detailed by Investigators at University of Bourgogne (Inflammasomes and Natural Ingredients towards New Anti-Inflammatory Agents)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Antiinflammatory Agents. According to news reporting originating in Dijon, France, by NewsRx editors, the research stated, "Inflammasomes are a family of proteins in charge of the initiation of inflammatory process during innate immune response. They are now considered major actors in many chronic inflammatory diseases."

The news reporters obtained a quote from the research from the University of Bourgogne, "However, no major drug focusing on this target is currently on the market. Among the various approaches aiming to control this major metabolic pathway, compounds aiming to modify the intracellular antioxidant profile appear to be promising. This can be obtained by 'light' antioxidants able to induce natural antioxidant response of the cell itself."

According to the news reporters, the research concluded: "This review will give an overview of the current available information on this promising pharmacology approach."

For more information on this research see: Inflammasomes and Natural Ingredients towards New Anti-Inflammatory Agents. Molecules, 2016;21(11):1047-1059. Findings on Antimicrobials Discussed by Investigators at BioMerieux Inc. [Antimicrobial binding and growth kinetics in BacT/ALERTA (R) FA Plus and BACTECA (R) Aerobic/F Plus blood culture media]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Antimicrobials is now available. According to news reporting from Durham, North Carolina, by NewsRx journalists, research stated, "The capacity of absorbent beads in BacT/ALERTA ® FA Plus and BACTECA ® Aerobic/F Plus blood culture bottles to bind and neutralize antibiotics was compared."

The news correspondents obtained a quote from the research from BioMerieux Inc., "Binding was established using reverse-phase HPLC, and inactivation was based on the recovery of susceptible test stains from simulated blood cultures. The FA Plus medium demonstrated more rapid and better overall binding kinetics for each drug tested, resulting in significantly better overall recovery rates."

According to the news reporters, the research concluded: "Differences in time to detection favored the FA Plus medium for three drug/organism combinations and Aerobic/F Plus for two."

For more information on this research see: Antimicrobial binding and growth kinetics in BacT/ALERTA ® FA Plus and BACTECA ® Aerobic/F Plus blood culture media. European Journal of Clinical Microbiology & Infectious Diseases, 2016;35(12):2033-2036. Findings on Antimicrobials Reported by Investigators at Indian Institute of Technology (Development and Scale-up of an Efficient and Green Process for HPLC Purification of Antimicrobial Homologues of Commercially Important Microbial Lipopeptides)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antimicrobials are presented in a new report. According to news originating from Kharagpur, India, by NewsRx correspondents, research stated, "Lipopeptides are green surfactants with myriad applications in the areas of
healthcare, energy, and the environment. However, the commercial potential of these ecofriendly molecules could not be fully realized due to lack of an economically viable and environmentally sustainable purification process.

Financial supporters for this research include Ministry of Earth Sciences, Department of Biotechnology, Ministry of Science and Technology.

Our news journalists obtained a quote from the research from the Indian Institute of Technology, "Thus, we endeavored to systematically develop and scale-up a green chromatographic process with zero solvent discharge for rapid and efficient purification of bioactive homologues of three lipopeptide families produced by marine Bacillus megaterium. On optimization of the purification process by analytical HPLC, significant reduction of elution time from 80 to 30 min with simultaneous improvement in peak resolution was achieved. This process was scaled-up to semipreparative HPLC, while maintaining the solvent linear velocity constant to achieve the same purification efficiency and product quality. MALDI-ToF mass spectral analysis of the purified fractions confirmed the presence of the homologues of the iturin, fengycin, and surfactin families of lipopeptides, which were subsequently tested positive for their antimicrobial activities. As evident from minimum inhibitory concentrations, the homologues containing long chain fatty acid exhibited stronger antimicrobial activities than those with shorter chains."

According to the news editors, the research concluded: "Thus, the ecofriendly process can well qualify as a standard operating procedure for efficient purification of a particular lipopeptide homologue with the desired therapeutic properties."

For more information on this research see: Development and Scale-up of an Efficient and Green Process for HPLC Purification of Antimicrobial Homologues of Commercially Important Microbial Lipopeptides. *ACS Sustainable Chemistry & Engineering*, 2016;4(12):6638-6646. *ACS Sustainable Chemistry & Engineering* can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA.

The news correspondents report that additional information may be obtained from R. Sen, Indian Inst Technol, Dept. of Biotechnol, Kharagpur 721302, W Bengal, India. Additional authors for this research include V. Rangarajan, P.R. Sridhar and R. Sen.

**Drugs and Therapies - Antineoplastics**

**Findings on Antineoplastics Reported by Investigators at Imam Khomeini International University (Kinetic and thermodynamic studies of methotrexate adsorption on chitosan-modified magnetic multi-walled carbon nanotubes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Antineoplastics have been presented. According to news reporting originating in Qazvin, Iran, by NewsRx journalists,
research stated, "A new type of drug delivery system involved chitosan (CS)-modified magnetic multi-walled carbon nanotubes (M-CS-MWNTs) was synthesized. Prepared M-CS-MWNTs was characterized by Fourier transform infrared spectroscopy, scanning electron microscope, thermogravimetric analysis, X-ray diffraction, and CHN techniques."

The news reporters obtained a quote from the research from Imam Khomeini International University, "The nanocarrier was used for controllable loading and release of anticancer drug methotrexate. The full factorial design methodology was employed to obtain the optimum conditions for time, dose of adsorbent, initial methotrexate concentration, and pH of preparative media on the drug loading efficiency, by using Minitab 16 and Design Expert 7.1.6 software. The maximum loading (89 %) was achieved under optimized condition (pH: 7.0, time: 35 min, methotrexate concentration: 20 mg dm(-3), and M-CS-MWNTs dosage: 0.20 g dm(-3)). The adsorption isotherm and other properties including kinetics and thermodynamics were studied. Pseudo-second order shows the best fitting of methotrexate adsorption."

According to the news reporters, the research concluded: "The thermodynamic studies showed that the adsorption of methotrexate on nanocarrier is spontaneous and exothermic in nature."

For more information on this research see: Kinetic and thermodynamic studies of methotrexate adsorption on chitosan-modified magnetic multi-walled carbon nanotubes. *Monatshefte Fur Chemie*, 2016;147(12):2051-2060. *Monatshefte Fur Chemie* can be contacted at: Springer Wien, Sachsenplatz 4-6, PO Box 89, A-1201 Wien, Austria.

Antioxidants

**Findings on Antioxidants Detailed by Investigators at Tarbiat Modares University (Antioxidant effects of alfalfa can improve iron oxide nanoparticle damage: Invivo and invitro studies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Antioxidants. According to news reporting originating in Tehran, Iran, by NewsRx journalists, research stated, "Medicago sativa Linn. or alfalfa (Leguminosae) has been used traditionally as an effective cure for CNS, heart and metabolic disorders and digestive aids. Alfalfa is a resistant plant against stress due to small antioxidant molecules and enzymes."

The news reporters obtained a quote from the research from Tarbiat Modares University, "Our previous work demonstrated that 100 ggiml of 50 nm size Fe2O3-NP causes harsh oxidative stress in HepG2 cells and 100 mg/kg of same nanoparticle causes extreme damage in rat's liver. Therefore it can be used as a useful model for invivo and invitro studies of oxidative stress. This study assessed the effects of two concentration of alfalfa on the mentioned..."
invivo and invitro damage. Our results showed alfalfa reduced reactive oxygen species (ROS) production and enhanced reduced glutathione (GSH) that cause reduction of DNA fragmentation and prevent apoptosis pathway so improve viability of the cells. Results also showed alfalfa decreased hepatic enzymes penetrating and lipid peroxidation in rat's liver. Note that Fe203-NP potentially has widespread biological application but its usage is limited due to bio incompatibility."

According to the news reporters, the research concluded: "A suitable antioxidant compound that reduce nanoparticle side effects can be used as an effective adjuvant with iron oxide nanoparticle (and may be other nanomaterials) in biological applications."

For more information on this research see: Antioxidant effects of alfalfa can improve iron oxide nanoparticle damage: Invivo and invitro studies. Regulatory Toxicology and Pharmacology, 2016;81():39-46. Drugs and Therapies - Antipsychotics

Findings on Antipsychotics Reported by Researchers at University of Calgary (Amygdala responses to quetiapine XR and citalopram treatment in major depression: the role of 5-HTTLPR-S/Lg polymorphisms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Antipsychotics. According to news reporting out of Calgary, Canada, by NewsRx editors, research stated, "Genotype and drug pharmacology may contribute to variations in brain response to antidepressants. We examined the impact of two antidepressants with differential actions on serotonin transporter and the 5-HHTLPR-S/Lg polymorphisms on amygdala responses in major depressive disorder (MDD)."

Funders for this research include Astra Zeneca, Hotchkiss Brain Institute for Neuroimaging Research Unit, Foothills Hospital, Mathison Centre for Mental Health Research and Education, Calgary.

Our news journalists obtained a quote from the research from the University of Calgary, "Caucasians with MDD were given either citalopram or quetiapine extended release for 8 weeks. Patients were genotyped for 5-HTTLPR. Clinical efficacy was assessed using the Hamilton Depression Rating Scale. fMRI responses to negative emotional faces were acquired..."
at baseline, week 1 and week 8. The outcome measure was change in amygdala responses at week 8. Citalopram had no effect on amygdala responses in MDD patients with S/Lg alleles at weeks 1 and 8 compared with baseline, whereas it induced changes in amygdala responses in LL homozygotes. By contrast, quetiapine decreased amygdala responses at both time points in S/Lg carriers, and changes in amygdala responses at week 8 correlated with a reduction in depression scores. The small number of LL homozygotes in quetiapine group was a limitation. Efficacy of both treatments was comparable."

According to the news editors, the research concluded: "These preliminary data suggest that pharmacological mechanisms and genetics need to be considered in the development of neuroimaging markers for the evaluation of antidepressant treatments." For more information on this research see: Amygdala responses to quetiapine XR and citalopram treatment in major depression: the role of 5-HTTLPR-S/Lg polymorphisms. Human Psychopharmacology, 2016;31(2):144-55. (Wiley-Blackwell - www.wiley.com/; Human Psychopharmacology - onlinelibrary.wiley.com/journal/10.1002/(ISSN)1099-1077)

Drugs and Therapies - Antiretrovirals

Findings on Antiretrovirals Reported by Investigators at Vall d'Hebron Research Institute (Impact of low-level viraemia on virological failure in HIV-1-infected patients with stable antiretroviral treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antiretrovirals are presented in a new report. According to news reporting originating from Barcelona, Spain, by NewsRx correspondents, research stated, "Low-level viraemia (LLV) occurs in 20-40% of patients achieving viral suppression with antiretroviral therapy (ART). The risk of virological failure (VF: confirmed HIV RNA > 200 copies/ml) in these patients is still a matter of debate."

Our news editors obtained a quote from the research from Vall d'Hebron Research Institute, "This is a prospective cohort study in HIV-infected adults attending the HIV clinic of a tertiary care hospital in Spain. Patients with HIV RNA < 25 copies/ml and stable ART for at least 6 months presenting LLV (defined as HIV RNA between 25-1,000 copies/ml) from January 2011 to January 2013 were included and followed until VF or end of follow-up in June 2014. A total of 300 out of 1,733 (17.3%) patients with undetectable viraemia for 4.2 years
showed LLV: 25-50 copies/ml in 167 (55.7%) patients, 51-200 copies/ml in 111 (37%) and 201-1,000 copies/ml in 22 (7.3%) cases. After a median follow-up of 2.6 years, 23 (7.7%) patients presented VF. No patient with a single or multiple unconfirmed LLV went on to develop VF. HIV RNA > 200 copies/ml (HR 59.6; 95% CI 15.7, 227), ritonavir-boosted protease inhibitor (PI/r)-based dual therapy (HR 10.2; 95% CI 2.1, 49.8) and PI/r monotherapy (HR 7.9; 95% CI 1.4, 43.3) were associated with VF. Persistent LLV, defined as HIV RNA < 200 copies/ml in at least three consecutive samples, for at least 12 weeks, was detected in 27 (1.6%) patients and 14 (51.9%) of those evolved to VF. Nearly one-fifth of patients on suppressive ART showed LLV and 8% of them developed VF. HIV RNA > 200 copies/ml was the strongest predictor of VF.

According to the news editors, the research concluded: "Over half of patients with persistent viraemia < 200 copies/ml showed VF."

The news editors report that additional information may be obtained by contacting J. Navarro, Vall d'Hebron Res Inst, Barcelona, Spain. Additional authors for this research include E. Caballero, A. Curran, J. Burgos, I. Ocana, V. Falco, A. Torrella, M. Perez, E. Ribera and M. Crespo.

**Drugs and Therapies - Antiseptic and Germicides**

**Findings on Antiseptic and Germicides Discussed by Investigators at University of Medicine and Dentistry of New Jersey (UMDNJ) (Chlorhexidine versus Tincture of Iodine for Reduction of Blood Culture Contamination Rates: a Prospective Randomized ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Antiseptic and Germicides are presented in a new report. According to news reporting originating from New Brunswick, New Jersey, by NewsRx correspondents, research stated, "Blood cultures (BCs) are the standard method for diagnosis of bloodstream infections (BSIs). However, the average BC contamination rate (CR) in U.S. hospitals is 2.9%, potentially resulting in unnecessary antibiotic use and excessive therapy costs."

Our news editors obtained a quote from the research from the University of Medicine and Dentistry of New Jersey (UMDNJ), "Several studies have compared various skin antisepsis agents without a clear consensus as to which agent is most effective in reducing contamination. A prospective, randomized crossover study directly comparing blood culture contamination
rates using chlorhexidine versus iodine tincture for skin antisepsis was performed at Robert Wood Johnson University Hospital (RWJUH). Eight nursing units at RWJUH were provided with blood culture kits containing either chlorhexidine (CH) or iodine tincture (IT) for skin antisepsis prior to all blood culture venipunctures, which were obtained by nurses or clinical care technicians. At quarterly intervals, the antiseptic agent used on each nursing unit was switched. Analyses of positive BCs were performed to distinguish true BSIs from contaminants. Of the 6,095 total BC sets obtained from the participating nursing units, 667 (10.94%) were positive and 238 (3.90%) were judged by the investigators to be contaminated. Of the 3,130 BCs obtained using IT, 340 (10.86%) were positive and 123 (3.93%) were contaminated. Of 2,965 BCs obtained using CH, 327 (11.03%) were positive and 115 (3.88%) were contaminated. The rates of contaminated BCs were not statistically significant between the two antiseptic agents ($P = 1.0$).

According to the news editors, the research concluded: "CH and IT are equivalent agents for blood culture skin antisepsis."

For more information on this research see: Chlorhexidine versus Tincture of Iodine for Reduction of Blood Culture Contamination Rates: a Prospective Randomized Crossover Study. *Journal of Clinical Microbiology*, 2016;54(12):3007-3009. *Journal of Clinical Microbiology* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA.

**Aortic Aneurysms**

**Findings on Aortic Aneurysms Detailed by Investigators at University of Cologne (Single Centre Results of Total Endovascular Repair of Complex Aortic Aneurysms with Custom Made Anaconda Fenestrated Stent Grafts)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Aortic Aneurysms are discussed in a new report.

According to news reporting originating from Cologne, Germany, by NewsRx correspondents, research stated, "Fenestrated endovascular aneurysm repair (F-EVAR) has increased the number of patients with aneurysmal disease and a short or no existing neck being eligible for endovascular treatment. The aim of the study is to report experience using the Anaconda fenestrated device with special emphasis on. target vessel patency and pitfalls with the device."

Our news editors obtained a quote from the research from the University of Cologne,
Between 2011 and 2016, 48 F-EVAR procedures were performed in 37 males and 11 females under general anaesthesia using the Anaconda custom made device (CMD). Cerebrospinal fluid drainage was performed in selected cases only. Primary endpoints were 30 day mortality and any stent graft related complications. The median aneurysm diameter was 56 mm. Most of the patients had a juxtarenal aneurysm and six had an aorto-iliac aneurysm. The primary technical success was 94% with three unsuccessful cannulations of renovisceral arteries, two of which were successfully performed later. In the third patient an open repair was necessary because of occlusion of the main graft. The 30 day mortality was 4% because of colonic ischemia with two thrombotic occlusions of the superior mesenteric artery. Thirty day morbidity included four cases (8%) of acute limb ischemia: one with a complete limb occlusion caused by a torsion of the main body; two cases (4%) of assumed temporary spinal cord ischemia; six cases (12%) of acute renal failure; and 16 endoleaks (33%) (15 type II, 1 type III). During the median 24 months (range 0-53) follow up, three patients died (6%). One had migration of the stent graft, leading to open repair and post-operative multi-organ failure. The second had graft limb occlusion and died because of multi-organ failure caused by post-operative thrombosis of the reno-visceral stents. The third patient died of an unrelated cause. Two occlusions of the right renal stent/artery were detected. Moreover, there were three cases (6%) of late partial and seven cases (15%) of total graft limb thrombosis, with one being bilateral. 'Real world' feasibility of the fenestrated Anaconda stent graft is demonstrated with 4% perioperative mortality.

According to the news editors, the research concluded: "Target vessel patency is in line with other series; however, limb thrombosis during follow up is of concern."

The news editors report that additional information may be obtained by contacting J. Brunkwall, University of Cologne, University Hospital, Dept. of Vasc & Endovasc Surg, Cologne, Germany. Additional authors for this research include D. Gray, M. Gawenda and J. Brunkwall.

Findings on Arteriovenous Fistula Reported by Investigators at Johns Hopkins University (Neuromyelitis optica unmasked by a spinal dural arteriovenous fistula)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Arteriovenous Fistula. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Neuromyelitis optica spectrum disorder (NMO-SD) and spinal dural arteriovenous fistula (SDAVF) can both cause longitudinally extensive myelopathy. We describe a case of longitudinally extensive myelopathy attributed to a SDAVF."

Our news journalists obtained a quote from the research from Johns Hopkins University, "Despite treatment, myelopathy recurred and led to subsequent NMO-SD diagnosis. We consider a possible link between the two disorders which may shed light on the pathophysiology of NMO-SD."

According to the news editors, the research concluded: "To our knowledge, this is the first published case of co-existent NMO-SD and SDAVF leading to myelopathy."

For more information on this research see: Neuromyelitis optica unmasked by a spinal dural arteriovenous fistula. Journal of Neuroimmunology, 2016;300();18-20. Journal of Neuroimmunology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Findings on Arthritis Discussed by Investigators at CSL Ltd.  
(Therapeutic Targeting of the G-CSF Receptor Reduces Neutrophil Trafficking and Joint Inflammation in Antibody-Mediated Inflammatory Arthritis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Musculoskeletal Diseases and Conditions - Arthritis is now available. According to news reporting out of Parkville, Australia, by NewsRx editors, research stated, "G-CSF is a hemopoietic growth factor that has a role in steady state granulopoiesis, as well as in mature neutrophil activation and function. G-CSF and G-CSF receptor deficient mice are profoundly protected in several models of rheumatoid arthritis, and Ab blockade of G-CSF also protects against disease."

Our news journalists obtained a quote from the research from CSL Ltd., "To further investigate the actions of blocking G-CSF/G-CSF receptor signaling in inflammatory disease, and as a prelude to human studies of the same approach, we developed a neutralizing mAb to the murine G-CSF receptor, which potently antagonizes binding of murine G-CSF and thereby inhibits STAT3 phosphorylation and G-CSF receptor signaling. Anti G-CSF receptor rapidly halted the progression of established disease in collagen Ab-induced arthritis in mice. Neutrophil accumulation in joints was inhibited, without rendering animals neutropenic, suggesting an effect of G-CSF receptor blockade on neutrophil homing to inflammatory sites. Consistent with this, neutrophils in the blood and arthritic joints of anti G-CSF receptor treated mice showed alterations in cell adhesion receptors, with reduced CXCR2 and increased CD62L expression. Furthermore, blocking neutrophil trafficking with anti G-CSF receptor suppressed local production of proinflammatory cytokines (IL-1 beta, IL-6) and chemokines (KC, MCP-1) known to drive tissue damage. Differential gene expression analysis of joint neutrophils showed a switch away from an inflammatory phenotype following anti G-CSF receptor therapy in collagen Ab-induced arthritis. Importantly, G-CSF receptor blockade did not adversely affect viral clearance during influenza infection in mice."

According to the news editors, the research concluded: "To our knowledge, we describe for the first time the effect of G-CSF receptor blockade in a therapeutic model of inflammatory joint disease and provide support for pursuing this therapeutic approach in treating neutrophil-associated inflammatory diseases."

For more information on this research see: Therapeutic Targeting of the G-CSF Receptor Reduces Neutrophil Trafficking and Joint Inflammation in Antibody-Mediated Inflammatory Arthritis. Journal of Immunology, 2016;197(11):4392-4402. Journal of Immunology can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. Cardiovascular Diseases and Conditions - 

Findings on Atherosclerosis Described by Researchers at Department of Neurology (Higher Levels of Cystatin C Are Associated with Extracranial Carotid Artery Steno-Occlusive Disease in Patients with Noncardioembolic Ischemic Stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Atherosclerosis. According to news reporting originating in Nagoya, Japan, by NewsRx journalists, research stated, "Large artery atherosclerosis is a major cause of ischemic stroke worldwide. Differential biomarker profiles associated with extra-and intracranial atherosclerosis are a topic of considerable interest."

The news reporters obtained a quote from the research from the Department of Neurology, "Cystatin C (CysC), a marker of renal function, is a risk factor for cardiovascular disease. We sought to determine whether CysC levels were associated with extra-and intracranial large artery stenosis (LAS) in patients with acute ischemic stroke. We retrospectively analyzed data of acute noncardioembolic ischemic stroke patients who were admitted to our stroke center within 5 days from symptom onset. Serum CysC levels were measured using latex agglutination turbidimetric immunoassay. Extra-and intracranial LAS were defined as (>=) 50% diameter stenosis or occlusion of the relevant internal carotid artery (ICA) and/or middle cerebral artery (MCA) using carotid echography and volume rendering on magnetic resonance angiography. Multivariate logistic analyses were used to assess the association between CysC levels and LAS after adjustment for potential confounders. Of 205 patients (mean age 70.2 years), 76 (37.1%) had LAS. The distribution of LAS was 29 extracranial ICA, 34 intracranial ICA/MCA (8 ICA only, 25 MCA only, 1 ICA+MCA) and 13 tandem stenosis (both extracranial ICA and intracranial ICA/MCA). Levels of CysC were higher in patients with extracranial ICA stenosis than in those with intracranial ICA/MCA stenosis (1.23 ? 0.33 vs. 0.97 ? 0.21 mg/l, p<0.001). In multivariate analysis, the highest CysC tertile (>1.04 mg/l) was significantly associated with extracranial ICA stenosis (adjusted odds ratio [OR] 5.01, 95% confidence interval [CI] 1.51-16.63, p=0.009) after adjustment for age, sex, diabetes, chronic kidney disease, current smoking, systolic blood pressure, HDL cholesterol, high-sensitivity C-reactive protein (hs-CRP) and premorbid lipid-lowering drugs use. When CysC was considered as a continuous variable, 1 SD increase in CysC was significantly associated with extracranial ICA stenosis (adjusted OR 3.01, 95% CI 1.58-5.72, p=0.001). However, there were no significant associations between CysC levels and intracranial ICA/MCA stenosis. In addition, CysC levels showed a weak but statistically significant correlation with hs-CRP levels (r=0.195, p=0.021). Using receiver operating characteristic curve analysis, CysC value displayed good performance in discriminating extracranial ICA stenosis (c-statistic 0.79, 95% CI 0.69-
0.89, p<0.001). This preliminary study suggests that higher levels of CysC were independently associated with symptomatic extracranial ICA stenosis, but not with intracranial ICA/MCA stenosis in patients with noncardioembolic stroke.

According to the news reporters, the research concluded: "Our findings provide new insights into the link between serum CysC and carotid atherosclerosis."

Our news correspondents report that additional information may be obtained by contacting T. Umemura, Dept. of Neurology, Preventive Medical Center, Nagoya, Japan. Additional authors for this research include T. Kawamura, S. Mashita, T. Kameyama and G. Sobue.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000443338. This DOI is a link to an online electronic document that is either free or for purchase.

**Cardiovascular Diseases and Conditions**

**Findings on Atherosclerosis Detailed by Investigators at Singapore National University (NKT Cell Hyporesponsiveness Leads to Unrestrained Accumulation of Marginal Zone B Cells in Hypercholesterolemic Apolipoprotein E-Deficient Mice)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Atherosclerosis is the subject of a report. According to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Recently, the role of B cells in atherosclerosis has gained more attention but studies have mainly focused on B1 and follicular B cell subsets. Therefore, the contribution of marginal zone (MZ) B cells in experimental atherosclerosis remains elusive."

Our news editors obtained a quote from the research from Singapore National University, "In the current study, we examined the MZ B cell compartment in atherosclerotic apoE-deficient (apoE(-/-)) mice and found that hypercholesterolemia in these mice was associated with an increased number and percentage of MZ B cells. This aberrant accumulation of MZ B cells was not associated with alterations in their development or increased proliferation but was due to decreased apoptotic cell death. This decrease in MZ B cell death in apoE(-/-) mice was associated with the reduced capacity of invariant NKT (iNKT) cells to produce IFN-gamma and IL-4 after activation. Lowering cholesterol plasma levels with ezetimibe in apoE(-/-) mice reversed iNKT function and MZ B cell accumulation. To elucidate the mechanism whereby iNKT cells control MZ B cell accumulation in apoE(-/-) mice, we performed an
adoptive transfer of iNKT cells and found that only wild-type iNKT cells but not IFN-gamma (-/-) iNKT cells reversed MZ B cell accumulation in apoE(-/-) recipient mice. Our findings reveal that lipid changes associated with atherosclerotic disease induce decreased production of IFN-gamma by iNKT, which in turn leads to aberrant accumulation of MZ B cells."

According to the news editors, the research concluded: "This study further extends the importance of iNKT cells in regulating MZ B cell compartment."

For more information on this research see: NKT Cell Hyporesponsiveness Leads to Unrestrained Accumulation of Marginal Zone B Cells in Hypercholesterolemic Apolipoprotein E-Deficient Mice. *Journal of Immunology*, 2016;197(10):3894-3904. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. **Cardiovascular Diseases and Conditions -...**

**Findings on Atherosclerosis Discussed by Investigators at Erasmus University Medical Center [Plasma cystatin C and neutrophil gelatinase-associated lipocalin in relation to coronary atherosclerosis on intravascular ultrasound and cardiovascular ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Atherosclerosis are presented in a new report. According to news reporting originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "We investigated whether plasma cystatin C (CysC) and neutrophil gelatinase-associated lipocalin (NGAL) are associated with intravascular ultrasound (IVUS)-derived characteristics of coronary atherosclerosis and 1-year adverse coronary events in patients with normal and mildly-to-moderately impaired kidney function. Between 2008 and 2011, virtual histology (VH)-IVUS of a non-culprit coronary artery was performed in 581 patients undergoing coronary angiography."

Our news editors obtained a quote from the research from Erasmus University Medical Center, "Creatinine, CysC and NGAL were measured in pre-procedural blood samples. Presence of VH-IVUS-derived thin-cap fibroatheroma (TCFA) lesions, lesions with plaque burden (PB) >= 70% and lesions with minimal luminal area (MLA) <= 4 mm 2 was assessed. Major adverse coronary events (MACE) comprised the composite of all-cause mortality, acute coronary syndrome, or unplanned coronary revascularization. Analyses were stratified using eGFR(Cr) of 90 ml/min/1.73 m(2) as the cut-off. In patients with normal kidney function, those
with higher CysC levels had fewer lesions with PB >= 70% and fewer VH-TFCA lesions (adjusted odds ratios (ORs) and 95% confidence intervals (CIs): 0.46 [0.30-0.69] and 0.59 [0.44-0.83], respectively, per standard deviation (SD) ln[ng/mL] CysC). Those with higher NGAL levels also had fewer lesions with PB >= 70% (adjusted OR [95% CI]: 0.49 [0.29-0.82]).

In patients with impaired kidneys, no differences in high-risk lesions were observed for CysC or NGAL. However, those with higher CysC had higher risk of MACE (hazard ratio (HR): 1.4, 95% CI [1.03-1.92]). This was not the case in patients with normal kidney function. NGAL did not influence risk of MACE. Mild-to-moderate kidney dysfunction modifies the relationship between CysC and high-risk coronary lesions.

According to the news editors, the research concluded: "This has not been established before, and offers an explanation for the difference in findings between experimental and epidemiologic studies."

The news editors report that additional information may be obtained by contacting I. Kardys, Erasmus MC, Dept. of Cardiol, Rotterdam, Netherlands. Additional authors for this research include K.M. Akkerhuis, N. Buljubasic, J.M. Cheng, R.M. Oemrawsingh, H.M. Garcia-Garcia, E. Regar, P.W. Serruys, R.J. van Geuns, E. Boersma and I. Kardys.

(HFrEF). This study evaluated the effect of permanent AF on renal function in HFrEF and investigated the associations of atrial fibrillation, neutrophil gelatinase-associated lipocalin (NGAL), and neutrophil-to-lymphocyte ratio (NLR) with adverse clinical outcome."

Our news editors obtained a quote from the research from the Department of Cardiology, "Serum NGAL levels measured by ELISA and NLR were compared between patients with sinus rhythm (HFrEF-SR, n=68), with permanent AF (HFrEF-AF, n=62), and a healthy control group (n=50). Mean eGFR levels were significantly lower, and NLR and NGAL levels were significantly higher in the HFrEF patients than in the control patients but the difference between HFrEF-SR and HFrEF-AF was not statistically significant (NGAL: 95 ng/mL in HFrEF-SR, 113 ng/mL in HFrEF-AF and 84 ng/mL in the control group; p<0.001). Independent associates of baseline eGFR were age, hemoglobin, NLR, triiodothyronine, and pulmonary artery systolic pressure. In a mean 16 months follow-up, adverse clinical outcome defined as progression of kidney dysfunction and composite of all-cause mortality and re-hospitalization were not different between HFrEF-SR and HFrEF-AF patients. Although NGAL was associated with clinical endpoints in the univariate analysis, Cox regression analysis showed that independent predictors of increased events were the presence of signs right heart failure, C-reactive protein, NLR, triiodothyronine, and hemoglobin. In ROC analysis, a NLR >3 had a 68% sensitivity and 75% specificity to predict progression of kidney disease (AUC=0.72, 95% CI 0.58-0.85, p=0.001). Presence of AF in patients with HFrEF was not an independent contributor of adverse clinical outcome (i.e., all-cause death, re-hospitalization) or progression of renal dysfunction."

According to the news editors, the research concluded: "Renal dysfunction in HFrEF was associated with both NLR and NGAL levels, but systemic inflammation reflected by NLR seemed to be a more important determinant of progression of kidney dysfunction."

Findings on Atrial Fibrillation Discussed by Investigators at University of Pennsylvania Hospital (Recurrent atrial arrhythmias in the setting of chronic pulmonary vein isolation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Atrial Fibrillation are discussed in a new report. According to news reporting out of Philadelphia, Pennsylvania, by NewsRx editors, research stated, "Atrial arrhythmias may still occur in patients after durable pulmonary vein isolation (PVI). The purpose of this study was to examine the incidence of patients undergoing ablation for recurrent arrhythmia despite chronic PVI and their clinical outcomes."

Our news journalists obtained a quote from the research from the University of Pennsylvania Hospital, "Patients undergoing repeat left atrial ablation procedures were selected from a prospective registry. From this population, we identified patients with chronic PVI. Clinical characteristics, ablation strategies, and outcomes were analyzed. Between January 2003 and December 2013, 1045 patients underwent 1298 repeat left atrial procedures. Of these, 900 patients had atrial fibrillation (AF) and 145 had atrial flutter (AFL)/atrial tachycardia (AT). Fifty-two patients (5.0%; 27 with AF and 25 with AFL/AT) had chronic PVI and were included in the study. Patients were followed for 19.7 +/- 5.6 months. In patients with AF, 11 (41%) had a non-PV trigger identified. Ablation strategies included non-PV trigger ablation (n = 11), empiric trigger-site ablation (n = 3), provoked arrhythmia ablation (n = 9), complex fractionated atrial electrogram ablation (n = 2), and linear ablation (n = 2). During follow-up, 9 (33%) had no recurrence, 7 (26%) had rare AF (<= 2 episodes during follow-up >= 1 year), and 11 (41%) had AF recurrence. In patients with AFL/AT, 12 (48%) had no recurrence, 4 (16%) had rare recurrence (<= 2 episodes during follow-up >= 1 year), and 9 (36%) had recurrence. In patients with PVI undergoing a repeat procedure during the time period studied, only a small portion had chronic PVI."

According to the news editors, the research concluded: "A strategy of targeting non-PV triggers for AF and linear/focal ablation for AFL/AT may achieve long-term arrhythmia control in the majority of patients."

Our news journalists report that additional information may be obtained by contacting F.E. Marchlinski, University of Pennsylvania Hospital, Founders Pavil Cardiol 9, Philadelphia, PA 19104, United States. Additional authors for this research include S. Maeda, W. Chik, P. Santangeli, E.S. Zado, R.D. Schaller, G.E. Supple, D.S. Frankel, M.D. Hutchinson, F.C. Garcia, M.P. Riley, D. Lin, S. Dixit, D.J. Callans and F.E. Marchlinski.

Heart Disorders and Diseases - Atrial Fibrillation

Findings on Atrial Fibrillation Reported by A.G. Bejinariu et al (Left atrial thrombi and spontaneous echo contrast in patients with atrial fibrillation Systematic analysis of a single-center experience)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Atrial Fibrillation. According to news reporting originating from Detmold, Germany, by NewsRx correspondents, research stated, "Atrial fibrillation is associated with a high risk for thromboembolic events. Thrombi in the left atrial appendage and spontaneous echo contrast (SEC) correlate positively with this embolic risk."

Our news editors obtained a quote from the research, "We studied the laboratory, echocardiographic, and epidemiologic parameters that could predict left atrial thrombi and the intensity of the SEC. Between September 2013 and June 2015 we included 372 patients with atrial fibrillation before planned electrical cardioversion (transesophageal-guided strategy) in this study. After assessing the risk of stroke and bleeding (CHA(2)DS(2)-VASc and HAS-BLED scores), we measured the concentration of the D-dimer and B-type natriuretic peptide at the time of the transesophageal echocardiography as well as the left atrial volume and the ejection fraction during transthoracic echocardiography. The ejection fraction and the CHA(2)DS(2)-VASc score were identified as independent predictors of both left atrial thrombi and SEC, whereas the left atrial volume could only predict the intensity of SEC. In contrast to the results of other studies, the biomarkers in this study failed to predict the outcome. Only the echocardiographic and epidemiologic parameters were predictors of left atrial thrombi and SEC intensity, while the studied biomarkers had no predictive power."

According to the news editors, the research concluded: "Using clinical data and transthoracic echocardiography, we can change the therapeutic strategy in high-risk patients."

For more information on this research see: Left atrial thrombi and spontaneous echo contrast in patients with atrial fibrillation Systematic analysis of a single-center experience. **Findings on Autism Spectrum Disorders Detailed by Investigators at University of California (Histone Acetylome-wide Association Study of Autism Spectrum Disorder)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Developmental Diseases and Conditions - Autism Spectrum Disorders are discussed in a new report. According to news reporting originating in Los Angeles, California, by NewsRx journalists, research stated, "The association of histone modification changes with autism spectrum disorder (ASD) has not been systematically examined. We conducted a histone acetylome-wide association study (HAWAS) by performing H3K27ac chromatin immunoprecipitation sequencing (ChIP-seq) on 257 postmortem samples from ASD and matched control brains."

Financial supporters for this research include PsychENCODE, Agency for Science, Technology and Research.

The news reporters obtained a quote from the research from the University of California, "Despite etiological heterogeneity, ≥68% of syndromic and idiopathic ASD cases shared a common acetylome signature at >5,000 cis-regulatory elements in prefrontal and temporal cortex. Similarly, multiple genes associated with rare genetic mutations in ASD showed common 'epi-mutations.' Acetylome aberrations in ASD were not attributable to genetic differentiation at cis-SNPs and highlighted genes involved in synaptic transmission, ion transport, epilepsy, behavioral abnormality, chemokinesis, histone deacetylation, and immunity. By correlating histone acetylation with genotype, we discovered >2,000 histone acetylation quantitative trait loci (haQTLs) in human brain regions, including four candidate causal variants for psychiatric diseases."

According to the news reporters, the research concluded: "Due to the relative stability of histone modifications postmortem, we anticipate that the HAWAS approach will be applicable to multiple diseases."

Our news correspondents report that additional information may be obtained by contacting D.H. Geschwind, University of California, David Geffen Sch Med, Center Autism Res & Treatment, Program NeurogenetDept NeurolSemel Inst, Los Angeles, CA 90095, United States. Oncology - B-Cell Lymphoma

Findings on B-Cell Lymphoma Described by M. Saito and Colleagues
(Regression of gastric de novo diffuse large B-cell lymphoma following Helicobacter pylori eradication: a case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - B-Cell Lymphoma.

According to news reporting originating in Hokkaido, Japan, by NewsRx journalists, research stated, "We report a case of primary gastric diffuse large B-cell lymphoma (DLBCL), de novo DLBCL without the features of mucosa-associated lymphoid tissue (MALT) lymphoma, which regressed after Helicobacter pylori (HP) eradication. A 27-year-old Japanese female with epigastralgia was revealed to have ulcerated lesions in the angle and antral regions on gastroscopy."

The news reporters obtained a quote from the research, "Biopsy specimen was consistent with a diagnosis of DLBCL without MALT lymphoma component, indicating de novo development. Her clinical staging on the Lugano system was Stage I. HP was positive on a rapid urease test, and she received HP eradication therapy twice, because the first therapy was not successful."

According to the news reporters, the research concluded: "On gastroscopy performed 1 month after the second HP eradication therapy, no ulcerated lesion was noted, and the lymphoma cells had regressed histopathologically."

Our news correspondents report that additional information may be obtained by contacting M. Saito, Aiiku Hosp, Dept. of Internal Med & Hematol, Sapporo, Hokkaido, Japan. Additional authors for this research include M. Masutani, K. Mabe, K. Izumiyama, A. Mori, T. Irie, M. Tanaka, M. Morioka and M. Tanino.

Bacterial Infections and Mycoses - Bacteremia

Findings on Bacteremia Detailed by G. Sakoulas and Co-Authors
(Cefazolin and Ertapenem, a Synergistic Combination Used To Clear Persistent Staphylococcus aureus Bacteremia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Bacterial Infections and Mycoses - Bacteremia.

According to news reporting originating in Cheongju, South Korea, by NewsRx journalists, research stated, "We report a case of persistent Staphylococcus aureus bacteremia treated with cefazolin and ertapenem. A 70-year-old female with diabetes and chronic obstructive pulmonary disease was admitted to the hospital with fever and chills. Blood cultures were positive for S. aureus."

The news reporters obtained a quote from the research, "Blood cultures were positive for S. aureus, and she received empiric antibiotic therapy with cefazolin and ertapenem. Her S. aureus isolate was resistant to methicillin.

According to the news reporters, the research concluded: "The patient's fever resolved within 24 hours of antibiotic treatment. Her S. aureus isolate was sensitive to ertapenem."

Our news correspondents report that additional information may be obtained by contacting G. Sakoulas, Dept. of Internal Med, Clin Univ Saint Luk, 10 Ave Hippocrate, Brussels, B-1200, Belgium. Additional authors for this research include M. Cid, B. Yassin, F. Tanghe, F. Guerin, P. Vandenplas, M. Zanini and L. De Smet.

Keywords for this news article include: Cheongju, South Korea, Asia, Bacterial Infections and Mycoses - Bacteremia, Staphylococcus aureus, Antimicrobial Agents, Antibiotics, Methicillin, Resistance, Therapy.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
& Wellness Week -- Fresh data on Bacterial Infections and Mycoses - Bacteremia are presented in a new report. According to news reporting originating in San Diego, California, by NewsRx journalists, research stated, "Ertapenem and cefazolin were used in combination to successfully clear refractory methicillin-susceptible Staphylococcus aureus (MSSA) bacteremia. In addition, recent work has demonstrated activity of combination therapy with beta-lactams from different classes against methicillin-resistant S. aureus (MRSA)."

Financial support for this research came from HHS | National Institutes of Health (NIH).

The news reporters obtained a quote from the research, "The ertapenem-plus-cefazolin combination was evaluated for synergy in vitro and in vivo in a murine skin infection model using an index MSSA bloodstream isolate from a patient in whom persistent bacteremia was cleared with this combination and against a cadre of well-described research strains and clinical strains of MSSA and MRSA. Against the index MSSA bloodstream isolate, ertapenem and cefazolin showed synergy using both checkerboard (fractional inhibitory concentration [FIC] index = 0.375) and time-kill assays. Using a disk diffusion ertapenem potentiation assay, the MSSA isolate showed a cefazolin disk zone increased from 34 to 40 mm. In vitro pharmacokinetic/pharmacodynamic modeling at clinically relevant drug concentrations demonstrated bactericidal activity (>3 log10-CFU/ml reduction) of the combination but bacteriostatic activity of ether drug alone at 48 h. A disk diffusion potentiation assay showed that ertapenem increased the cefazolin zone of inhibition by >3 mm for 34/35 (97%) MSSA and 10/15 (67%) MRSA strains. A murine skin infection model of MSSA showed enhanced activity of cefazolin plus ertapenem compared to monotherapy with these agents. After successful use in clearance of MSSA bacteremia, the combination of ertapenem and cefazolin showed synergy against MSSA in vitro and in vivo."

According to the news reporters, the research concluded: "This combination may warrant consideration for future clinical study in MSSA bacteremia."

For more information on this research see: Cefazolin and Ertapenem, a Synergistic Combination Used To Clear Persistent Staphylococcus aureus Bacteremia. Antimicrobial Agents and Chemotherapy, 2016;60(11):6609-6618. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Findings on Bacteremia Detailed by Investigators at Mayo Clinic
(Management of bacteremia in patients living with cardiovascular implantable electronic devices)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Bacterial Infections and Mycoses - Bacteremia have been presented. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "Cardiovascular implantable electronic devices (CIEDs) have become a critical component in management of patients with cardiac rhythm disturbances, heart failure, and prevention of sudden cardiac death. However, infection remains a major complication of CIED implantation and is associated with significant morbidity and mortality for device recipients."

The news correspondents obtained a quote from the research from Mayo Clinic, "Early-onset CIED infections frequently originate from the generator pocket, secondary to device or pocket contamination at the time of implantation, and may progress to involve device leads or cardiac valves. However, hematogenous seeding of the device leads from a remote source of bacteremia is not infrequent in patients with late-onset CIED infections. Whereas CIED pocket infection can be diagnosed in the majority of cases based on physical findings at the pulse generator site, device lead infection may only manifest with fever and positive blood cultures. However, not every patient with a CIED and positive blood cultures has underlying CIED lead infection. Consequently, management of bacteremia in a CIED recipient without local signs of infection presents a significant challenge. The risk of underlying CIED lead infection in patients presenting with bacteremia depends on several factors, including the type of microorganism isolated in blood cultures, duration and source of bacteremia, type of CIED, and number of device-related procedures. These risk factors must be considered when making decisions regarding the need for further diagnostic imaging and whether to retain or remove the device."

According to the news reporters, the research concluded: "In this article, we review the published data regarding risk of CIED infection in patients presenting with bacteremia and propose an algorithm for appropriate evaluation and management."

Our news journalists report that additional information may be obtained by contacting D.C. DeSimone, Mayo Clin Coll Med, Dept. of Med, Div Hosp Internal Med, Rochester, MN, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.hrthm.2016.08.029. This DOI is a link to an online electronic document that is either free or for purchase.

Our reports deliver fact-based news of research and discoveries from around the
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Bacterial Infections and Mycoses - Bacteremia. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "With the increasing use of carbapenems, carbapenem-resistant Gram-negative bacteria have become a major concern in health care-associated infections. The present study was performed to evaluate the clinical and microbiological features of breakthrough Gram-negative bacteremia (GNB) during carbapenem therapy and to assess risk factors for development of breakthrough GNB."

Our news journalists obtained a quote from the research from Sungkyunkwan University, "A case-control study was performed at a tertiary hospital from 2005 to 2014. Case patients were defined as individuals whose blood cultures grew Gram-negative bacteria while the patients were receiving carbapenems for at least 48 h before breakthrough GNB. Age-, sex-, and date-matched controls were selected from patients who received carbapenem for at least 48 h and did not develop breakthrough GNB during carbapenem treatment. A total of 101 cases of breakthrough GNB were identified and compared to 100 controls. The causative microorganisms for breakthrough GNB were Stenotrophomonas maltophilia (n = 33), Acinetobacter baumannii (n = 32), Pseudomonas aeruginosa (n = 21), and others (n = 15). Approximately 90% of S. maltophilia isolates were susceptible to levofloxacin and trimethoprim-sulfamethoxazole. The most common infection types were primary bacteremia (38.6%) and respiratory infections (35.6%). More than half of the patients died within a week after bacteremia, and the 30-day mortality rate was 70.3%. In a multivariate analysis, a longer hospital stay, hematologic malignancy, persistent neutropenia, immunosuppressant use, and previous colonization by causative microorganisms were significantly associated with breakthrough GNB." According to the news editors, the research concluded: "Our data suggest that S. maltophilia, A. baumannii, and P. aeruginosa are the major pathogens of breakthrough GNB during carbapenem therapy, in association with a longer hospital stay, hematologic malignancy, persistent neutropenia, immunosuppressant use, and previous colonization."

For more information on this research see: Clinical Features and Risk Factors for Development of Breakthrough Gram-Negative Bacteremia during Carbapenem Therapy. Antimicrobial Agents and Chemotherapy, 2016;60(11):6673-6678. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Biological Factors - Biological Pigments**

**Findings on Biological Pigments Detailed by Investigators at University of Montpellier (Martinique Crinkled Retinal Pigment Epitheliopathy Clinical Stages and Pathophysiologic Insights)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biological Factors - Biological Pigments is the subject of a report. According to news reporting originating in Montpellier, France, by NewsRx journalists, research stated, "To reappraise the autosomal dominant Martinique crinkled retinal pigment epitheliopathy (MCRPE) in light of the knowledge of its associated mutated gene mitogen-activated protein kinase-activated protein kinase 3 (MAPKAPK3), an actor in the p38 mitogen-activated protein kinase pathway. Clinical and molecular study."

The news reporters obtained a quote from the research from the University of Montpellier, "A total of 45 patients from 3 generations belonging to a family originating from Martinique with an autosomal dominant MCRPE were examined. Best-corrected visual acuity, fundus photographs, and spectral-domain optical coherence tomography (SD OCT) of all clinically affected patients and carriers for the causal mutation were reviewed at the initial visit and 4 years later for 10 of them. Histologic retinal lesions of Mapkapk3(-/-) mice were compared with those of the human disease. The MCRPE natural history in view of MAPKAPK3 function and Mapkapk3(-/-) mouse retinal lesions. Eighteen patients had the c. 518T >C mutation. One heterozygous woman aged 20 years was asymptomatic with normal fundus and SD OCT (stage 0). All c. 518T >C heterozygous patients older than 30 years of age had the characteristic dried-out soil fundus pattern (stages 1 and 2). Complications (stage 3) were observed in 7 cases, including polypoidal choroidal vasculopathy (PCV) and macular fibrosis or atrophy. One patient was homozygous and had a form with severe Bruch's membrane (BM) thickening and macular exudation with a dried-out soil pattern in the peripheral retina. The oldest heterozygous patient, who was legally blind, had peripheral nummular pigmentary changes (stage 4). After 4 years, visual acuity was unchanged in 6 of 10 patients. The dried-out soil elementary lesions radically enlarged in patients with a preferential macular extension and confluence. These findings are in line with the progressive thickening of BM noted with age in the mouse model. During follow-up, there was no occurrence of PCV. MCRPE is an autosomal dominant, fully penetrant retinal dystrophy with a preclinical stage, an onset after the age of 30 years, and a preserved visual acuity until occurrence of macular complications."

According to the news reporters, the research concluded: "The natural history of MCRPE is in relation to the role of MAPKAPK3 in BM modeling, vascular endothelial growth factor activity, retinal pigment epithelial responses to aging, and oxidative stress."

For more information on this research see: Martinique Crinkled Retinal Pigment
Transplant Medicine - Bone Marrow Harvesting

Findings on Bone Marrow Harvesting Discussed by Investigators at Medical University (Multiple small versus few large amount aspirations for bone marrow harvesting in autologous and allogeneic bone marrow transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Transplant Medicine - Bone Marrow Harvesting are presented in a new report. According to news reporting out of Vienna, Austria, by NewsRx editors, research stated, "For successful bone marrow transplantation it is necessary to obtain enough progenitor cells during the bone marrow (BM) harvesting procedure. Most centers are using multiple aspirations of maximum 2 ml BM (A), while other centers are using few larger amount aspirations for BM harvesting (B)."

Our news journalists obtained a quote from the research from Medical University, "There is still a discussion about possible differences in graft composition between A and B. To evaluate the feasibility in children we evaluated twenty BM harvestings that were performed in 18 donors, 7 autologous (median age 6.93y; 2.48-16.6) and 13 allogeneic donors (median age 19.75y; 6.45-50.7). A and B were performed crosswise by 2 operators starting with A (2 ml) or B (100 ml) changing to B or A, collecting identically amounts with both methods. We found no statistically significant difference between A and B for MNC, T-cells, and CFU (MNC/ml 824572 versus 725000, p = 0.728; MNC/kg 3.1 10(7) versus 2.9 10(7), p = 0.296; CD3/m1162500 versus 300000, p = 0.310; CFU/10(5) MNC 1678 versus 1315, p = 0.094), but for CD34+ cells (CD34/kg 2.62 versus 2.09, p = 0.045)."

According to the news editors, the research concluded: "BM harvest by the large amount few punctures method (B) is as sufficient as the commonly used small amount frequent punctures method (A), and could be therefore used equally."

For more information on this research see: Multiple small versus few large amount aspirations for bone marrow harvesting in autologous and allogeneic bone marrow transplantation. Transfusion and Apheresis Science, 2016;55(2):221-224. Transfusion and Apheresis Science can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. (Elsevier - www.elsevier.com;
Our news journalists report that additional information may be obtained by contacting V. Witt, Medical University of Vienna, Dept. of Pediat, St Anna Kinderspital, Vienna, Austria. Additional authors for this research include H. Pichler, G. Fritsch and C. Peters.

Bone Research

Findings on Bone Research Detailed by Investigators at Iran University of Medical Sciences (A Dermal Equivalent Engineered with TGF-beta 3 Expressing Bone Marrow Stromal Cells and Amniotic Membrane: Cosmetic Healing of Full-Thickness Skin ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Bone Research is the subject of a report. According to news reporting originating from Tehran, Iran, by NewsRx correspondents, research stated, "Transforming growth factor beta-3 (TGF-beta 3) has been shown to decrease scar formation after scheduled topical applications to the cutaneous wounds. This study aimed to continuously deliver TGF-beta 3, during the early phase of wound healing, by engineering a dermal equivalent (DE) using TGF-beta 3 expressing bone marrow stromal cells (BM-SCs) and human dehydrated amniotic membrane (hDAM)."

Our news editors obtained a quote from the research from the Iran University of Medical Sciences, "To engineer a DE, rat BM-SCs were seeded on the hDAM and TGF-beta 3 was transiently transfected into the BM-SCs using a plasmid vector. Pieces of the dermal equivalent were transplanted onto the full-thickness excisional skin wounds in rats. The process of wound healing was assessed by image analysis, Manchester Scar Scale (MSS), and histopathological studies 7, 14, 21, and 85 days after the excision. The results confirmed accurate construction of recombinant pcDNA3.1-TGF-beta 3 expression system and showed that the transfected BM-SCs seeded on hDAM expressed TGF-beta 3 mRNA and protein from day 3 through day 7 after transfection. After implantation of the DE, contraction of the wounds was measured from day 7 through 21 and analyzed by linear regression, which revealed that the rate of wound contraction in all experimental groups was similar. Histologic evaluation demonstrated that transfected BM-SCs decreased retention and recruitment of the cells during the early stage of wound healing, decreased the formation of vascular structures and led to formation of uniformly parallel collagen bundles. MSS scores showed that TGF-beta 3 secreting cells significantly improved the cosmetic appearance of the healed skin and decreased the scar formation."

According to the news editors, the research concluded: "From these results, it could
be concluded that transient secretion of TGF-beta 3, during the early phase of healing, by BM-SCs seeded on hDAM can improve the cosmetic appearance of the scar in cutaneous wounds without negatively affecting the process of wound repair.

The news editors report that additional information may be obtained by contacting A. Samadikuchakaraei, Iran Univ Med Sci, Fac Allied Med, Dept. of Med Biotechnol, Tehran, Iran. **Musculoskeletal Diseases and Conditions - Bone**

**Findings on Bone Resorption Discussed by Investigators at Tianjin Medical University (Aggravation of spinal cord compromise following new osteoporotic vertebral compression fracture prevented by teriparatide in patients with surgical ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Bone Resorption have been published. According to news reporting from Tianjin, People's Republic of China, by NewsRx journalists, research stated, "Patients with spinal cord deficits following new unstable osteoporotic compression fracture and surgical contraindications were considered to receive conservative treatment. Teriparatide was better than alendronate at improving bone mineral density and bone turnover parameters, as well as preventing aggravation of spinal cord compromise."

Financial support for this research came from National Science Foundation of China. The news correspondents obtained a quote from the research from Tianjin Medical University, "This study compared the preventive effects of teriparatide and alendronate on aggravation of spinal cord compromise following new unstable osteoporotic vertebral compression fracture (OVCF) in patients with surgical contraindications. This was a 12-month, randomized, open-label study of teriparatide versus alendronate in 49 patients with new unstable OVCF and surgical contraindications. Neurological function was evaluated using modified Japanese Orthopedic Association (mJOA) score (11-point scale, the maximum score of 11 implies normalcy). Visual analog scale (VAS) scores, kyphotic angles, anterior-border heights and diameters of the spinal canal of the fractured vertebrae, any incident of new OVCFs (onset of OVCF during follow-up), spine bone mineral density (BMD), and serumarkers of bone resorption and bone formation were also examined at baseline and 1, 3, 6, and 12 months after initiation of the medication regimen. At 12 months, mean mJOA score had improved in the
teriparatide group and decreased in the alendronate group. Mean concentrations of bone formation and bone resorption biomarkers, mean spine BMD, and mean anterior-border height and spinal canal diameter of the fractured vertebrae were significantly greater in the teriparatide group than in the alendronate group. Mean VAS score, mean kyphotic angle of the fractured vertebrae, and incidence of new OVCFs were significantly smaller in the teriparatide group than in the alendronate group."

According to the news reporters, the research concluded: "In patients with neurological deficits following new unstable OVCF and with surgical contraindications, teriparatide was better than alendronate at improving the BMD and the bone turnover parameters, as well as preventing aggravation of spinal cord compromise."

Our news journalists report that additional information may be obtained by contacting Y. Xue, Tianjin Med Univ, General Hospital, Dept. of Orthopaed, Tianjin, People's Republic of China. Additional authors for this research include R. Xue, N. Shi, Y. Xue, Y. Zong, W. Lin, B. Pei, C. Sun, R. Fan and Y. Jiang.

Musculoskeletal Diseases and Conditions - Bone...

Findings on Bone Resorption Discussed by Investigators at Veterans Affairs Medical Center (Protection From Glucocorticoid-Induced Osteoporosis by Anti-Catabolic Signaling in the Absence of Sost/Sclerostin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Musculoskeletal Diseases and Conditions - Bone Resorption. According to news originating from Indianapolis, Indiana, by NewsRx correspondents, research stated, "Excess of glucocorticoids, either due to disease or iatrogenic, increases bone resorption and decreases bone formation and is a leading cause of osteoporosis and bone fractures worldwide. Improved therapeutic strategies are sorely needed."

Our news journalists obtained a quote from the research from Veterans Affairs Medical Center, "We investigated whether activating Wnt/beta-catenin signaling protects against the skeletal actions of glucocorticoids, using female mice lacking the Wnt/beta-catenin
antagonist and bone formation inhibitor Sost. Glucocorticoids decreased the mass, deteriorated the microarchitecture, and reduced the structural and material strength of bone in wild-type (WT), but not in Sost(-/-) mice. The high bone mass exhibited by Sost(-/-) mice is due to increased bone formation with unchanged resorption. However, unexpectedly, preservation of bone mass and strength in Sost(-/-) mice was due to prevention of glucocorticoid-induced bone resorption and not to restoration of bone formation. In WT mice, glucocorticoids increased the expression of Sost and the number of sclerostin-positive osteocytes, and altered the molecular signature of the Wnt/beta-catenin pathway by decreasing the expression of genes associated with both anticatabolism, including osteoprotegerin (OPG), and anabolism/survival, such as cyclin D1. In contrast in Sost(-/-) mice, glucocorticoids did not decrease OPG but still reduced cyclin D1. Thus, in the context of glucocorticoid excess, activation of Wnt/beta-catenin signaling by Sost/sclerostin deficiency sustains bone integrity by opposing bone catabolism despite markedly reduced bone formation and increased apoptosis.

According to the news editors, the research concluded: "This crosstalk between glucocorticoids and Wnt/beta-catenin signaling could be exploited therapeutically to halt resorption and bone loss induced by glucocorticoids and to inhibit the exaggerated bone formation in diseases of unwanted hyperactivation of Wnt/beta-catenin signaling."

The news correspondents report that additional information may be obtained from T. Bellido, Richard L Roudebush Vet Adm Med Center, Indianapolis, IN, United States. **Drugs and Therapies - Botulinum Toxin Therapy**

**Findings on Botulinum Toxin Therapy Discussed by R.L. Rosales and Co-Researchers (Botulinum toxin as early intervention for spasticity after stroke or non-progressive brain lesion: A meta-analysis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Botulinum Toxin Therapy have been presented. According to news originating from Manila, Philippines, by NewsRx correspondents, research stated, "Spasticity is a functionally limiting disorder that commonly occurs following stroke or severe brain injury, and may lead to disability and pain. In tandem with neurorehabilitation, botulinum toxin type A (BoNT-A) is the recommended first-line treatment for spasticity and, to date, the majority of trials have reported BoNT-A use in patients..."
>6 months after ictus."

Financial support for this research came from Ipsen Pharma.

Our news journalists obtained a quote from the research, "The present meta-analysis aimed to evaluate the effects of early BoNT-A injection for post-stroke spasticity on improvements in hypertonicity, disability, function and associated pain. A literature search yielded six studies reporting the effects of BoNT-A treatment within 3 months post-stroke; three in the upper limb and three in the lower limb. All six studies permitted concomitant rehabilitation. Reduction in hyper-tonicity was compared in all six studies and revealed a significant treatment effect (P = 0.0002) on the most affected joints between weeks 4 and 12 following injection. However, no significant effects of treatment were observed for improvement in disability at week 4 or improvement in function at weeks 4 and 20-24. A trend towards reduction in spasticity-related pain at week 4 following BoNT-A treatment (P = 0.13) was also observed."

According to the news editors, the research concluded: "These results demonstrate the beneficial effects of BoNT-A treatment on improving hypertonicity within 3 months post-stroke and emphasise the importance of concomitant neurorehabilitation therapy."

For more information on this research see: Botulinum toxin as early intervention for spasticity after stroke or non-progressive brain lesion: A meta-analysis. Oncology - Breast Cancer

Findings on Breast Cancer Detailed by Researchers at Catholic University of Korea (The Long-term Prognostic Performance of Ki-67 in Primary Operable Breast Cancer and Evaluation of Its Optimal Cutoff Value)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Breast Cancer have been presented. According to news reporting from Daejeon, South Korea, by NewsRx journalists, research stated, "Markers of proliferation are considered to have prognostic importance in breast cancer (BC). The Ki-67 index has been reported as a prognostic factor, but standardized cutoff values and counting
methods are not yet established."

The news correspondents obtained a quote from the research from the Catholic University of Korea, "We assayed the Ki-67 labeling index (LI) of 589 consecutive operable BC patients who underwent surgical resection. Ki-67 immunostaining was performed, and the LI was manually counted using an image processing program. We also compared the manual cell count (MCC) of Ki-67 to the whole-section eyeballed estimate count (EEC). Univariate survival analysis showed statistically significant differences in long-term BC-specific survival in the following factors: tumor size, histologic grade, nuclear grade, lymph node metastasis stage, estrogen receptor, progesterone receptor, human epidermal growth factor-2 (HER2) status, and intrinsic type (p <0.05). The MCC and EEC Ki-67 evaluations were statistically well correlated (Pearson correlation=0.683, p<0.001). Their agreement rate was highest at a 20% cutoff (k-coefficient=0.464). With cutoff values of 14% and 20%, high Ki-67 LI was associated with poor BC-specific survival (p=0.028 and 0.012, respectively), and a 20% cutoff had a higher hazard ratio. High Ki-67 LI with a 20% cutoff was also associated with poor survival in the hormone receptor-positive and lymph node-positive subgroups (p=0.015 and 0.016, respectively)."

According to the news reporters, the research concluded: "Ki-67 LI had prognostic significance, especially in hormone receptor-positive and lymph node-positive BC patients. EEC was relatively reliable counting method with a higher cutoff value. We suggest that the 20% cutoff value be the preferable value in clinical practice."

For more information on this research see: The Long-term Prognostic Performance of Ki-67 in Primary Operable Breast Cancer and Evaluation of Its Optimal Cutoff Value. Applied Immunohistochemistry & Molecular Morphology, 2016;24(3):159-66. Oncology - Breast Cancer

Findings on Breast Cancer Discussed by Investigators at Chulalongkorn University (Plumbagin Enhances Tamoxifen Sensitivity and Inhibits Tumor Invasion in Endocrine Resistant Breast Cancer through EMT Regulation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report.
According to news reporting from Bangkok, Thailand, by NewsRx journalists, research stated, "Tamoxifen is widely used as the first line drug for estrogen receptor-positive subtype which is expressed in 70% of overall breast cancer patients. However, approximately 50% of these patients develop acquired resistance after 5 years of treatment, which is characterized by tumor recurrence and metastasis."

The news correspondents obtained a quote from the research from Chulalongkorn University, "The epithelial mesenchymal transition (EMT) is an important process in breast cancer invasion. Fundamentally, targeting the EMT represents a crucial therapeutic strategy for preventing or treating breast cancer metastasis. Plumbagin (PLB) is a natural naphthoquinone with significant anticancer effects against several types of tumor cells including breast cancer. In this study, we investigated the effect of PLB on human endocrine-resistant breast cancer cell growth, invasion and the possible mechanisms underlying such actions. PLB exhibited potent cytotoxic activity at a micromolar concentration against endocrine-resistant breast cancer cells. Interestingly, a fixed low concentration of PLB and tamoxifen combination resulted in an increase in growth inhibition in endocrine-resistant cells. In addition, PLB also significantly suppressed mesenchymal biomarker expressions that govern the EMT process, resulting in attenuated metastatic capabilities."

According to the news reporters, the research concluded: "PLB should be developed as a pharmacological agent for the use as a single treatment or in combination for endocrine-resistant breast cancer."

Our news journalists report that additional information may be obtained by contacting W. Ketchart, Chulalongkorn University, Dept. of Pharmacol, Fac Med, Bangkok 10330, Thailand. Additional authors for this research include N. Kalpongnukul, T. Pisitkun and W. Ketchart.

Oncology - Breast Cancer

Findings on Breast Cancer Reported by Investigators at Singapore National University (miR-93 inhibits the invasive potential of triple-negative breast cancer cells in vitro via protein kinase WNK1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Breast Cancer is now available. According to news reporting originating from Singapore, Singapore, by NewsRx correspondents, research stated, "Despite advances in treatment, the highly metastatic nature of breast tumors has given
rise to the urgent need for development of novel therapeutic and prognostic markers. miR-93 is known to regulate the epithelial to mesenchymal transition process and to influence metastatic spread in breast carcinoma, although the exact mechanism(s)/genes involved remain unknown. In the present study, we examined the role of miR-93 in MDA-MB-231 breast cancer cells.

Our news editors obtained a quote from the research from Singapore National University, "Overexpression of mature miR-93-5p in MDA-MB-231 cells decreased cell migratory capability and invasive potential, as well as increased adhesion. In contrast, inhibition of miR-93 induced the opposite effects. miRNA-mRNA target prediction (TargetScan) identified WNK lysine deficient protein kinase 1 (WNK1), which is known to interact with diverse signaling pathways and regulate cell proliferation, survival, angiogenesis and metastasis, as one of the potential targets of miR-93. Furthermore, we showed by luciferase assay that WNK1 is a putative miR-93 target. siRNA mediated silencing of WNK1 also decreased the invasive ability of the cells, suggesting that the effects of miR-93 may be attributed at least in part to decreased WNK1 expression."

According to the news editors, the research concluded: "Further in vivo studies are required to ascertain the miR-93-WNK1-metastasis cascade, that has potential implications in breast cancer therapy."

The news editors report that additional information may be obtained by contacting B.H. Bay, Singapore National University, Yong Loo Lin Sch Med, Dept. of Anat, Singapore 117594, Singapore. Additional authors for this research include H.P. Lim and B.H. Bay.

**Diagnostics and Screening - Breast Cancer Screening**

**Findings on Breast Cancer Screening Discussed by Investigators at International Hospital (Contrast enhanced dual energy spectral mammogram, an emerging addendum in breast imaging)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Diagnostics and Screening - Breast Cancer Screening are discussed in a new report. According to news reporting from Tamil Nadu, India, by NewsRx journalists, research stated, "To assess the role of contrast-enhanced dual-energy spectral mammogram (CEDM) as a problem-solving tool in equivocal cases. 44 consenting females with equivocal findings on full-field digital mammogram underwent CEDM."

The news correspondents obtained a quote from the research from International Hospital, "All the images were interpreted by two radiologists independently. Confidence of presence was plotted on a three-point Likert scale and probability of cancer was assigned on Breast Imaging Reporting and Data System scoring. Histopathology was taken as the gold standard. Statistical analyses of all variables were performed. 44 breast lesions were included in
the study, among which 77.3% lesions were malignant or precancerous and 22.7% lesions were benign or inconclusive. 20% of lesions were identified only on CEDM. True extent of the lesion was made out in 15.9% of cases, multifocality was established in 9.1% of cases and ductal extension was demonstrated in 6.8% of cases. Statistical significance for CEDM was p-value < 0.05. Interobserver kappa value was 0.837. CEDM has a useful role in identifying occult lesions in dense breasts and in triaging lesions. In a mammographically visible lesion, CEDM characterizes the lesion, affirms the finding and better demonstrates response to treatment. Hence, we conclude that CEDM is a useful complementary tool to standard mammogram.

Advances in knowledge: CEDM can detect and demonstrate lesions even in dense breasts with the advantage of feasibility of stereotactic biopsy in the same setting."

According to the news reporters, the research concluded: "Hence, it has the potential to be a screening modality with need for further studies and validation."

Our news journalists report that additional information may be obtained by contacting K.D. Kariyappa, MIOT Int Hosp, Dept. of Radiodiag, Madras, Tamil Nadu, India. Additional authors for this research include F. Gnanaprakasam, S. Anand, M. Krishnaswami and M. Ramachandran.

**Gram-Negative Bacteria - Burkholderia pseudomallei**

**Findings on Burkholderia pseudomallei Detailed by Researchers at Federal University (Farnesol increases the susceptibility of Burkholderia pseudomallei biofilm to antimicrobials used to treat melioidosis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Gram-Negative Bacteria - Burkholderia pseudomallei. According to news originating from Fortaleza, Brazil, by NewsRx correspondents, research stated, "The aim of this study was to analyse the in vitro activity of farnesol alone and combined with the antibacterial drugs amoxicillin, doxycycline, ceftazidime and sulfamethoxazole-trimethoprim against Burkholderia pseudomallei biofilms. Susceptibility was assessed by the broth microdilution test and cell viability was read with the oxidation-reduction indicator dye resazurin."

Funders for this research include Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, FUNCAP-PPSUS.

Our news journalists obtained a quote from the research from Federal University, "The biofilms were evaluated through three microscopic techniques (optical, confocal and electronic microscopy). The minimum biofilm eradication concentration (MBEC) for farnesol was 75-2400 mmol l(-1). In addition, farnesol significantly reduced the MBEC values for
ceftazidime, amoxicillin, doxycycline and sulfamethoxazole-trimethoprim by 256, 16, 4 and 4 times respectively (p <0.05). Optical, confocal and electronic microscopic analyses of farnesol-treated B. pseudomallei biofilms demonstrated that this compound damages biofilm matrix, probably facilitating antimicrobial penetration in the biofilm structure. This study demonstrated the effectiveness of farnesol against B. pseudomallei biofilms and its potentiating effect on the activity of antibacterial drugs, in particular ceftazidime, amoxicillin, doxycycline and sulfamethoxazole-trimethoprim. The intrinsic antimicrobial resistance of B. pseudomallei is a serious challenge for the treatment of melioidosis."

According to the news editors, the research concluded: "Thus, this paper reports the inhibitory potential of farnesol against B. pseudomallei biofilms, as well as highlights the favourable pharmacological interaction of farnesol with antibiotics tested, not only on cell viability, but also in the structural morphology of biofilms."

For more information on this research see: Farnesol increases the susceptibility of Burkholderia pseudomallei biofilm to antimicrobials used to treat melioidosis. *Journal of Applied Microbiology*, 2016;120(3):600-6. (Wiley-Blackwell - [www.wiley.com/](http://www.wiley.com/); Journal of Applied Microbiology - [onlinelibrary.wiley.com/journal/10.1111/(ISSN)1365-2672])

The news correspondents report that additional information may be obtained from D.S. Castelo-Branco, Postgraduate Program in Medical Microbiology, Federal University of Ceara, Fortaleza, Ceara, Brazil. Additional authors for this research include G.B. Riello, D.C. Vasconcelos, G.M. Guedes, R. Serpa, T.J. Bandeira, A.J. Monteiro, R.A. Cordeiro, M.F. Rocha, J.J. Sidrim and R.S Brilhante.

**Gram-Negative Bacteria - Burkholderia pseudomallei**

**Findings on Burkholderia pseudomallei Reported by Researchers at Case Western Reserve University (Exposing a β-Lactamase "Twist" the Mechanistic Basis for the High Level of Ceftazidime Resistance in the C69F Variant of the Burkholderia ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Negative Bacteria - Burkholderia pseudomallei are presented in a new report. According to news originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Around the world, Burkholderia spp. are emerging as pathogens highly resistant to β-lactam antibiotics, especially ceftazidime. Clinical variants of Burkholderia pseudomallei possessing the class A β-lactamase PenI with substitutions at positions C69 and P167 are known to demonstrate ceftazidime resistance."

Funders for this research include HHS | National Institutes of Health (NIH), U.S.
Department of Veterans Affairs (VA).

Our news journalists obtained a quote from the research from Case Western Reserve University, "However, the biochemical basis for ceftazidime resistance in class A β-lactamases in B. pseudomallei is largely undefined. Here, we performed site saturation mutagenesis of the C69 position and investigated the kinetic properties of the C69F variant of PenI from B. pseudomallei that results in a high level of ceftazidime resistance (2 to 64 mg/liter) when expressed in Escherichia coli. Surprisingly, quantitative immunoblotting showed that the steady-state protein levels of the C69F variant β-lactamase were ∼4-fold lower than those of wild-type PenI (0.76 fg of protein/cell versus 4.1 fg of protein/cell, respectively). However, growth in the presence of ceftazidime increases the relative amount of the C69F variant to greater than wild-type PenI levels. The C69F variant exhibits a branched kinetic mechanism for ceftazidime hydrolysis, suggesting there are two different conformations of the enzyme. When incubated with an anti-PenI antibody, one conformation of the C69F variant rapidly hydrolyzes ceftazidime and most likely contributes to the higher levels of ceftazidime resistance observed in cell-based assays. Molecular dynamics simulations suggest that the electrostatic characteristics of the oxyanion hole are altered in the C69F variant. When ceftazidime was positioned in the active site, the C69F variant is predicted to form a greater number of hydrogen-bonding interactions than PenI with ceftazidime."

According to the news editors, the research concluded: "We propose 'a new twist' for enhanced ceftazidime resistance mediated by the C69F variant of the PenI β-lactamase based on conformational changes in the C69F variant. Our findings explain the biochemical basis of ceftazidime resistance in B. pseudomallei, a pathogen of considerable importance, and suggest that the full repertoire of conformational states of a β-lactamase profoundly affects β-lactam resistance."

For more information on this research see: Exposing a β-Lactamase "Twist"the Mechanistic Basis for the High Level of Ceftazidime Resistance in the C69F Variant of the Burkholderia pseudomallei PenI β-Lactamase. Antimicrobial Agents and Chemotherapy, 2015;60(2):777-88. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Findings on Cancer Epidemiology Reported by Investigators at University of Health Sciences [Cancer patterns in Karachi (all districts), Pakistan: First results (2010-2015) from a Pathology based cancer registry of the largest government-run ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Cancer Epidemiology. According to news reporting out of Karachi, Pakistan, by NewsRx editors, research stated, "National level population-based cancer data have never been published from Pakistan in seven decades since independence (1947). Therefore, generation of high-quality regional data becomes highly relevant."

Our news journalists obtained a quote from the research from the University of Health Sciences, "Cancer data for the period of 2010-2015 representing the population from all districts of Karachi (14.6 million) are presented herein. After institutional approval (Ref no. IRB-459/DUHS/-14), a Pathology based cancer registry was established at the largest government-run diagnostic and reference center of Karachi. During 2010-2015, a total of 13,508 cancers (including 668 non-melanoma-skin-cancers (NMSC)) were diagnosed. Of these, 5665 (41.9%) were in males while 7843 (58.1%) were in females. Incidence rates for all cancers (excluding NMSC) were 66.7 per 100,000 (crude) and 105.1 per 100,000 (ASR) for males and 112.0 per 100,000 (crude) and 175.8 per 100,000 (ASR) for females. In males, cancer of lip and oral cavity was the most frequently diagnosed cancer (30.8%, ASR 33.1), followed by NMSC (7.7%, ASR 9.5) and colorectum (7%, ASR 7.3). In females, breast cancer was the most frequently recorded malignancy (49.5%, ASR 87.9), followed by lip and oral cavity (11.2%, ASR 22.0) and oesophagus (5.6%, ASR 10.7). We report that Karachi has the highest incidence of cancers of breast, lip and oral cavity, oesophagus and larynx in females and cancer of lip and oral cavity and larynx (2nd only to Turkey) in males compared to any of the Asian populations."

According to the news editors, the research concluded: "Notably, incidence of tobacco associated cancers is very high in Karachi, demanding urgent attention by relevant authorities to address the un-controlled and drastically high consumption of various forms of tobacco in the city."

Our news journalists report that additional information may be obtained by contacting M.A. Qureshi, Dow Univ Hlth Sci, Dow Int Med College, Karachi, Pakistan. Additional authors for this research include T. Mirza, S. Khan, B. Sikandar, M. Zahid, M. Aftab, S. Mohsin, S. Sharafat, L. Avesi and S. Hassan.

Findings on Cancer Therapy Detailed by Investigators at Dalian Medical University (Anti-tumor effects of osthole on ovarian cancer cells in vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Cancer Therapy is now available. According to news originating from Liaoning, People's Republic of China, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: Cnidium monnieri (L.) Cusson is a commonly used traditional Chinese medicine to treat gynecological disease in some countries. Osthole, an active O-methylated coumarin isolated from Cnidium monnieri (L) Cusson, has been shown to induce various beneficial biochemical effects such as anti-seizure and anti-inflammatory effects."

Our news journalists obtained a quote from the research from Dalian Medical University, "However, the anti-tumor mechanism of osthole is not well known. Aim of study: Here, we show that osthole inhibited the proliferation and migration of two widely used ovarian cancer cell lines, A2780 and OV2008 cells, in a dose-dependent manner. The study investigated the molecular mechanisms underlying ovarian cancer cells proliferation, apoptosis, cell cycle arrest and migration triggered by osthole. Ovarian cancer cell lines A2780, OV2008 and normal ovarian cell line IOSE80 were used as experimental model. MTT assay was employed to evaluate cell viability. Flow cytometry assays were performed to confirm apoptosis and cell cycle. We employed wound healing and transwell assays to delineate invasive and migratory potential triggered by osthole. MTT assays indicated that cell viability significantly decreased in ovarian cancer cells treated with osthole without effect on normal ovarian cells. Flow cytometric analysis revealed that osthole suppressed cells proliferation by promoting G2/M arrest and inducing apoptosis. The underlying mechanisms involved were regulation of the relative apoptotic protein Bcl-2, Bax and Caspase 3/9. In addition, wound healing and transwell assays revealed that the migratory potential and activity of matrix metalloproteinase MMP-2 and MMP-9 were markedly inhibited when cells were exposed to osthole."

According to the news editors, the research concluded: "Our findings suggested that osthole has the potential to be used in novel anti-cancer therapeutic formulations for ovarian cancer treatment."

The news correspondents report that additional information may be obtained from W.L. Li, Dalian Med Univ, Dept. of Biotechnol, Dalian 116044, Liaoning, People's Republic of China. Findings on Cancer Therapy Reported by Researchers at National Cancer Center Research Institute (Telomerase reverse transcriptase moonlights: Therapeutic targets beyond telomerase)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Cancer Therapy. According to news reporting originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Telomeres, the repetitive sequences at chromosomal ends, protect intact chromosomes. Telomeres progressively shorten through successive rounds of cell divisions, and critically shortened telomeres trigger senescence and apoptosis."

Funders for this research include Project for Development of Innovative Research on Cancer Therapeutics, Ministry of Education, Culture, Sports, Science, and Technology, Ichiro Kanehara Foundation for the Promotion of Medical Sciences and Medical Care.

Our news editors obtained a quote from the research from National Cancer Center Research Institute, "The enzyme that elongates telomeres and maintains their structure is known as telomerase. The catalytic subunit of this enzyme (telomerase reverse transcriptase [TERT]) is expressed at a high level in malignant cells, but at a very low level in normal cells. Although telomerase activity was long believed to be the only function of TERT, emerging evidence indicates that TERT plays roles beyond telomeres. For example, TERT contributes to stem cell maintenance and cell reprogramming processes in a manner independent of its canonical function. Even some types of splice variants that lack the telomerase catalytic domains exhibit the functions in a manner that does not depend on telomerase activity. We recently demonstrated that the RNA-dependent RNA polymerase (RdRP) activity of TERT is involved in regulation of gene silencing and heterochromatic transcription. Moreover, TERT RdRP activity is mediated by a newly identified complex, distinct from the authentic telomerase complex, that plays a role in cancer stem cells in a telomere maintenance independent manner. TERT has attracted interest as a molecular target for anticancer treatment, but previous efforts aimed at developing novel therapeutic strategies focused only on the canonical function of TERT. However, accumulating evidence about the non-canonical functions of TERT led us to speculate that the functions other than telomerase might be therapeutic targets as well."

According to the news editors, the research concluded: "In this review, we discuss the non-canonical functions of TERT and their potential applications for anticancer treatment."

The news editors report that additional information may be obtained by contacting Y. Maida, Division of Cancer Stem Cell, National Cancer Center Research Institute, Tokyo, Japan.

Drugs and Therapies - Carbamazepine Therapy

Findings on Carbamazepine Therapy Reported by Researchers at University of Michigan (Influence of Coformer Stoichiometric Ratio on Pharmaceutical Cocrystal Dissolution: Three Cocrystals of Carbamazepine/4-Aminobenzoic Acid)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Carbamazepine Therapy is the subject of a report. According to news reporting originating in Ann Arbor, Michigan, by NewsRx journalists, research stated, "Cocrystallization is a technique to optimize solid forms that shows great potential to improve the solubility of active pharmaceutical ingredients (APIs). In some systems, an API can form cocrystals in multiple stoichiometries with the same coformer."

Financial support for this research came from U.S. Department of Health and Human Services.

The news reporters obtained a quote from the research from the University of Michigan, "However, it remains unclear how coformer stoichiometry influences solubility. This paper investigates the pharmaceutical:coformer pair carbamazepine (CBZ)/p-aminobenzoic acid (PABA); both CBZ/PABA 1:1 and 2:1 cocrystals are known, and a novel 4:1 CBZ/PABA cocrystal is reported here. The 4:1 cocrystal is structurally characterized, and phase stability data suggest that it is a thermodynamically unstable form. Dissolution experiments show that there is no correlation between the cocrystal stoichiometry and dissolution rate in this system."

According to the news reporters, the research concluded: "On the other hand, with the relatively weak intermolecular interactions, metastable forms can be beneficial to dissolution rate, which suggests that more effort should be devoted to cocrystal production with kinetic growth methods."

Our news correspondents report that additional information may be obtained by contacting Z. Li, Dept. of Chemistry, Macromolecular Science and Engineering Program, University of Michigan, 930 North University Avenue, Ann Arbor, Michigan 48109-1055, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.molpharmaceut.5b00843. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Carcinomas

Findings on Carcinomas Described by Researchers at Postgraduate Institute of Medical Education and Research (Dosimetric evaluation and clinical outcome in post-operative patients of carcinoma vulva treated with intensity-modulated radiotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Carcinomas is now available. According to news reporting from Chandigarh, India, by NewsRx journalists, research stated, "To compare dosimetric parameters of intensity-modulated radiation therapy (IMRT) with 3D conformal radiotherapy (3DCRT) in post-operative patients of vulvar cancer and to assess clinical outcome and toxicity with IMRT. A total of 8 post-operative patients of vulvar cancer were treated with IMRT."

The news correspondents obtained a quote from the research from the Postgraduate Institute of Medical Education and Research, "All patients were also planned by 3DCRT for comparison with IMRT. The two plans were compared in terms of conformity index, homogeneity index, tumor control probability (TCP) and normal tissue complication probability (NTCP) for the planning target volume and organs at risk (OAR). IMRT resulted in significantly lesser doses to rectum, bladder, bowel and femoral head as compared with 3DCRT plans. Mean conformity and homogeneity indices were better and within range with IMRT. The TCP was comparable between the two treatment plans and NTCP for rectum, bladder, bowel and femoral head was significantly less with IMRT as compared with 3DCRT. Treatment was well-tolerated and none of the patients developed Grade 3 or higher toxicity. IMRT yielded superior plans with respect to target coverage, homogeneity and conformality while lowering dose to adjacent OAR as compared with 3DCRT."

According to the news reporters, the research concluded: "Thus, IMRT offers a reduction in NTCP while maintaining TCP."

Our news journalists report that additional information may be obtained by contacting D. Khosla, Dept. of Radiotherapy and Oncology, Regional Cancer Centre, Postgraduate Institute of Medical Education and Research, Chandigarh, India. Additional authors for this research include F.D. Patel, A.K. Shukla, B. Rai, A.S. Oinam and S.C Sharma.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.4103/0019-509X.178448. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Carcinomas

Findings on Carcinomas Reported by Investigators at University of Michigan (Trends in hospice discharge, documented inpatient palliative care services and inpatient mortality in ovarian carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Carcinomas. According to news reporting originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "To investigate the trends in discharge to hospice, documented inpatient palliative care services, and inpatient mortality in metastatic ovarian cancer (mOvCa) patients. Patients >= 18 years with mOvCa and a non-elective admission between January 1, 2006 and December 31, 2011 were identified from the National Inpatient Sample (NIS)."

Our news editors obtained a quote from the research from the University of Michigan, "The primary outcome of interest was the temporal trend in the annual proportion of hospitalizations for mOvCa where discharge destination was hospice. Secondary outcomes included temporal trend of inpatient mortality and documented palliative care services. Multivariable logistic regression models were used to ascertain independent factors predictive of hospice discharge and documented palliative services across the clusters of hospitals. A total of 106,203 non-elective hospitalizations were identified. The rate of hospice discharge increased from 9.2% in 2004 to 11.1% in 2011 (p(trend) < 0.001). Similarly, the rate of documented palliative care services increased from 2.7% in 2004 to 10.4% in 2011 (p(trend) < 0.001). The inpatient mortality decreased from 9.6% in 2004 to 7.4% in 2011 (p(trend) < 0.001). In a subset of hospitalizations with extreme risk of dying, 22% were discharged to hospice and 11% received documented palliative care services. One fifth of the patients who died in the hospital received documented palliative care services. The use of hospice as a discharge destination and documented palliative care services is relatively low but appears to be increasing over time for mOvCa patients."

According to the news editors, the research concluded: "Monitoring this data is vital to plan educational programs regarding palliative care approaches in this at-risk population."

For more information on this research see: Trends in hospice discharge, documented inpatient palliative care services and inpatient mortality in ovarian carcinoma. *Gynecologic Oncology*, 2016;143(2):371-378. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Findings on Carcinomas Reported by Researchers at Ain Shams University (Continuous Low-Dose Oral Cyclophosphamide and Methotrexate as Maintenance Therapy in Patients With Advanced Ovarian Carcinoma After Complete Clinical Response to Platinum ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Carcinomas is now available. According to news reporting originating from Cairo, Egypt, by NewsRx correspondents, research stated, "The aim of this study was to evaluate efficacy and safety of continuous, low dose of oral, metronomic chemotherapy as maintenance therapy in patients with advanced ovarian carcinoma after complete clinical response to platinum and paclitaxel chemotherapy. In this nonrandomized study, patients older than 18 years, with Eastern Cooperative Oncology Group performance status less than 2, with advanced ovarian carcinoma after complete clinical response to platinum and paclitaxel chemotherapy were enrolled in 2 arms--arm A (maintenance arm), treated with continuous low-dose oral cyclophosphamide 50 mg and methotrexate 2.5 mg, and arm B (observation arm)."

Our news editors obtained a quote from the research from Ain Shams University, "Both arms were followed up for progression-free survival and toxicity. Thirty patients were accrued in each arm from January 2009 to December 2010 in Ain Shams University Hospitals, where they received the treatment and followed up for disease progression and toxicity. Patients had a median age of 53 years in maintenance arm and 52.5 years in the observational arm, respectively. Over 80% had papillary serous adenocarcinoma, and over 40% of them had a stage IV disease in both arms. After median follow-up of 27 months, patients achieved median progression-free survival of 18 months in maintenance arm (A) and 15.5 months in observational arm (B), respectively. Toxicity profile was excellent with no grade 3 or 4 toxicity reported."

According to the news editors, the research concluded: "Current study may provide an evidence of efficacy and tolerability of continuous low-dose oral cyclophosphamide and methotrexate as a maintenance therapy in patients with advanced ovarian carcinoma after complete clinical response to platinum and paclitaxel chemotherapy."

The news editors report that additional information may be obtained by contacting K. El-Husseiny, Departments of *Clinical Oncology and †Obstetrics and Gynecology, Ain Shams University Hospitals, Cairo, Egypt. Additional authors for this research include H. Motawei and M.S Ali.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1097/IGC.0000000000000647. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiology

Findings on Cardiology Described by Researchers at Institute of Genetics (Bioinspired negatively charged calcium phosphate nanocarriers for cardiac delivery of MicroRNAs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiology is the subject of a report. According to news reporting originating in Milan, Italy, by NewsRx journalists, research stated, "To develop biocompatible and bioresorbable negatively charged calcium phosphate nanoparticles (CaP-NPs) as an innovative therapeutic system for the delivery of bioactive molecules to the heart. CaP-NPs were synthesized via a straightforward one-pot biomineralization-inspired protocol employing citrate as a stabilizing agent and regulator of crystal growth."

The news reporters obtained a quote from the research from the Institute of Genetics, "CaP-NPs were administered to cardiac cells in vitro and effects of treatments were assessed. CaP-NPs were administered in vivo and delivery of microRNAs was evaluated. CaP-NPs efficiently internalized into cardiomyocytes without promoting toxicity or interfering with any functional properties. CaP-NPs successfully encapsulated synthetic microRNAs, which were efficiently delivered into cardiac cells in vitro and in vivo."

According to the news reporters, the research concluded: "CaP-NPs are a safe and efficient drug-delivery system for potential therapeutic treatments of polarized cells such as cardiomyocytes."

Our news correspondents report that additional information may be obtained by contacting V. Di Mauro, National Research Council (CNR), Institute of Genetics & Biomedical Research, Milan Unit, Milan 20138, Italy. Additional authors for this research include M. Iafisco, N. Salvarani, M. Vacchiano, P. Carullo, G.B. Ramirez-Rodriguez, T. Patricio, A. Tampieri, M. Miragoli and D. Catalucci.

Findings on Cardiology Detailed by Investigators at University of Leeds (Acute Reverse Remodelling After Transcatheter Aortic Valve Implantation: A Link Between Myocardial Fibrosis and Left Ventricular Mass Regression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiology have been published. According to news reporting originating in Leeds, United Kingdom, by NewsRx journalists, research stated, "Despite the wealth of data showing the positive effects on cardiac reverse remodelling in the long-term, the immediate effects of transcatheter aortic valve implantation (TAVI) on the left ventricle are yet to be comprehensively described using cardiovascular magnetic resonance imaging. Also, the link between myocardial fibrosis and acute left ventricular (LV) mass regression is unknown."

The news reporters obtained a quote from the research from the University of Leeds, "Fifty-seven patients with severe aortic stenosis awaiting TAVI underwent paired cardiovascular magnetic resonance scans before and early after the procedure (4 [interquartile range, 3-5] days). LV mass, volume, and function were measured. Late gadolinium enhancement (LGE) imaging was performed to assess for the presence of and pattern of myocardial fibrosis. After the procedure, 53 (95%) patients experienced an immediate (10.1 +/- 7.1%) reduction in indexed LV mass (LVMi) from 76 +/- 15.5 to 68.4 +/- 14.7 g/m(2) (P < 0.001). Those with no LGE experienced the greatest LVMi regression (13.9 +/- 7.1%) compared with those with a midwall/focal fibrosis pattern LGE (7.4 +/- 5.8%) and infarct pattern LGE (7.2 +/- 7.0%; P = 0.005). There was no overall change in LV ejection fraction (LVEF; 55.1 +/- 12.1% to 55.5 +/- 10.9%; P = 0.867), however a significant improvement in LVEF was seen in those with abnormal (< 55%; n = 24; 42%) baseline LVEF (43.2 +/- 8.9 to 46.7 +/- 10.5%; P = 0.027). Baseline LVMi (P = 0.005) and myocardial fibrosis (P < 0.001) were strong independent predictors of early LVMi regression. LV reverse remodelling occurs immediately after TAVI, with significant LV mass regression in the total population and an improvement in LVEF in those with preexisting LV impairment."

According to the news reporters, the research concluded: "Those without myocardial fibrosis at baseline experience greater LV mass regression than those with fibrosis."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cjca.2016.04.009. This DOI is a link to an online electronic document that is either free or for purchase.
Drugs and Therapies - Cardiovascular Agents

Findings on Cardiovascular Agents Detailed by Investigators at Copenhagen University Hospital (Effect of clonidine to prevent agitation in children after sevoflurane anaesthesia: a randomised placebo controlled multicentre trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Cardiovascular Agents have been published. According to news reporting from Koge, Denmark, by NewsRx journalists, research stated, "Post-operative agitation (PA) is a common problem (20-70%) in children anaesthetised with sevoflurane. Clonidine is widely used off-label in children for several indications, including PA; but the current level of evidence is limited."

The news correspondents obtained a quote from the research from Copenhagen University Hospital, "Our aim is to investigate the impact of prophylactic intravenous (IV) clonidine administered at the end of surgery on the incidence and degree of PA. Furthermore, the pharmacokinetic profile of IV clonidine in children is not well established and our aim is to obtain pharmacokinetic data relating hereto. This is a multicentre, randomised and blinded clinical trial in which we will be enrolling 380 children aged 1-5 years who are planned for anaesthesia with sevoflurane and fentanyl. Inclusion is based on computer-generated randomisation (1:1) and stratified by age and site. The study drug is administered IV approximately 20 min. before the expected completion of surgery (intervention: clonidine 3 μg per kg; placebo: equal quantity of saline). The primary outcome is PA measured on the Watcha scale. The secondary outcomes include post-operative pain relief and adverse effects, including a 30-day follow-up."

According to the news reporters, the research concluded: "In total, 40 children will be allocated to drug assay sampling, enabling a compartmental pharmacokinetic analysis."

For more information on this research see: Effect of clonidine to prevent agitation in children after sevoflurane anaesthesia: a randomised placebo controlled multicentre trial. *Danish Medical Journal*, 2016;63(6):3-7. *Danish Medical Journal* can be contacted at: Danish Medical Assoc, Trondhjemsgade 9, Dk-2100 Copenhagen, Denmark.

Our news journalists report that additional information may be obtained by contacting M. Ydemann, Rigshospitalet, Juliane Marie Center, Dept. of Anaesthesiol, Koge, Denmark. Additional authors for this research include B.N. Nielsen, J. Wetterslev, S. Henneberg, T. Lauritsen, N. Steen, B. Edstrom and A. Afshari.

Findings on Cardiovascular Imaging Described by H.U. Aksu and Colleagues (Isolated cleft of both the anterior and posterior mitral valve leaflets)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Medical Imaging - Cardiovascular Imaging is the subject of a report. According to news originating from Istanbul, Turkey, by NewsRx correspondents, research stated, "A 37 year-old female patient in whom the transthoracic echocardiography examination revealed dilatation of left heart chambers with left ventricular ejection fraction of 30% and moderate-to-severe mitral valve regurgitation was admitted to our hospital."

Our news journalists obtained a quote from the research, "On 2DTEE examination, mitral valve was normal; however, on 3D images, clefts of both anterior and posterior leaflets were revealed."

According to the news editors, the research concluded: "Isolated cleft mitral valve without any other feature of atrioventricular septal defect is uncommon. 2D echocardiography has limited capability in defining the complex 3D anatomic characteristics of the cleft. 3DTEE allows to visualize the cleft position, morphology, and size, and it is important for surgical planning."

For more information on this research see: Isolated cleft of both the anterior and posterior mitral valve leaflets. Echocardiography-A Journal of Cardiovascular Ultrasound and Allied Techniques, 2016;33(11):1793-1794. Echocardiography-A Journal of Cardiovascular Ultrasound and Allied Techniques can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

The news correspondents report that additional information may be obtained from H.U. Aksu, Mehmet Akif Ersoy Thorac & Cardiovasc Surg Traini, Istanbul, Turkey. Additional authors for this research include M. Aslan, D. Ozturk, A.A. Yalcin and A. Yildirim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/echo.13309. This DOI is a link to an online electronic document that is either free or for purchase.

Cardiovascular Research

Findings on Cardiovascular Research Reported by Investigators at School of Medicine (Effect of diastolic dysfunction on postoperative outcomes after cardiovascular surgery: A systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Research have been presented. According to news reporting originating in Lima, Peru, by NewsRx journalists, research stated, "The
objective of this study was to investigate the effect of preoperative diastolic dysfunction on postoperative mortality and morbidity after cardiovascular surgery. We systematically searched for articles that assessed the prognostic role of diastolic dysfunction on cardiovascular surgery in PubMed, Cochrane Library, Web of Science, Embase, and Scopus until February 2016."

The news reporters obtained a quote from the research from the School of Medicine, "Twelve studies (n = 8224) met our inclusion criteria. Because of the scarcity of outcome events, fixed-effects meta-analysis was performed via the Mantel-Haenszel method. Preoperative diagnosis of diastolic dysfunction was associated with greater postoperative mortality (odds ratio [OR], 2.41; 95% confidence interval [CI], 1.54-3.71; P < .0001), major adverse cardiac events (OR, 2.07; 95% CI, 1.55-2.78; P = .0001), and prolonged mechanical ventilation (OR, 2.08; 95% CI, 1.04-4.16; P = .04) compared with patients without diastolic dysfunction among patients who underwent cardiovascular surgery. The odds of postoperative myocardial infarction (OR, 1.29; 95% CI, 0.82-2.05; P = .28) and atrial fibrillation (OR, 2.67; 95% CI, 0.49-14.43; P = .25) did not significantly differ between the 2 groups. Severity of preoperative diastolic dysfunction was associated with increased postoperative mortality (OR, 21.22; 95% CI, 3.74-120.33; P = .0006) for Grade 3 diastolic dysfunction compared with patients with normal diastolic function. Inclusion of left ventricular ejection fraction (LVEF) <40% accompanying diastolic dysfunction did not further impact postoperative mortality (P = .27; I^2 = 18%) compared with patients with normal LVEF and diastolic dysfunction. Presence of preoperative diastolic dysfunction was associated with greater postoperative mortality and major adverse cardiac events, regardless of LVEF."

According to the news reporters, the research concluded: "Mortality was significantly greater in grade III diastolic dysfunction."

Our news correspondents report that additional information may be obtained by contacting A.V. Hernandez, Univ Peruana Ciencias Aplicadas UPC, Sch Med, Lima 9, Peru. Additional authors for this research include A.V. Hernandez, V. Pasupuleti, A. Deshpande, V. Nagarajan, H. Bueno, C.I. Coleman, J.P.A. Ioannidis, D.L. Bhatt and E.H. Blackstone.

Membrane Proteins - Catecholamine Receptors

Findings on Catecholamine Receptors Discussed by Investigators at University of North Carolina (Discovery of G Protein-Biased D2 Dopamine Receptor Partial Agonists)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Membrane Proteins - Catecholamine Receptors is the subject of a report. According to news reporting out of Chapel Hill, North Carolina, by NewsRx editors, research stated, "Biased ligands (also known as functionally selective ligands) of G protein-coupled receptors are valuable tools for dissecting the roles of G protein-dependent and independent signaling pathways in health and disease. Biased ligands have also been increasingly pursued by the biomedical community as promising therapeutics with improved efficacy and reduced side effects compared with unbiased ligands."

Financial support for this research came from National Institute of Mental Health.

Our news journalists obtained a quote from the research from the University of North Carolina, "We previously discovered first-in-class, beta-arrestin-biased agonists of dopamine D2 receptor (D2R) by extensively exploring multiple regions of aripiprazole, a balanced D2R agonist. In our continuing efforts to identify biased agonists of D2R, we unexpectedly discovered a G protein-biased agonist of D2R, compound 1, which is the first G protein-biased D2R agonist from the aripiprazole scaffold. We designed and synthesized novel analogues to explore two regions of 1 and conducted structure functional selectivity relationship (SFSR) studies."

According to the news editors, the research concluded: "Here we report the discovery of 1, findings from our SFSR studies, and characterization of novel G protein-biased D2R agonists."

Our news journalists report that additional information may be obtained by contacting B.L. Roth, University of North Carolina, NIMH, Psychoact Drug Screening Program, Sch Med, Chapel Hill, NC 27599, United States. Additional authors for this research include J.D. McCorvy, M.G. Fischer, K.V. Butler, Y.D. Shen, B.L. Roth and J. Jin.

Drugs and Therapies - Central Nervous System Agents

Findings on Central Nervous System Agents Discussed by Investigators at Kerman University of Medical Sciences (Induction of antinociceptive tolerance to the chronic intrathecal administration of apelin-13 in rat)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Central Nervous System Agents is the subject of a report. According to news reporting originating from Kerman, Iran, by NewsRx correspondents, research stated, "Pain represents a major contributing factor to the individual's quality of life. Although pain killers as opioids, endogenous or exogenous peptides can decrease pain perception, the chronic use of them leads to antinociceptive tolerance."

Financial support for this research came from Kerman University of Medical Sciences.

Our news editors obtained a quote from the research from the Kerman University of Medical Sciences, "It has been demonstrated that neuropeptide apelin has potent antinociceptive effect. However, the possibility of the induction of its antinociceptive tolerance has not yet been clarified. The tail-flick test was used to assess the nociceptive threshold. All experiments were carried out on male Wistar rats which received intrathecal apelin for 7 days. To determine the role of apelin and opioid receptors on the development of apelin analgesic tolerance, their receptor antagonists (F-13 A and naloxone, respectively) were injected simultaneously with apelin. The lumbar spinal cord was assayed to determine apelin receptor levels by the western blotting method. Plasma corticosterone levels were assayed using ELISA. Results showed that apelin (3 mu g/rat) induced strong thermal antinociception. In addition, chronic apelin produced tolerance to its antinociceptive effect and down regulated spinal apelin receptor. F-13 A and naloxone could inhibit apelin tolerance development. The corticosterone levels did not change following drug administration."

According to the news editors, the research concluded: "Taken together, the data indicated that apelin like other analgesic drugs leads to the induction of side effects such as analgesic tolerance which is mediated partly via the apelin and opioid receptors activation."

For more information on this research see: Induction of antinociceptive tolerance to the chronic intrathecal administration of apelin-13 in rat. Neuropeptides, 2016;60():7-12. Neuropeptides can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. (Elsevier - www.elsevier.com; Neuropeptides - www.journals.elsevier.com/neuropeptides/)

Drugs and Therapies - Central Nervous System Agents

Findings on Central Nervous System Agents Discussed by Investigators at University of Toronto (Enhanced Thalamic Spillover Inhibition during Non-rapid-eye-movement Sleep Triggers an Electrocortical Signature of Anesthetic Hypnosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Central Nervous System Agents is now available. According to news reporting originating in Toronto, Canada, by NewsRx journalists, research stated, "Alterations in thalamic-a-aminobutyric acid-mediated signaling are thought to underlie the increased frontal alpha-beta frequency electrocortical activity that signals anesthetic-induced loss of consciousness with a-aminobutyric acid receptor type A (GABA(A)R)-targeting general anesthetics. The general anesthetic etomidate elicits phasic extrasynaptic GABA(A)R activation (‘spillover’ inhibition) at thalamocortical neurons in vitro."

The news reporters obtained a quote from the research from the University of Toronto, "We hypothesize that this action of etomidate at the thalamus is sufficient to trigger an increase in frontal alpha-beta frequency electrocortical activity and that this effect of etomidate is fully recapitulated by enhanced thalamic spillover inhibition in vivo. We recorded electrocortical activity and sleep-wake behavior in freely behaving wild-type (n = 33) and extrasynaptic delta-subunit-containing GABA(A)R knockout mice (n = 9) during bilateral microperfusion of the thalamus with etomidate and/or other pharmacologic agents that influence GABA(A)R or T-type Ca2+ channel activity. Microperfusion of etomidate into the thalamus elicited an increase in alpha-beta frequency electrocortical activity that occurred only during non-rapid-eye-movement (REM) sleep (11.0 +/- 11.8% and 16.0 +/- 14.2% greater 8 to 12- and 12 to 30-Hz power, respectively; mean +/- SD; both P< 0.031) and was not affected by blockade of thalamic T-type Ca2+ channels. Etomidate at the thalamus also increased spindle-like oscillations during non-REM sleep (4.5 +/- 2.4 spindle per minute with etomidate vs. 3.2 +/- 1.7 at baseline; P = 0.002). These effects of etomidate were fully recapitulated by enhanced thalamic extrasynaptic GABA(A)R-mediated spillover inhibition."

According to the news reporters, the research concluded: "These findings identify how a prototypic GABA(A)R-targeting general anesthetic agent can elicit the characteristic brain wave pattern associated with anesthetic hypnosis when acting at the thalamus by promoting spillover inhibition and the necessity of a preexisting non-REM mode of activity in the thalamus to generate this effect."

For more information on this research see: Enhanced Thalamic Spillover Inhibition during Non-rapid-eye-movement Sleep Triggers an Electrocortical Signature of Anesthetic Hypnosis. Anesthesiology, 2016;125(5):964-978. Anesthesiology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Drugs and Therapies - Central Nervous System Agents

Findings on Central Nervous System Agents Reported by Researchers at University of Texas Health Science Center (Delay discounting of the m-opioid receptor agonist remifentanil in rhesus monkeys)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Central Nervous System Agents. According to news originating from San Antonio, Texas, by NewsRx correspondents, research stated, "Although increased impulsivity (delay discounting) is an important risk factor for drug abuse, the impact of delay on drug taking has received relatively little attention. This study examined delay discounting of the m-opioid receptor agonist remifentanil in rhesus monkeys (n=4) responding for intravenous infusions under a concurrent choice procedure."

Our news journalists obtained a quote from the research from the University of Texas Health Science Center, "Dose-effect curves for remifentanil were determined by varying the dose available on one lever (0.001-0.32 mg/kg/infusion) while keeping the dose available on the other lever (0.1 mg/kg/infusion) the same. Dose-effect curves were determined when both infusions were delivered immediately and when delivery of the fixed dose was delayed (15-180 s). When both doses of remifentanil were delivered immediately, monkeys chose the large dose. Delaying delivery of the fixed dose reduced choice of that dose and increased choice of small immediately available doses. Extending previous studies, these results show that the effects of delay on choice between two doses of a m-opioid receptor agonist are consistent with hyperbolic discounting. Delaying delivery of a preferred reinforcer (e.g. large dose of drug) reduces its effectiveness and increases the effectiveness of small immediately available doses."

According to the news editors, the research concluded: "This effect of delay, particularly on drug self-administration, might contribute to drug abuse."

For more information on this research see: Delay discounting of the m-opioid receptor agonist remifentanil in rhesus monkeys. *Behavioural Pharmacology*, 2016;27(2-3 Spec I):148-54. (Lippincott Williams and Wilkins - www.lww.com; Behavioural Pharmacology - journals.lww.com/behaviouralpharm/pages/default.aspx)

The news correspondents report that additional information may be obtained from D.R. Maguire, Departments of aPharmacology bPsychiatry, The University of Texas Health Science Center at San Antonio, San Antonio, Texas, United States. Additional authors for this research include L.R. Gerak and C.P France.

Findings on Cerebral Palsy Detailed by Investigators at University of Gothenburg (Association of COL4A1 gene polymorphisms with cerebral palsy in a Chinese Han population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Cerebral Palsy have been published. According to news reporting originating from Gothenburg, Sweden, by NewsRx correspondents, research stated, "The basement membrane (BM) is an extracellular matrix associated with overlying cells and is important for proper tissue development, stability, and physiology. COL4A1 is the most abundant component of type IV collagen in the BM, and COL4A1 variants can present with variable phenotypes that might be related to cerebral palsy (CP)."

Our news editors obtained a quote from the research from the University of Gothenburg, "We postulated, therefore, that variations in the COL4A1 gene might play an important role in the etiology of CP. In this study, six single nucleotide polymorphisms (SNPs) in the COL4A1 gene were genotyped among 351 CP patients and 220 healthy controls from the Chinese Han population. Significant association was found for an association between CP and rs1961495 (allele: p= 0.008, odds ratio (OR)= 1.387, 95% confidence interval (CI)= 1.088-1.767) and rs1411040 (allele: p= 0.009, OR= 1.746, 95% CI= 1.148-2.656) SNPs of the COL4A1 gene. Multifactor dimensionality reduction analysis suggested that these SNPs had interactive effects on the risk of CP. This study is the first attempt to investigate the contribution of polymorphisms in the COL4A1 gene to the susceptibility of CP in a Chinese Han population."

According to the news editors, the research concluded: "This study shows an association of the COL4A1 gene with CP and suggests a potential role of COL4A1 in the pathogenesis of CP."

The news editors report that additional information may be obtained by contacting C. Zhu, University of Gothenburg, Center Brain Repair & Rehabil, Gothenburg, Sweden. Additional authors for this research include H. Wang, Q. Shang, Y. Xu, F. Wang, M. Chen, C. Ma, Y. Sun, X. Zhao, C. Gao, L. Wang, C. Zhu and Q. Xing.

Findings on Cervical Cancer Reported by Investigators at Academic Medical Center (Vaginal high-risk human papillomavirus infection in a cross-sectional study among women of six different ethnicities in Amsterdam, the Netherlands: the HELIUS ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Cervical Cancer is the subject of a report. According to news reporting originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "In the Netherlands the incidence of cervical cancer is higher among ethnic minority populations compared with the general Dutch population. We investigated the prevalence of, and risk factors associated with, vaginal high-risk human papillomavirus (hrHPV) infection in women of six different ethnicities living in Amsterdam."

Our news editors obtained a quote from the research from Academic Medical Center, "For this cross-sectional study we selected women aged 18-34 years old of six ethnicities from the large-scale multiethnic HEalthy LIfe in an Urban Setting study. Self-collected vaginal swabs were tested for HPV DNA and genotyped using a highly sensitive PCR and reverse line blot assay (short PCR fragment (SPF) 10-PCR DNA enzyme immunoassay/LiPA25-system version-1, delft diagnostic laboratory (DDL)). Participants completed a questionnaire regarding demographics and sexual behaviour. Logistic regression using generalised estimating equations was used to assess risk factors of hrHPV, and to investigate whether prevalence of hrHPV differed among ethnicities. The study population consisted of 592 women with a median age of 27 (IQR: 23-31) years. Dutch and African Surinamese women reported the highest sexual risk behaviour. HrHPV prevalence was highest in the Dutch (40%) followed by the African Surinamese (32%), Turkish (29%), Ghanaian (26%), Moroccan (26%) and South-Asian Surinamese (18%). When correcting for sexual risk behaviour, the odds to be hrHPV-positive were similar for all non-Dutch groups when compared with that of the Dutch group. We found an overall higher hrHPV prevalence and higher sexual risk behaviour in the native Dutch population."

According to the news editors, the research concluded: "Further research is needed to unravel the complex problem concerning cervical cancer disparities, such as differences in participation in the cervical cancer screening programme, or differences in clearance and persistence of hrHPV."

For more information on this research see: Vaginal high-risk human papillomavirus infection in a cross-sectional study among women of six different ethnicities in Amsterdam, the Netherlands: the HELIUS study. Sexually Transmitted Infections, 2016;92(8):611-618. Sexually Transmitted Infections can be contacted at: Bmj Publishing Group, British Med Assoc House, Tavistock Square, London WC1H 9JR, England. Findings on Chemical Biology and Drug Design Reported by Researchers at Ministry of Education (Novel Peptides from Skins of Amphibians Showed Broad-Spectrum Antimicrobial Activities)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Chemical Biology and Drug Design. According to news originating from Kunming, People's Republic of China, by NewsRx correspondents, research stated, "Peptide agents are often considered as potential biomaterials for developing new drugs that can overcome the rising resistance of pathogenic micro-organisms to classic antibiotic treatments. One key source of peptide agents is amphibian skin, as they provide a great deal of naturally occurring antimicrobial peptide (AMP) templates awaiting further exploitation and utilization."

Financial supporters for this research include National Natural Science Foundation of China, Chinese Academy of Sciences, Youth Science Foundation of Yunnan Minzu University, Scientific Research Foundation of Yunnan Minzu University, Open Research Fund of Key Laboratory of Chemistry in Ethnic Medicinal Resources (Yunnan Minzu University), State Ethnic Affairs Commission & Ministry of Education, P.R. China.

Our news journalists obtained a quote from the research from the Ministry of Education, "In this study, 12 novel AMPs from the skins of 3 ranid frogs, Rana limnocharis, R. exilispinosa, and Amolops afghanus, were identified using a 5' PCR primer. A total of 11 AMPs exhibited similarities with currently known AMP families, including brevinin-1, brevinin-2, esculetin-1, and nigrocin, besides, one AMP, named as Limnocharin, represented a novel AMP family. All 12 AMPs contain a C-terminus cyclic motif and most of them show obvious antimicrobial activities against 18 standard and clinically isolated strains of bacteria, including 4 Gram-positive bacteria, 11 Gram-negative bacteria, and 3 fungus."

According to the news editors, the research concluded: "These findings provide helpful insight that will be useful in the design of anti-infective peptide agents."

The news correspondents report that additional information may be obtained from Y. Wang, Key Laboratory of Chemistry in Ethnic Medicine Resource, State Ethnic Affairs Commission & Ministry of Education, School of Ethnic Medicine, Yunnan Minzu University, Kunming, 650500, People's Republic of China. Chemistry

Findings on Chemistry Discussed by Investigators at University of Santiago (Ruthenation of Non-stacked Guanines in DNA G-Quadruplex Structures: Enhancement of c-MYC Expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Chemistry are presented in a new report. According to news reporting originating from Santiago de Compostela, Spain, by NewsRx correspondents, research stated, "Guanine quadruplexes (GQs) are compact four-stranded DNA structures that play a key role in the control of a variety of biological processes, including gene transcription."

Our news editors obtained a quote from the research from the University of Santiago, "Bulky ruthenium complexes featuring a bipyridine, a terpyridine, and one exchangeable ligand ([Ru(terpy)(bpy)X](n+)) are able to metalate exposed guanines present in the GQ of the c-MYC promoter region that are not involved in quadruplex base pairing. qRT-PCR and western-blot experiments indicated that the complexes promote a remarkable increase in the expression of this oncogene."

According to the news editors, the research concluded: "We also show that exchangeable thioether ligands (X = RSR', Met) allow regulation of the metalating activity of the complex with visible light."

The news editors report that additional information may be obtained by contacting M.E. Vazquez, University of Santiago, Dept. of Quim Organ, Santiago De Compostela 15782, Spain. Additional authors for this research include J. Mosquera, J.R. Couceiro, M.E. Vazquez and J.L. Mascarenas.

Findings on Chronic Lymphocytic Leukemia Detailed by Researchers at University of Kansas (Targeting HSF1 disrupts HSP90 chaperone function in chronic lymphocytic leukemia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Chronic Lymphocytic Leukemia. According to news reporting originating in Kansas City, Kansas, by NewsRx journalists, research stated, "CLL is a disease characterized by chromosomal deletions, acquired copy number changes and aneuploidy. Recent studies have shown that overexpression of Heat Shock Factor (HSF) 1 in aneuploid tumor cells can overcome deficiencies in heat shock protein (HSP) 90-mediated protein folding and restore protein homeostasis."

The news reporters obtained a quote from the research from the University of Kansas, "Interestingly, several independent studies have demonstrated that HSF1 expression and activity also affects the chaperoning of HSP90 kinase clients, although the mechanism underlying this observation is unclear. Here, we determined how HSF1 regulates HSP90 function using CLL as a model system. We report that HSF1 is overexpressed in CLL and treatment with triptolide (a small molecule inhibitor of HSF1) induces apoptosis in cultured and primary CLL B-cells. We demonstrate that knockdown of HSF1 or its inhibition with triptolide results in the reduced association of HSP90 with its kinase co-chaperone cell division cycle 37 (CDC37), leading to the partial depletion of HSP90 client kinases, Bruton's Tyrosine Kinase (BTK), c-RAF and cyclin-dependent kinase 4 (CDK4). Treatment with triptolide or HSF1 knockdown disrupts the cytosolic complex between HSF1, p97, HSP90 and the HSP90 deacetylase-Histone deacetylase 6 (HDAC6). Consequently, HSF1 inhibition results in HSP90 acetylation and abrogation of its chaperone function. Finally, tail vein injection of Mec-1 cells into Rag2-/IL2Rgc--/mice followed by treatment with minnelide (a pro-drug of triptolide), reduced leukemia, increased survival and attenuated HSP90-dependent survival signaling in vivo."

According to the news reporters, the research concluded: "Our study provides a strong rationale to target HSF1 and test the activity of minnelide against human CLL."

For more information on this research see: Targeting HSF1 disrupts HSP90 chaperone function in chronic lymphocytic leukemia. Oncotarget, 2015;6(31):31767-79.

Lung Diseases and Conditions - Chronic Obstructive...

Findings on Chronic Obstructive Pulmonary Disease Reported by Researchers at Leiden University Medical Center (Prediction of Long-Term Benefits of Inhaled Steroids by Phenotypic Markers in Moderate-to-Severe COPD: A Randomized Controlled Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease are discussed in a new report. According to news reporting originating from Leiden, Netherlands, by NewsRx correspondents, research stated, "The decline in lung function can be reduced by long-term inhaled corticosteroid (ICS) treatment in subsets of patients with chronic obstructive pulmonary disease (COPD). We aimed to identify which clinical, physiological and non-invasive inflammatory characteristics predict the benefits of ICS on lung function decline in COPD."

Our news editors obtained a quote from the research from Leiden University Medical Center, "Analysis was performed in 50 steroid-naive compliant patients with moderate to severe COPD (postbronchodilator forced expiratory volume in one second (FEV1), 30-80% of predicted, compatible with GOLD stages II-III), age 45-75 years, >10 packyears smoking and without asthma. Patients were treated with fluticasone propionate (500 mg bid) or placebo for 2.5 years. Postbronchodilator FEV1, dyspnea and health status were measured every 3 months; lung volumes, airway hyperresponsiveness (PC20), and induced sputum at 0, 6 and 30 months. A linear mixed effect model was used for analysis of this hypothesis generating study. Significant predictors of attenuated FEV1-decline by fluticasone treatment compared to placebo were: fewer packyears smoking, preserved diffusion capacity, limited hyperinflation and lower inflammatory cell counts in induced sputum (p <0.04). Long-term benefits of ICS on lung function decline in patients with moderate-to-severe COPD are most pronounced in patients with fewer packyears, and less severe emphysema and inflammation."

According to the news editors, the research concluded: "These data generate novel hypotheses on phenotype-driven therapy in COPD."

For more information on this research see: Prediction of Long-Term Benefits of Inhaled Steroids by Phenotypic Markers in Moderate-to-Severe COPD: A Randomized Controlled Trial. Plos One; 2015;10(12):e0143793. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

The news editors report that additional information may be obtained by contacting J.B. Snoeck-Stroband, Dept. of Public Health and Primary Care, Leiden University Medical Center, Leiden, Netherlands. Musculoskeletal Diseases and Conditions - Chronic...

Findings on Chronic Pain Described by Researchers at Department of Anesthesiology (Prevalence and determinants of medication non-adherence in chronic pain patients: a systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Musculoskeletal Diseases and Conditions - Chronic Pain is the subject of a report. According to news reporting out of Nieuwegein, Netherlands, by NewsRx editors, research stated, "Chronic pain is commonly treated with analgesic medication. Non-adherence to prescribed pain medication is very common and may result in sub-optimal treatment outcome."

Financial support for this research came from Center for Pain Medicine of the Erasmus MC University Medical Center Rotterdam.

Our news journalists obtained a quote from the research from the Department of Anesthesiology, "The aim of this review was to investigate the prevalence of medication non-adherence and to present determinants that may help identify patients at risk for non-adherence to analgesic medication. A search was performed in PubMed and Embase with systematic approach including PRISMA recommendations. Individual risk of bias was assessed and systematic data extraction was performed. Twenty-five studies were included. Non-adherence rates to pain prescriptions ranged from 8% to 62% with a weighted mean of 40%. Underuse of pain medication was more common than overuse in most studies. Factors that were commonly positively associated with non-adherence were dosing frequency, polymedication, pain intensity, and concerns about pain medication. Factors negatively associated with non-adherence were age, again pain intensity and quality of the patient-caregiver relationship. Underuse was positively associated with active coping strategies and self-medication, and negatively associated with perceived need for analgesic medication. Overuse was positively associated with perceived need, pain intensity, opioid use, number of prescribed analgesics, a history of drug abuse, and smoking. Non-adherence to analgesic medication use is very common in the chronic pain population. The choice for pharmacological therapy should not only be based upon pain diagnosis but should also take the risks of non-adherence into account."

According to the news editors, the research concluded: "The value of adherence monitoring or adherence enhancing interventions has to be investigated in future studies."

Our news journalists report that additional information may be obtained by contacting L. Timmerman, Dept. of Anesthesiology, Intensive Care and Pain Medicine, St Antonius Hospital, Nieuwegein, Netherlands. Additional authors for this research include D.L. Stronks, J.G. Groeneweg and F.J Huygen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/aas.12697. This DOI is a link to an online electronic document that is either free or for purchase.

Findings on Clinical Epidemiology Reported by Investigators at Public Hospital System (Peer reviewers identified spin in manuscripts of nonrandomized studies assessing therapeutic interventions, but their impact on spin in abstract conclusions ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Health and Medicine - Clinical Epidemiology is now available. According to news originating from Paris, France, by NewsRx correspondents, research stated. "To describe the impact of peer reviewers on spin in reports of nonrandomized studies assessing a therapeutic intervention. This is a systematic review and retrospective before after study."

Our news journalists obtained a quote from the research from Public Hospital System, "The sample consists of primary reports (n = 128) published in BioMed Central Medical Series journals between January 1, 2011, and December 31, 2013. The main outcome measures are the following: number and type of spin examples identified, deleted, or added by peer reviewers in the whole manuscript; number of reports with spin in abstract conclusions not detected by peer reviewers; the level of spin (i.e., no, low, moderate, and high level of spin) in the abstract conclusions before and after the peer review. For 70 (55%) submitted manuscripts, peer reviewers identified at least one example of spin. Of 123 unique examples of spin identified by peer reviewers, 82 (67%) were completely deleted by the authors. For 19 articles (15%), peer reviewers requested adding some spin, and for 11 (9%), the spin was added by the authors. Peer reviewers failed to identify spin in abstract conclusions of 97 (76%) reports. Peer reviewers identified many examples of spin in submitted manuscripts."

According to the news editors, the research concluded: "However, their influence on changing spin in the abstract conclusions was low."

For more information on this research see: Peer reviewers identified spin in manuscripts of nonrandomized studies assessing therapeutic interventions, but their impact on spin in abstract conclusions was limited. *Journal of Clinical Epidemiology*, 2016;77():44-51. *Journal of Clinical Epidemiology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. (Elsevier - www.elsevier.com; Journal of Clinical Epidemiology - www.journals.elsevier.com/journal-of-clinical-epidemiology/)

Findings on Clinical Nephrology Described by A. Bellasi and Colleagues
(Cinacalcet but not vitamin D use modulates the survival benefit associated with sevelamer in the INDEPENDENT study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Health and Medicine - Clinical Nephrology have been published. According to news reporting out of Solofra, Italy, by NewsRx editors, research stated, "Whether differences in outcomes of calcium-free vs. calcium-containing phosphate binder treatments can be amplified by concurrent treatment with a calcium-sensing receptor agonist or vitamin D remains to be elucidated. A post-hoc analysis of the INDEPENDENT study, an open-label randomized controlled trial designed to evaluate the impact of sevelamer (SV) vs. calcium salts (CS) on survival in incident dialysis patients."

Our news journalists obtained a quote from the research, "We recruited 466 middle-aged men and women. Cinacalcet (CC) and vitamin D (VD) were administered to a portion of patients as part of their routine care. We tested the impact of CC and VD on survival in the overall and in both treatment arms of the original study cohort. Overall SV, but not CC or VD, administration was associated with a survival benefit (mean follow-up: 28 (10) months). However, a significant (p = 0.006) interaction of SV and CC on mortality was observed. CC use was associated with improved survival if administered in combination with SV (HR 0.34, 95% CI 0.14 - 0.81, p = 0.01 for subjects receiving or not CC) but not CS (HR 1.28, 95% CI 0.82 - 2.00; p = 0.26 for subjects receiving or not CC). No effect on mortality or interaction of phosphate binder use with VD was noted."

According to the news editors, the research concluded: "Though hypothesis generating, these results lend support to the idea that use of a CC may increase survival in incident hemodialysis patients when used with a calcium-free phosphate binder."

For more information on this research see: Cinacalcet but not vitamin D use modulates the survival benefit associated with sevelamer in the INDEPENDENT study. Clinical Nephrology, 2016;86(3):113-124. Clinical Nephrology can be contacted at: Dustri-Verlag Dr Karl Feistle, Bahnhofstrasse 9 Postfach 49, D-82032 Deisenhofen-Muenchen, Germany.

Our news journalists report that additional information may be obtained by contacting B. Di Iorio, PO A Landolfo, UOC Nefrol, I-83029 Solofra, AV, Italy. Additional authors for this research include M. Cozzolino, D. Russo, D. Molony and B. Di Iorio.

Findings on Clinical Pharmacology and Therapeutics Reported by Investigators at Massachusetts Institute of Technology (Leveraging Industry-Academia Collaborations in Adaptive Biomedical Innovation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Clinical Pharmacology and Therapeutics have been presented. According to news reporting originating in Cambridge, Massachusetts, by NewsRx journalists, research stated, "Despite the rapid pace of biomedical innovation, research and development (R&D) productivity in the pharmaceutical industry has not improved broadly. Increasingly, firms need to leverage new approaches to product development and commercial execution, while maintaining adaptability to rapid changes in the marketplace and in biomedical science."

The news reporters obtained a quote from the research from the Massachusetts Institute of Technology, "Firms are also seeking ways to capture some of the talent, infrastructure, and innovation that depends on federal R&D investment. As a result, a major transition to external innovation is taking place across the industry. One example of these external innovation initiatives is the Sanofi-MIT Partnership, which provided seed funding to MIT investigators to develop novel solutions and approaches in areas of interest to Sanofi. These projects were highly collaborative, with information and materials flowing both ways."

According to the news reporters, the research concluded: "The relatively small amount of funding and short time frame of the awards built an adaptable and flexible process to advance translational science."

Findings on Clinical Trials and Studies Discussed by Y.K. Chae and Co-Researchers (Repurposing metformin for cancer treatment: current clinical studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Clinical Research - Clinical Trials and Studies have been presented. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "In recent years, several studies have presented evidence suggesting a potential role for metformin in anti-cancer therapy. Preclinical studies have demonstrated several anticancer molecular mechanisms of metformin including mTOR inhibition, cytotoxic effects, and immunomodulation."

Our news journalists obtained a quote from the research, "Epidemiologic data have demonstrated decreased cancer incidence and mortality in patients taking metformin. Several clinical trials, focused on evaluation of metformin as an anti-cancer agent are presently underway. Data published from a small number of completed trials has put forth intriguing results. Clinical trials in pre-surgical endometrial cancer patients exhibited a significant decrease in Ki67 with metformin monotherapy. Another interesting observation was made in patients with breast cancer, wherein a trend towards improvement in cancer proliferation markers was noted in patients without insulin resistance. Data on survival outcomes with the use of metformin as an anti-cancer agent is awaited."

According to the news editors, the research concluded: "This manuscript will critically review the role of metformin as a potential cancer treatment."

For more information on this research see: Repurposing metformin for cancer treatment: current clinical studies. Oncotarget, 2016;7(26):40767-40780.

Findings on Clinical Trials and Studies Reported by Investigators at Copenhagen University Hospital [Thromboelastography (TEG) or thromboelastometry (ROTEM) to monitor haemostatic treatment versus usual care in adults or children with bleeding]
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Research - Clinical Trials and Studies. According to news reporting originating in Copenhagen, Denmark, by NewsRx journalists, research stated, "Severe bleeding and coagulopathy are serious clinical conditions that are associated with high mortality. Thromboelastography (TEG) and thromboelastometry (ROTEM) are increasingly used to guide transfusion strategy but their roles remain disputed."

The news reporters obtained a quote from the research from Copenhagen University Hospital, "This review was first published in 2011 and updated in January 2016. We assessed the benefits and harms of thromboelastography (TEG)-guided or thromboelastometry (ROTEM)-guided transfusion in adults and children with bleeding. We looked at various outcomes, such as overall mortality and bleeding events, conducted subgroup and sensitivity analyses, examined the role of bias, and applied trial sequential analyses (TSAs) to examine the amount of evidence gathered so far. Search methods In this updated review we identified randomized controlled trials (RCTs) from the following electronic databases: Cochrane Central Register of Controlled Trials (CENTRAL; 2016, Issue 1); MEDLINE; Embase; Science Citation Index Expanded; International Web of Science; CINAHL; LILACS; and the Chinese Biomedical Literature Database (up to 5 January 2016). We contacted trial authors, authors of previous reviews, and manufacturers in the field. The original search was run in October 2010. Selection criteria We included all RCTs, irrespective of blinding or language, that compared transfusion guided by TEG or ROTEM to transfusion guided by clinical judgement, guided by standard laboratory tests, or a combination. We also included interventional algorithms including both TEG or ROTEM in combination with standard laboratory tests or other devices. The primary analysis included trials on TEG or ROTEM versus any comparator. Data collection and analysis Two review authors independently abstracted data; we resolved any disagreements by discussion. We presented pooled estimates of the intervention effects on dichotomous outcomes as risk ratio (RR) with 95% confidence intervals (CIs). Due to skewed data, meta-analysis was not provided for continuous outcome data. Our primary outcome measure was all-cause mortality. We performed subgroup and sensitivity analyses to assess the effect based on the presence of coagulopathy of a TEG- or ROTEM-guided algorithm, and in adults and children on various clinical and physiological outcomes. We assessed the risk of bias through assessment of trial methodological components and the risk of random error through TSA. We included eight new studies (617 participants) in this updated review. In total we included 17 studies (1493 participants). A total of 15 trials provided data for the meta-analyses. We judged only two trials as low risk of bias. The majority of studies included participants undergoing cardiac surgery. We found six ongoing trials but were unable to retrieve any data from them. Compared with transfusion guided by any method, TEG or ROTEM seemed to reduce overall mortality (7.4% versus 3.9%; risk ratio (RR) 0.52, 95% CI 0.28 to 0.95; I2 = 0%, 8 studies, 717 participants, low quality of evidence) but only eight trials provided data on mortality, and two were zero event trials. Our analyses demonstrated a statistically significant effect of TEG or ROTEM compared to any comparison on the proportion of participants transfused with pooled red blood cells (PRBCs) (RR 0.86, 95% CI 0.79 to 0.94; I2 = 0%, 10 studies, 832 participants, low quality of evidence), fresh frozen plasma (FFP) (RR 0.57, 95% CI 0.33 to 0.96; I2 = 86%, 8 studies, 761 participants, low quality of evidence), platelets (RR 0.73, 95% CI 0.60 to 0.88; I2 = 0%, 10 studies, 832 participants, low quality of evidence), and overall haemostatic transfusion with FFP or platelets (low quality of evidence). Meta-analyses also showed fewer participants with dialysis-dependent renal failure. We found no difference in the proportion needing surgical reinterventions (RR 0.75, 95% CI 0.50 to 1.10; I2 = 0%, 9 studies, 887 participants, low quality of evidence) and excessive bleeding events or massive transfusion (RR 0.38, 95% CI 0.38 to 1.77; I2 = 34%, 2 studies, 280 participants, low quality of evidence). The
planned subgroup analyses failed to show any significant differences. We graded the quality of evidence as low based on the high risk of bias in the studies, large heterogeneity, low number of events, imprecision, and indirectness. TSA indicates that only 54% of required information size has been reached so far in regards to mortality, while there may be evidence of benefit for transfusion outcomes. Overall, evaluated outcomes were consistent with a benefit in favour of a TEG-or ROTEM-guided transfusion in bleeding patients. Authors’ conclusions There is growing evidence that application of TEG-or ROTEM-guided transfusion strategies may reduce the need for blood products, and improvement in patients with bleeding. However, these results are primarily based on trials of elective cardiac surgery involving cardiopulmonary bypass, and the level of evidence remains low."

According to the news reporters, the research concluded: "Further evaluation of TEG-or ROTEM-guided transfusion in acute settings and other patient categories in low risk of bias studies is needed."

**Clinical Research - Clinical Trials and Studies**

**Findings on Clinical Trials and Studies Reported by Investigators at Maastricht University (Randomized clinical trial on the efficacy of hesperidin 2S on validated cardiovascular biomarkers in healthy overweight individuals)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news originating from Maastricht, Netherlands, by NewsRx correspondents, research stated, "Endothelial dysfunction (ED) is involved in the development of atherosclerosis. Hesperidin, a citrus flavonoid with antioxidant and other biological properties, potentially exerts beneficial effects on endothelial function (EF)."

Our news journalists obtained a quote from the research from Maastricht University, "We investigated the effect of hesperidin 2S supplementation on EF in overweight individuals. This was a randomized, double-blind, placebo-controlled study in which 68 individuals were randomly assigned to receive hesperidin 2S (450 mg/d) or a placebo for 6 wk. At baseline and after 6 wk of intervention, flow-mediated dilation (FMD), soluble vascular adhesion molecule-1
(sVCAM-1), soluble intracellular adhesion molecule-1 (sICAM-1), soluble P-selectin (sP-selectin), systolic blood pressure (SBP), and diastolic blood pressure (DBP) were assessed. Acute, reversible ED was induced by intake of a high-fat meal (HFM). A second FMD scan was performed 2 h postprandially, and adhesion molecules were assessed 2 and 4 h postprandially. An additional exploratory analysis was performed in subjects with baseline FMD >= 3%. No significant change in fasting or postprandial FMD was observed after 6 wk of hesperidin intake compared with placebo intake. However, there was a trend for a reduction of sVCAM-1, sICAM-1, sP-selectin, SBP, and DBP after 6 wk of hesperidin treatment. In the FMD >= 3% group, hesperidin protected individuals from postprandial ED (P = 0.050) and significantly downregulated sVCAM-1 and sICAM-1 (all P <= 0.030). The results reported in the current article were not adjusted for multiplicity. Six weeks of consumption of hesperidin 2S did not improve basal or postprandial FMD in our total study population. There was a tendency toward a reduction of adhesion molecules and a decrease in SBP and DBP. Further exploratory analyses revealed that, in subjects with baseline FMD >= 3%, hesperidin 2S improved ED after an HFM and reduced adhesion molecules. These results indicate the cardiovascular health benefits of hesperidin 2S in overweight and obese individuals with a relatively healthy endothelium.

According to the news editors, the research concluded: "This trial was registered at clinicaltrials.gov as NCT02228291."

The news correspondents report that additional information may be obtained from B.N. Salden, Maastricht University, Medical Center, Sch Nutr & Translat Res Metab, Dept. of Internal MedDiv Gastroenterol Hepatol, Maastricht, Netherlands. Clinical Research - Clinical Trials and Studies

Findings on Clinical Trials and Studies Reported by Investigators at Zhejiang University (Dexmedetomidine Versus Propofol Sedation Improves Sublingual Microcirculation After Cardiac Surgery: A Randomized Controlled Trial)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news reporting from Hangzhou, People's Republic of China, by NewsRx journalists, research stated, "To compare the effects of dexmedetomidine and propofol on sublingual microcirculation in patients after cardiac surgery. A prospective, randomized, single-blind study. University hospital."

The news correspondents obtained a quote from the research from Zhejiang University, "Adult patients undergoing elective valve surgery with cardiopulmonary bypass. On arrival in the intensive care unit (ICU), patients were assigned randomly to receive either dexmedetomidine (0.2-1.5 μg/kg/h) or propofol (5-50 μg/kg/min) with open-label titration to a target Richmond Agitation Sedation Scale of 0 to -3. Sublingual microcirculation was recorded using sidestream dark-field imaging at ICU admission (baseline [T1]) and 4 hours (T2) and 24 hours after ICU admission (T3). At T2, median changes in perfused small vessel density and the De Backer score from baseline were significantly greater in the dexmedetomidine group (n = 29) than in the propofol group (n = 32) (1.3 v 0 mm/mm², p = 0.025; 0.9 v -0.1/mm, p = 0.005, respectively); median changes in small-vessel density and the proportion of perfused small vessels from baseline also tended to be higher in the dexmedetomidine group compared with the propofol group (1.0 v -0.1 mm/mm², p = 0.050; 2.1% v 0.5%, p = 0.062, respectively). At T3, there still was a trend toward greater improvements in the small-vessel density, proportion of perfused small-vessels, perfused small-vessel density, and De Backer score from baseline in the dexmedetomidine group than in the propofol group."

According to the news reporters, the research concluded: "This trial demonstrated that dexmedetomidine sedation may be better able to improve microcirculation in cardiac surgery patients during the early postoperative period compared with propofol."

Our news journalists report that additional information may be obtained by contacting X.M. Fang, Zhejiang University, Sch Med, Affiliated Hosp 1, Dept. of Anesthesiol & Intens Care Unit, Hangzhou, Zhejiang, People's Republic of China. Additional authors for this research include K. Zhang, W. Wang, G.H. Xie, B.L. Cheng, Y. Wang, Y.Q. Hu and X.M. Fang.

Findings on Clinical Trials and Studies Reported by Researchers at Fukuoka University [Intracellular mechanisms underlying lipid accumulation (white opaque substance) in gastric epithelial neoplasms: A pilot study of expression profiles of ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Research - Clinical Trials and Studies. According to news reporting out of Fukuoka, Japan, by NewsRx editors, research stated, "White opaque substance (WOS) is a novel endoscopic finding in gastric neoplasms, indicating the intracellular accumulation of lipid droplets (LDs). However, gastric lipid metabolism has not been extensively investigated, even in normal mucosa."

Funders for this research include Central Research Institute for Endoscopy (Fukuoka iEndo), Fukuoka University, Clinical Research from the National Hospital Organization of Japan.

Our news journalists obtained a quote from the research from Fukuoka University, "We investigated the expression profiles of lipid-metabolism-associated genes in gastric neoplasms. Thirty-four patients with early gastric cancer or adenoma were enrolled in this study. Paired biopsy samples from tumor and adjacent non-tumor areas were obtained and analyzed by real-time polymerase chain reaction. Endoscopically resected specimens were evaluated histopathologically. Genes associated with b-oxidation (peroxisome proliferator-activated receptor a, carnitine palmitoyltransferase 1A, and hydroxyacyl-CoA dehydrogenase), lipoprotein excretion (apolipoprotein B, microsomal triglyceride transfer protein, and acyl-CoA:cholesterol acyltransferase 2), fatty acid transport (fatty acid-binding protein), construction of triglycerides in the endoplasmic reticulum (acyl-CoA:diacylglycerol acyltransferase 1), and LD degradation/lipolysis (comparative gene identification-58, adipose triglyceride lipase) were significantly downregulated in neoplasms compared with non-tumor areas. Pyruvate dehydrogenase lipoamide kinase isozyme 4 (negative regulator of glycolysis) and adipophilin (LD surface component) were also repressed. Conversely, expression levels of genes associated with de novo lipogenesis (sterol regulatory element-binding protein 1c, acyl-CoA:diacylglycerol acyltransferase 2) were significantly enhanced in neoplasms. There was no significant difference in gene expression levels between carcinomas and adenomas, or between WOS-positive and WOS-negative neoplasms. Gene expression profiles in neoplasms suggest a predominance of lipid storage (lipogenesis/LD formation) over consumption (b-oxidation/excretion/lipolysis)."

According to the news editors, the research concluded: "Lipid accumulation and WOS in gastric epithelial neoplasms may be caused by impaired mitochondrial oxidation, lipoprotein excretion, and LD degradation."

Our news journalists report that additional information may be obtained by contacting M. Enjoji, Faculty of Pharmaceutical Sciences, Fukuoka University, Fukuoka, Japan. Additional authors for this research include M. Kohjima, K. Ohtsu, K. Matsunaga, Y. Murata, M. Nakamuta, K. Imamura, H. Tanabe, A. Iwashita, T. Nagahama and K. Yao.

**Drugs and Therapies - Coagulation Modifiers**

**Findings on Coagulation Modifiers Reported by Investigators at CSIR**

*(Site-Specific Thiol-mediated PEGylation of Streptokinase Leads to Improved Properties with Clinical Potential)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Coagulation Modifiers. According to news reporting out of Chandigarh, India, by NewsRx editors, research stated, "Streptokinase (SK) is an efficient thrombolytic agent that dissolves fibrin blood clots with clinical efficiency comparable to the high priced drug, tissue plasminogen activator (tPA). However, being of bacterial origin, its major drawbacks are its potentially high antigenicity, and relatively short circulating half-life (approximately 10-15 min)."

Our news journalists obtained a quote from the research from CSIR, "In the present investigation, an attempt has been made to address both these shortcomings by site-specific pegylation, and to obtain longer lasting thrombolytics, which are consistent with clinical requirements. Therefore, we employed available three-dimensional structural information on SK to carry out site-specific cysteine incorporation at 'optimal' surface-exposed sites within all the three domains in streptokinase followed by pegylation with 20KDa PEG groups, and screening for biologically active variants. Interestingly, some of these SK PEG-conjugates exhibited considerably subdued immune-reactivity along with enhanced in-vitro proteolytic stability profiles and extended circulating in-vivo half-lives (2 to 20-fold compared to that of native unconjugated SK) depending upon location and number of PEG-groups per molecule obtained in homogeneous form."

According to the news editors, the research concluded: "The obtained results are a promising approach for favorably modulating immune-reactivity and half-life by cysteine-specific PEGylation of SK to achieve therapeutic attributes desirable for the treatment of different circulatory disorders, such as ischemic stroke, myocardial infarction and pulmonary embolism."

Our news journalists report that additional information may be obtained by contacting G. Sahni, CSIR Inst Microbial Technol, Dept. of Mol Biol & Prot Sci & Engn, Chandigarh 160036, India. Additional authors for this research include S. Kumar, N.

FINDINGS

Oncology - Colon Cancer

Findings on Colon Cancer Detailed by Researchers at Peking Union
Medical College (Developmental genes significantly afflicted by
aberrant promoter methylation and somatic mutation predict overall
survival of late-stage colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According
to news originating from Beijing, People's Republic of China, by NewsRx correspondents,
research stated, "Carcinogenesis is an exceedingly complicated process, which involves multi-
level dysregulations, including genomics (majorly caused by somatic mutation and copy number
variation), DNA methyomics, and transcriptomics. Therefore, only looking into one molecular
level of cancer is not sufficient to uncover the intricate underlying mechanisms."

Our news journalists obtained a quote from the research from Peking Union Medical
College, "With the abundant resources of public available data in the Cancer Genome Atlas
(TCGA) database, an integrative strategy was conducted to systematically analyze the aberrant
patterns of colorectal cancer on the basis of DNA copy number, promoter methylation, somatic
mutation and gene expression. In this study, paired samples in each genomic level were
retrieved to identify differentially expressed genes with corresponding genetic or epigenetic
dysregulations. Notably, the result of gene ontology enrichment analysis indicated that the
differentially expressed genes with corresponding aberrant promoter methylation or somatic
mutation were both functionally concentrated upon developmental process, suggesting the
intimate association between development and carcinogenesis. Thus, by means of random walk
with restart, 37 significant development-related genes were retrieved from a priori-knowledge
based biological network."

According to the news editors, the research concluded: "In five independent
microarray datasets, Kaplan-Meier survival and Cox regression analyses both confirmed that the
expression of these genes was significantly associated with overall survival of Stage III/IV
colorectal cancer patients."

For more information on this research see: Developmental genes significantly
afflicted by aberrant promoter methylation and somatic mutation predict overall survival of late-
stage colorectal cancer. Scientific Reports, 2015;5():18616. (Nature Publishing Group -
www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from N.
An, State Key Laboratory of Molecular Oncology, Dept. of Etiology and Carcinogenesis, Peking
Findings on Colon Cancer Discussed by Investigators at McGill University (Four-week prehabilitation program is sufficient to modify exercise behaviors and improve preoperative functional walking capacity in patients with colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Montreal, Canada, by NewsRx journalists, research stated, "High complication rates following colorectal surgery render many patients unable to fully regain functional capacity, thus seriously compromising quality of life. The aim of this study was to assess whether a 4-week trimodal prehabilitation program (exercise, nutritional supplementation, and counseling on relaxation techniques), implemented during the preoperative period, is sufficient to modify exercise behaviors and improve functional capacity of elderly patients scheduled for colorectal cancer surgery."

Financial supporters for this research include Montreal General Hospital Foundation, Peri-Operative Program (POP) Foundation.

The news reporters obtained a quote from the research from McGill University, "Patients were assigned to either a prehabilitation (PREHAB; n = 57) or matched time control group (CTRL; n = 59). Over the 4-week period prior to surgery, patients in PREHAB participated in a trimodal prehabilitation program. Patients in CTRL received the same program but only postoperatively. The Community Healthy Activities Model Program for Seniors (CHAMPS) questionnaire was used to measure physical activity levels, while the 6-min walk test (6MWT) was used for assessment of functional walking capacity. Measurements were collected at baseline and at the time of surgery. Over the preoperative period, patients in PREHAB significantly increased the amount of moderate- and vigorous-intensity physical activities that they performed. PREHAB patients also demonstrated a greater improvement in 6MWT compared to CTRL. At the time of surgery, a greater proportion of patients in PREHAB met current physical activity guidelines, as compared to CTRL."

According to the news reporters, the research concluded: "These findings highlight the positive effects of a trimodal prehabilitation program on patients' physical activity levels and functional walking capacity and demonstrate that modifying exercise behaviors and improving physical function within the 4-week preoperative period are an achievable goal."

For more information on this research see: Four-week prehabilitation program is sufficient to modify exercise behaviors and improve preoperative functional walking capacity in...

**Oncology - Colon Cancer**

**Findings on Colon Cancer Discussed by Investigators at Tongji University (A nomogram improves AJCC stages for colorectal cancers by introducing CEA, modified lymph node ratio and negative lymph node count)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Colon Cancer is the subject of a report. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Lymph node stages (pN stages) are primary contributors to survival heterogeneity of the 7th AJCC staging system for colorectal cancer (CRC), indicating spaces for modifications. To implement the modifications, we selected eligible CRC patients from the Surveillance Epidemiology and End Results (SEER) database as participants in a training (n = 6675) and a test cohort (n = 6760), and verified tumor deposits to be metastatic lymph nodes to derive modified lymph node count (mLNC), lymph node ratio (mLNR), and positive lymph node count (mPLNC)."

Our news journalists obtained a quote from the research from Tongji University, "After multivariate Cox regression analyses with forward stepwise elimination of the mLNC and mPLNC for the training cohort, a nomogram was constructed to predict overall survival (OS) via incorporating preoperative carcinoembryonic antigen, pT stages, negative lymph node count, mLNR and metastasis. Internal validations of the nomogram showed concordance indexes (c-index) of 0.750 (95% CI, 0.736-0.764) and 0.749 before and after corrections for overfitting. Serial performance evaluations indicated that the nomogram outperformed the AJCC stages (c-index = 0.725) with increased accuracy, net benefits, risk assessment ability, but comparable complexity and clinical validity. All the results were reproducible in the test cohort. In summary, the proposed nomogram may serve as an alternative to the AJCC stages."

According to the news editors, the research concluded: "However, validations with longer follow-up periods are required."

For more information on this research see: A nomogram improves AJCC stages for

**Oncology - Colon Cancer**

**Findings on Colon Cancer Reported by Investigators at Liaoning University (Oncogenic Activin C Interacts With Decorin in Colorectal Cancer In Vivo and In Vitro)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating from Shenyang, People's Republic of China, by NewsRx correspondents, research stated, "Activin C is a member of the transforming growth factor-beta (TGF-beta) superfamily with various biological activities. Decorin is a member of the small leucine-rich proteoglycan family, which can bind to TGF-beta and modulate TGF-beta-mediated signaling."

Our news editors obtained a quote from the research from Liaoning University, "In the decorin-deficient mouse model, we found that the expression of activin C was remarkably increased in the intestine of Dcn(-/-) mice compared to the expression of activin C in the intestine of Dcn(+/+) mice. Addition of activin C protein to colorectal cancer cells or over-expression of activin C in these cells stimulated cell growth, migration, and invasion in vitro. Enhanced AP-1 expression in colorectal cancer cells was found to be associated with the oncoprotein-like effects of activin C through the JNK/AP-1 pathway, and not the Smad signaling pathway. However, these effects were abolished when decorin expression was restored by transfecting the cells with a decorin-expressing plasmid or by reducing the expression of activin C via interfering RNA."

According to the news editors, the research concluded: "Further analysis demonstrated that decorin could directly bind to and accelerate the degradation of activin C. our data provided the first evidence demonstrating the oncogenic role of activin C in intestinal tumorigenesis of decorin-deficient mice and colorectal cancer cells."

The news editors report that additional information may be obtained by contacting
Findings on Colon Cancer Reported by Investigators at National Institute for Public Health and the Environment (The Dutch public are positive about the colorectal cancer-screening programme, but is this a well-informed opinion?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Colon Cancer are discussed in a new report. According to news reporting originating in Bilthoven, Netherlands, by NewsRx journalists, research stated, "Population-based colorectal cancer (CRC) screening is widely recommended, and members of the eligible screening population seem to be positive about it. However, it is not well known how people outside the eligible screening population view CRC screening, and whether they are supportive of the government providing this."

The news reporters obtained a quote from the research from National Institute for Public Health and the Environment, "Public opinion may affect people's personal views and their screening decision. The aim of our study was to examine the opinion of the Dutch general public regarding the national CRC screening programme. An online survey was carried out in a Dutch population sample of adults aged 18 and older, assessing level of support, personal attitude, collective attitude, perceived social norm, awareness, and knowledge regarding the CRC screening programme. The response rate was 56% (n = 1679/3000). Generally, the Dutch public are positive about and supportive of the CRC screening programme. We found the biggest proportion of support (86%) when people were asked directly. A smaller proportion (48%) was supportive when people had to choose between other options concerning how the government could possibly deal with CRC. People report knowing more about the benefits of CRC screening than about its possible harms and risks. Many people found it difficult to answer the knowledge questions that asked about numerical information concerning CRC screening correctly. People were less supportive of the CRC screening programme when having to choose between other options concerning dealing with CRC, and their support may not be based on a full comprehension of what CRC screening entails."

According to the news reporters, the research concluded: "Further research is needed to establish what knowledge people need in order to form a wellfounded opinion."

For more information on this research see: The Dutch public are positive about the colorectal cancer-screening programme, but is this a well-informed opinion? BMC Public Health, 2016;16():76-87. Oncology - Colon Cancer

Findings on Colon Cancer Reported by Investigators at School of Medicine (Functional exploration of colorectal cancer genomes using Drosophila)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "The multigenic nature of human tumours presents a fundamental challenge for cancer drug discovery. Here we use Drosophila to generate 32 multigenic models of colon cancer using patient data from The Cancer Genome Atlas."

Our news editors obtained a quote from the research from the School of Medicine, "These models recapitulate key features of human cancer, often as emergent properties of multigenic combinations. Multigenic models such as ras p53 pten apc exhibit emergent resistance to a panel of cancer-relevant drugs. Exploring one drug in detail, we identify a mechanism of resistance for the PI3K pathway inhibitor BEZ235. We use this data to identify a combinatorial therapy that circumvents this resistance through a two-step process of emergent pathway dependence and sensitivity we term 'induced dependence'. This approach is effective in cultured human tumour cells, xenografts and mouse models of colorectal cancer."

According to the news editors, the research concluded: "These data demonstrate how multigenic animal models that reference cancer genomes can provide an effective approach for developing novel targeted therapies."

The news editors report that additional information may be obtained by contacting R.L. Cagan, Icahn Sch Med Mt Sinai, Dept. of Dev & Regenerat Biol, New York, NY 10029, United States. Additional authors for this research include C. Murgia, A.G.S. Teague, O.J. Sansom and R.L. Cagan.

Findings on Congenital Myopathy Detailed by Investigators at National Institute of Neuroscience (Calcium Dyshomeostasis in Tubular Aggregate Myopathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Congenital Diseases and Conditions - Congenital Myopathy. According to news reporting from Tokyo, Japan, by NewsRx journalists, research stated, "Calcium is a crucial mediator of cell signaling in skeletal muscles for basic cellular functions and specific functions, including contraction, fiber-type differentiation and energy production. The sarcoplasmic reticulum (SR) is an organelle that provides a large supply of intracellular Ca2+ in myofibers."

The news correspondents obtained a quote from the research from the National Institute of Neuroscience, "Upon excitation, it releases Ca2+ into the cytosol, inducing contraction of myofibrils. During relaxation, it takes up cytosolic Ca2+ to terminate the contraction. During exercise, Ca2+ is cycled between the cytosol and the SR through a system by which the Ca2+ pool in the SR is restored by uptake of extracellular Ca2+ via a specific channel on the plasma membrane. This channel is called the store-operated Ca2+ channel or the Ca2+ release-activated Ca2+ channel. It is activated by depletion of the Ca2+ store in the SR by coordination of two main molecules: stromal interaction molecule 1 (STIM1) and calcium release-activated calcium channel protein 1 (ORAI1). Recently, myopathies with a dominant mutation in these genes have been reported and the pathogenic mechanism of such diseases have been proposed. This review overviews the calcium signaling in skeletal muscles and role of store-operated Ca2+ entry in calcium homeostasis."

According to the news reporters, the research concluded: "Finally, we discuss the phenotypes and the pathomechanism of myopathies caused by mutations in the STIM1 and ORAI1 genes."

For more information on this research see: Calcium Dyshomeostasis in Tubular Aggregate Myopathy. International Journal of Molecular Sciences, 2016;17(11):2661-2675. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

**Drugs and Therapies - Coumarins and Indandiones**

**Findings on Coumarins and Indandiones Discussed by Investigators at Central South University (The effects of Chuanxiong on the pharmacokinetics of warfarin in rats after biliary drainage)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Coumarins and Indandiones. According to news reporting out of Changsha, People's Republic of China, by NewsRx editors, research stated, "Ethnopharmacological relevance: Chuanxiong Rhizoma (rhizomes of Ligusticum chuanxiong Hort), known as Chuanxiong in Chinese, has been used for treating cardiovascular diseases for centuries. Chuanxiong is a classical activating blood circulation herb in the treatment of thromboembolism heart diseases."

Financial supporters for this research include Education Department of Hunan Province, Natural Science Foundation of Hunan Province, National Natural Science Foundation for Young Scientists of China, National Natural Science Foundation.

Our news journalists obtained a quote from the research from Central South University, "Warfarin often combines with herbal prescriptions containing Chuanxiong in China. Aim of the study: The herb-drug interaction involving enterohepatic circulation process remains unclear. This study aimed to elucidate the effects of Chuanxiong Rhizoma on the pharmacokinetics of warfarin in rats after biliary drainage. Thirty-two rats were randomly divided into four groups: WN (healthy rats after the gastric-administration of 0.5 mg/kg warfarin sodium), WO (a rat model of biliary drainage after the gastric-administration of 0.5 mg/kg warfarin sodium), WCN (healthy rats after the gastric-administration of 0.5 mg/kg warfarin sodium and 10 g/kg Chuanxiong decoction), and WCO (a rat model of biliary drainage after the gastric-administration of 0.5 mg/kg warfarin sodium and 10 g/kg Chuanxiong decoction). The levels of warfarin and internal standard were quantified by LC-MS/MS. Comparisons between groups were performed according to the main pharmacokinetic parameters calculated by the DAS 2.1.1 software. The established LC-MS/MS method was specific, precise and rapid. The pharmacokinetic parameters showed a significant difference between the WN and WO groups. There were significant differences in the area under the curve (AUC(0-t)), peak concentration (C-max), total plasma clearance (CLz/F) and mean residence time (MRT0-t) between the WCO and WCN groups; the AUC(0-t) of warfarin in the WCN group was 2.42 times than that of the WN group (p < 0.01); the WCO group displayed a decreased to 61.6% in the Cmax compared the WO group (p < 0.01)."

According to the news editors, the research concluded: "Biliary drainage significantly influenced the disposition of warfarin, and Chuanxiong significantly affected the warfarin disposition in rat plasma."

Our news journalists report that additional information may be obtained by contacting Y. Wang, Central South University, Xiangya Hosp, Lab Ethnopharmacol, Dept. of Integrated Tradit Chinese & Western Med, Changsha 410008, Hunan, People's Republic of China. Lung Diseases and Conditions – Cystic Fibrosis

Findings on Cystic Fibrosis Reported by Investigators at University of Tehran (Antimicrobial susceptibility of microorganisms isolated from sputum culture of patients with cystic fibrosis: Methicillin-resistant Staphylococcus aureus as a ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Cystic Fibrosis is the subject of a report. According to news reporting out of Tehran, Iran, by NewsRx editors, research stated, "Infection is a major cause of morbidity and mortality in patients with cystic fibrosis (CF). Antimicrobial resistance of the bacterial spp. particularly methicillin resistance in Staphylococcus aureus has caused a lot of attention."

Financial support for this research came from Tehran University of Medical Sciences.

Our news journalists obtained a quote from the research from the University of Tehran, "The aim of this study was to describe the prevalence of S. aureus, Pseudomonas aeruginosa and Burkholderia cepacia-complex as well as their antimicrobial susceptibility patterns in CF patients in an Iranian referral pediatrics Hospital. From March 2011 until February 2012, 172 samples were collected at the Children Medical Center (CMC), an Iranian referral hospital in Tehran, Iran. Sputum specimens were cultured for the following bacterial pathogens: P. aeruginosa, S. aureus, B. cepacia complex. Antimicrobial susceptibility was performed according to the Clinical Laboratory Standards Institute recommendations. In our study, 54% of the patients (n = 93) harbored at least once S. aureus, 30% (n = 52) P. aeruginosa, and 2% (n = 3) Burkholderia cepacia. In 40 patients (23%), none of these organisms was grown. An increasing colonization rate of P. aeruginosa in the second decade of life was found. In contrast, the colonization rate of S. aureus was constant in both decades of life. Methicillin resistant S. aureus (MRSA) was detected in 40 isolates (43%). Among MRSA, no resistance against vancomycin, linezolid and quinupristinidalfopristin occurred. The susceptibility of P. aeruginosa isolates to meropenem, imipenem, doripenem, levofloxacin and polymixin B were more than 90%. The prevalence of MRSA has been rising."

According to the news editors, the research concluded: "Since its impact on clinical outcomes, optimal prevention and treatment strategies are unclear, further studies to expand the knowledge about the infection control strategies and MRSA treatment are highly recommended."

For more information on this research see: Antimicrobial susceptibility of

Our news journalists report that additional information may be obtained by contacting S. Mamishi, Univ Tehran Med Sci, Pediat Infect Dis Res Center, Tehran, Iran. **Proteins - DNA-Binding Proteins**

**Findings on DNA-Binding Proteins Reported by Investigators at Jinzhou Medical University (Tenuigenin exhibits protective effects against LPS-induced acute kidney injury via inhibiting TLR4/NF-kappa B signaling pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Proteins - DNA-Binding Proteins. According to news originating from Jinzhou, People's Republic of China, by NewsRx correspondents, research stated, "Tenuigenin (TNG) has been reported to have various pharmacological activities, such as anti-oxidative and anti-inflammatory activities. However, the protective effects of TNG on lipopolysaccharides (LPS)induced acute kidney injury (AKI) are still not clear."

Our news journalists obtained a quote from the research from Jinzhou Medical University. "The aim of this study was to investigate the protective effects and mechanism of TGN on LPS-induced AKI in mice. The kidney histological change, levels of blood urea nitrogen (BUN), and creatinine were measured to assess the protective effects of TNG on LPS-induced AKI. The levels of TNF-alpha, IL-1 beta, and IL-6 in serum and kidney tissues were detected by ELISA. The extent of nuclear factor kappa-B (NF-kappa B) p65 and the expression of Toll-like receptor-4 (TLR4) were detected by western blot analysis. The results showed that TNG markedly attenuated the histological alterations, BUN and creatinine levels in kidney."
TNG also suppressed LPS-induced TNF-alpha, IL-1 beta, and IL-6 production. Furthermore, the expression of TLR4 and NF-kappa B activation induced by LPS were markedly inhibited by TNG."

According to the news editors, the research concluded: "This study demonstrated that TNG protected against LPS-induced AKI by inhibiting TLR4/NF-kappa B signaling pathway."

Keywords for this news article include: Jinzhou, People's Republic of China, Asia, Transcription Factors, DNA-Binding Proteins, Acute Kidney Injury, Nuclear Proteins, NF-kappa B, Jinzhou Medical University.

**Mosquito-Borne Diseases - Dengue Hemorrhagic Fever**

**Findings on Dengue Hemorrhagic Fever Detailed by Investigators at La Jolla Institute for Allergy and Immunology [HLA-DRB1 Alleles Are Associated With Different Magnitudes of Dengue Virus-Specific CD4(+) T-Cell Responses]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mosquito-Borne Diseases - Dengue Hemorrhagic Fever. According to news reporting out of La Jolla, California, by NewsRx editors, research stated, "Each year dengue virus (DENV) infects 400 million human but causes symptomatic disease in only a subset of patients, suggesting that host genetic factors may play a role. HLA molecules that restrict T-cell responses are one of the most polymorphic host factors in humans."

Our news journalists obtained a quote from the research from La Jolla Institute for Allergy and Immunology, "Here we map HLA DRB1-restricted DENV-specific epitopes in individuals previously exposed to DENV, to identify the breadth and specificity of CD4(+) T-cell responses. To investigate whether HLA-specific variations in the magnitude of response might predict associations between dengue outcomes and HLA-DRB1 alleles, we assembled samples from hospitalized patients with known severity of disease. The capsid protein followed by nonstructural protein 3 (NS3), NS2A, and NS5 were the most targeted proteins. We further noticed a wide variation in magnitude of T-cell responses as a function of the restricting DRB1 allele and found several HLA alleles that showed trends toward a lower risk of hospitalized disease were associated with a higher magnitude of T-cell responses."

According to the news editors, the research concluded: "Comprehensive identification of unique CD4(+) T-cell epitopes across the 4 DENV serotypes allows the testing
of T-cell responses by use of a simple, approachable technique and points to important implications for vaccine design."

Our news journalists report that additional information may be obtained by contacting D. Weiskopf, La Jolla Inst Allergy & Immunol, Div Vaccine Discovery, La Jolla, CA, United States. Additional authors for this research include M.A. Angelo, A. Grifoni, P.H. O'Rourke, J. Sidney, S. Paul, A.D. De Silva, E. Phillips, S. Mallal, S. Premawansa, G. Premawansa, A. Wijewickrama, B. Peters and A. Sette.

**Findings on Diabetic Nephropathy Reported by Investigators at University of Utah (An additive effect of anti-PAI-1 antibody to ACE inhibitor on slowing the progression of diabetic kidney disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Diabetic Nephropathy have been published. According to news reporting out of Salt Lake City, Utah, by NewsRx editors, research stated, "While angiotensin II blockade slows the progression of diabetic nephropathy, current data suggest that it alone cannot stop the disease process. New therapies or drug combinations will be required to further slow or halt disease progression."

Our news journalists obtained a quote from the research from the University of Utah, "Inhibition of plasminogen activator inhibitor type 1 (PAI-1) aimed at enhancing ECM degradation has shown therapeutic potential in diabetic nephropathy. Here, using a mouse model of type diabetes, the maximally therapeutic dose of the PAI-1-neutralizing mouse monoclonal antibody (MEDI-579) was determined and compared with the maximally effective dose of enalapril. We then examined whether addition of MEDI-579 to enalapril would enhance the efficacy in slowing the progression of diabetic nephropathy. Untreated uninephrectomized diabetic db/db mice developed progressive albuminuria and glomerulosclerosis associated with increased expression of transforming growth factor (TGF)-beta 1, PAI-1, type IV collagen, and fibronectin from weeks 18 to 22, which were reduced by MEDI-579 at 3 mg/kg body wt, similar to enalapril given alone from weeks 12 to 22. Adding MEDI-579 to enalapril from weeks 18 to 22 resulted in further reduction in albuminuria and markers of renal fibrosis. Renal plasmin generation was dramatically reduced by 57% in diabetic mice, a decrease that was partially reversed by MEDI-579 or enalapril given alone but was further restored by these two treatments given in combination. Our results suggest that MEDI-579 is effective in slowing the progression..."
of diabetic nephropathy in db/db mice and that the effect is additive to ACEI."

According to the news editors, the research concluded: "While enalapril is renal protective, the add-on PAI-1 antibody may offer additional renoprotection in progressive diabetic nephropathy via enhancing ECM turnover."

For more information on this research see: An additive effect of anti-PAI-1 antibody to ACE inhibitor on slowing the progression of diabetic kidney disease. American Journal of Physiology-Renal Physiology, 2016;311(5):F852-F863. American Journal of Physiology-Renal Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Our news journalists report that additional information may be obtained by contacting Y.F. Huang, University of Utah, Div Nephrol, Salt Lake City, UT, United States. Additional authors for this research include J.D. Zhang, N.A. Noble, X.R. Peng and Y.F. Huang.

Diet and Nutrition

Findings on Diet and Nutrition Detailed by Investigators at Queensland University of Technology (Exploring power and influence in nutrition policy in Australia)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Diet and Nutrition are presented in a new report. According to news reporting out of Brisbane, Australia, by NewsRx editors, research stated, "The food industry is often described as having more power and influence in nutrition policymaking than nutrition professionals, scientists and other practitioners working for the public interest; yet authors often allude to this point as an assumed truth, rather than an evidence-based fact. This paper applies social network analysis techniques to provide a concise evidence-based demonstration of the food industry's capacity to influence nutrition policymaking networks in Australia."

Our news journalists obtained a quote from the research from the Queensland University of Technology, "Network analysis using four rounds of data collection was undertaken, and the capacity of individual actors and occupational categories to influence policy decision makers were analysed. Network graphs were developed using cluster analysis to identify the structure of clusters and the path distance of actors from decision makers. The assumed advantage for the 'food industry' was present both strategically in overall network position and with respect to the number of direct access points to 'decision makers', whereas 'nutrition professionals' were densely clustered together with limited links to key 'decision makers'. The results demonstrate that the food industry holds the strategic high ground in advocating their interests to policymakers in the contexts studied."
According to the news editors, the research concluded: "Nutrition professionals may be hampered by their reliance on strong ties with other nutrition professionals as well as limited direct links to 'decision makers.'"

Our news journalists report that additional information may be obtained by contacting K. Cullerton, Queensland University of Technology, Sch Exercise & Nutr Sci, Brisbane, Qld 4059, Australia. Additional authors for this research include T. Donnet, A. Lee and D. Gallegos.

**Disability Research**

**Findings on Disability Research Discussed by Investigators at Oregon Health and Science University (Parent Beliefs About the Causes of Learning and Developmental Problems Among Children With Autism Spectrum Disorder: Results From a National ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Disability Research have been presented. According to news reporting from Portland, Oregon, by NewsRx journalists, research stated, "This study aimed to assess variation in parent beliefs about causes of learning and developmental problems in U.S. children with autism spectrum disorder, using data from a nationally representative survey. Results showed that beliefs about a genetic/hereditary cause of learning/developmental problems were most common, but nearly as many parents believed in exposure causes."

The news correspondents obtained a quote from the research from Oregon Health and Science University, "Forty present of parents had no definite causal beliefs. On multivariate analysis, parents who were non-White, publicly insured or poor were more likely than other parents to endorse exposure causes, or less likely to endorse genetic causes, compared to other parents."

According to the news reporters, the research concluded: "Further research should assess how these beliefs modify health care quality or services use."

Our news journalists report that additional information may be obtained by contacting K.E. Zuckerman, Oregon Health Sciences University, Portland, OR 97201, United
Disease Attributes - Disease Progression

Findings on Disease Progression Reported by Researchers at University Medical Center (Recommendations for the use of tolvaptan in autosomal dominant polycystic kidney disease: a position statement on behalf of the ERA-EDTA Working Groups on ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Disease Attributes - Disease Progression is now available. According to news reporting out of Groningen, Netherlands, by NewsRx editors, research stated, "Recently, the European Medicines Agency approved the use of the vasopressin V2 receptor antagonist tolvaptan to slow the progression of cyst development and renal insufficiency of autosomal dominant polycystic kidney disease (ADPKD) in adult patients with chronic kidney disease stages 1-3 at initiation of treatment with evidence of rapidly progressing disease. In this paper, on behalf of the ERA-EDTA Working Groups of Inherited Kidney Disorders and European Renal Best Practice, we aim to provide guidance for making the decision as to which ADPKD patients to treat with tolvaptan."

Our news journalists obtained a quote from the research from University Medical Center, "The present position statement includes a series of recommendations resulting in a hierarchical decision algorithm that encompasses a sequence of risk-factor assessments in a descending order of reliability. By examining the best-validated markers first, we aim to identify ADPKD patients who have documented rapid disease progression or are likely to have rapid disease progression. We believe that this procedure offers the best opportunity to select patients who are most likely to benefit from tolvaptan, thus improving the benefit-to-risk ratio and cost-effectiveness of this treatment."

According to the news editors, the research concluded: "It is important to emphasize that the decision to initiate treatment requires the consideration of many factors besides eligibility, such as contraindications, potential adverse events, as well as patient motivation and lifestyle factors, and requires shared decision-making with the patient."

Our news journalists report that additional information may be obtained by contacting R.T. Gansevoort, Dept. of Nephrology, University Medical Center Groningen, University of Groningen, Groningen, Netherlands. Additional authors for this research include M. Arici, T. Benzing, H. Birn, G. Capasso, A. Covic, O. Devuyst, C. Drechsler, K.U. Eckardt, O.J. Lindly and B. Sinche. Drugs and Therapies - Drug Delivery Systems

Findings on Drug Delivery Systems Reported by Investigators at Tongji University (A superparamagnetic polymersome with extremely high T-2 relaxivity for MRI and cancer-targeted drug delivery)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Drug Delivery Systems. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "Improving the relaxivity of magnetic resonance imaging (MRI) contrast agents is an important challenge for cancer theranostics. Herein we report the design, synthesis, characterization, theoretical analysis and in vivo tests of a superparamagnetic polymersome as a new MRI contrast agent with extremely high T-2 relaxivity (611.6 mM(-1)s(-1))."

Our news journalists obtained a quote from the research from Tongji University, "First, a noncytotoxic cancer-targeting polymersome is synthesized based on a biodegradable diblock copolymer, folic acid-poly(L-glutamic acid)-block-poly(epsilon-caprolactone) [FA-PGA-b-PCL]. Then, ultra-small superparamagnetic iron oxide nanoparticles (SPIONs) are in situ generated in the hydrophilic PGA coronas of polymersomes to afford magnetic polymersomes. The in vivo MRI assay revealed prominent negative contrast enhancement of magnetic polymersomes at a very low Fe dose of 0.011 mmol/kg."

According to the news editors, the research concluded: "Moreover, this cancer-targeting magnetic polymersome can effectively encapsulate and deliver anticancer drug to inhibit the tumor growth, demonstrating promising theranostic applications in biomedicine."

Our news journalists report that additional information may be obtained by contacting J.Z. Du, Tongji Univ, Sch Mat Sci & Engn, Dept. of Polymer Mat, Shanghai 201804, People's Republic of China. Additional authors for this research include L.W. Song, S.A. Chen, J.Y. Gao, P.Y. Zhao and J.Z. Du.

Keywords for this news article include: Shanghai, People's Republic of China, Asia, Drug Delivery Systems, Drugs and Therapies, Oncology, Cancer, Tongji University.

Drug Development

Findings on Drug Development Reported by Investigators at Monash University (The ways and means of fragment-based drug design)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drug Development have been presented. According to news originating from Parkville, Australia, by NewsRx correspondents, research stated, "Fragment-based drug design (FBDD) has emerged as a mainstream approach for the rapid and efficient identification of building blocks that can be used to develop high-affinity ligands against protein targets. One of the strengths of FBDD is the relative ease and low cost of the primary screen to identify fragments that bind."

Our news journalists obtained a quote from the research from Monash University, "However, the fragments that emerge from primary screens often have low affinities, with K-D values in the high mu M to mM range, and a significant challenge for FBDD is to develop the initial fragments into more potent ligands. Successful fragment elaboration often requires co-structures of the fragments bound to their target proteins, as well as a range of biophysical and biochemical assays to track potency and efficacy. These challenges have led to the development of specific chemical strategies for the elaboration of weakly binding fragments into more potent 'hits' and lead compounds."

According to the news editors, the research concluded: "In this article we review different approaches that have been employed to meet these challenges and describe some of the strategies that have resulted in several fragment-derived compounds entering clinical trials."

The news correspondents report that additional information may be obtained from M.J. Scanlon, Monash University, Monash Inst Pharmaceut Sci, Medical Chem, Parkville, Vic 3052, Australia. Additional authors for this research include R.S. Norton and M.J. Scanlon.

Ebola Virus

Findings on Ebola Virus Discussed by Investigators at University of Pennsylvania (Pathogenicity Comparison Between the Kikwit and Makona Ebola Virus Variants in Rhesus Macaques)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Ebola Virus are presented in a new report. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "Enhanced virulence and/or transmission of West African Ebola virus (EBOV) variants, which are divergent from their Central African counterparts, are suspected to have contributed to the sizable toll of the recent Ebola virus disease (EVD) outbreak. This study evaluated the pathogenicity and shedding in rhesus macaques infected with 1 of 2 West African isolates (EBOV-C05 or EBOV-C07) or a Central African isolate (EBOV-K)."

Funders for this research include Public Health Agency of Canada, Canadian Safety and Security Program, Canadian Institutes of Health Research, Banting Postdoctoral Fellowship, Chinese Academy of Sciences President's International Fellowship Initiative.

The news correspondents obtained a quote from the research from the University of Pennsylvania, "All animals infected with EBOV-C05 or EBOV-C07 died of EVD, whereas 2 of 3 EBOV-K-infected animals died. The viremia level was elevated 10-fold in EBOV-C05-infected animals, compared with EBOV-C07- or EBOV-K-infected animals. More-severe lung pathology was observed in 2 of 6 EBOV-C05/C07-infected macaques. This is the first detailed analysis of the recently circulating EBOV-C05/C07 in direct comparison to EBOV-K with 6 animals per group, and it showed that EBOV-C05 but not EBOV-C07 can replicate at higher levels and cause more tissue damage in some animals."

According to the news reporters, the research concluded: "Increased virus shedding from individuals who are especially susceptible to EBOV replication is possibly one of the many challenges facing the community of healthcare and policy-making responders since the beginning of the outbreak."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/infdis/jiw267. This DOI is a link to an online electronic document that is either free or for purchase.

**Oncology - Endometrial Cancer**

**Findings on Endometrial Cancer Detailed by Investigators at Royal Marsden NHS Foundation Trust (Assessment of sexual difficulties associated with multi-modal treatment for cervical or endometrial cancer: A systematic review of measurement ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Endometrial Cancer. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Practitioners and researchers require an outcome measure that accurately identifies the range of common treatment-induced changes in sexual function and well-being experienced by women after cervical or endometrial cancer. This systematic review critically appraised the measurement properties and clinical utility of instruments validated for the measurement of female sexual dysfunction (FSD) in this clinical population."

Financial support for this research came from Remedi and MacMillan Cancer Support.

Our news editors obtained a quote from the research from Royal Marsden NHS Foundation Trust, "A bibliographic database search for questionnaire development or validation papers was completed and methodological quality and measurement properties of selected studies rated using the Consensus-based Standards for the selection of health Measurement Instrument (COSMIN) checklist. 738 articles were screened, 13 articles retrieved for full text assessment and 7 studies excluded, resulting in evaluation of 6 papers; 2 QoL and 4 female sexual morbidity measures. Five of the six instruments omitted one or more dimension of female sexual function and only one instrument explicitly measured distress associated with sexual changes as per DSM V (APA 2013) diagnostic criteria. None of the papers reported measurement error, responsiveness data was available for only two instruments, three papers failed to report on criterion validity, and test-retest reliability reporting was inconsistent. Heterosexual penile-vaginal intercourse remains the dominant sexual activity focus for sexual morbidity PROMS terminology and instruments lack explicit reference to solo or non-coital sexual expression or validation in a non-heterosexual sample. Four out of six instruments included mediating treatment or illness items such as vaginal changes, menopause or altered body image. Findings suggest that the Female Sexual Function Index (FSFI) remains the most robust sexual morbidity outcome measure, for research or clinical use, in sexually active women treated for cervical or endometrial cancer."

According to the news editors, the research concluded: "Development of an instrument that measures sexual dysfunction in women who are infrequently/not sexually active due to treatment consequences is still required to identify women in need of sexual rehabilitation."

For more information on this research see: Assessment of sexual difficulties associated with multi-modal treatment for cervical or endometrial cancer: A systematic review of measurement instruments. *Gynecologic Oncology*, 2016;143(3):664-673. *Gynecologic Oncology* can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. Findings on Environmental Research and Public Health Reported by Investigators at Nanjing Medical University (Polymorphism of the XRCC1 Gene Is Associated with Susceptibility and Short-Term Recovery of Ischemic Stroke)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Environmental Health - Environmental Research and Public Health have been published. According to news reporting originating in Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "Base excision repair (BER) is the primary DNA repair system with the ability to fix base lesions caused by oxidative damage. Genetic variants influencing the BER pathway may affect the susceptibility and the outcomes of ischemic stroke."

The news reporters obtained a quote from the research from Nanjing Medical University. "Here, we examined how single nucleotide polymorphisms (SNPs) associated with BER impact susceptibility and short-term recovery of ischemic stroke. We selected 320 ischemic stroke patients and 303 controls. Then we genotyped SNPs of NEIL1 rs4462560, NEIL3 rs12645561 and XRCC1 rs25487 in both groups. Polymorphism in XRCC1 rs25487 was significantly associated with reduced ischemic stroke (IS) risk (dominant model: OR = 0.53, 95% CI = 0.36-0.79, p = 0.002), a milder initial stroke (dominant model: OR = 0.57, 95% CI = 0.33-0.98, p = 0.043), and also a better short-term recovery (dominant model: OR = 0.57, 95% CI = 0.35-0.92, p = 0.022). No association was observed in the other two SNPs."

According to the news reporters, the research concluded: "Our study suggests that the genetic variant of XRCC1 rs25487 may contribute to the etiology of ischemic stroke."

For more information on this research see: Polymorphism of the XRCC1 Gene Is Associated with Susceptibility and Short-Term Recovery of Ischemic Stroke. International Journal of Environmental Research and Public Health, 2016;13(10):1106-1113. Central Nervous System Diseases and Conditions —

Findings on Epilepsy Discussed by Investigators at Dartmouth-Hitchcock Medical Center (The implantation effect: delay in seizure occurrence with implantation of intracranial electrodes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Central Nervous System Diseases and Conditions - Epilepsy. According to news reporting out of Lebanon, New Hampshire, by NewsRx editors, research stated, "A transient decrease in seizure frequency has been identified during therapeutic brain stimulation trials with stimulator in patients in the inactive sham group. This study was performed to examine whether the implantation of intracranial electrodes decreases seizure occurrence and explores factors that may be associated."

Our news journalists obtained a quote from the research from Dartmouth-Hitchcock Medical Center, "A retrospective review of 193 patients was performed, all evaluated with both scalp video EEG monitoring and intracranial EEG (iEEG) monitoring. Data about the number of seizures per day during the monitoring period, the number of days until the first seizure, anti-epileptic drugs (AEDs), pain medications, types of implanted electrodes, and anesthetic agents were reviewed. We conducted a repeated measure analysis for counted data using generalized estimating equations with a log-link function and adjustment for number of days and anti-epileptic medication load on the previous day to compare seizure frequencies between scalp and iEEG monitoring. The time to the first seizure was significantly prolonged during iEEG monitoring as compared to scalp monitoring after correction for AED withdrawal (hazard ratio: 0.81, CI 0.69-0.96). During scalp video EEG monitoring, patients experienced an average of 1.09 seizures/day vs 1.27 seizures/day during iEEG monitoring (P=.066). There was no significant difference in seizure frequency in patients that received craniotomy vs burr holes only for intracranial implantation. An increasing number of electrodes implanted increased the delay to seizures (P=.01). Of all anesthetic agents used, desflurane seemed to have an anticonvulsive effect compared to other anesthetics (P=.006). Pain medication did not influence delay to seizures. Seizures are delayed during iEEG as opposed to scalp monitoring illustrating the 'implantation effect' previously observed."

According to the news editors, the research concluded: "Surgical planning should account for longer monitoring periods, particularly when using larger intracranial arrays."

Our news journalists report that additional information may be obtained by contacting B.C. Jobst, Dartmouth Hitchcock Med Cent, Dept. of Neurol, Lebanon, NH 03766,
Findings on Epilepsy Reported by Investigators at Department of Neurology (Is intravenous lorazepam really more effective and safe than intravenous diazepam as first-line treatment for convulsive status epilepticus? A systematic review with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Epilepsy. According to news originating from Merano, Italy, by NewsRx correspondents, research stated, "Some guidelines or expert consensus indicate that intravenous (IV) lorazepam (LZP) is preferable to IV diazepam (DZP) for initial treatment of convulsive status epilepticus (SE). We aimed to critically assess all the available data on efficacy and tolerability of IV LZP compared with IV DZP as first-line treatment of convulsive SE."

Our news journalists obtained a quote from the research from the Department of Neurology, "Systematic search of the literature (MEDLINE, CENTRAL, EMBASE, ClinicalTrials.gov) to identify randomized controlled trials (RCTs) comparing IV LZP versus IV DZP used as first-line treatment for convulsive SE (generalized or focal). Inverse variance, Mantel-Haenszel meta-analysis to obtain risk ratio (RR) with 95% confidence intervals (CI) of following outcomes: seizure cessation after drug administration; continuation of SE requiring a different drug; seizure cessation after a single dose of medication; need for ventilator support; clinically relevant hypotension. Five RCTs were included, with a total of 656 patients, 320 randomly allocated to IV LZP and 336 to IV DZP. No statistically significant differences were found between IV LZP and IV DZP for clinical seizure cessation (RR 1.09; 95% CI 1.00 to 1.20), continuation of SE requiring a different drug (RR 0.76; 95% CI 0.57 to 1.02), seizure cessation after a single dose of medication (RR 0.96; 95% CI 0.85 to 1.08), need for ventilator support RR 0.93; 95% CI 0.61 to 1.43, and clinically relevant hypotension."

According to the news editors, the research concluded: "Despite its favorable pharmacokinetic profile, a systematic appraisal of the literature does not provide evidence to strongly support the preferential use of IV LZP as first-line treatment of convulsive SE over IV DZP."

For more information on this research see: Is intravenous lorazepam really more effective and safe than intravenous diazepam as first-line treatment for convulsive status epilepticus? A systematic review with meta-analysis of randomized controlled trials. *Epilepsy & Behavior*, 2016;64():29-36. *Epilepsy & Behavior* can be contacted at: Academic Press Inc
Gram-Negative Bacteria - Escherichia coli

Findings on Escherichia coli Detailed by Investigators at University of Toronto (Mechanism of Selective Nickel Transfer from HypB to HypA, Escherichia coli [NiFe]-Hydrogenase Accessory Proteins)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Escherichia coli have been presented. According to news reporting originating in Toronto, Canada, by NewsRx journalists, research stated, 

"[NiFe]-hydrogenase enzymes catalyze the reversible reduction of protons to molecular hydrogen and serve as a vital component of the metabolism of many pathogens. The synthesis of the bimetallic catalytic center requires a suite of accessory proteins, and the penultimate step, nickel insertion, is facilitated by the metallochaperones HypA and HypB."

Funders for this research include Institute of Infection and Immunity, Natural Sciences and Engineering Research Council of Canada.

The news reporters obtained a quote from the research from the University of Toronto, "In Escherichia coli, nickel moves from a site in the GTPase domain of HypB to HypA in a process accelerated by GDP. To determine how the transfer of nickel is controlled, the impacts of HypA and nucleotides on the properties of HypB were examined. Integral to this work was His2Gln HypA, a mutant with attenuated nickel affinity that does not support hydrogenase production in E. coli. This mutation inhibits the translocation of nickel from HypB. H2Q-HypA does not modulate the apparent metal affinity of HypB, but the stoichiometry and stability of the HypB nickel complex are modulated by the nucleotide. Furthermore, the HypA HypB interaction was detected by gel filtration chromatography if HypB was loaded with GDP, but not a GTP analogue, and the protein complex dissociated upon binding of nickel to His2 of HypA. In contrast, a nucleotide does not modulate the binding of zinc to HypB, and loading zinc into the GTPase domain of HypB inhibits formation of the complex with HypA."

According to the news reporters, the research concluded: "These results demonstrate that GTP hydrolysis controls both metal binding and protein-protein interactions, conferring selective and directional nickel transfer during [NiFe]-hydrogenase biosynthesis."

Our news correspondents report that additional information may be obtained by contacting D.B. Zamble, University of Toronto, Dept. of Biochem, Toronto, ON M5S 1A8, Canada. Additional authors for this research include C.D. Douglas and D.B. Zamble.

**Gram-Negative Bacteria - Escherichia coli**

**Findings on Escherichia coli Reported by Investigators at Duke University (In Vivo and in Vitro Synthesis of Phosphatidylglycerol by an Escherichia coli Cardiolipin Synthase)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Gram-Negative Bacteria - Escherichia coli is now available. According to news reporting out of Durham, North Carolina, by NewsRx editors, research stated, "Phosphatidylglycerol (PG) makes up 5-20% of the phospholipids of Escherichia coli and is essential for growth in wild-type cells. PG is synthesized from the dephosphorylation of its immediate precursor, phosphatidylglycerol phosphate (PGP) whose synthase in E. coli is PgsA."

Our news journalists obtained a quote from the research from Duke University, "Using genetic, biochemical, and highly sensitive mass spectrometric approaches, we identified an alternative mechanism for PG synthesis in E. coli that is PgsA independent. The reaction of synthesis involves the conversion of phosphatidylethanolamine and glycerol into PG and is catalyzed by ClsB, a phospholipase D-type cardiolipin synthase. This enzymatic reaction is demonstrated herein both in vivo and in vitro as well as by using the purified ClsB protein. When the growth medium was supplemented with glycerol, the expression of E. coli ClsB significantly increased PG and cardiolipin levels, with the growth deficiency of pgsA null strain also being complemented under such conditions. Identification of this alternative mechanism for PG synthesis not only expands our knowledge of bacterial anionic phospholipid biosynthesis, but also sheds light on the biochemical functions of the cls gene redundancy in E. coli and other bacteria."

According to the news editors, the research concluded: "Finally, the PGP-independent PG synthesis in E. coli may also have important implications for the understanding of PG biosynthesis in eukaryotes that remains incomplete."

For more information on this research see: In Vivo and in Vitro Synthesis of

Our news journalists report that additional information may be obtained by contacting Z.Q. Guan, Duke University, Medical Center, Dept. of Biochem, Durham, NC 27710, United States. Additional authors for this research include B.K. Tan, J.S. Zhao and Z.Q. Guan.

**Oncology - Esophageal Cancer**

**Findings on Esophageal Cancer Detailed by Researchers at University Medical Center (Current understanding of the functional roles of aberrantly expressed microRNAs in esophageal cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Esophageal Cancer.

According to news reporting from Utrecht, Netherlands, by NewsRx journalists, research stated, "The incidence of esophageal cancer is rising, mostly because the increasing incidence of esophageal adenocarcinoma in Western countries. Despite improvements in diagnosis and treatment, the overall 5-year survival rates remain low."

The news correspondents obtained a quote from the research from University Medical Center, "MicroRNAs (miRNAs) are small non-coding RNA molecules that regulate the expression of target genes. Recently, disease specific miRNAs have been identified, which act as tumor suppressors or oncogenes. In this review, we will summarize the current knowledge about the function of aberrantly expressed miRNAs in esophageal cancer. We selected 5 miRNAs (miRNA-21, -143, -145, -196a and let-7) based on the available literature, and described their potential role in regulating pathways that are deregulated in esophageal cancer. Finally we will highlight the current achievements of using and targeting miRNAs."

According to the news reporters, the research concluded: "Because these miRNAs likely have important regulatory roles in cancer development, they open a therapeutic window for new treatment modalities."

Our news journalists report that additional information may be obtained by contacting C. Kestens, Christine Kestens, Peter D Siersema, Jantine WPM van Baal, Dept. of Gastroenterology and Hepatology, University Medical Center Utrecht, 3508 GA Utrecht,
Netherlands. Additional authors for this research include P.D. Siersema and J.W van Baal.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i1.1. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Esophageal Cancer

Findings on Esophageal Cancer Discussed by Investigators at Fudan University (Landscape of expression profiles in esophageal carcinoma by The Cancer Genome Atlas data)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Esophageal Cancer have been published. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "In this study, we explored the gene and microRNA (miRNA) expressions profile of esophageal carcinoma. The expression data for messenger RNAs and miRNAs in normal and cancerous esophageal tissues were obtained from the Cancer Genome Atlas database and then the differentially expressed genes and miRNAs were identified."

Our news journalists obtained a quote from the research from Fudan University, "As a result, we identified 2962 genes and 45 miRNAs differentially expressed in esophageal carcinoma compared with normal esophageal tissues. Subsequently, the altered gene functions and signaling pathways were investigated using gene ontology (GO) and Kyoto Encyclopedia of Genes and Genomes (KEGG) analyses, and these differentially expressed genes were significantly enriched in the cell cycle, cell migration, mitogen-activated protein kinase (MAPK) and toll-like receptor signaling pathway, and so on. Then the regulatory relationships between the differentially expressed miRNAs and genes were examined with Targetscan and Miranda, and the potential target sites of transcription factors (TFs) in the promoter regions of these miRNAs and genes were identified using the TRANSFAC database. Finally the TF-miRNA-gene network in esophageal cancer was established, summarizing the regulatory links among the TFs, differentially expressed miRNAs and differentially expressed genes. Factors such as core promoter-binding protein (CPBP), nuclear factor of activated T-cells 1 (NFAT-1), miR-30c-5p, were located in the central hub of this network, highlighting their vital roles in esophageal tumorigenesis."

According to the news editors, the research concluded: "These findings may extend our understanding of the molecular mechanisms underlying esophageal carcinoma and promote new perspectives for prevention, diagnosis and treatment."

The news correspondents report that additional information may be obtained from Y.
Findings on Fabry Disease Reported by Investigators at School of Medicine (Later Onset Fabry Disease, Cardiac Damage Progress in Silence Experience With a Highly Prevalent Mutation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Nutritional and Metabolic Diseases and Conditions - Fabry Disease are discussed in a new report. According to news originating from New York City, New York, by NewsRx correspondents, research stated, "Recently, several studies revealed a much higher prevalence of later onset Fabry disease (FD) than previously expected. It suggested that later onset FD might present as an important hidden health issue in certain ethnic or demographic populations in the world."

Our news journalists obtained a quote from the research from the School of Medicine, "However, the natural history of its phenotype has not been systemically investigated, especially the cardiac involvement. The study analyzed a large-scale newborn screening program for FD to understand the natural course of later onset FD. To date, 916,383 newborns have been screened for FD in Taiwan, including more than 1,200 individuals with the common, later onset IVS4+919G >A (IVS4) mutation. Echocardiography was performed in 620 adults with the IVS4 mutation to analyze the prevalence of left ventricular hypertrophy (LVH), and gadolinium-enhanced cardiac magnetic resonance imaging was performed in 129 patients with FD, including 100 IVS4 adults. LVH was observed in 67% of men and 32% of women older than 40 years. Imaging evidenced significant late gadolinium enhancement in 38.1% of IVS4 men and 16.7% of IVS4 women with the IVS4 mutation but without LVH. Seventeen patients underwent endomyocardial biopsies, which revealed significant globotriaosylceramide substrate accumulation in their cardiomyocytes. Significant cardiomyocyte substrate accumulation in IVS4 patients led to severe and irreversible cardiac fibrosis before development of LVH or other significant cardiac manifestations. Thus, it might be too late to start enzyme replacement therapy after the occurrence of LVH or other significant cardiac manifestations in patients with later onset FD."

According to the news editors, the research concluded: "This study also indicated the importance of newborn screening for early detection of the insidious, ongoing, irreversible cardiac damage in patients with later onset FD."

For more information on this research see: Later Onset Fabry Disease, Cardiac Damage Progress in Silence Experience With a Highly Prevalent Mutation. Journal of the American College of Cardiology, 2016;68(23):2554-2563. Nutritional and Metabolic Diseases and Conditions -

Findings on Fabry Disease Reported by Investigators at Tohoku University (Focal Reduction in Cardiac I-123-Metaiodobenzylguanidine Uptake in Patients With Anderson-Fabry Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Nutritional and Metabolic Diseases and Conditions - Fabry Disease. According to news reporting from Miyagi, Japan, by NewsRx journalists, research stated, "It remains to be elucidated whether cardiac sympathetic nervous activity is impaired in patients with Anderson-Fabry disease (AFD). We performed I-123-meta-iodobenzylguanidine (MIBG) scintigraphy and gadolinium-enhanced cardiovascular magnetic resonance (CMR) in 5 AFD patients."

The news correspondents obtained a quote from the research from Tohoku University, "MIBG uptake in the inferolateral wall, where wall thinning and delayed enhancement were noted on CMR, was significantly lower compared with the anteroseptal wall. The localized reduction in MIBG uptake was also noted in 2 patients with no obvious abnormal findings on CMR."

According to the news reporters, the research concluded: "Cardiac sympathetic nervous activity is impaired in AFD before development of structural myocardial abnormalities."

Our news journalists report that additional information may be obtained by contacting K. Sugimura, Tohoku University, Grad Sch Med, Dept. of Cardiovasc Med, Sendai, Miyagi, Japan. Additional authors for this research include H. Suzuki, K. Sugimura, S. Tatebe, T. Aoki, M. Miura, N. Yaoita, H. Sato, K. Kozu, H. Ota, K. Takanami, K. Takase and H. Shimokawa.

Findings on Frontotemporal Dementia Detailed by Investigators at Free University (Cerebral blood flow in presymptomatic MAPT and GRN mutation carriers: A longitudinal arterial spin labeling study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Neurodegenerative Diseases and Conditions - Frontotemporal Dementia. According to news reporting originating from Amsterdam, Netherlands, by NewsRx correspondents, research stated, "Frontotemporal dementia (FTD) is characterized by behavioral disturbances and language problems. Familial forms can be caused by genetic defects in microtubule-associated protein tau (MAPT), progranulin (GRN), and C9orf72."

Funders for this research include Dioraphte Foundation, NWO.

Our news editors obtained a quote from the research from Free University, "In light of upcoming clinical trials with potential disease-modifying agents, the development of sensitive biomarkers to evaluate such agents in the earliest stage of FTD is crucial. In the current longitudinal study we used arterial spin labeling MRI (ASL) in presymptomatic carriers of MAPT and GRN mutations to investigate early changes in cerebral blood flow (CBF). Healthy first-degree relatives of patients with a MAPT or GRN mutation underwent ASL at baseline and follow-up after two years. We investigated cross-sectional and longitudinal differences in CBF between mutation carriers (n = 34) and controls without a mutation (n = 31). GRN mutation carriers showed significant frontoparietal hypoperfusion compared with controls at follow-up, whereas we found no cross-sectional group differences in the total study group or the MAPT subgroup. Longitudinal analyses revealed a significantly stronger decrease in CBF in frontal, temporal, parietal, and subcortical areas in the total group of mutation carriers and the GRN subgroup, with the strongest decrease in two mutation carriers who converted to clinical FTD during follow-up. We demonstrated longitudinal alterations in CBF in presymptomatic FTD independent of grey matter atrophy, with the strongest decrease in individuals that developed symptoms during follow-up."

According to the news editors, the research concluded: "Therefore, ASL could have the potential to serve as a sensitive biomarker of disease progression in the presymptomatic stage of FTD in future clinical trials."

The news editors report that additional information may be obtained by contacting J.C. van Swieten, Vrije Univ Amsterdam Med Center, Dept. of Clin Genet, Amsterdam, Netherlands. Additional authors for this research include V. Chalos, E. Ghariq, T. den Heijer, A.
Findings on Frontotemporal Dementia Reported by Investigators at University of Sao Paulo (GRN and MAPT Mutations in 2 Frontotemporal Dementia Research Centers in Brazil)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Neurodegenerative Diseases and Conditions - Frontotemporal Dementia have been presented. According to news reporting out of Sao Paulo, Brazil, by NewsRx editors, research stated, "Mutations in GRN (progranulin) and MAPT (microtubule-associated protein tau) are among the most frequent causes of monogenic frontotemporal dementia (FTD), but data on the frequency of these mutations in regions such as Latin America are still lacking. We aimed to investigate the frequencies of GRN and MAPT mutations in FTD cohorts from 2 Brazilian dementia research centers, the University of Sao Paulo and the Federal University of Minas Gerais medical schools."

Our news journalists obtained a quote from the research from the University of Sao Paulo, "We included 76 probands diagnosed with behavioral-variant FTD (n = 55), semantic-variant Primary Progressive Aphasia (PPA) (n = 11), or nonfluent-variant PPA (n = 10). Twenty-five percent of the cohort had at least 1 relative affected with FTD. Mutations in GRN were identified in 7 probands, and in MAPT, in 2 probands. We identified 3 novel GRN mutations (p.Q130X, p.317Afs*12, and p.K259Afs*23) in patients diagnosed with nonfluent-variant PPA or behavioral-variant FTD. Plasma progranulin levels were measured and a cutoff value of 70 ng/mL was found, with 100% sensitivity and specificity to detect null GRN mutations. The frequency of GRN mutations was 9.6% and that of MAPT mutations was 7.1%.

According to the news editors, the research concluded: "Among familial cases of FTD, the frequency of GRN mutations was 31.5% and that of MAPT mutations was 10.5%.

For more information on this research see: GRN and MAPT Mutations in 2 Frontotemporal Dementia Research Centers in Brazil. Alzheimer Disease & Associated Disorders, 2016;30(4):310-317. Findings on Gastric Cancer Discussed by Investigators at Xiamen University (Trefoil factor family 2 expression inhibits gastric cancer cell growth and invasion in vitro via interactions with the transcription factor Sp3)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Gastric Cancer is now available. According to news reporting from Fujian, People's Republic of China, by NewsRx journalists, research stated, "The trefoil factor family (TFF) is a group of short secretory peptides of gastric mucous neck cells. The loss of TFF2 protein expression enhances gastric inflammation and occurs in gastric cancer."

The news correspondents obtained a quote from the research from Xiamen University, "In this study, we examined the effect of TFF2 on gastric cancer cell lines in vitro and characterized the interaction between TFF2 and Sp3, including the mechanisms that mediate this interaction, using genomics and proteomics approaches, as well as genetics techniques, such as RNA interference and gene knockdown. Assays were performed to examine the role of TFF2 and Sp3 in cancer cell proliferation, invasion and migration. We found that TFF2 expression inhibited the proliferation and invasion capacity of gastric cancer cells, and induced apoptosis. TFF2 interacted with the Sp3 protein, as shown by immunofluorescence staining and immunoprecipitation with western blot analysis. Sp3 knockdown in gastric cancer cells antagonized TFF2 anti-tumor activity. Additionally, TFF2 upregulated the expression of pro-apoptotic proteins, such as Bid, but downregulated the expression of NF-B and the anti-apoptotic proteins, Bcl-xL and Mcl-1. By contrast, Sp3 knockdown significantly blocked TFF2 activity, affecting the expression of these proteins. The data from our study demonstrate that the antitumor activity of TFF2 is mediated by an interaction with the Sp3 protein in gastric cancer cells."

According to the news reporters, the research concluded: "Additional in vivo and ex vivo warned in order to fully characterize this interaction."

*International Journal of Molecular Medicine* can be contacted at: Spandidos Publ Ltd, Pob 18179, Athens, 116 10, Greece.

Our news journalists report that additional information may be obtained by contacting H.X. Shi, Xiamen University, Dept. of Gastroenterol, Zhongshan Hosp, Xiamen
Our news journalists obtained a quote from the research from Yeungnam University, "Patients were categorized into two groups; the H. pylori tested group (n = 257) and the H. pylori non-tested group (n = 176) based on performance of H. pylori status test after ESD of EGC. The H. pylori tested group was further categorized into three subgroups based on H. pylori status; the H. pylori-eradicated subgroup (n = 120), the H. pylori-persistent subgroup (n = 42), and the H. pylori-negative subgroup (n = 95). Incidences of MGC and risk factors of MGC were identified. Median follow-up duration after ESD was 30.00 mo (range, 6-107 mo). Total 15 patients developed MGC during follow-up. MGC developed in 11 patients of the H. pylori tested group (7 in the H. pylori-negative subgroup, 3 in the H. pylori-eradicated subgroup, and 1 in the H. pylori-persistent subgroup) and 4 patients of the H. pylori non-tested group (P > 0.05). The risk factors of MGC were endoscopic mucosal atrophy in the H. pylori tested group and intestinal metaplasia in all patients. H. pylori eradication and H. pylori status test seems to have no preventive effect on the development of MGC after ESD for EGC."

According to the news editors, the research concluded: "The risk factors of MGC development were endoscopic mucosal atrophy in the H. pylori tested group alone and intestinal metaplasia in all patients."

Oncology - Gastric Cancer

Findings on Gastric Cancer Reported by Investigators at Nanjing University (Expression profile of E-cadherin, estrogen receptors, and P53 in early-onset gastric cancers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Early-onset gastric cancer (EOGC) is predominant in females, diffuse histology, and hereditary pattern. Germline mutation of CDH1 and p53 has been reported previously and female dominance was speculated to be associated with estrogen and its receptors."

Financial support for this research came from Nanjing Scientific Technology and Development Project.

Our news journalists obtained a quote from the research from Nanjing University, "Expression of E-cadherin, estrogen receptor alpha (ER alpha), estrogen receptor beta (ER beta), and p53 in EOGC remains unclear, which was the focus of this study, to assess clinical significance of their expression in EOGC. The expression of E-cadherin, ER alpha, ER beta, and p53 in tumors and normal tissues from surgically resected EOGCs was assessed by immunohistochemistry (n = 139) and Western blot (n = 7) methods, respectively. The expression in tumor tissues was significantly higher for ER alpha, ER beta, and p53, but lower for E-cadherin, compared to uninvolved mucosa. Positive staining of ER beta and p53 was more frequently observed in younger patients with advanced TNM stages. For E-cadherin, significant correlation was observed between the immunopositivity and TNM stages IA+ IB. P53-negative patients had significantly better outcomes than p53-positive patients. Significant association between expression of E-cadherin and histologic types was found in familial, but not in sporadic, EOGC."

According to the news editors, the research concluded: "Our results demonstrated E-cadherin may have a role in initiation of EOGC and positive ER beta and p53 expression may partially explained early-onset and tumor progression of EOGC."

The news correspondents report that additional information may be obtained from L. Wang, Nanjing University, Dept. of Gastroenterol, Drum Tower Hosp, Sch Med, Nanjing, Jiangsu, People's Republic of China. Additional authors for this research include Y.Y. Xu, J. Shi, X. Lan, X.P. Zou, L. Wang and Q. Huang.

Oncology - Gastric Cancer

Findings on Gastric Cancer Reported by Investigators at Research Institute (Effects for Sequential Treatment of siAkt and Paclitaxel on Gastric Cancer Cell Lines)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Gastric Cancer have been published. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Real-time screening of cellular response on the drugs could provide valuable insights for the early detection of therapeutic efficiency and the evaluation of disease progression. Cancer cells have the ability to vary widely in response to stress in a manner to adjust the signaling pathway to promote the survival or having a resistance to stimulation."

Our news journalists obtained a quote from the research from Research Institute, "Cell-based label-free technologies using electronic impedance sensor have strategies for constructing the signature profiles of each cells. To achieve exquisite sensitivity to substantially change of live-cell response have an important role that predict the potential of therapeutic effects. In this study, we use an impedance-based real-time cell analysis system to investigate dynamic phenotypes of cells described as a cellular index value. We show that gastric cancer cells generated characteristic kinetic patterns that corresponded to the treatment order of therapeutics. The kinetic feature of the cells offers insightful information that cannot be acquired from a conventional single end-point assay. Furthermore, we employ a 'sequential treatment strategy' to increase cytotoxic effects with minimizing the use of chemotherapeutics. Specifically, treatment of paclitaxel (PTX) after down-regulating Akt gene expression using RNAi reduces the cell proliferation and increases apoptosis. We propose that the sequential treatment may exhibit more effective approach rather than traditional combination therapy."

According to the news editors, the research concluded: "Moreover, the dynamic monitoring of cell-drug interaction enables us to obtain a better understanding of the temporal effects in vitro."

For more information on this research see: Effects for Sequential Treatment of siAkt and Paclitaxel on Gastric Cancer Cell Lines. International Journal of Medical Sciences, 2016;13(9):708-716. International Journal of Medical Sciences can be contacted at: Ivyspring

Digestive System Diseases and Conditions - Gastric...

Findings on Gastric Ulcers Reported by Researchers at Jagiellonian University College of Medicine [The renin-angiotensin system and its vasoactive metabolite angiotensin-(1-7) in the mechanism of the healing of preexisting gastric ulcers. The ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Digestive System Diseases and Conditions - Gastric Ulcers have been presented. According to news reporting originating in Krakow, Poland, by NewsRx journalists, research stated, "The inhibition of angiotensin-converting enzyme (ACE) or the blockade of angiotensin (Ang) AT-1 receptors affords protection against acute gastric mucosal injury, but whether the major metabolite of renin-angiotensin system (RAS), Ang-(1-7), accelerates the healing process of preexisting gastric ulcers remains unknown. Previous studies documented that Ang-(1-7) acting via its own Mas receptor exerts vascular responses opposing those of Ang II."

The news reporters obtained a quote from the research from the Jagiellonian University College of Medicine, "We studied the effects of the Ang-(1-7)/Mas receptor axis on the healing rate of acetic-acid-induced gastric ulcers with or without the blockade of Mas receptors by A 779 and compared it with the effects of activation and blockade of the AT-1 receptor by the treatment with Ang II and losartan, respectively, the inhibition of ACE by lisinopril, the NO/cNOS inhibition by L-NAME and inhibition of prostaglandin/COX system by indomethacin in the presence of Ang-(1-7). Additionally, ex vivo metabolism of Ang I in gastric tissue was assessed by LC/MS method. At day 9 after ulcer induction, the area of these ulcers and the accompanying changes in total gastric blood flow (GBF) were determined as were gastric mucosal blood flow (GMBF) at ulcer margin and gastric oxygen uptake (GVO2). The gastric mucosal expression of mRNAs for constitutive nitric oxide synthase (cNOS), superoxide dismutase (SOD), and pro-inflammatory cytokines interleukin 1b (IL-1b) and tumor necrosis factor alpha (TNF-a) and plasma level of both cytokines were determined by RT-PCR and ELISA. The 9 days treatment with Ang II dose-dependently increased the area of gastric ulcers and this effect was accompanied by a significant fall in the GBF, GVO2 and GMBF at ulcer margin. In contrast, treatment with Ang-(1-7) which produced a significant rise in the luminal content of NO significantly reduced the area of gastric ulcer and significantly increased the
GBF, GVO2 and the GMBF at ulcer margin. Similar GMBF changes and significant reduction in the area of gastric ulcer was observed in rats with gastric ulcers treated with the agonist of Mas receptor, AVE 0991. These effects of Ang-(1-7) and AVE 0991 were eliminated by blockade of the Mas receptor with A779. Similarly to Ang-(1-7), treatment with losartan or lisinopril significantly reduced the area of gastric ulcers and the accompanying increase in the GMBF at ulcer margin and these effects were significantly attenuated by a concomitant administration of L-NAME and indomethacin. The rate of healing of ulcers was associated with a decrease in ex vivo Ang-(1-7) formation and this effect was attenuated by lisinopril. The treatment with Ang-(1-7) or AVE 0991 increased the expression of mRNA for cNOS and SOD and downregulated that of IL-1b and TNF-a followed by the decrease in the plasma IL-1b and TNF-a levels. We conclude that the Ang-(1-7)/Mas receptor system accelerates the healing of preexisting gastric ulcers via an increase in the gastric macro- and microcirculations, and an increase in gastric tissue oxygenation. These effects are mediated by PG and NO derived from overexpression of cNOS, an increase in the expression of antioxidizing enzyme SOD2 and an anti-inflammatory action involving the inhibition of expression and release of pro-inflammatory cytokines IL-1b and TNF-a.

According to the news reporters, the research concluded: "Our results seem to underlie the importance of the Ang-(1-7), AT-1 and Mas receptors in the regulation of local vascular and metabolic effects associated with mechanism of gastric ulcer healing."

For more information on this research see: The renin-angiotensin system and its vasoactive metabolite angiotensin-(1-7) in the mechanism of the healing of preexisting gastric ulcers. The involvement of Mas receptors, nitric oxide, prostaglandins and proinflammatory cytokines. *Journal of Physiology and Pharmacology*, 2016;67(1):75-91.

**Genetics**

**Findings on Genetics Discussed by Investigators at School of Public Health [Human epidermal growth factor receptor 4 (Her4) Suppresses p53 Protein via Targeting the MDMX-MDM2 Protein Complex IMPLICATION OF A NOVEL MDMX SER-314 PHOSPHOSITE]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Genetics. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Deregulated receptor tyrosine kinase (RTK) signaling is frequently associated with tumorigenesis and therapy resistance, but its underlying mechanisms still need to be elucidated.
In this study, we have shown that the RTK human epidermal growth factor receptor 4 (Her4, also known as Erbb4) can inhibit the tumor suppressor p53 by regulating MDMX-mouse double minute 2 homolog (MDM2) complex stability.

Our news editors obtained a quote from the research from the School of Public Health, "Upon activation by either overexpression of a constitutively active vector or ligand binding (Neuregulin-1), Her4 was able to stabilized the MDMX-MDM2 complex, resulting in suppression of p53 transcriptional activity, as shown by p53-responsive element-driven luciferase assay and mRNA levels of p53 target genes. Using a phospho-proteomics approach, we functionally identified a novel Her4-induced posttranslational modification on MDMX at Ser-314, a putative phosphorylation site for the CDK4/6 kinase. Remarkably, inhibition of Ser-314 phosphorylation either with Ser-to-Ala substitution or with a specific inhibitor of CDK4/6 kinase blocked Her4-induced stabilization of MDMX-MDM2 and rescued p53 activity."

According to the news editors, the research concluded: "Our study offers insights into the mechanisms of deregulated RTK-induced carcinogenesis and provides the basis for the use of inhibitors targeting RTK-mediated signals for p53 restoration."

The news editors report that additional information may be obtained by contacting Z.M. Yuan, Harvard TH Chan Sch Public Hlth, John B Little Center Radiat Sci, Boston, MA 02115, United States. Life Science Research - Genetics
Findings on Genetics Discussed by Investigators at University of Pittsburgh (The Fitness Effects of Spontaneous Mutations Nearly Unseen by Selection in a Bacterium with Multiple Chromosomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Life Science Research - Genetics is now available. According to news reporting originating in Pittsburgh, Pennsylvania, by NewsRx journalists, research stated, "Mutation accumulation (MA) experiments employ the strategy of minimizing the population size of evolving lineages to greatly reduce effects of selection on newly arising mutations. Thus, most mutations fix within MA lines independently of their fitness effects."

The news reporters obtained a quote from the research from the University of Pittsburgh, "This approach, more recently combined with genome sequencing, has detailed the rates, spectra, and biases of different mutational processes. However, a quantitative
understanding of the fitness effects of mutations virtually unseen by selection has remained an untapped opportunity. Here, we analyzed the fitness of 43 sequenced MA lines of the multi-chromosome bacterium Burkholderia cenocepacia that had each undergone 5554 generations of MA and accumulated an average of 6.73 spontaneous mutations. Most lineages exhibited either neutral or deleterious fitness in three different environments in comparison with their common ancestor. The only mutational class that was significantly overrepresented in lineages with reduced fitness was the loss of the plasmid, though nonsense mutations, missense mutations, and coding insertion-deletions were also overrepresented in MA lineages whose fitness had significantly declined. Although the overall distribution of fitness effects was similar between the three environments, the magnitude and even the sign of the fitness of a number of lineages changed with the environment, demonstrating that the fitness of some genotypes was environmentally dependent."

According to the news reporters, the research concluded: "These results present an unprecedented picture of the fitness effects of spontaneous mutations in a bacterium with multiple chromosomes and provide greater quantitative support for the theory that the vast majority of spontaneous mutations are neutral or deleterious."

For more information on this research see: The Fitness Effects of Spontaneous Mutations Nearly Unseen by Selection in a Bacterium with Multiple Chromosomes. *Genetics*, 2016;204(3):1225-1238,583-589. *Genetics* can be contacted at: Genetics Society America, 9650 Rockville Ave, Bethesda, MD 20814, USA. **Oncology - Germ Cell Cancer**

**Findings on Germ Cell Cancer Reported by Researchers at Institute for Cancer Research and Treatment (IRCCS) (Prognostic impact of progression to induction chemotherapy and prior paclitaxel therapy in patients with germ cell tumors receiving ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Germ Cell Cancer have been published. According to news reporting from Milano, Italy, by NewsRx journalists, research stated, "Little is known about the prognostic impact of prior paclitaxel therapy and response to induction chemotherapy defined as the regimen preceding high-dose chemotherapy (HDCT) for the salvage therapy of advanced germ cell tumors. Twenty European Society for Blood and Marrow Transplantation centers contributed data on patients treated between 2002 and 2012."
The news correspondents obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "Paclitaxel used in either prior lines of therapy or in induction-mobilization regimens was considered. Multivariable Cox analyses of prespecified factors were undertaken on PFS and overall survival (OS). As of October 2013, data for 324 patients had been contributed to this study. One hundred and ninety-two patients (59.3%) had received paclitaxel. Sixty-one patients (19%) had a progression to induction chemotherapy, 234 (72%) a response (29 (9%) missing or granulocyte colony-stimulating factor without chemotherapy). Both progression to induction chemotherapy and prior paclitaxel were significantly associated with shorter OS univariably (p <0.001 and p=0.032). On multivariable analysis from the model with fully available data (N=216) progression to induction was significantly prognostic for PFS and OS (p=0.003), but prior paclitaxel was not (p=0.674 and p=0.739). These results were confirmed after multiple imputation of missing data."

According to the news reporters, the research concluded: "Progression to induction chemotherapy could be demonstrated as an independent prognostic factor, in contrast to prior paclitaxel."

For more information on this research see: Prognostic impact of progression to induction chemotherapy and prior paclitaxel therapy in patients with germ cell tumors receiving salvage high-dose chemotherapy in the last 10 years: a study of the European Society for Blood and Marrow Transplantation. Bone Marrow Transplantation, 2015;51(3):384-90. Bone Marrow Transplantation can be contacted at: Nature Publishing Group, 345 Park Avenue South, New York, NY 10010-1707, USA. Oncology - Glioblastomas

Findings on Glioblastomas Discussed by B. Kim and Co-Researchers (Apigenin Inhibits Cancer Stem Cell-Like Phenotypes in Human Glioblastoma Cells via Suppression of c-Met Signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Glioblastomas. According
to news originating from Chungnam, South Korea, by NewsRx correspondents, research stated, "Glioblastoma (GBM) is a highly malignant human brain tumor with limited treatment choices. The extremely aggressive characteristics of GBM result from GBM stem cells (GSCs), a subpopulation in tumor having self-renewal potential and resistance to chemotherapy and radiotherapy."

Our news journalists obtained a quote from the research, "Therefore, eliminating GSCs is an effective strategy to treat this fatal disease. In this study, we investigated the therapeutic effects of dietary flavonoids, including apigenin, quercetin, and naringenin, against cancer stem cell-like phenotypes of human GBM cell lines U87MG and U373MG. Among flavonoids studied, apigenin and quercetin significantly suppressed not only the self-renewal capacity such as cell growth and clonogenicity, but also the invasiveness of GBM stem-like cells. Notably, apigenin blocked the phosphorylation of c-Met and its downstream effectors, transducer and activator of transcription 3, AKT (Protein kinase B), and mitogen-activated protein kinase in the GSCs, thereby reducing the expression levels of GSC markers such as CD133, Nanog, and Sox2."

According to the news editors, the research concluded: "These results suggest that the GSC inhibition effect of apigenin may be caused by downregulation of c-Met signaling pathway."

The news correspondents report that additional information may be obtained from H.J. Jung, Sun Moon UniversityDept. of BT Convergent Pharmaceut Engn, Asan 336708, Chungnam, South Korea. Additional authors for this research include N. Jung, S. Lee, J.K. Sohng and H.J. Jung.

Gynecology

Findings on Gynecology Reported by Investigators at Democritus University (MiRNAs: regulators of human disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gynecology are discussed in a new report. According to news reporting out of Athens, Greece, by NewsRx editors, research stated, "MicroRNAs (miRNAs) represent the mediators of important leading biological functions of molecular pathways in humans. They are a class of very small, non-coding RNAs; their function is the balance of the protein levels at the post-transcriptional stage."

Our news journalists obtained a quote from the research from Democritus University, "They are implicated in molecular processes and diseases, including diabetes, metabolism, autoimmune diseases, angiogenesis and tumorigenesis, and female fertility, exhibiting an altered expression profile. Any process taking place in the human organism is intertwined by miRNAs.
MiRNAs have an impact on the biochemistry of pathways of the invisible molecular world. They circulate in a stable chemical configuration in body fluids (tears, serum, plasma, amniotic fluid, ascetic fluid, urine) with their molecular sequence specificity remaining unchanged. Their indisputable molecular stability ranks them as extremely vigorous potential markers in human disease. MiRNAs demonstrate a specific expressive signature, representative of the tissue specificity and the clinical staging. The shift on the concentration and expression of a miRNA reflects the course of a disease. MiRNAs may operate as oncogenes (tumor growth) or tumor suppressor (tumor reduction) genes in cancer pathways."

According to the news editors, the research concluded: "In malignant disease, proliferation, maintenance, and progression of cancer cells is induced by the stimulation of the oncogenes or complete deactivation of the tumor suppressor gene activity."

Our news journalists report that additional information may be obtained by contacting E.N. Kontomanolis, Democritus University of Thrace, Dept. of Obstet & Gynecol, Athens, Greece. Additional authors for this research include Z. Koukouli, A. Liberis, G. Stanulov and H. Achouhan.

Keywords for this news article include: Athens, Greece, Europe, Gynecology, Oncology, Article Review, Tumor Suppression, Genetics, Democritus University.

**Immune System Diseases and Conditions - HIV/AIDS**

**Findings on HIV/AIDS Reported by Investigators at Center for Disease Control and Prevention (Prevalence and Correlates of Heterosexual Anal Intercourse Among Men and Women, 20 US Cities)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immune System Diseases and Conditions - HIV/AIDS. According to news reporting originating in Atlanta, Georgia, by NewsRx journalists, research stated, "Heterosexual anal intercourse (HAI) is not an uncommon behavior and it confers a higher risk of HIV transmission than vaginal intercourse. We examined data from heterosexuals recruited in 20 US cities for the 2013 National HIV Behavioral Surveillance system."

The news reporters obtained a quote from the research from Center for Disease Control and Prevention, "We assessed correlates of reporting HAI in the previous year. Then, among people reporting HAI in the past year, we assessed what event-level factors are associated with having HAI at last sex. Thirty percent of women and 35 % of men reported HAI in the past year. Among people who had HAI in the past year, those who had HAI at last sex were more likely to have a partner who was HIV-positive or of unknown status or to have exchanged money or drugs for sex at last sex."

According to the news reporters, the research concluded: "Information that highlights the risk of HIV transmission associated with HAI would complement existing HIV prevention messages focused on heterosexuals in the U.S."

**Immune System Diseases and Conditions - HIV/AIDS**

**Findings on HIV/AIDS Reported by Investigators at Population Council (First-in-Human Trial of MIV-150 and Zinc Acetate Coformulated in a Carrageenan Gel: Safety, Pharmacokinetics, Acceptability, Adherence, and Pharmacodynamics)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immune System Diseases and Conditions - HIV/AIDS is the subject of a report. According to news reporting originating from New York City, New York, by NewsRx correspondents, research stated, "To evaluate the safety and pharmacokinetics of MIV-150 and zinc acetate in a carrageenan gel (PC-1005). Acceptability, adherence, and pharmacodynamics were also explored."

Our news editors obtained a quote from the research from Population Council, "A 3-day open-label safety run-in (n = 5) preceded a placebo-controlled, double-blind trial in healthy, HIV-negative, abstinent women randomized (4: 1) to vaginally apply 4 mL of PC-1005 or placebo once daily for 14 days. Assessments included physical examinations, safety labs, colposcopy, biopsies, cervicovaginal lavages (CVLs), and behavioral questionnaires. MIV-150 (plasma, CVL, tissue), zinc (plasma, CVL), and carrageenan (CVL) concentrations were determined with LC-MS/MS, ICP-MS, and ELISA, respectively. CVL antiviral activity was measured using cell-based assays. Safety, acceptability, and adherence were analyzed descriptively. Pharmacokinetic parameters were calculated using noncompartmental techniques and actual sampling times. CVL antiviral EC50 values were calculated using a dose-response inhibition analysis. Participants (n = 20) ranged from 19-44 years old; 52% were black or African American. Among those completing the trial (13/17, PC-1005; 3/3, placebo), 11/17 reported liking the gel overall; 7 recommended reducing the volume. Adverse events, which were primarily mild and/or unrelated, were comparable between groups. Low systemic MIV-150 levels were observed, without accumulation. Plasma zinc levels were unchanged from baseline. Seven of seven CVLs collected 4-hour postdose demonstrated antiviral (HIV, human papillomavirus) activity. High baseline CVL anti-herpes-simplex virus type-2 (HSV-2) activity
precluded assessment of postdose activity. PC-1005 used vaginally for 14 days was well tolerated. Low systemic levels of MIV-150 were observed. Plasma zinc levels were unchanged. Postdose CVLs had anti-HIV and antihuman papillomavirus activity."

According to the news editors, the research concluded: "These data warrant further development of PC-1005 for HIV and sexually transmitted infection prevention."

**Oncology - Head and Neck Cancer**

**Findings on Head and Neck Cancer Reported by Investigators at University of Amsterdam (A critical evaluation of lymph node ratio in head and neck cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Head and Neck Cancer. According to news reporting originating in Amsterdam, Netherlands, by NewsRx journalists, research stated, "In head and neck squamous cell carcinoma (HNSCC), the search for better prognostic factors beyond TNM-stage is ongoing. Lymph node ratio (LNR) (positive lymph nodes/total lymph nodes) is gaining interest in view of its potential prognostic significance."

The news reporters obtained a quote from the research from the University of Amsterdam, "All HNSCC patients at the Netherlands Cancer Institute undergoing neck dissection for lymph node metastases in the neck region between 2002 and 2012 (n = 176) were included. Based on a protocol change in specimen processing, the cohort was subdivided in two distinct consecutive periods (pre and post 2007). The prognostic value of LNR, N-stage, and number of positive lymph nodes for overall survival was assessed. The mean number of examined lymph nodes after 2007 was significantly higher (42.3) than before (35.8) (p = 0.024). The higher number concerned mostly lymph nodes in level V. The mean number of positive lymph nodes before 2007 was 3.3 vs. 3.6 after 2007 (p = 0.745). By multivariate analysis of both pre- and post-2007 cohort data, two factors remained associated with an increased hazard..."
of dying: N2 [HR 2.1 (1.1-4.1) and 2.4 (1.0-5.8)] and ≥ 3 positive lymph nodes [HR 2.0 (1.1-3.5) and 3.1 (1.4-6.9)]. Hazard ratio for LNR > 7% was not significantly different: pre 2007 at 2.2 (1.3-3.8) and post 2007 at 2.1 (1.0-4.8, p = 0.053). In this study, changes in specimen processing influenced LNR values, but not the total number of tumor positive nodes found.

According to the news reporters, the research concluded: "Therefore, in HNSCC, the number of positive nodes seems a more reliable parameter than LNR, provided a minimum number of lymph nodes are examined."

Our news correspondents report that additional information may be obtained by contacting M. de Ridder, University of Amsterdam, Academy Med Center, Dept. of Radiat Oncol, Amsterdam, Netherlands. Additional authors for this research include C.C.M. Marres, L.E. Smeele, M.W.M. van den Brekel, M. Hauptmann, A.J.M. Balm and M.L.F. van Velthuysen.

**Health and Medicine**

**Findings on Health and Medicine Reported by Investigators at King Abdul-Aziz University Hospital (Costly coagulation profile tests prior to performing breast biopsies Do we really need it?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Health and Medicine are discussed in a new report. According to news originating from Jeddah, Saudi Arabia, by NewsRx correspondents, research stated, "To reassess the need for routine coagulation profile testing in patients undergoing image-guided breast biopsies. This is a retrospective cross-sectional study."

Our news journalists obtained a quote from the research from King Abdul-Aziz University Hospital, "Data was collected from the logbook of patients that underwent image-guided biopsies in the breast unit at the Department of Radiology, King Abdulaziz University Hospital, Jeddah, Saudi Arabia. Patients' electronic records between November 2013 and October 2014 were included in the study. Exclusion criteria were those on anticoagulants, or platelet aggregation inhibitors, and patients with known primary, or secondary bleeding diathesis. The study was analyzed using the IBM Statistical Packages for Social Sciences Version 22 (IBM Corp, Armonk, NY, USA). A total of 136 patients were included in our study. Neither partial thromboplastin time (PTT), or thrombocytenia was related to bleeding with p-values of 0.536 PTT and 0.997 thrombocytenia. Needle gauge was found to be significantly related to bleeding episodes with a p=0.020. We advise against the routine use of coagulation
profiles to predict bleeding risk. A thorough bleeding assessment is more advantageous."

According to the news editors, the research concluded: "Laboratory tests should be
tailored according to the patient's history and examination findings."

For more information on this research see: Costly coagulation profile tests prior to

Health and Medicine

Findings on Health and Medicine Reported by Investigators at Mayo
Clinic (The Promise and Peril of Precision Medicine: Phenotyping Still
Matters Most)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators discuss new findings in Health and Medicine. According to
news reporting originating from Rochester, Minnesota, by NewsRx correspondents, research
stated, "We illustrate the work necessary to reverse course after identification of a KCNQ1
variant interpreted erroneously as causing long QT syndrome (LQTS) and to identify the true
cause of a case of sudden death in the young. Surrogate genetic testing of a decedent's living
brother identified a rare KCNQ1-V133I variant, which prompted an implantable cardioverter
defibrillator and subsequent diagnosis of LQTS in other family members."

Our news editors obtained a quote from the research from Mayo Clinic,
"Subsequently, this presumed LQT1 family came to our institution for further clinical evaluation
and research-based investigations, including KCNQ1-V133I variant-specific analysis of the
decedent, heterologous expression studies of KCNQ1-V133I, and a whole-exome molecular
autopsy along with genomic triangulation using his unaffected parents' DNA. After evaluating
several V133I-positive family members, clinical doubt was cast on the veracity of the previously
levied diagnosis of LQT1, resulting in a re-opening of the case and an intense pursuit of the
lethal substrate. Furthermore, the decedent tested negative for V133I, and heterologous
expression studies demonstrated a normal cellular phenotype for V133I-containing Kv7.1
channels. Instead, after whole-exome molecular autopsy, a de novo pathogenic variant
(p.R454W) in DES-encoded desmin was identified. As detailed herein, the forensic evaluation
of sudden death in the young requires meticulous focus on the decedent followed by a careful
and deliberate assessment of the decedent's relatives. Surrogate genetic testing can have
disastrous consequences and should be avoided. Genetic test results require careful scrutiny to
avoid unintended and potentially devastating repercussions. Although the root cause of the
decedent's tragic death would have remained a mystery, the unintended consequences for the
living relatives described herein might have been avoided based on clinical grounds alone. All
family members had electrocardiograms with normal QT intervals, making the diagnosis of
familial LQTS unlikely."
According to the news editors, the research concluded: "As such, if the clinicians caring for these patients had focused solely on clinical data from the survivors, there might have been no reason to embark on a path of inappropriate treatment based on genetic testing."

The news editors report that additional information may be obtained by contacting M.J. Ackerman, Mayo Clinic, Dept. of Mol, Windland Smith Rice Sudden Death Genom Lab, Rochester, MN 55905, United States. Additional authors for this research include D.C. Bartos, J.D. Kapplinger, D.J. Tester, B.P. Delisle and M.J. Ackerman.

Keywords for this news article include: Rochester, Minnesota, United States, North and Central America, Health and Medicine, Genetics, Mayo Clinic.

**Health and Medicine - Health and Society**

**Findings on Health and Society Detailed by Investigators at Michigan State University (Three modes of power operation: Understanding doctor-patient conflicts in China's hospital therapeutic landscapes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Health and Medicine - Health and Society. According to news reporting originating from East Lansing, Michigan, by NewsRx correspondents, research stated, "Doctor-patient conflicts in contemporary China are increasing in numbers and severity. This health geographic study shows how hospitals as a type of therapeutic landscape can shape doctor-patient relationships."

Our news editors obtained a quote from the research from Michigan State University, "First, the comprehensive nature of therapeutic landscapes with an emphasis on power operation within symbolic environments is provided as a framework for this study. Second, the results from participant observation and interviews with patients and doctors previously involved in conflicts are reported from Internal Medicine and Surgery Departments, within four hospitals in Anhui Province, Eastern China. The study finds that the spatial and temporal arrangements of spaces, the inside decorations and the different modes of discourses can build or ruin harmonious doctor-patient relations."

According to the news editors, the research concluded: "The research concludes that adaptations to current hospital therapeutic landscapes can improve trust between patients and doctors, resulting in fewer conflicts and better health outcomes in China."

The news editors report that additional information may be obtained by contacting P.L. Zhou, Michigan State University, Dept. of Geog Environm & Spatial Sci, East Lansing, MI
Findings on Heart Disease Detailed by Investigators at Landspitali University Hospital (Adult height associates with angiographic extent of coronary artery disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Heart Disease. According to news originating from Reykjavik, Iceland, by NewsRx correspondents, research stated, "Shorter stature is an established risk factor for coronary artery disease (CAD), but less is known about its association with extent of the disease. We assessed the relationship between self-reported height and angiographic findings in 7706 men and 3572 women identified from a nationwide coronary angiography registry in Iceland."

Our news journalists obtained a quote from the research from Landspitali University Hospital, "After adjustment for traditional cardiovascular risk factors, a standard deviation decrease in height associated with a greater likelihood of significant CAD (defined as >= 50% luminal diameter stenosis) both in men (adjusted odds ratio [ORadj]: 1.24, 95% confidence interval [CI]: 1.18, 1.31; p = 3.2 x 10(-16)) and women (ORadj = 1.10, 95% CI: 1.02, 1.18; p = 0.012). In partial proportional odds logistic regression models, a standard deviation decrease in height was associated with higher odds of having greater extent of CAD in men (ORadj = 1.19, 95% CI: 1.15, 1.25; p = 1.5 x 10(-16)) and women (ORadj = 1.09, 95% CI: 1.02, 1.16; p = 0.014). When limited to patients with significant CAD, the association was statistically significant in men (ORadj = 1.08, 95% CI: 1.03, 1.14; p = 0.0022) but not in women (p = 0.56). Our findings show that shorter stature is associated with greater extent of coronary atherosclerosis in a large unselected population of individuals undergoing coronary angiography."

According to the news editors, the research concluded: "This relationship appears to be sex-dependent, with stronger effects in men than in women."

The news correspondents report that additional information may be obtained from T. Gudnason, Landspitali Univ Hosp, Dept. of Internal Med, Cardiovasc Res Center, IS-101 Reykjavik, Iceland. Additional authors for this research include G. Thorgeirsson and T. Gudnason.

Heart Disorders and Diseases - Heart Disease

Findings on Heart Disease Reported by Researchers at Department of Cardiology (Unrecognized Myocardial Infarction Assessed by Cardiac Magnetic Resonance Imaging--Prognostic Implications)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Disease have been published. According to news reporting out of Orebro, Sweden, by NewsRx editors, research stated, "Clinically unrecognized myocardial infarctions (UMI) are not uncommon and may be associated with adverse outcome. The aims of this study were to determine the prognostic implication of UMI in patients with stable suspected coronary artery disease (CAD) and to investigate the associations of UMI with the presence of CAD."

Our news journalists obtained a quote from the research from the Department of Cardiology, "In total 235 patients late gadolinium enhancement cardiovascular magnetic resonance (LGE-CMR) imaging and coronary angiography were performed. For each patient with UMI, the stenosis grade of the coronary branch supplying the infarcted area was determined. UMI were present in 25% of the patients and 67% of the UMI were located in an area supplied by a coronary artery with a stenosis grade (>=)70%. In an age-and gender-adjusted model, UMI independently predicted the primary endpoint (composite of death, myocardial infarction, resuscitated cardiac arrest, hospitalization for unstable angina pectoris or heart failure within 2 years of follow-up) with an odds ratio of 2.9; 95% confidence interval 1.1-7.9. However, this association was abrogated after adjustment for age and presence of significant coronary disease. There was no difference in the primary endpoint rates between UMI patients with or without a significant stenosis in the corresponding coronary artery. The presence of UMI was associated with a threefold increased risk of adverse events during follow up. However, the difference was no longer statistically significant after adjustments for age and severity of CAD. Thus, the results do not support that patients with suspicion of CAD should be routinely investigated by LGE-CMR for UMI."

According to the news editors, the research concluded: "However, coronary angiography should be considered in patients with UMI detected by LGE-CMR."

For more information on this research see: Unrecognized Myocardial Infarction Assessed by Cardiac Magnetic Resonance Imaging--Prognostic Implications. Plos One, 2016;11 (2):e0148803. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news journalists report that additional information may be obtained by contacting A.M. Nordenskjold, Dept. of Cardiology, Faculty of Health, Orebro University, Orebro, Sweden. Additional authors for this research include P. Hammar, H. Ahlstrom, T.
Heart Disorders and Diseases - Heart Failure

Findings on Heart Failure Discussed by J. Tomono and Co-Researchers (Usefulness of anaerobic threshold to peak oxygen uptake ratio to determine the severity and pathophysiological condition of chronic heart failure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Heart Disorders and Diseases - Heart Failure is the subject of a report. According to news reporting from Maebashi, Japan, by NewsRx journalists, research stated, "Anaerobic threshold (AT) and peak oxygen uptake (VO2) are well known as indicators of severity and prognosis of heart failure. Since these parameters are regulated by many factors, multiple organ dysfunction may occur in chronic heart failure, and these two parameters would vary among patients."

The news correspondents obtained a quote from the research, "However, it is not clear whether AT and peak VO2 deteriorate similarly. Therefore, we planned to compare the degree of deterioration of these two parameters using a ratio of AT and peak VO2 (%AT/peak), and evaluated its significance in heart failure subjects. One hundred ninety-four stable heart failure patients who had optimal medical treatment for at least 3 months were enrolled. Cardiopulmonary exercise testing, echocardiography, and blood sampling were examined within one week. Since %AT/peak varied from 50.3% to 108.5%, we divided patients into tertiles of %AT/peak [Group A, 50.1-70.0 (n = 112), Group B, 70.1-90.0 (n = 64), Group C, 90.1-110.0 (n = 18)], and compared factors relating with skeletal muscle and heart failure among these 3 groups. In Group A, ratio of measured AT against predicted value (%AT) and measured peak VO2 against predicted value (%peak VO2) were similar (80.3 +/- 19.0% and 80.4 +/- 17.1%, respectively). Peak VO2 became lower as %AT/peak increased (Group B; 65.6 +/- 14.8%, p< 0.01 vs. Group A, Group C; 38.3 +/- 9.7%, p< 0.01 vs. Group B). On the other hand, %AT in Group B (77.1 +/- 18.5%) was similar to Group A, and diminished in Group C (58.0 +/- 8.2%, p < 0.05 vs. Group B). Peak work rate and lean body mass were smaller in Group B than those in Group A. Although, left ventricular ejection fraction and E/E' deteriorated in Group B compared with Group A, plasma B-type natriuretic peptide and estimated glomerular filtration rate stayed constant in Group B and deteriorated in Group C. %AT/peak showed negative correlation with peak VO2."

According to the news reporters, the research concluded: "In chronic heart failure, muscle weakness occurs at an early stage, and this can be evaluated using %AT/peak."

For more information on this research see: Usefulness of anaerobic threshold to
peak oxygen uptake ratio to determine the severity and pathophysiological condition of chronic heart failure. *Journal of Cardiology*, 2016;68(5-6):373-378. *Journal of Cardiology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Journal of Cardiology - www.journals.elsevier.com/journal-of-cardiology/)

Our news journalists report that additional information may be obtained by contacting H. Adachi, Gunma Prefectural Cardiovasc Center, Maebashi, Gumma 3710004, Japan. Additional authors for this research include H. Adachi, S. Oshima and M. Kurabayashi.

**Transplant Medicine - Heart Transplants**

**Findings on Heart Transplants Reported by Investigators at University of Louisville (Differences in Status 1A Heart Transplantation Survival in the Continuous Flow Left Ventricular Assist Device Era)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Transplant Medicine - Heart Transplants have been published. According to news reporting originating in Louisville, Kentucky, by NewsRx journalists, research stated, "Heart transplantation remains the gold standard therapy for end-stage heart failure patients; however, volumes are limited because of donor organ shortage. With the increasing availability of more durable continuous flow left ventricular assist devices (CFLVADs), the matrix of the heart transplantation waiting list and that of donor allocation have seen substantial changes."

The news reporters obtained a quote from the research from the University of Louisville, "We aimed to evaluate the impact of the stated reasons for status 1A at time of transplantation on post-transplantation survival in CFVAD patients. The United Network of Organ Sharing (UNOS) thoracic organ transplantation database was queried between 2006 and 2013 to identify patients aged 18 years or older who underwent heart transplantation as UNOS status 1A. We further assessed the data to identify reasons for status 1A at time of transplantation in CFVAD patients. We also computed posttransplantation survival of patients supported with CFLVAD who were status 1A at the time of transplantation. A total of 15,779 patients underwent heart transplantation during the study time period, of whom 8,429 were Status 1A, and 3,913 had CFLVAD at time of transplantation. Of all status 1A patients, 2,737 had CFLVAD at time of transplantation, of which 52% (1,413) had device complications (thrombosis, infection, malfunction, and other) and 48% (1,314) were on 30-day grace status 1A. Post-transplantation survival (at 3 years) of CFLVAD patients who received a transplant on 30-day grace status 1A was similar to patients who underwent transplantation on status 1B (84% versus 85%, p = 0.5), both of which were significantly better than status 1A patients because of device complications (84% and 85% versus 78%, p = 0.01) (Fig 1). CFLVAD patients who underwent transplantation as Status 1B or on the 30-day grace Status 1A have similar post-
transplantation survival."

According to the news reporters, the research concluded: "These data suggest that there needs to be an objective organ allocation system for recipients of heart transplant that prioritize patients with CFVAD complications and patients not eligible for CFVAD for transplantation over 30-day grace period patients."

Our news correspondents report that additional information may be obtained by contacting M.S. Slaughter, University of Louisville, Dept. of Cardiovasc & Thorac Surg, Louisville, KY 40292, United States. Additional authors for this research include K. Rajagopal, E.M. Schumer, E.J. Birks, A. Lenneman, A. Cheng and M.S. Slaughter.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.athoracsur.2016.04.027. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Hepatitis B Virus

Findings on Hepatitis B Virus Reported by Investigators at University of Naples (Occult HBV infection in the oncohematological setting)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Liver Diseases and Conditions - Hepatitis B Virus are presented in a new report. According to news reporting out of Naples, Italy, by NewsRx editors, research stated, "Occult hepatitis B infection (OBI), a virological condition characterized by a low release of Hepatitis B Virus (HBV) from liver cells and low HBV-DNA levels in serum and/or liver tissue of HBsAg-negative subjects, may reactivate in oncohematological patients undergoing immunosuppression by aggressive chemotherapy or hematopoietic stem cell transplantation. The entity of OBI reactivation varies from an increase in HBV replication without liver damage to an active HBV replication followed by liver cell necrosis, frequently severe and in some cases life threatening."

Our news journalists obtained a quote from the research from the University of Naples, "Because of a possible severe outcome associated with OBI reactivation (hepatic failure or death due to the discontinuation of chemotherapy), prophylaxis with anti-HBV nucleot(s) ide analogues is recommended in relation to the foreseeable degree of immunosuppression. This review article focuses on the clinical impact of OBI in the oncohematological setting and is addressed to all health care workers having in care oncohematological patients or involved in the treatment of HBV infection and OBI prophylaxis. International guidelines have indicated lamivudine prophylaxis in hematopoietic stem cell transplantation and when high-dose
corticosteroids or anti-CD20 or anti-CD52 monoclonal antibodies are used. Entecavir or tenofovir should replace lamivudine for patients with advanced liver diseases for whom reactivation of OBI may be life threatening."

According to the news editors, the research concluded: "When anti-CD20 or anti-CD52 sparing schedules or other non-aggressive chemotherapies are used, monitoring may be indicated, but very early treatment with highly effective antiviral drugs (entecavir or tenofovir) should be administered once a reactivation of OBI has occurred."

For more information on this research see: Occult HBV infection in the oncohematological setting. Infection, 2016;44(5):575-582. Infection can be contacted at: Springer Heidelberg, Tiergartenstrasse 17, D-69121 Heidelberg, Germany. (Springer - www.springer.com; Infection - www.springerlink.com/content/0300-8126/)

Our news journalists report that additional information may be obtained by contacting E. Sagnelli, University of Naples, Dept. of Mental Hlth & Public Med, Infect Dis Sect, I-80131 Naples, Italy. Additional authors for this research include M. Macera, M. Pisaturo, R. Zampino, M. Coppola and E. Sagnelli.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s15010-016-0891-1. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Hepatitis C Virus

Findings on Hepatitis C Virus Discussed by Investigators at China Medical University and Hospital (RELATIONSHIP BETWEEN UVEITIS, DIFFERENT TYPES OF VIRAL HEPATITIS, AND LIVER CIRRHOSIS A 12-Year Nationwide Population-Based Cohort Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Liver Diseases and Conditions - Hepatitis C Virus. According to news reporting originating in Taichung, Taiwan, by NewsRx journalists, research stated, "This study investigates whether patients with viral hepatitis and cirrhosis are at risk of uveitis in the years following hepatitis. We used data from Taiwan National Health Insurance system."

The news reporters obtained a quote from the research from China Medical University and Hospital, "The cases were patients newly diagnosed with viral hepatitis from 2000 to 2011. The end point of interest was a diagnosis of uveitis. A chi-square test was used for the difference of demographic characteristics between viral hepatitis and comparison. The risk of uveitis in hepatitis was stratified using Cox proportional hazard regression. We selected 17,389 patients with viral hepatitis and 34,778 matched comparison. The risk of uveitis in hepatitis cohort was 1.30-fold (95% confidence interval = 1.01-1.69). Patients with hepatitis B
virus and hepatitis C virus coinfection had the highest risk (hazard ratio = 2.88; 95% confidence interval = 1.07-7.78), and followed by only hepatitis C virus infection (hazard ratio = 1.75; 95% confidence interval = 1.10-2.79). Patients with cirrhosis had a higher risk in the multivariable model but did not attach statistic difference. Patients with hepatitis B virus and hepatitis C virus coinfection had the highest risk of uveitis. In patients with hepatitis C virus and/or hepatitis B virus infection, the symptoms of uveitis should be alerted.

According to the news reporters, the research concluded: "Although these epidemiologic studies yielded informative results, the underlying mechanisms and the host's genetic factors remain to be investigated."

For more information on this research see: RELATIONSHIP BETWEEN UVEITIS, DIFFERENT TYPES OF VIRAL HEPATITIS, AND LIVER CIRRHOSIS A 12-Year Nationwide Population-Based Cohort Study. Findings on Hepatocyte Growth Factor Discussed by Investigators at Imperial College (Identifying ultrasensitive HGF dose-response functions in a 3D mammalian system for synthetic morphogenesis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Intercellular Signaling Peptides and Proteins - Hepatocyte Growth Factor have been published. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "Nonlinear responses to signals are widespread natural phenomena that affect various cellular processes. Nonlinearity can be a desirable characteristic for engineering living organisms because it can lead to more switch-like responses, similar to those underlying the wiring in electronics."

Our news journalists obtained a quote from the research from Imperial College, "Steeper functions are described as ultrasensitive, and can be applied in synthetic biology by using various techniques including receptor decoys, multiple co-operative binding sites, and sequential positive feedbacks. Here, we explore the inherent non-linearity of a biological signaling system to identify functions that can potentially be exploited using cell genome engineering. For this, we performed genome-wide transcription profiling to identify genes with...
ultrasensitive response functions to Hepatocyte Growth Factor (HGF). We identified 3,527 genes that react to increasing concentrations of HGF, in Madin-Darby canine kidney (MDCK) cells, grown as cysts in 3D collagen cell culture. By fitting a generic Hill function to the dose-responses of these genes we obtained a measure of the ultrasensitivity of HGF-responsive genes, identifying a subset with higher apparent Hill coefficients (e.g. MMP1, TIMP1, SNORD75, SNORD86 and ERRFI1).

According to the news editors, the research concluded: "The regulatory regions of these genes are potential candidates for future engineering of synthetic mammalian gene circuits requiring nonlinear responses to HGF signalling."

The news correspondents report that additional information may be obtained from M. Isalan, Imperial Coll London, Dept. of Life Sci, London SW7 2AZ, United Kingdom. Additional authors for this research include M. Sturrock, G. Piedrafita and M. Isalan.

Oncology - Hereditary Cancer Syndrome

**Findings on Hereditary Cancer Syndrome Detailed by Investigators at Genomic Medicine Institute (Strategies for clinical implementation of screening for hereditary cancer syndromes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Hereditary Cancer Syndrome have been published. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "Hereditary cancer syndromes generally account for 5%-10% of malignancies. While these syndromes are rare, affected patients carry significantly elevated risks of developing cancer, as do their at-risk relatives."

The news reporters obtained a quote from the research from Genomic Medicine Institute, "Identification of these patients is critical to ensure timely and appropriate genetic testing relevant to cancer patients and their relatives. Several guidelines and tools are available to assist clinicians. Patients suspected to have hereditary cancer syndromes should be offered genetic testing in the setting of genetic counseling by a qualified genetics professional. Germline testing ranges from testing for a known specific familial mutation to testing of a broad differential diagnosis using a pan-cancer multi-gene panel."

According to the news reporters, the research concluded: "Taking a family history, referring specific types of tumors with higher likelihood of heredity, implementing universal screening protocols such as microsatellite instability/immunohistochemistry (MSI/IHC) for specific tumors, and referring patients with somatic tumor testing that have potentially germline consequences are all important components to the identification of hereditary cancer syndromes.
Drugs and Therapies - Hormone Replacement Therapy

Findings on Hormone Replacement Therapy Reported by Investigators at School of Psychology (Estradiol Is Associated With Altered Cognitive and Physiological Responses During Fear Conditioning and Extinction in Healthy and Spider Phobic Women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Hormone Replacement Therapy have been presented. According to news reporting originating in Sydney, Australia, by NewsRx journalists, research stated, "The first-line psychological treatment for anxiety disorders is exposure therapy, which can be modeled in the laboratory using fear extinction. In healthy women, estradiol levels predict return of fear following extinction, whereas low levels are associated with greater return of fear."

The news reporters obtained a quote from the research from the School of Psychology, "Investigating whether estradiol is similarly associated with extinction in clinically anxious women may provide insight to mechanisms underlying symptom relapse following exposure therapy. In the present study, women with spider phobia and healthy women participated in a 2-day fear conditioning and extinction procedure during a period of high or low estradiol levels. Skin conductance responses, shock expectancy, and valence ratings were measured throughout. Women exhibited comparable decreases in physiological arousal from conditioning to the end of extinction training on Day 1. However, compared to women with high estradiol, and irrespective of clinical status, women with low estradiol exhibited significant return of physiological arousal at extinction recall on Day 2, despite accurate ratings regarding the likelihood of shock. Low estradiol women also reported heightened threat expectancy and physiological responding during presentation of safety cues."

According to the news reporters, the research concluded: "These results may point to novel means of enhancing exposure therapy in women by timing treatment delivery during
periods of higher estradiol levels."

Our news correspondents report that additional information may be obtained by contacting B.M. Graham, Univ New South Wales Australia, Sch Psychol, Sydney, NSW 2052, Australia.

Genetics - Human Genetics

Findings on Human Genetics Detailed by Investigators at Hanken School of Economics (Twinning Rates in Isolates)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Genetics - Human Genetics. According to news reporting from Helsinki, Finland, by NewsRx editors, the research stated, "The aim of this study was to investigate the twinning rates (TWRs) in isolates relative to the TWRs in the surrounding populations. It is not uncommon that the TWR shows extreme values (high or low rates) within isolated subpopulations."

The news correspondents obtained a quote from the research from the Hanken School of Economics, "Starting from the isolated populations of the Aland Islands in Finland (high rates), we enlarged our studies to other isolated subpopulations in other countries: the island of Gotland (high rates), the county of Alvsborg located in the southwestern part of Sweden (low rates), and mountain villages in Norway. In our statistical analyses, we paid special attention to the robustness of the variance formula of the TWR and to alternative confidence intervals for the TWR. Particularly, we show how to obtain the most precise confidence intervals for the twinning rates. These statistical methods are crucial when the extreme TWRs within subpopulations are compared with the TWRs within the general population."

According to the news reporters, the research concluded: "One must decide whether the differences are real or caused by random fluctuations within the small isolates."

For more information on this research see: Twinning Rates in Isolates. Twin Research and Human Genetics, 2016;19(6):673-678. Twin Research and Human Genetics can be contacted at: Cambridge Univ Press, 32 Avenue Of The Americas, New York, NY 10013-2473, USA. Findings on Hypercholesterolemia from R. Mehta and Colleagues Provide New Insights (The panorama of familial hypercholesterolemia in Latin America: a systematic review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Nutritional and Metabolic Diseases and Conditions - Hypercholesterolemia. According to news reporting originating from Mexico City, Mexico, by NewsRx correspondents, research stated, "The burden caused by familial hypercholesterolemia (FH) varies among countries and ethnic groups. The prevalence and characteristics of FH in Latin American (LA) countries is largely unknown."

Our news editors obtained a quote from the research, "We present a systematic review (following the PRISMA statement) of FH in LA countries. The epidemiology, genetics, screening, management, and unique challenges encountered in these countries are discussed. Published reports discussing FH in Hispanic or LA groups was considered for analysis. Thirty studies were included representing 10 countries. The bulk of the data was generated in Brazil and Mexico. Few countries have registries and there was little commonality in FH mutations between LA countries. LDL receptor mutations predominate; APOB and PCSK9 mutations are rare. No mutation was found in an FH gene in nearly 50% of cases. In addition, some country-specific mutations have been reported. Scant information exists regarding models of care, cascade screening, cost, treatment effectiveness, morbidity, and mortality."

According to the news editors, the research concluded: "FH is largely underdiagnosed and undertreated in the LA region. The genetic admixture with indigenous populations, producing mestizo's groups, may influence the mutational findings in Latin America. Potential opportunities to close gaps in knowledge and health care are identified."

The news editors report that additional information may be obtained by contacting C.A. Aguilar-Salinas, Inst Nacl Ciencias Med Nutr Salvador Zubiran, Dept. of Endocrinol Metab, Mexico City, DF, Mexico. Additional authors for this research include R. Zubiran, A.J. Martagon, A. Vazquez-Cardenas, Y. Segura-Kato, M.T. Tusie-Luna and C.A. Aguilar-Salinas.

Cardiovascular Diseases and Conditions...

Findings on Hypertension Detailed by Investigators at George Mason University (Improving Prognostic Web Calculators: Violation of Preferential Risk Independence)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Hypertension have been published. According to news reporting from Fairfax, Virginia, by NewsRx journalists, research stated, "Web-based applications are available for prognostication of individual patients. These prognostic models were developed for groups of patients."

The news correspondents obtained a quote from the research from George Mason University, "No one is the average patient, and using these calculators to inform individual patients could provide misleading results. This article gives an example of paradoxical results that may emerge when indices used for prognosis of the average person are used for care of an individual patient. We calculated the expected mortality risks of stomach cancer and its associated comorbidities. Mortality risks were calculated using data from 140,699 Veterans Administration nursing home residents. On average, a patient with hypertension has a higher risk of mortality than one without hypertension. Surprisingly, among patients with lung cancer, hypertension is protective and reduces risk of mortality. This paradoxical result is explained by how group-level, average prognosis could mislead individual patients. In particular, average prognosis of lung cancer patients reflects the impact of various comorbidities that co-occur in lung cancer patients. The presence of hypertension, a relatively mild comorbidity of lung cancer, indicates that more serious comorbidities have not occurred. It is not that hypertension is protective; it is the absence of more serious comorbidities that is protective. The article shows how the presence of these anomalies can be checked through the mathematical concept of preferential risk independence."

According to the news reporters, the research concluded: "Instead of reporting average risk scores, web-based calculators may improve accuracy of predictions by reporting the unconfounded risks."

Our news journalists report that additional information may be obtained by contacting F. Alemi, George Mason University, Dept. of Hlth Adm & Policy, Fairfax, VA 22030, United States. Additional authors for this research include C. Levy, B.A. Citron, A.R. Williams, E. Pracht and A. Williams.

The direct object identifier (DOI) for that additional information is:
Findings on Hypertension Discussed by Investigators at Catholic University of Leuven (BMPRII influences the response of pulmonary microvascular endothelial cells to inflammatory mediators)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Hypertension have been presented. According to news reporting from Leuven, Belgium, by NewsRx journalists, research stated, "Mutations in the bone morphogenetic protein receptor (BMPR2) gene have been observed in 70% of patients with heritable pulmonary arterial hypertension (HPAH) and in 11-40% with idiopathic PAH (IPAH). However, carriers of a BMPR2 mutation have only 20% risk of developing PAH."

The news correspondents obtained a quote from the research from the Catholic University of Leuven, "Since inflammatory mediators are increased and predict survival in PAH, they could act as a second hit inducing the development of pulmonary hypertension in BMPR2 mutation carriers. Our specific aim was to determine whether inflammatory mediators could contribute to pulmonary vascular cell dysfunction in PAH patients with and without a BMPR2 mutation. Pulmonary microvascular endothelial cells (PMEC) and arterial smooth muscle cells (PASMC) were isolated from lung parenchyma of transplanted PAH patients, carriers of a BMPR2 mutation or not, and from lobectomy patients or lung donors. The effects of CRP and TNF alpha on mitogenic activity, adhesiveness capacity, and expression of adhesion molecules were investigated in PMECs and PASMCs. PMECs from BMPR2 mutation carriers induced an increase in PASMC mitogenic activity; moreover, endothelin-1 secretion by PMECs from carriers was higher than by PMECs from non-carriers. Recruitment of monocytes by PMECs isolated from carriers was higher compared to PMECs from non-carriers and from controls, with an elevated ICAM-1 expression. CRP increased adhesion of monocytes to PMECs in carriers and non-carriers, and TNF alpha only in carriers."

According to the news reporters, the research concluded: "PMEC from BMPR2 mutation carriers have enhanced adhesiveness for monocytes in response to inflammatory mediators, suggesting that BMPR2 mutation could generate susceptibility to an inflammatory insult in PAH."

Our news journalists report that additional information may be obtained by contacting R. Quarck, Univ Leuven, Dept. of Clin & Expt Med, Leuven, Belgium. Additional

Findings on Hypertension Reported by Investigators at Johns Hopkins University (Microbial short chain fatty acid metabolites lower blood pressure via endothelial G protein-coupled receptor 41)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Hypertension is now available. According to news reporting originating in Baltimore, Maryland, by NewsRx journalists, research stated, "Short chain fatty acid (SCFA) metabolites are byproducts of gut microbial metabolism that are known to affect host physiology via host G protein-coupled receptor (GPCRs). We previously showed that an acute SCFA bolus decreases blood pressure (BP) in anesthetized mice, an effect mediated primarily via Gpr41."

Funders for this research include American Heart Association (AHA), Japan Heart foundation, HHS | National Institutes of Health (NIH), Hopkins Conte Digestive Diseases Basic and Traslational Research Core Center.

The news reporters obtained a quote from the research from Johns Hopkins University, "In this study, our aims were to identify the cellular localization of Gpr41 and to determine its role in BP regulation. We localized Gpr41 to the vascular endothelium using RT-PCR: Gpr41 is detected in intact vessels (with endothelium) but is absent from denuded vessels (without endothelium). Furthermore, using pressure myography we confirmed that SCFAs dilate resistance vessels in an endothelium-dependent manner. Since we previously found that Gpr41 mediates a hypotensive response to acute SCFA administration, we hypothesized that Gpr41 knockout (KO) mice would be hypertensive. Here, we report that Gpr41 KO mice have isolated systolic hypertension compared with wild-type (WT) mice; diastolic BP was not different between WT and KO. Older Gpr41 KO mice also exhibited elevated pulse wave velocity, consistent with a phenotype of systolic hypertension; however, there was no increase in ex vivo aorta stiffness (measured by mechanical tensile testing). Plasma renin concentrations were also similar in KO and WT mice. The systolic hypertension in Gpr41 KO is not salt sensitive, as it is not significantly altered on either a high-or low-salt diet."

According to the news reporters, the research concluded: "In sum, these studies suggest that endothelial Gpr41 lowers baseline BP, likely by decreasing active vascular tone without altering passive characteristics of the blood vessels, and that Gpr41 KO mice have hypertension of a vascular origin."
For more information on this research see: Microbial short chain fatty acid metabolites lower blood pressure via endothelial G protein-coupled receptor 41. *Physiological Genomics*, 2016;48(11):826-834. *Physiological Genomics* can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

**Cardiovascular Diseases and Conditions**

**Findings on Hypertension Reported by Investigators at University of Catania (Blood Pressure Control in Smokers with Arterial Hypertension Who Switched to Electronic Cigarettes)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiovascular Diseases and Conditions - Hypertension are presented in a new report. According to news reporting originating in Catania, Italy, by NewsRx journalists, research stated, "Electronic cigarettes (ECs) are battery-operated devices designed to vaporise nicotine, which may help smokers with quitting or reducing their tobacco consumption. No data is available regarding the health effects of ECs use among smokers with arterial hypertension and whether regular use results in blood pressure (BP) changes."

The news reporters obtained a quote from the research from the University of Catania, "We investigated long-term changes in resting BP and level of BP control in hypertensive smokers who quit or reduced substantially their tobacco consumption by switching to ECs. A medical records review of patients with hypertension was conducted to identify patients reporting regular daily use of ECs on at least two consecutive follow-up visits. Regularly smoking hypertensive patients were included as a reference group. A marked reduction in cigarette consumption was observed in ECs users (n = 43) though consumption remained unchanged in the control group (n = 46). Compared to baseline, at 12 months (follow-up visit 2) decline in cigarette consumption was associated with significant reductions in median (25th-, 75th-centile) systolic BP (140 (134.5, 144) to 130 (123.5, 138.5) mmHg; p< 0.001) and diastolic BP (86 (78, 90) to 80 (74.5, 90) mmHg; p = 0.006). No significant changes were observed in the control group. As expected, decline in cigarette consumption in the ECs users was also associated with improved BP control. The study concludes that regular ECs use may aid smokers with arterial hypertension reduce or abstain from cigarette smoking, with only trivial post-cessation weight gain."

According to the news reporters, the research concluded: "This resulted in
improvements in systolic and diastolic BP as well as better BP control."

Our news correspondents report that additional information may be obtained by contacting R. Polosa, University of Catania, Policlinico V Emanuele, Internal & Emergency Med, I-95123 Catania, Italy. **Drugs and Therapies - Ibuprofen Therapy**

**Findings on Ibuprofen Therapy Discussed by Investigators at Silesian Technical University (Influence of Inorganic Ions and Organic Substances on the Degradation of Pharmaceutical Compound in Water Matrix)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Drugs and Therapies - Ibuprofen Therapy is now available. According to news reporting from Gliwice, Poland, by NewsRx journalists, research stated, "The paper determined the influence of inorganic substances and high-molecular organic compounds on the decomposition of diclofenac, ibuprofen, and carbamazepine in the process of photocatalysis conducted with the presence of Titanium dioxide (TiO2). It was determined that the presence of such ions as CO32-, HCO3-, HPO42- as well as SO42- inhibited the decomposition of carbamazepine, whereas the efficiency of diclofenac degradation was decreased only by the presence of CO32- and HCO3- anions."

The news correspondents obtained a quote from the research from Silesian Technical University, "In case of ibuprofen sodium salt (IBU), all investigated anions influenced the increase in its decomposition rate. The process of pharmaceutical photooxidation conducted in suspensions with Al3+ and Fe3+ cations was characterized by a significantly decreased efficiency when compared to the solution deprived of inorganic compounds. The addition of Ca2+, Mg2+ and NH4 + affected the increase of reaction rate constant value of diclofenac and ibuprofen decomposition. On the other hand, high molecular organic compounds present in the model effluent additionally catalysed the degradation process of pharmaceutical compounds and constituted an additional sorbent that enabled to decrease their concentration."

According to the news reporters, the research concluded: "Toxicological analysis conducted in deionized water with pharmaceutical compounds' patterns proved the production of by-products from oxidation and/or reduction of micropollutants, which was not observed for model effluent irradiation."

For more information on this research see: Influence of Inorganic Ions and Organic Substances on the Degradation of Pharmaceutical Compound in Water Matrix. *Water*, 2016;8 (11):934-951. *Water* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel,

Proteins - Immediate-Early Proteins

Findings on Immediate-Early Proteins Detailed by Investigators at State Oceanic Administration (Shrimp STAT was hijacked by white spot syndrome virus immediate-early protein IE1 involved in modulation of viral genes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Proteins - Immediate-Early Proteins. According to news reporting originating from Xiamen, People's Republic of China, by NewsRx correspondents, research stated, "STATs are a family of transcription factors that regulate a cascade of cellular processes including cell growth, differentiation, apoptosis and immune responses. However, they are usually targeted by viruses to assist infection."

Funders for this research include Major State Basic Research Development Program of China, China Agriculture Research System-47, National Natural Science Foundation of China, Scientific Research Foundation of Third Institute of Oceanography, Fujian Science and Technology Project.

Our news editors obtained a quote from the research from State Oceanic Administration, "In this study, we identified that white spot syndrome virus (WSSV) immediate-early protein IE1 interacted with Litopenaeus vannamei STAT (LvSTAT) and thereby led to its phosphorylation activation. In addition, we demonstrated that LvSTAT could bind to the promoters of the viral immediate early genes wsv051 and iel through STAT-binding motifs in vitro and vivo, allowing the enhancement of their promoters' activities. Moreover, IE1 could promote the transcriptional activation activity of LvSTAT to augment the transcription of wsv051 and iel."

According to the news editors, the research concluded: "Our findings revealed a novel linkage between WSSV IE1 and shrimp STAT, which was a clue to well understand how WSSV adopted the active strategies to modulate the shrimp signaling pathway."

For more information on this research see: Shrimp STAT was hijacked by white spot syndrome virus immediate-early protein IE1 involved in modulation of viral genes. *Fish & Shellfish Immunology*, 2016;59():268-275. *Fish & Shellfish Immunology* can be contacted at: Academic Press Ltd- Elsevier Science Ltd, 24-28 Oval Rd, London NW1 7DX, England. Immunology - Immunoglobulins

Findings on Immunoglobulins Discussed by Investigators at Genentech, Inc. (Peripheral neuropathy with microtubule inhibitor containing antibody drug conjugates: Challenges and perspectives in translatability from nonclinical toxicology studies ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Immunoglobulins have been published. According to news reporting originating from San Francisco, California, by NewsRx correspondents, research stated, "Antibody drug conjugates (ADC) consist of potent cytotoxic drugs conjugated to antibodies via chemical linkers, which enables specific targeting of tumor cells while reducing systemic exposure to the cytotoxic drug and improving the therapeutic window. The valine citrulline monomethyl auristatin E (vcMMAE, conventional linker-drug) ADC platform has shown promising clinical activity in several cancers, but peripheral neuropathy (PN) is a frequent adverse event leading to treatment discontinuation and dose reduction."

Financial support for this research came from Genentech.

Our news editors obtained a quote from the research from Genentech, Inc., "This was not predicted based on nonclinical toxicology studies in monkeys or rats treated with vcMMAE ADCs. We evaluated four hypotheses for the lack of translatability of PN with vcMMAE ADCs: 1) species differences in exposure; 2) insensitivity of animal models; 3) species differences in target biology and other vcMMAE ADC properties in peripheral nerves and 4) increased susceptibility of patient population. The result of this hypothesis-based approach identified opportunities to improve the predictivity of PN in our animal models by increasing duration of exposure and adding an expanded neurohistopathology assessment of peripheral nerves."

According to the news editors, the research concluded: "The utility of a predictive animal model would be to provide possible mitigation strategies in the clinic with vcMMAE ADCs and help to screen the next generation microtubule inhibitor (MTI) ADCs for reduced PN."

For more information on this research see: Peripheral neuropathy with microtubule inhibitor containing antibody drug conjugates: Challenges and perspectives in translatability from nonclinical toxicology studies to the clinic. Regulatory Toxicology and Pharmacology, 2016;82(1-13. Regulatory Toxicology and Pharmacology can be contacted at: Academic
Membrane Proteins - Immunologic Receptors

Findings on Immunologic Receptors Detailed by Investigators at China Pharmaceutical University (Structural and functional aspects of decorsin and its analog as recognized by integrin alpha IIb beta 3)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Membrane Proteins - Immunologic Receptors is now available. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Decorsin is an antagonist of platelet glycoprotein integrin alpha IIb beta 3 on platelets; the protein is 39 amino acids long with three disulfide bridges in its tertiary structure. To demonstrate decorsin's mechanism of action, we applied the computational virtual technique and platelet aggregation inhibition assay, which showed that the flanking amino-acid residues of the Arg-Gly-Asp (RGD) motif play an important role in platelet aggregation."

Our news journalists obtained a quote from the research from China Pharmaceutical University, "The computational simulations revealed that the RGD motif mainly contributes to the stability of the complex when decorsin interacts with integrin alpha IIb beta 3. However, the C-terminal residues, such as 34A -> W and 35D -> R, was also found to possibly play a key role in their binding structures. Moreover, we produced a decorsin analog (A34W plus D35R decorsin), in which the 34A (alanine) and 35D (aspartic acid) residues were respectively substituted by W (tryptophan) and R (arginine). This isoform was then recombinantly expressed in Escherichia coli. Intriguingly, this mutant type showed higher anti-platelet aggregation activity than the wildtype."

According to the news editors, the research concluded: "Our study may further contribute to finding decorsin mutants with higher anti-platelet aggregation activity."

For more information on this research see: Structural and functional aspects of decorsin and its analog as recognized by integrin alpha IIb beta 3. Journal of Molecular Modeling, 2016;22(11):280-289. Journal of Molecular Modeling can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Journal of
Inflammation

Findings on Inflammation Detailed by J.M. De Cock and Co-Authors (Inflammation Triggers Zeb1-Dependent Escape from Tumor Latency)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Inflammation have been presented. According to news reporting from Cambridge, Massachusetts, by NewsRx journalists, research stated, "The emergence of metastatic disease in cancer patients many years or decades after initial successful treatment of primary tumors is well documented but poorly understood at the molecular level. Recent studies have begun exploring the cell-intrinsic programs, causing disseminated tumor cells to enter latency and the cellular signals in the surrounding non-permissive tissue microenvironment that maintain the latent state."

The news correspondents obtained a quote from the research, "However, relatively little is known about the mechanisms that enable disseminated tumor cells to escape cancer dormancy or tumor latency. We describe here an in vivo model of solitary metastatic latency in the lung parenchyma. The induction of a localized inflammation in the lungs, initiated by lipopolysaccharide treatment, triggers the awakening of these cells, which develop into macroscopic metastases. The escape from latency is dependent on the expression of Zeb1, a key regulator of the epithelial-to-mesenchymal transition (EMT)."

According to the news reporters, the research concluded: "Furthermore, activation of the EMT program on its own, as orchestrated by Zeb1, is sufficient to incite metastatic outgrowth by causing carcinoma cells to enter stably into a metastasis-initiating cell state."

For more information on this research see: Inflammation Triggers Zeb1-Dependent Escape from Tumor Latency. Cancer Research, 2016;76(23):6778-6784. Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. (American Association for Cancer Research - www.aacr.com; Cancer Research - cancerres.aacrjournals.org/)

Findings on Inflammatory Bowel Disease Discussed by Investigators at Shanghai Jiao-Tong University (Exosome in intestinal mucosal immunity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Digestive System Diseases and Conditions - Inflammatory Bowel Disease. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Intercellular communication of immune cells is critical to elicit efficient inflammatory responses. In intestinal mucosa, imbalance in pro-inflammatory and anti-inflammatory mediators, especially cytokines and chemokines, characterizes the underlying immune mechanisms of inflammatory bowel disease."

The news reporters obtained a quote from the research from Shanghai Jiao-Tong University, "Exosomes, small membrane vesicles secreted into the extracellular environment, are emerging as another important intercellular messenger in immune responses. A major recent breakthrough in this field unveils the capacity of exosomes to mediate the functional transfer of genetic materials (mRNAs and miRNAs) between immune cells. RAB27A and RAB27B are two small GTPases involved in exosome secretion. With respect to intestinal mucosal immunity, increased number of RAB27A-positive immune cells and RAB27B-positive immune cells are demonstrated in the colonic mucosa of patients with active ulcerative colitis as compared with that of healthy controls. This indicates the important role of exosome-mediated immune responses in the pathogenesis of inflammatory bowel disease."

According to the news reporters, the research concluded: "Here, we will discuss the immune properties of exosomes and recent advances in their function with a special focus on intestinal mucosal immunity."

Our news correspondents report that additional information may be obtained by contacting Z.H. Ran, Shanghai Jiao Tong University, Key Lab Gastroenterol & Hepatol, Shanghai Inst Digest DisDiv Gastroenterol & Hepa, Minist HlthRen Ji HospSch MedShanghai IBD Res, Shanghai, People's Republic of China. Additional authors for this research include J.T. Lu, Z.H. Ran and Q. Zheng.

Findings on Intermediate Uveitis Detailed by Investigators at Duke University (Injectable Fluocinolone Acetonide Long-Acting Implant for Noninfectious Intermediate Uveitis, Posterior Uveitis, and Panuveitis Two-Year Results)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Eye Diseases and Conditions - Intermediate Uveitis have been published. According to news reporting originating from Durham, North Carolina, by NewsRx correspondents, research stated, "To determine the effect of an injectable fluocinolone acetonide implant (FAi) in eyes with noninfectious intermediate uveitis, posterior uveitis, or panuveitis. Noncomparative, interventional, dose-randomized, dose-masked, prospective, individual, investigator-sponsored investigational new drug study."

Our news editors obtained a quote from the research from Duke University, "Eleven eyes of 11 participants with a history of recurrent noninfectious intermediate uveitis, posterior, or panuveitis. Participants were randomized to receive either a low-or a high-dose FAi. Eyes were observed on day 0 (day the implant was injected) and then at regular intervals through 2 years. Ocular inflammation, visual acuity, anti-inflammatory medication use, and safety parameters before and after FAi implantation. All participants were followed up for 2 years. At baseline, mean study eye visual acuity was 0.56 logarithm of the minimum angle of resolution (logMAR; standard deviation [SD], 0.43 logMAR). These values improved significantly to +0.25 logMAR (SD, 0.14 logMAR) and +0.17 logMAR (SD, 0.14 logMAR) at 12 and 24 months after implantation, respectively (P = 0.041 and P = 0.016, respectively). The average number of inflammation recurrences in the 12 months before implantation was 1.54 episodes per eye. None of the study eyes experienced a recurrence during the follow-up period. Of the 6 participants who continued receiving systemic medication after implantation, the dosage was reduced in 4 participants. Five of 11 eyes received an average of 1.6 posterior sub-Tenon triamcinolone acetonide (PSTA) injections in the 12 months preceding implantation. None required a PSTA injection after FAi implantation. The most common adverse event was intraocular pressure (IOP) rise. At baseline, 1 study eye (9%) required pressure-lowering drops; 2 additional study eyes (18%) required them during the follow-up period. Filtering procedures were performed in 2 of these eyes (18.1%). No FAi explantations were required, nor were any participants lost to follow-up during the investigation. It is feasible to place a long-acting FAi in an outpatient setting, without prolonged adverse events attributed to the implant injection procedure. The FAi effectively controlled intraocular inflammation in all eyes in the study, and at the last follow-up, all implanted eyes demonstrated an improvement in visual acuity. Elevated IOP that occurred in 18% of FAi-implanted eyes was managed by standard means."

According to the news editors, the research concluded: "The FAi implant is a promising approach for patients with noninfectious intermediate uveitis, posterior uveitis, or panuveitis who do not respond to, or are intolerant to, conventional therapy."

Findings on Investigative Medicine Detailed by Investigators at Turgut Ozal University (Suppression of bromodomain-containing protein 4 by shRNA: A new approach for cancer treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Health and Medicine - Investigative Medicine have been presented. According to news reporting originating in Ankara, Turkey, by NewsRx journalists, research stated, "MYC is a transcription factor coding gene that is believed to control 15% of the genes in the entire human genome. The central role of c-MYC in cancer pathogenesis makes it a major therapeutic target in field of anticancer agent development."

The news reporters obtained a quote from the research from Turgut Ozal University, "We targeted the acetyl-lysine binding modules or bromodomains, which are associated with c-MYC transcriptional activation. Sequence specific inhibition of BET bromodomains with small hairpin RNAs (shRNAs) resulted in cessation of cellular proliferation in different cancer cell lines. Unlike previous studies on inhibition of bromodomains with selective small-molecule inhibitors, our study revealed the significant role of BET bromodomains in solid tumours and also highlighted the ease of RNA interference (RNAi) methodology for inhibition of bromodomain translation."

According to the news reporters, the research concluded: "The degree of influence of BET bromodomain inhibition on proliferation in five cancer cell lines established it as the major target in malignancies characterized by activation of c-MYC."

Our news correspondents report that additional information may be obtained by contacting T. Kaya, Turgut Ozal Univ, Fac Med, Ankara, Turkey. Additional authors for this research include B. Kahraman, N. Bazarov, A.S. Toker, A. Celik, S. Cigdem and E. Gunduz. Keywords for this news article include: Ankara, Turkey, Eurasia, Investigative Medicine, Health and Medicine, Oncology, Genetics, Cancer, Turgut Ozal University.

Findings on Kidney Transplants Reported by Investigators at University of Birmingham (Clinical outcomes with ABO antibody titer variability in a multicenter study of ABO-incompatible kidney transplantation in the United Kingdom)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Transplant Medicine - Kidney Transplants is now available. According to news reporting out of Birmingham, United Kingdom, by NewsRx editors, research stated, "ABO blood group-incompatible kidney transplantation (ABOiKTx) outcomes are good, but complications are more common than in conventional transplantation. Regimens that use extracorporeal antibody removal therapy (EART) and enhanced immunosuppression are guided by titration of ABO blood group antibodies (using hemagglutination [HA] dilution assays), and these assays vary significantly in performance between centers."

Our news journalists obtained a quote from the research from the University of Birmingham, "This study aims to describe the differences in titer measurement and the effect on clinical practice and outcomes. This multicentre, prospective cohort study of 100 ABOiKTx recipients assessed treatment and outcome data, including HA assay results measured retrospectively in a single central laboratory. Patient and allograft survival at 1 year was 99% and 94%, respectively. There were significant differences in the number of pretransplantation EART sessions in centers undertaking plasma exchange (PEx), compared with immunoadsorption (IA) (median, 6 vs. 4 sessions; p = 0.007). The pre-EART HA titer in both groups was the same when centrally assayed. The local HA assay used to guide treatment yielded significantly higher titers in centers undertaking PEx compared with IA (median, 128 vs. 32; p < 0.005). Patients undergoing PEx rather than IA were significantly more likely to suffer postoperative hematoma (12.9% vs. 1.8%; p = 0.05) or any perioperative collection requiring drainage (19.4% vs. 3.6%; p = 0.02). The colinearity of HA assay sensitivity with the receipt of PEx and EART limits some conclusions regarding the likely direction of causation."

According to the news editors, the research concluded: "However, the association of differences in clinical practice with recognized perioperative complications of ABOiKTx identifies targets for further investigation and quality improvement."

Our news journalists report that additional information may be obtained by contacting S. Ball, University of Birmingham, Sch Immum & Infect, Birmingham, W Midlands, United Kingdom. Additional authors for this research include A.N.R. Barnett, M. Braitch, N. Kessaris, W. McKane, C. Newstead, G. McHaffie, A. Brown, S. Griffin, N. Mamode, D. Briggs and S. Ball.

Findings on Leg Ulcers Discussed by Investigators at Federal University (Autologous stem cell-based therapy for sickle cell leg ulcer: a pilot study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Skin Diseases and Conditions - Leg Ulcers. According to news reporting out of Salvador, Brazil, by NewsRx editors, research stated, "Recurrent chronic leg ulcers are among the most severe vasculopathic complications of sickle cell disease (SCD). Their treatment remains a challenge."

Funders for this research include Ministerio da Saude, Conselho Nacional de Desenvolvimento Cientifico e Tecnologico, Fundacao de Amparo a Pesquisa do Estado da Bahia.

Our news journalists obtained a quote from the research from Federal University, "Stem cell therapy with bone marrow mononuclear cells (BMMC) is a promising new therapeutic option for other forms of chronic ulcers. This prospective pilot study was performed to evaluate safety and feasibility of BMMC implantation in patients with SCD and chronic leg ulcers (SCLU). Ulcer closure, recurrence and local pain were evaluated. BMMC were successfully administered to 23 SCLU patients and no serious adverse events occurred. During the 6-month follow-up period, 91 <bold>3% </bold> of patients had improved ulcer pain compared with baseline and 29 <bold>2% </bold> of the treated ulcers achieved total healing. The frequency of progenitor stem cells (CD34CD45(low) and fibroblast colony-forming units) in BMMC was found to be significantly reduced in SCLU patients and compared to SCD patients without ulcers (P <0 004 and P<0 01, respectively). No relationship was observed between treatment outcome and the number of implanted BM progenitor stem cells."

According to the news editors, the research concluded: "BMMC implantation is a feasible and safe procedure, showing favourable outcomes for the treatment of SCLU, and encouraging further controlled clinical trials."

Our news journalists report that additional information may be obtained by contacting V. Fortuna, Federal University of Bahia, Hlth Sci Inst, BR-40110100 Salvador, BA, Brazil. Additional authors for this research include V. Fortuna, E.S. de Souza, G.C. Daltro, R. Meyer, C.P. Minniti and R. Boroevic.

Findings on Leishmaniasis Reported by Investigators at Bernhard-Nocht-Institute for Tropical Medicine (A Telomeric Cluster of Antimony Resistance Genes on Chromosome 34 of Leishmania infantum)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Parasitic Diseases and Conditions - Leishmaniasis have been presented. According to news reporting originating from Hamburg, Germany, by NewsRx correspondents, research stated, "The mechanisms underlying the drug resistance of Leishmania spp. are manifold and not completely identified. Apart from the highly conserved multidrug resistance gene family known from higher eukaryotes, Leishmania spp. also possess genus-specific resistance marker genes."

Financial support for this research came from European Union 7th Framework Programme.

Our news editors obtained a quote from the research from Bernhard-Nocht-Institute for Tropical Medicine, "One of them, ARM58, was first identified in Leishmania braziliensis using a functional cloning approach, and its domain structure was characterized in L. infantum. Here we report that L. infantum ARM58 is part of a gene cluster at the telomeric end of chromosome 34 also comprising the neighboring genes ARM56 and HSP23. We show that overexpression of all three genes can confer antimony resistance to intracellular amastigotes. Upon overexpression in L. donovani, ARM58 and ARM56 are secreted via exosomes, suggesting a scavenger/secretion mechanism of action. Using a combination of functional cloning and next-generation sequencing, we found that the gene cluster was selected only under antimony tartrate challenge and weakly under Cu2+ challenge but not under sodium arsenite, Cd2+, or miltefosine challenge. The selective advantage is less pronounced in intracellular amastigotes treated with the sodium stibogluconate, possibly due to the known macrophage-stimulatory activity of this drug, against which these resistance markers may not be active."

According to the news editors, the research concluded: "Our data point to the specificity of these three genes for antimony resistance."

For more information on this research see: A Telomeric Cluster of Antimony Resistance Genes on Chromosome 34 of Leishmania infantum. *Antimicrobial Agents and Chemotherapy*, 2016;60(9):5262-5275. *Antimicrobial Agents and Chemotherapy* can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Leukocyte Diseases and Conditions - Leukocytosis**

**Findings on Leukocytosis Reported by Investigators at Brown University (Leukocytosis and Leukemia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Leukocyte Diseases and Conditions - Leukocytosis have been presented. According to news originating from Providence, Rhode Island, by NewsRx correspondents, research stated, "Leukocytosis is among the most common findings on peripheral blood smear."

Our news journalists obtained a quote from the research from Brown University, "A wide range of causes may mediate this finding, and careful clinical and laboratory evaluation assist in differentiating between benign and malignant causes of increased white blood cell counts. In this article, various nonmalignant causes are explored, including infectious, inflammatory, autoimmune, and allergic."

According to the news editors, the research concluded: "In addition, malignant causes of leukocytosis are discussed, including myeloproliferative disorders, acute leukemia, and chronic leukemia, as well as treatment and monitoring for patients with these diseases."

The news correspondents report that additional information may be obtained from E.S. Winer, Brown University, Rhode Island Hospital, Div Hematol Oncol, Providence, RI 02903, United States.

Findings on Leukotriene Modifiers Reported by Investigators at Consejo Nacl Invest Cient and Tecn (Development of an enantioselective capillary electrophoretic method for the simultaneous determination of montelukast enantiomeric and ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Leukotriene Modifiers. According to news reporting originating from Buenos Aires, Argentina, by NewsRx correspondents, research stated, "A stereoselective CD-MEKC system has been developed for the quality control of Montelukast (MK), commercialized as a pure enantiomer. The proposed method is the first one that allows the simultaneous determination of MK, its enantiomeric form, diastereoisomers and its main degradation compound (MK sulphoxide)."

Our news editors obtained a quote from the research from Consejo Nacl Invest Cient and Tecn, "CD-MEKC system is composed of 10 mM SDS, 10 mM sulfobutylether-beta-CD, 10 mM TM-beta-CD, and 20 mM borate buffer at pH 9.0. Combination of these two CDs allows high baseline enantioresolution between MK and its enantiomeric impurity, but also, between the diastereoisomeric forms. Moreover, a multivariate design was applied to optimize operational parameters. The method was designed to meet with requirements of the official pharmacopoeias and fully validated according to international guidelines. Linearity of MK was demonstrated in the range from 10.0 to 100.0 μg/mL (r^2 = 0.9908) with a LOD and LOQ of 0.30 and 0.90 μg/mL, respectively. Intra and interday precision were evaluated and RSD values were below 2%, and also, accuracy expressed as percentage of recovery was in a range from 99.0 to 101.9 for the three assayed levels. The method allows determining 0.02% w/w of the enantiomeric and diastereoisomeric impurities, and 0.01% w/w of MK sulphoxide. Robustness was evaluated by a Plackett and Burman design."

According to the news editors, the research concluded: "Finally, the CD-MEKC system was successfully applied to the determination of related substances in MK bulk drug and its quantification in two pediatric pharmaceutical dosage forms."

The news editors report that additional information may be obtained by contacting S. Lucangioli, Consejo Nacl Invest Cient & Tecn, Buenos Aires, DF, Argentina. Additional authors for this research include M.H. Juan, V. Tripodi and S. Lucangioli.

Keywords for this news article include: Buenos Aires, Argentina, South America, Antiarrhythmic Agents, Leukotriene Modifiers, Drugs and Therapies, Montelukast Therapy, Respiratory Agents, Consejo Nacl Invest Cient and Tecn.

Findings on Liposomes Detailed by Investigators at Rush University
(Postoperative Pain Management After Primary Total Knee Arthroplasty: The Value of Liposomal Bupivacaine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biotechnology - Liposomes. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "Multimodal pain protocols have been proposed to achieve improved long-acting postoperative analgesia. Controlling postoperative pain after joint arthroplasty is especially important as it relates to patient satisfaction and outcomes."

Our news journalists obtained a quote from the research from Rush University, "The purpose of this study was to compare the postoperative pain, time to ambulation, and overall narcotic usage between patients who received either a femoral nerve block with a periarticular bupivacaine injection or a periarticular bupivacaine and extended-release liposomal bupivacaine injection after primary total knee arthroplasty. A total of 597 consecutive primary total knee arthroplasties performed between September 1, 2012 and August 31, 2014 received preoperative celecoxib, oxycodone, and transdermal scopolamine. Intraoperatively, patients either received a single-dose bupivacaine femoral nerve block along with 30-mL 0.25% bupivacaine periarticular injection (group A) or a 60-mL periarticular injection alone (20-mL liposomal bupivacaine, 30-mL 0.25% bupivacaine, and 10-mL saline; group B). The postoperative pain scores, narcotic usage, and time to ambulation were retrospectively collected from the electronic medical record. These outcomes were compared between treatment groups. There were 325 patients in group A compared with 272 in group B during the time frame. There was no difference among age, gender, race, and body mass index between the groups. Group B demonstrated a decreased need for breakthrough pain medication (16.9% vs 36.3% P< .001), decreased pain 12 hours postoperatively (3.2 vs 3.6 P< .003), and an earlier time to ambulation (29.5 hours vs 32.2 hours, P< .017). There was no difference in hospital length of stay (2.8 vs 2.6 days, P = .123). On controlling for demographic factors, patients in group B were able to ambulate 2.3 hours earlier than those in group A (coefficient = -2.3, P = .049)."

According to the news editors, the research concluded: "Liposomal bupivacaine resulted in a decrease need for breakthrough pain medication, improved pain scores at 12 hours, and an earlier time to ambulation compared to a combined femoral nerve block and periarticular bupivacaine injection."

Our news journalists report that additional information may be obtained by contacting S.M. Sporer, Rush University, Medical Center, Dept. of Orthopaed Surg, Chicago, IL 60612, United States.

Biotechnology - Liposomes

Findings on Liposomes Reported by Investigators at University of Waterloo (Adsorption of Nanoceria by Phosphocholine Liposomes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Biotechnology - Liposomes. According to news reporting from Waterloo, Canada, by NewsRx journalists, research stated, "Nanoceria (CeO2 nanoparticle) possesses a number of enzyme-like activities. In particular, it scavenges reactive oxygen species based on in-vitro and in vivo antioxidation studies."

Financial support for this research came from Natural Sciences and Engineering Research Council of Canada.

The news correspondents obtained a quote from the research from the University of Waterloo, "An important aspect of fundamental physical understanding is its interaction with lipid membranes that are the main components of the cell membrane. In this work, adsorption of nanoceria onto phosphocholine (PC) liposomes was performed. PC lipids are the main constituents of the cell outer membrane. Using a fluorescence quenching assay, a nanoceria adsorption isotherm was determined at various pH values and ionic strengths. A non-Langmuir isotherm occurred at pH 4 because of lateral electrostatic repulsion among the adsorbed cationic nanoceria. The phosphate group in the PC lipid is mainly responsible for the interaction, and the adsorbed nanoceria can be displaced by free inorganic phosphate. The tendency of the system to form large aggregates is a function of pH and the concentration of nanoceria, attributable to nanoceria being positively charged at pH 4 and neutral at physiological pH. Calcein leakage tests indicate that nanoceria induces liposome leakage because of transient lipid phase transition, and cryo-transmission electron microscopy indicates that the overall shape of the liposome is retained although deformation is still observed."

According to the news reporters, the research concluded: "This study provides fundamental biointerfacial information at a molecular level regarding the interaction of nanoceria and model cell membranes."

Our news journalists report that additional information may be obtained by contacting J.W. Liu, University of Waterloo, Waterloo Inst Nanotechnol, Dept. of Chem, Waterloo, ON N2L 3G1, Canada.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1021/acs.langmuir.6b03342. This DOI is a link to an online electronic document that is either free or for purchase.

Findings on Liver Cancer Discussed by Investigators at China Medical University and Hospital (Short-term and long-term efficacy of 7 targeted therapies for the treatment of advanced hepatocellular carcinoma: a network meta-analysis Efficacy of ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Liver Cancer have been published. According to news reporting originating in Shenyang, People's Republic of China, by NewsRx journalists, research stated, "A variety of targeted drug therapies in clinical trials have been proven to be effective for the treatment of hepatocellular carcinoma (HCC). Our study aims to compare the short-term and long-term efficacies of different targeted drugs in advanced hepatocellular carcinoma (AHCC) treatment using a network meta-analysis approach."

The news reporters obtained a quote from the research from China Medical University and Hospital, "PubMed, Embase, Ovid, EBSCO, and Cochrane central register of controlled trials were searched for randomized controlled trials (RCTs) of different targeted therapies implemented to patients with AHCC. And the retrieval resulted in 7 targeted drugs, namely, sorafenib, ramucirumab, everolimus, brivanib, tivantinib, sunitinib, and sorafenib+erlotinib. Direct and indirect evidence were combined to evaluate stable disease (SD), progressive disease (PD), complete response (CR), partial response (PR), disease control rate (DCR), overall response ratio (ORR), overall survival (OS), and surface under the cumulative ranking curve (SUCRA) of patients with AHCC. A total of 11 RCTs were incorporated into our analysis, including 6594 patients with AHCC, among which 1619 patients received placebo treatment and 4975 cases had targeted therapies. The results revealed that in comparison with placebo, sorafenib, and ramucirumab displayed better short-term efficacy in terms of PR and ORR, and brivanib was better in ORR. Regarding long-term efficacy, sorafenib and sorafenib+erlotinib treatments exhibited longer OS. The data of cluster analysis showed that ramucirumab or sorafenib+erlotinib presented relatively better short-term efficacy for the treatment of AHCC."

According to the news reporters, the research concluded: "This network meta-analysis shows that ramucirumab and sorafenib+erlotinib may be the better targeted drugs for AHCC patients, and sorafenib+erlotinib achieved a better long-term efficacy."

For more information on this research see: Short-term and long-term efficacy of 7 targeted therapies for the treatment of advanced hepatocellular carcinoma: a network meta-analysis Efficacy of 7 targeted therapies for AHCC. Medicine, 2016;95(49):511-520. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Findings on Liver Cancer Reported by Investigators at Kansai Medical University (Effects of implementing an "enhanced recovery after surgery" program on patients undergoing resection of hepatocellular carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting from Osaka, Japan, by NewsRx journalists, research stated, "To evaluate the effects of implementing an 'enhanced recovery after surgery' (ERAS) program on the feasibility, safety, and effectiveness of extensive and potentially curative liver resection for hepatocellular carcinoma (HCC). We compared clinicopathologic factors, surgical factors, and outcomes of patients who underwent extended hepatectomy (defined as resection of more than two sections) for HCC, before and after the introduction of an ERAS program."

The news correspondents obtained a quote from the research from Kansai Medical University, "Operating times and postoperative hospital stay were significantly shorter, and total volume infused during surgery was significantly lower, for the ERAS group than for the control group. Although the ERAS group had a significantly lower percentage of patients with retention of abdominal drainage, this group had a higher frequency of abdominal paracentesis in patients without intraoperative abdominal drainage. Oral dietary intake and the ability to walk steadily resumed significantly earlier in the ERAS group. Postoperative serum concentrations of albumin and cholinesterase were significantly higher in the ERAS group than in the control group."

According to the news reporters, the research concluded: "The ERAS program was feasible and effective for patients with chronic liver disease undergoing extended liver resection for HCC, because it allowed earlier oral dietary intake and promoted faster postoperative recovery."

Our news journalists report that additional information may be obtained by contacting M. Kaibori, Kansai Mededical University, Next Generat Minimally Invas Surg, Hirakata, Osaka 5731191, Japan. Additional authors for this research include K. Matsui, M. Ishizaki, H. Iida, K. Yoshii, H. Asano and M. Kon.

Findings on Liver Cancer Reported by Investigators at Soochow University (Biomarker MicroRNAs for Diagnosis, Prognosis and Treatment of Hepatocellular Carcinoma: A Functional Survey and Comparison)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Liver Cancer are discussed in a new report. According to news reporting from Suzhou, People's Republic of China, by NewsRx journalists, research stated, "Hepatocellular Carcinoma (HCC) is one of the most common malignant tumors with high incidence and mortality rate. Precision and effective biomarkers are therefore urgently needed for the early diagnosis and prognostic estimation."

The news correspondents obtained a quote from the research from Soochow University, "MicroRNAs (miRNAs) are important regulators which play functions in various cellular processes and biological activities. Accumulating evidence indicated that the abnormal expression of miRNAs are closely associated with HCC initiation and progression. Recently, many biomarker miRNAs for HCC have been identified from blood or tissues samples, however, the universality and specificity on clinicopathological features of them are less investigated."

According to the news reporters, the research concluded: "In this review, we comprehensively surveyed and compared the diagnostic, prognostic, and therapeutic roles of HCC biomarker miRNAs in blood and tissues based on the cancer hallmarks, etiological factors as well as ethnic groups, which will be helpful to the understanding of the pathogenesis of biomarker miRNAs in HCC development and further provide accurate clinical decisions for HCC diagnosis and treatment."

Findings on Liver Cancer Reported by Researchers at Yonsei University College of Medicine (Subclassification of Barcelona Clinic Liver Cancer B and C hepatocellular carcinoma: A cohort study of the multicenter registry database)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Liver Cancer. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "We aimed to subclassify hepatocellular carcinoma (HCC) using Barcelona Clinic Liver Cancer intermediate and advanced stages, which include a highly heterogeneous population. From two registries ('random' and 'voluntary' cohorts in the Korean Liver Cancer Study Group), patients who were newly diagnosed as HCC with intermediate or advanced stage between 2003 and 2005 were considered eligible."

Our news journalists obtained a quote from the research from the Yonsei University College of Medicine, "Overall survival (OS) was analyzed using Kaplan-Meier method with comparison by log-rank test. Patients with intermediate-stage HCC (n=994) were subclassified according to tumor size and Child-Pugh class. Patients with tumor size <5 cm (B1), those with tumor size (≥) 5 cm and Child-Pugh A (B2), and those with tumor size (≥) 5 cm and Child-Pugh B (B3) had median OS of 30.73, 20.60, and 9.23 months, respectively (p <0.001 by log-rank test). Among patients with advanced stage HCC (n=1746), patients were subclassified according to presence of significant portal vein invasion (sPVI; defined as portal vein invasion in lobar, main, or contralateral branch) and extrahepatic spread (EHS). Patients with neither sPVI nor EHS (C1), those with either sPVI or EHS (C2), and those with both sPVI and EHS (C3) had median OS of 8.43, 4.63, and 3.63 months, respectively (p <0.001 by log-rank test)."

According to the news editors, the research concluded: "Subclassification of Barcelona Clinic Liver Cancer intermediate and advanced stages might be useful for determining patient prognosis and guiding treatment strategies for HCC."

Our news journalists report that additional information may be obtained by contacting S. Lee, The Korean Liver Cancer Study Group, Yonsei University College of Medicine, Seoul, South Korea. Additional authors for this research include B.K. Kim, K. Song, J.Y. Park, S.H. Ahn, S.U. Kim, K.H. Han and do Y Kim.

Findings on Lung Cancer Discussed by Investigators at People's Hospital (WWOX inhibits the invasion of lung cancer cells by downregulating RUNX2)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Lung Cancer is now available. According to news reporting from Jiangsu, People's Republic of China, by NewsRx journalists, research stated, "The WW domain-containing oxidoreductase (WWOX) is a tumor suppressor that is lost or decreased in most human tumors. The role of WWOX in human lung carcinoma invasion is still not clear."

The news correspondents obtained a quote from the research from People's Hospital, "This study aimed to elucidate the potential role of WWOX in lung cancer cell invasion. WWOX mRNA levels in human lung cancers and lung cancer cell lines were assayed by quantitative real-time. PCR. WWOX in lung cancer cell lines was manipulated by transfection of expression vector or small interfering RNA. Cell migration and invasion were assessed by wound healing and/or transwell migration and invasion assays. The protein levels of WWOX, E-cadherin and RUNX2 were analyzed by western blot or immunofluorescence. WWOX expression is inversely correlated to invasiveness of lung cancer. WWOX overexpression in highly invasive H1299 cells reduced cell motility and invasiveness, and inhibited the expression of RUNX2 and its target gene matrix metalloprotease-9 (MMP-9). Silencing WWOX in less invasive NL9980 cells resulted in opposite effects. Overexpressing RUNX2 in H1299 or silencing RUNX2 in NL9980 cells reversed the effects of WWOX."

According to the news reporters, the research concluded: "These results suggested that WWOX inhibited the invasive phenotype of lung cancer through downregulating the expression of RUNX2."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/cgt.2016.59. This DOI is a link to an online electronic document that is either free or for purchase.

Findings on Lung Cancer Reported by Investigators at City of Hope National Medical Center (Perceptions and Utilization of Lung Cancer Screening Among Primary Care Physicians)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news reporting originating in Duarte, California, by NewsRx journalists, research stated, "Lung cancer screening (LCS) with low-dose computed tomography (LDCT) is effective at reducing lung cancer mortality in high-risk current and former smokers. Despite the fact that screening is recommended by the U.S."

Funders for this research include Lung Cancer Research Foundation, National Institutes of Health.

The news reporters obtained a quote from the research from the City of Hope National Medical Center, "Preventative Services Task Force (USPSTF), few eligible patients are screened. We set out to study the barriers to LCS by surveying primary care physicians (PCPs). We surveyed a randomly selected sample of 1384 eligible PCPs between January and October 2015, using the American Medical Association Physician Masterfile, though surveys sent by mail, fax, and e-mail. The survey included questions regarding knowledge of LCS guidelines, utilization of LCS over the prior 12 months, and perceptions of barriers to LCS. Training background, years in practice, practice type, and demographics were also collected. The survey response rate was 18%. Responders and nonresponders did not differ by practice or demographic characteristics. Of the respondents, 47% indicated that LCS was recommended by the USPSTF, 52% had referred at least one patient for LDCT, and 12% had referred at least one patient to a LCS program over the prior 12 months. Perceived barriers to LCS included uncertainty regarding their benefit of LCS, concern regarding insurance coverage, and the harm of LCS. Although LCS is recommended by the USPSTF, LDCT is utilized in a minority of eligible patients, as reported by surveyed PCPs. Approximately half of PCPs are familiar with USPSTF recommendations for LCS and a number of physician barriers to adherence to guidelines exist."

According to the news reporters, the research concluded: "Additional study of physician- and system-based interventions to improve adherence to LCS recommendations is needed."

Our news correspondents report that additional information may be obtained by contacting D.J. Raz, City Hope Natl Med Center, Div Thorac Surg, Duarte, CA, United States. Additional authors for this research include G.X. Wu, M. Consunji, R. Nelson, C. Sun, L. Erhunmwunsee, B. Ferrell, V. Sun and J.Y. Kim.

Oncology - Lymphoma

Findings on Lymphoma Detailed by Investigators at University of Alberta (The Influence of Corticosteroids on Diagnostic Accuracy of Biopsy for Primary Central Nervous System Lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lymphoma have been published. According to news reporting from Edmonton, Canada, by NewsRx journalists, research stated, "Classical neurosurgical teaching suggests that corticosteroid administration reduces the diagnostic yield of stereotactic brain biopsy for primary central nervous system lymphoma (PCNSL)."

The news correspondents obtained a quote from the research from the University of Alberta, "In a single-center series spanning 6 years, we reviewed 155 consecutive biopsy patients, 135 treated with prebiopsy corticosteroids. PCNSL was correctly diagnosed on initial biopsy in 15 of 16 steroid-treated patients; in the single nondiagnostic specimen, polymerase chain reaction reanalysis by an outside institution showed evidence of lymphoproliferative disease consistent with PCNSL."

According to the news reporters, the research concluded: "Our data challenge the notion that it is necessary to withhold corticosteroid therapy for cerebral edema in patients awaiting stereotactic biopsy for suspected PCNSL."

For more information on this research see: The Influence of Corticosteroids on Diagnostic Accuracy of Biopsy for Primary Central Nervous System Lymphoma. Canadian Journal of Neurological Sciences, 2016;43(5):721-725. Canadian Journal of Neurological Sciences can be contacted at: Cambridge Univ Press, 32 Avenue Of The Americas, New York, NY 10013-2473, USA.

Findings on Lymphoma Discussed by Investigators at University of Athens (Brentuximab vedotin in combination with or without donor lymphocyte infusion for patients with Hodgkin lymphoma after allogeneic stem cell transplantation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Lymphoma have been published. According to news originating from Athens, Greece, by NewsRx correspondents, research stated, "In our study, we evaluated the safety and efficacy of Brentuximab vedotin (BV) with or without the addition of donor lymphocyte infusion (DLI) after allogeneic stem cell transplantation (allo-SCT) in 16 patients with advanced Hodgkin lymphoma (HL). Thirteen patients with relapsed HL after allo-SCT received BV as treatment for active disease."

Our news journalists obtained a quote from the research from the University of Athens, "Three patients without progression of HL after allo-SCT received BV as consolidation. Twelve patients had been previously exposed to BV for treatment of relapse after autologousSCT. Ten out of 16 patients received BV in combination with DLI. Among the 13 patients treated for active disease, CR and PR was observed in 7 and 2 patients, respectively. With a median follow-up of 13 months, 13 out of 16 patients are alive, while 3 died because of disease progression. The median PFS was 6 months. DLI-associated GVHD occurred in seven patients. Five patients with GVHD required immunosuppression, and in all cases, GVHD resolved after a short course of low dose steroids, implying that an antiGVHD modulating effect could be induced by the concurrent administration of BV."

According to the news editors, the research concluded: "No serious adverse event was observed in any of the patients."

For more information on this research see: Brentuximab vedotin in combination with or without donor lymphocyte infusion for patients with Hodgkin lymphoma after allogeneic stem cell transplantation. Bone Marrow Transplantation, 2016;51(10):1313-1317. Bone Marrow Transplantation can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Bone Marrow Transplantation - www.nature.com/bmt/)

The news correspondents report that additional information may be obtained from P. Tsirigotis, University of Athens, ATTIKO Univ Hosp, Dept. of Internal Med 2, Athens 2462, Greece. Additional authors for this research include I. Danylesko, K. Gkirkas, N. Shem-Tov, R. Yerushalmi, M. Stamouli, A. Avigdor, A. Spyridonidis, J. Gauthier, G. Goldstein, J. Apostolidis, M. Mohty, A. Findings on Lymphoma Reported by Researchers at Alexandra Hospital
(Recent treatment advances in Hodgkin lymphoma: a concise review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lymphoma. According to news reporting originating in Brisbane, Australia, by NewsRx journalists, research stated, "The majority of patients with Hodgkin lymphoma enjoy durable remissions following front-line treatment. This typically involves combination chemotherapy with or without radiotherapy."

The news reporters obtained a quote from the research from Alexandra Hospital, "A significant minority of patients experience relapsed/refractory disease, of whom only approximately half can be 'salvaged' with conventional second-line treatments. Until recently, for those patients either failing or who are not fit for salvage, there have been few curative alternatives. Furthermore, there is a significant risk of delayed treatment complications to conventional therapies, including secondary malignancies and cardiac disease. However, novel targeted therapies are producing excellent results in clinical trials. They provide additional treatment options for those with relapsing/refractory disease; they may have potential in front-line therapy. The anti-CD30 antibody brentuximab vedotin (BV) has been tested as monotherapy and in combination in a variety of clinical settings, including in relapsed/refractory patients and as consolidative therapy following standard second-line therapy. Nivolumab and pembrolizumab, currently used in other malignancies that are known to utilise the programmed death pathway for survival, have shown outstanding results when used as single agents in heavily pre-treated (including BV refractory) patients. Individualising and adapting a patient's treatment course, whether augmenting or rationalising therapy, based on an interim positron emission tomography/computed tomography response is an important strategy currently under exploration to minimise toxicity while maximising response. Further work is needed to explore clinical and biological factors associated with improved outcomes."

According to the news reporters, the research concluded: "Knowledge of these factors combined with the movement of novel therapies into the front-line setting will enable individualised therapy to enhance clinical responses and minimise toxicities."

Our news correspondents report that additional information may be obtained by contacting S. Arulogun, Dept. of Haematology, Princess Alexandra Hospital, Brisbane, Queensland, Australia. Additional authors for this research include M. Hertzberg and M.K Gandhi.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/imj.13051. This DOI is a link to an online electronic document that is either free or for purchase.

Findings on Macropinocytosis Reported by Investigators at School of Medicine (A Diaphanous-related formin links Ras signaling directly to actin assembly in macropinocytosis and phagocytosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Macropinocytosis are presented in a new report. According to news reporting originating in Hannover, Germany, by NewsRx journalists, research stated, "Phagocytosis and macropinocytosis are Ras-regulated and actin-driven processes that depend on the dynamic rearrangements of the plasma membrane that protrudes and internalizes extracellular material by cup-shaped structures. However, the regulatory mechanisms underlying actin assembly in large-scale endocytosis remain elusive."

The news reporters obtained a quote from the research from the School of Medicine, "Here, we show that the Diaphanous-related formin G (ForG) from the professional phagocyte Dictyostelium discoideum localizes to endocytic cups. Biochemical analyses revealed that ForG is a rather weak nucleator but efficiently elongates actin filaments in the presence of profilin. Notably, genetic inactivation of ForG is associated with a strongly impaired endocytosis and a markedly diminished F-actin content at the base of the cups. By contrast, ablation of the Arp2/3 (actin-related protein-2/3) complex activator SCAR (suppressor of cAMP receptor) diminishes F-actin mainly at the cup rim, being consistent with its known localization. These data therefore suggest that ForG acts as an actin polymerase of Arp2/3-nucleated filaments to allow for efficient membrane expansion and engulfment of extracellular material."

According to the news reporters, the research concluded: "Finally, we show that ForG is directly regulated in large-scale endocytosis by RasB and RasG, which are highly related to the human proto-oncogene KRas."

For more information on this research see: A Diaphanous-related formin links Ras signaling directly to actin assembly in macropinocytosis and phagocytosis. Proceedings of the National Academy of Sciences of the United States of America, 2016;113(47):E7464-E7473. Findings on Mathematics Reported by Investigators at Mississippi State University (Constrained topological optimization of a football helmet facemask based on brain response)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Mathematics is now available. According to news reporting originating from Mississippi State, Mississippi, by NewsRx correspondents, research stated, "Surrogate model-based multi-objective design optimization was performed to reduce concussion risk during frontal football helmet impacts. In particular, a topological decomposition of the football helmet facemask was performed to formulate the design problem, and brain injury metrics were exploited as objective functions."

Our news editors obtained a quote from the research from Mississippi State University, "A validated finite element model of a helmeted human head was used to recreate facemask impacts. Due to the prohibitive computational expense of the full scale simulations, a surrogate modeling approach was employed. An optimal surrogate model selection framework, called Concurrent Surrogate Model Selection, or COSMOS, was utilized to identify the surrogate models best suited to approximate each objective function. The resulting surrogate models were implemented in the Non-dominated Sorting Genetic Algorithm II (NSGA-II) optimization algorithm. Constraints were implemented to control the solid material fraction in the facemask design space, and binary variables were used to control the placement of the facemask bars. The optimized facemask designs reduced the maximum tensile pressure in the brain by 7.5% and the maximum shear strain by a remarkable 39.5%." According to the news editors, the research concluded: "This research represents a first-of-its-kind approach to multi-objective design optimization on a football helmet, and demonstrates the possibilities that are achievable in improving human safety by using such a simulation-based design optimization."

The news editors report that additional information may be obtained by contacting K.L. Johnson, Mississippi State University, CAVS, Mississippi State, MS 39762, United States. Additional authors for this research include S. Chowdhury, W.B. Lawrimore, Y. Mao, A. Mehmani, R. Prabhu, G.A. Rush and M.F. Horstemeyer. Findings on Medical Genetics Reported by Investigators at Hospital of Santa Maria (A Novel MED12 Mutation: Evidence for a Fourth Phenotype)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Genetics - Medical Genetics is the subject of a report. According to news reporting out of Perugia, Italy, by NewsRx editors, research stated, "Mutations of the MED12 gene have been reported mainly in males with FG (Opitz-Kaveggia), Lujan-Fryns, or X-linked Ohdo syndromes. Recently, a different phenotype characterized by minor anomalies, severe intellectual disability (ID), and absent language was reported in female and male patients belonging to the same family and carrying a frameshift MED12 mutation (c.5898dupC)."

Our news journalists obtained a quote from the research from the Hospital of Santa Maria, "Here, we report on two brothers and their niece affected by severe and mild ID, respectively, where whole exome sequencing combined with variant analysis within a panel of ID-related genes, disclosed a novel c.2312T>C (p.Ile771Thr) MED12 mutation. This variant, which has not been reported as a polymorphism, was not present in a third unaffected brother, and was predicted to be deleterious by five bioinformatic databases. This finding together with the phenotypic analogies shared with the carriers of c.5898dupC mutation suggests the existence of a fourth MED12-related disorder, characterized by severe ID, absent or deficient language and, milder, clinical manifestation in heterozygotes."

According to the news editors, the research concluded: "We have reviewed the literature on MED12 heterozygotes, their clinical manifestations, and discuss the possible biological causes of this condition."

Our news journalists report that additional information may be obtained by contacting P. Prontera, Hosp Santa Maria Misericordia, Medical Genet Unit, Perugia, Italy. Additional authors for this research include V. Ottaviani, D. Rogaia, I. Isidori, A. Mencarelli, N. Malerba, D. Cocciadiferro, P. Rolph, G. Stangoni, A. Vulto-vanSilfhout and G. Merla.

Health and Medicine - Medical Physics

Findings on Medical Physics Detailed by Researchers at Sunnybrook Research Institute (Quantifying masking in clinical mammograms via local detectability of simulated lesions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Health and Medicine - Medical Physics. According to news reporting originating from Toronto, Canada, by NewsRx correspondents, research stated, "High mammographic density is known to be associated with decreased sensitivity of mammography. Recent changes in the BI-RADS density assessment address the effect of masking by densities, but the BI-RADS assessment remains qualitative and achieves only moderate agreement between radiologists."

Funders for this research include Ontario Institute for Cancer Research (OICR), Canadian Cancer Society Research Institute (CCSRI).

Our news editors obtained a quote from the research from Sunnybrook Research Institute, "An automated, quantitative algorithm that estimates the likelihood of masking of simulated masses in a mammogram by dense tissue has been developed. The algorithm considers both the effects of loss of contrast due to density and the distracting texture or appearance of dense tissue. A local detectability (dL) map is created by tessellating the mammograms into overlapping regions of interest (ROIs), for which the detectability by a non-prewhitening observer is computed using local estimates of the noise power spectrum and volumetric breast density (VBD). The dL calculation was validated in a 4-alternative forced-choice observer study on the ROIs of 150 craniocaudal digital mammograms. The dL metric was compared against the inverse threshold contrast, \((DmT)^{-1}\) from the observer study, the anatomic noise parameter \(b\), the radiologist's BI-RADS density category, and a validated measure of VBD (Cumulus). The mean dL had a high correlation of \(r=0.915\) and \(r=0.699\) with \((DmT)^{-1}\) in the computerized and human observer study, respectively. In comparison, the local VBD estimate had a low correlation of \(0.538\) with \((DmT)^{-1}\). The mean dL had a correlation of \(0.663\), \(0.835\), and \(0.696\) with BI-RADS density, \(b\), and Cumulus VBD, respectively. The proposed dL metric may be useful in characterizing the potential for lesion masking by dense tissue."

According to the news editors, the research concluded: "Because it uses information about the anatomic noise or tissue appearance, it is more closely linked to lesion detectability than VBD metrics."

For more information on this research see: Quantifying masking in clinical mammograms via local detectability of simulated lesions. Medical Physics, 2016;43(3):1249-58. Medical Physics can be contacted at: Amer Assoc Physicists Medicine Amer Inst Phys, Ste 1 No 1, 2 Huntington Quadrangle, Melville, NY 11747-4502, USA. (American Association of Physicists in Medicine - www.aapm.org; Medical Physics - online.medphys.org/)

The news editors report that additional information may be obtained by contacting J.G. Mainprize, Physical Sciences, Sunnybrook Research Institute, 2075 Bayview Avenue, Toronto, Ontario M4N 3M5, Canada. Additional authors for this research include O. Alonzo-Proulx, R.A. Jong and M.J Yaffe.

Oncology - Melanoma

Findings on Melanoma Reported by Investigators at University of Ulsan
(Upregulation of annexin A1 expression by butyrate in human melanoma cells induces invasion by inhibiting E-cadherin expression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Melanoma. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "Epithelial to mesenchymal transition (EMT) is a critical step in the metastasis of epithelial cancer cells. Butyrate, which is produced from dietary fiber by colonic bacterial fermentation, has been reported to influence EMT."

Funders for this research include Basic Science Research Program through the National Research Foundation of Korea (NRF) funded by the Ministry of Education, Asan Institute for Life Sciences.

The news correspondents obtained a quote from the research from the University of Ulsan, "However, some studies have reported that butyrate promotes EMT, while others have reported an inhibitory effect. To clarify these controversial results, it is necessary to elucidate the mechanism by which butyrate can influence EMT. In this study, we examined the potential role of annexin A1 (ANXA1), which was previously reported to promote EMT in breast cancer cells, as a mediator of EMT regulation by butyrate. We found that ANXA1 mRNA and protein were expressed in highly invasive melanoma cell lines (A2058 and A375), but not in SK-MEL-5 cells, which are less invasive. We also showed that butyrate induced ANXA1 mRNA and protein expression and promoted EMT-related cell invasion in SK-MEL-5 cells. Downregulation of ANXA1 expression using specific small interfering RNAs in butyrate-treated SK-MEL-5 cells resulted in increased expression of the epithelial marker E-cadherin and decreased cell invasion. Moreover, overexpressing ANXA1 decreased the expression of the E-cadherin."

According to the news reporters, the research concluded: "Collectively, these results indicate that butyrate induces the expression of ANXA1 in human melanoma cells, which then promotes invasion through activating the EMT signaling pathway."

Our news journalists report that additional information may be obtained by contacting S.W. Jang, University of Ulsan, Coll Med, Dept. of Biochem & Mol Biol, Seoul 138736, South Korea. Additional authors for this research include I.S. Song, J.H. Pak and S.W.
Oncology - Merkel Cell Cancer

Findings on Merkel Cell Cancer Reported by Investigators at IBBTEC (Shared Oncogenic Pathways Implicated in Both Virus-Positive and UV-Induced Merkel Cell Carcinomas)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Merkel Cell Cancer are presented in a new report. According to news reporting originating from Santander, Spain, by NewsRx correspondents, research stated, "Merkel cell carcinoma (MCC) is a highly malignant neuroendocrine tumor of the skin whose molecular pathogenesis is not completely understood, despite the role that Merkel cell polyomavirus can play in 55-90% of cases. To study potential mechanisms driving this disease in clinically characterized cases, we searched for somatic mutations using whole-exome sequencing, and extrapolated our findings to study functional biomarkers reporting on the activity of the mutated pathways."

Our news editors obtained a quote from the research from IBBTEC, "Confirming previous results, Merkel cell polyomavirus-negative tumors had higher mutational loads with UV signatures and more frequent mutations in TP53 and RB compared with their Merkel cell polyomavirus-positive counterparts. Despite important genetic differences, the two Merkel cell carcinoma etiologies both exhibited nuclear accumulation of oncogenic transcription factors such as NFAT or nuclear factor of activated T cells (NFAT), P-CREB, and P-STAT3, indicating commonly deregulated pathogenic mechanisms with the potential to serve as targets for therapy."

According to the news editors, the research concluded: "A multi-variable analysis identified phosphorylated CRE-binding protein as an independent survival factor with respect to clinical variables and Merkel cell polyomavirus status in our cohort of Merkel cell carcinoma patients."

The news editors report that additional information may be obtained by contacting J.P. Vaque, IBBTEC UC CSIC SODERCAN, Inst Biomed & Biotecnol Cantabria, Santander, Spain. Additional authors for this research include S. Curiel-Olmo, S. Derdak, S. Beltran, M.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jid.2016.08.015. This DOI is a link to an online electronic document that is either free or for purchase.

Nutritional and Metabolic Diseases and Conditions - …

Findings on Metabolic Syndrome Discussed by Investigators at Ignacio Chavez National Institute of Cardiology (Effect of the Aged Garlic Extract on Cardiovascular Function in Metabolic Syndrome Rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Metabolic Syndrome have been published. According to news reporting from Mexico City, Mexico, by NewsRx journalists, research stated, "The antioxidant properties of aged garlic extract (AGE) on cardiovascular functioning (CF) in metabolic syndrome (MS) remains poorly studied. Here we study the AGE effects on CF in a rat model of MS."

The news correspondents obtained a quote from the research from the Ignacio Chavez National Institute of Cardiology, "Control rats plus saline solution (C + SS), MS rats (30% sucrose in drinking water from weaning) plus saline solution (MS + SS), control rats receiving AGE (C + AGE 125 mg/Kg/12 h) and MS rats with AGE (MS + AGE) were studied. MS + SS had increased triglycerides, systolic blood pressure, insulin, leptin, HOMA index, and advanced glycation end products. AGE returned their levels to control values (p < 0.01). Cholesterol was decreased by AGE (p = 0.05). Glutathion and GPx activity were reduced in MS + SS rats and increased with AGE (p = 0.05). Lipid peroxidation was increased in MS + SS and AGE reduced it (p = 0.001). Vascular functioning was deteriorated by MS (increased vasocontraction and reduced vasodilatation) and AGE improved it (p = 0.001). Coronary vascular resistance was increased in MS rats and AGE decreased it (p = 0.001). Cardiac performance was not modified by MS but AGE increased it. NO measured in the perfusate liquid from the heart and serum citrulline, nitrites/nitrates were decreased in MS and AGE increased them (p < 0.01)."

According to the news reporters, the research concluded: "AGE reduces MS-induced cardiovascular risk, through its anti-oxidant properties."

Minimally Invasive Gynecology

Findings on Minimally Invasive Gynecology Discussed by Investigators at Mayo Clinic (Location of the Deep Epigastric Vessels in the Resting and Insufflated Abdomen)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Minimally Invasive Gynecology have been published. According to news reporting originating in Rochester, Minnesota, by NewsRx journalists, research stated, "To determine whether the location of the superior and inferior epigastric vessels (deep epigastric vessels) change with abdominal insufflation. Descriptive study (Canadian Task Force classification III)."

The news reporters obtained a quote from the research from Mayo Clinic, "Tertiary care academic institution. Patients undergoing gynecologic laparoscopic surgery were recruited. A total of 35 subjects were enrolled. Subjects underwent color Doppler ultrasound assessment of deep epigastric vessel location preoperatively and intraoperatively following abdominal insufflation. The deep epigastric vessels were identified at 5 points along the abdomen (pubic symphysis, anterior superior iliac spine [ASIS], umbilicus, xiphoid, and midpoint from umbilicus to xiphoid), with the distance from vessels to midline measured. Paired t tests and split-plot analysis of variance were used as appropriate. The mean patient age was 45.6 +/- 16.5 years, and mean BMI was 29.8 +/- 7.2. A significant difference between vessel location in the resting abdomen and insufflated abdomen was noted bilaterally at the ASIS, umbilicus, and midpoint from the umbilicus to the xiphoid. At each of these points, the deep epigastric vessels were found more laterally after insufflation on average, ranging from 0.6 +/- 0.9 cm (p <.001) more laterally at the midpoint between the umbilicus and xiphoid to 1.1 +/- 0.8 cm (p <.001) more laterally at the umbilicus. The most lateral location of the deep vessels after insufflation was seen at the ASIS (10.6 cm) and the umbilicus (10.9 cm). In a subanalysis of subjects grouped by body mass index (obese vs nonobese), deep epigastric vessels were more lateral in the insufflated abdomen of obese subjects compared with that of nonobese subjects at the ASIS, umbilicus, and midpoint from umbilicus to xiphoid (p <.05 for each point bilaterally). The deep epigastric vessels shift laterally with abdominal insufflation, and may be found as far as 10.9 cm from the midline; this is more lateral than previously described and is clinically significant."

According to the news reporters, the research concluded: "Obesity is associated with a more lateral location of the deep epigastric vessels."

**Oncology - Molecular Cancer and Carcinogenesis**

**Findings on Molecular Cancer and Carcinogenesis Reported by Investigators at University of Sao Paulo (beta-ionone modulates the expression of miRNAs and genes involved in the metastatic phenotype of microdissected persistent preneoplastic ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Molecular Cancer and Carcinogenesis have been published. According to news reporting originating from Sao Paulo, Brazil, by NewsRx correspondents, research stated, "MicroRNAs (miRNAs) are post-transcriptional gene expression regulators which expression is frequently altered in hepatocellular carcinoma (HCC). -ionone (I) is noted for its ability to inhibit persistent preneoplastic lesions (pPNLs) in liver rats. We evaluated the expression of miRNAs involved in carcinogenesis and possible targets modulated by I, in pPNLs and surrounding of microdissected tissues."

Our news editors obtained a quote from the research from the University of Sao Paulo, "Rats subjected to resistant hepatocyte model were treated during promotion stage with I (16mg/100g body weight) or corn oil (CO; 0.25mL/100g body weight; controls). Five animals receive no treatment (NT). In CO group, 38 and 29 miRNAs showed reduced expression relative to NT (P <0.05) in pPNLs and surrounding, respectively. No miRNAs showed increased expression in surrounding of the CO compared to NT group; however, 30 miRNAs showed increased expression (P0.05) in pPNLs of the CO group. There was no difference between I and CO groups (P >0.05) in the expression of miRNAs in surrounding. In pPNLs I increased expression of miR-122 and miR-34a (P0.05) and reduced of Igf2 (P0.05), target of the latter, compared to CO. Additionally, I decreased the expression of miR-181c and its target Gdf2 (P0.05). I reduced the expression of miR-181b and miR-708 (P0.05) and increased the expression of their respective target mRNAs Timp3 and Mtss1 (P0.05), relative to CO group. Modulation of miRNAs target genes by I was confirmed in vitro."

According to the news editors, the research concluded: "I is a promising chemopreventive agent in the initial stages of hepatocarcinogenesis, as it modulates the expression of the miRNAs and target genes that can alter the metastatic phenotype of HCC."

For more information on this research see: beta-ionone modulates the expression of miRNAs and genes involved in the metastatic phenotype of microdissected persistent preneoplastic lesions in rats submitted to hepatocarcinogenesis. *Molecular Carcinogenesis,*
Findings on Molecular Research Discussed by Investigators at Dong-A University (Transcriptional and Posttranslational Regulation of Nucleotide Excision Repair: The Guardian of the Genome against Ultraviolet Radiation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Molecular Research are presented in a new report. According to news reporting out of Busan, South Korea, by NewsRx editors, research stated, "Ultraviolet (UV) radiation from sunlight represents a constant threat to genome stability by generating modified DNA bases such as cyclobutane pyrimidine dimers (CPD) and pyrimidine-pyrimidone (6-4) photoproducts (6-4PP). If unrepaired, these lesions can have deleterious effects, including skin cancer."

Our news journalists obtained a quote from the research from Dong-A University, "Mammalian cells are able to neutralize UV-induced photolesions through nucleotide excision repair (NER). The NER pathway has multiple components including seven xeroderma pigmentosum (XP) proteins (XPA to XPG) and numerous auxiliary factors, including ataxia telangiectasia and Rad3-related (ATR) protein kinase and RCC1 like domain (RLD) and homologous to the E6-AP carboxyl terminus (HECT) domain containing E3 ubiquitin protein ligase 2 (HERC2)."

According to the news editors, the research concluded: "In this review we highlight recent data on the transcriptional and posttranslational regulation of NER activity."

For more information on this research see: Transcriptional and Posttranslational Regulation of Nucleotide Excision Repair: The Guardian of the Genome against Ultraviolet Radiation. International Journal of Molecular Sciences, 2016;17(11):1207-1220. International Journal of Molecular Sciences can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

Molecular Research

Findings on Molecular Research Reported by Investigators at Pusan National University (MICAL-like Regulates Fasciclin II Membrane Cycling and Synaptic Development)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Molecular Research is the subject of a report. According to news reporting originating in Yangsan, South Korea, by NewsRx journalists, research stated, "Fasciclin II (FasII), the Drosophila ortholog of neural cell adhesion molecule (NCAM), plays a critical role in synaptic stabilization and plasticity. Although this molecule undergoes constitutive cycling at the synaptic membrane, how its membrane trafficking is regulated to ensure proper synaptic development remains poorly understood."

The news reporters obtained a quote from the research from Pusan National University, "In a genetic screen, we recovered a mutation in Drosophila mical-like that displays an increase in bouton numbers and a decrease in FasII levels at the neuromuscular junction (NMJ). Similar phenotypes were induced by presynaptic, but not postsynaptic, knockdown of mical-like expression. FasII trafficking assays revealed that the recycling of internalized FasII molecules to the cell surface was significantly impaired in mical-like-knockdown cells. Importantly, this defect correlated with an enhancement of endosomal sorting of FasII to the lysosomal degradation pathway. Similarly, synaptic vesicle exocytosis was also impaired in mical-like mutants."

According to the news reporters, the research concluded: "Together, our results identify Mical-like as a novel regulator of synaptic growth and FasII endocytic recycling."

Our news correspondents report that additional information may be obtained by contacting J. Lee, Pusan National University, Inst Translat Dental Sci, Yangsan 50612, South Korea. Additional authors for this research include S. Park, J. Lee and S. Lee.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.14348/molcells.2016.0203. This DOI is a link to an online electronic document that is either free or for purchase.

Monoterpenes

Findings on Monoterpenes from S.F. Yang and Colleagues Provide New Insights (A Multiscale Study on the Penetration Enhancement Mechanism of Menthol to Osthole)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Monoterpenes are presented in a new report. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Menthol is a widely used penetration enhancer in clinical medicine due to its high efficiency and relative safety. However, details of the penetration enhancement mechanism of menthol on the molecular level is rarely involved in the discussion."

Funders for this research include Program for New Century Excellent Talents in University, National Natural Science Foundation of China.

Our news journalists obtained a quote from the research, "In this work, the penetration enhancement (PE) mechanism of menthol is explored by a multiscale method containing molecular dynamics simulations, in vitro penetration experiments, and transmission electron microscopy. Osthole is chosen to be the tested drug due to its common use in external preparations and because it often accompanies menthol as a PE in the preparations. The results show that menthol in each testing concentration can impair the lipid packing of stratum corneum (SC) and promote osthole permeating into SC, and the penetration promoting effect has an optimal concentration. At a low concentration, menthol causes the bilayer to relax with a reduction in thickness and increment in the lipid headgroup area. At a high concentration, menthol destroys the bilayer structure of SC and causes lipids to form a reversed micelle structure. The penetration enhancement mechanism of menthol is characterized mainly by the disruption of the highly ordered SC lipid in low concentrations and an improvement in the partitioning of drugs into the SC in high concentrations."

According to the news editors, the research concluded: "The results can provide some assistance for additional studies and applications of menthol as a penetration enhancer."

The news correspondents report that additional information may be obtained from X.Y. Shi, Key Lab TCM Informat Engn State Adm TCM, Beijing 100102, People's Republic of China. Additional authors for this research include R. Wang, G. Wan, Z.M. Wu, S.J. Guo, X.X. Dai, X.Y. Shi and Y.J. Qiao.

Autoimmune Diseases and Conditions - Multiple…

Findings on Multiple Sclerosis Discussed by Investigators at Royal Melbourne Hospital (A genetic basis for multiple sclerosis severity: Red herring or real?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Autoimmune Diseases and Conditions - Multiple Sclerosis. According to news reporting originating from Melbourne, Australia, by NewsRx correspondents, research stated, "Multiple Sclerosis (MS) is an autoimmune degenerative disease of the central nervous system, characterized by multifocal demyelination and neurodegeneration. The genetic architecture of MS is complex, where genetic risk has been attributed to over 100 polymorphic loci each with small odds ratios."

Our news editors obtained a quote from the research from Royal Melbourne Hospital, "MS is a highly heterogeneous disease with numerous clinical and paraclinical endophenotypes. To-date, no genetic variant has been associated with clinical outcome, however, evidence exists that MS outcomes, like risk, are to an extent also controlled by genetic variation."

According to the news editors, the research concluded: "Here we summarise the current evidence for genetic determination of disease outcomes and make recommendations for future research directions."

The news editors report that additional information may be obtained by contacting V.G. Jokubaitis, Royal Melbourne Hospital, Dept. of Neurol, Melbourne, Vic, Australia.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.mcp.2016.08.007. This DOI is a link to an online electronic document that is either free or for purchase.

Gram-Negative Bacteria - Mycoplasma pneumoniae

Findings on Mycoplasma pneumoniae Reported by Researchers at Georg-August-University (Hydrogen sulfide is a novel potential virulence factor of Mycoplasma pneumoniae: characterization of the unusual cysteine desulfurase/desulfhydrase HapE)
A new study on Gram-Negative Bacteria - Mycoplasma pneumoniae is now available. According to news reporting from Gottingen, Germany, by NewsRx journalists, research stated, "Mycoplasma pneumoniae is a human pathogen causing atypical pneumonia with a minimalized and highly streamlined genome. So far, hydrogen peroxide production, cytadherence, and the ADP-ribosylating CARDS toxin have been identified as pathogenicity determinants."

The news correspondents obtained a quote from the research from Georg-August-University, "We have studied haemolysis caused by M. pneumoniae, and discovered that hydrogen peroxide is responsible for the oxidation of heme, but not for lysis of erythrocytes. This feature could be attributed to hydrogen sulfide, a compound that has previously not been identified as virulence factor in lung pathogens. Indeed, we observed hydrogen sulfide production by M. pneumoniae. The search for a hydrogen sulfide-producing enzyme identified HapE, a protein with similarity to cysteine desulfurases. In contrast to typical cysteine desulfurases, HapE is a bifunctional enzyme: it has both the cysteine desulfurase activity to produce alanine and the cysteine desulphydrase activity to produce pyruvate and hydrogen sulfide."

According to the news reporters, the research concluded: "Experiments with purified HapE showed that the enzymatic activity of the protein is responsible for haemolysis, demonstrating that HapE is a novel potential virulence factor of M."

For more information on this research see: Hydrogen sulfide is a novel potential virulence factor of Mycoplasma pneumoniae: characterization of the unusual cysteine desulfurase/desulphydrase HapE. Molecular Microbiology, 2016;100(1):42-54. (Wiley-Blackwell - www.wiley.com/; Molecular Microbiology - onlinelibrary.wiley.com/journal/10.1111/(ISSN)1365-2958)

Our news journalists report that additional information may be obtained by contacting S. Großhennig, Dept. of General Microbiology, Georg-August-University Gottingen, Grisebachstr 8, D-37077, Gottingen, Germany. Additional authors for this research include T. Ischebeck, J. Gibhardt, J. Busse, I. Feussner and J. Stulke.

Nanotechnology - Nanoparticles

Findings on Nanoparticles Discussed by Investigators at School of Chemistry and Environment (Using hyaluronic acid-functionalized pH stimuli-responsive mesoporous silica nanoparticles for targeted delivery to CD44-overexpressing cancer cells)
According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "In this study, novel hyaluronic acid-pH stimuli-responsive lipid membrane mesoporous silica nanoparticles (HA-PL-MSNs) were designed and assembled, with the chemotherapeutic agent doxorubicin (DOX) as the model drug. HA-PL-MSNs exhibited a well-defined mesostructure covered by lipid bilayer and particle size of similar to 150 nm."

Our news journalists obtained a quote from the research from the School of Chemistry and Environment, "The drug loading capacity was up to similar to 18.2%. DOX release could be effectively retained by the lipid bilayer in pH 7.4 buffer and exhibited a pH-triggered burst release in the acidic condition. Confocal laser scanning microscopy and fluorescence-activated cell sorting showed that HA-PL-MSNs exhibited higher cellular uptake efficiency via CD44 receptor-mediated endocytosis compared with PL-MSNs in HeLa cells. In vitro cytotoxicity studies demonstrated that HA-PL-MSNs could effectively enhance the targeted delivery of DOX and restrain the growth of HeLa cells."

According to the news editors, the research concluded: "This might provide a promising alternative for the development of a targeted anticancer drug delivery system."

For more information on this research see: Using hyaluronic acid-functionalized pH stimuli-responsive mesoporous silica nanoparticles for targeted delivery to CD44-overexpressing cancer cells. *International Journal of Nanomedicine, 2016;11():6485-6497*. *International Journal of Nanomedicine* can be contacted at: Dove Medical Press Ltd, PO Box 300-008, Albany, Auckland 0752, New Zealand.

**Nephrology**

**Findings on Nephrology Discussed by D. Habedank and Co-Researchers (Vasodilation and Exercise Capacity in Patients with End-Stage Renal Disease: A Prospective Proof-of-Concept Study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nephrology have been presented. According to news reporting out of Berlin, Germany, by NewsRx editors, research stated, "Previous data have pointed to the fact that vascular function is significantly impaired in patients with end-stage renal disease (ESRD). We aimed to better characterise vasodilation and exercise capacity in both ESRD and chronic heart failure (CHF) patients."
Our news journalists obtained a quote from the research, "A total of 30 ESRD patients (23 male; mean age 45.7 +/- 9.9 years) were included in a prospective proof-of-concept study at a tertiary care academic centre. The patients underwent forearm venous plethysmography with post-ischaemic peak blood flow (PF) and flow-dependent flow (FDF) testing as well as cardiopulmonary exercise testing during the morning of the day following the last haemodialysis. After matching for age, gender, and body mass index, the data were compared to 30 patients with CHF and 20 age-matched healthy controls. PF in ESRD patients was reduced when compared to that in CHF patients (12.5 +/- 4.2 vs. 15.6 +/- 6.9 ml/100 ml/min; p = 0.048) and healthy controls (26.4 +/- 9.3 ml/100 ml/min; p< 0.001). When compared to controls, FDF was significantly reduced in ESRD patients (7.6 +/- 3.1 vs. 6.0 +/- 2.5 ml/100 ml/min; p = 0.03), but not in CHF patients, whereas resting blood flow did not differ between the ESRD, CHF, and healthy control groups. In contrast to indices of vasodilative capacity, maximum exercise capacity (peakVO(2)) was higher in ESRD when compared to CHF patients (23.8 +/- 7.3 vs. 18.8 +/- 5.2 ml/min/kg), but significantly impaired when compared to controls (32.8 +/- 6.7 ml/min/kg; p< 0.001). In this proof-of-concept study, exercise capacity was relatively preserved, while vasodilative capacity was substantially impaired in ESRD patients."

According to the news editors, the research concluded: "Additional studies are warranted to examine the underlying mechanisms and potential clinical implications of our findings."

Our news journalists report that additional information may be obtained by contacting D. Habedank, DRK Kliniken Berlin Kopenick, Medical Klin Kardiol, DE-12559 Berlin, Germany. Additional authors for this research include J.C. Schefold, C. Bernhardt, T. Karhausen, W. Doehner, S.D. Anker and P. Reinke.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1159/000449174. This DOI is a link to an online electronic document that is either free or for purchase.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Mutation of PKD1, encoding the protein polycystin-1 (PC1), is the main cause of autosomal dominant polycystic kidney disease (ADPKD). The signaling pathways downstream of PC1 in ADPKD are still not fully understood."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Here, we provide genetic evidence for the necessity of G alpha 12 (encoded by Gna12, hereafter G alpha 12) for renal cystogenesis induced by Pkd1 knockout. There was no phenotype in mice with deletion of Galpha12 (Galpha12(-/-)). Polyinosine-polycytosine (pI: pC)-induced deletion of Pkd1 (Mx1Cre(+)Pkd1(f/f)G alpha 12(+/-)) in 1-week-old mice resulted in multiple kidney cysts by 9 weeks, but the mice with double knockout of Pkd1 and Galpha12 (Mx1Cre(+)Pkd1(f/f)G alpha 12(-/-)) had no structural and functional abnormalities in the kidneys. These mice could survive more than one year without kidney abnormalities except multiple hepatic cysts in some mice, which indicates that the effect of G alpha 12 on cystogenesis is kidney specific. Furthermore, Pkd1 knockout promoted G alpha 12 activation, which subsequently decreased cell-matrix and cell-cell adhesion by affecting the function of focal adhesion and E-cadherin, respectively."

According to the news editors, the research concluded: "Our results demonstrate that G alpha 12 is required for the development of kidney cysts induced by Pkd1 mutation in mouse ADPKD."

Keywords for this news article include: Boston, Massachusetts, United States, North and Central America, Nephrology, Genetics, Kidney, Cysts, Harvard School of Medicine.

Nephrology

**Findings on Nephrology Reported by Investigators at University of Sydney (Recent advances in autosomal-dominant polycystic kidney disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nephrology have been published. According to news reporting originating from Sydney, Australia, by NewsRx correspondents, research stated, "Autosomal-dominant polycystic kidney disease (ADPKD) is the most common genetic renal disease in adults, affecting one in every 1000 Australians. It is caused by loss-of-function heterozygous mutations in either PKD1 or PKD2, which encode the proteins, polycystin-1 and polycystin-2 respectively."

Our news editors obtained a quote from the research from the University of Sydney,
"The disease hallmark is the development of hundreds of microscopic fluid-filled cysts in the kidney during early childhood, which grow exponentially and continuously through life at varying rates (between 2% and 10% per year), causing loss of normal renal tissue and up to a 50% lifetime risk of dialysis-dependent kidney failure. Other systemic complications include hypertensive cardiac disease, hepatic cysts, intracranial aneurysms, diverticular disease and hernias. Over the last two decades, advances in the genetics and pathogenesis of this disease have led to novel treatments that reduce the rate of renal cyst growth and may potentially delay the onset of kidney failure. New evidence indicates that conventional therapies (such as angiotensin inhibitors and statins) have mild attenuating effects on renal cyst growth and that systemic levels of vasopressin are critical for promoting renal cyst growth in the postnatal period. Identifying and integrating patient-centred perspectives in clinical trials is also being advocated."

According to the news editors, the research concluded: "This review will provide an update on recent advances in the clinical management of ADPKD."

The news editors report that additional information may be obtained by contacting G.K. Rangan, University of Sydney, Westmead Inst Med Res, Center Transplant & Renal Res, Sydney, NSW, Australia. Additional authors for this research include M.C. Tchan, A. Tong, A.T.Y. Wong and B.J. Nankivell.

**Neurodegenerative Diseases**

**Findings on Neurodegenerative Diseases Reported by Investigators at Max-Planck-Institute (The m-AAA Protease Associated with Neurodegeneration Limits MCU Activity in Mitochondria)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Neurodegenerative Diseases have been published. According to news reporting from Cologne, Germany, by NewsRx journalists, research stated, "Mutations in subunits of mitochondrialm-AAA proteases in the inner membrane cause neurodegeneration in spinocerebellar ataxia (SCA28) and hereditary spastic paraplegia (HSP7). m-AAA proteases preserve mitochondrial proteostasis, mitochondrial morphology, and efficient OXPHOS activity, but the cause for neuronal loss in disease is unknown. We have determined the neuronal interactome of m-AAA proteases in mice and identified a complex with C2ORF47 (termed MAIP1), which counteracts cell death by regulating the assembly of the mitochondrial Ca2+ uniporter MCU."

The news correspondents obtained a quote from the research from Max-Planck-Institute, "While MAIP1 assists biogenesis of the MCU subunit EMRE, the m-AAA protease degrades non-assembled EMRE and ensures efficient assembly of gatekeeper subunits with
MCU. Loss of the m-AAA protease results in accumulation of constitutively active MCU-EMRE channels lacking gatekeeper subunits in neuronal mitochondria and facilitates mitochondrial Ca2+ overload, mitochondrial permeability transition pore opening, and neuronal death."

According to the news reporters, the research concluded: "Together, our results explain neuronal loss in m-AAA protease deficiency by deregulated mitochondrial Ca2+ homeostasis."

For more information on this research see: The m-AAA Protease Associated with Neurodegeneration Limits MCU Activity in Mitochondria. *Molecular Cell*, 2016;64(1):148-162. *Molecular Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. **Oncology - Neuroendocrine Cancer**

**Findings on Neuroendocrine Cancer Detailed by Investigators at Ochsner Medical Center (Neuroendocrine Tumors and Lanreotide Depot: Clinical Considerations and Nurse and Patient Preferences)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Neuroendocrine Cancer is now available. According to news reporting out of Kenner, Louisiana, by NewsRx editors, research stated, "Somatostatin analogs (SSAs) are a mainstay therapy for the treatment of carcinoid syndrome associated with neuroendocrine tumors (NETs). They are effective for a range of gastroenteropancreatic NETs (GEP-NETs)."

Our news journalists obtained a quote from the research from Ochsner Medical Center, "Lanreotide depot (Somatuline ®) is an SSA that is approved for the treatment of GEP-NETs to improve progression-free survival (PFS). The article reviews the efficacy, safety, and administration of lanreotide depot and relates those attributes to considerations and preferences of oncology nurses and their patients. A review of the literature on the use of lanreotide for the treatment of NETs and carcinoid syndrome was conducted. In addition, the literature on drug delivery and routes of administration was surveyed to provide context for comparative studies related to clinical and patient preferences. Lanreotide depot prolongs PFS and is well tolerated.
by patients who expressed satisfaction in the ability to control symptoms related to carcinoid syndrome. Nurses cited several benefits to using lanreotide depot in the clinical setting, including more time saved to address other patient care issues."

According to the news editors, the research concluded: "Attributes of lanreotide depot—including its efficacy, safety and tolerability, dosing and administration, and cost-may contribute to healthcare decisions regarding the treatment and management of NETs."

For more information on this research see: Neuroendocrine Tumors and Lanreotide Depot: Clinical Considerations and Nurse and Patient Preferences. Clinical Journal of Oncology Nursing, 2016;20(6):E139-E146. Clinical Journal of Oncology Nursing can be contacted at: Oncology Nursing Soc, 125 Enterprise Dr, Pittsburgh, PA 15275, USA.

Our news journalists report that additional information may be obtained by contacting P. Ryan, Ochsner Med Center, Infus Center, Kenner, LA 70065, United States. Additional authors for this research include A.T. Phan, D.T. Adelman and M. Iwasaki.

Neurons

Findings on Neurons Detailed by Investigators at Tokyo Women's Medical University (Endoplasmic reticulum stress-mediated neuronal apoptosis by acrylamide exposure)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Neurons is the subject of a report. According to news originating from Tokyo, Japan, by NewsRx correspondents, research stated, "Acrylamide (AA) is a well-known neurotoxic compound in humans and experimental animals. However, intracellular stress signaling pathways responsible for the neurotoxicity of AA are still not clear."

Our news journalists obtained a quote from the research from Tokyo Women's Medical University, "In this study, we explored the involvement of the endoplasmic reticulum (ER) stress response in AA-induced neuronal damage in vitro and in vivo. Exposure of SH-SY5Y human neuroblastoma cells to AA increased the levels of phosphorylated form of eukaryotic translation initiation factor 2 alpha (eIF2 alpha) and its downstream effector, activating transcription factor 4 (ATF4), indicating the induction of the unfolded protein response (UPR) by AA exposure. Furthermore, AA exposure increased the mRNA level of c/EBP homologous protein (CHOP), the ER stress-dependent apoptotic factor, and caused the accumulation of reactive oxygen species (ROS) in SH-SY5Y cells. Treatments of SH-SY5Y cells with the chemical chaperone, 4-phenylbutyric acid and the ROS scavenger, N-acetyl-cysteine reduced the AA-induced expression of ATF4 protein and CHOP mRNA, and resulted in the suppression of apoptosis. In addition, AA-induced eIF2 alpha phosphorylation was also
suppressed by NAC treatment. In consistent with in vitro study, exposure of zebrafish larvae at 6-day post fertilization to AA induced the expression of chop mRNA and apoptotic cell death in the brain, and also caused the disruption of brain structure. These findings suggest that AA exposure induces apoptotic neuronal cell death through the ER stress and subsequent elF2 alpha-ATF4-CHOP signaling cascade."

According to the news editors, the research concluded: "The accumulation of ROS by AA exposure appears to be responsible for this ER stress-mediated apoptotic pathway."

The news correspondents report that additional information may be obtained from Y. Komoike, Tokyo Women's Medical University, Dept. of Hyg & Public Hlth, Shinjuku Ku, Tokyo 1628666, Japan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.taap.2016.09.005. This DOI is a link to an online electronic document that is either free or for purchase.

**Neutral Amino Acids**

**Findings on Neutral Amino Acids Detailed by Investigators at Van Andel Research Institute (The role of the unusual threonine string in the conversion of prion protein)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Neutral Amino Acids are discussed in a new report. According to news originating from Grand Rapids, Michigan, by NewsRx correspondents, research stated, "The conversion of normal prion protein (PrP) into pathogenic PrP conformers is central to prion disease, but the mechanism remains unclear. The alpha-helix 2 of PrP contains a string of four threonines, which is unusual due to the high propensity of threonine to form beta-sheets."

Our news journalists obtained a quote from the research from Van Andel Research Institute, "This structural feature was proposed as the basis for initiating PrP conversion, but experimental results have been conflicting. We studied the role of the threonine string on PrP conversion by analyzing mouse Prnp(a) and Prnp(b) polymorphism that contains a polymorphic residue at the beginning of the threonine string, and PrP mutants in which threonine 191 was replaced by valine, alanine, or proline. The PMCA (protein misfolding cyclic amplification) assay was able to recapitulate the in vivo transmission barrier between PrPa and PrPb. Relative to PMCA, the amyloid fibril growth assay is less restrictive, but it did reflect certain properties
of in vivo prion transmission."

According to the news editors, the research concluded: "Our results suggest a plausible theory explaining the apparently contradictory results in the role of the threonine string in PrP conversion and provide novel insights into the complicated relationship among PrP stability, seeded conformational change, and prion structure, which is critical for understanding the molecular basis of prion infectivity."

For more information on this research see: The role of the unusual threonine string in the conversion of prion protein. Scientific Reports, 2016;6():1-9. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from J.Y. Ma, Van Andel Res Inst, Center Neurodegenerat Sci, Grand Rapids, MI 49503, United States. Additional authors for this research include F. Wang, K.J.V. Stel, K. Sinniah and J.Y. Ma.

Oncology - Non-Small Cell Lung Cancer

Findings on Non-Small Cell Lung Cancer Described by Researchers at School of Public Health (Dose-Dependent Mutation Rates Determine Optimum Erlotinib Dosing Strategies for EGFR Mutant Non-Small Cell Lung Cancer Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Non-Small Cell Lung Cancer have been published. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "The advent of targeted therapy for cancer treatment has brought about a paradigm shift in the clinical management of human malignancies. Agents such as erlotinib used for EGFR-mutant non-small cell lung cancer or imatinib for chronic myeloid leukemia, for instance, lead to rapid tumor responses."

Our news journalists obtained a quote from the research from the School of Public Health, "Unfortunately, however, resistance often emerges and renders these agents ineffective after a variable amount of time. The FDA-approved dosing schedules for these drugs were not designed to optimally prevent the emergence of resistance. To this end, we have previously utilized evolutionary mathematical modeling of treatment responses to elucidate the dosing schedules best able to prevent or delay the onset of resistance. Here we expand on our approaches by taking into account dose-dependent mutation rates at which resistant cells emerge. The relationship between the serum drug concentration and the rate at which resistance mutations arise can lead to non-intuitive results about the best dose administration strategies to prevent or delay the emergence of resistance. We used mathematical modeling, available clinical trial data, and different considerations of the relationship between mutation rate and drug concentration to predict the effectiveness of different dosing strategies. We designed
several distinct measures to interrogate the effects of different treatment dosing strategies and found that a low-dose continuous strategy coupled with high-dose pulses leads to the maximal delay until clinically observable resistance. Furthermore, the response to treatment is robust against different assumptions of the mutation rate as a function of drug concentration.

According to the news editors, the research concluded: "For new and existing targeted drugs, our methodology can be employed to compare the effectiveness of different dose administration schedules and investigate the influence of changing mutation rates on outcomes."

Our news journalists report that additional information may be obtained by contacting L.L. Liu, Dept. of Biostatistics, Harvard T H Chan School of Public Health, Boston, MA 02115, United States. Additional authors for this research include F. Li, W. Pao and F. Michor.

**Oncology - Non-Small Cell Lung Cancer**

**Findings on Non-Small Cell Lung Cancer Detailed by Investigators at Kyungpook National University (The Different Effect of VEGF Polymorphisms on the Prognosis of Non-Small Cell Lung Cancer according to Tumor Histology)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Non-Small Cell Lung Cancer are discussed in a new report. According to news originating from Daegu, South Korea, by NewsRx correspondents, research stated, "Vascular endothelial growth factor (VEGF) contributes to tumor angiogenesis. The role of VEGF single nucleotide polymorphisms (SNPs) in lung cancer susceptibility and its prognosis remains inconclusive and controversial."

Our news journalists obtained a quote from the research from Kyungpook National University, "This study was performed to investigate whether VEGF polymorphisms affect survival outcomes of patients with early stage non-small cell lung cancer (NSCLC) after surgery. Three potentially functional VEGF SNPs (rs833061T >C, rs2010963G >C, and rs3025039C >T) were genotyped. A total of 782 NSCLC patients who were treated with surgical resection were enrolled. The association of the SNPs with overall survival (OS) and disease free survival (DFS) was analyzed. In overall population, none of the three polymorphisms were significantly associated with OS or DFS. However, when the patients were stratified by tumor histology, squamous cell carcinoma (SCC) and adenocarcinoma (AC) had significantly different
OS (Adjusted hazard ratio [aHR] = 0.76, 95% CI = 0.56-1.03 in SCC; aHR = 1.33, 95% CI = 0.98-1.82 in AC; P for heterogeneity = 0.001) and DFS (aHR = 0.75, 95% CI = 0.58-0.97 in SCC; aHR = 1.26, 95% CI = 1.00-1.60 in AC; P for heterogeneity = 0.004) according to the rs833061T >C genotypes."

According to the news editors, the research concluded: "Our results suggest that the prognostic role of VEGF rs833061T >C may differ depending on tumor histology."

For more information on this research see: The Different Effect of VEGF Polymorphisms on the Prognosis of Non-Small Cell Lung Cancer according to Tumor Histology. Journal of Korean Medical Science, 2016;31(11):1735-1741. Proteins - Nucleoproteins

Findings on Nucleoproteins Detailed by Investigators at Stanford University (A New Chromatin-Cytoskeleton Link in Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Proteins - Nucleoproteins is now available. According to news reporting originating from Stanford, California, by NewsRx editors, the research stated, "The set domain containing 2 ( SETD2) histone methyltransferase, located at 3p2, specifically trimethylates lysine 36 of histone H3 (H3K36me3). H3K36me3 is an active mark involved in transcriptional elongation and RNA processing and a key regulator of DNA repair."

Our news editors obtained a quote from the research from Stanford University, "In fact, SETD2 is the only methyltransferase that 'writes' the H3K36me3 mark. Recent results from Park and colleagues have found a new role for SETD2 in the methylation of K40 of alpha-tubulin. Loss of SETD2 abolishes methylation of K40 of alpha-tubulin and results in a dysfunctional mitotic spindle and abnormalities in cytokinesis. Thus, SETD2 links chromatin and cytoskeleton homeostasis through its methyltransferase activity."

According to the news editors, the research concluded: "These studies have important implications on the role of SETD2 mutations in promoting genomic instability and tumor progression."

For more information on this research see: A New Chromatin-Cytoskeleton Link in Cancer. Molecular Cancer Research, 2016;14(12):1173-1175. Molecular Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA
Nutritional and Metabolic Diseases and Conditions —

**Findings on Obesity Detailed by Investigators at Salzburg University (Attentional and motor impulsivity interactively predict 'food addiction' in obese individuals)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Nutritional and Metabolic Diseases and Conditions - Obesity. According to news reporting originating in Salzburg, Austria, by NewsRx journalists, research stated, "Impulsivity is a multifaceted construct and constitutes a common risk factor for a range of behaviors associated with poor self-control (e.g., substance use or binge eating). The short form of the Barratt Impulsiveness Scale (BIS-15) measures impulsive behaviors related to attentional (inability to focus attention or concentrate), motor (acting without thinking), and non planning (lack of future orientation or forethought) impulsivity."

The news reporters obtained a quote from the research from Salzburg University, "Eating-related measures appear to be particularly related to attentional and motor impulsivity and recent findings suggest that interactive effects between these two facets may play a role in eating- and weight-regulation. One-hundred thirty-three obese individuals presenting for bariatric surgery (77.4% female) completed the BIS-15 and the Yale Food Addiction Scale (YFAS) 2.0, which measures addiction-like eating based on the eleven symptoms of substance use disorder outlined in the fifth version of the Diagnostic and Statistical Manual of Mental Disorders. Sixty-three participants (47.4%) were classified as being 'food addicted'. Scores on attentional and motor impulsivity interactively predicted 'food addiction' status: higher attentional impulsivity was associated with a higher likelihood of receiving a YFAS 2.0 diagnosis only at high (+1 SD), but not at low (-1 SD) levels of motor impulsivity. Results support previous findings showing that non-planning impulsivity does not appear to play a role in eating-related self regulation. Furthermore, this is the first study that shows interactive effects between different impulsivity facets when predicting 'food addiction' in obese individuals."

According to the news reporters, the research concluded: "Self-regulatory failure in eating-regulation (e.g., addiction-like overeating) may particularly emerge when both attentional and motor impulsivity levels are elevated."

For more information on this research see: Attentional and motor impulsivity interactively predict 'food addiction' in obese individuals. *Comprehensive Psychiatry, 2017;72*
Findings on Obesity Discussed by Investigators at University of New Mexico (Mirror, Mirror on the Wall: Children's Preferences and Self-Perceptions of Weight in a Rural Hispanic Community)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Obesity is the subject of a report. According to news reporting from Albuquerque, New Mexico, by NewsRx journalists, research stated, "Although studies have documented parents' misperceptions regarding their children's weight, studies examining preadolescent children's self-perceptions of weight-in particular, Hispanic children's self-perceptions of weight-are limited. A convenience sample of 424 children from a rural community, aged 8 to 11 years and in grades 3 through 5, participated in this cross-sectional, descriptive, nonexperimental study."

The news correspondents obtained a quote from the research from the University of New Mexico, "Using the Children's Body Image Scale, the children were asked to select a figure representing their actual body perception and a figure representing their ideal body perception. The children were weighed and measured, body mass index (BMI) was calculated, and each child was assigned to one of the Centers for Disease Control and Prevention weight categories: underweight, normal or healthy weight, overweight, or obese. Only BMI category was found to be significantly associated with accurate perception, \( \chi^2(3) = 201.4, p < .001 \), with only 9% of overweight or obese children selecting figures representing their actual BMI category. Actual BMI category, \( \chi^2(2) = 8.8, p = .032 \), and grade level, \( \chi^2(2) = 6.7, p = .036 \), had a significant association with selection of an underweight ideal. Overall, 32% of children selected an underweight figure as ideal. Prepubertal children who are either overweight or obese do not accurately perceive their weight status."

According to the news reporters, the research concluded: "Rather than focusing solely on weight reduction programs, emphasis should be placed on promoting healthy lifestyles and choices."

Our news journalists report that additional information may be obtained by contacting C. Montoya, University of New Mexico, Coll Nursing, Albuquerque, NM 87131, United States. Additional authors for this research include B. Boursaw, B. Tigges and M.L. Lobo.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.pedhc.2015.11.010. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Albuquerque, New Mexico, United States, North and Central America, Nutritional and Metabolic Diseases and Conditions, Pediatrics, Bariatrics, Obesity, University of New Mexico.

Nutritional and Metabolic Diseases and Conditions -…

Findings on Obesity Reported by Investigators at University of Zurich (Organic Cation Transporter 2 Overexpression May Confer an Increased Risk of Gentamicin-Induced Nephrotoxicity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Obesity is the subject of a report. According to news reporting originating from Zurich, Switzerland, by NewsRx correspondents, research stated, "Nephrotoxicity is a relevant limitation of gentamicin, and obese patients have an increased risk for gentamicin-induced kidney injury. This damage is thought to depend on the accumulation of the drug in the renal cortex."

Our news editors obtained a quote from the research from the University of Zurich, "Obese rats showed substantially higher levels of gentamicin in the kidney than did lean animals. This study characterized the role of organic cation transporters (OCTs) in gentamicin transport and elucidated their possible contribution in the increased renal accumulation of gentamicin in obesity. The mRNA and protein expression levels of the organic cation transporters Oct2 (Slc22a2) and Oct3 (Slc22a3) were increased in kidney samples from obese mice fed a high-fat diet. Similarly, OCT2 (similar to 2-fold) and OCT3 (similar to 3-fold) showed increased protein expression in the kidneys of obese patients compared with those of nonobese individuals. Using HEK293 cells overexpressing the different OCTs, human OCT2 was found to transport [H-3] gentamicin with unique sigmoidal kinetics typical of homotropic positive cooperativity (autoactivation). In mouse primary proximal tubular cells, [H-3] gentamicin uptake was reduced by approximately 40% when the cells were coincubated with the OCT2 substrate metformin. The basolateral localization of OCT2 suggests that gentamicin can enter proximal tubular cells from the blood side, probably as part of a slow tubular secretion process that may influence intracellular drug concentrations and exposure time."

According to the news editors, the research concluded: "Increased expression of OCT2 may explain the higher accumulation of gentamicin, thereby conferring an increased risk of renal toxicity in obese patients."

For more information on this research see: Organic Cation Transporter 2 Overexpression May Confer an Increased Risk of Gentamicin-Induced Nephrotoxicity.
Findings on Obstructive Sleep Apnea Reported by Investigators at Capital Medical University [Mean apnea-hypopnea duration (but not apnea-hypopnea index) is associated with worse hypertension in patients with obstructive sleep apnea]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Respiratory Tract Diseases and Conditions - Obstructive Sleep Apnea. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "To determine which polysomnography parameters are associated with severity of hypertension. This retrospective study collected data on all patients admitted to our urban, academic center in Beijing with hypertension who had undergone polysomnograms (PSG) and were diagnosed with obstructive sleep apnea (OSA) (apnea-hypopnea index [AHI] >= 5/hour)."

The news reporters obtained a quote from the research from Capital Medical University, "We then compared polysomnographic parameters (AHI, oxygen desaturation index [ODI], lowest oxygen saturation [LOS], and mean apnea hypopnea duration [MAD]) by hypertension severity in this cohort. There were 596 subjects who met entry criteria. Age, sex distribution, body mass index (BMI), history of current smoking and alcohol were similar among groups. Subjects with longer MAD suffered from more severe hypertension (P=0.011). There were no relationship between AHI, ODI, and LOS and hypertension in our cohort. There were no significant differences in age, sex, BMI, history of current smoking and alcohol use between hypertension groups. MAD had a small but significant independent association (odds ratio [OR]=1.072, 95% confidence interval [CI] 1.019-1.128, P=0.007) with moderate to severe hypertension, using logistic regression analysis that accounted for age, sex, BMI, history of current smoking and alcohol, AHI, and LOS. Chinese inpatients with longer MAD by PSG face higher odds of moderate to severe hypertension. The mechanism of these effects may be due to aggravated nocturnal hypoxaemia and hypercapnia, as well as disturbed sleep architecture."
According to the news reporters, the research concluded: "These results suggest that additional information available in the polysomnogram, such as MAD, should be considered when evaluating OSA patients."

For more information on this research see: Mean apnea-hypopnea duration (but not apnea-hypopnea index) is associated with worse hypertension in patients with obstructive sleep apnea. *Medicine, 2016;95(48):183-187.* *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Our news correspondents report that additional information may be obtained by contacting Y.X. Wei, Capital Med Univ, Beijing An Zhen Hosp, Beijing 100029, People's Republic of China. Additional authors for this research include X.J. Zhan, M.N. Zhao and Y.X. Wei.

**Oncology**

**Findings on Oncology Described by T. Baker and Colleagues**

*(Acquisition of a single EZH2 D1 domain mutation confers acquired resistance to EZH2-targeted inhibitors)*

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology is now available. According to news originating from Cambridge, Massachusetts, by NewsRx correspondents, research stated, "Although targeted therapies have revolutionized cancer treatment, overcoming acquired resistance remains a major clinical challenge. EZH2 inhibitors (EZH2i), EPZ-6438 and GSK126, are currently in the early stages of clinical evaluation and the first encouraging signs of efficacy have recently emerged in the clinic."

Our news journalists obtained a quote from the research, "To anticipate mechanisms of resistance to EZH2i, we used a forward genetic platform combining a mutagenesis screen with next generation sequencing technology and identified a hotspot of secondary mutations in the EZH2 D1 domain (Y111 and I109). Y111D mutation within the WT or A677G EZH2 allele conferred robust resistance to both EPZ-6438 and GSK126, but it only drove a partial resistance within the Y641F allele. EZH2 mutants required histone methyltransferase (HMT) catalytic activity and the polycomb repressive complex 2 (PRC2) components, SUZ12 and EED, to drive drug resistance. Furthermore, D1 domain mutations not only blocked the ability of EZH2i to bind to WT and A677G mutant, but also abrogated drug binding to the Y641F mutant. These data provide the first cellular validation of the mechanistic model underpinning the oncogenic function of WT and mutant EZH2."

According to the news editors, the research concluded: "Importantly, our findings suggest that acquired-resistance to EZH2i may arise in WT and mutant EZH2 patients through a single mutation that remains targetable by second generation EZH2i."

For more information on this research see: Acquisition of a single EZH2 D1 domain

The news correspondents report that additional information may be obtained from T. Baker, ARIAD Pharmaceuticals, Inc, Cambridge, MA 02139, United States. Additional authors for this research include S. Nerle, J. Pritchard, B. Zhao, V.M. Rivera, A. Garner and F. Gonzalvez.

Nursing - Oncology Nursing

Findings on Oncology Nursing Discussed by Investigators at Isfahan University of Medical Sciences (Perceptions of patients, families, physicians and nurses regarding challenges in cancer disclosure: A descriptive qualitative study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Nursing - Oncology Nursing have been presented. According to news reporting out of Esfahan, Iran, by NewsRx editors, research stated, "The findings of numerous studies have illustrated that there is still a high proportion of cancer patients in Eastern and Middle-East countries including Iran, who are not properly informed of their disease due to the concealment atmosphere which still prevails. This descriptive qualitative study is aimed at exploring perceptions of patients, patients' family members, physicians and nurses regarding cancer disclosure challenges."

Our news journalists obtained a quote from the research from the Isfahan University of Medical Sciences, "Thirty-five participants (15 patients, 6 family members, 9 physicians, and 5 nurses) were selected through purposive sampling. The data were collected through in-depth interviews; after which they were analyzed using a qualitative content analysis with an inductive approach. Data analysis revealed the following three categories: first, challenges related to healthcare system which deals with the deficiencies, strains and concerns in medical setting and healthcare team training; second, challenges related to family insistence on concealment which includes their fear of cancer disclosure and its negative impact on the patients; and third, challenges related to policy making which consists of deficiencies in legislative and supportive institutions for advocacy of truth telling."

According to the news editors, the research concluded: "Successful move from concealment to effective disclosure attitude in cancer patients in Iran requires a national determination for resolving challenges in medical education as well as other different social,. cultural and policy making dimensions."

For more information on this research see: Perceptions of patients, families, physicians and nurses regarding challenges in cancer disclosure: A descriptive qualitative study. European Journal of Oncology Nursing, 2016;25():55-61. European Journal of Oncology Nursing can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington,
Findings on Oral Cancer Reported by Investigators at National Taiwan
University (Phenethyl isothiocyanate enhances TRAIL-induced
apoptosis in oral cancer cells and xenografts)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Investigators publish new report on Oncology - Oral Cancer. According to
news originating from Hsinchu, Taiwan, by NewsRx correspondents, research stated, "Tumor
necrosis factor-related apoptosis-inducing ligand (TRAIL) has been regarded as a promising
candidate for cancer therapy. However, most of oral cancer cell lines are resistant to the TRAIL-
induced cytotoxicity."

Financial supporters for this research include National Taiwan University Hospital,
Hsin-chu Branch, National Science Council, Taipei, Taiwan.

Our news journalists obtained a quote from the research from National Taiwan
University. "The aim of this study was to investigate the ability of phenethyl isothiocyanate
(PEITC) to sensitize TRAIL-induced apoptosis in TRAIL-resistant oral cancer cells and
xenografts. Terminal deoxynucleotidyl transferase-mediated dUTP nick-end labeling assay,
Western blotting, and a mouse xenograft model were used to study the effects of PEITC and
TRAIL on two TRAIL-resistant human oral cancer cells, SAS and Ca9-22. PEITC upregulated
death receptor 4 (DR4) and DR5 protein expression and increased reactive oxygen species
(ROS) production in both SAS and Ca9-22 cells. Antioxidant N-acetyl-l-cysteine (NAC) and c-
Jun NH2-terminal kinase (JNK) inhibitor SP600125 inhibited PEITC-induced DR4 and DR5
expression. Inhibitor experiments showed that PEITC induced apoptosis through ROS-mediated
JNK activation and upregulation of DR4 and DR5. Furthermore, treatment with PEITC
significantly increased TRAIL-induced apoptosis in both cells. Combined treatment with PEITC
and TRAIL had greater effect on the inhibition of tumor growth than either agent alone. We
showed for the first time that PEITC overcomes TRAIL resistance in oral cancer cells and
enhance the therapeutic potential of TRAIL in vivo."

According to the news editors, the research concluded: "PEITC, either alone or in
combination with TRAIL, can be used as a new therapeutic approach for the treatment of oral
cancers."

Musculoskeletal Diseases and Conditions –

Findings on Osteoporosis Reported by Investigators at Columbia University (Effects of Daily or Cyclic Teriparatide on Bone Formation in the Iliac Crest in Women on No Prior Therapy and in Women on Alendronate)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Osteoporosis have been published. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "There is little information on the effects of combination therapy for osteoporosis at the tissue level. Using quadruple tetracycline-labeled bone biopsies, we have compared the bone formation response to teriparatide (TPTD) in treatment-naive subjects (Rx-Naive) and in subjects on prior and ongoing alendronate (ALN) treatment (ALN-Rx)."

The news correspondents obtained a quote from the research from Columbia University. "Three bone envelopes were analyzed: cancellous, endocortical, and intracortical. TPTD was given as a standard, continuous daily injection or as a cyclic regimen (3 months on daily TPTD, 3 months off, 3 months on daily TPTD). Subjects were biopsied at 7 weeks and at 7 months to allow comparison of the bone formation response to the first and second cycles of TPTD. Baseline values for dynamic bone formation indices were lower in ALN-Rx than Rx-Naive subjects. Both Rx-Naive and ALN-RX subjects responded to TPTD with significant increases in bone formation indices at both time points. With cyclic TPTD treatment, the first and second cycles of TPTD stimulated bone formation rate in the cancellous and endocortical envelopes to a similar extent in ALN-Rx and Rx-Naive subjects. However, in Rx-Naive patients, bone formation rate (BFR/BS) was higher in patients receiving daily treatment compared with those receiving cyclic TPTD treatment in all three envelopes in the 7-month biopsies. This suggests that the cyclic approach does not provide a skeletal benefit in treatment-naive patients. In the 7-month biopsies, cortical porosity was higher in the Rx-Naive group receiving daily TPTD than in all other groups."
According to the news reporters, the research concluded: "These data provide supporting evidence at the tissue level for previous biochemical and densitometric data suggesting that addition of either cyclic or daily TPTD to ongoing ALN treatment may be an effective approach for patients with severe osteoporosis already treated with ALN who remain at high risk of fracture."

Our news journalists report that additional information may be obtained by contacting D.W. Dempster, Columbia University, Dept. of Pathol & Cell Biol, New York, NY, United States. Additional authors for this research include F. Cosman, H. Zhou, J.W. Nieves, M. Bostrom and R. Lindsay.

**Oncology - Ovarian Cancer**

**Findings on Ovarian Cancer Detailed by Investigators at Jagiellonian University (17-Estradiol Reverses Leptin-Inducing Ovarian Cancer Cell Migration by the PI3K/Akt Signaling Pathway)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Ovarian Cancer are discussed in a new report. According to news reporting originating in Krakow, Poland, by NewsRx journalists, research stated, "Accumulating evidence suggests that leptin is expressed at higher levels in obese women and stimulates cell migration in epithelial cancers. However, the biology of ovarian cancer is different from others, mainly due to the production of estrogens because of the involvement of ovarian tissue, which is the main source of estrogens; as a result, the levels are at least 100- to 1000-fold higher than normal circulating levels."

The news reporters obtained a quote from the research from Jagiellonian University, "Thus, ovarian cancer tissues are exposed to 17-estradiol, which promotes ovarian cancer cell migration and may modulate the effect of other hormones. Therefore, this study investigated the effects of 17-estradiol (1 nmol/L) with leptin (1-40 ng/mL) at physiological levels, on the migration of OVCAR-3 and SKOV-3 ovarian cancer cells, and the expression levels and activity of metalloproteinases (MMPs) 2 and 9. Here, we found that leptin stimulated ovarian cancer cell line migration, which is mediated via the expression and activity of MMP-9 in the OVCAR-3 but not in the SKOV-3 cells. After the administration of 17-estradiol and leptin, we observed antagonistic effects of 17-estradiol on leptin-induced OVCAR-3 cell migration and MMP-9 expression and activity. Moreover, the antagonistic effect of 17-estradiol on leptin-induced
cancer cell migration was reversed by pretreatment of the cells with the phosphatidylinositol 3-kinase (PI3K) pathway inhibitor."

According to the news reporters, the research concluded: "Taken together, our results, for the first time, show that in ovarian cancer cells ObR(+)/ER+, 17-estradiol has an antagonistic effect on leptin-induced cell migration as well as MMP-9 expression and activity, which is mediated by the PI3K pathway."

For more information on this research see: 17-Estradiol Reverses Leptin-Inducing Ovarian Cancer Cell Migration by the PI3K/Akt Signaling Pathway. *Reproductive Sciences*, 2016;23(11):1600-1608. *Reproductive Sciences* can be contacted at: Sage Publications Inc, 2455 Teller Rd, Thousand Oaks, CA 91320, USA. **Oncology - Ovarian Cancer**

**Findings on Ovarian Cancer Reported by Researchers at Royal Marsden NHS Foundation Trust (UK BRCA mutation testing in patients with ovarian cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Ovarian Cancer is now available. According to news reporting from London, United Kingdom, by NewsRx editors, the research stated, "Despite the increasing clinical importance of germline BRCA mutation status in managing women with ovarian cancer, few patients are currently being tested. The traditional means of selecting patients for BRCA mutation testing using restrictive criteria will miss many women with a mutation."

The news correspondents obtained a quote from the research from Royal Marsden NHS Foundation Trust, "To expand access to testing and streamline the testing process, several centres in the UK have been developing new models for BRCA testing. Trials with these integrated models involving closer collaborations between genetics and oncology services are now under way. In addition to testing for BRCA mutations, there is also increasing interest in testing for other genes associated with a predisposition to ovarian cancer. Advances in next-generation sequencing technology have resulted in the development of comprehensive genetic testing panels for use in the research and diagnostic settings. Interest is also increasing in expanding testing for somatic mutations in ovarian cancer, particularly for genes such as BRCA1 and BRCA2, whereby mutations may allow more patients to benefit from targeted agents, including poly(ADP-ribose) polymerase inhibitors."

According to the news reporters, the research concluded: "In this review, the issues of who should be offered testing, how testing could be delivered, when testing should occur and
the technology and costs associated with genetic testing are addressed."

Our news journalists report that additional information may be obtained by contacting A. George, The Royal Marsden NHS Foundation Trust, Fulham Road, London SW3 6JJ, UK.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/bjc.2015.396. This DOI is a link to an online electronic document that is either free or for purchase.

*Surgery - Ovariectomy*

**Findings on Ovariectomy Detailed by Investigators at Veterans Affairs Medical Center [RANKL (Receptor Activator of NF kappa B Ligand) Produced by Osteocytes Is Required for the Increase in B Cells and Bone Loss Caused by Estrogen Deficiency in ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Surgery - Ovariectomy. According to news reporting out of Little Rock, Arkansas, by NewsRx editors, research stated, "The cytokine receptor activator of NF kappa B ligand (RANKL) produced by osteocytes is essential for osteoclast formation in cancellous bone under physiological conditions, and RANKL production by B lymphocytes is required for the bone loss caused by estrogen deficiency. Here, we examined whether RANKL produced by osteocytes is also required for the bone loss caused by estrogen deficiency."

Our news journalists obtained a quote from the research from Veterans Affairs Medical Center, "Mice lacking RANKL in osteocytes were protected from the increase in osteoclast number and the bone loss caused by ovariectomy. Moreover, these mice did not exhibit the increase in bone marrow B lymphocytes caused by ovariectomy that occurred in control littermates. Deletion of estrogen receptor alpha from B cells did not alter B cell number or bone mass and did not alter the response to ovariectomy. In addition, lineage-tracing studies demonstrated that B cells do not act as osteoclast progenitors in estrogen-replete or estrogen-deficient mice. Taken together, these results demonstrate that RANKL expressed by osteocytes is required for the bone loss as well as the increase in B cell number caused by estrogen deficiency. Moreover, they suggest that estrogen control of B cell number is indirect via osteocytes and that the increase in bone marrow B cells may be a necessary component of the cascade of events that lead to cancellous bone loss during estrogen deficiency."

According to the news editors, the research concluded: "However, the role of B cells is not to act as osteoclast progenitors but may be to act as osteoclast support cells."

For more information on this research see: RANKL (Receptor Activator of NF kappa B Ligand) Produced by Osteocytes Is Required for the Increase in B Cells and Bone Loss..."
Findings on Oxygenators Reported by Investigators at Oslo University Hospital (VAVD vacuum may cause bubble transgression in membrane oxygenators)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oxygenators is the subject of a report. According to news reporting from Oslo, Norway, by NewsRx journalists, research stated, "Vacuum-assisted venous drainage (VAVD) is widely used to enhance venous blood return from patients undergoing cardiopulmonary bypass (CPB). This vacuum can accidentally reach the oxygenator of the heart-lung machine and draw gas bubbles into the blood."

The news correspondents obtained a quote from the research from Oslo University Hospital, "This is known as bubble transgression (BT) and may cause air emboli in the arterial blood line. In order to avoid BT and minimize the risk of patient injury, knowledge of oxygenator tolerance to vacuum load is critical. Thus, the main aim of this thesis was to investigate how much vacuum a membrane oxygenator can withstand before BT appears. We investigated four different adult oxygenators: Quadrox-i, Affinity Fusion, Capiox RX25 and Inspire 6M. They were tested in an in vitro setup where VAVD vacuum was allowed to reach the oxygenator through a non occlusive roller pump. An ultrasonic clinical bubble counter, Gampt BCC 200, was used to count bubbles on the arterial line when the arterial pump was restarted. We observed a significant increase in bubble count for two of the oxygenators, caused by-30 mmHg of VAVD vacuum in the blood reservoir (Affinity Fusion and Inspire 6M). Massive air ingress was shown in two of the oxygenators, caused by-30 mmHg of VAVD vacuum in the reservoir (Capiox RX25) and -40 mmHg of VAVD vacuum in the reservoir (Affinity Fusion). VAVD vacuum may cause bubble transgression in an oxygenator. This was shown for all the oxygenators in this test. VAVD vacuum may cause visible massive air ingress in an oxygenator. This was shown for two of the oxygenators in this test (Capiox RX25 and Affinity Fusion)."

According to the news reporters, the research concluded: "An alarm triggering on negative pressure in the oxygenator or a pressure relief valve might improve safety when using

**Oncology - Pancreatic Cancer**

**Findings on Pancreatic Cancer Discussed by Investigators at Veterans Affairs Medical Center (Tissue Transglutaminase Activates Cancer-Associated Fibroblasts and Contributes to Gemcitabine Resistance in Pancreatic Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Pancreatic Cancer have been published. According to news reporting originating in Chicago, Illinois, by NewsRx journalists, research stated, "Resistance to chemotherapy is a hallmark of pancreatic ductal adenocarcinoma (PDA) and has been partly attributed to the dense desmoplastic stroma, which forms a protective niche for cancer cells. Tissue transglutaminase (TG2), a Ca2+-dependent enzyme, is secreted by PDA cells and cross-links proteins in the tumor microenvironment (TME) through acyl-transfer between glutamine and lysine residues, promoting PDA growth."

The news reporters obtained a quote from the research from Veterans Affairs Medical Center, "The objective of the current study was to determine whether secreted TG2 by PDA cells alters the response of pancreatic tumors to gemcitabine. Orthotopic pancreatic xenografts and co-culture of PDA and stromal cells were employed to determine the mechanisms by which TG2 alters tumor-stroma interactions and response to gemcitabine. Analysis of the pancreatic The Cancer Genome Atlas (TCGA) database demonstrated that increased TG2 expression levels correlate with worse overall survival (hazard ratio = 1.37). Stable TG2 knockdown in PDA cells led to decreased size of pancreatic xenografts and increased sensitivity to gemcitabine in vivo. However, TG2 downregulation did not increase cytotoxicity of gemcitabine in vitro. Additionally, multivessel density and gemcitabine uptake in pancreatic tumor tissue, as measured by mass spectrometry (MS-HPLC), were not significantly different in tumors expressing TG2 versus tumors in which TG2 was knocked down. Fibroblasts, stimulated by TG2 secreted by PDA cells, secrete laminin A1, which protects cancer cells from gemcitabine-induced cytotoxicity. In all, our results demonstrate that TG2 secreted in the pancreatic TME orchestrates the cross talk between cancer cells and stroma, impacting tumor growth and response to chemotherapy."

According to the news reporters, the research concluded: "Our study supports TG2 inhibition to increase the antitumor effects of gemcitabine in PDA."

For more information on this research see: Tissue Transglutaminase Activates

Our news correspondents report that additional information may be obtained by contacting D. Matei, Jesse Brown VA Med Center, Chicago, IL, United States. Additional authors for this research include B. Yakubov, C. Ivan, D.R. Jones, A. Caperell-Grant, M. Fishel, H. Cardenas and D. Matei.

Oncology - Pancreatic Cancer

Findings on Pancreatic Cancer Reported by Investigators at Nanjing Medical University (Long non-coding RNA IRAIN suppresses apoptosis and promotes proliferation by binding to LSD1 and EZH2 in pancreatic cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Pancreatic Cancer have been published. According to news reporting originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "Long non-coding RNA (lncRNA) modulates gene expression, while lncRNA dysregulation is associated with human cancer. Furthermore, while recent studies have shown that lncRNA IRAIN plays an important role in other malignancies, the role of IRAIN in pancreatic cancer (PC) progression remains unclear."

Financial supporters for this research include The Six Talents Peak Project of Jiangsu Province, The Key Project supported by Medical Science and technology development Foundation, Nanjing Department of Health, The Medical Science and Technology Development Foundation, Nanjing Medical University.

Our news editors obtained a quote from the research from Nanjing Medical University, "In this study, we found that upregulation of lncRNA IRAIN was significantly correlated with tumor size, TNM stage, and lymph node metastasis in a cohort of 37 PC patients. In vitro experiments showed that knockdown of IRAIN by small interfering RNA (siRNA) significantly induced cell apoptosis and inhibited cell proliferation in both BxPC-3 and PANC-1 cells. Further mechanism study showed that, by binding to histone demethylase lysine-specific demethylase 1 (LSD1), an enhancer of zeste homolog 2 (EZH2), IRAIN reduced PC tumor cell apoptosis and induced growth arrest by silencing the expression of Kruppel-like factor 2 (KLF2) and P15. Moreover, IRAIN expression was inversely correlated with that of KLF2 and P15 in PC tissues."

According to the news editors, the research concluded: "To our knowledge, this is
the first report elucidating the role and mechanism of IRAIN in PC progression."

For more information on this research see: Long non-coding RNA IRAIN suppresses apoptosis and promotes proliferation by binding to LSD1 and EZH2 in pancreatic cancer. *Tumor Biology*, 2016;37(11):14929-14937. *Tumor Biology* can be contacted at: Springer, Van Godewijckstraat 30, 3311 Gz Dordrecht, Netherlands. **Oncology - Pancreatic Cancer**

**Findings on Pancreatic Cancer Reported by Investigators at University of Tokyo (Measles virus selectively blind to signaling lymphocyte activity molecule has oncolytic efficacy against nectin-4-expressing pancreatic cancer cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Pancreatic Cancer are discussed in a new report. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Pancreatic cancer is one of the most intractable cancers and has a devastating prognosis; over the past three decades the 5-year survival rate has been <10%. Therefore, development of a novel anticancer treatment for pancreatic cancer is a matter of urgency."

Funders for this research include Ministry of Health, Labour, and Welfare of Japan, Japan Agency for Medical Research and Development.

Our news journalists obtained a quote from the research from the University of Tokyo, "We previously developed an oncolytic recombinant measles virus (MV), rMV-SLAMblind, that had lost the ability to bind to its principal receptor, signaling lymphocyte activity molecule (SLAM), but which selectively infected and efficiently killed nectin-4-expressing breast and lung cancer cells. In this study, we analyzed the antitumor effect of this virus against pancreatic cancer. Nectin-4 was expressed on the surface of 4/16 tested pancreatic cancer cell lines, which were efficiently infected and killed by rMV-SLAMblind invitro. The intratumoral inoculation of rMV-SLAMblind suppressed the growth of KLM1 and Capan-2 cells xenografted in SCID mice. The sequence analysis of MV isolated from the tumor revealed that the designed mutation in the H protein of rMV-SLAMblind had been stably maintained for 47days after the last inoculation."

According to the news editors, the research concluded: "These results suggest that
rMV-SLAMblind is a promising candidate for the novel treatment of pancreatic cancer."

Our news journalists report that additional information may be obtained by contacting C. Kai, University of Tokyo, Inst Med Sci, Lab Anim Res Center, Tokyo, Japan. Additional authors for this research include T. Fujiyuki, K. Shoji, Y. Amagai, Y. Murakami, Y. Furukawa, H. Sato, M. Yoneda and C. Kai.

Oncology - Pancreatic Cancer

Findings on Pancreatic Cancer Reported by Researchers at North Dakota State University (Acridine Orange Conjugated Polymersomes for Simultaneous Nuclear Delivery of Gemcitabine and Doxorubicin to Pancreatic Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news reporting from Fargo, North Dakota, by NewsRx journalists, research stated, "Considering the systemic toxicity of chemotherapeutic agents, there is an urgent need to develop new targeted drug delivery systems. Herein, we have developed a new nuclear targeted, redox sensitive, drug delivery vehicle to simultaneously deliver the anticancer drugs gemcitabine and doxorubicin to the nuclei of pancreatic cancer cells."

Financial supporters for this research include National Institute of General Medical Sciences, Division of Materials Research.

The news correspondents obtained a quote from the research from North Dakota State University, "We prepared polymeric bilayer vesicles (polymersomes), and actively encapsulated the drug combination by the pH gradient method. A redox-sensitive polymer (PEG-S-S-PLA) was incorporated to sensitize the formulation to reducing agent concentration. Acridine orange (AO) was conjugated to the surface of the polymersomes imparting nuclear localizing property. The polymersomes' toxicity and efficacy were compared with those of a free drug combination using monolayer and three-dimensional spheroid cultures of pancreatic cancer cells. We observed that the redox sensitive, nuclear-targeted polymersomes released more than 60% of their encapsulated contents in response to 50 mM glutathione. The nanoparticles are
nontoxic; however, the drug encapsulated vesicles have significant toxicity. The prepared formulation can increase the drug's therapeutic index by delivering the drugs directly to the cells' nuclei, one of the key organelles in the cells."

According to the news reporters, the research concluded: "This study is likely to initiate research in targeted nuclear delivery using other drug formulations in other types of cancers."

Our news journalists report that additional information may be obtained by contacting T. Anajafi, Dept. of Pharmaceutical Sciences and ‡Dept. of Physics, North Dakota State University, Fargo, North Dakota 58108, United States. Additional authors for this research include M.D. Scott, S. ### Papillomas

**Findings on Papillomas Reported by Researchers at Johns Hopkins University (Immunologic Control of Mus musculus Papillomavirus Type 1)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Papillomas is the subject of a report. According to news reporting out of Baltimore, Maryland, by NewsRx editors, research stated, "Persistent papillomas developed in ~10% of out-bred immune-competent SKH-1 mice following MusPV1 challenge of their tail, and in a similar fraction the papillomas were transient, suggesting potential as a model. However, papillomas only occurred in BALB/c or C57BL/6 mice depleted of T cells with anti-CD3 antibody, and they completely regressed within 8 weeks after depletion was stopped."

Our news journalists obtained a quote from the research from Johns Hopkins University, "Neither CD4+ nor CD8+ T cell depletion alone in BALB/c or C57BL/6 mice was sufficient to permit visible papilloma formation. However, low levels of MusPV1 were sporadically detected by either genomic DNA-specific PCR analysis of local skin swabs or in situ hybridization of the challenge site with an E6/E7 probe. After switching to CD3+ T cell depletion, papillomas appeared upon 14/15 of mice that had been CD4+ T cell depleted throughout the challenge phase, 1/15 of CD8+ T cell depleted mice, and none in mice without any prior T cell depletion. Both control animals and those depleted with CD8-specific antibody
generated MusPV1 L1 capsid-specific antibodies, but not those depleted with CD4-specific antibody prior to T cell depletion with CD3 antibody. Thus, normal BALB/c or C57BL/6 mice eliminate the challenge dose, whereas infection is suppressed but not completely cleared if their CD4 or CD8 T cells are depleted, and recrudescence of MusPV1 is much greater in the former following treatment with CD3 antibody, possibly reflecting their failure to generate capsid antibody. Systemic vaccination of C57BL/6 mice with DNA vectors expressing MusPV1 E6 or E7 fused to calreticulin elicits potent CD8 T cell responses and these immunodominant CD8 T cell epitopes were mapped. Adoptive transfer of a MusPV1 E6-specific CD8+ T cell line controlled established MusPV1 infection and papilloma in RAG1-knockout mice.

According to the news editors, the research concluded: "These findings suggest the potential of immunotherapy for HPV-related disease and the importance of host immunogenetics in the outcome of infection."

For more information on this research see: Immunologic Control of Mus musculus Papillomavirus Type 1. Plos Pathogens, 2015;11(10):e1005243. (Public Library of Science - www.plos.org; Plos Pathogens - www.plospathogens.org)

**Life Science Research - Parasitology**

**Findings on Parasitology Reported by Researchers at University of Berne (Approaches for the vaccination and treatment of Neospora caninum infections in mice and ruminant models)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Life Science Research - Parasitology have been presented. According to news reporting originating from Bern, Switzerland, by NewsRx correspondents, research stated, "Neospora caninum is a leading cause of abortion in cattle, and is thus an important veterinary health problem of high economic significance. Vaccination has been considered a viable strategy to prevent bovine neosporosis."

Our news editors obtained a quote from the research from the University of Berne, "Different approaches have been investigated, and to date the most promising results have been achieved with live-attenuated vaccines. Subunit vaccines have also been studied, and most of them represented components that are functionally involved in (i) the physical interaction between the parasite and its host cell during invasion or (ii) tachyzoite-to-bradyzoite stage conversion. Drugs have been considered as an option to limit the effects of vertical transmission of N. caninum. Promising results with a small panel of compounds in small laboratory animal..."
models indicate the potential value of a chemotherapeutical approach for the prevention of neosporosis in ruminants. For both, vaccines and drugs, the key for success in preventing vertical transmission lies in the application of bioactive compounds that limit parasite proliferation and dissemination, without endangering the developing fetus not only during an exogenous acute infection but also during recrudescence of a chronic infection.

According to the news editors, the research concluded: "In this review, the current status of vaccine and drug development is presented and novel strategies against neosporosis are discussed."

For more information on this research see: Approaches for the vaccination and treatment of Neospora caninum infections in mice and ruminant models. Parasitology, 2015;143(3):245-59. Parasitology can be contacted at: Cambridge University Press, 32 Avenue of the Americas, New York, NY 10013-2473. Neurodegenerative Diseases and Conditions -...

Findings on Parkinson's Disease Detailed by Investigators at Palacky University (Familial atypical parkinsonism with rare variant in VPS35 and FBX07 genes A case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Neurodegenerative Diseases and Conditions - Parkinson's Disease. According to news reporting originating from Olomouc, Czech Republic, by NewsRx correspondents, research stated, "A higher prevalence of parkinsonism was recently identified in southeastern Moravia (Czech Republic). Further research confirmed 3 large pedigrees with familial autosomal-dominant parkinsonism spanning 5 generations."

Our news editors obtained a quote from the research from Palacky University, "This case report concerns a patient belonging to one of these 3 pedigrees, in whom motor and oculomotor symptoms were accompanied by frontal-type dementia, who finally developed a clinical phenotype of progressive supranuclear palsy. Molecular genetic examinations were performed due to the positive family history. No previously described causal mutation was found. After filtering against common variants (minor allele frequency (MAF) < 0.01), 2 noncoding and 1 synonymous rare mutation potentially associative with parkinsonism were identified: GIGYF2-GRB10 Interacting GYF Protein 2, PARK11 (c.*2030G > A,
rs115669549); VPS35 gene-vacuolar protein sorting 35, PARK17 (c. 102 + 33G > A, rs192115886); and FBXO7-F-box only protein 7 gene, PARK15 (c. 540A > G, rs41311141). As to the changes in the FBXO7 and VPS35 genes (despite phylogenetic conservation in primates), probably neither the FBXO7 nor the VPS35 variants will be direct causal mutations."

According to the news editors, the research concluded: "Both described variants, and possibly the influence of their combination, could increase the risk of the disease."

For more information on this research see: Familial atypical parkinsonism with rare variant in VPS35 and FBXO7 genes A case report. Medicine, 2016;95(46):312-316. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Pentanoic Acids

Findings on Pentanoic Acids Discussed by Investigators at University of Michigan (Alterations in the human proteome following administration of valproic acid)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Pentanoic Acids. According to news reporting from Ann Arbor, Michigan, by NewsRx journalists, research stated, "High doses of the histone deacetylase inhibitor valproic acid (VPA, 150-400 mg/kg) improve outcomes in animal models of lethal insults. We are conducting a US Food and Drug Administration-approved Phase I, double-blind, placebo-controlled trial to evaluate the safety and tolerability of ascending doses of VPA in human volunteers."

The news correspondents obtained a quote from the research from the University of Michigan, "We hypothesized that VPA would induce significant changes in the proteome of healthy humans when given at doses lower than those used in prior animal studies. Peripheral blood mononuclear cells were obtained from three healthy subjects randomized to receive VPA (120 mg/kg over 1 hour) at baseline and at 4 and 8 hours following infusion. Detailed proteomic analysis was performed using 1D gel electrophoresis, liquid chromatography, and mass spectrometry. Proteins with differential expression were chosen for functional annotation and pathway analysis using Ingenuity Pathway Analysis (Qiagen GmbH, Hilden, Germany) and Panther Gene Ontology. A total of 3,074 unique proteins were identified. The average number of proteins identified per sample was 1,716 +/- 459. There were a total of 140 unique differentially expressed proteins (p < 0.05). There was a minor and inconsistent increase in histone and nonhistone protein acetylation. Functional annotation showed significant
enrichment of apoptosis (p = 3.5E-43), cell death (p = 9.9E-72), proliferation of cells (p = 1.6E-40), dementia (p = 9.6E-40), amyloidosis (p = 6.3E-38), fatty acid metabolism (p = 4.6E-76), quantity of steroid (p = 4.2E-75), and cell movement (p = 1.9E-64). Valproic acid induces significant changes to the proteome of healthy humans when given at a dose of 120 mg/kg. It alters the expression of key proteins and pathways, including those related to cell survival, without significant modification of protein acetylation."

According to the news reporters, the research concluded: "In the next part of the ongoing Phase I trial, we will study the effects of VPA on trauma patients in hemorrhagic shock."

For more information on this research see: Alterations in the human proteome following administration of valproic acid. Journal of Trauma and Acute Care Surgery, 2016;81 (6):1020-1027. Journal of Trauma and Acute Care Surgery can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Journal of Trauma and Acute Care Surgery - journals.lww.com/jtrauma/pages/default.aspx)

Our news journalists report that additional information may be obtained by contacting H.B. Alam, University of Michigan, Dept. of Surg, Ann Arbor, MI 48109, United States. Enzymes and Coenzymes - Peptide Hydrolases

Findings on Peptide Hydrolases Described by Researchers at University of Wurzburg (Development of a New Antileishmanial Aziridine-2,3-Dicarboxylate-Based Inhibitor with High Selectivity for Parasite Cysteine Proteases)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Enzymes and Coenzymes - Peptide Hydrolases is the subject of a report. According to news reporting originating from Wuerzburg, Germany, by NewsRx correspondents, research stated, "Leishmaniasis is one of the major neglected tropical diseases of the world. Druggable targets are the parasite cysteine proteases (CPs) of clan CA, family C1 (CAC1)."

Our news editors obtained a quote from the research from the University of Wurzburg, "In previous studies, we identified two peptidomimetic compounds, the aziridine-2,3-dicarboxylate compounds 13b and 13e, in a series of inhibitors of the cathepsin L (CL) subfamily of the papain clan CAC1. Both displayed antileishmanial activity in vitro while not showing cytotoxicity against host cells. In further investigations, the mode of action was characterized in Leishmania major. It was demonstrated that aziridines 13b and 13e mainly inhibited the parasitic cathepsin B (CB)-like CPC enzyme and, additionally, mammalian CL. Although these compounds induced cell death of Leishmania promastigotes and amastigotes in
vitro, the induction of a proleishmanial T helper type 2 (Th2) response caused by host CL inhibition was observed in vivo. Therefore, we describe here the synthesis of a new library of more selective peptidomimetic aziridine-2,3-dicarboxylates discriminating between host and parasite CPs. The new compounds are based on 13b and 13e as lead structures. One of the most promising compounds of this series is compound s9, showing selective inhibition of the parasite CPs LmaCatB (a CB-like enzyme of L. major; also named L. major CPC) and LmCPB2.8 (a CL-like enzyme of Leishmania mexicana) while not affecting mammalian CL and CB. It displayed excellent leishmanicidal activities against L. major promastigotes (50% inhibitory concentration [IC[50]=37.4 mM) and amastigotes (IC[50]=2.3 mM).

According to the news editors, the research concluded: "In summary, we demonstrate a new selective aziridine-2,3-dicarboxylate, compound s9, which might be a good candidate for future in vivo studies."

For more information on this research see: Development of a New Antileishmanial Aziridine-2,3-Dicarboxylate-Based Inhibitor with High Selectivity for Parasite Cysteine Proteases. Antimicrobial Agents and Chemotherapy, 2015;60(2):797-805. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news editors report that additional information may be obtained by contacting U. Schurigt, Institute for Molecular Infection Biology, University of Wuerzburg, Wuerzburg, Germany. vacuoles, swollen mitochondria, and apoptosis in tubular epithelial cells. Pericyte ablation led to endothelial cell swelling, reduced expression of vascular homeostasis markers, and peritubular capillary loss. Despite the observed injury, no signs of the acute inflammatory response were observed. Pathway enrichment analysis of genes expressed in kidney pericytes in vivo identified basement membrane proteins, angiogenic factors, and factors regulating vascular tone as major regulators of vascular function. Using novel microphysiological devices, we recapitulated human kidney peritubular capillaries coated with pericytes and showed that pericytes regulate permeability, basement membrane deposition, and microvascular tone.

According to the news reporters, the research concluded: "These findings suggest that through the active support of the microvasculature, pericytes are essential to adult kidney homeostasis."

For more information on this research see: Maintenance of vascular integrity by pericytes is essential for normal kidney function. American Journal of Physiology-Renal Physiology, 2016;311(6):F1230-F1242. American Journal of Physiology-Renal Physiology can be contacted at: Amer Physiological Soc, 9650 Rockville Pike, Bethesda, MD 20814, USA.

Drugs and Therapies - Pharmacoepidemiology and Drug Safety Reported by Investigators at University of Milan (A probabilistic bias analysis for misclassified categorical exposures, with application to oral antihyperglycaemic drugs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Pharmacoepidemiology and Drug Safety. According to news reporting from Milan, Italy, by NewsRx journalists, research stated, "The effect of drug exposure misclassification generally receives little attention in pharmacoepidemiological research. In this paper, we illustrate a probabilistic bias analysis approach for misclassified categorical exposures and apply it in a database study of oral anti-hyperglycaemic drugs (OADs)."

The news correspondents obtained a quote from the research from the University of Milan, "A cohort study based on the Health Search Database general-practice database was carried out by including 12 640 adult (>= 40 years) patients newly treated with OADs during 2003-2010. The proportion of days covered by OADs prescriptions during the first year of follow-up was evaluated for each individual, either by means of the prescribed daily dose or the defined daily dose. The effect of misclassification on hypothetical OAD-outcome association profiles was assessed through the proposed probabilistic bias analysis approach, taking advantage of available exposure validation data. During the first year of follow-up, the average
(SD) number of months with OADs available was 7 (4) months and 5 (3) months according to the prescribed daily dose and defined daily dose metrics, respectively. Probabilistic bias analysis results based on validation data suggest that the effect of misclassification is complex, as conventional exposure-outcome association estimates may be of greater or lower magnitude than their misclassification-adjusted values. Misclassification should be taken into account in database studies on the safety of prescribed medications."

According to the news reporters, the research concluded: "To this aim, investigators should take advantage of external exposure validation data in sensitivity analysis approaches such as ours."

Our news journalists report that additional information may be obtained by contacting A. Arfe, Univ Milano Bicocca, Dept. of Stat & Quantitat Methods, Milan, Italy. Additional authors for this research include F. Nicotra, A. Ghirardi, M. Simonetti, F. Lapi, M. Sturkenboom and G. Corrao.

Pharmacology

**Findings on Pharmacology Detailed by Researchers at University of Naples Federico II (Insights on FXR selective modulation. Speculation on bile acid chemical space in the discovery of potent and selective agonists)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacology have been presented. According to news originating from Naples, Italy, by NewsRx correspondents, research stated, "Bile acids are the endogenous modulators of the nuclear receptor FXR and the membrane receptor GPBAR1. FXR represents a promising pharmacological target for the treatment of cholestatic liver disorders."

Our news journalists obtained a quote from the research from the University of Naples Federico II, "Currently available semisynthetic bile acid derivatives cover the same chemical space of bile acids and therefore they are poorly selective toward BA receptors, increasing patient risk for adverse side effects. In this report, we have investigated around the structure of CDCA describing the synthesis and the in vitro and in vivo pharmacological characterization of a novel family of compounds modified on the steroidal tetracyclic core and on the side chain. Pharmacological characterization resulted in the identification of several potent and selective FXR agonists."

According to the news editors, the research concluded: "These novel agents might add utility in the treatment of cholestatic disorders by potentially mitigating side effects linked
to unwanted activation of GPBAR1."

For more information on this research see: Insights on FXR selective modulation. Speculation on bile acid chemical space in the discovery of potent and selective agonists. *Scientific Reports*, 2016;6():19008. (Nature Publishing Group - www.nature.com/, Scientific Reports - www.nature.com/srep/)

The news correspondents report that additional information may be obtained from V. Sepe, Dept. of Pharmacy, University of Naples Federico II, Via D Montesano, 49, 80131 Naples, Italy. **Pharmacology**

**Findings on Pharmacology Reported by Investigators at Ministry of Agriculture (Synthesis and Pharmacological Evaluation of Novel Pleuromutilin Derivatives with Substituted Benzimidazole Moieties)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacology. According to news reporting out of Lanzhou, People's Republic of China, by NewsRx editors, research stated, "A series of novel pleuromutilin derivatives with substituted benzimidazole moieties were designed and synthesized from pleuromutilin and 5-amino-2-mercaptobenzimidazole through sequential reactions. All the newly synthesized compounds were characterized by IR, NMR, and HRMS."

Our news journalists obtained a quote from the research from the Ministry of Agriculture, "Each of the derivatives was evaluated in vitro for their antibacterial activity against Escherichia coli (E. coli) and five Gram (+) inoculums. 14-O-((5-amino-benzimidazole-2-yl)thioacetyl)mutilin (3) was the most active compound and showed highest antibacterial activities. Furthermore, we evaluated the inhibition activities of compound 3 on short-term S. aureus and MRSA growth and cytochrome P450 (CYP)."

According to the news editors, the research concluded: "The bioassay results indicate that compound 3 could be considered potential antibacterial agents but with intermediate inhibition of CYP3A4."

For more information on this research see: Synthesis and Pharmacological Evaluation of Novel Pleuromutilin Derivatives with Substituted Benzimidazole Moieties. *Molecules*, 2016;21(11):995-1005. *Molecules* can be contacted at: Mdpi Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland. Pharmacology

Findings on Pharmacology Reported by R.C. Anderson et al (Iodinated benzimidazole PARP radiotracer for evaluating PARP1/2 expression in vitro and in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Pharmacology are presented in a new report. According to news reporting from Philadelphia, Pennsylvania, by NewsRx journalists, research stated, "PARP inhibitors (PARPi) have the potential to impact cancer therapy in a selective patient population; however, despite current patient selection methods clinical trials have shown mixed response rates. It is therefore clinically useful to determine which patients will respond prior to receiving PARPi therapy."

The news correspondents obtained a quote from the research, "One essential biomarker is to measure the level of PARP enzyme expression in tumors. Small molecule radiotracers have been developed to accurately quantify PARP-1 expression in vitro and in vivo. [I-125]KX-02-019 is the first report of a radioiodinated analogue of the benzimidazole class of PARPi. Herein, we studied the pharmacological properties of [I-125]KX-02-019 as well as the in vivo biodistribution. [I-125]KX-02-019 was evaluated in both cancer and non-cancer cell lines. We evaluated the pharmacologic properties of [I-125]KX-02-019 in live cells by measuring enzyme association and dissociation kinetics, saturation, and specificity. In addition, competitive inhibition experiments were carried out with commercially available PARPi. Protein expression was analyzed by Western blot to compare PARP-1 and PARP-2 expression across cell lines studied. The biodistribution was studied in a mouse EMT6 tumor model at time points of 0.5, 1, 2, 4 and 6 h. [I-125]KX-02-019 showed subtle differences in pharmacological properties in the absence of PARP-2. In addition, [I-125]KX-02-019 was competitively displaced by clinical PARPi. In vivo biodistribution studies showed an increasing tumor to muscle ratio over 6 h as well as fast clearance from healthy tissues. [I-125]KX-02-019 has binding sites in both PARP1 KO cells as well as PARP2 MO cells showing higher affinity for PARP-2. This observation is supported by a decrease in binding affinity in PARP2 MO cells compared to PARP1 KO cells."

According to the news reporters, the research concluded: "The pharmacologic and biological properties of [I-125]KX-02-019 studied in vitro and in vivo showed that this analogue may be useful in determining pharmacokinetic and pharmacodynamic properties of clinical PARPi."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.nucmedbio.2016.08.007. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Pharmacy Practice

Findings on Pharmacy Practice Discussed by Investigators at University of Arkansas (Community pharmacy owners’ views of star ratings and performance measurement: In-depth interviews)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmacy Practice. According to news reporting from Little Rock, Arkansas, by NewsRx journalists, research stated, "The star rating system implemented by Medicare has the potential to positively affect patient health and may have financial implications for community pharmacies. Learning from owners of community pharmacies with high performance on these quality measures may help us to identify and further understand factors contributing to their success."

The news correspondents obtained a quote from the research from the University of Arkansas, "This study described high-performing community pharmacy owners' current awareness and knowledge of star ratings, attitudes toward star ratings and performance measurement, and initiatives being offered in pharmacies that aim to improve the quality of care. Qualitative interviews with owners of independent community pharmacies were conducted in Spring 2015. Fifteen community pharmacies with high performance on the star rating measures were invited to participate. Recruitment did not end until the saturation point had been reached. All interviews were transcribed verbatim. Interview data were analyzed with the use of ATLAS.ti by 2 coders trained in thematic analysis. Krippendorf's alpha was calculated to assess intercoder reliability. Ten high-performing pharmacy owners participated. Analysis identified 8 themes, which were organized into the following categories: 1) current awareness and knowledge (i.e., superficial or advanced knowledge); 2) attitudes toward star ratings (positive perceptions, skeptical of performance rewards, and lack a feeling of control); and 3) pharmacy initiatives (personal patient relationships, collaborative employee relationships, and use of technology). Intercoder reliability was good overall. Interviews with high-performing pharmacies suggested that awareness of the star rating measures, overall positive attitudes toward the star ratings, the relationships that pharmacy owners have with their patients and their employees, and the use of technology as a tool to enhance patient care may contribute to high performance on the star rating measures."

According to the news reporters, the research concluded: "Future research is needed to determine if and how these constructs are associated with pharmacy performance in a larger population."
For more information on this research see: Community pharmacy owners' views of star ratings and performance measurement: In-depth interviews. *Journal of the American Pharmacists Association*, 2016;56(5):549-554. *Journal of the American Pharmacists Association* can be contacted at: Amer Pharmaceutical Assoc, 2215 Constitution Ave NW, Washington, DC 20037, USA.

**Photodynamics**

**Findings on Photodynamics Detailed by Investigators at University of Sao Paulo (In vitro effects of photodynamic therapy induced by chloroaluminum phthalocyanine nanoemulsion)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Photodynamics have been published. According to news reporting from Ribeirao Preto, Brazil, by NewsRx journalists, research stated, "The photodynamic therapy (PDT) has been used to treat cancer mainly by inducing oxidative stress. Our aim was to evaluate the effect of PDT and its combination with methoxyamine (MX), a blocker of base excision repair (BER), in cells expressing high levels of the APE1 protein, which is involved in cell oxidative damage response."

The news correspondents obtained a quote from the research from the University of Sao Paulo, "The HeLa and A549 cells were treated for 3 h with chloroaluminum phthalocyanine incorporated into a well-designed nanoemulsion (C1A1Pc/NE); and then irradiated by visible light (@670 nm) with doses of 0.1, 0.5 and 1.0 J/cm(2). A simultaneous combination of MX+CIA1Pc/NE was performed and then irradiated with the selected dose of 0.5 J/cm(2). The treatments were evaluated in terms of viability, clonogenicity, DNA fragmentation, and cell death mechanism by apoptosis and/or necrosis. The APE1 protein expression observed was higher in HeLa than in A549. Both cell lines exhibited substantial differences in cell cytotoxicity. The PDT decreased the clonogenicity of HeLa by inducing apoptosis (sub-G1 and annexin detection). Additionaly, the MX potentiates the PDT-effects in HeLa. Otherwise, low cytotoxicity was observed in A549 cells."

According to the news reporters, the research concluded: "The PDT induced apoptosis in high APE1 expressive HeLa cells, and the blockage of BER by MX increased its effects."

For more information on this research see: In vitro effects of photodynamic therapy induced by chloroaluminum phthalocyanine nanoemulsion. *Photodiagnosis and Photodynamic*
Findings on Platinum Compounds Reported by Investigators at University of Messina (Evaluation of cisplatin plasma levels in patients undergoing cytoreductive surgery and hyperthermic intraperitoneal chemotherapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Platinum Compounds are discussed in a new report. According to news reporting out of Messina, Italy, by NewsRx editors, research stated, "Peritoneal surface malignancies have long been regarded as incurable, however, they can be treated with cytoreductive surgery in addition to hyperthermic intraperitoneal chemotherapy. This approach is associated with an increase in morbidity and mortality, unless hyperhydration is provided in a timely manner."

Our news journalists obtained a quote from the research from the University of Messina, "Cisplatin (CDDP) is the most widely used chemotherapeutic agent. Plasma levels of cisplatin (CDDP), a widely used chemotherapeutic agent, were measured before, during, and after the procedure. This was done in order to identify the window of highest risk as a function of drug concentrations, assuming a dose-dependent effect. Plasma levels of CDDP peak during perfusion. The concentration remains high until the 4th post-operative day and returns to pre-operative levels by the 7th post-operative day."

According to the news editors, the research concluded: "Our findings suggest that ensuring hyperhydration as well as infusing albumin and fresh frozen plasma may be of particular value for at least the first 4 days after the procedure."

Our news journalists report that additional information may be obtained by contacting F. Fleres, University of Messina, Dept. of Human Pathol, I-98125 Messina, Italy. Additional authors for this research include E. Saladino, R. Catanoso, V. Arcoraci, T.
Platinum Compounds

Findings on Platinum Compounds Reported by Researchers at Shanghai Jiao-Tong University (Phenylethyl isothiocyanate reverses cisplatin resistance in biliary tract cancer cells via glutathionylation-dependent degradation of Mcl-1)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Platinum Compounds. According to news originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Biliary tract cancer (BTC) is a highly malignant cancer. BTC exhibits a low response rate to cisplatin (CDDP) treatment, and therefore, an understanding of the mechanism of CDDP resistance is urgently needed."

Our news journalists obtained a quote from the research from Shanghai Jiao-Tong University, "Here, we show that BTC cells develop CDDP resistance due, in part, to upregulation of myeloid cell leukemia 1 (Mcl-1). Phenyethyl isothiocyanate (PEITC), a natural compound found in watercress, could enhance the efficacy of CDDP by degrading Mcl-1. PEITC-CDDP co-treatment also increased the rate of apoptosis of cancer stem-like side population (SP) cells and inhibited xenograft tumor growth without obvious toxic effects. In vitro, PEITC decreased reduced glutathione (GSH), which resulted in decreased GSH/oxidized glutathione (GSSG) ratio and increased glutathionylation of Mcl-1, leading to rapid proteasomal degradation of Mcl-1. Furthermore, we identified Cys16 and Cys286 as Mcl-1 glutathionylation sites, and mutating them resulted in PEITC-mediated degradation resistant Mcl-1 protein."

According to the news editors, the research concluded: "We demonstrate for the first time that CDDP resistance is partially associated with Mcl-1 in BTC cells and we identify a novel mechanism that PEITC can enhance CDDP-induced apoptosis via glutathionylation-dependent degradation of Mcl-1. Hence, our results provide support that dietary intake of watercress may help reverse CDDP resistance in BTC patients."

For more information on this research see: Phenylethyl isothiocyanate reverses cisplatin resistance in biliary tract cancer cells via glutathionylation-dependent degradation of Mcl-1. Oncotarget, 2016;7(9):10271-82.

Polyethylene Glycols

Findings on Polyethylene Glycols Reported by Investigators at University of Lisbon (Controlled drug release from hydrogels for contact lenses: Drug partitioning and diffusion)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Polyethylene Glycols are presented in a new report. According to news reporting from Lisbon, Portugal, by NewsRx journalists, research stated, "Optimization of drug delivery from drug loaded contact lenses assumes understanding the drug transport mechanisms through hydrogels which relies on the knowledge of drug partition and diffusion coefficients. We chose, as model systems, two materials used in contact lens, a poly-hydroxyethylmethacrylate (pHEMA) based hydrogel and a silicone based hydrogel, and three drugs with different sizes and charges: chlorhexidine, levofloxacin and diclofenac."

The news correspondents obtained a quote from the research from the University of Lisbon, "Equilibrium partition coefficients were determined at different ionic strength and pH, using water (pH 5.6) and PBS (pH 7.4). The measured partition coefficients were related with the polymer volume fraction in the hydrogel, through the introduction of an enhancement factor following the approach developed by the group of C. J. Radke (Kotsmar et al., 2012; Liu et al., 2013). This factor may be decomposed in the product of three other factors E-HS, E-el and E-ad which account for, respectively, hard-sphere size exclusion, electrostatic interactions, and specific solute adsorption. While E-HS and E-el are close to 1, E-ad >> 1 in all cases suggesting strong specific interactions between the drugs and the hydrogels. Adsorption was maximal for chlorhexidine on the silicone based hydrogel, in water, due to strong hydrogen bonding. The effective diffusion coefficients, D-e, were determined from the drug release profiles."

According to the news reporters, the research concluded: "Estimations of diffusion coefficients of the non-adsorbed solutes D = De x E-ad allowed comparison with theories for solute diffusion in the absence of specific interaction with the polymeric membrane."

Our news journalists report that additional information may be obtained by contacting B. Saramago, University of Lisbon, Inst Super Tecn, Center Quim Estrutural, P-1049001 Lisbon, Portugal. Additional authors for this research include J. Ascenso, J.C.S. Fernandes, R. Colaco, A.P. Serro and B. Saramago.

**Peptide Proteins - Posterior Pituitary Hormones**

**Findings on Posterior Pituitary Hormones Discussed by Investigators at Mental Health Research Institute (A meta-analytic review of the correlation between peripheral oxytocin and cortisol concentrations)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Peptide Proteins - Posterior Pituitary Hormones. According to news reporting originating from Ottawa, Canada, by NewsRx correspondents, research stated, "The stress dampening effects of exogenous oxytocin in humans have been well documented. However, the relation between endogenous oxytocin and cortisol is poorly understood."

Our news editors obtained a quote from the research from Mental Health Research Institute, "We conducted a meta analysis on the correlation between oxytocin and cortisol levels measured at baseline (k = 24, N = 739). The effect size for the baseline correlation statistic was small (Pearson r = 0.163, p = 0.008), with high heterogeneity (I-2 = 67.88%). Moderation analysis revealed that studies where participants anticipated an experimental manipulation evidenced a greater positive correlation compared to those that did not (Pearson r = 0.318, p = 0.006). A supplementary analysis including additional studies indicated that oxytocin levels in unextracted samples were 60 times higher when using this questionable practice. The findings suggest that the interplay between oxytocin and cortisol is dynamic and sensitive to the anticipation of stress or novelty."

According to the news editors, the research concluded: "Furthermore, extraction of oxytocin appears to be an essential methodological practice."

The news editors report that additional information may be obtained by contacting C. Cardoso, Royal Ottawa Mental Hlth Center, Mental Hlth Res Inst, Ottawa, ON, Canada. Additional authors for this research include C. Cardoso and M.A. Ellenbogen.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.yfrne.2016.11.001. This DOI is a link to an online electronic document that is either free or for purchase.

Findings on Prostate Cancer Detailed by Investigators at Duke University (Physician Recommendations Trump Patient Preferences in Prostate Cancer Treatment Decisions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness \& Wellness Week -- New research on Oncology - Prostate Cancer is the subject of a report. According to news reporting originating from Durham, North Carolina, by NewsRx correspondents, research stated, "To assess the influence of patient preferences and urologist recommendations in treatment decisions for clinically localized prostate cancer. We enrolled 257 men with clinically localized prostate cancer (prostate-specific antigen < 20; Gleason score 6 or 7) seen by urologists (primarily residents and fellows) in 4 Veterans Affairs medical centers."

Our news editors obtained a quote from the research from Duke University, "We measured patients' baseline preferences prior to their urology appointments, including initial treatment preference, cancer-related anxiety, and interest in sex. In longitudinal follow-up, we determined which treatment patients received. We used hierarchical logistic regression to determine the factors that predicted treatment received (active treatment v. active surveillance) and urologist recommendations. We also conducted a directed content analysis of recorded clinical encounters to determine if urologists discussed patients' interest in sex. Patients' initial treatment preferences did not predict receipt of active treatment versus surveillance, Delta chi(2)(4) = 3.67, P = 0.45. Instead, receipt of active treatment was predicted primarily by urologists' recommendations, Delta chi(2)(2) = 32.81, P< 0.001. Urologists' recommendations, in turn, were influenced heavily by medical factors (age and Gleason score) but were unrelated to patient preferences, Delta chi(2)(6) = 0, P = 1. Urologists rarely discussed patients' interest in sex (< 15% of appointments)."

According to the news editors, the research concluded: "Patients' treatment decisions were based largely on urologists' recommendations, which, in turn, were based on medical factors (age and Gleason score) and not on patients' personal views of the relative pros and cons of treatment alternatives."

The news editors report that additional information may be obtained by contacting P.A. Ubel, Duke University, Sanford Sch Public Policy, Durham, NC, United States. Additional authors for this research include A. Fagerlin, T. Hofer, L.D. Scherer, M. Holmes-Rovner, L.D. Williamson, V.C. Kahn, J.S. Montgomery, K.L. Greene, B.Q. Zhang and P.A. Ubel.

Keywords for this news article include: Durham, North Carolina, United States, North and Central America, Cancer, Epidemiology, Prostatic Neoplasms, Prostate Cancer, Oncology, Duke University.

Findings on Prostate Cancer Detailed by Researchers at Institute of Medical Sciences (Outcome of radical prostatectomy as primary treatment for high-risk prostate cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Prostate Cancer are discussed in a new report. According to news reporting originating from Maharashtra, India, by NewsRx correspondents, research stated, "Recently, there has been considerable interest in the role of radical prostatectomy (RP) in men with high-risk prostate cancer. The objective of our study is to report the outcome of upfront RP in our patients with high-risk prostate cancer (Stage (>=) cT2c, a pre-operative serum prostate specific antigen >20 ng/ml or a biopsy Gleason score [GS] 8-10)."

Our news editors obtained a quote from the research from the Institute of Medical Sciences, "From 1996 to 2010, 208 patients of prostate cancer (high risk category D'Amico's criteria) underwent open RP with bilateral pelvic lymphadenectomy. The data was statistically analyzed using Kaplan Meier method and log rank test to calculate progression free, metastasis free survival (MFS) and cancer specific survival (CSS). Furthermore multivariate analysis (MVA) was carried out using SPSS 14 software. (IBM company). At 7 and 10 years, prostate cancer-specific survival (PCSS) was found to be 79.7% and 65%, respectively, biochemical recurrence free survival (BRFS) was 42.4% and 36.7%, respectively and the MFS was 71.1% and 64.4% respectively. High GS was highly predictable of PCSS, BRFS and MFS. Node positivity was the single poor risk factor on MVA whereas biopsy GS, pStage (p=0.016) and seminal vesicle invasion (p=0.045) had statistical significance in predicting the MFS."

According to the news editors, the research concluded: "RP provides accurate pathologic staging of patients with high risk prostate cancer, allows better stratification of patients for further adjuvant therapy and either as an initial approach or part of a multimodal regimen, can provide durable local control and provides excellent CSS."

For more information on this research see: Outcome of radical prostatectomy as primary treatment for high-risk prostate cancer patients. Indian Journal of Cancer, 2015;52 (4):646-52.

The news editors report that additional information may be obtained by contacting V.S. Gunavanthe, Dept. of Urology, Bombay Hospital Institute of Medical Sciences, Mumbai, Maharashtra, India. Additional authors for this research include V.S. Gunavanthe and A. Dhale.

Oncology - Prostate Cancer

Findings on Prostate Cancer Reported by Investigators at Cancer Institute (Sexual Function After Hypofractionated Versus Conventionally Fractionated Radiotherapy for Prostate Cancer: Results From the Randomized Phase III HYPRO Trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Prostate Cancer.

According to reports originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "Hypofractionated radiotherapy could increase the radiobiological tumor dose for localized prostate cancer. The effects of hypofractionation on sexual function are not well known."

Our news journalists obtained a quote from the research from Cancer Institute, "To compare sexual function in patients with prostate cancer treated with 78 Gy in 39 fractions of 2 Gy or 64.6 Gy in 19 fractions of 3.4 Gy. In total, 820 men with intermediate-to high-risk T1b-T4NX-0MX-0 prostate cancer were enrolled in the phase III HYPRO trial (2007-2010) and randomized to conventional fractionation (39 x 2 Gy) or hypofractionation (19 x 3.4 Gy). Sexual function was assessed at baseline and at 6, 12, 24, and 36 months after treatment using the International Index of Erectile Function (IIEF). For this analysis, patients (n = 322) with a baseline assessment, at least one follow-up assessment, and no or short-term (6-month) androgen-deprivation therapy were included. Mean IIEF domain scores were compared between treatments in the total population and the hormone-naive population (n = 197) using the independent t-test. Incidences of severe erectile dysfunction (domain score < 11) at last follow-up were calculated in patients with partial or full baseline function. Binary logistic regression analyses were applied to calculate the odds ratio of hypofractionation vs conventional fractionation and to adjust for clinical factors. Median age was 71 years (interquartile range = 67-71) and median follow-up was 37 months (interquartile range = 25-38). Androgen-deprivation therapy was prescribed in 125 (39%). IIEF domain scores decreased after treatment but were comparable between treatment arms at baseline and during follow-up. Orgasmic function scores in hormone-naive patients were significantly higher at 3 years after hypofractionation (4.08 vs 2.65, P = .031). In patients (n = 120) with partial or full baseline erectile function, the incidence of erectile dysfunction at last follow-up was 34.4% for hypofractionated treatment vs 39.3% for conventional treatment (adjusted odds ratio = 0.84, 95% CI = 0.37-1.90, P = .67). No significant differences in erectile functioning between conventional and hypofractionated radiotherapy were found."

According to the news editors, the research concluded: "Hormone-naive patients reported significantly higher orgasmic function scores at 3 years after hypofractionation."

The news correspondents report that additional information may be obtained from L. Incrocci, Erasmus MC Canc Inst, Dept. of Radian Oncol, NL-3075 EA Rotterdam, Netherlands. Additional authors for this research include F.J. Pos, W.D. Heemsbergen and L. Incrocci.

**Oncology - Prostate Cancer**

**Findings on Prostate Cancer Reported by Investigators at Yale University School of Medicine (The Association Between Evaluation at Academic Centers and the Likelihood of Expectant Management in Low-risk Prostate Cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting out of New Haven, Connecticut, by NewsRx editors, research stated, "To identify factors associated with expectant management (EM) in a large cohort of men with low-risk prostate cancer based on cancer center type (community vs academic). EM, consisting of active surveillance or observation for men with low-risk prostate cancer, is an increasingly recognized management option, given the morbidity and lack of a survival benefit associated with definitive treatment."

Our news journalists obtained a quote from the research from the Yale University School of Medicine, "However, the influence of cancer center type on treatment selection is uncertain. We performed a retrospective analysis of the National Cancer Data Base from 2010 to 2013. Men with low-risk prostate cancer were divided by management strategy into groups consisting of EM or definitive treatment. The association between management strategy and facility type (community vs academic) was characterized using 2-level hierarchical mixed effects logistic regression models. There were 52,417 (57%) men evaluated at community centers and 39,139 men (43%) evaluated at academic centers. Patients evaluated at academic centers were significantly more likely to receive EM than those at community centers (17% vs 8%, P<.001). After adjusting for pertinent covariates, evaluation at an academic vs community facility was independently associated with increased odds of EM utilization (adjusted odds ratio 2.70, 95% confidence interval 2.00-3.66). Fifty-one percent of the total variance was explained by interfacility variation. The likelihood of receiving EM for low-risk prostate cancer was significantly lower in men evaluated at community centers."

According to the news editors, the research concluded: "Further investigation is warranted to elucidate factors that influence the management of low-risk prostate cancer, including individual treatment center patterns."

Our news journalists report that additional information may be obtained by contacting N.H. Lester-Coll, Yale Sch Med, Dept. of Internal Med, New Haven, CT, United States. Additional authors for this research include H.S. Park, C.E. Rutter, C.D. Corso, B.R. Mancini, D.N. Yeboa, S.P. Kim, C.P. Gross and J.B. Yu.

Prothrombin

Findings on Prothrombin Discussed by K. Kapoor and Co-Researchers (Discovery of Novel Nonactive Site Inhibitors of the Prothrombinase Enzyme Complex)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Prothrombin are discussed in a new report. According to news reporting originating from Knoxville, Tennessee, by NewsRx correspondents, research stated, "The risk of serious bleeding is a major liability of anticoagulant drugs that are active-site competitive inhibitors targeting the Factor Xa (FXa) prothrombin (PT) binding site. The present work identifies several new classes of small molecule anticoagulants that can act as nonactive site inhibitors of the prothrombinase (PTase) complex composed of FXa and Factor Va (FVa)."

Financial support for this research came from National Heart, Lung, and Blood Institute.

Our news editors obtained a quote from the research, "These new classes of anticoagulants were identified, using a novel agnostic computational approach to identify previously unrecognized binding pockets at the FXa-FVa interface. From about three million docking calculations of 281,128 compounds in a conformational ensemble of FXa heavy chains identified by molecular dynamics (MD) simulations, 97 compounds and their structural analogues were selected for experimental validation, through a series of inhibition assays. The compound selection was based on their predicted binding affinities to FXa and their ability to successfully bind to multiple protein conformations while showing selectivity for particular binding sites at the FXa/FVa interface. From these, thirty-one (31) compounds were experimentally identified as nonactive site inhibitors. Concentration-based assays further identified 10 compounds represented by four small-molecule families of inhibitors that achieve dose-independent partial inhibition of PTase activity in a nonactive site-dependent and self-limiting mechanism."

According to the news editors, the research concluded: "Several compounds were identified for their ability to bind to protein conformations only seen during MD, highlighting the importance of accounting for protein flexibility in structure-based drug discovery approaches."

The news editors report that additional information may be obtained by contacting K.
Lung Diseases and Conditions - Pulmonary Embolism

Findings on Pulmonary Embolism Discussed by Investigators at Queen Margaret Hospital (D-dimer test for excluding the diagnosis of pulmonary embolism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Lung Diseases and Conditions - Pulmonary Embolism have been published. According to news reporting originating in Fife, United Kingdom, by NewsRx journalists, research stated, "Pulmonary embolism (PE) can occur when a thrombus (blood clot) travels through the veins and lodges in the arteries of the lungs, producing an obstruction. People who are thought to be at risk include those with cancer, people who have had a recent surgical procedure or have experienced long periods of immobilisation and women who are pregnant."

The news reporters obtained a quote from the research from Queen Margaret Hospital, "The clinical presentation can vary, but unexplained respiratory symptoms such as difficulty breathing, chest pain and an increased respiratory rate are common. D-dimers are fragments of protein released into the circulation when a blood clot breaks down as a result of normal body processes or with use of prescribed fibrinolytic medication. The D-dimer test is a laboratory assay currently used to rule out the presence of high D-dimer plasma levels and, by association, venous thromboembolism (VTE). D-dimer tests are rapid, simple and inexpensive and can prevent the high costs associated with expensive diagnostic tests. To investigate the ability of the D-dimer test to rule out a diagnosis of acute PE in patients treated in hospital outpatient and accident and emergency (A&E) settings who have had a pre-test probability (PTP) of PE determined according to a clinical prediction rule (CPR), by estimating the accuracy of the test according to estimates of sensitivity and specificity. The review focuses on those patients who are not already established on anticoagulation at the time of study recruitment. Search methods We searched 13 databases from conception until December 2013. We cross-checked the reference lists of relevant studies. Selection criteria Two review authors independently applied exclusion criteria to full papers and resolved disagreements by discussion. We included cross-sectional studies of D-dimer in which ventilation/perfusion (V/Q) scintigraphy, computerised tomography pulmonary angiography (CTPA), selective pulmonary angiography and magnetic resonance pulmonary angiography (MRPA) were used as the reference standard. Adults who were managed in hospital outpatient and A&E settings and were suspected of acute PE were eligible for inclusion in the review if they had received a pre-test probability score based on a CPR. Index tests: quantitative, semi quantitative and qualitative D-
dimer tests. Target condition: acute symptomatic PE. Reference standards: We included studies that used pulmonary angiography, V/Q scintigraphy, CTPA and MRPA as reference standard tests. Data collection and analysis Two review authors independently extracted data and assessed quality using Quality Assessment of Diagnostic Accuracy Studies-2 (QUADAS-2). We resolved disagreements by discussion. Review authors extracted patient-level data when available to populate 2 x 2 contingency tables (true-positives (TPs), true-negatives (TNs), false-positives (FPs) and false-negatives (FNs)). We included four studies in the review (n = 1585 patients). None of the studies were at high risk of bias in any of the QUADAS-2 domains, but some uncertainty surrounded the validity of studies in some domains for which the risk of bias was uncertain. D-dimer assays demonstrated high sensitivity in all four studies, but with high levels of false-positive results, especially among those over the age of 65 years. Estimates of sensitivity ranged from 80% to 100%, and estimates of specificity from 23% to 63%. Authors' conclusions A negative D-dimer test is valuable in ruling out PE in patients who present to the A&E setting with a low PTP."

According to the news reporters, the research concluded: "Evidence from one study suggests that this test may have less utility in older populations, but no empirical evidence was available to support an increase in the diagnostic threshold of interpretation of D-dimer results for those over the age of 65 years."

For more information on this research see: D-dimer test for excluding the diagnosis of pulmonary embolism. Cochrane Database of Systematic Reviews, 2016;(8):1472-1517. Cochrane Database of Systematic Reviews can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA.

Our news correspondents report that additional information may be obtained by contacting F. Crawford, Queen Margaret Hosp, NHS Fife, Dunfermline KY12 0SU, Fife, United Kingdom. Additional authors for this research include A. Andras, K. Welch, K. Sheares, D. Keeling and F.M. Chappell.

Lung Diseases and Conditions - Pulmonary…

Findings on Pulmonary Hypertension Reported by Investigators at University of Toronto (Simvastatin prevents and reverses chronic pulmonary hypertension in newborn rats via pleiotropic inhibition of RhoA signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Pulmonary Hypertension. According to news reporting from Toronto, Canada, by NewsRx journalists, research stated, "Chronic neonatal pulmonary hypertension (PHT) frequently results in early death. Systemically administered Rho-kinase (ROCK) inhibitors prevent and reverse chronic PHT in neonatal rats, but at the cost of severe adverse effects, including systemic
h typedr and growth restriction."

Financial support for this research came from Canadian Institutes of Health Research.

The news correspondents obtained a quote from the research from the University of Toronto, "Simvastatin has pleiotropic inhibitory effects on isoprenoid intermediates that may limit activity of RhoA, which signals upstream of ROCK. We therefore hypothesized that statin treatment would safely limit pulmonary vascular RhoA activity and prevent and reverse experimental chronic neonatal PHT via downstream inhibitory effects on pathological ROCK activity. Sprague-Dawley rats in normoxia (room air) or moderate normobaric hypoxia (13% O-2) received simvastatin (2 mg.kg(-1).day(-1) ip) or vehicle from postnatal days 1-14 (prevention protocol) or from days 14-21 (rescue protocol). Chronic hypoxia increased RhoA and ROCK activity in lung tissue. Simvastatin reduced lung content of the isoprenoid intermediate farnesyl pyrophosphate and decreased RhoA/ROCK signaling in the hypoxia-exposed lung. Preventive or rescue treatment of chronic hypoxia-exposed animals with simvastatin decreased pulmonary vascular resistance, right ventricular hypertrophy, and pulmonary arterial remodeling. Preventive simvastatin treatment improved weight gain, did not lower systemic blood pressure, and did not cause apparent toxic effects on skeletal muscle, liver or brain. Rescue therapy with simvastatin improved exercise capacity."

According to the news reporters, the research concluded: "We conclude that simvastatin limits RhoA/ROCK activity in the chronic hypoxia-exposed lung, thus preventing or ameliorating hemodynamic and structural markers of chronic PHT and improving long-term outcome, without causing adverse effects."

Our news journalists report that additional information may be obtained by contacting R.P. Jankov, University of Toronto, Fac Med, Dept. of Physiol, Toronto, ON, Canada. Additional authors for this research include C. Kantores, J. Ivanovska, A. Jain and R.P. Jankov.

Findings on Radiation Pneumonitis Reported by Investigators at Department of Radiation Oncology (Dosimetric factors predicting radiation pneumonitis after CyberKnife stereotactic body radiotherapy
for peripheral lung cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Lung Diseases and Conditions - Radiation Pneumonitis. According to news reporting originating from Hyogo, Japan, by NewsRx correspondents, research stated, "The aims of this study were to investigate the frequency of symptomatic radiation pneumonitis (RP) after CyberKnife lung stereotactic body radiotherapy (SBRT) and to evaluate predictive factors of symptomatic RP. 56 patients with peripheral non-small-cell lung cancer were treated using the CyberKnife ® VSI ™ System (Accuracy Inc., Sunnyvale, CA) between May 2013 and September 2015."

Our news editors obtained a quote from the research from the Department of Radiation Oncology, "Total radiation doses ranged from 48 to 56 Gy, as delivered in four equal fractions. Symptomatic RP was defined as a grade of >= 2. Predictive factors for symptomatic RP were evaluated using univariate and multivariate analyses. With a median follow-up duration of 12.5 months (range, 3-27 months), symptomatic RP was observed in 6 (10.7%) of the 56 patients. In the univariate analysis, percent vital capacity (p < 0.05), maximum tumour diameter (p < 0.05), gross tumour volume (p < 0.05), planning target volume (p < 0.01), mean lung dose (p < 0.01) and a normal lung volume receiving 5-50 Gy of radiation (V5-50) (p < 0.01) were identified as significant predictive factors for symptomatic RP. In the multivariate analysis, only a V-25 > 3.4% (p = 0.011) was identified as a significant predictive factor of symptomatic RP. The incidence of symptomatic RP after CyberKnife SBRT was almost identical to the incidences reported in the linear accelerator-based SBRT. A significant association was observed between a V-25 > 3.4% and the risk of developing symptomatic RP. Advances in knowledge: This is the first report that has investigated prognostic factors for symptomatic RP after CyberKnife SBRT for lung cancer."

According to the news editors, the research concluded: "The newly developed scoring system may help to predict symptomatic RP."

The news editors report that additional information may be obtained by contacting H. Nishimura, Kobe Minimally Invas Canc Center, Dept. of Radiat Oncol, Kobe, Hyogo, Japan. Additional authors for this research include H. Nishimura, M. Nakayama, H. Mayahara, H. Uezono, A. Harada, N. Hashimoto, Y. Ejima, T. Ishihara and R. Sasaki.

Drugs and Therapies - Radiotherapy

Findings on Radiotherapy Detailed by Investigators at French National Institute of Health and Medical Research (INSERM) (Vaginal dose assessment in image-guided brachytherapy for cervical cancer: Can we
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Radiotherapy. According to news reporting out of Villejuif, France, by NewsRx editors, research stated, "Although dose-volume parameters in image-guided brachytherapy have become a standard, the use of posterior-inferior border of the pubic symphysis (PIES) points has been recently proposed in the reporting of vaginal doses. The aim was to evaluate their pertinence."

Our news journalists obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "Nineteen patients who received image-guided brachytherapy after concurrent radiochemotherapy were included. Per treatment, CT scans were performed at Days 2 and 3, with reporting of the initial dwell positions and times. Doses delivered to the PIES points were evaluated on each plan, considering that they were representative of one-third of the treatment. The movements of the applicator according to the PIES point were analysed. Mean prescribed doses at PIGS -2, PIES, PIES +2 were, respectively, 2.23 +/- 1.4, 6.39 +/- 6.6, and 31.85 +/- 36.06 Gy. Significant differences were observed between the 5 patients with vaginal involvement and the remaining 14 at the level of PIES +2 and PIES: +47.60 Gy and +7.46 Gy, respectively (p = 0.023 and 0.03). The variations, between delivered and prescribed doses at PIES points were not significant. However, at International commission on radiation units and measurements rectovaginal point, the delivered dose was decreased by 1.43 +/- 2.49 Gy from the planned dose (p = 0.019). The delivered doses at the four points were strongly correlated with the prescribed doses with R-2 ranging from 0.93 to 0.95. The movements of the applicator in regard of the PEES point assessed with the Digital Imaging and Communications in Medicine coordinates were insignificant. The doses evaluated at PIES points are not impacted by intrafractional movements. PEES and PIES +2 dose points allow distinguishing the plans of patients with vaginal infiltration."

According to the news editors, the research concluded: "Further studies are needed to correlate these parameters with vaginal morbidity."

Findings on Rectal Cancer Reported by Investigators at Aarhus University (Cancer of the Upper Rectum)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Rectal Cancer. According to news reporting from Aarhus, Denmark, by NewsRx editors, the research stated, "Rectal cancer constitutes one-third of all colorectal cancers, and the incidence in Denmark increasing. In 2012, 1,400 cases were registered, and of these 38% were located in the upper rectum."

The news correspondents obtained a quote from the research from Aarhus University, "There have been several key advances in the optimal management of rectal cancer during the past decades, primarily by standardisation and improvement of the surgical procedure. There is now general agreement that the optimal surgical treatment involves the concept of total mesorectal excision and that a resection with tumour-free margins is crucial. Controversy exists as to whether total mesorectal excision (TME) is necessary for upper rectal cancers or if a partial mesorectal excision (PME) with mesorectal transection 5 cm below the tumour is adequate. Furthermore, there is no agreement as to whether surgery alone is sufficient or whether neoadjuvant radio-and/or chemotherapy should be administered for tumours of the upper rectum. This thesis aims to discuss aspects of the treatment of rectal cancer with regard to the adequacy of mesorectal excision and oncological outcome with a particular focus on cancer of the upper rectum. In study I, the extent and completeness of mesorectal excision was estimated by postoperative magnetic resonance imaging of the pelvis in patients with primary surgery for rectal cancer. In the 136 patients with postoperative MRI, inadvertent residual mesorectal tissue was evident in 40%, especially following PME, suggesting suboptimal surgery performed. Additionally in patients who had PME, the distal margin was found to be less than 3 cm in more than 50% of patients, suggesting a discrepancy between guidelines and the actual surgery performed. In study II, we estimated the risk of local recurrence in the previously audited cohort of patients, with a particular focus on patients with upper rectal cancer treated by PME and without neoadjuvant therapy as standard. Using Kaplan-Meier analysis, the total three-year local recurrence rate was 7% with tumour stage and an involved circumferential margin as the most important predictors of local recurrence. The local recurrence rate after PME was significantly higher than for TME (14% vs. 3%; p=0.032), and were diagnosed earlier (p=0.001). In all cases with local recurrence following PME there was evidence of either inadvertent residual mesorectum and/or an insufficient distal resection margin. In study III, we investigated the length of the distal resection margin and degree of tissue shrinkage after surgical removal and fixation by using MRI of the fresh and fixed specimen. We found that the length of the specimen and the distal margin was reduced by 30% after surgical removal and fixation."

According to the news reporters, the research concluded: "If a 5-cm distal margin below the luminal level of the primary tumour on the fresh specimen is the objective for advanced cancer of the upper rectum treated with PME surgery, a margin of at least 3.5 cm of mesorectum on the fixed specimen should be attained for the pathologist to accurately establish distal radicality."

For more information on this research see: Cancer of the Upper Rectum. Danish Medical Journal, 2016;63(10):34-64. Danish Medical Journal can be contacted at: Danish Medical Assoc, Trondhjemsgade 9, Dk-2100 Copenhagen, Denmark.

Findings on Retinoblastoma Reported by Investigators at Scripps Research Institute (Mapping the interactions of adenoviral E1A proteins with the p160 nuclear receptor coactivator binding domain of CBP)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Eye Diseases and Conditions - Retinoblastoma. According to news reporting originating from La Jolla, California, by NewsRx correspondents, research stated, "Many viruses deregulate the cell and force transcription of viral genes by competing with cellular proteins for binding to the transcriptional co-activators CREB-binding protein (CBP) and p300. Through its interactions with CBP/p300 and the retinoblastoma protein, the adenovirus (AdV) early region 1A (E1A) oncoprotein hijacks the cell cycle and, in rodents, transforms the cell; the mechanistic and structural basis for these effects remain unclear."

Our news editors obtained a quote from the research from Scripps Research Institute, "In this study we compare the affinity of protein constructs from the E1A proteins from two adenovirus serotypes, non-oncogenic AdV5 and highly oncogenic AdV12, for binding to the nuclear receptor coactivator binding domain (NCBD) of CBP. NMR spectra show that the E1A constructs from both serotypes are intrinsically disordered in the free state and that each contains three homologous binding sites for the NCBD, one in the N-terminal region and two within conserved region 1 (CR1) of E1A. The binding sites in CR1 correspond to the motifs that bind the retinoblastoma protein and the TAZ2 domain of CBP/ p300. The E1A and NCBD peptides fold synergistically upon complex formation. Binding affinities determined from NMR titrations show that, although the overall affinities for AdV5 and AdV12 E1A are comparable, there are significant differences between the two E1A serotypes in the relative strength with which their constituent interaction motifs bind to the NCBD."

According to the news editors, the research concluded: "The individual E1A interaction motifs were unable to compete effectively with p53 for binding to the NCBD and both the N-terminal region and CR1 region of E1A are required for efficient competition with p53."

The news editors report that additional information may be obtained by contacting P.E. Wright, Scripps Res Inst, Skaggs Inst Chem Biol, La Jolla, CA 92037, United States. Additional authors for this research include M. Arai, M.A. Martinez-Yamout, H.J. Dyson and P.E. Wright.

Findings on Rotavirus from V. Hoffman and Colleagues Provide New Insights (Validation of current procedural terminology codes for rotavirus vaccination among infants in two commercially insured US populations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Rotavirus. According to news originating from Ann Arbor, Michigan, by NewsRx correspondents, research stated, "We validated procedure codes used in health insurance claims for reimbursement of rotavirus vaccination by comparing claims for monovalent live-attenuated human rotavirus vaccine (RV1) and live, oral pentavalent rotavirus vaccine (RV5) to medical records. Using administrative data from two commercially insured United States populations, we randomly sampled vaccination claims for RV1 and RV5 from a cohort of infants aged less than 1 year from an ongoing post-licensure safety study of rotavirus vaccines."

Our news journalists obtained a quote from the research, "The codes for RV1 and RV5 found in claims were confirmed through medical record review. The positive predictive value (PPV) of the Current Procedural Terminology codes for RV1 and RV5 was calculated as the number of medical record-confirmed vaccinations divided by the number of medical records obtained. Medical record review confirmed 92 of 104 RV1 vaccination claims (PPV: 88.5%; 95% CI: 80.7-93.9%) and 98 of 113 RV5 vaccination claims (PPV: 86.7%; 95% CI: 79.1-92.4%). Among the 217 medical records abstracted, only three (1.4%) of vaccinations were misclassified in claims-all were RV5 misclassified as RV1. The medical records corresponding to 9 RV1 and 15 RV5 claims contained insufficient information to classify the type of rotavirus vaccine. Misclassification of rotavirus vaccines is infrequent within claims."

According to the news editors, the research concluded: "The PPVs reported here are conservative estimates as those with insufficient information in the medical records were assumed to be incorrectly coded in the claims."

The news correspondents report that additional information may be obtained from V. Hoffman, Optum Epidemiol, Ann Arbor, MI 48108, United States. Additional authors for this research include N.J. Everage, S.C. Quinlan, K. Skerry, D. Esposito, N. Praet, D. Rosillon, C.N. Holick and D.D. Dore.
Blood Diseases and Conditions - Sepsis

Findings on Sepsis Detailed by Investigators at Harbin Medical University (The plasma levels of CST and BCKDK in patients with sepsis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Blood Diseases and Conditions - Sepsis have been published. According to news reporting out of Harbin, People's Republic of China, by NewsRx editors, research stated, "CST has been recently identified as a mediator of various beneficial effects in animal models of sepsis. At present, no data are available concerning the levels of CST in sepsis patients."

Financial support for this research came from Provincial youth science fund.

Our news journalists obtained a quote from the research from Harbin Medical University. "In sepsis the plasma amino acid pattern is characterized by decreased branched chain amino acids (BCAAs). We investigated the levels of plasma CST or branched-chain ce-ketoacid dehydrogenase kinase (BCKDK) and their relationship to component traits in patients with sepsis. We studied 228 patients and divided them into two groups based on severity of infection. Blood samples were taken at study entry, and CST, BCKDK were measured. CST and BCKDK levels were significantly higher in patients with sepsis than in controls: the median plasma CST concentration was 103.1 ng/ml (range, <83.13-189.7 ng/ml) in patients with sepsis and 49.69 ng/ml (range, <19.38-100.8 ng/ml) in controls (p= 0.0022); the median plasma BCKDK concentration was 801.7 ng/ml in sepsis group and 745 ng/ml in controls (p = 0.0292). Additionally, there was correlation between the plasma concentrations of CST and BCKDK in sepsis patients (r(2) = 0.6357, p< 0.01). We conclude that the plasma levels of CST in sepsis patients were higher than in controls, and there is a relationship between CST and BCKDK in sepsis patients."

According to the news editors, the research concluded: "Future experimental and clinical studies are needed to evaluate CST as a novel prognostic tool in sepsis patients and its potential therapeutic use in sepsis."

For more information on this research see: The plasma levels of CST and BCKDK in patients with sepsis. *Peptides*, 2016;86():80-84. *Peptides* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Blood Diseases and Conditions - Sepsis

Findings on Sepsis Reported by Investigators at Logan College of Chiropractic (Pharmacist impact on time to antibiotic administration in patients with sepsis in an ED)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Blood Diseases and Conditions - Sepsis are presented in a new report. According to news reporting originating from Loma Linda, California, by NewsRx correspondents, research stated, "The purpose was to determine if the physical presence of a clinical pharmacist in the emergency department (ED) would decrease antibiotic order to administration time in adult patients with sepsis, severe sepsis, or septic shock. We conducted a retrospective review of adult patients presenting to the ED between January and December 2014 with a diagnosis of sepsis, severe sepsis, or septic shock who required intravenous antibiotics."

Our news editors obtained a quote from the research from the Logan College of Chiropractic, "A total of 186 patients (92 patients when an ED pharmacist was present and 94 when no ED pharmacist was present) were included in the analysis. Baseline characteristics were similar between groups. When a pharmacist was present, patients received antibiotics sooner (median 0.61 vs 0.88 hour, P = .001), Surviving Sepsis Campaign goals for antibiotic administration time were more likely to be met (88% vs 72%, P = .0097), and initial antibiotics were appropriate more often (97% vs 81%, P = .0008). No significant differences were noted in intensive care unit length of stay, hospital length of stay, ventilator days, or in-hospital mortality."

According to the news editors, the research concluded: "Physical presence of a clinical pharmacist in the ED decreased time to administration and increased appropriateness of intravenous antibiotics for adult patients with sepsis, severe sepsis, or septic shock."

The news editors report that additional information may be obtained by contacting K. Moussavi, Loma Linda Logan College of Chiropractic, Sch Pharm, Loma Linda, CA 92354, United States.

Findings on Sickle Cell Anemia Detailed by Investigators at Oregon Health and Science University (Contemporary outcomes of sickle cell disease in pregnancy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hematologic Diseases and Conditions - Sickle Cell Anemia have been presented. According to news reporting originating from Portland, Oregon, by NewsRx correspondents, research stated, "Data regarding pregnancy outcomes in sickle cell disease are conflicting. Previous studies are limited by small sample size, narrow geographic area, and a wide range of resource availability."

Our news editors obtained a quote from the research from Oregon Health and Science University, "The purpose of this study was to examine the association between maternal sickle cell disease and adverse pregnancy outcomes in a contemporary North American cohort. We performed a retrospective cohort study of 2,027,323 women with singleton pregnancies delivered in California from 2005-2008. Deliveries at < 24 or > 42 6/7 weeks of gestation were excluded. Women with sickle cell disease were compared with control subjects. Maternal outcomes of interest included preeclampsia, preterm delivery, placental abruption, oligohydramnios, and cesarean delivery; neonatal outcomes included small for gestational age, anomalies, stillbirth, neonatal death, and infant death. The prevalence of sickle cell disease was 0.017%. Compared with control subjects, women with sickle cell disease were more likely to have limited prenatal care (7.4 vs 3.8%; P = .001), underlying chronic hypertension (2.3% vs 1.1%; P = .038), and fetal anomalies (14.0 vs 6.4%; P < .001). The increased odds of fetal anomalies persisted after adjustment for multiple confounders (odds ratio, 1.73; 95% confidence interval, 1.26-2.38). Women with sickle cell disease also had higher odds of severe preeclampsia (odds ratio, 3.75; 95% confidence interval, 2.21-6.38), preterm delivery (odds ratio, 2.50; 95% confidence interval, 1.93-3.21), small for gestational age (odds ratio, 1.96; 95% confidence interval, 1.18-3.25), and cesarean delivery (odds ratio, 1.93; 95% confidence interval, 1.40-2.67). Women with sickle cell disease are at high risk of maternal and neonatal morbidity. Low rates of fetal and neonatal death may reflect improved antenatal surveillance and management as compared with previous studies."

According to the news editors, the research concluded: "The association between sickle cell disease and fetal anomalies warrants further investigation."

The news editors report that additional information may be obtained by contacting K. Kuo, Oregon Health Sciences University, Dept. of Obstet & Gynecol, Portland, OR 97201,
Drugs and Therapies - Small Molecule Inhibitors

Findings on Small Molecule Inhibitors Reported by Researchers at University of New South Wales (A small molecule inhibitor of tropomyosin dissociates actin binding from tropomyosin-directed regulation of actin dynamics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Small Molecule Inhibitors have been published. According to news reporting from Sydney, Australia, by NewsRx journalists, research stated, "The tropomyosin family of proteins form end-to-end polymers along the actin filament. Tumour cells rely on specific tropomyosin-containing actin filament populations for growth and survival."

The news correspondents obtained a quote from the research from the University of New South Wales, "To dissect out the role of tropomyosin in actin filament regulation we use the small molecule TR100 directed against the C terminus of the tropomyosin isoform Tpm3.1. TR100 nullifies the effect of Tpm3.1 on actin depolymerisation but surprisingly Tpm3.1 retains the capacity to bind F-actin in a cooperative manner. In vivo analysis also confirms that, in the presence of TR100, fluorescently tagged Tpm3.1 recovers normally into stress fibers. Assembling end-to-end along the actin filament is thereby not sufficient for tropomyosin to fulfil its function. Rather, regulation of F-actin stability by tropomyosin requires fidelity of information communicated at the barbed end of the actin filament."

According to the news reporters, the research concluded: "This distinction has significant implications for perturbing tropomyosin-dependent actin filament function in the context of anti-cancer drug development."

For more information on this research see: A small molecule inhibitor of tropomyosin dissociates actin binding from tropomyosin-directed regulation of actin dynamics. *Scientific Reports*, 2016;6():19816. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Oncology - Squamous Cell Carcinoma

Findings on Squamous Cell Carcinoma Detailed by Investigators at Soochow University (Sunitinib modulates the radiosensitivity of esophageal squamous cell carcinoma cells in vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Squamous Cell Carcinoma. According to news reporting originating in Changzhou, People's Republic of China, by NewsRx journalists, research stated, "This study aims to explore the radiosensitivity of sunitinib on esophageal cancer cell lines. For in vitro studies, human esophageal squamous cell carcinoma (ESCC) cell lines were treated with sunitinib 24hours before irradiation."

The news reporters obtained a quote from the research from Soochow University, "ESCC cell lines were treated with sunitinib with or without radiation. Cell proliferation was detected by Cell Counting Kit 8 assay. Radiosensitization was evaluated by clonogenic survival assay. Cell apoptosis and cell cycle analysis were detected by flow cytometry. Deoxyribonucleic acid (DNA) double-strand breaks were performed by immunocytofluorescence analysis. Western blot analysis was used to determine the effect of sunitinib on radiation induced signal transduction. Sunitinib potently sensitized ESCC cells to radiation with a sensitization enhancement ratio of 1.13-1.72. Furthermore, sunitinib increased radiation induced DNA double-strand breaks, promoted the apoptosis of ESCC cells and induced the G2/M arrest. Radiosensitization was accompanied with enhanced apoptosis and regulated by the intrinsic pathway of apoptosis. Sunitinib sensitized ESCC cells to the cytotoxic effects of radiation."

According to the news reporters, the research concluded: "This compound is promising for future clinical trials with chemoradiation in esophageal cancer."

Oncology - Squamous Cell Carcinoma

Findings on Squamous Cell Carcinoma Discussed by Investigators at Hebei Medical University (Association of programmed death-1 polymorphisms with the risk and prognosis of esophageal squamous cell carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Squamous Cell Carcinoma. According to news reporting from Shijiazhuang, People's Republic of China, by NewsRx journalists, research stated, "Programmed death-1 (PD-1) is an immunoinhibitory receptor belonging to the CD28 family. This study was designed to investigate the association of PD-1 rs36084323:A>G, rs2227981:C>T, rs2227982:C>T and rs10204525:A>G single nucleotide polymorphisms (SNPs) with the risk and prognosis of esophageal squamous cell carcinoma (ESCC) in a high-incidence population from Northern China."

Financial support for this research came from Financial Department of Hebei Province.

The news correspondents obtained a quote from the research from Hebei Medical University, "These four SNPs were genotyped by polymerase chain reaction ligase detection reaction (PCR-LDR) method in 584 ESCC patients and 585 healthy controls. The rs2227981:C>T SNP C/T genotype increased the risk of ESCC for the smokers (OR = 1.483, 95% Cl = 1.018-2.160) and rs2227982:C>T SNP UT genotype enhanced susceptibility to ESCC for the females (OR = 1.708, 95% CI = 1.056-2.762). For rs10204525:A>G SNP, A/A genotype was related to increased risk of ESCC (OR = 1.735, 95% CI = 1.086-2.771) overall. Among the 584 ESCC patients, the survival information of 204 ESCC patients was collected. The rs36084323:A>G SNP A/G genotype was associated with lower risk of death in ESCC patients with upper gastrointestinal cancer (UGIC) family history (HR = 0.339, 95%CI = 0.115-0.996). The rs2227982:C>T SNP C/T genotype was associated with lower risk of death in smoker ESCC patients and ESCC patients with UGIC family history (HR = 0.409 and 0.292, 95%CI = 0.194-0.863 and 0.101-0.847). PD-1 rs2227981:C>T, rs2227982:C>T and rs10204525:A>G SNPs might be used as predictive markers of the susceptibility to ESCC for the Han nationality in a high-incidence population from Northern China."

According to the news reporters, the research concluded: "PD-1 rs36084323:A>G and rs2227982:C>T SNPs were associated with the prognosis of the Han ESCC patients in this high-incidence region."

For more information on this research see: Association of programmed death-1 polymorphisms with the risk and prognosis of esophageal squamous cell carcinoma. Cancer Genetics, 2016;209(9):365-375. Findings on Squamous Cell Carcinoma Discussed by Investigators at Nanchang University (CD47 is a Potential Target for the Treatment of Laryngeal Squamous Cell Carcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Squamous Cell Carcinoma have been published. According to news reporting from Nanchang, People's Republic of China, by NewsRx journalists, research stated, "This study aims to investigate the effect of CD47 on the development of laryngeal squamous cell carcinoma (LSCC) and the therapeutic potential of monoclonal antibody against CD47 and its ligand SIRP alpha in the treatment of LSCC. We firstly detected the expressions of CD47 mRNA and protein in LSCC and para-carcinoma tissues, introduced the most efficient CD47siRNA sequence into LSCC cells by lentiviral transfection and employed three monoclonal antibodies to evaluate their anti-LSCC effects in vitro and in vivo."

The news correspondents obtained a quote from the research from Nanchang University, "We observed that the mRNA and protein expressions of CD47 in LSCC tissue had significant increase in LSCC tissues compared with those in para-carcinoma tissue (p < 0.05). After the treatments of three monoclonal antibodies, i.e. anti-SIRP alpha, anti CD47 BRIC126, anti-CD47 B6H12.2, in rats transfected with Hep-2 cell, it has been showed that the mRNA and protein expressions of CD47 in LSCC tissue decreased, macrophage efficiency was promoted when anti-SIRPa and/or CD47siRNA were used, the amounts, viabilities and expressions of CD47 protein of tumor cell were significantly inhibited. Additionally, combined use of CD47siRNA and anti-SIRPa seemed more efficient than solo use of CD47siRNA/antiSIRP alpha."

According to the news reporters, the research concluded: "The results suggested a critical role of CD47 in LSCC development and the promising treatment of antiCD47/SIRP alpha and/or CD47siRNA in LSCC."

Central Nervous System Diseases and Conditions –…

Findings on Subarachnoid Hemorrhage Described by I.R. Da Silva and Colleagues (Effect of Age on Transcranial Doppler Velocities in Patients with Aneurysmal Subarachnoid Hemorrhage)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage is the subject of a report. According to news reporting originating in Rio de Janeiro, Brazil, by NewsRx journalists, research stated, "It is not well understood whether age impacts transcranial Doppler (TCD) mean flow velocities (MFVs) in patients with aneurysmal subarachnoid hemorrhage (SAH) with or without delayed cerebral ischemia (DCI). The aim of our study was to analyze the behavior of TCD MFV during the first 7 days after SAH in patients of different ages and correlate them with the occurrence of DCI."

The news reporters obtained a quote from the research, "This study is a databank analysis of patients with SAH admitted between 2010 and 2012 in a single center. We analyzed mean MFV of bilateral middle cerebral arteries (MCAs) in all patients enrolled in the study on days 1, 3 and 7. The correlation between age and TCD MFV was analyzed using a univariate linear regression model. Fifty-five patients were studied. Starting on the third day after the bleeding, increasing age was associated with slower MFVs. This trend was not affected by the interrogation of the right or left MCA."

According to the news reporters, the research concluded: "After correction to include only patients who developed DCI, the same findings persisted on days 3 and 7. Older age was correlated with a significant decrease on TCD velocities in patients with SAH, even after correction for patients who developed DCI."

For more information on this research see: Effect of Age on Transcranial Doppler Velocities in Patients with Aneurysmal Subarachnoid Hemorrhage. European Neurology, 2016;76(5-6):261-266. Heart Disorders and Diseases - Takotsubo…

**Findings on Takotsubo Cardiomyopathy Detailed by Investigators at University of Athens (A Heartbreaking Renal Transplantation: Is Norepinephrine the Culprit to Blame?)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Takotsubo Cardiomyopathy are discussed in a new report. According to news reporting originating in Athens, Greece, by NewsRx journalists, research stated, "Takotsubo cardiomyopathy (TCM), also known as 'broken heart syndrome,' 'apical ballooning syndrome,' and 'stress-induced cardiomyopathy,' was first described in Japanese patients in 1990 by Sato et al. TCM is an increasingly recognized syndrome characterized by transient and reversible systolic dysfunction of the apical and middle segments of the left ventricle."

The news reporters obtained a quote from the research from the University of Athens, "This syndrome resembles acute myocardial infarction in the absence of evident coronary artery occlusion. Herein, we present a case of a 51-year old male who underwent his second deceased-donor renal transplantation for end-stage renal disease due to a work-related accident. Perioperatively, initiation of continuous infusion of noradrenaline was decided to achieve adequate graft perfusion due to persistently low blood pressure. On the second postoperative day, the patient experienced tachycardia and atypical angina-like chest pain. Electrocardiogram (ECG) showed signs of myocardial infarction and elevated troponin levels were observed. Urgent coronary angiography was normal and transthoracic echocardiography (TEE) was indicative for Takotsubo cardiomyopathy. Although, the precise pathophysiology of Takotsubo cardiomyopathy is still unknown, it seems that it is associated with excessive sympathetic stimulation, microvascular dysfunction, coronary artery vasospasm, and abnormal myocardial tissue metabolism. The development of patient's symptoms after the initiation of norepinephrine along with their immediate resolution after the discontinuation of the drug might suggest a causal relationship."

According to the news reporters, the research concluded: "This is the first time that TCM after renal transplantation is thought to be linked with the administration of exogenous catecholamines."

Our news correspondents report that additional information may be obtained by contacting M.G. Vailas, University of Athens, Sch Med, Laiko Gen Hosp, Transplantat Unit, Athens 11527, Greece. Additional authors for this research include S. Vernadakis, K. Kakavia, I. Paizis, J. Bokos, J. Boletis and G. Zavos.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.transproceed.2016.05.014. This DOI is a link to an online electronic document that is either free or for purchase.

Lymphatic Diseases and Conditions - Thymoma

Findings on Thymoma Reported by Investigators at Yonsei University (Limited thymectomy as a potential alternative treatment option for early-stage thymoma: A multi-institutional propensity-matched study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lymphatic Diseases and Conditions - Thymoma. According to news reporting from Seoul, South Korea, by NewsRx journalists, research stated, "For early-stage thymoma, complete thymectomy has classically been regarded as the standard treatment protocol. However, several studies have shown that limited thymectomy may be an alternative treatment option for thymoma."

The news correspondents obtained a quote from the research from Yonsei University, "This study compared perioperative outcomes, survival, and recurrence rates between patients undergoing limited thymectomy and complete thymectomy. Between January 2000 and December 2013, a total of 762 patients underwent thymectomy for stage I or II thymomas at four institutions participating in the Korean Association for Research on the Thymus. Patients were divided into two groups: limited thymectomy group (n = 295) and complete thymectomy group (n = 467). Comparative clinicopathological, surgical, and oncological features were reviewed retrospectively. The median follow-up time was 49 months (range: 0.2-189 months). A propensity score matching analysis, based on seven variables (age, sex, surgical approach, tumor size, WHO histological type, Masaoka-Koga stage, and adjuvant radiotherapy), was performed using 141 patients selected from each group. The 5- and 10-year freedom-from-recurrence rates in the limited thymectomy group were 96.3% and 89.7%, respectively, and those in the complete thymectomy group were 97.0% and 85.0%, respectively. No significant differences in these rates were observed between groups (p = 0.86). A multivariate Cox regression analysis showed that overall survival and freedom-from-recurrence rates did not significantly differ by surgery extent (p = 0.27, 0.66, respectively). Perioperative outcomes were better in the limited thymectomy group. Limited thymectomy was not inferior to complete thymectomy with respect to recurrence, and had better perioperative outcomes."

According to the news reporters, the research concluded: "Limited thymectomy may be a viable treatment option for early stage thymoma."

Our news journalists report that additional information may be obtained by
Thyroid Diseases and Conditions - Thyroiditis

Findings on Thyroiditis Discussed by Investigators at Catholic University of Louvain (Pioglitazone, a PPAR gamma Agonist, Upregulates the Expression of Caveolin-1 and Catalase, Essential for Thyroid Cell Homeostasis: A Clue to the Pathogenesis ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Thyroid Diseases and Conditions - Thyroiditis have been presented. According to news originating from Brussels, Belgium, by NewsRx correspondents, research stated, "Peroxisome proliferator-activated receptor gamma (PPAR gamma) is a transcription factor that regulates the expression of multiple target genes involved in several metabolic pathways as well as in inflammation. The expression and cell localization of caveolin-1 (Cav-1), thyroperoxidase (TPO), and dual oxidase (DUOX), involved in extracellular iodination, is modulated by Th1 cytokines in human normal thyroid cells and in Hashimoto's thyroiditis (HT)."

Our news journalists obtained a quote from the research from the Catholic University of Louvain, "The objectives of this study were (i) to analyze the PPAR gamma protein and mRNA expression at the follicular level in HT versus controls in correlation with the one of Cav-1; (ii) to study the effects of Th1 cytokines on PPAR gamma and catalase expression in human thyrocyte primary cultures; and (iii) to study the effects of pioglitazone, a PPAR gamma agonist, on thyroxisome components (Cav-1, TPO, DUOX) and on catalase, involved in antioxidant defense. Although the global expression of PPAR gamma in the whole gland of patients with HT was not modified compared with controls, there was great heterogeneity among glands and among follicles within the same thyroid. Besides normal (type 1) follicles, there were around inflammatory zones, hyperactive (type 2) follicles with high PPAR gamma and Cav-1 expression, and inactive (type 3) follicles which were unable to form thyroxine and did not express PPAR gamma or Cav-1. In human thyrocytes in primary culture, Th1 cytokines decreased PPAR gamma and catalase expression; pioglitazone increased Cav-1, TPO, and catalase expression. PPAR gamma may play a central role in normal thyroid physiology by upregulating Cav-1, essential for the organization of the thyroxisome and extracellular iodination. By upregulating catalase, PPAR gamma may also contribute to cell homeostasis."

According to the news editors, the research concluded: "The inhibitory effect of Th1 cytokines on PPAR gamma expression may be considered as a new pathogenetic mechanism for
HT, and the use of PPAR gamma agonists could open a new therapeutic approach."

For more information on this research see: Pioglitazone, a PPAR gamma Agonist, Upregulates the Expression of Caveolin-1 and Catalase, Essential for Thyroid Cell Homeostasis: A Clue to the Pathogenesis of Hashimoto's Thyroiditis. Thyroid, 2016;26(9):1320-1331. Thyroid can be contacted at: Mary Ann Liebert, Inc, 140 Huguenot Street, 3RD Fl, New Rochelle, NY 10801, USA. Biomedical Engineering - Tissue Engineering

Findings on Tissue Engineering Described by Researchers at Institute of Basic Medical Sciences (Development of Electrically Conductive Double-Network Hydrogels via One-Step Facile Strategy for Cardiac Tissue Engineering)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Biomedical Engineering - Tissue Engineering are presented in a new report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "Cardiac tissue engineering is an effective method to treat the myocardial infarction. However, the lack of electrical conductivity of biomaterials limits their applications."

The news correspondents obtained a quote from the research from the Institute of Basic Medical Sciences, "In this work, a homogeneous electronically conductive double network (HEDN) hydrogel via one-step facile strategy is developed, consisting of a rigid/hydrophobic/conductive network of chemical crosslinked poly(thiophene-3-acetic acid) (PTAA) and a flexible/hydrophilic/biocompatible network of photo-crosslinking methacrylated aminated gelatin (MAAG). Results suggest that the swelling, mechanical, and conductive properties of HEDN hydrogel can be modulated via adjusting the ratio of PTAA network to MAAG network. HEDN hydrogel has Young's moduli ranging from 22.7 to 493.1 kPa, and its conductivity (&asymp;10(-4) S cm(-1)) falls in the range of reported conductivities for native myocardium tissue. To assess their biological activity, the brown adipose-derived stem cells (BADSCs) are seeded on the surface of HEDN hydrogel with or without electrical stimulation.
Our data show that the HEDN hydrogel can support the survival and proliferation of BADSCs, and that it can improve the cardiac differentiation efficiency of BADSCs and upregulate the expression of connexin 43. Moreover, electrical stimulation can further improve this effect."

According to the news reporters, the research concluded: "Overall, it is concluded that the HEDN hydrogel may represent an ideal scaffold for cardiac tissue engineering."

Our news journalists report that additional information may be obtained by contacting B. Yang, Dept. of Advanced Interdisciplinary Studies, Institute of Basic Medical Sciences and Tissue Engineering Research Center, Academy of Military Medical Sciences, Beijing, 100850, People's Republic of China. Biomedical Engineering - Tissue Engineering

Findings on Tissue Engineering Reported by Investigators at National Institute of Technology (Alginate Bead Based Hexagonal Close Packed 3D Implant for Bone Tissue Engineering)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Biomedical Engineering - Tissue Engineering. According to news reporting originating in Rourkela, India, by NewsRx journalists, research stated, "Success of bone tissue engineering (BTE) relies on the osteogenic microarchitecture of the biopolymeric scaffold and appropriate spatiotemporal distribution of therapeutic molecules (growth factors and drugs) inside it. However, the existing technologies have failed to address both the issues together."

The news reporters obtained a quote from the research from the National Institute of Technology, "Keeping this perspective in mind, we have developed a novel three-dimensional (3D) implant prototype by stacking hexagonal close packed (HCP) layers of calcium alginate beads. The HCP arrangement of the beads lead to a patterned array of interconnected tetrahedral and octahedral pores of average diameter of 142.9 and 262.9 μm, respectively, inside the implant. The swelling pattern of the implants changed from isotropic to anisotropic in the z-direction in the absence of bivalent calcium ions (Ca2+) in the swelling buffer. Incubation of the implant in simulated body fluid (SBF) resulted in a 2.7-fold increase in the compressive modulus. The variation in the relaxation times as derived from the Weichert viscoelasticity model predicted a gradual increase in the interactions among the alginate molecules in the matrix. We demonstrated the tunability of the spatiotemporal drug release from the implant in a
tissue mimicking porous semisolid matrix as well as in conventional drug release set up by changing the spatial coordinates of the 'drug loaded depot layer' inside the implant. The therapeutic potential of the implant was confirmed against Escherichia coil using metronidazole as the model drug. Detailed analysis of cell viability, cell cycle progression, and cytoskeletal reorganization using osteoblast cells (MG-63) proved the osteoconductive nature of the implant. Expression of differentiation markers such as alkaline phosphatase, runx2, and collagen type 1 in human mesenchymal stem cell in vitro confirmed the osteogenic nature of the implant. When tested in vivo, VEGF loaded implant was found capable of inducing angiogenesis in a mice model."

According to the news reporters, the research concluded: "The bead based implant may find its utility in non-load-bearing BTE."

For more information on this research see: Alginate Bead Based Hexagonal Close Packed 3D Implant for Bone Tissue Engineering. ACS Applied Materials & Interfaces, 2016;8 (47):32132-32145. Bacterial Infections and Mycoses - Toxemia

Findings on Toxemia from B.J. Yamamoto and Colleagues Provide New Insights (Efficacy Projection of Obiltoxaximab for Treatment of Inhalational Anthrax across a Range of Disease Severity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Bacterial Infections and Mycoses - Toxemia are discussed in a new report. According to news reporting originating from Pine Brook, New Jersey, by NewsRx correspondents, research stated, "Inhalational anthrax has high mortality even with antibiotic treatment, and antitoxins are now recommended as an adjunct to standard antimicrobial regimens. The efficacy of obiltoxaximab, a monoclonal antibody against anthrax protective antigen (PA), was examined in multiple studies conducted in two animal models of inhalational anthrax."

Our news editors obtained a quote from the research, "A single intravenous bolus of 1 to 32 mg/kg of body weight obiltoxaximab or placebo was administered to New Zealand White rabbits (two studies) and cynomolgus macaques (4 studies) at disease onset (significant body temperature increase or detection of serum PA) following lethal challenge with aerosolized
Bacillus anthracis spores. The primary endpoint was survival. The relationship between efficacy and disease severity, defined by pretreatment bacteremia and toxemia levels, was explored. In rabbits, single doses of 1 to 16 mg/kg obiltoxaximab led to 17 to 93% survival. In two studies, survival following 16 mg/kg obiltoxaximab was 93% and 62% compared to 0% and 0% for placebo (P = 0.0010 and P = 0.0013, respectively). Across four macaque studies, survival was 6.3% to 78.6% following 4 to 32 mg/kg obiltoxaximab. In two macaque studies, 16 mg/kg obiltoxaximab reduced toxemia and led to survival rates of 31%, 35%, and 47% versus 0%, 0%, and 6.3% with placebo (P = 0.0085, P = 0.0053, P = 0.0068). Pretreatment bacteremia and toxemia levels inversely correlated with survival.

According to the news editors, the research concluded: "Overall, obiltoxaximab monotherapy neutralized PA and increased survival across the range of disease severity, indicating clinical benefit of toxin neutralization with obiltoxaximab in both early and late stages of inhalational anthrax."

For more information on this research see: Efficacy Projection of Obiltoxaximab for Treatment of Inhalational Anthrax across a Range of Disease Severity. Antimicrobial Agents and Chemotherapy, 2016;60(10):5787-5795. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

The news editors report that additional information may be obtained by contacting N.V. Serbina, Elusys Therapeut Inc, Pine Brook, NJ 07058, United States. Drugs and Therapies - Trimethoprim Therapy

Findings on Trimethoprim Therapy Detailed by Investigators at University of Otago (Pharmacist-only trimethoprim: pharmacist satisfaction on their training and the impact on their practice)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Trimethoprim Therapy is the subject of a report. According to news reporting originating from Dunedin, New Zealand, by NewsRx correspondents, research stated, "In 2012, in a first for the developed world, New Zealand reclassified trimethoprim to allow specially trained pharmacists to supply the medicine without a prescription to women with cystitis fitting specific criteria. This study explored pharmacists' views of the training and screening tool, impact on practice, and the pharmacists' perceptions of views of patients and doctors."

Our news editors obtained a quote from the research from the University of Otago, "Structured interviews were conducted with 28 New Zealand pharmacists trained to supply..."
trimethoprim. These pharmacists were selected to represent geographical spread as well as urban, suburban and rural. The key areas for investigation were: satisfaction about training, appropriateness of training, opinions on the screening tool, impact on clinical practice and perception of others. Audio recorded interviews were thematically analyzed. Of 40 pharmacies invited, 28 pharmacists agreed to participate. Most pharmacists were positive about being able to supply trimethoprim, the training and increased clinical focus of their practice. The content of the training was considered appropriate, as was the screening tool, which was well utilised during consultations. Minor suggestions on the training and consultation materials were provided. Some pharmacists reported that referral to the doctor without supply in a minority of trimethoprin consultations, frustrated some women. Frequency of supplies varied considerably by pharmacists from none supplied to weekly supplies. Some pharmacists questioned the exclusion to supply for women who had taken antibiotics in the last six months. Many women had reportedly appreciated the easier access in the pharmacy compared with doctor access, especially at weekends, but sometimes misunderstood the role of the pharmacist in the supply. While pharmacists reported that some doctors had been negative about pharmacist-supply, others were informing women about the service from the pharmacist. Pharmacist supply of trimethoprim using mandated training and a screening tool or algorithm for supply is workable and well-accepted by pharmacists. Minor changes have been recommended.

According to the news editors, the research concluded: "Further research is needed to understand perspectives of other stakeholders (women, doctors and practice nurses) and outcomes for patients."

The news editors report that additional information may be obtained by contacting R. Braund, University of Otago, Sch Pharm, Clin Pharm Practice, Dunedin 9054, New Zealand. Additional authors for this research include E. Henderson, E. Mcnab, R. Sarten, E. Wallace and N. Gauld.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s11096-016-0388-0. This DOI is a link to an online electronic document that is either free or for purchase.

Tryptamines

Findings on Tryptamines Described by Z.I. Sandor and Colleagues (Serotonin or the Mucosa Do Not Mediate the Motor Effect of Allyl Isothiocyanate in the Guinea-Pig Small Intestine)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
Research findings on Tryptamines are discussed in a new report. According to news reporting out of Pecs, Hungary, by NewsRx editors, research stated, "Serotonin (5-hydroxytryptamine, 5-HT), originating from the enterochromaffin cells has been reported to mediate the contractile effect of the sensory stimulant and TRPA1 activator allyl isothiocyanate (AITC) in the guinea-pig small intestine [Nozawa et al: Proc Natl Acad Sci U.S.A 2009; 106:3408-3413]. In the present experiments, the nerve-mediated contraction of this preparation due to AITC was not inhibited by a combination of methysergide (broad-spectrum 5-HT antagonist; 0.3 µmol/l), Y 25130 (azasetron, 5-HT3 receptor antagonist; 1 µmol/l) and SB 204070 (5-HT4 receptor antagonist; 2 µmol/l) or by 5-HT receptor desensitization, that is, pretreatments that practically abolished contractions of similar size in response to exogenous 5-HT, without causing nonspecific effects."

Our news journalists obtained a quote from the research, "AITC also contracted longitudinal muscle-myenteric plexus preparations, an effect also fully resistant to the combination of 5-HT receptor antagonists. The pharmacology of AITC in strip preparations matched that in the whole ileum. Key Messages: It is concluded that neither endogenous 5-HT nor the gut mucosa contributes to the excitatory effect of AITC in the guinea-pig small intestine."

According to the news editors, the research concluded: "The combination of 5-HT antagonists elaborated is suitable for studying the possible involvement of 5-HT in motor responses of the guinea-pig intestine."

For more information on this research see: Serotonin or the Mucosa Do Not Mediate the Motor Effect of Allyl Isothiocyanate in the Guinea-Pig Small Intestine. Pharmacology, 2016;98(5-6):199-203. Findings on Tuberculosis Reported by Investigators at Capital Medical University (Interactions of linezolid and second-line anti-tuberculosis agents against multidrug-resistant Mycobacterium tuberculosis in vitro and in vivo)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Mycobacterium Infections - Tuberculosis have been
presented. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "The objectives of this study were to evaluate the interactions between linezolid (LZD) and second-line anti-tuberculosis (TB) agents in susceptible and multidrug-resistant (MDR) TB in vitro, and to validate the in vitro results in a murine TB model. The minimum inhibitory concentrations of LZD and seven second-line anti-TB drugs against H37Rv and three multidrug-resistant clinical isolates were determined by Alamar Blue assay, and the interaction patterns of LZD and the seven second-line anti-TB agents against the four isolates were studied using a dynamic checkerboard method."

Our news journalists obtained a quote from the research from Capital Medical University, "The activities of these combinations against Mycobacterium tuberculosis were evaluated in a murine model of TB. The combination of LZD + capreomycin exhibited partial synergism for three of four isolates, LZD + para-aminosalicylic acid exhibited partial synergism for two of four isolates, and LZD + levofloxacin and LZD + amikacin exhibited partial synergism for one of four isolates; all other combinations showed indifference or an additive effect in vitro. The activities of six combinations and the standard regimen rifampicin + isoniazid + pyrazinamide were investigated in a murine model of TB (infection with H37Rv). Significant reductions in colony-forming units (CFU) were found in LZD + capreomycin and LZD + clofazimine groups when the CFU in the lungs on day 0 (the day of beginning treatment) was compared with the CFU in the lungs after 2 months of treatment."

According to the news editors, the research concluded: "These combinations of LZD and second-line anti-TB drugs were all active against MDR-TB with indifference or an additive effect, except LZD + capreomycin, which showed partial synergy."

The news correspondents report that additional information may be obtained from Z.Y. Guo, Capital Med Univ, Pharm Beijing Chest Hosp, Beijing, People's Republic of China. Additional authors for this research include M.Q. Zheng, B. Wang, X.P. Mu, P. Li, L. Fu, S. Liu and Z.Y. Guo.

**Mycobacterium Infections - Tuberculosis**

**Findings on Tuberculosis Reported by Investigators at University of Arkansas (Mobility patterns of persons at risk for drug-resistant tuberculosis in Mumbai, India)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Mycobacterium Infections - Tuberculosis have been published. According to news reporting originating from Fayetteville, Arkansas, by NewsRx correspondents, research stated, "Tuberculosis (TB) hospital in Mumbai, India. To describe the mobility patterns of persons with suspected drug-resistant tuberculosis (DR-TB) and to assess whether there were significant differences in demographic or risk characteristics based on mobility."

Our news editors obtained a quote from the research from the University of Arkansas, "Observational cohort study of TB clinic patients at risk for DR-TB. Among 602 participants, 37% had ever moved from their place of birth; 14% were local movers (within state), and 23% were distant movers, between states or countries. Univariate multinomial logistic regression models showed that distant movers were more likely than non-movers to have lower income, less education, a greater number of previous TB episodes, and to have ever smoked. Compared to non-movers, local movers were more likely to have lower income and were more likely to have seen a doctor in the past 2 years. Clinical outcomes, including DR-TB, diabetes, and human immunodeficiency virus (HIV), did not differ between the three mobility groups. Mobility was common among patients at risk for DR-TB in Mumbai."

According to the news editors, the research concluded: "TB programs should consider the implications of mobility on the protracted treatment for DR-TB in India."

For more information on this research see: Mobility patterns of persons at risk for drug-resistant tuberculosis in Mumbai, India. *International Journal of Tuberculosis and Lung Disease, 2016;20(12):1633-1638.* *International Journal of Tuberculosis and Lung Disease* can be contacted at: Int Union Against Tuberculosis Lung Disease (I U A T L D), 68 Boulevard Saint-Michel, 75006 Paris, France.

Findings on Type 1 Diabetes Mellitus Reported by Investigators at Harvard School of Medicine [Singular role for T-BET+ CXCR3(+) regulatory T cells in protection from autoimmune diabetes]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Type 1 Diabetes Mellitus is now available. According to news reporting originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Foxp3(+) regulatory T (Treg) cells are crucial for restraining inflammation in a variety of autoimmune diseases, including type 1 diabetes (T1D). However, the transcriptional and functional phenotypes of Treg cells within the pancreatic lesion remain poorly understood."

Our news editors obtained a quote from the research from the Harvard School of Medicine, "Here we characterized pancreas-infiltrating Treg cells in the NOD mouse model of T1D and uncovered a substantial enrichment of the Treg subpopulation expressing the chemokine receptor CXCR3. Accumulation of CXCR3(+) Treg cells within pancreatic islets was dependent on the transcription factor T-BET, and genetic ablation of T-BET increased the onset and penetrance of disease, abrogating the sex bias normally seen in the NOD model. Both male and female mice lacking T-BET+ Treg cells showed a more aggressive insulitic infiltrate, reflected most prominently by elevated production of type 1 cytokines."

According to the news editors, the research concluded: "Our results suggest the possibility of fine therapeutic targeting of Treg cells, in a tissue-and cell-subset-specific fashion, as a more focused immunotherapy for T1D."

The news editors report that additional information may be obtained by contacting D. Mathis, Harvard Med Sch, Dept. of Microbiol & Immunobiol, Div Immunol, Boston, MA 02115, United States. Additional authors for this research include D. Mathis and C. Benoist.

Nutritional and Metabolic Diseases and Conditions - …

Findings on Type 2 Diabetes Detailed by W. Stonehouse and Co-Authors (Short term effects of palm-tocotrienol and palm-carotenes on vascular function and cardiovascular disease risk: A randomised controlled trial)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting originating from Adelaide, Australia, by NewsRx correspondents, research stated, "In vitro, ex vivo and animal studies suggest palm-based tocotrienols and carotenes enhance vascular function, but limited data in humans exists. The aim was to examine the effects of palm-tocotrienols (TRF-80) and palm-carotene (CC-60) supplementation on vascular function and cardiovascular disease (CVD) risk factors in adults at increased risk of impaired vascular function."

Our news editors obtained a quote from the research, "Ninety men and women (18-70 yr, 20-45 kg/m(2)) with type 2 diabetes, impaired fasting glucose and/or elevated waist circumference were randomised to consume either TRF-80 (420 mg/day tocotrienol + 132 mg/day tocopherol), CC-60 (21 mg/day carotenes) or placebo (palm olein) supplements for 8 weeks. Brachial artery flow-mediated dilation (FMD), other physiological and circulatory markers of vascular function, lipid profiles, glucose, insulin and inflammatory markers were assessed pre- and post-supplementation. Pairwise comparisons were performed using mixed effects longitudinal models (n = 87, n = 3 withdrew before study commencement). Plasma alpha- and beta-carotene and alpha-, delta- and gamma-tocotrienol concentrations increased in CC-60 and TRF-80 groups, respectively, compared to placebo (mean +/- SE difference in total plasma carotene change between CC-60 and placebo: 1.5 +/- 0.13 mu g/ml, p< 0.0001; total plasma tocotrienol change between TRF-80 and placebo: 0.36 +/- 0.05 mu g/ml, p< 0.0001). Neither FMD (treatment x time effect for CC-60 vs. placebo, p = 0.71; TRF-80 vs. placebo, p = 0.80) nor any other vascular function and CVD outcomes were affected by treatments."

According to the news editors, the research concluded: "CC-60 and TRF-80 supplementation increased bioavailability of palm-based carotenes and tocotrienols but had no effects, superior or detrimental, on vascular function or CVD risk factors."

The news editors report that additional information may be obtained by contacting W. Stonehouse, Commonwealth Sci Ind Res Organization, Hlth & Biosecur, Adelaide, SA, Australia. Additional authors for this research include G.D. Brinkworth, C.H. Thompson and M.Y. Abeywardena.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.atherosclerosis.2016.10.027. This DOI is a link to an online electronic document that is either free or for purchase.

Findings on Type 2 Diabetes Discussed by Investigators at Central South University (Long-term effects intensive medical therapy on the development and progression of subclinical atherosclerosis and the metabolic syndrome in Chinese patients ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news originating from Changsha, People's Republic of China, by NewsRx correspondents, research stated, "Few studies have investigated the progression of subclinical atherosclerosis and metabolic syndrome (MetS) in Chinese patients with type 2 diabetes mellitus (T2DM). This study was to compare the long-term effects of intensive medical therapy on the development and progression of subclinical atherosclerosis and MetS in Chinese T2DM patients with that of a conventional treatment regimen."

Our news journalists obtained a quote from the research from Central South University, "A total of 316 T2DM patients were randomized to receive conventional pharmacological treatment or intensive medical therapy, consisting of diet and exercise counseling, from 2002 to 2014 at our hospital in Changsha, China. Clinical indicators of subclinical atherosclerosis and MetS were evaluated over the 12-year follow-up period. A chi(2) analysis or t tests was used to compare the data between the 2 groups. Risk factors for subclinical atherosclerosis were identified using Cox proportional hazard models. The incidence of subclinical atherosclerosis increased in both groups over time, and did not differ significantly between the 2 groups at the end of the study. However, after 6 years of treatment, the risk of subclinical atherosclerosis was significantly lower in the intensive medical therapy group, based on intima-media thickness (IMT) measurements, compared with that in the conventional treatment (44.2% vs. 69.7%; P<0.01). Age, creatinine, and IMT of the common iliac artery were significantly associated with subclinical atherosclerosis. Although the indicators of MetS did not differ significantly at the end of study, the success rate for the management of MetS in the intensive medical therapy group was significantly higher than that in the conventional treatment group in 2006, 2008, 2010, and 2012. The incidence of atherosclerosis in the intensive medical therapy group was significantly lower than that in the conventional treatment group from 2006 to 2010 (P <0.05), and the incidence of MetS in the intensive medical therapy group was significantly higher than that in the conventional treatment group from 2006 to 2012."

According to the news editors, the research concluded: "Kaplan-Meier estimations showed that the risk of subclinical atherosclerosis in the intensive medical therapy group was significantly lower than that in the conventional treatment group (P <0.001), whereas the risk of MetS was not significantly different between the treatment groups (P >0.05)."

For more information on this research see: Long-term effects intensive medical therapy on the development and progression of subclinical atherosclerosis and the metabolic syndrome in Chinese patients with type 2 diabetes mellitus. Medicine, 2016;95(46):84-91.
Findings on Type 2 Diabetes Reported by Investigators at Merck & Company (Discovery of benzofuran propanoic acid GPR120 agonists: From uHTS hit to mechanism-based pharmacodynamic effects)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Type 2 Diabetes have been published. According to news reporting originating in Kenilworth, New Jersey, by NewsRx journalists, research stated, "The transformation of an aryloxybutanoic acid ultra high-throughput screening (uHTS) hit into a potent and selective series of G-protein coupled receptor 120 (GPR120) agonists is reported. uHTS hit 1 demonstrated an excellent rodent pharmacokinetic profile and selectivity over the related fatty acid receptor GPR40, but only modest GPR120 potency."

The news reporters obtained a quote from the research from Merck & Company, "Optimization of the 'left-hand' aryl group led to compound 6, which demonstrated a GPR120 mechanism-based pharmacodynamic effect in a mouse oral glucose tolerance test (oGTT). Further optimization gave rise to the benzofuran propanoic acid series (exemplified by compound 37), which demonstrated acute mechanism-based pharmacodynamic effects."

According to the news reporters, the research concluded: "The combination of in vivo efficacy and attractive rodent pharmacodynamic profiles suggests compounds generated from this series may afford attractive candidates for the treatment of Type 2 diabetes."

Our news correspondents report that additional information may be obtained by contacting M. Lombardo, Merck & Co Inc, Kenilworth, NJ 07033, United States. Additional
Findings on Urothelial Cancer Discussed by Investigators at University of G. d'Annunzio [The Clinical Use of the Neutrophil to Lymphocyte Ratio (NLR) in Urothelial Cancer: A Systematic Review]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Urothelial Cancer. According to news reporting originating in Chieti, Italy, by NewsRx journalists, research stated, "The neutrophil to lymphocyte ratio (NLR) is an inflammatory index that has been considered as a potential prognostic factor in human cancer. The aim of this study was to evaluate the available evidence regarding the NLR as a prognostic value in patients affected by urothelial cancer."

The news reporters obtained a quote from the research from the University of G. d'Annunzio, "This literature review, including papers on NLR in urothelial cancers, was done on PubMed/Medline and Cochrane libraries in November 2015. The selection of the articles followed the Preferred Reporting Items for Systematic Reviews and Meta-Analyses process. Twenty-three of 99 articles fulfilled all the inclusion criteria, including data on 6240 patients affected by urothelial cancers. Overall, cancer specific, and recurrence-free survival were evaluated as the main oncological outcomes. There was significant heterogeneity among studies, and the majority of studies were of poor quality. Overall, NLR was considered as a prognostic marker in 87.5%, 80%, and 60% of the studies on upper tract urothelial cancer, urothelial bladder cancer, and metastatic and advanced disease, respectively. The NLR cut-off value ranged between 2 and 5. A high NLR was associated with worse overall, cancer-specific, and recurrence-free survival. NLR is a widely available, easy-to-collect, costless, prognostic marker in urothelial cancers."

According to the news reporters, the research concluded: "Its clinical use still remains under investigation, especially for the need for cut-off values, particularly in different subsets of patients."

For more information on this research see: The Clinical Use of the Neutrophil to Lymphocyte Ratio (NLR) in Urothelial Cancer: A Systematic Review. Clinical Genitourinary Cancer, 2016;14(6):473-484. Immunization - Vaccines

Findings on Vaccines Reported by Investigators at Chinese Academy of Sciences (Improving adjuvanticity of quaternized chitosan-based microgels for H5N1 split vaccine by tailoring the particle properties to achieve antigen dose sparing effect)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Immunization - Vaccines. According to news reporting originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "In this study, we developed the quaternized chitosan microgels without chemical crosslinking as an adjuvant of H5N1 split vaccine. The microgels with pH-sensitivity, positive surface charge and good biocompatibility, have been demonstrated in favor of enhancing both humoral and cellular immune response."

Our news editors obtained a quote from the research from the Chinese Academy of Sciences, "However, the detailed mechanism of the chitosan-based microgels to enhance antigen specific immune responses remains unclear. Therefore, we prepared the quaternized chitosan microgels with well defined quaternization degrees (QDs, 20-80%) and particle sizes (800 nm-5 μm) by the premix membrane emulsification technique, and investigated the effect of quaternization degree (QD) and size on the adjuvanticity of microgels. Results suggested that microgels with relatively smaller size (807 nm) and moderate quaternization degree (QD 41% and 60%) were favorable for a maximum immune response. The mechanism was studied and explained by examining the characteristics of microgels and investigating the stimulation of bone-marrow derived dendritic cells (BMDCs). Moreover, they induced significantly stronger immune responses at lower antigen doses (known as antigen sparing effect) compared to aluminum adjuvant."

According to the news editors, the research concluded: "These data indicated that a maximum immune response can be achieved by controlling properties of chitosan microgels, which also could serve as a significant guidance for rational design of chitosan-based particle adjuvant."

For more information on this research see: Improving adjuvanticity of quaternized chitosan-based microgels for H5N1 split vaccine by tailoring the particle properties to achieve antigen dose sparing effect. *International Journal of Pharmaceutics*, 2016;515(1-2):84-93. *International Journal of Pharmaceutics* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Findings on Venous Thromboembolism Described by Researchers at Leiden University Medical Center (Instrumental variable analysis as a complementary analysis in studies of adverse effects: venous thromboembolism and second-generation versus ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Cardiovascular Diseases and Conditions - Venous Thromboembolism. According to news reporting from Leiden, Netherlands, by NewsRx journalists, research stated, "A potentially useful role for instrumental variable (IV) analysis may be as a complementary analysis to assess the presence of confounding when studying adverse drug effects. There has been discussion on whether the observed increased risk of venous thromboembolism (VTE) for third-generation oral contraceptives versus second-generation oral contraceptives could be (partially) attributed to confounding."

Financial support for this research came from Netherlands Organisation for Health Research and Development.

The news correspondents obtained a quote from the research from Leiden University Medical Center, "We investigated how prescribing preference IV estimates compare with conventional estimates. Women in the Clinical Practice Research Database who started a second-generation or third-generation oral contraceptive from 1989 to 2013 were included. Ordinary least squares and two-stage least squares regression were used to estimate risk differences in VTE. Cox regression and IV for Cox proportional hazards regression were used to calculate hazard ratios (HR). The instrument used was the proportion of prescriptions for third-generation oral contraceptives by the general practitioner in the year preceding the current prescription. All analyses pointed in the direction of an increased VTE risk for third-generation oral contraceptives. The adjusted HR from the conventional Cox regression was 1.62 (95% confidence interval 1.16-2.27) and the fully adjusted HR from the IV Cox regression was 3.45 (95% confidence interval; 0.97-11.7), showing a larger risk and wider confidence intervals in the IV analysis. The similarity in direction of results from the IV analyses and conventional analyses suggests that major confounding is unlikely."

According to the news reporters, the research concluded: "IV analysis can be a useful complementary analysis to assess the presence of confounding in studies of adverse drug effects in very large databases."

For more information on this research see: Instrumental variable analysis as a complementary analysis in studies of adverse effects: venous thromboembolism and second-generation versus third-generation oral contraceptives. *Pharmacoepidemiology and Drug Safety*,...

Findings on Venous Thromboembolism Reported by Investigators at Huazhong University of Science and Technology (Subtypes of SERPINC1 mutations and the thrombotic phenotype of inherited antithrombin deficient individuals in Chinese Han population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cardiovascular Diseases and Conditions - Venous Thromboembolism. According to news reporting out of Wuhan, People's Republic of China, by NewsRx editors, research stated, "Inherited antithrombin (AT) deficiency is a rare autosomal disease that could increase the risk of venous thromboembolism (VTE) and usually caused by mutations of SERPINC1. Although a number of mutations of SERPINC1 have been reported in Chinese Han population, the impact of different subtypes of these mutations on the thrombotic phenotype is still unknown."

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the Huazhong University of Science and Technology, "Here, we performed a retrospective cohort study including 169 AT patients from 63 families to compare the clinical features between null mutation carriers and missense mutation carriers. We found that patients carrying null mutations have a higher risk of VTE (HR 2.29, 95% CI 1.16-4.69, P = 0.02 adjusted for sex and VTE family history) and earlier median onset age of VTE (27 vs. 32 years, P = 0.045) as well as lower AT activities (47.6 +/- 1.0% vs. 59.1 +/- 2.3%, P< 0.001) than those with missense mutations. We also observed that thrombus location sites showed no difference between null mutation carriers and missense mutation carriers, gene locations of the mutations did not relate with the incidence rate of VTE."

According to the news editors, the research concluded: "This study demonstrated that different types of SERPINC1 mutations may play different roles in the development of VTE and should be considered in the prevention of VTE."

For more information on this research see: Subtypes of SERPINC1 mutations and

**beta-Lactams**

**Findings on beta-Lactams Detailed by Investigators at Aix-Marseille University [First Report of German Cockroaches (Blattella germanica) as Reservoirs of CTX-M-15 Extended-Spectrum-beta-Lactamase-and OXA-48 Carbapenemase-Producing ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on beta-Lactams have been presented. According to news reporting originating in Marseille, France, by NewsRx journalists, research stated, "Here we report the isolation of extended-spectrum beta-lactamase (ESBL)-and carbapenemase-producing Enterobacteriaceae from German cockroaches caught in the burn unit of Batna University Hospital in Algeria."

The news reporters obtained a quote from the research from Aix-Marseille University, "Nine of 12 isolates harbored the bla(CTX-M-15) ESBL gene. One Enterobacter cloacae isolate belonging to sequence type 528 coexpressed the bla(OXA-48), bla(CTX-M-15), and blaTEM genes."

According to the news reporters, the research concluded: "Our findings indicate that cockroaches may be one of the most dangerous reservoirs for ESBL and carbapenemase producers in hospitals."

Our news correspondents report that additional information may be obtained by contacting J.M. Rolain, Aix Marseille Univ, Fac Med & Pharm, IHU Mediterranee Infect,
French National Institute of Health and Medical Research (INSERM) Reports Findings in Age-Related Macular Degeneration (Twelve-Month Outcomes of Ranibizumab vs. Afiblercept for Neovascular Age-Related Macular Degeneration: Data from an ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Eye Diseases and Conditions - Age-Related Macular Degeneration. According to news reporting from Montpellier, France, by NewsRx journalists, research stated, "To directly compare visual acuity (VA) outcomes with ranibizumab vs. aflibercept for eyes with neovascular age-related macular degeneration (nAMD) treated in routine clinical practice. Database observational study."

The news correspondents obtained a quote from the research from the French National Institute of Health and Medical Research (INSERM), "Treatment-naive eyes with nAMD tracked by the Fight Retinal Blindness outcome registry that commenced antivascular endothelial growth factor therapy with ranibizumab or aflibercept between December 1, 2013, and January 31, 2015. Eyes were matched at baseline for VA, age, and choroidal neovascular membrane (CNV) size. Locally weighted scatterplot smoothing curves were used to display VA results. Eyes that switched or discontinued treatment were included with their last observation carried forward. Change in mean VA (number of letters read on a logarithm of the minimum angle of resolution chart); number of injections and visits; proportion of eyes with inactive CNV over 12 months. We identified 394 eyes (197 treated with ranibizumab and 197 with aflibercept) from 372 patients who received treatment from 34 practitioners. Baseline parameters were well matched. The mean (standard deviation [SD]) VA of ranibizumab-treated eyes increased from 58.6 (20.3) letters at baseline to 62.3 (23.9) (+3.7 [95% confidence interval CI 1.4-6.1]) letters (P = 0.001), compared with 58.9 (19.2) letters at baseline to 63.1 (21.5) (+4.26 [95% CI 2.0-6.5]) letters (P < 0.001) for eyes receiving aflibercept. The difference in change in crude VA of 0.6 letters between the 2 groups was not statistically significant (P = 0.76), nor was the difference in adjusted mean VA of the 2 groups (P = 0.26). In completers, the mean (SD) numbers of injections (8.1 [2.1] vs. 8.0 [2.3]; P = 0.27) and visits (9.6 [3.0] vs. 9.5 [3.1]; P = 0.15) did not differ between the 2 groups. The adjusted proportion of eyes in which the CNV lesion was graded as inactive during the study was similar between the eyes receiving ranibizumab and aflibercept (74% vs. 77%, respectively; P = 0.63)."

According to the news reporters, the research concluded: "Visual acuity outcomes at 12 months did not differ between ranibizumab and aflibercept used for nAMD in this large observational study, nor was a difference in treatment frequency found."
For more information on this research see: Twelve-Month Outcomes of Ranibizumab vs. Aflibercept for Neovascular Age-Related Macular Degeneration: Data from an Observational Study. *Ophthalmology, 2016;123(12):2545-2553.* *Ophthalmology* can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Oncology - Prostate Cancer**

**Fudan University Shanghai Cancer Center Reports Findings in Prostate Cancer (Effect of body mass index on the performance characteristics of PSA-related markers to detect prostate cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Prostate Cancer have been published. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "To examine whether the predictive performance of prostate-specific antigen (PSA) and PSA-related markers for prostate cancer (PCa) is modified by body mass index (BMI). Patients with a PSA 2-10 ng/mL who underwent multicore prostate biopsies were recruited from three tertiary centers."

The news reporters obtained a quote from the research from Fudan University Shanghai Cancer Center, "Serum markers measured included total PSA (tPSA), free-to-total PSA (f/tPSA), p2PSA, percentage of p2PSA (%p2PSA), and prostate health index (PHI). The association between serum markers and PCa risk was assessed by logistic regression. Predictive performance for each marker was quantified using the area under the receiver operator curves (AUC). Among 516 men, 18.2% had PCa at biopsy. For all tested markers, their predictive value on PCa risk was lower in obese patients compared to normal weight patients. We found statistically significant interactions between BMI and tPSA (p=0.0026) and p2PSA (p=0.038). PHI achieved an AUC of 0.872 in normal weight patients and 0.745 in obese patients, which outperformed the other predictors regardless of BMI category."

According to the news reporters, the research concluded: "PHI achieved the best predictive performance for detecting PCa and was not influenced by BMI."

For more information on this research see: Effect of body mass index on the performance characteristics of PSA-related markers to detect prostate cancer. *Scientific Reports,*

Drugs and Therapies - Drug Delivery Systems

Fujian Agriculture and Forestry University Details Findings in Drug Delivery Systems (Rehmannia glutinosa polysaccharide liposome as a novel strategy for stimulating an efficient immune response and their effects on dendritic cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Drug Delivery Systems have been presented. According to news reporting from Fuzhou, People's Republic of China, by NewsRx journalists, research stated, "Nanomedicine, the medical application of nanotechnology, promises a seemingly limitless range of applications from drug delivery to adjuvants and therapeutics. Our current research is focused on natural polymer-based liposome adjuvants."

The news correspondents obtained a quote from the research from Fujian Agriculture and Forestry University, "With the aim of inducing protective and long-lasting immunity, the immunological adjuvant activity of Rehmannia glutinosa polysaccharide liposome (RGPL) was investigated. In vivo, the splenic lymphocyte proliferation ratios and ovalbumin-specific immunoglobulin G titers of ovalbumin-RGPL-vaccinated mice were significantly upregulated. In draining lymph nodes, the expression of MHC II(+)CD11c(+) and CD86(+)CD11c(+) was increased by RGPL; in addition, the percentages of central memory cells (T-CM) and effector memory cells (T-EM) were also elevated. RGPL could effectively provide adequate antigen exposure in lymph nodes. In vitro, RGPL could promote dendritic cell maturation and enhance dendritic cell functions, such as the mixed lymphocyte reaction and antigen presentation."

According to the news reporters, the research concluded: "Overall, the results demonstrated that RGPL has the potential to act as an effective controlled release vaccine adjuvant."

For more information on this research see: Rehmannia glutinosa polysaccharide liposome as a novel strategy for stimulating an efficient immune response and their effects on dendritic cells. International Journal of Nanomedicine, 2016;11():6795-6808. International Journal of Nanomedicine can be contacted at: Dove Medical Press Ltd, PO Box 300-008, Albany, Auckland 0752, New Zealand.

Oncology - Breast Cancer

Gene test could pinpoint patients sensitive to new type of cancer drug

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Testing for a gene commonly mutated in ovarian cancers could pick out patients who will respond well to a promising new class of cancer drugs, a major new study reveals.

Scientists found that defects in a gene called ARID1A caused sensitivity to new drugs targeting the DNA repair process within tumour cells.

The new drugs - called ATR inhibitors - are already being tested in early clinical trials, and the new research could help identify those patients who will benefit most.

Scientists at The Institute of Cancer Research, London, used molecular screening techniques to find that cancers with mutations in ARID1A were particularly sensitive to ATR inhibitors.

ARID1A is mutated in a wide range of hard-to-treat tumour types, including ovarian cancer and stomach cancer, but until now there has been no way of targeting treatment at tumours with this genetic defect.

The research, which is published in the journal Nature Communications, was funded by Cancer Research UK and Breast Cancer Now.

Scientists at The Institute of Cancer Research (ICR) found that ATR inhibitors stopped cancer cells with ARID1A mutations from growing, both in culture dishes and in mice. They also found that switching off the ARID1A gene in breast and bowel cancer cells greatly increased their sensitivity to ATR inhibitors.

The researchers found the treatment killed cancer cells with ARID1A mutations through a process called 'synthetic lethality'.

Cancer cells with ARID1A mutations become particularly reliant on the DNA safeguarding activity of the ATR protein to survive - so they are especially sensitive to drugs that block its effects.

Patients on clinical trials of ATR inhibitors could now start to be tested for ARID1A mutations in their tumours - in order to assess whether those with the genetic defects are particularly likely to benefit.

Dr Chris Lord, Leader of the Gene Function Team at The Institute of Cancer Research, London, said: "Our research has opened up a potential way of personalising treatment for cancer by targeting drugs to those patients who will benefit most.

"We found in cell cultures and in mice that cancers with defective versions of the
ARID1A gene are particularly sensitive to a new class of drug called ATR inhibitors."

"Our research could lead to patients with ARID1A mutant tumours being assessed for whether they respond particularly well to this new class of cancer treatment."

Dr Justine Alford, Cancer Research UK's senior science information officer, said: "By identifying a potential way to exploit a specific genetic vulnerability in cancer this research could point the way to tailoring treatments to each patient, helping to make them kinder and more effective. The next steps will be to better understand the effects of targeting this weakness, and to find out whether this promising strategy will work in people."

Katie Goates, Senior Research Communications Officer at Breast Cancer Now, said: "This early finding could bring us a step closer to more 'personalised' medicine, targeting treatment to exploit weaknesses in patients' tumours and hopefully improve their chances of survival.

"It's particularly exciting to see an idea that was initially tested in breast cancer cells be translated into potential benefit for a number of other cancers. We hope these findings now lay the groundwork for clinical trials to investigate the potential of ATR inhibitors as a targeted cancer treatment in the near future."

Central Nervous System Diseases and Conditions -

General Hospital Describes Findings in Subarachnoid Hemorrhage (Melatonin attenuated early brain injury induced by subarachnoid hemorrhage via regulating NLRP3 inflammasome and apoptosis signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Central Nervous System Diseases and Conditions - Subarachnoid Hemorrhage have been published. According to news reporting originating in Shenyang, People's Republic of China, by NewsRx journalists, research stated, "Subarachnoid hemorrhage (SAH) is a devastating condition with high morbidity and mortality rates due to the lack of effective therapy. Nucleotide-binding oligomerization domain-like receptor family pyrin domain-containing 3 (NLRP3) inflammasome activation associated with the upregulation of apoptotic signaling pathway has been implicated in various inflammatory diseases including hemorrhagic insults."

Funders for this research include National Natural Science Foundation of China, Medical Science Youth Breeding Project of Chinese People's Liberation Army, China Postdoctoral Science Foundation.

The news reporters obtained a quote from the research from General Hospital, "Melatonin is reported to possess substantial anti-inflammatory properties, which is beneficial for early brain injury (EBI) after SAH. However, the molecular mechanisms have not been clearly identified. This study was designed to investigate the protective effects of melatonin against EBI induced by SAH and to elucidate the potential mechanisms. The adult mice were subjected to SAH. Melatonin or vehicle was injected intraperitoneally 2 hr after SAH. Melatonin was neuroprotective, as shown by increased survival rate, as well as elevated
neurological score, greater survival of neurons, preserved brain glutathione levels, and reduced brain edema, malondialdehyde concentrations, apoptotic ratio, and blood-brain barrier (BBB) disruption. Melatonin also attenuated the expressions of NLRP3, apoptosis-associated speck-like protein containing a caspase recruitment domain (ASC), cleaved caspase-1, interleukin-1β (IL-1β), and interleukin-6 (IL-6); these changes were also associated with an increase in the anti-apoptotic factor (Bcl2) and reduction in the pro-apoptotic factor (Bim)."

According to the news reporters, the research concluded: "In summary, our results demonstrate that melatonin treatment attenuates the EBI following SAH by inhibiting NLRP3 inflammasome-associated apoptosis."

Our news correspondents report that additional information may be obtained by contacting Y. Dong, Dept. of Neurosurgery, General Hospital of Shenyang Military Area Command, Shenyang, People's Republic of China. Additional authors for this research include C. Fan, W. Hu, S. Jiang, Z. Ma, X. Yan, C. Deng, S. Di, Z. Xin, G. Wu, Y. Yang, R.J. Reiter and G. Liang.

Oncology - Carcinomas

**General Hospital Details Findings in Carcinomas (The influence of American Society of Anesthesiologists Physical Status on patient morbidity and survival after total thyroidectomy)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Carcinomas have been published. According to news reporting from Hyogo, Japan, by NewsRx journalists, research stated, "In cases of thyroid papillary carcinoma, a less aggressive cancer, surgeons may hesitate to perform total thyroidectomy on patients with poor general condition because these may experience longer survival without undergoing surgery. To investigate the influence of general patient condition on the patients' survival who received total thyroidectomy, we utilized the American Society of Anesthesiologists Physical Status (ASA-PS)."

The news correspondents obtained a quote from the research from General Hospital, "We retrospectively reviewed all patients undergoing total thyroidectomy under general anesthesia and graded by ASA-PS between 2004 and 2014. Patients with anaplastic carcinoma and metastatic thyroid renal cell carcinoma were excluded. There were 77 (30%), 149 (58%),
and 30 (12%) ASA-PS 1, 2, and 3 cases, respectively. Patient age increased significantly with increasing ASA-PS score (median age of 53, 64, and 71 years for ASA-PS 1, 2, and 3). Hospitalization periods extended significantly for patients with ASA-PS 3. Twenty patients died during the study (3.89 median years). Five-year overall survival rates were 100%, 93%, and 79% for ASA-PS 1, 2 and 3, respectively. Patients in the ASA-PS 1 group had significantly better prognosis by log-rank test. Univariate analysis showed an increased risk of death as ASA-PS score increased (hazard ratio: 3.03, 95% confidence interval: 1.55-5.92, p=0.00). In multivariate analysis, including patient age and presence of malignancy, patient age was the only significant predictor of overall survival (hazard ratio: 1.09 by year, 95% confidence interval: 1.03-1.14, p=0.00)."

According to the news reporters, the research concluded: "We concluded that a high ASA-PS score should not inhibit performance of total thyroidectomy if a patient's age is suitable for the surgery."

Our news journalists report that additional information may be obtained by contacting S. Shinohara, General Hospital, Dept. of Otolaryngol Head & Neck Surg, Kobe City Med Center, Kobe, Hyogo, Japan. Additional authors for this research include M. Kikuchi, H. Harada, S. Takebayashi, K. Yunoki and K. Yamazaki.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1507/endocrj.EJ16-0342. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Hyogo, Japan, Asia, Endocrine Surgical Procedures, Surgery, Risk and Prevention, Thyroidectomy, Carcinomas, Oncology, General Hospital.

**Neurodegenerative Diseases**

**Genes Nardilysin and OGDHL linked to human neurological conditions**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- An international team of scientists has discovered that the gene, OGDHL, a key protein required for normal function of the mitochondria -- the energy-producing factory of the cell -- and its chaperone, nardilysin (NRD1) are linked to progressive loss of neurological function in humans. Working with the fruit fly, an experimental animal model in the lab, the scientists found a mechanism by which misregulation of mitochondrial function leads to neurodegeneration. The results appear in Neuron.

"In our research we look for genes whose loss of function results in deterioration of neurological functions in the fruit fly Drosophila melanogaster," said first author Dr. Wan Hee Yoon, postdoctoral fellow in the laboratory of Dr. Hugo Bellen, professor at Baylor College of Medicine, investigator at the Howard Hughes Medical Institute, and senior author of the paper. "In the fly we found that loss of function of nardilysin led to a slow, progressive neurodegeneration."
Yoon and colleagues discovered that nardilysin helps the folding of an important protein, an enzyme called OGDH, present in mitochondria. Loss of nardilysin function results in loss of OGDH and a build-up of a compound called a-ketoglutarate (a-KG). High levels of a-KG increase a cellular response mechanism called mTOR that normally provides clearance of cellular components such as proteins and organelles. Yoon observed that mutation of nardilysin leads to abnormal build-up of a-KG followed by mTOR activation and eventually to slow accumulation of cellular trash. Importantly, a drug named rapamycin suppresses the neurodegenerative conditions caused by this accumulation of cellular garbage.

In 2009, a group led by Dr. Eiichiro Nishi in Japan genetically engineered a mouse to lack nardilysin. The mice developed neurological problems with motor coordination, balance and memory issues, findings which at the time were not known to be linked to the mechanism described above in the fruit fly. The team led by Bellen realized that the results in fruit flies and in mice might suggest a role for nardilysin and its target protein OGDH in neurological problems in humans.

Searching for disease variants of nardilysin, OGDHL

At the same time that Yoon was investigating nardilysin and its target protein OGDH, across the street co-author Dr. Ender Karaca, a postdoctoral fellow in the laboratory of Dr. James R. Lupski’s group at Baylor, was working to solve a rare disease by sequencing the patient's genome through the Baylor-Hopkins Center for Mendelian Genomics (BHCMG). Karaca had discovered a 16-year-old patient with a rare variant in OGDHL who was unable to walk, was bound to a wheelchair and whose head had not grown normally. Yoon and Karaca connected and realized that the mechanism in flies that Yoon was working on might explain the undiagnosed patient of Karaca. "We realized that Ender had identified OGDHL as the top candidate gene for his patient at the same time that we were identifying OGDHL as a target of nardilysin," said Yoon. "After we saw a patient with a severe disorder and variants in OGDHL, we wondered about nardilysin," said Bellen. The researchers then widened their search for similar patients by posting the information of the disease-causing variants of nardilysin in GeneMatcher, a web tool for rare disease researchers developed by the BHCMG team at Johns Hopkins University. Researchers looking for patients carrying rare disease genes post the gene in GeneMatcher. If another researcher around the world has a patient with a matching gene, the teams can contact each other to share the information and collaborate. By posting nardilysin in GeneMatcher, Yoon and colleagues identified a patient whose DNA had been sequenced at the University of California in Los Angeles Clinical Genomics Center. The patient is a 15-year-old boy who presents with symptoms that are remarkably similar to those present in the patient identified by Karaca. "We knew then that these two patients had a very similar disorder, but we had to prove that the genetic variants were causing their conditions," said Yoon and Bellen.

Using flies to study how human disease genes work

The data from the two patients were strong evidence that the variants in nardilysin and OGDHL are linked to neurodegenerative disease in humans. However, to establish that the disease variants can cause the condition, the researchers turned back to the flies where they could use genetic technology to test the variants. "We can test a human gene side by side with a copy containing a variant from a patient in flies," said co-author Dr. Michael F. Wangler, assistant professor of molecular and human genetics at Baylor. Using this technology, Yoon showed that mutant flies carrying a normal copy of the human gene show normal development and neuronal function. However, flies carrying genes with deleterious variants found in patients failed to rescue the loss of the genes in flies. This suggests that the mutations found in patients are indeed deleterious.

"These studies show how valuable the fruit fly model is to uncover and test genes
linked to human conditions, and to work out how mutations may cause diseases," said Bellen.

Gram-Negative Bacteria - Pseudomonas aeruginosa

Georgia State University Reports Findings in Pseudomonas aeruginosa (Inhibition and Dispersal of Pseudomonas aeruginosa Biofilms by Combination Treatment with Escapin Intermediate Products and Hydrogen Peroxide)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Gram-Negative Bacteria - Pseudomonas aeruginosa have been presented. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "Escapin is an L-amino acid oxidase that acts on lysine to produce hydrogen peroxide (H2O2), ammonia, and equilibrium mixtures of several organic acids collectively called escapin intermediate products (EIP). Previous work showed that the combination of synthetic EIP and H2O2 functions synergistically as an antimicrobial toward diverse planktonic bacteria."

Financial support for this research came from Georgia Research Alliance (GRA).

The news correspondents obtained a quote from the research from Georgia State University, "We initiated the present study to investigate how the combination of EIP and H2O2 affected bacterial biofilms, using Pseudomonas aeruginosa as a model. Specifically, we examined concentrations of EIP and H2O2 that inhibited biofilm formation or fostered disruption of established biofilms. High-throughput assays of biofilm formation using microtiter plates and crystal violet staining showed a significant effect from pairing EIP and H2O2, resulting in inhibition of biofilm formation relative to biofilm formation in untreated controls or with EIP or H2O2 alone. Similarly, flow cell analysis and confocal laser scanning microscopy revealed that the EIP and H2O2 combination reduced the biomass of established biofilms relative to that of the controls. Area layer analysis of biofilms posttreatment indicated that disruption of biomass occurs down to the substratum. Only nanomolar to micromolar concentrations of EIP and H2O2 were required to impact biofilm formation or disruption, and these concentrations are significantly lower than those causing bactericidal effects on planktonic bacteria. Micromolar concentrations of EIP and H2O2 combined enhanced P. aeruginosa swimming motility compared to the effect of either EIP or H2O2 alone."

According to the news reporters, the research concluded: "Collectively, our results suggest that the combination of EIP and H2O2 may affect biofilms by interfering with bacterial attachment and destabilizing the biofilm matrix."

For more information on this research see: Inhibition and Dispersal of Pseudomonas aeruginosa Biofilms by Combination Treatment with Escapin Intermediate Products and Hydrogen Peroxide. Antimicrobial Agents and Chemotherapy, 2016;60(9):5554-5562. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. **Pharmaceutical Companies**

**Gilead Sciences to Present at the 35th Annual J.P. Morgan Healthcare Conference on Monday, January 9**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Gilead Sciences, Inc. (Nasdaq: GILD) announced that its corporate presentation will be webcast from the 35th Annual J.P. Morgan Healthcare Conference in San Francisco.

John F. Milligan, PhD, Gilead's President and Chief Executive Officer, will provide an overview of the company at the conference on Monday, January 9 at 10:30 a.m. Pacific Time (1:30 p.m. Eastern Time).

The live webcast can be accessed at the company's Investors page at www.gilead.com/investors. Please connect to the company's website at least 15 minutes prior to the start of the presentation to ensure adequate time for any software download that may be required to listen to the webcast. The replay will be available for 14 days following the presentation. About Gilead Gilead Sciences is a biopharmaceutical company that discovers, develops and commercializes innovative therapeutics in areas of unmet medical need. The company's mission is to advance the care of patients suffering from life-threatening diseases. Gilead has operations in more than 30 countries worldwide, with headquarters in Foster City, California. For more information on Gilead Sciences, please visit the company's website at www.gilead.com, follow Gilead on Twitter (@GileadSciences) or call Gilead Public Affairs at 1-800-GILEAD-5 or 1-650-574-3000. Glancy Prongay & Murray LLP Commences Investigation on Behalf of Endologix, Inc. Investors

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Glancy Prongay & Murray LLP ("GPM") announces an investigation on behalf of Endologix, Inc. ("Endologix" or the "Company") (NASDAQ: ELGX) investors concerning the Company and its officers' possible violations of federal securities laws. GPM is preparing a lawsuit on behalf of Endologix investors.

Endologix develops, manufactures, markets and sells medical devices for the treatment of abdominal aortic aneurysms in the United States and internationally.

Nellix is Endologix's endovascular aneurysm sealing system for infrarenal abdominal aortic aneurysms. On August 2, 2016, Endologix indicated that it would seek approval of the original version of the Nellix system that was used in the Nellix investigational device exemption (IDE) clinical trial, the EVAS FORWARD-IDE Study. However, on November 16, 2016, Endologix disclosed that the FDA had requested a two-year follow-up on patients enrolled in the EVAS-FORWARD-IDE study to accurately evaluate Nellix. On this news, shares of Endologix fell over 20% to close at just $7.82 per share on November 16, 2016.

Then on December 27, 2016 Endologix announced a temporarily hold on AFX Endovascular AAA System shipments, citing the need to complete an investigation of a manufacturing issue with different sizes of the device.

On this news, shares of Endologix have fallen nearly 20% to just $5.76 per share during intra-day trading on December 27, 2016.

If you purchased Endologix securities, have information or would like to learn more about these claims, or have any questions concerning this announcement or your rights or interests with respect to these matters, please contact Lesley Portnoy, Esquire, of GPM, 1925 Century Park East, Suite 2100, Los Angeles, California 90067 at 310-201-9150, Toll-Free at 888-773-9224, by email to shareholders@glancylaw.com, or visit our website at http://www.glancylaw.com. If you inquire by email please include your mailing address, telephone number and number of shares purchased.

Digestive System Diseases and Conditions --

Gut microorganisms affect our physiology

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers have found evidence that could shed new light on the complex community of trillions of microorganisms living in all our guts, and how they interact with our
bodies.

Scientists at the University of Exeter Medical School and University of Zaragoza in Spain studied a protein known as TLR2, a critical detector of the microbiota found in the intestine. They found that it regulates levels of serotonin - a neurotransmitter which carries messages to the brain, and is also found in the gut, where it regulates our bowel routines.

The research, carried out in cell cultures and verified in mice, provides strong evidence that microbiota can interfere with human physiology by modulating the serotonin transporter activity. Serotonin transporter is a target for numerous diseases and it seems that microbiota living in our guts is able to interfere with this transporter, controlling our serotonin levels.

The finding, published in PLOS ONE, comes as scientists across the world are working to understand the complicated interactions between the "invisible world" of the microbiota in our bodies and the impact they have on our health and even our moods. Recently, scientists in California found evidence that the bacteria in the gut play a role in causing Parkinson's Disease.

It may also help explain how the microbiota in our guts affect our physiology. Inflammatory bowel disease is thought to be triggered when TLR2 is not functioning properly, but so far, the mechanisms behind this have not been fully understood. This study aimed to further this understanding, and was supported the Foundation for the Study of Inflammatory Bowel Diseases in Aragon (ARAINF), in Spain.

Dr Eva Latorre, a postdoctoral researcher at the University of Exeter Medical School, said the new finding helped to further understanding in a fast-growing research area. She said: "This paper has concluded that the protein TLR2 alters the availability of serotonin, which is important in a range of conditions from depression to inflammatory bowel disease. It is early days in this research though. We need to understand much more about the relationship between the microbiota in our guts and how they interact, before we can hope to harness effective new treatments."

The research team examined human cells in a model of the intestine in the laboratory, looking at how they express proteins and RNA - activities which regulate how they behave. They found that TLR2 controls serotonin transporter - obtaining the same result in studies on mice.

Principal investigator of this study, Professor Jose E Mesonero, at the University of Zaragoza, said: "This paper opens our minds about the complex universe of this forgotten organ: the microbiome. We have concluded that TLR2 not only can detect microbiota, but also modulate serotonin transport, one of the crucial mechanism in neurological and inflammatory diseases. Much has to be yet studied, but this work can improve our understanding about the connection between gut and brain thought microbiota."

Oncology - Glioblastomas

Hadassah-Hebrew University Details Findings in Glioblastomas
(Expression level of miRNAs on chromosome 14q32.31 region correlates with tumor aggressiveness and survival of glioblastoma patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Glioblastomas is now available. According to news reporting originating from Jerusalem, Israel, by NewsRx correspondents, research stated, "The 54 microRNAs (miRNAs) within the DLK-DIO3 genomic region on chromosome 14q32.31 (cluster-14-miRNAs) are organized into sub-clusters 14A and 14B. These miRNAs are downregulated in glioblastomas and might have a tumor suppressive role."

Our news editors obtained a quote from the research from Hadassah-Hebrew University, "Any association between the expression levels of cluster-14-miRNAs with overall survival (OS) is undetermined. We randomly selected miR-433, belonging to sub-cluster 14A and miR-323a-3p and miR-369-3p, belonging to sub-cluster 14B, and assessed their role in glioblastomas in vitro and in vivo. We also determined the expression level of cluster-14-miRNAs in 27 patients with newly diagnosed glioblastoma, and analyzed the association between their level of expression and OS. Overexpression of miR-323a-3p and miR-369-3p, but not miR-433, in glioblastoma cells inhibited their proliferation and migration in vitro. Mice implanted with glioblastoma cells overexpressing miR323a-3p and miR369-3p, but not miR433, exhibited prolonged survival compared to controls (P = .003). Bioinformatics analysis identified 13 putative target genes of cluster-14-miRNAs, and real-time RT-PCR validated these findings. Pathway analysis of the putative target genes identified neuregulin as the most enriched pathway. The expression level of cluster-14-miRNAs correlated with patients' OS. The median OS was 8.5 months for patients with low expression levels and 52.7 months for patients with high expression levels (HR 0.34; 95 % CI 0.12-0.59, P = .003)."

According to the news editors, the research concluded: "The expression level of cluster-14-miRNAs correlates directly with OS, suggesting a role for this cluster in promoting aggressive behavior of glioblastoma, possibly through ErBb/neuregulin signaling."

For more information on this research see: Expression level of miRNAs on chromosome 14q32.31 region correlates with tumor aggressiveness and survival of glioblastoma patients. Journal of Neuro-Oncology, 2016;130(3):413-422. Journal of Neuro-Oncology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Harbin Institute of Technology Reports Findings in Cellular Structures (How Leucocyte Cell Membrane Modified Janus Microcapsules are Phagocytosed by Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Cellular Structures. According to news reporting out of Harbin, People's Republic of China, by NewsRx editors, research stated, "Modern drug delivery systems rely on either antibody-based single-surface recognition or on surface-hydrophobicity-based approaches. For a tumor showing various surface mutations, both approaches fail."

Financial supporters for this research include Harbin Institute of Technology, National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the Harbin Institute of Technology, "This publication hereby presents Janus capsules based on polyelectrolyte multilayer microcapsules exhibiting human leucocyte (THP-1 cell line) cell membranes for discriminating HUVEC cells from three different cancer cell lines. Despite destroying the cellular integrity of leucocyte cells, the modified Janus capsules are able to adhere to cancer cells."

According to the news editors, the research concluded: "Leucocyte cell-membrane-coated Janus capsules are phagocytosed with the cellular membrane part pointing to the cells."

Our news journalists report that additional information may be obtained by contacting W. He, Key Laboratory of Microsystems and Microstructures Manufacturing, Ministry of Education, Micro, Nano Technology Research Centre, Harbin Institute of Technology, Yikuang Street 2 B1, Harbin 150080, People's Republic of China. Musculoskeletal Diseases and Conditions - Kyphosis

Harvard School of Medicine Reports Findings in Kyphosis (Heritability of Thoracic Spine Curvature and Genetic Correlations With Other Spine Traits: The Framingham Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Musculoskeletal Diseases and Conditions - Kyphosis have been published. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Hyperkyphosis is a common spinal disorder in older adults, characterized by excessive forward curvature of the thoracic spine and adverse health outcomes. The etiology of hyperkyphosis has not been firmly established, but may be related to changes that occur with aging in the vertebrae, discs, joints, and muscles, which function as a unit to support the spine."

The news reporters obtained a quote from the research from the Harvard School of Medicine, "Determining the contribution of genetics to thoracic spine curvature and the degree of genetic sharing among co-occurring measures of spine health may provide insight into the etiology of hyperkyphosis. The purpose of our study was to estimate heritability of thoracic spine curvature using T-4-T-12 kyphosis (Cobb) angle and genetic correlations between thoracic spine curvature and vertebral fracture, intervertebral disc height narrowing, facet joint osteoarthritis (OA), lumbar spine volumetric bone mineral density (vBMD), and paraspinal muscle area and density, which were all assessed from computed tomography (CT) images. Participants included 2063 women and men in the second and third generation offspring of the original cohort of the Framingham Study. Heritability of kyphosis angle, adjusted for age, sex, and weight, was 54% (95% confidence interval [CI], 43% to 64%). We found moderate genetic correlations between kyphosis angle and paraspinal muscle area (G), 0.05; 95% CI, -0.15 to 0.24) were low."

According to the news reporters, the research concluded: "Thoracic spine curvature may be heritable and share genetic factors with other age-related spine traits including trunk muscle size, vertebral fracture, and bone mineral density."

Heart-related deaths spike at Christmas

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Heart-related deaths spike during Christmas, but the effect may have nothing to do with the cold winter season, according to new research in Journal of the American Heart Association, the Open Access Journal of the American Heart Association/American Stroke Association.

"Spikes in deaths from natural causes during Christmas and New Year's Day has been previously established in the United States. However, the Christmas holiday period (December 25th to January 7th) in the U.S. falls within the coldest period of the year when death rates are already seasonally high due to low temperatures and influenza," said Josh Knight, B.Sc., study author and research fellow at the University of Melbourne in Australia.

In this study, researchers analyzed trends in deaths in New Zealand, where Christmas occurs during the summer season when death rates are usually at a seasonal low - allowing researchers to separate any winter effect from a holiday effect.

During a 25-year period (1988-2013), there were a total of 738,409 deaths (197,109 were noted as cardiac deaths).

Researchers found:

A 4.2 percent increase in heart-related deaths occurring away from a hospital from December 25 - January 7.

The average age of cardiac death was 76.2 years during the Christmas period, compared with 77.1 years during other times of the year.

There are a range of theories that may explain the spike in deaths during the holiday season, including the emotional stress associated with the holidays, changes in diet and alcohol consumption, less staff at medical facilities, and changes in the physical environment (for example visiting relatives). However, there have been few attempts to replicate prior studies.

Although more research is needed to explain the spike in deaths, researchers suggest one possibility may be that patients hold back in seeking medical care during the holiday season.

"The Christmas holiday period is a common time for travel within New Zealand, with people frequently holidaying away from their main medical facilities. This could contribute to delays in both seeking treatment, due to a lack of familiarity with nearby medical facilities, and due to geographic isolation from appropriate medical care in emergency situations," Knight said.

Another explanation may have to do with a terminally ill patients' will to live and hold off death for a day that is important to them.

"The ability of individuals to modify their date of death based on dates of significance has been both confirmed and refuted in other studies, however it remains a possible explanation for this holiday effect," Knight said.

However, researchers note that the study did not track daily temperatures and New Zealand has an island climate, which almost eliminates the extremes of temperature that have been associated with heart-related death rates in previous studies.

Helix BioPharma Corp. Successfully Out-Licenses Late Stage Biphasix Technology

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Helix BioPharma Corp. ("Helix" or the "Company") (TSX: HBP) (FRANKFURT: HBP), a clinical-stage, immuno-oncology company developing innovative drug candidates for the prevention and treatment of cancer, announces it has signed an exclusive out-license agreement with Xisle Pharma Ventures Trust ("Xisle") for the Company's late-stage, Biphasix™ technology platform, including the lead product candidate, interferon alpha. Xisle will be responsible for the continued clinical development and subsequent commercialization of the product for the treatment of HPV-induced, low-grade, cervical intraepithelial lesions. As part of its asset development strategy, Xisle has initiated collaboration with senior pharmaceutical executives at Altum Pharmaceuticals Inc., who possess extensive regulatory, clinical, and product development expertise.

Under the terms of the agreement, Xisle has paid an up-front fee and agreed to subsequent milestone payments as they advance the technology to registration and market approvals. Helix has retained marketing rights for certain territories. EVOLUTION Life Science Partners LLC, a division of Gordian Investments, LLC acted as advisor to Helix BioPharma Corp.

"This is an important milestone for Helix as it represents our ability to take a novel immunotherapy asset from discovery to out license," said Dr. Sven Rohmann, Chief Executive Officer for Helix. Dr. Rohmann added that, "We can now fully concentrate our financial and development efforts on advancing our clinical stage Tumor Defense Breaker and newest CAR-T program aimed at solid tumors."

Oncology - Lung Cancer

Histologic classification impacts SBRT treatment in early-stage lung cancer patients

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- DENVER - Early-stage non-small cell lung cancer (NSCLC) patients with squamous cell carcinoma (SqCC) have a significantly higher rate of local failure after stereotactic body radiation therapy (SBRT) than other NSCLC histological subtypes.

Lung cancer is the leading cause of cancer deaths worldwide, causing more deaths than breast, colon, and prostate cancers combined. NSCLC is the most common type of lung cancer, accounting for roughly 85% of lung cancers. Surgical resection is the standard treatment of early-stage (stage I, II) lung cancers. However, a subset of early-stage patients will be unable to tolerate surgery due to their age, location of tumor, or medical comorbidities. SBRT is a
noninvasive, high-precision radiation delivery technique of a few (or even a single) high-dose fractions to small areas or tumors that has become established as the standard of care in medically inoperable patients. NSCLC is composed of several histological subtypes that effect the genetic and microenvironments of tumors, and the impact of histology or tumor heterogeneity on SBRT treatments is not very well understood.

A group of researchers from Cleveland Clinic in Cleveland, Ohio, USA analyzed 740 patients from an institutional review board-approved database of early-stage NSCLC patients treated with SBRT from 2003 through 2015 to investigate the impact of histological subtype and tumor heterogeneity on SBRT treatment. Patients were grouped into four categories by tumor type: adenocarcinoma, SqCC, unknown, and NSCLC not otherwise specified (NOS). The unknown group included patients who did not undergo a tissue biopsy and those with a nondiagnostic biopsy result. The NSCLC NOS group included patients with large cell carcinoma and NSCLC NOS. Patients were well balanced for patient age, sex, BMI, performance status, length of follow-up, and radiotherapy (RT) dose. Cumulative incidence curves (CICs) for local failure, defined as radiographic progression with or without positive biopsy results within 1 cm of the planning target volume (PTV), were estimated using the competing risk method. Predictors of local failure were estimated using Fine and Gray regression. Actuarial analysis was used to estimate rates of overall survival (OS), and the Kaplan-Meier method was used to generate OS curves.

The results of the study published in the Journal of Thoracic Oncology, the official journal of the International Association for the Study of Lung Cancer (IASLC), show that of the 740 eligible patients 32% were characterized as adenocarcinoma, 29% as SqCC, 30% as unknown, and 8% as NSCLC NOS. Overall, 72 patients had a local failure, with a cumulative incidence of local failure at 3 years of 11.8%. Univariate analysis demonstrated that SqCC histological subtype, younger age, fewer medical comorbidities, higher body mass index, higher positron emission tomography standardized uptake value, central tumors, and lower radiation dose were associated with an increased risk for local failure. Multivariate analysis identified SqCC histological subtype (hazard ratio = 2.4, p = 0.008) as the strongest predictor of local failure. Three year cumulative rates of local failure demonstrated that patients with SqCC (18.9% (95% CI: 12.7-25.1)) failed SBRT at a significantly higher rate than those with adenocarcinomas (8.7% (95% CI: 4.6-12.8)), or NSCLC NOS (4.1% (95% CI: 0-9.6)).

The authors comment that, "This study is the first demonstration of a histological basis for local failure after SBRT. The results demonstrate that SqCC have a significantly higher rate of local failure after SBRT than other NSCLCs do. The local failure rate for SqCC was twofold higher than for adenocarcinomas. These results suggest that SqCCs are more resistant to SBRT than other NSCLCs are. The clinically significant implication of our study is that SBRT treatments should be optimized on the basis of histological subtype."

History of kidney injury increases risk of pregnancy complications

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A study by Massachusetts General Hospital (MGH) investigators finds, for the first time, that women with a history of acute kidney injury with complete clinical recovery have an increase of several adverse outcomes of pregnancy - including premature delivery and preeclampsia, a condition that is hazardous for both mother and baby - even though they appear to have normal kidney function prior to pregnancy. Their findings are being published online in the Journal of the American Society of Nephrology.

"Our findings that women with a history of acute kidney injury were at increased risk of complications including preeclampsia are important, because all of these women appeared to have recovered from their kidney injury prior to pregnancy," says Jessica Sheehan Tangren, MD, of the MGH Division of Nephrology, lead and corresponding author of the report. "They would not necessarily have been identified as at high risk for pregnancy complications."

While acute kidney injury is primarily seen in the elderly and in critically ill individuals, it can occur in children or young adults hospitalized for conditions including serious infections, major surgery, trauma or from medication side effects or interactions. Existing kidney disease is recognized to increase the risk for pregnancy complications, but the possibility that a previous episode of acute kidney injury could also increase risk had not previously been investigated.

To address that question the research team analyzed medical records for all women who delivered babies at the MGH between 1998 and 2007 - 105 of whom had a history of recovering from acute kidney injury and 24,640 with no history of kidney disease. Despite having normal results on the standard test for kidney function - the glomerular filtration rate - women with a history of acute kidney injury were more likely to develop preeclampsia (23 percent versus 4 percent) and to have cesarean deliveries (40 percent versus 27 percent). In addition to greater likelihood of being born early, their babies were more likely to be small for their gestational age and to require intensive care treatment.

After adjustment for several factors, a history of acute kidney injury was associated with a 2.4 times greater risk of any adverse fetal outcome and a 5.9 times greater risk of preeclampsia. While the reason behind this increased risk is unclear, it's possible that changes known to take place in small blood vessels within in the kidneys during recovery from acute kidney injury may compromise the organ's ability to cope with the demands of pregnancy. "We know that kidneys undergo major changes during pregnancy, and that sort of 'renal stress test' may reveal previously undetected kidney disease in women with a history of acute kidney injury," says Tangren.

Jeffrey Ecker, MD, chief of Obstetrics and Gynecology at MGH, says, "Information like this helps obstetric providers know what to be vigilant for in pregnant women with a history of acute kidney injury and indicates that asking about such history is important. Being especially watchful for signs and symptoms of preeclampsia in such patients is one immediate application of this work. In a longer view, work like this offers important hypotheses for future study. Can interventions in patients with a history of acute kidney injury prevent complications like preeclampsia? Taking a baby aspirin each day during pregnancy is recommended for some women at high risk for preeclampsia. Should such preventative treatment be used in women with a history of acute kidney injury? Questions like this deserve further thought and study."

Hong Kong Baptist University Details Findings in Clinical Trials and Studies [Tolerability, exposure and pharmacokinetics in healthy subjects of a Chinese herbal medicine MaZiRenWan (MZRW): Study protocol for a randomized open-labelled, ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Research - Clinical Trials and Studies. According to news reporting from Hong Kong, People's Republic of China, by NewsRx journalists, research stated, "The formula of MaZiRenWan (MZRW) has been commonly used in Chinese medicine to treat constipation. Our previous studies have showed benefits in terms of increased bowel movement, relief in the severity of constipation and straining of evacuation when compared with placebo."

The news correspondents obtained a quote from the research from Hong Kong Baptist University, "However, the lack of studies on its safety, tolerability, system exposure and pharmacokinetics making it difficult to obtain a consistent picture of its mechanism of action. This is a randomized, open-labelled, three-arm phase 0/1 clinical trial. After the run-in period, eligible healthy subjects will be randomized assigned in a ratio of 1: 1:1 to receive 5.0 g, 7.5 g, 10 g q.d. of MZRW. The primary outcome will be the number of participants with adverse events as a measurement of safety and tolerability among three doses of MZRW. Secondary outcome will be the clearness of pharmacokinetic parameters of main active ingredients in human sample, include the area under the plasma concentration-time curve (AUC), the peak plasma concentration of an ingredient after administration (C-max), the time to reach Cmax (t (max)), the elimination half-life (t(1/2)) and clearance (CL). Ethics and dissemination: The study was approved by Hong Kong Baptist University Ethics Committee on the Use of Human Subjects for Teaching and Research (Approval no. HASC/13-14/0017) and was registered with an identifier (NCT02359396) in Clinical Trial. gov."

According to the news reporters, the research concluded: "The potential risks incurred by study participants will be reported to the public and the study results will be released to the investigators, patients and the general medical community."

Our news journalists report that additional information may be obtained by contacting L.L.D. Zhong, Hong Kong Baptist University, Hong Kong Chinese Med Clin Study Center, Kowloon Tong, Hong Kong, People's Republic of China. Additional authors for this

IMPORTANT INVESTOR ALERT: Goldberg Law PC Announces an Investigation of Endologix, Inc. and Advises Investors with Losses to Contact the Firm

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Goldberg Law PC, a national shareholder rights litigation firm, announces that it is investigating Endologix, Inc. ("Endologix" or the "Company") (Nasdaq: ELGX) concerning possible violations of federal securities laws.

If you purchased or otherwise acquired Endologix shares and would like more information regarding the investigation, we encourage you to contact Michael Goldberg or Brian Schall, of Goldberg Law PC, 1999 Avenue of the Stars Suite 1100, Los Angeles, CA 90067, at 800-977-7401, to discuss your rights without cost to you. You can also reach us through the firm's website at http://www.Goldberglawpc.com, or by email at info@goldberglawpc.com.

Endologix designs, manufactures and sells medical products intended to treat abdominal aortic aneurysms.

Nellix is used as Endologix's endovascular aneurysm sealing system for infrarenal abdominal aortic aneurysms. Endologix stated that it would approve the initial version of the Nellix system used in the Nellix investigational device exemption (IDE) clinical trial, the EVAS FORWARD-IDE Study.

On November 16, 2016 however, Endologix revealed that the FDA requested a two-year follow-up on patients in the EVAS-FORWARD-IDE study to accurately measure Nellix.

On December 27, 2016 Endologix revealed that it was temporarily holding AFX Endovascular AAA System shipments, due to an investigation of a manufacturing problem.

When this information was released to the public, the value of Endologix fell 20%, causing investors harm.

If you have any questions concerning your legal rights, please immediately contact Goldberg Law PC at 800-977-7401, or visit our website at http://www.Goldberglawpc.com, or email us at info@goldberglawpc.com.

Goldberg Law PC represents shareholders around the world and specializes in securities class actions and shareholder rights litigation.

This press release may be considered Attorney Advertising in some jurisdictions under the applicable law and ethical rules. View source version on businesswire.com: http://www.businesswire.com/news/home/20161227005267/en/
INVESTOR ALERT: Law Offices of Howard G. Smith Commences Investigation on Behalf of Endologix, Inc. Investors

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Law Offices of Howard G. Smith announces an investigation on behalf of investors of Endologix, Inc. ("Endologix" or the "Company") (NASDAQ: ELGX) concerning the Company and its officers' potential violation of federal securities laws.

Endologix develops, manufactures, markets and sells medical devices for the treatment of abdominal aortic aneurysms in the United States and internationally.

Nellix is Endologix's endovascular aneurysm sealing system for infrarenal abdominal aortic aneurysms. On August 2, 2016, Endologix indicated that it would seek approval of the original version of the Nellix system that was used in the Nellix investigational device exemption (IDE) clinical trial, the EVAS FORWARD-IDE Study. However, on November 16, 2016, Endologix disclosed that the FDA had requested a two-year follow-up on patients enrolled in the EVAS-FORWARD-IDE study to accurately evaluate Nellix. On this news, shares of Endologix fell over 20% to close at just $7.82 per share on November 16, 2016.

Then on December 27, 2016 Endologix announced a temporarily hold on AFX Endovascular AAA System shipments, citing the need to complete an investigation of a manufacturing issue with different sizes of the device.

On this news, shares of Endologix have fallen nearly 20% to just $5.76 per share during intra-day trading on December 27, 2016.

If you purchased Endologix securities, have information or would like to learn more about these claims, or have any questions concerning this announcement or your rights or interests with respect to these matters, please contact Howard G. Smith, Esquire, of Law Offices of Howard G. Smith, 3070 Bristol Pike, Suite 112, Bensalem, Pennsylvania 19020 by telephone at (215) 638-4847, toll-free at (888) 638-4847, or by email to howardsmith@howardsmithlaw.com, or visit our website at www.howardsmithlaw.com.

**Imperial College Details Findings in Chronic Obstructive Pulmonary Disease (Angiotensin-Converting Enzyme Inhibition as an Adjunct to Pulmonary Rehabilitation in Chronic Obstructive Pulmonary Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Lung Diseases and Conditions - Chronic Obstructive Pulmonary Disease is the subject of a report. According to news originating from London, United Kingdom, by NewsRx correspondents, research stated, "Epidemiological studies in older individuals have found an association between the use of angiotensin-converting enzyme (ACE) inhibition (ACE-I) therapy and preserved locomotor muscle mass, strength, and walking speed. ACE-I therapy might therefore have a role in the context of pulmonary rehabilitation (PR)."

Our news journalists obtained a quote from the research from Imperial College, "To investigate the hypothesis that enalapril, an ACE inhibitor, would augment the improvement in exercise capacity seen during PR. We performed a double-blind, placebo-controlled, parallel-group randomized controlled trial. Patients with chronic obstructive pulmonary disease, who had at least moderate airflow obstruction and were taking part in PR, were randomized to either 10 weeks of therapy with an ACE inhibitor (10 mg enalapril) or placebo. The primary outcome measurement was the change in peak power (assessed using cycle ergometry) from baseline. Eighty patients were enrolled, 78 were randomized (age 67 +/- 8 years; FEV1 48 +/- 21% predicted), and 65 completed the trial (34 on placebo, 31 on the ACE inhibitor). The ACE inhibitor-treated group demonstrated a significant reduction in systolic blood pressure (Delta, -16 mm Hg; 95% confidence interval [CI], -22 to -11) and serum ACE activity (Delta, -18 IU/L; 95% CI, -23 to -12) versus placebo (between-group differences, P< 0.0001). Peak power increased significantly more in the placebo group (placebo Delta, +9 W; 95% CI, 5 to 13 vs. ACE-I Delta, + 1 W; 95% CI, -2 to 4; between-group difference, 8 W; 95% CI, 3 to 13; P = 0.001). There was no significant between group difference in quadriceps strength or health-related quality of life."

According to the news editors, the research concluded: "Use of the ACE inhibitor enalapril, together with a program of PR, in patients without an established indication for ACE-I, reduced the peak work rate response to exercise training in patients with chronic obstructive pulmonary disease."

The news correspondents report that additional information may be obtained from N.S. Hopkinson, Imperial College, London, United Kingdom. Additional authors for this research include V.M. Meyrick, B. Mehta, G.S. Haji, K. Li, H. Montgomery, W.D.C. Man, M.I. Polkey and N.S. Hopkinson.

Indiana University School of Medicine Reports Findings in Esterases (Identification and Characterization of New Chemical Entities Targeting Apurinic/Apyrimidinic Endonuclease 1 for the Prevention of Chemotherapy-Induced Peripheral Neuropathies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Enzymes and Coenzymes - Esterases are discussed in a new report. According to news reporting originating in Indianapolis, Indiana, by NewsRx journalists, research stated, "Chemotherapy-induced peripheral neuropathy (CIPN) is a potentially debilitating side effect of a number of chemotherapeutic agents. There are currently no U.S."

The news reporters obtained a quote from the research from the Indiana University School of Medicine, "Food and Drug Administration-approved interventions or prevention strategies for CIPN. Although the cellular mechanisms mediating CIPN remain to be determined, several lines of evidence support the notion that DNA damage caused by anticancer therapies could contribute to the neuropathy. DNA damage in sensory neurons after chemotherapy correlates with symptoms of CIPN. Augmenting apurinic/apyrimidinic endonuclease (APE)-1 function in the base excision repair pathway reverses this damage and the neurotoxicity caused by anticancer therapies. This neuronal protection is accomplished by either overexpressing APE1 or by using a first-generation targeted APE1 small molecule, E3330 [(2E)-2-[(4,5-dimethoxy-2-methyl-3,6-dioxo-1,4-cyclohexadien-1yl) methylene]-undecanoic acid; also called APX3330]. Although E3330 has been approved for phase 1 clinical trials (Investigational New Drug application number IND125360), we synthesized novel, second-generation APE1-targeted molecules and determined whether they would be protective against neurotoxicity induced by cisplatin or oxaliplatin while not diminishing the platin's antitumor effect. We measured various endpoints of neurotoxicity using our ex vivo model of sensory neurons in culture, and we determined that APX2009 [(2E)-2-[(3-methoxy-1,4-dioxo-1,4-dihydonaphthalen-2-yl) methylidene]N, N-diethylpentanamide] is an effective small molecule that is neuroprotective against cisplatin and oxaliplatin-induced toxicity. APX2009 also demonstrated a strong tumor cell killing effect in tumor cells and the enhanced tumor cell killing was further substantiated in a more robust three-dimensional pancreatic tumor model."

According to the news reporters, the research concluded: "Together, these data suggest that the second-generation compound APX2009 is effective in preventing or reversing platinum-induced CIPN while not affecting the anticancer activity of platin."

Our news correspondents report that additional information may be obtained by
contacting M.R. Kelley, Indiana Univ Sch Med, Dept. of Pharmacol & Toxicol, Indianapolis, IN 46202, United States. Additional authors for this research include J.H. Wikel, C.L. Guo, K.E. Pollok, B.J. Bailey, R. Wireman, M.L. Fishel and M.R. Vasko.

Keywords for this news article include: Indianapolis, Indiana, United States, North and Central America, Enzymes and Coenzymes, Endonucleases, Esterases, Indiana University School of Medicine.

Clinical Research - Clinical Trials and Studies

Institute for Cardiovascular Research Reports Findings in Clinical Trials and Studies [Phosphate Binding Therapy to Lower Serum Fibroblast-Growth-Factor-23 Concentrations in Chronic Kidney Disease: Rationale and Study Design of the Sevelamer on ...]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Clinical Research - Clinical Trials and Studies. According to news reporting out of Amsterdam, Netherlands, by NewsRx editors, research stated, "Increased levels of phosphate and fibroblast growth factor-23 (FGF23) are strong predictors of cardiovascular morbidity and mortality in patients with chronic kidney disease (CKD)."

Our news journalists obtained a quote from the research from Institute for Cardiovascular Research, "Preliminary data suggest that interventions lowering gastro-intestinal phosphate uptake lowers serum FGF23 concentrations and improves cardiovascular risk and subsequently survival. However, data are lacking about the magnitude of effects, the effect in different stages of CKD and whether there is a dose effect relationship."

According to the news editors, the research concluded: "Therefore, the Sevelamer on FGF23 Trial (SoFT) is designed as an open-label, single-arm, clinical pilot study aiming to demonstrate the feasibility of a phosphate-restricted diet in combination with the phosphate binder sevelamer to induce an effective, predictable and sustained decrease in FGF23 level in patients with an estimated glomerular filtration rate (eGFR) of 15-90 or >90 ml/min/1.73 m(2) with proteinuria >1.0 g in 24 h urine collection, despite optimally dosed RAAS blockade, without inducing hypophosphatemia using a forced uptitration treatment regimen aimed at restricting phosphate uptake."

Our news journalists report that additional information may be obtained by contacting M.G. Vervloet, Inst Cardiovasc Res VU ICar VU, Amsterdam, Netherlands. Additional authors for this research include M.A. de Jong, M.H. de Borst, P.M. ter Wee and M.G. Vervloet.

Lung Diseases and Conditions - Asthma

Interleukin-1α causes people to choke on air

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Scientists at the Immunology Frontier Research Center (IFReC) at Osaka University, Japan have pinpointed a specific molecular events that could explain allergic reactions to air pollution. These findings provide a new therapeutic candidate to treat asthma and related respiratory diseases.

Photos of cities darkened by pollution are becoming evermore common. These same cities are seeing a rise in cases of asthma and other respiratory ailments, marking a relationship between pollution and health costs. Nanosopic particulates polluting the air enter the lungs to cause the allergic reactions. Which immune-related events in the lung lead to this response, however, are unclear.

"We found that particulates kill macrophages, which then go on to release interleukin-1α (IL-1α)", explains Etsushi Kuroda, who first-authored a new study in Immunity that indicates IL-1α triggers a series of events that causes respiratory illnesses. The release of IL-1α in mice primed the lungs for inflammation when the mice were later exposed to an allergen. Kuroda added, "Particulates that did not kill macrophages did not cause an allergic reaction."

However, the vulnerability of macrophages to particulates remains unclear, which is why understanding the events following IL-1α secretion may be key to prevention and treatment.

"IL-1α secretion was followed by the formation of iBALTs. iBALTs are frequently found in infected or inflamed lungs and in patients with asthma," said Osaka University Professor Ken J. Ishii, who led the study. The increase in iBALTs led to an increase in IgE antibodies, which intensified the immune response. On the other hand, mutant mice that were insensitive to IL-1α did not produce iBALTs and reduced IgE responses.

The presence of iBALTs would suggest that a human population could remain susceptible to high levels of asthma attacks even on clear days, as the iBALTs could form on days of high pollution, but the patient could then be exposed to the allergen much later.

This finding suggested that iBALTs could prime the lungs to an allergic reaction, which is why Ishii believes that iBALTs could make a promising therapeutic target to combat the rise of respiratory illnesses associated with air pollution. But first, he said, "we must identify the molecular signals and key chemicals that form these iBALTs."

Lung Diseases and Conditions - Pulmonary Embolism

Investigators at A.T. Still University of Health Sciences Report Findings in Pulmonary Embolism [Pulseless electrical activity in pulmonary embolism treated with thrombolysis (from the "PEAPETT" study)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Lung Diseases and Conditions - Pulmonary Embolism. According to news reporting originating in Mesa, Arizona, by NewsRx journalists, research stated, "Pulseless electrical activity (PEA) during cardiac arrest portends a poor prognosis. There is a paucity of data in the use of thrombolytic therapy in PEA and cardiopulmonary arrest due to confirmed pulmonary embolism (PE)."

The news reporters obtained a quote from the research from the A.T. Still University of Health Sciences, "We evaluated the outcome of low-dose systemic thrombolysis with tissue plasminogen activator (tPA) in patients presenting with PEA due to PE. During a 34-month period, we treated 23 patients with PEA and cardiopulmonary arrest due to confirmed massive PE. All patients received 50 mg of tPA as intravenous push in 1 minute while cardiopulmonary resuscitation was ongoing. The time from initiation of cardiopulmonary resuscitation to administration of tPA was 6.5 +/- 2.1 minutes. Return of spontaneous circulation occurred in 2 to 15 minutes after tPA administration in all but 1 patient. There was no minor or major bleeding despite chest compression. Of the 23 patients, 2 died in the hospital, and at 22 +/- 3 months of follow-up, 20 patients (87%) were still alive. The right ventricular/left ventricular ratio and pulmonary artery systolic pressure dropped from 1.79 +/- 0.27 and 58.10 +/- 7.99 mm Hg on admission to 1.16 +/- 0.13 and 40.25 +/- 4.33 mm Hg within 48 hours, respectively (P <.001 for both comparisons). There was no recurrent venous thromboembolism or bleeding during hospitalization or at follow-up."

According to the news reporters, the research concluded: "Rapid administration of 50 mg of tPA is safe and effective in restoration of spontaneous circulation in PEA due to massive PE leading to enhanced survival and significant reduction in pulmonary artery pressures."

Our news correspondents report that additional information may be obtained by contacting M. Sharifi, AT Still Univ, Mesa, AZ, United States. Additional authors for this research include J. Berger, P. Beeston, C. Bay, Z. Vajo and S. Javadpoor.

Gram-Positive Bacteria - Corynebacterium glutamicum

Investigators at Academy of Sciences Detail Findings in Corynebacterium glutamicum (Stereospecificity of Corynebacterium glutamicum 2,3-butanediol dehydrogenase and implications for the stereochemical purity of bioproduced 2,3-butanediol)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Gram-Positive Bacteria - Corynebacterium glutamicum. According to news originating from Lisbon, Portugal, by NewsRx correspondents, research stated, "The stereochemistry of 2,3-butanediol (2,3-BD) synthesis in microbial fermentations is important for many applications. In this work, we showed that Corynebacterium glutamicum endowed with the Lactococcus lactis genes encoding alpha-acetolactate synthase and decarboxylase activities produced meso-2,3-BD as the major end product, meaning that β-acetoin is a substrate for endogenous 2,3-butanediol dehydrogenase (BDH) activity."

Financial support for this research came from Fundacao para a Ciencia e a Tecnologia FCT.

Our news journalists obtained a quote from the research from the Academy of Sciences, "This is curious in view of the reported absolute stereospecificity of C. glutamicum BDH for (S)-acetoin (Takusagawa et al. Biosc Biotechnol Biochem 65:1876-1878, 2001). To resolve this discrepancy, the enzyme encoded by butA (Cg) was produced in Escherichia coli and purified, and the stereospecific properties of the pure protein were examined. Activity assays monitored online by H-1-NMR using racemic acetoin and an excess of NADH showed an initial, fast production of (2S,3S)-2,3-BD, followed by a slow (similar to 20-fold lower apparent rate) formation of meso-2,3-BD. Kinetic parameters for (S)-acetoin, β-acetoin, meso-2,3-BD and (2S,3S)-BD were determined by spectrophotometric assays."

According to the news editors, the research concluded: "V (max) values for (S)-acetoin and β-acetoin were 119 +/- 15 and 5.23 +/- 0.06 mu mol min(-1) mg protein(-1), and K (m) values were 0.23 +/- 0.02 and 1.49 +/- 0.07 mM, respectively. C. glutamicum BDH is not absolutely specific for (S)-acetoin, though this is the preferred substrate. Importantly, the low activity of BDH with β-acetoin was sufficient to support high yields of meso-2,3-BD in the engineered strain C. glutamicum Delta aceE Delta pko Delta ldhA(pEKEx2-als,aldB,butA (Cg)). Additionally, we found that the BDH activity was nearly abolished upon inactivation of butA (Cg) (from 0.30 +/- 0.03 to 0.004 +/- 0.001 mu mol min(-1) mg protein(-1)), indicating that C. glutamicum expresses a single BDH under the experimental conditions examined."

For more information on this research see: Stereospecificity of Corynebacterium glutamicum 2,3-butanediol dehydrogenase and implications for the stereochemical purity of bioproduced 2,3-butanediol. Investigators at Addenbrooke's Hospital Report Findings in Blood Cells (The Allelic Landscape of Human Blood Cell Trait Variation and Links to Common Complex Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cell Research - Blood Cells is now available. According to news originating from Cambridge, United Kingdom, by NewsRx correspondents, research stated, "Many common variants have been associated with hematological traits, but identification of causal genes and pathways has proven challenging. We performed a genome-wide association analysis in the UK Biobank and INTERVAL studies, testing 29.5 million genetic variants for association with 36 red cell, white cell, and platelet properties in 173,480 European-ancestry participants."

Funders for this research include NHS Health Education England, BLUEPRINT Grant Code, BHF Cambridge Centre of Excellence, MRC CASE Industrial, Pfizer, British Heart Foundation, European Research Council, National Institute for Health Research, NIHR BioResource-Rare Diseases, NIHR, European Commission, Bristol Myers-Squibb, NHSBT, UK Medical Research Council, BHF, Cambridge Biomedical Research Centre, European Commission Framework Programme 7, Merck, Wellcome Trust, EU FP7, NIHR-BTRU, "la Caixa".

Our news journalists obtained a quote from the research from Addenbrooke's Hospital, "This effort yielded hundreds of low frequency (<5%) and rare (<1%) variants with a strong impact on blood cell phenotypes. Our data highlight general properties of the allelic architecture of complex traits, including the proportion of the heritable component of each blood trait explained by the polygenic signal across different genome regulatory domains."

According to the news editors, the research concluded: "Finally, through Mendelian randomization, we provide evidence of shared genetic pathways linking blood cell indices with complex pathologies, including autoimmune diseases, schizophrenia, and coronary heart disease and evidence suggesting previously reported population associations between blood cell indices and cardiovascular disease may be non-causal."

The news correspondents report that additional information may be obtained from J. Danesh, Addenbrookes Hospital, Div Cardiovasc Med, British Heart Fdn Center Excellence,

Oncology - Osteosarcomas

Investigators at Albert Einstein College of Medicine Report Findings in Osteosarcomas [Targeted therapy of osteosarcoma with radiolabeled monoclonal antibody to an insulin-like growth factor-2 receptor (IGF2R)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Osteosarcomas have been published. According to news reporting from Bronx, New York, by NewsRx journalists, research stated, "Osteosarcoma overall survival has plateaued around 70%, without meaningful improvements in over 30 years. Outcomes for patients with overt metastatic disease at presentation or who relapse are dismal."

The news correspondents obtained a quote from the research from the Albert Einstein College of Medicine, "In this study we investigated a novel osteosarcoma therapy utilizing radioimmunotherapy (RIT) targeted to IGF2R, which is widely expressed in OS. Binding efficiency of the Rhenium-(188)(Re-188)-labeled IGF2R-specific monoclonal antibody (mAb) to IGF2R on OS17 OS cells was assessed with Scatchard plot analysis. Biodistribution studies were performed in heterotopic murine osteosarcoma xenografts. Tumor growth was compared over a 24-day period post-treatment between mice randomized to receive Re-188-labeled IGF2R-specific murine mAb MEM-238 (Re-188-MEM-238) or one of three controls: Re-188-labeled isotype control mAb, unlabeled MEM-238, or no treatment. Results demonstrate that the radioimmunoconjugate had a high binding constant to IGF2R. Both Re-188-MEM-238 and the isotype control had similar initial distribution in normal tissue. After 48 h Re-588-MEM-238 exhibited a 1.8 fold selective uptake within tumor compared to the isotype control (p = 0.057). Over 24 days, the tumor growth ratio was suppressed in animals treated with RIT compared to unlabeled and untreated controls (p = 0.005) as demonstrated by a 38% reduction of IGF2R expressing osteosarcoma cells in the RIT group (p = 0.002). In conclusion, given the lack of new effective therapies in osteosarcoma, additional investigation into this target is warranted. Advances in knowledge: High expression of IGF2R on osteosarcoma tumors, paired with the specificity and in vivo anti-cancer activity of Re-188-labeled IGF2R-specific mAb suggests that IGF2R may represent a novel therapeutic target in the treatment of osteosarcoma."

According to the news reporters, the research concluded: "Implications for patient care: This targeted approach offers the benefits of being independent of a specific pathway, a resistance mechanism, and/or an inherent biologic tumor trait and therefore is relevant to all OS tumors that express IGF2R."

Our news journalists report that additional information may be obtained by contacting D.S. Geller, Albert Einstein College of Medicine, Bronx, NY 10467, United States. Additional authors for this research include J. Morris, E. Revskaya, M. Kahn, W. Zhang, S. Piperdi, A. Park, P. Koirala, H. Guzik, C. Hall, B. Hoang, R. Yang, M. Roth, J. Gill, R. Gorlick and E. Dadachova.

**Oncology - Thyroid Cancer**

**Investigators at Allegheny General Hospital Describe Findings in Thyroid Cancer (Lymphocytic Thyroiditis Is Associated With Increased Number Of Benign Cervical Nodes And Fewer Central Neck Compartment Metastatic Lymph Nodes In Patients With ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Oncology - Thyroid Cancer is now available. According to news originating from Pittsburgh, Pennsylvania, by NewsRx correspondents, research stated, "Whether or not autoimmune thyroid disease influences the progression of differentiated thyroid cancer (DTC) remains controversial. Findings of previous studies are influenced by lead time bias and/or procedure bias selection."

Our news journalists obtained a quote from the research from Allegheny General Hospital, "These biases can be reduced by studying a single-institution patient population that underwent a similar extent of surgical resection. From a cohort of 660 patients with DTC who underwent thyroidectomy, we retrospectively studied 357 patients who underwent total thyroidectomy and central compartment node dissection (CCND) for DTC between 2003 and 2013. Forty-one percent (140/345) of study patients had lymphocytic thyroiditis (IT), and 30% (91/301) had serum positive for thyroglobulin antibody (TgAb). IT was reported in 78% of the TgAb-positive cases. Sixty percent (213/357) of cases had metastatic thyroid carcinoma in 1 or more neck lymph nodes (55% [198/357] central compartment, and 22% [77/356] lateral compartment). Patients with IT had fewer metastatic cervical lymph nodes than those with no LT (2.7 +/- 4.7 vs 3.5 +/- 4.8, respectively, P = .0285). Patients with positive TgAb and thyroiditis had a larger number of benign cervical lymph nodes removed than those with negative TgAb or no LT No significant difference was observed in age, tumor size,
multifocality, extrathyroidal extension, vascular invasion, or frequency of cervical lymph node metastasis between TgAb-negative and -positive cases or between cases with and without LT. Lymphocytic thyroiditis is associated with fewer central neck compartment metastatic lymph nodes and a larger number of excised reactive benign cervical lymph nodes."

According to the news editors, the research concluded: "Whether this association indicates a protective role of thyroid autoimmunity in lymph node spreading remains unclear."

For more information on this research see: Lymphocytic Thyroiditis Is Associated With Increased Number Of Benign Cervical Nodes And Fewer Central Neck Compartment Metastatic Lymph Nodes In Patients With Differentiated Thyroid Cancer. *Endocrine Practice*, 2016;22(10):1192-1198. *Endocrine Practice* can be contacted at: Amer Assoc Clinical Endocrinologists, 245 Riverside Avenue, Ste 200, Jacksonville, FL 32202, USA.

The news correspondents report that additional information may be obtained from I. Donangelo, Allegheny Gen Hosp, Allegheny Hlth Network, Div Endocrinol, Pittsburgh, PA 15212, United States. Additional authors for this research include A.E. Walts, C. Bresee and G.D. Braunstein.

**Oncology - Pancreatic Cancer**

**Investigators at Asia University Report Findings in Pancreatic Cancer (Oncogenic Functions of Gli1 in Pancreatic Adenocarcinoma Are Supported by Its PRMT1-Mediated Methylation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Pancreatic Cancer. According to news reporting out of Taichung, Taiwan, by NewsRx editors, research stated, "The oncogenic transcription factor Gli1 is a critical effector in the Hedgehog (Hh) pathway, which is necessary for the development and progression of pancreatic ductal adenocarcinoma (PDAC). Although TGF beta and K-Ras are known regulators of Gli1 gene transcription in this setting, it is not understood how Gli1 functional activity is regulated." Our news journalists obtained a quote from the research from Asia University, "Here, we report the identification of Gli1 as a substrate for the protein arginine N-methyltransferase PRMT1 in PDAC. We found that PRMT1 methylates Gli1 at R597, promoting its transcriptional activity by enhancing the binding of Gli1 to its target gene promoters. Interruption of Gli1 methylation attenuates oncogenic functions of Gli1 and sensitizes PDAC cells to gemcitabine treatment. In human PDAC specimens, the levels of both total Gli1 and methylated Gli1 were correlated positively with PRMT1 protein levels. Notably, PRMT1 regulated Gli1 independently of the canonical Hh pathway as well as the TGF beta/Kras-
mediated noncanonical Hh pathway, thereby signifying a novel regulatory mechanism for Gli1 transcriptional activity."

According to the news editors, the research concluded: "Taken together, our results identified a new posttranslational modification of Gli1 that underlies its pivotal oncogenic functions in PDAC."

For more information on this research see: Oncogenic Functions of Gli1 in Pancreatic Adenocarcinoma Are Supported by Its PRMT1-Mediated Methylation. Cancer Research, 2016;76(23):7049-7058. Pharmacology

Investigators at Assam University Target Pharmacology (Cicca acida L.: phytochemistry and pharmacological studies)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacology have been presented. According to news reporting originating from Silchar, India, by NewsRx correspondents, research stated, "Cicca acida L., is reported with traditional and pharmacological uses, and a good number of pure compounds have been isolated from its different parts. But published information is sporadic and fragmentary in nature."

Our news editors obtained a quote from the research from Assam University, "Therefore, it is imperative to have a comprehensive account of all of its medicinal potentialities with critical analysis. In this review, the traditional reports, phytochemical and pharmacology studies associated with Cicca acida have been compiled to figure out the net possibilities for its application in modern medicine. Careful scrutiny reveals that the plant possesses a huge range of medicinal properties, but published report analysis suggests that the plant is effectively used as antibacterial, hepatoprotective, anticonceptive and antidiabetic purposes. The published papers revealed the bioactivity of only 04 compounds. This indicates that a good number of isolated major compounds of this plant are yet to be pharmacologically investigated. Intensive study of Cicca acida showed that despite of its plentiful isolated molecules, the effort leading to final product stage seems to be less."

According to the news editors, the research concluded: "Therefore, the plant and its
compounds need concentrated effort towards establishment of its therapeutic potentialities."

The news editors report that additional information may be obtained by contacting R. Ghosh Tarafdar, Ethnobotany and Medicinal Plants Research Laboratory, Dept. of Life Science and Bioinformatics, Assam University, Silchar, India. Additional authors for this research include S. Nath, A. Das Talukdar and M. Dutta Choudhury.

**Heart Disorders and Diseases - Ventricular Tachycardia**

**Investigators at Baylor University College of Medicine Have Reported New Data on Ventricular Tachycardia (Safety and Feasibility of Open Chest Epicardial Mapping and Ablation of Ventricular Tachycardia During the Period of Left Ventricular ...)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Ventricular Tachycardia have been published. According to news originating from Houston, Texas, by NewsRx correspondents, research stated, "Patients undergoing catheter ablation for ventricular tachycardia (VT) may require epicardial mapping. In patients with end-stage heart failure, hybrid surgical epicardial mapping and ablation during the period of left ventricular assist device (LVAD) implantation may be considered in select patients to reduce post-LVAD ventricular tachycardia."

Our news journalists obtained a quote from the research from the Baylor University College of Medicine, "From March 2009 to October 2012, 5 patients (4 men and 1 woman, age range 52-73 years) underwent open chest electrophysiology study and epicardial mapping for recurrent ventricular tachycardia while the heart was exposed during the period of LVAD implantation. Epicardial mapping was considered if patients had recurrent VT despite failed prior endocardial ablation and/or electrocardiogram (EKG) features of an epicardial exit. Activation and/or a substrate mapping approach were employed during all procedures. Three of 5 patients (60%) had acute procedural success. In all patients, VT was either eliminated or significantly reduced with epicardial ablation. One patient had mediastinal bleeding delaying sternal closure. During a follow-up period of 363 ? 368 days, 4 patients died due to nonarrhythmic causes."

According to the news editors, the research concluded: "Open-chest hybrid epicardial mapping and ablation for recurrent VT is feasible and can be considered in select patients during the period of LVAD implantation."

For more information on this research see: Safety and Feasibility of Open Chest Epicardial Mapping and Ablation of Ventricular Tachycardia During the Period of Left Ventricular Assist Device Implantation. *Journal of Cardiovascular Electrophysiology*, 2015;27
Investigators at Baylor University College of Medicine Report Findings in Immunoglobulins (Coming-of-Age of Antibodies in Cancer Therapeutics)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Immunology - Immunoglobulins are presented in a new report. According to news reporting from Houston, Texas, by NewsRx journalists, research stated, "Antibody-based therapies have garnered considerable success in recent years. This is due to the availability of strategies to successfully engineer antibodies into humanized forms, better understanding of the biological processes involved in cancer development, the availability of novel recombinant antibody formats, better antibody selection platforms, and improved antibody conjugation methodologies."

The news correspondents obtained a quote from the research from the Baylor University College of Medicine, "Such achievements have led to an explosion in the generation of antibodies and antibody-associated constructs for the treatment of cancer and other diseases. In this review, we critically assess recent trends in the development and applications of bispecific antibodies (bsAbs), antibody drug conjugates (ADCs), and immune checkpoint inhibitors (ICIs) as cancer therapeutics."

According to the news reporters, the research concluded: "We also highlight recent US FDA approvals and clinical trials of antibody-based cancer therapies."

Our news journalists report that additional information may be obtained by
contacting B.V. Ayyar, Baylor College of Medicine, Dept. of Biochem & Mol Biol, Houston, TX 77030, United States. Additional authors for this research include S. Arora and R. O’Kennedy.

Drugs and Therapies - Pharmacology

Investigators at Beijing Institute of Pharmacology and Toxicology Detail Findings in Pharmacology (Allosteric activation of midazolam CYP3A5 hydroxylase activity by icotinib - Enhancement by ketoconazole)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Drugs and Therapies - Pharmacology. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Icotinib (ICO), a novel small molecule and a tyrosine kinase inhibitor, was developed and approved recently in China for non-small cell lung cancer. During screening for CYP inhibition potential in human liver microsomes (HLM), heterotropic activation toward CYP3A5 was revealed."

The news reporters obtained a quote from the research from the Beijing Institute of Pharmacology and Toxicology, "Activation by icotinib was observed with CYP3A-mediated midazolam hydroxylase activity in HLM (similar to 40% over the baseline) or recombinant human CYP3A5 (rhCYP3A5) (similar to 70% over the baseline), but not in the other major CYPs including rhCYP3A4. When co-incubated with selective CYP3A4 inhibitor CYP3cide or monoclonal human CYP3A4 inhibitory antibody in HLM, the activation was extended to similar to 60%, suggesting CYP3A5 might be the isozyme involved. Further, the relative activation was enhanced to similar to 270% in rhCYP3A5 in the presence of ketoconazole. The activation was substrate and pathway dependent and observed only in the formation of 1'-OH-midazolam, and not 4-OH-midazolam, 6p-OH-testosterone, or oxidized nifedipine. The activation requires the presence of cytochrome b5 and it is only observed in the liver microsomes of dogs, monkeys, and humans, but not in rats and mice. Kinetic analyses of 1'-OH-midazolam formation showed that ICO increased the V-max values in HLM and rhCYP3A5 with no significant changes in K-m values. By adding CYP3cide with ICO to the incubation, the V, values increased 2-fold over the CYP3cide control. Addition of ketoconazole with ICO alone or ICO plus CYP3cide resulted in an increase in V-max values and decrease in K-m values compared to their controls."

According to the news reporters, the research concluded: "This phenomenon may be attributed to a new mechanism of CYP3A5 heterotropic activation, which warrants further investigation."

For more information on this research see: Allosteric activation of midazolam CYP3A5 hydroxylase activity by icotinib - Enhancement by ketoconazole. Biochemical Pharmacology, 2016;121():67-77. Biochemical Pharmacology can be contacted at: Pergamon-
Investigators at Beijing University of Chinese Medicine Zero in on Metabolic Syndrome [Panax notoginseng saponins ameliorate impaired arterial vasodilation in SHRSP.Z-Lepr(fa) /IzmDmcr rats with metabolic syndrome]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Metabolic Syndrome have been published. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "Panax notoginseng saponins (PNS) are major components of Panax notoginseng, a herb with established clinical efficacy against vascular diseases. SHRSP.Z-Lepr(fa) /IzmDmcr (SHRSP.ZF) rats, a new animal model for metabolic syndrome, display an impaired vasorelaxation response in aortas and mesenteric arteries that is mediated by nitric oxide (NO)."

Our news journalists obtained a quote from the research from the Beijing University of Chinese Medicine, "This study investigated whether PNS and its components can ameliorate this vascular dysfunction in SHRSP.ZF rats. In an in vitro study, in the presence or absence of PNS and its components, vasodilation in response to nitroprusside was determined from myographs under isometric tension conditions in aortas and mesenteric arteries from male SHRSP.ZF rats at 18-20 weeks of age. In an in vivo study, PNS (30 mg/kg per day) was orally administered to SHRSP.ZF rats from 8 to 20 weeks of age. In vitro treatment with PNS and Ginsenoside Rb1 increased nitroprusside-induced relaxation of aortas and mesenteric arteries in SHRSP.ZF rats. The PNS-induced increase was not affected by a nitric oxide (NO) synthase inhibitor or endothelium denudation. Relaxation in response to a cell-permeable cGMP analogue was increased by PNS, but cGMP accumulation by nitroprusside was not altered. In vivo treatment with PNS in SHRSP.ZF rats lowered blood pressure and increased relaxation and the expression of soluble guanylyl cyclase protein in arteries, without affecting metabolic abnormalities. These results indicate that PNS causes an increase in vasodilation in response to NO and a decrease in blood pressure, resulting in protection against vascular dysfunction in SHRSP.ZF rats."

According to the news editors, the research concluded: "PNS might be beneficial in alleviating impaired vasodilation in metabolic syndrome."

The news correspondents report that additional information may be obtained from T. Wu, School of Chinese Materia Medica, Beijing University of Chinese Medicine, Beijing, People's Republic of China. Additional authors for this research include J. Sun, S. Kagota, K. Maruyama, H. Wakuda and K. Shinozuka.

Inflammation

Investigators at Brigham Young University Describe Findings in Inflammation (Up-Regulation of Claudin-6 in the Distal Lung Impacts Secondhand Smoke-Induced Inflammation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Inflammation. According to news reporting out of Provo, Utah, by NewsRx editors, research stated, "It has long been understood that increased epithelial permeability contributes to inflammation observed in many respiratory diseases. Recently, evidence has revealed that environmental exposure to noxious material such as cigarette smoke reduces tight junction barrier integrity, thus enhancing inflammatory conditions."

Our news journalists obtained a quote from the research from Brigham Young University, "Claudin-6 (Cldn6) is a tetraspanin transmembrane protein found within the tight junctional complex and is implicated in maintaining lung epithelial barriers. To test the hypothesis that increased Cldn6 ameliorates inflammation at the respiratory barrier, we utilized the Tet-On inducible transgenic system to conditionally over-express Cldn6 in the distal lung. Cldn6 transgenic (TG) and control mice were continuously provided doxycycline from postnatal day (PN) 30 until euthanasia date at PN90. A subset of Cldn6 TG and control mice were also subjected to daily secondhand tobacco smoke (SHS) via a nose only inhalation system from PN30-90 and compared to room air (RA) controls. Animals were euthanized on PN90 and lungs were harvested for histological and molecular characterization. Bronchoalveolar lavage fluid (BALF) was procured for the assessment of inflammatory cells and molecules. Quantitative RT-PCR and immunoblotting revealed increased Cldn6 expression in TG vs. control animals and SHS decreased Cldn6 expression regardless of genetic up-regulation. Histological evaluations revealed no adverse pulmonary remodeling via Hematoxylin and Eosin (H&E) staining or any qualitative alterations in the abundance of type II pneumocytes or proximal non-ciliated epithelial cells via staining for cell specific propeptide of Surfactant Protein-C (proSP-C) or Club Cell Secretory Protein (CCSP), respectively. Immunoblotting and qRT-PCR confirmed the
differential expression of Cldn6 and the pro-inflammatory cytokines TNF-alpha and IL-1 beta. As a general theme, inflammation induced by SHS exposure was influenced by the availability of Cldn6. These data reveal captivating information suggesting a role for Cldn6 in lungs exposed to tobacco smoke."

According to the news editors, the research concluded: "Further research is critically necessary in order to fully explain roles for tight junctional components such as Cldn6 and other related molecules in lungs coping with exposure."

For more information on this research see: Up-Regulation of Claudin-6 in the Distal Lung Impacts Secondhand Smoke-Induced Inflammation. *International Journal of Environmental Research and Public Health*, 2016;13(10):1131-1142. *International Journal of Environmental Research and Public Health* can be contacted at: Mdp Ag, St Alban-Anlage 66, Ch-4052 Basel, Switzerland.

**Cardiology**

**Investigators at Bristol-Myers Squibb Detail Findings in Cardiology (Evaluation of microRNAs-208 and 133a/b as differential biomarkers of acute cardiac and skeletal muscle toxicity in rats)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cardiology are presented in a new report. According to news reporting originating in New Brunswick, New Jersey, by NewsRx journalists, research stated, "Conventional circulating biomarkers of cardiac and skeletal muscle (SKM) toxicity lack specificity and/or have a short half-life. MicroRNAs (miRNAs) are currently being assessed as biomarkers of tissue injury based on their long half-life in blood and selective expression in certain tissues."

The news reporters obtained a quote from the research from Bristol-Myers Squibb, "To assess the utility of miRNAs as biomarkers of cardiac and SKM injury, male Sprague-Dawley rats received a single dose of isoproterenol (ISO); metaproterenol (MET); allylamine (MM); mitoxantrone (MIT); acetaminophen (APAP) or vehicle. Blood and tissues were collected from rats in each group at 4, 24 and 48 h. ISO, MET, and AAM induced cardiac and SKM lesions and APAP induced liver specific lesions. There was no evidence of tissue injury with MIT by histopathology. Serum levels of candidate miRNAs were compared to conventional serum biomarkers of SHIM/cardiac toxicity. Increases in heart specific miR-208 only occurred in rats with cardiac lesions alone and were increased for a longer duration than cardiac troponin and FABP3 (cardiac biomarkers). ISO, MET and MM induced increases in Myl3 and skeletal muscle troponin (sTnl) (SKM biomarkers). MIT induced large increases in sTnl indicative of SICM toxicity, but sTnl levels were also increased in APAP-treated rats that
lacked SKM toxicity. Serum levels of miR-133a/b (enriched in cardiac and SKM) increased following ISO, MET, AAM and MIT treatments but were absent in APAP-treated rats."

According to the news reporters, the research concluded: "Our results suggest that miR-133a/b are sensitive and specific markers of SKM and cardiac toxicity and that miR-208 used in combination with miR-133a/b can be used to differentiate cardiac from SKM toxicity."

For more information on this research see: Evaluation of microRNAs-208 and 133a/b as differential biomarkers of acute cardiac and skeletal muscle toxicity in rats. Toxicology and Applied Pharmacology, 2016;312(1):53-60. Heart Disorders and Diseases - Heart Disease

Investigators at Broad Institute of MIT and Harvard Detail Findings in Heart Disease (Genetic Risk, Adherence to a Healthy Lifestyle, and Coronary Disease)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Heart Disorders and Diseases - Heart Disease are discussed in a new report. According to news reporting originating from Cambridge, Massachusetts, by NewsRx correspondents, research stated, "Both genetic and lifestyle factors contribute to individual-level risk of coronary artery disease. The extent to which increased genetic risk can be offset by a healthy lifestyle is unknown."

Our news editors obtained a quote from the research from the Broad Institute of MIT and Harvard, "Using a polygenic score of DNA sequence polymorphisms, we quantified genetic risk for coronary artery disease in three prospective cohorts - 7814 participants in the Atherosclerosis Risk in Communities (ARIC) study, 21,222 in the Women's Genome Health Study (WGHS), and 22,389 in the Malmo Diet and Cancer Study (MDCS) - and in 4260 participants in the cross-sectional BioImage Study for whom genotype and covariate data were available. We also determined adherence to a healthy lifestyle among the participants using a scoring system consisting of four factors: no current smoking, no obesity, regular physical activity, and a healthy diet. The relative risk of incident coronary events was 91% higher among participants at high genetic risk (top quintile of polygenic scores) than among those at low genetic risk (bottom quintile of polygenic scores) (hazard ratio, 1.91; 95% confidence interval [CI], 1.75 to 2.09). A favorable lifestyle (defined as at least three of the four healthy lifestyle factors) was associated with a substantially lower risk of coronary events than an unfavorable lifestyle (defined as no or only one healthy lifestyle factor), regardless of the genetic risk category. Among participants at high genetic risk, a favorable lifestyle was associated with a
46% lower relative risk of coronary events than an unfavorable lifestyle (hazard ratio, 0.54; 95% CI, 0.47 to 0.63). This finding corresponded to a reduction in the standardized 10-year incidence of coronary events from 10.7% for an unfavorable lifestyle to 5.1% for a favorable lifestyle in ARIC, from 4.6% to 2.0% in WGHS, and from 8.2% to 5.3% in MDCS. In the BioImage Study, a favorable lifestyle was associated with significantly less coronary-artery calcification within each genetic risk category. Across four studies involving 55,685 participants, genetic and lifestyle factors were independently associated with susceptibility to coronary artery disease."

According to the news editors, the research concluded: "Among participants at high genetic risk, a favorable lifestyle was associated with a nearly 50% lower relative risk of coronary artery disease than was an unfavorable lifestyle."

For more information on this research see: Genetic Risk, Adherence to a Healthy Lifestyle, and Coronary Disease. New England Journal of Medicine, 2016;375(24):2349-2358. of patients. Facial tremors response to acute levodopa challenge showed 92% sensitivity and 93% specificity to predict a final PD diagnosis. In PD patients, facial tremor magnitude of response to levodopa was not different from that of hand rest tremor (p = 0.8). Facial tremors, although infrequent, can be an early sign of PD.

According to the news reporters, the research concluded: "Positive response to acute levodopa challenge predicts long-term PD diagnosis."

**Drugs and Therapies - Aerosol Medicine and…**

**Investigators at Carleton University Detail Findings in Aerosol Medicine and Pulmonary Drug Delivery (Characterization of Medication Velocity and Size Distribution from Pressurized Metered-Dose Inhalers by Phase Doppler Anemometry)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Aerosol Medicine and Pulmonary Drug Delivery. According to news reporting originating in Ottawa, Canada, by NewsRx journalists, research stated, "Particle size and velocity are two of the most significant factors that impact the deposition of pressurized metered-dose inhaler (pMDI) sprays in the mouth cavity. pMDIs are prominently used around the world in the treatment of patients suffering from a variety of lung diseases such as asthma and chronic obstructive pulmonary disease. Since their introduction in the field, and as a result of their effectiveness and simplicity of usage, pMDIs are considered to be the most widely prescribed medical aerosol delivery system."

The news reporters obtained a quote from the research from Carleton University, "In the current study, particle velocity and size distribution were measured at three different locations along the centerline of a pMDI spray using Phase Doppler Anemometry. pMDIs from four different pharmaceutical companies were tested, each using salbutamol sulfate as the
medication. Measurements along at the pMDI centerline (at 0, 75, and 100mm downstream of the inhaler mouthpiece) showed that the spray velocities were bimodal in time for all four pMDI brands. The first peak occurred as the spray was leaving the mouthpiece, while the second peak (at the same location, 0 mm) occurred at around 60, 95, 95, and 115 milliseconds later, respectively, for the four tested inhalers, with a drop in the velocity between the two peaks. Three probability density functions (PDFs) were tested, and the Rosin-Rammler PDF best fit the empirical data, as determined using a chi-squared test.

According to the news reporters, the research concluded: "These results suggest that there is a difference in the mean particle velocities at the centerline for the tested pMDIs and the diameter of released particles varied statistically for each brand."

Our news correspondents report that additional information may be obtained by contacting E. Matida, Carleton University, Dept. of Mech & Aerosp Engn, Ottawa, ON K1S 5B6, Canada.

Oncology - Lymphoma

Investigators at Case Western Reserve University Detail Findings in Lymphoma (Dual institution experience of nodal marginal zone lymphoma reveals excellent long-term outcomes in the rituximab era)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Lymphoma are discussed in a new report. According to news reporting out of Cleveland, Ohio, by NewsRx editors, research stated, "Nodal marginal zone lymphoma (NMZL) is a rare non-Hodgkin lymphoma that arises from mature B-cells. We delineate outcomes, prognostic factors and treatment trends among a large cohort of patients with NMZL in the rituximab era."

Our news journalists obtained a quote from the research from Case Western Reserve University, "We identified 56 such patients treated at our institutions. The majority presented with advanced stage disease (786%). Over a median follow-up of 382months, median progression-free survival (PFS) was 424months and median overall survival (OS) was not reached. Kaplan-Meier estimates of OS at 120months after diagnosis was 719%. High-risk follicular lymphoma international prognostic index (FLIPI) was associated with inferior PFS."
Age >60 years and elevated serum lactate dehydrogenase (LDH) were associated with inferior OS. Transformation to diffuse large B-cell lymphoma occurred in 7 patients, 6 of who presented with advanced disease. OS was comparable to our previously reported extranodal MZL cohort. FLIPI score predicted for inferior PFS and OS when both cohorts were analysed together (n=267). In summary, outcomes in NMZL are favourable with a large majority of patients surviving at 120 months.”

According to the news editors, the research concluded: ”High risk FLIPI, age > 60 years, and elevated serum LDH were associated with inferior outcomes.”

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/bjh.14228. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Breast Cancer

Investigators at Catholic University of Korea Report New Data on Breast Cancer (Potential therapeutic implications of IL-6/IL-6R/gp130-targeting agents in breast cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, “Interleukin-6 (IL-6) is a pleiotropic cytokine with known multiple functions in immune regulation, inflammation, and oncogenesis. Binding of IL-6 to the IL-6 receptor (IL-6R) induces homodimerization and recruitment of glycoprotein 130 (gp130), which leads to activation of downstream signaling.”

Our news journalists obtained a quote from the research from the Catholic University of Korea, “Emerging evidence suggests that high levels of IL-6 are correlated with poor prognosis in breast cancer patients. IL-6 appears to play a critical role in the growth and metastasis of breast cancer cells, renewal of breast cancer stem cells (BCSCs), and drug
resistance of BCSCs, making anti-IL-6/IL-6R/gp130 therapies promising options for the treatment and prevention of breast cancers. However, preclinical and clinical studies of the applications of anti-IL-6/IL-6R/gp130 therapy in breast cancers are limited."

According to the news editors, the research concluded: "In this review, we summarize the structures, preclinical and clinical studies, mechanisms of action of chemical and biological blockers that directly bind to IL-6, IL-6R, or gp130, and the potential clinical applications of these pharmacological agents as breast cancer therapies."

The news correspondents report that additional information may be obtained from T.H. Heo, NP512, Laboratory of Pharmacoimmunology, Integrated Research Institute of Pharmaceutical Sciences, College of Pharmacy, The Catholic University of Korea, Seoul, South Korea. Additional authors for this research include J. Wahler and N. Suh.

Clinical Research - Clinical Trials and Studies

Investigators at Cedars-Sinai Medical Center Report Findings in Clinical Trials and Studies (Selecting Patients for Intra-Arterial Therapy in the Context of a Clinical Trial for Neuroprotection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Clinical Research - Clinical Trials and Studies have been published. According to news reporting out of Los Angeles, California, by NewsRx editors, research stated, "'The advent of intra-arterial neurothrombectomy (IAT) for acute ischemic stroke opens a potentially transformative opportunity to improve neuroprotection studies. Combining a putative neuroprotectant with recanalization could produce more powerful trials but could introduce heterogeneity and adverse event possibilities.'"

Our news journalists obtained a quote from the research from Cedars-Sinai Medical Center, "'We sought to demonstrate feasibility of IAT in neuroprotectant trials by defining IAT selection criteria for an ongoing neuroprotectant clinical trial. The study drug, 3K3A-APC, is a pleiotropic cytoprotectant and may reduce thrombolysis-associated hemorrhage. The NeuroNEXT trial NN104 (RHAPSODY) is designed to establish a maximally tolerated dose of 3K3A-APC. Each trial site provided their IAT selection criteria. An expert panel reviewed site criteria and published evidence. Finally, the trial leadership designed IAT selection criteria. Derived selection criteria reflected consistency among the sites and comparability to published IAT trials. A protocol amendment allowing IAT (and relaxed age, National Institutes of Health Stroke Scale, and time limits) in the RHAPSODY trial was implemented on June 15, 2015. Recruitment before and after the amendment improved from 8 enrolled patients (601 screened, 1.3%) to 51 patients (821 screened, 6.2%; odds ratio [95% confidence limit] of 4.9 [2.3-10.4]; P <0.001). Gross recruitment was 0.11 patients per site month versus 0.43 patients per site per
month, respectively, before and after the amendment. It is feasible to include IAT in a neuroprotectant trial for acute ischemic stroke."

According to the news editors, the research concluded: "Criteria are presented for including such patients in a manner that is consistent with published evidence for IAT while still preserving the ability to test the role of the putative neuroprotectant."

For more information on this research see: Selecting Patients for Intra-Arterial Therapy in the Context of a Clinical Trial for Neuroprotection. *Stroke*, 2016;47(12):2979-2985. *Stroke* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Stem Cell Research - Mesenchymal Stem Cells**

**Investigators at Central Hospital Discuss Findings in Mesenchymal Stem Cells (Combination of butylphthalide with umbilical mesenchymal stem cells for the treatment of delayed encephalopathy after carbon monoxide poisoning)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Stem Cell Research - Mesenchymal Stem Cells. According to news originating from Hebei, People's Republic of China, by NewsRx correspondents, research stated, "Delayed encephalopathy after carbon monoxide (CO) poisoning (DEACMP) is still a clinical challenge. This study aimed to investigate the efficacy of combined therapy of mesenchymal stem cell (MSC) transplantation and butylphthalide in DEACMP patients."

Our news journalists obtained a quote from the research from Central Hospital, "Forty-two DEACMP patients were treated with 1 of the 3 therapies: combined therapy of MSC transplantation and butylphthalide; MSC transplantation alone; or hyperbaric oxygen therapy. The MSCs were alternatively injected into the subarachnoid space and the carotid artery using a self-made high-pressure injector. The Mini-Mental State Examination and the Barthel index of activities of daily living were administered before the treatment, and at 1 month, 3 months, and 6 months after the treatment. Computed tomography and magnetic resonance imaging results before and after the treatment were compared. At 1 month, 3 months, and 6 months after the treatment, the Mini-Mental State Examination scores and the Barthel scores were significantly
higher in patients with the combined therapy of MSC transplantation and butylphthalide than those in patients with MSC transplantation alone or hyperbaric oxygen therapy (all P < 0.0001). No significant adverse events occurred."

According to the news editors, the research concluded: "The combination of MSC transplantation and butylphthalide is safe and effective in treating DEACMP."

For more information on this research see: Combination of butylphthalide with umbilical mesenchymal stem cells for the treatment of delayed encephalopathy after carbon monoxide poisoning. *Medicine*, 2016;95(49):113-117. *Medicine* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. **Transfusion Medicine - Blood Transfusion**

**Investigators at Central South University Report Findings in Blood Transfusion [mTOR Signaling Regulates Protective Activity of Transferred CD4(+)Foxp3(+) T Cells in Repair of Acute Kidney Injury]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Transfusion Medicine - Blood Transfusion. According to news reporting originating in Changsha, People's Republic of China, by NewsRx journalists, research stated, "CD4(+)Foxp3(+) regulatory T cells (Tregs) are required for normal immune homeostasis. Recent studies suggested that Treg transfer facilitates recovery from acute kidney injury (AKI), but the molecular events that maintain Treg function after adoptive transfer remain unclear."

The news reporters obtained a quote from the research from Central South University, "This study aimed to investigate the regulation of mammalian target of rapamycin (mTOR) signaling in the Treg-mediated therapeutic effect on ischemic AKI. We noted significant Treg expansion in C57BL/6 mouse kidney, with enhanced immunosuppressive capacity after renal ischemia/reperfusion. mTOR inhibition significantly increased the frequency of Tregs in cultured CD4(+) T cells, with enhanced production of anti-inflammatory cytokines, which, conversely, was reduced by mTOR activation. Rapamycin, an inhibitor of mTOR, was transiently administered to C57BL/6 mice before ischemia/reperfusion surgery. No beneficial effect of rapamycin treatment was seen in the early recovery of AKI as a result of its inhibitory effect on tubular regeneration. However, rapamycin markedly enhanced the expansion of kidney Tregs, with increased mRNA expression of anti-inflammatory cytokines. Adoptive transfer of rapamycin-treated Tregs markedly suppressed conventional T cells, responder myeloid cells, and reactive myofibroblasts; however, it promoted host Tregs and alternative macrophages, leading to better renal function and less kidney fibrosis. Taken together, Treg transfer with mTOR inhibition markedly improves outcomes of ischemic AKI."
According to the news reporters, the research concluded: "These findings reveal an important role for mTOR signaling in maintaining Treg activity after adoptive transfer and highlight the therapeutic potential of targeting Tregs in acute and chronic kidney disease."

For more information on this research see: mTOR Signaling Regulates Protective Activity of Transferred CD4(+)Foxp3(+) T Cells in Repair of Acute Kidney Injury. *Journal of Immunology*, 2016;197(10):3917-3926. *Journal of Immunology* can be contacted at: Amer Assoc Immunologists, 9650 Rockville Pike, Bethesda, MD 20814, USA. **Oncology - Colon Cancer**

**Investigators at Chiba Cancer Center Discuss Findings in Colon Cancer**

[Magnified endoscopic observation of early colorectal cancer by linked color imaging with crystal violet staining (with video)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Oncology - Colon Cancer. According to news reporting from Chiba, Japan, by NewsRx journalists, research stated, "Many reports have shown the usefulness of magnification endoscopy with crystal violet (CV) staining for delineating the pit pattern in the diagnosis of colorectal carcinoma. However, the diagnostic accuracy of this method is not adequate for assessing the depth of invasion of early stage cancers."

The news correspondents obtained a quote from the research from Chiba Cancer Center, "The novel technology of linked color imaging (LCI) combined with CV staining is expected to improve the accuracy of determining the depth of invasion. We studied 3 patients with early stage colorectal cancer who were referred to our hospital. After CV spraying, high-magnification endoscopy was conducted by using the LCI mode. Efficacy of this modality was evaluated by comparing the preoperative diagnostic endoscopic images with posttreatment histopathologic findings. In 2 cases of rectal cancer, although conventional endoscopic examination could not exclude the possibility of submucosal cancer, use of the LCI mode with CV staining confirmed mucosal cancer. Eventually, EMR was conducted and achieved curative resection. In 1 case of sigmoid colon cancer, both conventional and CV magnification endoscopy suggested submucosal cancer. However, mucosal cancer was diagnosed by the novel method, and EMR achieved curative resection."

According to the news reporters, the research concluded: "LCI high-magnification endoscopy combined with CV staining provides images close to histopathologic findings and is expected to improve the accuracy of endoscopic diagnosis of the depth of invasion for early
stage colorectal cancer."

For more information on this research see: Magnified endoscopic observation of early colorectal cancer by linked color imaging with crystal violet staining (with video). *Gastrointestinal Endoscopy*, 2016;84(4):726-729. *Gastrointestinal Endoscopy* can be contacted at: Mosby-Elsevier, 360 Park Avenue South, New York, NY 10010-1710, USA. **Cardiovascular Diseases and Conditions - Vascular...**

**Investigators at Children’s Hospital Report Findings in Vascular Malformations (Spontaneous Cystic Penile Vascular Malformation in an Adolescent and Review of the Literature)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Vascular Malformations have been published. According to news reporting originating from Columbus, Ohio, by NewsRx correspondents, research stated, "Vascular malformations rarely involve the male genitalia, and even fewer appear as cystic lesions on the penile shaft."

Our news editors obtained a quote from the research from Children's Hospital, "We report an uncommon case of spontaneous swelling near the coronal margin of the penis that was found to arise from a vascular malformation."

According to the news editors, the research concluded: "We review the pathologic findings and the literature regarding vascular malformations of the penis and other penile cystic structures that have similar clinical appearance, and discuss treatment options for penile vascular malformations."

The news editors report that additional information may be obtained by contacting J. Preece, Nationwide Childrens Hosp, Sect Pediat Urol, Columbus, OH 43205, United States. Additional authors for this research include V. Prasad, M. Schober and D.G. DaJusta.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.urology.2016.04.009. This DOI is a link to an online electronic...
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Colon Cancer have been published. According to news reporting from Shenyang, People's Republic of China, by NewsRx journalists, research stated, "Long non-coding RNAs (lncRNAs) occupy the majority of the human genome. Their dysregulation is usually related with the procession of diseases, including tumors."

The news correspondents obtained a quote from the research from China Medical University and Hospital, "Abnormally expressed lncRNAs have been found in colorectal cancer (CRC), but are not fully understood. In the current study, we determined the expression level of a novel lncRNA-RP1-13P20.6 in 99 pairs of CRC tissues compared to their matched normal adjacent tissues, using real time polymerase chain reaction. We further assessed the correlation between their expression levels and their clinicopathological parameters, and determined the potential of RP1-13P20.6 as a biomarker for CRC. The expression of lncRNA-RP1-13P20.6 in CRC tissues and cell lines decreased significantly with an area under the curve (AUC) of 0.755 (p < 0.001). However, there was no significant difference between the expression levels of lncRNA-RP1-13P20.6 and the clinicopathological characteristics."

According to the news reporters, the research concluded: "The abnormal expression level and AUC values suggest that lncRNA-RP1-13P20.6 is a potential biomarker for CRC."

Our news journalists report that additional information may be obtained by contacting Z. Wang, China Med Univ, Hosp 1, Dept. of Surg Oncol & Gen Surg, Shenyang 110001, People's Republic of China. Investigators at China Medical University and Hospital Detail Findings in Gastric Cancer (Palliative Gastrectomy Prolongs Survival of Metastatic Gastric Cancer Patients with Normal Preoperative CEA or CA19-9 Values: A Retrospective Cohort Study)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Gastric Cancer. According to news reporting out of Taichung, Taiwan, by NewsRx editors, research stated, "Palliative gastrectomy has been suggested to improve survival of patients with metastatic gastric cancer, but limitations in study design and availability of robust prognostic factors have cast doubt on the overall merit of this procedure. The characteristics and clinical outcomes of 173 patients diagnosed between 2008 and 2012 were analyzed to determine the value of palliative gastrectomy and to identify potential prognostic factors."

Funders for this research include Taiwan Department of Health, China Medical University Hospital Cancer Research of Excellence, Ministry of Science and Technology, Taiwan, China Medical University Hospital.

Our news journalists obtained a quote from the research from China Medical University and Hospital, "Median overall patient survival was 6.5 months. To attenuate potential selection bias, patients with adequate performance and survival time of >= 2months since diagnosis were included for risk factor analysis (n = 137). The median overall survival was longer for patients who were younger than 60 years, had better performance status (8.7 versus 6.4 months, P = 0.015), received systemic chemotherapy, or had palliative gastrectomy in univariate analyses. Gastrectomy (P = 0.002) remained statistically significant in multivariate analyses. Subgroup analysis showed that patients aged < 60 years, CEA < 5 ng/mL or CA19-9 < 35 U/mL, obtained a survival advantage from palliative gastrectomy. In fact, palliative gastrectomy doubled overall survival for patients who had normal CEA and/or normal CA19-9."

According to the news editors, the research concluded: "Palliative gastrectomy prolongs the survival of metastatic gastric cancer patients with normal CEA and/or CA19-9 level at the time of diagnosis."

For more information on this research see: Palliative Gastrectomy Prolongs Survival of Metastatic Gastric Cancer Patients with Normal Preoperative CEA or CA19-9 Values: A Retrospective Cohort Study. Gastroenterology Research and Practice, 2016();1-9. Gastroenterology Research and Practice can be contacted at: Hindawi Publishing Corp, 315 Madison Ave 3RD Flr, Ste 3070, New York, NY 10017, USA. Investigators at China Pharmaceutical University Have Reported New Data on Multiple Myeloma (Wogonin inhibits multiple myeloma-stimulated angiogenesis via c-Myc/VHL/HIF-1a signaling axis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Oncology - Multiple Myeloma are discussed in a new report. According to news reporting originating in Nanjing, People's Republic of China, by NewsRx journalists, research stated, "Angiogenesis is associated with the progression of multiple myeloma (MM). Wogonin is an active mono-flavonoid with remarkable antitumor activity."

The news reporters obtained a quote from the research from China Pharmaceutical University, "However, its impact on MM-stimulated angiogenesis remains largely unknown. Here, we demonstrated that wogonin decreased expression and secretion of pro-angiogenic factors in MM cells via c-Myc/HIF-1a signaling axis, reducing MM-stimulated angiogenesis and MM cell proliferation in vivo. Overexpression of c-Myc in MM cells disrupted the balance between VHL SUMOylation and ubiquitination, and thus inhibited proteasome-mediated HIF-1a degradation. Impaired function of VHL ubiquitination complex in c-Myc-overexpressing cells was fully reversed by wogonin treatment via increasing HIF-1a-VHL interaction and promoting HIF-1a degradation."

According to the news reporters, the research concluded: "Collectively, our in vitro and in vivo studies reveal for the first time that wogonin represses MM-stimulated angiogenesis and tumor progression via c-Myc/VHL/HIF-1a signaling axis."

For more information on this research see: Wogonin inhibits multiple myeloma-stimulated angiogenesis via c-Myc/VHL/HIF-1a signaling axis. Oncotarget, 2016;7(5):5715-27.

Investigators at China University of Science and Technology Report Findings in Histone Deacetylase Inhibitors (HISTONE DEACETYLASE INHIBITOR-INDUCED EMERGENCE OF SYNAPTIC delta-OPIOID RECEPTORS AND BEHAVIORAL ANTINOCICEPTION IN PERSISTENT ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Histone Deacetylase Inhibitors have been published. According to news originating from Anhui, People's Republic of China, by NewsRx correspondents, research stated, "The efficacy of opioids in patients with chronic neuropathic pain remains controversial. Although activation of delta-opioid receptors (DORs) in the brainstem reduces inflammation-induced persistent hyperalgesia, it is not effective under persistent neuropathic pain conditions and these clinical problems remain largely unknown."

Our news journalists obtained a quote from the research from the China University of Science and Technology, "In this study, by using a chronic constriction injury (CCI) of the sciatic nerve in rats, we found that in the brainstem nucleus raphe magnus (NRM), DORs emerged on the surface membrane of central synaptic terminals on day 3 after CCI surgery and disappeared on day 14. Histone deacetylase (HDAC) inhibitors microinjected into the NRM in vivo increased the level of synaptosomal DOR protein and NRM infusion of DOR agonists producing an antinociceptive effect in a nerve growth factor (NGF) signaling-dependent manner. In vitro, in CCI rat slices incubated with HDAC inhibitors, DOR agonists significantly inhibited EPSCs. This effect was blocked by tyrosine receptor kinase A antagonists. Chromatin immunoprecipitation analysis revealed that NRM infusion of HDAC inhibitors in CCI rats increased the level of histone H4 acetylation at Ngf gene promoter regions. NGF was infused into the NRM or incubated CCI rat slices drove DORs to the surface membrane of synaptic terminals. Taken together, epigenetic upregulation of NGF activity by HDAC inhibitors in the NRM promotes the trafficking of DORs to pain-modulating neuronal synapses under neuropathic pain conditions, leading to delta-opioid analgesia."

According to the news editors, the research concluded: "These findings indicate that therapeutic use of DOR agonists combined with HDAC inhibitors might be effective in chronic neuropathic pain managements."

For more information on this research see: HISTONE DEACETYLASE INHIBITOR-INDUCED EMERGENCE OF SYNAPTIC delta-OPIOID RECEPTORS AND BEHAVIORAL ANTINOCICEPTION IN PERSISTENT NEUROPATHIC PAIN. Neuroscience, 2016;339():54-63. Neuroscience can be contacted at: Pergamon-Elsevier Science Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, England. (Elsevier - www.elsevier.com; Neuroscience - www.journals.elsevier.com/neuroscience/)

Investigators at China University of Science and Technology Report Findings in Shewanella (Extracellular biosynthesis of copper sulfide nanoparticles by Shewanella oneidensis MR-1 as a photothermal agent)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Negative Bacteria - Shewanella are discussed in a new report. According to news reporting out of Hefei, People's Republic of China, by NewsRx editors, research stated, "Photothermal therapy (PTT) is a minimally invasive and effective cancer treatment method and has a great potential for innovating the conventional chemotherapy approaches. Copper sulfide (CuS) exhibits photo stability, low cost, and high absorption in near infrared region, and is recognized as an ideal candidate for PIT."

Financial supporters for this research include Natural Science Foundation of China, Program for Changjiang Scholars and Innovative Research Team, Collaborative Innovation Center of Suzhou Nano Science and Technology of the Ministry of Education of China.

Our news journalists obtained a quote from the research from the China University of Science and Technology, "However, CuS, as a photothermal agent, is usually synthesized with traditional chemical approaches, which require high temperature, additional stabilization and hydrophilic modification. Herein, we report, for the first time, the preparation of CuS nanoparticles as a photothermal agent by a dissimilatory metal reducing bacterium Shewanella oneidensis MR-1. The prepared nanoparticles are homogenously shaped, hydrophilic, small-sized (similar to 5 nm) and highly stable. Furthermore, the biosynthesized CuS nanoparticles display a high photothermal conversion efficiency of 27.2% because of their strong absorption at 1100 nm. The CuS nanoparticles could be effectively used as a PTT agent under the irradiation of 1064 nm."

According to the news editors, the research concluded: "This work provides a simple, eco-friendly and cost-effective approach for fabricating PIT agents."

For more information on this research see: Extracellular biosynthesis of copper sulfide nanoparticles by Shewanella oneidensis MR-1 as a photothermal agent. Enzyme and Microbial Technology, 2016;95():230-235. Enzyme and Microbial Technology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. Investigators at Chinese Academy of Medical Sciences Have Reported New Data on Esophageal Cancer (An Interdisciplinary Nutrition Support Team Improves Clinical and Hospitalized Outcomes of Esophageal Cancer Patients with Concurrent ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Esophageal Cancer have been presented. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "The prevalence of malnutrition is very high in patients with cancer. The purpose of this study was to investigate whether or not a nutrition support team (NST) could benefit esophageal cancer patients undergoing chemoradiotherapy (CRT)."

The news correspondents obtained a quote from the research from the Chinese Academy of Medical Sciences, "Between June 2012 and April 2014, 50 esophageal cancer patients undergoing concurrent CRT were randomly assigned into two groups: The NST group and the control group. The nutritional statuses of 25 patients in the NST group were managed by the NST. The other 25 patients in the control group underwent the supervision of radiotherapy practitioners. At the end of the CRT, nutritional status, the incidence of complications, and completion rate of radiotherapy were evaluated. Besides, the length of hospital stay (LOS) and the in-patient cost were also compared between these two groups. At the completion of CRF, the nutritional status in the NST group were much better than those in the control group, as evidenced by prealbumin (ALB), transferrin, and ALB parameters (p=0.001, 0.000, and 0.000, respectively). The complication incidences, including bone marrow suppression (20% vs. 48%, p=0.037) and complications related infections (12% vs. 44%, p=0.012), in the NST group were lower and significantly different from the control group. In addition, only one patient in the NST group did not complete the planned radiotherapy while 6 patients in the control group had interrupted or delayed radiotherapy (96% vs. 76%, p=0.103). Furthermore, the average LOS was decreased by 4.5 days (p=0.001) and in-patient cost was reduced to 1.26 ± 0.75 thousand US dollars person-times (p >0.05) in the NST group. A NST could provide positive effects in esophageal cancer patients during concurrent CRT on maintaining their nutrition status and improving the compliance of CRF."

According to the news reporters, the research concluded: "Moreover, the NST could be helpful on reducing LOS and in-patient costs."

Our news journalists report that additional information may be obtained by contacting L. Yu, Dept. of Comprehensive Oncology, Chinese Academy of Medical Sciences Cancer Hospital, Beijing 100021, People's Republic of China. Additional authors for this research include S.L. Li, G.W. Cheng, J.Y. Liu, C.X. Song, Y.B. Deng, W.H. Shang, D. Yang, X.H. Liu, W.W. Liu, S.Y. Lu and L. Yu.

Oncology - Brain Cancer

Investigators at Chinese Academy of Sciences Describe Findings in Brain Cancer (Dual-Targeting Magnetic PLGA Nanoparticles for Codelivery of Paclitaxel and Curcumin for Brain Tumor Therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Brain Cancer have been published. According to news reporting originating from Shanghai, People's Republic of China, by NewsRx correspondents, research stated, "Chemotherapy is one of the most important strategies for glioma treatment. However, the 'impermeability' of the blood brain barrier (BBB) impedes most chemotherapeutics from entering the brain, thereby rendering very few drugs suitable for glioma therapy, letting alone application of a combination of chemotherapeutics."

Funders for this research include Ministry of Science and Technology of the People's Republic of China, China Postdoctoral Science Foundation, National Natural Science Foundation of China.

Our news editors obtained a quote from the research from the Chinese Academy of Sciences, "Thereby, there is a pressing need to overcome the obstacles. A dual-targeting strategy was developed by a combination of magnetic guidance and transferrin receptor-binding peptide T7-mediated active targeting delivery. The T7-modified magnetic PLGA nanoparticle (NP) system was prepared with co-encapsulation of the hydrophobic magnetic nanoparticles and a combination of drugs (i.e., paclitaxel and curcumin) based on a 'one-pot' process. The combined drugs yielded synergistic effects on inhibition of tumor growth via the mechanisms of apoptosis induction and cell cycle arrest, displaying significantly increased efficacy relative to the single use of each drug. Dual-targeting effects yielded a>10-fold increase in cellular uptake studies and a>5-fold enhancement in brain delivery compared to the nontargeting NPs. For the in vivo studies with an orthotopic glioma model, efficient brain accumulation was observed by using fluorescence imaging, synchrotron radiation X-ray imaging, and MM. Furthermore, the antiglioma treatment efficacy of the delivery system was evaluated. With application of a magnetic field, this system exhibited enhanced treatment efficiency and reduced adverse effects. All mice bearing orthotopic glioma survived, compared to a 62.5% survival rate for the combination group receiving free drugs."
According to the news editors, the research concluded: "This dual-targeting, co-delivery strategy provides a potential method for improving brain drug delivery and antiglioma treatment efficacy."

For more information on this research see: Dual-Targeting Magnetic PLGA Nanoparticles for Codelivery of Paclitaxel and Curcumin for Brain Tumor Therapy. *ACS Applied Materials & Interfaces*, 2016;8(47):32159-32169. ACS Applied Materials & Interfaces can be contacted at: Amer Chemical Soc, 1155 16TH St, NW, Washington, DC 20036, USA. (American Chemical Society - www.acs.org; ACS Applied Materials & Interfaces - www.pubs.acs.org/journal/aamick)

The news editors report that additional information may be obtained by contacting Y.Z. Huang, Chinese Academy Sci, Shanghai Inst Mat Med, Shanghai 201203, People's Republic of China. Additional authors for this research include M. Zhang, F. Zeng, H.Y. Jin, Q. Xu and Y.Z. Huang.

**Oncology - Breast Cancer**

**Investigators at Chinese Academy of Sciences Describe Findings in Breast Cancer (Dual pH-sensitive micelles with charge-switch for controlling cellular uptake and drug release to treat metastatic breast cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting out of Shanghai, People's Republic of China, by NewsRx editors, research stated, "For successful chemotherapy against metastatic breast cancer, the great efforts are still required for designing drug delivery systems that can be selectively internalized by tumor cells and release the cargo in a controlled manner. In this work, the chemotherapeutic agent paclitaxel (PTX) was loaded with the dual-pH sensitive micelle (DPM), which consisted of a pH-sensitive core, an acid-cleavable anionic shell, and a polyethylene glycol (PEG) corona."

Financial supporters for this research include National Basic Research Program of China, National Natural Science Foundation of China, Youth Innovation Promotion Association of CAS.

Our news journalists obtained a quote from the research from the Chinese Academy of Sciences, "In the slightly acidic environment of tumor tissues, the anionic shell was taken off, inducing the conversion of the surface charge of DPM from negative to positive, which resulted in more efficient cellular uptake, stronger cytotoxicity and higher intra-tumor accumulation of
PTX in the murine breast cancer 4T1 tumor-bearing mice models compared to the micelles with irremovable anionic or non-ionic shell. Meanwhile, the pH-sensitive core endowed DPM with rapid drug release in endo/lysosomes. The inhibitory rates of DPM against tumor growth and lung metastasis achieved 77.7% and 88.3%, respectively, without significant toxicity.

According to the news editors, the research concluded: "Therefore, DPM is a promising nanocarrier for effective therapy of metastatic breast cancer due to satisfying the requirements of both selective uptake by tumor cells and sufficient and fast intracellular drug release."

Our news journalists report that additional information may be obtained by contacting Q. Yin, Chinese Academy Sci, Shanghai Inst Mat Med, Center Pharmaceut, State Key Lab Drug Res, Shanghai 201203, People's Republic of China. Additional authors for this research include Q.S. Meng, H.P. **Proteomics**

**Investigators at Chinese Academy of Sciences Describe Findings in Proteomics [Brain quantitative proteomic responses reveal new insight of benzotriazole neurotoxicity in female Chinese rare minnow (Gobiocypris rarus)]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Proteomics is the subject of a report. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "Benzotriazole (BT) is a high-production volume chemical which has been ubiquitously detected in aquatic environments. Although adverse effects from acute and chronic exposure to BT have been reported, the neurotoxic effect of BT and the mechanisms of toxicity are not well documented."

Funders for this research include National Natural Science Foundation of China, Key Program of the National Natural Science Foundation of China, Natural Science Foundation of Inner Mongolia Autonomous Region of China, Major International Joint Research Project of the National Natural Science Foundation of China.

The news reporters obtained a quote from the research from the Chinese Academy of Sciences, "In this study, adult female Chinese rare minnow (Gobiocypris rarus) were exposed to
0.05, 0.5, and 5 mg/L BT for 28 days. The brain proteome showed that BT exposure mainly involved in metabolic process, signal transduction, stress response, cytoskeleton, and transport. Pathway analysis revealed that cellular processes affected by BT included cellular respiration, G-protein signal cascades, Ca2+-dependent signaling, cell cycle and apoptosis. Moreover, data on relative mRNA levels demonstrated that genes related to these toxic pathways were also significantly affected by BT. Furthermore, proteins affected by BT such as CKBB, GS, HPCA, VDAC1, and FLOT1A are associated with neurological disorders.

According to the news reporters, the research concluded: "Therefore, our finding suggested that BT induced molecular responses in the brain and could provide new insight into BT neurotoxicity in Chinese rare minnow."

For more information on this research see: Brain quantitative proteomic responses reveal new insight of benzotriazole neurotoxicity in female Chinese rare minnow (Gobiocypris rarus). *Aquatic Toxicology*, 2016;181():67-75. *Aquatic Toxicology* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Adenomas**

**Investigators at Chinese People's Liberation Army General Hospital Detail Findings in Adenomas (Clinical characteristics of PRKACA mutations in Chinese patients with adrenal lesions: a single-centre study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Adenomas have been presented. According to news reporting originating in Beijing, People's Republic of China, by NewsRx journalists, research stated, "ContextRecent studies have identified that the somatic PRKACA L206R mutation can cause cortisol-producing adenomas (CPAs). This study investigated the prevalence and characteristics of PRKACA, GNAS and CTNNB1 mutations in adrenal lesions in patients from a single centre in China."

Financial support for this research came from Natural Science Foundation of Hainan Province.

The news reporters obtained a quote from the research from Chinese People's Liberation Army General Hospital, "Patients and MeasurementsWe sequenced PRKACA, GNAS and CTNNB1 genes in 108 patients, including 60 patients with CPAs (57 with unilateral and three with bilateral adenomas), 13 with nonfunctional adenomas, 12 with adrenocortical..."
carcinomas (ACCs), 15 with primary bilateral macronodular hyperplasia (PBMAH) and eight with aldosterone and cortisol cosecreting adenomas. Mutations in PRKACA, GNAS and CTNNB1 were examined, and clinical characteristics were compared. Results Among the unilateral CPAs, we identified somatic mutations in PRKACA (L206R) in 23 cases (40%), GNAS (R201C and R201H) in six cases (10%), CTNNB1 (S45C, L46P and S45P) in six cases (10%) and CTNNB1 plus GNAS in two cases (3%). PRKACA and GNAS mutations were mutually exclusive. Among the patients with nonfunctional adenoma, two carried CTNNB1 mutations. Among the patients with ACC, two carried GNAS and CTNNB1 mutations but none carried PRKACA mutations. One patient showed bilateral CPA, and one PBMAH patient carried PRKACA mutations. No mutations in PRKACA, GNAS or CTNNB1 were identified in the eight patients with aldosterone and cortisol cosecreting adenomas. PRKACA-mutant adenomas were associated with young age, overt Cushing's syndrome and high cortisol levels compared with non-PRKACA-mutant or CTNNB1-mutant lesions. Conclusions PRKACA mutations are present in CPAs and bilateral adrenal macronodular hyperplasias."

According to the news reporters, the research concluded: "PRKACA mutation is associated with more severe autonomous cortisol secretion."

Our news correspondents report that additional information may be obtained by contacting X. Zhang, Chinese Peoples Liberat Army Gen Hosp, Chinese PLA Med Academy, Dept. of Urol, State Key Lab Kidney Dis, Beijing, People's Republic of China. Additional authors for this research include B.J. Wang, L. Tang, B. Lang, Y. Zhang, F. Zhang, L.Y. Chen, J.Z. Ouyang and X. Zhang.

Cardiovascular Diseases and Conditions - Thrombosis

Investigators at Chinese People's Liberation Army General Hospital Detail Findings in Thrombosis (Impact of acute kidney injury on coagulation in adult minimal change nephropathy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Cardiovascular Diseases and Conditions - Thrombosis is the subject of a report. According to news reporting from Beijing, People's Republic of China, by NewsRx journalists, research stated, "A hypercoagulable state exists in patients with nephrotic syndrome (NS), which more easily leads to venous thromboembolism (VTE)."
However, whether acute kidney injury (AKI), a common complication of NS, affects the hypercoagulable state and VTE has rarely been elucidated.

The news correspondents obtained a quote from the research from Chinese People's Liberation Army General Hospital, "In this study, we aimed to explore coagulation changes and analyze relevant influencing factors in NS-AKI patients. A total of 269 consecutive NS patients with minimal change disease (MCD) between 2011 and 2016 were included in this observational study. Ninety-one cases were in the AKI group and 178 cases in the non-AKI group. The 1:1 propensity score matching (PSM) method was applied to match the baseline information. The coagulation biomarkers were compared, and the thrombosis events were recorded. Linear correlation was performed to detect any relation between D-dimer and clinical data. The PSM method gave matched pairs of 88 MCD patients with AKI and non-AKI patients, resulting in no differences in baseline information. The D-dimer, fibrinogen, and thromboelastography parameters maximum amplitude (MA), G values of the MCD-AKI patients were significantly higher than the levels of the MCD patients without AKI (D-dimer: 1.8 [1.0, 3.3] vs 1.1 [0.6, 1.7] mg/L, P< 0.001; fibrinogen: 7.0 +/- 2.0 vs 6.5 +/- 1.4 g/L, P= 0.036; MA: 74.6 +/- 5.0 vs 70.5 +/- 5.3mm, P=0.020; G: 15.7 +/- 5.3 vs 12.5 +/- 3.3, P=0.034). For the MCD patients, the serum creatinine, white blood cell count, and interleukin-6 levels in the patients with D-dimers > 1mg/L were significantly higher than those of patients with D-dimers <= 1mg/L. The correlation analysis showed that the D-dimer level was correlated with serum creatinine, white blood cell count, and interleukin-6 (r=0.410, P= <0.001; r=0.248, P= < 0.001; r=0.306, P= < 0.001, respectively). Five deep vein thrombosis events occurred in the AKI group and 1 pulmonary embolism event occurred in the non-AKI group after adjusting the propensity score value. AKI appeared to have an association with higher incidence of VTE, but the difference was not statistically significant (RR: 4.9, 95% CI: 0.6-42.7, P=0.154)."

According to the news reporters, the research concluded: "The MCD-NS patients complicated with AKI had a more severe hypercoagulable state, which might be associated with the active inflammation of AKI that mediated activation of the coagulation system."

Investigators at Chinese University of Hong Kong Describe Findings in Thrombolysis (Good collateral circulation predicts favorable outcomes in intravenous thrombolysis: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Thrombolysis. According to news reporting originating from Hong Kong, People's Republic of China, by NewsRx correspondents, research stated, "Background and purpose Baseline collateral status has been correlated with outcomes of acute ischaemic stroke patients receiving intravenous thrombolysis (IVT) in previous studies. We carried out the current systematic review and meta-analysis to synthesize currently available evidence regarding such correlations."

Funders for this research include Chinese University of Hong Kong, Institute of Innovative Medicine.

Our news editors obtained a quote from the research from the Chinese University of Hong Kong, "Methods Full-text articles published since 2000 were retrieved and screened. The overall effect sizes of good versus poor collateral status over a series of outcomes and certain baseline features were estimated by random-effects models and presented in risk ratios (RRs) or mean differences. Results Overall, 28 (3057 patients) and 14 (1584 patients) studies were included in qualitative and quantitative synthesis, respectively. Compared with poor pre-treatment collateral status, good collaterals showed a beneficial effect over the primary outcome of a favorable functional outcome at 3 or 6 months [RR, 2.45; 95% confidence interval, 1.94-3.09; P<0.001] in acute ischaemic stroke patients receiving IVT treatment. However, such an effect tended to be different between studies with prescribed time windows of 3, 4.5 and >4.5h (up to 7h), with the RRs being 2.21, 2.48 and 5.00, respectively (I-2=53%). Good pre-treatment collaterals were also associated with a smaller infarct size at baseline, and a lower rate of symptomatic intracranial hemorrhage and a higher rate of neurological improvement early after IVT treatment."

According to the news editors, the research concluded: "Conclusions The present study has demonstrated the prognostic value of baseline collateral circulation for outcomes of acute ischaemic stroke patients receiving intravenous reperfusion therapies, studied with different time windows of up to 7h after ictus for IVT therapy."

The news editors report that additional information may be obtained by contacting K.S. Wong, Chinese University of Hong Kong, Dept. of Med & Therapeut, Hong Kong, Hong Kong, People's Republic of China. Additional authors for this research include L. Lan, L. Liu, T.W. Leung and K.S. Wong.

Investigators at Chongqing Medical University Report Findings in Breast Cancer (Association of MTDH immunohistochemical expression with metastasis and prognosis in female reproduction malignancies: a systematic review and meta-analysis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating from Chongqing, People's Republic of China, by NewsRx correspondents, research stated, "Various literatures have demonstrated that overexpression of Metadherin (MTDH) is correlated with tumor metastasis and it can predict poor survival outcomes in female reproduction malignancies. In order to enhance the statistical power and reach a recognized conclusion, we conducted a systematic review and meta-analysis to thoroughly investigate the association of MTDH expression with tumor metastasis and survival outcomes following PRISMA guidelines."

Our news editors obtained a quote from the research from Chongqing Medical University, "Odds ratios (ORs) and hazard ratios (HRs) were used to demonstrate the impact of MTDH on tumor metastasis and prognosis respectively. Data were pooled with appropriate effects model on STATA12.0. Our results indicated that high MTDH expression is significantly correlated with higher mortality for breast, ovarian and cervical cancer. High immunohistochemical expression of MTDH is remarkably associated with shorter disease-free survival (DFS) in breast cancer but not in ovarian cancer. The pooled results suggested that high level of MTDH significantly predicted distant metastasis and lymph node metastasis in breast cancer. Strong associations were observed between MTDH expression and lymph node metastasis in ovarian and cervical cancer."

According to the news editors, the research concluded: "MTDH might be a novel biomarker which can effectively reflect metastasis status and prognosis of breast cancer. However, its application in clinical practice needs more prospective studies with large samples."

Investigators at Chosun University Describe Findings in Thrombosis (Histologic features of acute thrombi retrieved from stroke patients during mechanical reperfusion therapy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Thrombosis. According to news reporting originating from Gwangju, South Korea, by NewsRx correspondents, research stated, "The histologic features of thrombus may differ according to the stroke subtypes. However, in acute reperfusion therapy, fibrin-specific thrombolytics are used based on the assumption that all thrombi are alike."

Our news editors obtained a quote from the research from Chosun University, "The histologic characteristics of thrombi were compared between patients with different stroke etiologies. Between April 2010 and March 2012, we analyzed thrombi retrieved from acute stroke patients during mechanical thrombectomy. All thrombi were analyzed using component-specific stains such as Martius scarlet blue for fibrins and immunostaining with CD42b antibody for platelets. The stroke subtypes were determined based on the Trial of ORG 10172 in Acute Stroke Treatment classification. Among 36 patients, 22 were diagnosed with cardioembolism, 8 with atherothrombosis, and 6 with undetermined etiology. In arteriogenic thrombi, red blood cells were most abundant (56.9 +/- 12.2%), and the platelets covered the fibrin layers or were localized at the edge or periphery of the thrombus. In cardiogenic thrombi, fibrin was most abundant (39.5 +/- 13.5%), and platelets were clustered within the rich fibrin. Red blood cells proportion was greater in arteriogenic thrombi than in cardiogenic thrombi (p < 0.001), whereas fibrin proportion was greater in cardiogenic thrombi than in arteriogenic thrombi (p = 0.003). Of six patients with undetermined etiology, the thrombi in five showed histologic features and composition similar to that of cardiogenic thrombi. Acute thrombi showed different histologic features according to the stroke etiology."

According to the news editors, the research concluded: "The distribution of platelets and proportion of red blood cells and fibrin were major distinguishing factors between stroke subtypes."

The news editors report that additional information may be obtained by contacting S.H. Ahn, Chosun Univ, Dept. of Neurol, Sch Med, Gwangju 61453, South Korea. Additional authors for this research include R. Hong, I.S. Choo, J.H. Heo, H.S. Nam, H.G. Kang, H.W. Kim and J.H. Kim.

Investigators at Chung Ang University Report Findings in Colon Cancer (Choroidal and skin metastases from colorectal cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Colon Cancer. According to news reporting out of Seoul, South Korea, by NewsRx editors, research stated, "Choroidal and skin metastasis of colon cancer is rare. In women, the frequency of cutaneous metastasis from colon cancer as the primary lesion in is 9% and skin metastasis occurs in 0.81% of all colorectal cancers."

Our news journalists obtained a quote from the research from Chung Ang University, "We report a patient with colonic adenocarcinoma who presented with visual disorder in her right eye and scalp pain as her initial symptoms. Contrast-enhance orbital magnetic resonance imaging with fat suppression revealed an infrabulbar mass, and skin biopsy of the posterior parietal scalp confirmed adenocarcinoma. These symptoms were diagnosed as being caused by choroidal and skin metastases of colonic adenocarcinoma. We started palliative chemotherapy with oral capecitabine (1000 mg/m(2), twice a day, on days 1-14) every 3 wk, which was effective at shrinking the brain masses and improving the visual disorder."

According to the news editors, the research concluded: "This is the first report that capecitabine is effective at reducing a choroidal and cutaneous metastatic lesion from right-sided colorectal cancer."

Our news journalists report that additional information may be obtained by contacting I.G. Hwang, Chung Ang University, Div Hematooncol, Dept. of Internal Med, Coll Med, Seoul 156861, South Korea. Additional authors for this research include E.H. Oh, M.K. Jung, S.E. Park, J.T. Kim and I.G. Hwang.

Investigators at City of Hope National Medical Center Report Findings in Colon Cancer (Oncolytic herpes simplex virus kills stem-like tumor-initiating colon cancer cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Colon Cancer is the subject of a report. According to news originating from Duarte, California, by NewsRx correspondents, research stated, "Stem-like tumor-initiating cells (TICs) are implicated in cancer progression and recurrence, and can be identified by sphere-formation and tumorigenicity assays. Oncolytic viruses infect, replicate in, and kill a variety of cancer cells."

Our news journalists obtained a quote from the research from the City of Hope National Medical Center, "In this study, we seek proof of principle that TICs are susceptible to viral infection. HCT8 human colon cancer cells were subjected to serum-free culture to generate TIC tumorspheres. Parent cells and TICs were infected with HSV-1 subtype NV1066. Cytotoxicity, viral replication, and Akt1 expression were assessed. TIC tumorigenicity was confirmed and NV1066 efficacy was assessed in vivo. NV1066 infection was highly cytotoxic to both parent HCT8 cells and TICs. In both populations, cell-kill of > 80% was achieved within 3 days of infection at a multiplicity of infection (MOI) of 1.0. However, the parent cells required 2-log greater viral replication to achieve the same cytotoxicity. TICs overexpressed Akt1 in vitro and formed flank tumors from as little as 100 cells, growing earlier, faster, larger, and with greater histologic atypia than tumors from parent cells. Treatment of TIC-induced tumors with NV1066 yielded tumor regression and slowed tumor growth."

According to the news editors, the research concluded: "We conclude that colon TICs are selected for by serum-free culture, overexpress Akt1, and are susceptible to oncolytic viral infection."

For more information on this research see: Oncolytic herpes simplex virus kills stem-like tumor-initiating colon cancer cells. Molecular Therapy-Oncolytics, 2016;3():1-9. Molecular Therapy-Oncolytics can be contacted at: Nature Publishing Group, 75 Varick St, 9TH Flr, New York, NY 10013-1917, USA.

The news correspondents report that additional information may be obtained from S.G. Warner, City Hope Natl Med Center, Dept. of Surg, Duarte, CA 91010, United States. Additional authors for this research include D. Haddad, J. Au, J.S. Carson, M.P. O'Leary, C. Lewis, S. Monette and Y.M. Fong.

Investigators at Cleveland Clinic Describe Findings in Connective Tissue Cells (In vitro chondrocyte toxicity following long-term, high-dose exposure to Gd-DTPA and a novel cartilage-targeted MR contrast agent)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Connective Tissue Cells have been published. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "To determine the concentrations exhibiting toxicity of a cartilage-targeted magnetic resonance imaging contrast agent compared with gadopentetate dimeglumine (Gd-DTPA) in chondrocyte cultures. A long-term Swarm rat chondrosarcoma chondrocyte-like cell line was exposed for 48 h to 1.0-20 mM concentrations of dianinobutyl-linked nitroxide (DAB4-DLN) citrate, 1.0-20 mM Gd-DTPA, 1.0 mu M staurosporine (positive control), or left untreated."

Financial support for this research came from No outside funding source.

The news reporters obtained a quote from the research from Cleveland Clinic, "Cell appearance, 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) assays of metabolic activity, quantitative PicoGreen assays of DNA content, and calcein-AM viability assays were compared. At 1.0-7.5 mM, minimal decrease in cell proliferation was found for both agents. At all doses of both agents, cell culture appearances were similar after 24 h of treatment. At the higher doses, differences in cell culture appearance were found after 48 h of treatment, with dose-dependent declines in chondrocyte populations for both agents. Concentration-dependent declines in DNA content and calcein fluorescence were found after 48 h of treatment, but beginning at a lower dose of DAB4-DLN citrate than Gd-DTPA. Dose-dependent decreases in MTT staining (cell metabolism) were apparent for both agents, but larger effects were evident at a lower dose for DAB-DLN citrate. Poor MTT staining of cells exposed for 48 h to 20 mM DAB4-DLN citrate probably indicates dead or dying cells. The minimal effect of the long-term exposure of model chondrocyte cell cultures to DAB4-DLN citrate and Gd-DTPA concentrations up to 7.5 mM (3x typical arthrographic administration) is supporting evidence that these doses are acceptable for MR arthrography."

According to the news reporters, the research concluded: "The findings are reassuring given that the experimental exposure to the contrast agents at sustained concentrations was much longer than when used clinically."

For more information on this research see: In vitro chondrocyte toxicity following long-term, high-dose exposure to Gd-DTPA and a novel cartilage-targeted MR contrast agent. Skeletal Radiology, 2017;46(1):23-33. Skeletal Radiology can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. (Springer - www.springer.com; Skeletal Radiology - www.springerlink.com/content/0364-2348/)

Heart Disorders and Diseases - Pericarditis

Investigators at Cleveland Clinic Detail Findings in Pericarditis (Complicated Pericarditis Understanding Risk Factors and Pathophysiology to Inform Imaging and Treatment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Pericarditis. According to news reporting originating in Cleveland, Ohio, by NewsRx journalists, research stated, "Most patients with acute pericarditis have a benign course and a good prognosis. However, a minority of patients develop complicated pericarditis, and the care of these patients is the focus of this review."

The news reporters obtained a quote from the research from Cleveland Clinic, "Specifically, we address risk factors, multimodality imaging, pathophysiology, and novel treatments. The authors conclude that: 1) early high-dose corticosteroids, a lack of colchicine, and an elevated high-sensitivity C-reactive protein are associated with the development of complicated pericarditis; 2) in select cases, cardiovascular magnetic resonance imaging may aid in the assessment of pericardial inflammation and constriction; 3) given phenotypic similarities between recurrent idiopathic pericarditis and periodic fever syndromes, disorders of the inflammasome may contribute to relapsing attacks; and 4) therapies that target the inflammasome may lead to more durable remission and resolution."

According to the news reporters, the research concluded: "Finally, regarding future investigations, the authors discuss the potential of cardiovascular magnetic resonance to inform treatment duration and the need to compare steroid-sparing treatments to pericardiectomy."

For more information on this research see: Complicated Pericarditis Understanding Risk Factors and Pathophysiology to Inform Imaging and Treatment. Journal of the American College of Cardiology, 2016;68(21):2311-2328. InVESTIGATORS AT CLEVELAND CLINIC REPORT FINDINGS IN CHEMOTHERAPY
(NUSE ADHERENCE TO SAFE-HANDLING PRACTICES: OBSERVATION VERSUS SELF-ASSessment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Chemotherapy have been published. According to news reporting originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Chemotherapy medications place nurses at risk for occupational exposure, a primary nursing safety concern. No literature was available on adherence to following chemotherapy handling practices and nurses' perceptions of safe-handling practices."

Our news editors obtained a quote from the research from Cleveland Clinic, "The aims of the pilot study were to examine actual and subjective ambulatory oncology nurse adherence to chemotherapy safe-handling guideline recommendations that prevent chemotherapy exposure. A prospective, comparative mixed-methods study was used to compare objective and subjective nurse behaviors of expected safe chemotherapy handling-specifically, micro-ethnography and questionnaires. Fisher's exact test was used to assess differences in the rates of observations and questionnaire responses. Twenty-two cases of chemotherapy handling were observed, and 12 of 33 nurses completed self-assessments. Of observed practices, nurses completed three behaviors 100% of the time (disposing of gloves in a chemotherapy-approved container after initiating chemotherapy, discarding the chemotherapy bag and tubing after disconnecting chemotherapy infusions, and washing hands after chemotherapy was administered). When objective and subjective behavior adherence were compared, three behaviors were carried out with greater frequency than what nurses perceived on questionnaires (double gloving and gowning when disconnecting chemotherapy and properly discarding chemotherapy)."

According to the news editors, the research concluded: "Two behaviors were carried out with less frequency than nurses provided on questionnaires (double gloving and protecting work surfaces during administration)."

The news editors report that additional information may be obtained by contacting C.M. Colvin, Cleveland Clinic, Off Educ & Profess Practice, Cleveland, OH 44106, United States. Additional authors for this research include D. Karius and N.M. Albert.

Cyclohexanes

Investigators at Clinical Neurosciences Division Detail Findings in Cyclohexanes (Ketamine's Mechanism Of Action: A Path To Rapid-acting Antidepressants)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Cyclohexanes are presented in a new report. According to news originating from West Haven, Connecticut, by NewsRx correspondents, research stated, "Major depressive disorder (MDD) is a common and debilitating psychiatric disorder. Traditional antidepressants are of limited efficacy and take weeks to months to yield full therapeutic effects."

Our news journalists obtained a quote from the research from Clinical Neurosciences Division, "Thus, there is a clear need for effective rapid-acting antidepressant medications. The N-methyl-D-aspartate receptor (NMDA-R) antagonist, ketamine, has received a great deal of attention over the last 20 years due to the discovery that a single subanesthetic dose leads to a rapid antidepressant effect in individuals with treatment-resistant depression. Animal and human research suggest that ketamine's antidepressant effects are mediated by a glutamate surge that leads to a cascade of events that result in synaptogenesis and reversal of the negative effects of chronic stress and depression, particularly within the prefrontal cortex (PFC). Preclinical and clinical data have provided compelling insights into the mechanisms underlying the rapid-acting antidepressant effects of ketamine. This review discusses stress-related neurobiology of depression and the safety, tolerability, and efficacy of ketamine for MDD, along with a review of ketamine's mechanism of action and prospective predictors of treatment response."

According to the news editors, the research concluded: "Research limitations and future clinical prospects are also discussed."

The news correspondents report that additional information may be obtained from C.G. Abdallah, Vet Affairs Connecticut Healthcare Syst, Clin Neurosci Div, Dept. of Vet Affairs, Natl Center Posttraumat Stress Disorder, West Haven, CT, United States. Additional authors for this research include T.G. Adams, B. Kelmendi, I. Esterlis, G. Sanacora and J.H. Krystal.

Investigators at Clinical Research Institute Report Findings in Abdominal Obesity (Time-dependent Changes of Atherosclerotic LDL Complexes after Smoking Cessation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Abdominal Obesity have been published. According to news originating from Kyoto, Japan, by NewsRx correspondents, research stated, "The alpha-1-antitrypsin-low-density lipoprotein complex (AT-LDL) and serum amyloid A-LDL complex (SAA-LDL) are oxidatively modified LDL complexes that promote atherosclerosis. The serum levels of AT-LDL and SAA-LDL are suggested to be increased by obesity and smoking."

Our news journalists obtained a quote from the research from Clinical Research Institute, "We have previously demonstrated that larger weight gain after smoking cessation (SC) perturbs a decrease in the serum level of AT-LDL at 3 months after SC. However, changes of these atherosclerotic makers > 3 months after SC are unknown. This study investigated post-SC time-dependent changes in two atherogenic lipoproteins, AT-LDL and SAA-LDL, and in the extent of abdominal obesity. In 50 outpatients who had continued SC for 1 year, we measured serum AT-LDL and SAA-LDL levels by the enzyme-linked immunosorbent assay before SC, and at 3 months and 1 year after SC. Both body mass index and waist circumstance significantly increased from pre-SC to 3 months after SC and from 3 months after SC to 1 year after SC. Although the serum levels of AT-LDL and SAA-LDL were unchanged from pre-SC to 3 months after SC, these levels decreased significantly from 3 months after SC to 1 year after SC. The extent of abdominal obesity and levels of two atherogenic lipoproteins time-dependently change after SC."

According to the news editors, the research concluded: "Although abdominal obesity progressively worsened after SC, the beneficial effect of non-smoking overcomes the potential vascular risks by cessation-associated obesity at 1 year after SC."

The news correspondents report that additional information may be obtained from K. Hasegawa, National Hospital Organization, Kyoto Med Center, Clin Res Inst, Kyoto, Japan. Additional authors for this research include S. Shimada, H. Wada, H. Yamakage, N. Satoh-Asahara, A. Shimatsu, M. Akao, T. Morimoto, Y. Takahashi and K. Hasegawa.

Investigators at Creighton University Report Findings in Proteus mirabilis (IMP-27, a Unique Metallo-beta-Lactamase Identified in Geographically Distinct Isolates of Proteus mirabilis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Gram-Negative Bacteria - Proteus mirabilis have been published. According to news reporting out of Omaha, Nebraska, by NewsRx editors, research stated, "A novel metallo-beta-lactamase gene, blaIMP-27, was identified in unrelated Proteus mirabilis isolates from two geographically distinct locations in the United States."

Our news journalists obtained a quote from the research from Creighton University, "Both isolates harbor blaIMP-27 as part of the first gene cassette in a class 2 integron. Antimicrobial susceptibility testing indicated susceptibility to aztreonam, piperacillin-tazobactam, and ceftazidime but resistance to ertapenem."

According to the news editors, the research concluded: "However, hydrolysis assays indicated that ceftazidime was a substrate for IMP-27."

Our news journalists report that additional information may be obtained by contacting N.D. Hanson, Creighton University, Sch Med, Center Res Antiinfect & Biotechnol, Dept. of Med Microbiol & Immunol, Omaha, NE 68102, United States. Additional authors for this research include R.C. Fowler, A. Yoshizumi, T. Horiyama, Y. Ishii, L. Harrison, C.N. Geyer, E.S. Moland, K. Thomson and N.D. Hanson.

Sexually Transmitted Diseases and Conditions…

Investigators at Creighton University School of Medicine Target Syphilis (The continuing threat of syphilis in pregnancy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Sexually Transmitted Diseases and Conditions (STDs) - Syphilis is the subject of a report. According to news originating from Omaha, Nebraska, by NewsRx correspondents, research stated, "Syphilis in pregnancy continues to be a worldwide threat to mothers and their fetuses, and in recent years has been increasing in prevalence. The purpose of this short review is to address current issues in the diagnosis and management of syphilis complicating pregnancies."
Our news journalists obtained a quote from the research from the Creighton University School of Medicine, "Maternal syphilis infections and congenital syphilis appear to be increasing in both high and low resource settings. Treponema pallidum ssp. pallidum, the causative spirochete of syphilis, remains one of the few human infectious pathogens that has not been successfully cultured, making identification difficult and research in targeted antimicrobial therapies challenging. Fortunately, syphilis remains sensitive to penicillin, which remains the foundational therapy for this infection. Patients with syphilis and significant penicillin allergies remain a specific challenge in treatment. Of concern is the emergence of T. pallidum resistant to macrolides such as azithromycin. This will limit options in patients with penicillin allergies, and potentially contribute to suboptimal treatment. During pregnancy, penicillin is the only known effective treatment for congenital syphilis, and pregnant patients with penicillin allergy should be desensitized and treated with penicillin. Research focusing on protein expression of the genome of T. pallidum may lead to more accurate screening and diagnosis and development of novel antibiotic therapies. Obstetric and pediatric providers, public health organizations, and governments should recognize the re-emergence of syphilis globally and in their local healthcare environments."

According to the news editors, the research concluded: "Screening of all pregnant patients with robust treatment and follow-up represents the most effective method to reduce congenital syphilis currently available."

For more information on this research see: The continuing threat of syphilis in pregnancy. Current Opinion In Obstetrics & Gynecology, 2016;28(2):101-4. (Lippincott Williams and Wilkins - www.lww.com; Current Opinion In Obstetrics & Gynecology - journals.lww.com/co-obgyn/pages/default.aspx)

**Investigators at Dalian University of Technology Target Chemical Biology and Drug Design (Mechanism of Mcl-1 Conformational Regulation Upon Small Molecule Binding Revealed by Molecular Dynamic Simulation)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Chemical Biology and Drug Design are discussed in a new report. According to news originating from Dalian, People's Republic of China, by NewsRx correspondents, research stated, "Inhibition of interactions
between Mcl-1 and proapoptotic proteins is considered to be a therapeutic strategy to induce apoptosis in cancer cells. Here, we adopted molecular dynamics simulation with molecular mechanics-Poisson Boltzmann/surface area method (MM-PB/SA) to study the inhibition mechanism of three Mcl-1 inhibitors, compounds 1, 2, and 3.

Financial support for this research came from National Natural Science Foundation of China.

Our news journalists obtained a quote from the research from the Dalian University of Technology, "Analysis of energy components shows that the better binding free energy of compound 3 than compounds 1 and 2 is attributable to the van der Waals energy (DEvdw) and non-polar solvation energy (DGnp) upon binding. In addition to the excellent agreement with previous experimentally determined affinities, our simulation results further show a bend of helix 4 on Mcl-1 upon compound 3 binding, which is driven by hydrophobic interaction with residue Val(253), leading to a narrowed BH3-binding groove to impede Puma(BH)(3) binding. The computational result is consistent with our competitive isothermal titration calorimetry (ITC) assays, which shows that the competitive ability of compound 3 toward Mcl-1/Puma(BH)(3) complex is improved beyond its direct binding affinity toward Mcl-1 itself, and compound 3 exhibits much more efficiency to compete with Puma(BH)(3) than compound 2."

According to the news editors, the research concluded: "Our study provides a new strategy to improve inhibitory activity on Mcl-1 based on the conformational dynamic change."

The news correspondents report that additional information may be obtained from A. Wang, State Key Laboratory of Fine Chemicals, School of Chemistry, Dalian University of Technology, Dalian, 116024, People's Republic of China. Additional authors for this research include T. Song, Z. Wang, Y. Liu, Y. Fan, Y. Zhang and Z. Zhang.

**Cardiovascular Diseases and Conditions**

**Investigators at Dandenong Hospital Release New Data on Hypotension (Calcium channel antagonist and beta-blocker overdose: antidotes and adjunct therapies)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions -
Hypotension have been published. According to news reporting originating in Dandenong, Australia, by NewsRx journalists, research stated, "Management of cardiovascular instability resulting from calcium channel antagonist (CCB) or beta-adrenergic receptor antagonist (BB) poisoning follows similar principles. Significant myocardial depression, bradycardia and hypotension result in both cases."

The news reporters obtained a quote from the research from Dandenong Hospital, "CCBs can also produce vasodilatory shock. Additionally, CCBs, such as verapamil and diltiazem, are commonly ingested in sustained-release formulations. This can also be the case for some BBs. Peak toxicity can be delayed by several hours. Provision of early gastrointestinal decontamination with activated charcoal and whole-bowel irrigation might mitigate this. Treatment of shock requires a multimodal approach to inotropic therapy that can be guided by echocardiographic or invasive haemodynamic assessment of myocardial function. High-dose insulin euglycaemia is commonly recommended as a first-line treatment in these poisonings, to improve myocardial contractility, and should be instituted early when myocardial dysfunction is suspected. Catecholamine infusions are complementary to this therapy for both inotropic and chronotropic support. Catecholamine vasopressors and vasopressin are used in the treatment of vasodilatory shock. Optimizing serum calcium concentration can confer some benefit to improving myocardial function and vascular tone after CCB poisoning. High-dose glucagon infusions have provided moderate chronotropic and inotropic benefits in BB poisoning. Phosphodiesterase inhibitors and levosimendan have positive inotropic effects but also produce peripheral vasodilation, which can limit blood pressure improvement. In cases of severe cardiogenic shock and/or cardiac arrest post-poisoning, extracorporeal cardiac assist devices have resulted in successful recovery."

According to the news reporters, the research concluded: "Other treatments used in refractory hypotension include intravenous lipid emulsion for lipophilic CCB and BB poisoning and methylene blue for refractory vasodilatory shock."

Our news correspondents report that additional information may be obtained by contacting A. Graudins, Monash Health Clinical Toxology and Addiction Medicine Service, Monash Health, Dandenong Hospital, David Street, Dandenong, VIC, 3175, Australia. Additional authors for this research include H.M. Lee and D. Druda.

Liver Diseases and Conditions - Hepatitis

Investigators at Dankook University Report Findings in Hepatitis
(Cerbera manghas methanol extract exerts anti-inflammatory activity by targeting c-Jun N-terminal kinase in the AP-1 pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Liver Diseases and Conditions - Hepatitis. According to news reporting originating from Gyeonggi Do, South Korea, by NewsRx correspondents, research stated, "Ethnopharmacological relevance: Cerbera manghas L. (Apocynaceae) is a medicinal plant traditionally used to ameliorate the clinical signs of inflammatory diseases and hypertension. Aim of study: Although C. manghas L has long been used as a traditional remedy for various diseases, the underlying molecular and cellular mechanisms are poorly understood."

Financial support for this research came from Research fund of Dankook University. Our news editors obtained a quote from the research from Dankook University, "A detailed investigation of these mechanisms is necessary to demonstrate the ethnopharmaceutical utility of this plant. The effects of C manghas methanol extract (Cm-ME) on the production of inflammatory mediators and the expression of proinflammatory cytokines and identification of molecular targets were investigated using lipopolysaccharide (LPS)-treated macrophages in vitro. In addition, the inhibitory effects of Cm-ME orally administered were tested by LPS/D-galactosamine (D-GalN)-induced hepatitis and LPS-induced peritonitis mouse models in vivo. Cm-ME downregulated the production of prostaglandin (PG)E-2 and the mRNA expression of cyclooxygenase (COX)-2, tumor necrosis factor (TNF)-alpha, and interleukin (IL)-1 beta in LPS-stimulated RAW264.7 cells under non-toxic concentration of Cm-ME. This extract inhibited the nuclear translocation of c-Jun and p-ATF2, the phosphorylation of JNK and p38, and AP-1 activity. Western blot analysis and in vitro kinase assay confirmed that JNK is a direct pharmacological target of Cm-ME action. In addition, Cm-ME significantly ameliorated the clinical signs of LPS/D-GalN-induced hepatitis and lowered the production of nitric oxide (NO) and the phosphorylation of JNK in LPS-induced peritonitis conditions. Cm-ME exerts anti-inflammatory actions on LPS-stimulated macrophages and in mouse models of acute inflammatory disease."

According to the news editors, the research concluded: "These actions are predominantly mediated by targeting JNK in the AP-1 signaling pathway."

The news editors report that additional information may be obtained by contacting D. Kim, Dankook University, Dept. of Multimedia Engn, Lab Bioinformat, Yongin, Gyeonggi Do, South Korea. Additional authors for this research include J.Y. Cho and D. Kim.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jep.2016.08.033. This DOI is a link to an online electronic document that is either free or for purchase.

Investigators at Department of Cardiology Discuss Findings in Propanolamines (Bailout intravenous esmolol for heart rate control in cardiac computed tomography angiography)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Propanolamines. According to news reporting from Lisbon, Portugal, by NewsRx journalists, research stated, "To evaluate the efficacy and safety of a heart rate (HR) reduction protocol using intravenous esmolol as bailout for failed oral metoprolol regimens in patients undergoing coronary computed tomography angiography (CCTA) with 64-slice multidetector computed tomography (64-MDCT). Patients who underwent cardiac 64-MDCT in a single institution between 2011 and 2014 were analyzed."

The news correspondents obtained a quote from the research from the Department of Cardiology, "Those with HR above 60 beats per minute (bpm) on presentation received oral metoprolol (50-200 mg) at least one hour before CCTA. Intravenous esmolol 1-2 mg/kg was administered as a bolus whenever HR remained over 65 bpm just before imaging. The primary efficacy endpoint was HR <65 bpm during CCTA. The primary safety endpoint was symptomatic hypotension or bradycardia up to hospital discharge. During the study period CCTA was performed in 947 cases. In 86% of these, oral metoprolol was the only medication required to successfully reduce HR <60 bpm. Esmolol was used in the remaining 130 patients (14%). For esmolol-treated patients mean baseline and acquisition HR were 74 +/- 14 bpm and 63 +/- 9 bpm, respectively (p <0.001). The target HR of <65 bpm was achieved in 82 of the 130 esmolol-treated patients (63%). Considering the whole population, esmolol use led to a significant increase in the primary efficacy endpoint from 86% to 95% (p <0.001). Esmolol also resulted in a statistically, but not clinically, significant reduction in systolic blood pressure (144 +/- 22 to 115 +/- 17 mmHg; p<0.001). The combined primary safety endpoint was only observed in two (1.5%) patients. Despite optimal use of oral beta-blockers, 14% of patients needed intravenous esmolol for HR control."

According to the news reporters, the research concluded: "The pre-medication combination of oral metoprolol and on-demand administration of intravenous esmolol was safe and effective and enabled 95% of patients to be imaged with HR below 65 bpm."

For more information on this research see: Bailout intravenous esmolol for heart rate control in cardiac computed tomography angiography. Revista Portuguesa De Cardiologia, 2016;35(12):673-678. Revista Portuguesa De Cardiologia can be contacted at: Elsevier Doyma Sl, Travesera De Garcia, 17-21, Barcelona, 08021, Spain. Our news journalists report that additional information may be obtained by contacting S.A. Rosa, Santa Marta Hosp, Dept. of Cardiol, Lisbon, Portugal. Additional authors for this research include R. Ramos, H. Marques, R. Santos, C. Leal, H. Casado, M. Saraiva, L.
Investigators at Department of Clinical Laboratory Release New Data on Peptide Hormones (Ghrelin attenuates the growth of HO-8910 ovarian cancer cells through the ERK pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Peptide Proteins - Peptide Hormones have been published. According to news originating from Hohhot, People's Republic of China, by NewsRx correspondents, research stated, "Ovarian cancer is one of the most common causes of death from gynecologic tumors and is an important public health issue. Ghrelin is a recently discovered bioactive peptide that acts as a natural endogenous ligand of the growth hormone secretagogue receptor (GHSR)."

Our news journalists obtained a quote from the research from the Department of Clinical Laboratory, "Several studies have identified the protective effects of ghrelin on the mammalian reproductive system. However, little research has been done on the effects of ghrelin on ovarian cancer cells, and the underlying mechanisms of these effects. We sought to understand the potential involvement of mitogen-activated protein kinases (MAPKs) in ghrelin-mediated inhibition of growth of the ovarian line HO-8910. We applied different concentrations of ghrelin and an inhibitor of the ghrelin receptor (D-Lys3-GHRP-6) to HO-8910 cells and observed the growth rate of cells and changes in phosphorylation of the MAPKs ERK1/2, JNK and p38. We discovered that ghrelin-induced apoptosis of HO-8910 cells was though phosphorylated ERK1/2, and that this phosphorylation (as well as p90rsk phosphorylation) was mediated by the GHSR. The ERK1/2 pathway is known to play an essential part in the ghrelin-mediated apoptosis of HO-8910 cells."

According to the news editors, the research concluded: "Hence, our study suggests that ghrelin inhibits the growth of HO-8910 cells primarily through the GHSR/ERK pathway."

For more information on this research see: Ghrelin attenuates the growth of HO-8910 ovarian cancer cells through the ERK pathway. Brazilian Journal of Medical and Biological Research, 2016;49(3):.

The news correspondents report that additional information may be obtained from R.X. Bai, Dept. of Clinical Laboratory, Inner Mongolia People's Hospital, Hohhot, People’s Republic of China. Additional authors for this research include W.P. Wang, P.W. Zhao and C.B Li.

Musculoskeletal Diseases and Conditions - Acromegaly

Investigators at Department of Endocrinology Zero in on Acromegaly (Circadian variation in serum cortisol during hydrocortisone replacement is not attributable to changes in cortisol-binding globulin concentrations)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Acromegaly. According to news reporting originating from London, United Kingdom, by NewsRx correspondents, research stated, "Patients taking hydrocortisone (HC) replacement for primary or secondary adrenal failure require individual adjustment of their dose. In addition to modifying the administered doses of HC for each patient, physicians are increasingly interested in variations in the bioavailability of glucocorticoid replacement."

Our news editors obtained a quote from the research from the Department of Endocrinology, "One potential determinant of the bioavailability of replaced HC is a variation in serum cortisol-binding globulin (CBG) concentration, which may, in turn, affect interpretation of cortisol profiles and individual dose selection for patients on hydrocortisone replacement therapy. To investigate the hypothesis that there is a circadian variation in CBG levels. A total of 34 male patients divided into 3 groups (10 patients with non-somatotroph structural pituitary disease on HC replacement, 11 patients with treated acromegaly on HC replacement and 13 patients with treated acromegaly not on HC replacement) and 10 healthy volunteers were included. Cortisol and CBG levels were measured at 6 time points (0800, 1100, 1300, 1500, 1700 and 1900). No significant circadian variation in CBG concentration was found in any of the 4 groups. Circadian variation in serum cortisol during hydrocortisone replacement is not attributable to changes in cortisol-binding globulin concentration."

According to the news editors, the research concluded: "Changes in serum cortisol levels may thus be explained by other factors including 11 b-hydroxysteroid dehydrogenase type 1 activity or circadian changes in the binding properties of CBG."

The news editors report that additional information may be obtained by contacting T.T. Chung, Dept. of Endocrinology, St Bartholomew's Hospital, Barts Health NHS Trust, London, UK. Additional authors for this research include K. Gunganah, J.P. Monson and W.M Drake.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/cen.12982. This DOI is a link to an online electronic document that is either free or for purchase.
Investigators at Department of Gynecology Describe Findings in Breast Cancer (Can a pathological complete response of breast cancer after neoadjuvant chemotherapy be diagnosed by minimal invasive biopsy?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting originating from Heidelberg, Germany, by NewsRx correspondents, research stated, "This study aimed to explore the ability of a minimal invasive biopsy to diagnose a pathological complete response (pCR = ypT0) in the breast. Ultrasound-guided, vacuum-assisted, minimal invasive biopsy (VAB) was performed in 50 patients after neoadjuvant chemotherapy and before breast surgery."

Our news editors obtained a quote from the research from the Department of Gynecology, "Negative predictive values (NPV) and false negative rates (FNR) to predict a pCR in surgical specimen were the main outcome measures. To assess the possible sampling error, the representativeness of the sample was evaluated by the biopsy performing physician (subjectively based on the visibility in ultrasound), by radiography of the biopsy specimen, and by the pathologist (based on histopathology). The cohort (n = 50) consisted of 15 (30%) triple negative breast cancers, 13 (26%) human epidermal growth factor receptor 2 (HER2) positive and 22 (44%) hormone receptor positive/HER2 negative cancers. ypT0 was diagnosed in 23 (46%) cases. In the overall cohort (n = 50), VAB yielded an NPV of 76.7% and an FNR of 25.9%. Given a representative VAB sample, according to the histopathological evaluation (n = 38), the NPV was 94.4% (95% CI 87.1-100.0) and the FNR 4.8% (95% CI 0.0-11.6). Non-representative VABs were mainly due to bad visibility of the target lesion in ultrasound."

According to the news editors, the research concluded: "A VAB can accurately diagnose a pCR, given a histopathologically representative sample."

The news editors report that additional information may be obtained by contacting J. Heil, Univ Breast Unit, Dept. of Gynecol, D-69120 Heidelberg, Germany. Additional authors for this research include B. Schaeffgen, P. Sinn, H. Richter, A. Harcos, C. Gomez, A. Stieber, A. Hennigs, G. Rauch, F. Schuetz, C. Sohn, A. Schneeweiss and M. Golatta.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ejca.2016.09.034. This DOI is a link to an online electronic
Investigators at Department of Medicine Discuss Findings in Paraproteinemias (Paraprotein-Related Kidney Disease: Kidney Injury from Paraproteins-What Determines the Site of Injury?)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immune System Diseases and Conditions - Paraproteinemias have been published. According to news reporting originating from Birmingham, Alabama, by NewsRx correspondents, research stated, "Disorders of plasma and B cells leading to paraproteinemias are associated with a variety of renal diseases. Understanding the mechanisms of injury and associated nephropathies provides a framework that aids clinicians in prompt diagnosis and appropriate adjunctive treatment of these disorders."

Our news editors obtained a quote from the research from the Department of Medicine, "Glomerular diseases that may be associated with paraproteinemias include amyloid deposition, monoclonal Ig deposition disease, proliferative GN with monoclonal Ig deposits, C3 glomerulopathy caused by alterations in the complement pathway, immunotactoid glomerulopathy, fibrillary GN, and cryoglobulinemia. Tubular lesions include the classic Fanconi syndrome, light chain proximal tubulopathy, interstitial fibrosis, and cast nephropathy. These paraproteinemic renal diseases are distinct in their pathogenesis as well as their urinary and kidney biopsy findings. Renal pathology is usually initiated by deposition and direct involvement of the intact monoclonal Ig or Ig fragments with resident cells of the nephron."

According to the news editors, the research concluded: "Our review summarizes current insights into the underlying molecular pathogenesis of these interesting kidney lesions."

The news editors report that additional information may be obtained by contacting P.W. Sanders, Vet Affairs Med Center, Dept. of Med, Birmingham, AL, United States. Additional authors for this research include A. Lahoti, F.R. Danesh, V. Batuman and P.W. Sanders.

Keywords for this news article include: Birmingham, Alabama, United States, North and Central America, Immune System Diseases and Conditions, Immunoproliferative Disorders, Paraproteinemias, Immunoglobulins, Blood Proteins, Renal Disease, Paraproteins, Nephrology, Immunology, Kidney, Department of Medicine.

Investigators at Department of Neuroscience Zero in on Carrier Proteins (TDP-43 functions within a network of hnRNP proteins to inhibit the production of a truncated human SORT1 receptor)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - Carrier Proteins have been published. According to news reporting from Jacksonville, Florida, by NewsRx journalists, research stated, "The aggregation and mislocalization of RNA-binding proteins leads to the aberrant regulation of RNA metabolism and is a key feature of many neurodegenerative diseases, including amyotrophic lateral sclerosis and frontotemporal dementia. However, the pathological consequences of abnormal deposition of TDP-43 and other RNA-binding proteins remain unclear, as the specific molecular events that drive neurodegeneration have been difficult to identify and continue to be elusive."

Funders for this research include Thierry Latran Fondation (REHNPALS), National Institutes of Health, National Institute of Neurological Disorders and Stroke, National Institute of Environmental Health Services, The ALS Association.

The news correspondents obtained a quote from the research from the Department of Neuroscience, "Here, we provide novel insight into the complexity of the RNA-binding protein network by demonstrating that the inclusion of exon 17b in the SORT1 mRNA, a pathologically relevant splicing event known to be regulated by TDP-43, is also considerably affected by additional RNA-binding proteins, such as hnRNP L, PTB/nPTB and hnRNP A1/A2. Most importantly, the expression of hnRNP A1/A2 and PTB/nPTB is significantly altered in patients with frontotemporal dementia with TDP-43-positive inclusions (FTLD-TDP), indicating that perturbations in RNA metabolism and processing in FTLD-TDP are not exclusively driven by a loss of TDP-43 function."

According to the news reporters, the research concluded: "These results also suggest that a comprehensive assessment of the RNA-binding protein network will dramatically advance our current understanding of the role of TDP-43 in disease pathogenesis, as well as enhance both diagnostic and therapeutic capabilities."

Our news journalists report that additional information may be obtained by contacting L. Petrucelli, Dept. of Neuroscience, Mayo Clinic, 4500 San Pablo Road S, Jacksonville, FL 32224, United States. Additional authors for this research include M. Prudencio, C. Stuani, C. Cook, K. Jansen-West, D.W. Dickson, L. Petrucelli and E. Buratti.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1093/hmg/ddv491. This DOI is a link to an online electronic document that is either free or for purchase.

Investigators at Department of Pharmacology & Toxicology Describe Findings in Skin Cancer (Anandamide-induced Endoplasmic Reticulum Stress and Apoptosis are Mediated by Oxidative Stress in Non-melanoma Skin Cancer: Receptor-independent ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Skin Cancer are presented in a new report. According to news reporting from Greenville, North Carolina, by NewsRx journalists, research stated, "Endocannabinoids are neuromodulatory lipids that regulate central and peripheral physiological functions. Endocannabinoids have emerged as effective antitumor drugs due to their ability to induce apoptosis in various cancer studies."

The news correspondents obtained a quote from the research from the Department of Pharmacology & Toxicology, "The G-protein coupled cannabinoid receptors (CB1 and CB2) and the TRPV1 ion channel were reported to mediate the antiproliferative activity of endocannabinoids. However, receptor-independent effects also account for their activity. Our previous studies showed that the antiproliferative activity of anandamide (AEA) was regulated by cyclooxygenase-2 (COX-2) via induction of endoplasmic reticulum (ER) stress. We also determined that AEA induced oxidative stress. However, the role of oxidative stress, the cannabinoid receptors, and TRPV1 in AEA-induced ER stress-apoptosis was unclear. Therefore, the current study examines the role of oxidative stress in ER stress-apoptosis and investigates whether this effect is modulated by CB1, CB2, or TRPV1. In non-melanoma skin cancer (NMSC) cells, AEA reduced the total intracellular level of glutathione and induced oxidative stress. To evaluate the importance of oxidative stress in AEA-induced cell death, the antioxidants, N-acetylcysteine (NAC) and Trolox, were utilized. Each antioxidant ameliorated the antiproliferative effect of AEA. Furthermore, Trolox inhibited AEA-induced CHOP10 expression and caspase 3 activity, indicating that oxidative stress was required for AEA-induced ER stress-apoptosis. On the other hand, selective blockade of CB1, CB2, and TRPV1 did not inhibit AEA-induced oxidative stress or ER stress-apoptosis. These findings suggest that AEA-induced ER stress-apoptosis in NMSC cells is mediated by oxidative stress through a receptor-independent mechanism."

According to the news reporters, the research concluded: "Hence, receptor-independent AEA signaling pathways may be targeted to eliminate NMSC."

Our news journalists report that additional information may be obtained by contacting R. Van Dross, East Carolina Univ, Brody Sch Med, Dept. of Pharmacol & Toxicol, Greenville, NC, United States.

Investigators at Department of Pharmacology Report Findings in Heart Attack (Inhibition of RhoA/Rho kinase by ibuprofen exerts cardioprotective effect on isoproterenol induced myocardial infarction in rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Heart Disorders and Diseases - Heart Attack. According to news reporting originating in Gujarat, India, by NewsRx journalists, research stated, "Myocardial infarction (MI) and hypertension are the leading cause of death worldwide so protection of heart is focus of intense research. Rho-kinase, a downstream effector of protein involved in MI and hypertension, is inhibited by ibuprofen."

The news reporters obtained a quote from the research from the Department of Pharmacology, "This study aims to elucidate cardioprotective effect of ibuprofen in rats. MI was produced in rats with 85 mg/kg isoproterenol (ISO) administered s.c. twice at an interval of 24 h. The rats were randomized into six groups: (I) Normal; (II) ISO; (III) ISO + ascorbic acid (250 mg/kg p.o.); (IV-VI) ISO + ibuprofen (30, 60 and 90 mg/kg p.o). After the completion of the study period of 21 days, cardiac function and biomarkers were assessed. Pre-treatment with ibuprofen (30, 60 and 90 mg/kg p.o) ameliorated high BP and left ventricular dysfunction, furthermore it prevented the rise in CKMB, LDH and alpha-HBDH, suggesting the effect of ibuprofen in maintenance of cell membrane integrity. In addition, it also prevented alteration in the levels of electrolytes, ATPase activity and antioxidant status. Ibuprofen suppressed ISO-induced ROCK-1 mRNA expression and histological changes."

According to the news reporters, the research concluded: "Ibuprofen provided cardioprotection in a model of myocardial infarction, by restoring most of the altered physical, physiological, biochemical, haemodynamic parameters, antioxidant status, and histological changes and by inhibiting ROCK-1 mRNA expression."

For more information on this research see: Inhibition of RhoA/Rho kinase by ibuprofen exerts cardioprotective effect on isoproterenol induced myocardial infarction in rats. European Journal of Pharmacology, 2016;791():91-98. European Journal of Pharmacology can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. Clinical Research - Clinical Trials and Studies

Investigators at Department of Radiation Oncology Release New Data on Clinical Trials and Studies (Phase I trial evaluating the antiviral agent Cidofovir in combination with chemoradiation in cervical cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Clinical Research - Clinical Trials and Studies. According to news originating from Villejuif, France, by NewsRx correspondents, research stated, "This phase I trial aimed to assess the safety and determine the recommended Phase II dose (RP2D) of Cidofovir combined with chemoradiotherapy in patients with stage IB2-IVA cervical cancer. Incremental doses (1, 2.5, 5 and 6.5 mg/kg) of IV Cidofovir were administered weekly for two weeks, and then every 2 weeks from the start of chemoradiotherapy to the initiation of utero-vaginal brachytherapy."

Our news journalists obtained a quote from the research from the Department of Radiation Oncology, "Biological expression of HPV was analyzed during treatment and tumor response was assessed according to RECIST v1.0 criteria. A total of 15 patients were treated with Cidofovir. Dose-limiting toxicities occurred in 2/6 patients at the 6.5 mg/kg dose level (G3 proteinuria, and G3 acute pyelonephritis with G3 febrile neutropenia). No toxicity occurred at the 5 mg/kg dose level, but only 3 patients received this dose due to trial interruption because of low accrual. The most frequent G3-4 adverse effects observed during the trial were: abdominal pain (n=3), infection (n=2), leuckoneutropenia (n=2), and others (n=6). No toxic death or major renal side effect occurred. The best response was that 8/9 evaluable patients achieved a complete response (89%). In the intention to treat population, the 2-year overall and progression-free survival rates were 93% and 76%, respectively. Biological monitoring of HPV-related markers (decreased p16 expression, and increased p53 and pRb levels) was possible on sequential tumor biopsy samples. The genomic alterations identified were PIK3CA (n=5; one also had a KRAS mutation), and HRAS (n=1) mutations. Cidofovir at a dose of 5mg/kg combined with chemoradiotherapy appeared tolerable and yielded tumor regressions."

According to the news editors, the research concluded: "Due to early trial interruption, the RP2D was not confirmed."

For more information on this research see: Phase I trial evaluating the antiviral agent Cidofovir in combination with chemoradiation in cervical cancer patients. Oncotarget, 2016;7 (18):25549-57.

Cardiovascular Diseases and Conditions - Thrombosis

Investigators at Department of Urology Report Findings in Thrombosis (Late Allograft Renal Vein Thrombosis Treated With Anticoagulation Alone: A Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiovascular Diseases and Conditions - Thrombosis is now available. According to news reporting originating in Oporto, Portugal, by NewsRx journalists, research stated, "Allograft renal vein thrombosis is a rare complication of kidney transplantation. Most cases occur in the first 2 weeks after transplantation, but there are cases described many years after the transplant surgery."

The news reporters obtained a quote from the research from the Department of Urology, "Allograft loss is the usual outcome. We present a case of a renal transplant recipient with allograft renal vein thrombosis associated with deep venous thrombosis of a lower limb, 9 years after transplantation. He was successfully treated with anticoagulation alone, with recovery of allograft function. The patient was given unfractioned heparin and elastic compression stockings. Five days later, the patient recovered diuresis and hemodialysis treatment was discontinued. Doppler ultrasound was done and revealed partial re-permeabilization of allograft renal vein, with maximal velocity of 15 cm/s. After 30 months of follow-up, the patient was maintained on oral anticoagulation with warfarin, and no thromboembolic or hemorrhagic events were documented. The patient's serum creatinine was stable, between 1.6 and 1.8 mg/dL."

According to the news reporters, the research concluded: "Our patient demonstrated that anticoagulation alone and dialytic support might be able to promote total recovery of allograft function after renal vein thrombosis."

Our news correspondents report that additional information may be obtained by contacting C. Ferreira, Unidade Local Saude Matosinhos, Dept. of Urol, Oporto, Portugal. Additional authors for this research include L. Pereira, P. Pereira, I. Tavares, S. Sampaio, M. Bustorff and M. Pestana.

Investigators at Digestive Disease Institute Target Inflammatory Bowel Disease (Links of Autophagy Dysfunction to Inflammatory Bowel Disease Onset)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Digestive System Diseases and Conditions - Inflammatory Bowel Disease is now available. According to news originating from Cleveland, Ohio, by NewsRx correspondents, research stated, "Autophagy is a cellular stress response that plays key roles in physiological processes, such as adaptation to starvation, degradation of aberrant proteins or organelles, anti-microbial defense, protein secretion, and innate and adaptive immunity. Dysfunctional autophagy is recognized as a contributing factor in many chronic inflammatory diseases, including inflammatory bowel disease (IBD)."

Our news journalists obtained a quote from the research from Digestive Disease Institute, "Genetic studies have identified multiple IBD-associated risk loci that include genes required for autophagy, and several lines of evidence demonstrate that autophagy is impaired in IBD patients. How dysfunctional autophagy contributes to IBD onset is currently under investigation by researchers. Dysfunctional autophagy has been identified to play a role in IBD pathogenesis by altering processes that include (1) intracellular bacterial killing, (2) anti-microbial peptide secretion by Paneth cells, (3) pro-inflammatory cytokine production by macrophages, (4) antigen presentation by dendritic cells, (5) goblet cell function, and (6) the endoplasmic reticulum stress response in enterocytes. The overall effect of dysregulation of these processes varies by cell type, stimulus, as well as cellular context. Manipulation of the autophagic pathway may provide a new avenue in the search for effective therapies for IBD. Autophagy plays multiple roles in IBD pathogenesis."

According to the news editors, the research concluded: "A better understanding of the role of autophagy in IBD patients may provide better subclassification of IBD phenotypes and novel approaches to disease management."

The news correspondents report that additional information may be obtained from F. El-Khider, Dept. of Gastroenterology and Hepatology, Digestive Disease Institute, Cleveland Clinic, Cleveland, Ohio, United States.

Investigators at Division of Cardiology Describe Findings in Immunoproteins [iMAP (TM) imaging of tumorous lesions surrounding the coronary arteries in a patient with an elevated serum level of immunoglobulin G4]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Immunology - Immunoproteins have been presented. According to news reporting originating from Toyota, Japan, by NewsRx correspondents, research stated, "A 76-year-old woman with multiple coronary risk factors was admitted to our hospital because of episodes of new-onset chest pain that had begun 3 days previously. She underwent percutaneous coronary intervention (PCI) for severe stenoses in the two high lateral (HL) branches."

Our news editors obtained a quote from the research from the Division of Cardiology, "Intravascular ultrasound (IVUS) revealed massive stenotic lesions in the HL branches and tumorous nonstenotic lesions in the left anterior descending coronary artery (LAD) and the left circumflex coronary artery (LCx). iMAP™, optical coherence tomography (OCT), and coronary computed tomography angiography (CCTA) were performed. iMAP depicted fibrosis in the vessel (green areas) and nonfibrotic tissue change suggestive of inflammation outside the vessel (yellow/red areas). OCT revealed high-intensity homogenous intimal hyperplasia with superficial calcification, and CCTA showed massive periarterial soft lesions in the HL, LAD, and LCx. The serum IgG4 level was high at 252-427 mg/dL (8 measurements) (reference range, 4.8-105.0 mg/dL). We suspected IgG4-related coronary periarteritis on the basis of the comprehensive diagnostic criteria as a possible diagnosis. The clinical course was good after initial and subsequent PCIs for both the HL stenoses and the progressing LCx stenosis, and there was no recurrence of angina pectoris thereafter."

According to the news editors, the research concluded: "Steroids were not administered because the massive lesions did not enlarge during the 16 months of follow-up. iMAP was able to evaluate the tissue characteristics of tumorous lesions in the stenosed HL branches and the nonstenotic LAD and LCx in a patient with an elevated level of IgG4."

For more information on this research see: iMAP™ imaging of tumorous lesions surrounding the coronary arteries in a patient with an elevated serum level of immunoglobulin G4. *Heart and Vessels*, 2016;31(12):2061-2067. *Heart and Vessels* can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Oncology - Acute Lymphoblastic Leukemia

Investigators at Dokkyo Medical University School of Medicine Report New Data on Acute Lymphoblastic Leukemia (Burkitt-Type Acute Lymphoblastic Leukemia With Precursor B-Cell Immunophenotype and Partial Tetrasomy of 1q: A Case Report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Acute Lymphoblastic Leukemia. According to news originating from Tochigi, Japan, by NewsRx correspondents, research stated, "Burkitt-type acute lymphoblastic leukemia (B-ALL) is thought as a variant of Burkitt lymphoma/leukemia and derived from mature B-cell lymphoblast.B-ALL was developed in a 10-year-old girl. Two characteristics were apparent in this case."

Our news journalists obtained a quote from the research from the Dokkyo Medical University School of Medicine, "First, the lymphoblasts were positive for CD10, CD19, CD20, and CD22, but negative for terminal deoxynucleotidyl transferase and surface immunoglobulins, indicating a B-cell immunophenotype. The detection of t(8;14)(q24;q32) with a chromosomal analysis is required for a diagnosis of B-ALL. Second, der(1)(pter → q32.1::q32.1 → q21.1::q11 → qter) was detected, in which 1q21.1 to 1q32.1 was inverted and inserted. Finally, partial tetrasomy of 1q was also present."

According to the news editors, the research concluded: "Because B-ALL with abnormal chromosome 1 has been reported poor outcome, the usual chemotherapy for stage 4 Burkitt lymphoma with added rituximab was administered for our patient. We report B-ALL with precursor B-cell immunophenotype and interesting partial tetrasomy of 1q."

For more information on this research see: Burkitt-Type Acute Lymphoblastic Leukemia With Precursor B-Cell Immunophenotype and Partial Tetrasomy of 1q: A Case Report. Medicine, 2016;95(10):e2904. (Elsevier - www.elsevier.com; Medicine - www.journals.elsevier.com/medicine/)

Ischemia

Investigators at Dokuz Eylul University Have Reported New Data on Ischemia (Renal Ischemia/Reperfusion Injury in Diabetic Rats: The Role of Local Ischemic Preconditioning)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Ischemia are presented in a new report. According to news reporting originating from Izmir, Turkey, by NewsRx correspondents, research stated, "The aim of this study was to evaluate the effects of local ischemic preconditioning using biochemical markers and histopathologically in the diabetic rat renal IR injury model. DM was induced using streptozotocin."

Our news editors obtained a quote from the research from Dokuz Eylul University, "Rats were divided into four groups: Group I, nondiabetic sham group (n=7), Group II, diabetic sham group (n=6), Group III, diabetic IR group (diabetic IR group, n=6), and Group IV, diabetic IR + local ischemic preconditioning group (diabetic IR + LIPC group, n=6). Ischemic renal injury was induced by clamping the bilateral renal artery for 45 min. 4 h following ischemia, clearance protocols were applied to assess biochemical markers and histopathologically in rat kidneys. The histomorphologic total cell injury scores of the nondiabetic sham group were significantly lower than diabetic sham, diabetic IR, and diabetic IR + LIPC groups. Diabetic IR group scores were not significantly different than the diabetic sham group. But diabetic IR + LIPC group scores were significantly higher than the diabetic sham and diabetic IR groups."

According to the news editors, the research concluded: "Local ischemic preconditioning does not reduce the risk of renal injury induced by ischemia/reperfusion in diabetic rat model."

For more information on this research see: Renal Ischemia/Reperfusion Injury in Diabetic Rats: The Role of Local Ischemic Preconditioning. *Biomed Research International*, 2016;2016():8580475.

Eye Diseases and Conditions - Age-Related Macular...

**Investigators at Duke University Detail Findings in Age-Related Macular Degeneration (Differential Response to Anti-VEGF Regimens in Age-Related Macular Degeneration Patients with Early Persistent Retinal Fluid)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Eye Diseases and Conditions - Age-Related Macular Degeneration is now available. According to news reporting out of Durham, North Carolina, by NewsRx editors, research stated, "To compare the effect of intravitreal aflibercept or ranibizumab drug type and frequency on visual acuity outcomes in eyes with neovascular age-
related macular degeneration (NVAMD) and early persistent retinal fluid after 3 initial monthly injections. A post hoc analysis of eyes enrolled in VIEW 1 and VIEW 2, 2 similarly designed, randomized, phase 3 trials."

Our news journalists obtained a quote from the research from Duke University, "A total of 1815 eyes with NVAMD from VIEW 1 and VIEW 2. Analyses included patients with known fluid status at baseline and weeks 4, 8, and 12 in 3 treatment groups: ranibizumab 0.5 mg every 4 weeks (Rq4) (n = 595), intravitreal aflibercept injection (IAI) 2 mg every 4 weeks (2q4) (n = 613), and IAI 2 mg every 8 weeks (2q8) after 3 monthly injections (n = 607). Mean best-corrected visual acuity (BCVA) change from baseline over weeks 16 to 52 and the proportion of eyes that gained >= 15 letters or lost >= 5 letters were evaluated in eyes with and without persistent fluid (cystic intraretinal or subretinal fluid at all 4 initial visits). Visual outcomes also were assessed in eyes with persistent fluid by fluid type (intraretinal and subretinal fluid). The proportions of eyes with persistent fluid were 29.4%, 18.8%, and 20.3% in the Rq4, 2q4, and 2q8 groups, respectively. In these eyes, mean BCVA gain from baseline to week 52 was greater with 2q4 compared with Rq4 (P < 0.01) and 2q8 (P < 0.05), whereas it was similar with Rq4 and 2q8 (P = 0.294). At week 52, similar proportions of eyes gained >= 15 letters (31.5%-35.2%), whereas fewer eyes lost >= 5 letters with 2q4 compared with Rq4 and 2q8 (6.5% vs. 16.6% and 16.2%). The pattern of visual outcomes was similar regardless of fluid type. In eyes without persistent fluid, BCVA changes were similar across treatment groups."

According to the news editors, the research concluded: "In patients with early persistent fluid, 2q4 may provide additional clinical benefit over 2q8 or Rq4."

For more information on this research see: Differential Response to Anti-VEGF Regimens in Age-Related Macular Degeneration Patients with Early Persistent Retinal Fluid. Ophthalmology, 2016;123(9):1856-1864. Ophthalmology can be contacted at: Elsevier Science Inc, 360 Park Ave South, New York, NY 10010-1710, USA. **Drugs and Therapies - Central Nervous System Agents**

**Investigators at Duke University Discuss Findings in Central Nervous System Agents (Use of Therapeutic Drug Monitoring, Electronic Health Record Data, and Pharmacokinetic Modeling to Determine the Therapeutic Index of Phenytoin and Lamotrigine)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Central Nervous System Agents. According to news reporting originating from Durham, North Carolina, by NewsRx correspondents, research stated, "Defining a drug's therapeutic index (TI) is important for patient safety and regulating the development of generic drugs. For many drugs, the TI is unknown."

Our news editors obtained a quote from the research from Duke University, "A systematic approach was developed to characterize the TI of a drug using therapeutic drug monitoring and electronic health record (EHR) data with pharmacokinetic (PK) modeling. This approach was first tested on phenytoin, which has a known TI, and then applied to lamotrigine, which lacks a defined TI. Retrospective EHR data from patients in a tertiary hospital were used to develop phenytoin and lamotrigine population PK models and to identify adverse events (anemia, thrombocytopenia, and leukopenia) and efficacy outcomes (seizure-free). Phenytoin and lamotrigine concentrations were simulated for each day with an adverse event or seizure. Relationships between simulated concentrations and adverse events and efficacy outcomes were used to calculate the TI for phenytoin and lamotrigine. For phenytoin, 93 patients with 270 total and 174 free concentrations were identified. A de novo 1-compartment PK model with Michaelis-Menten kinetics described the data well. Simulated average total and free concentrations of 10-15 and 1.0-1.5 mcg/mL were associated with both adverse events and efficacy in 50% of patients, resulting in a TI of 0.7-1.5. For lamotrigine, 45 patients with 53 concentrations were identified. A published 1-compartment model was adapted to characterize the PK data. No relationships between simulated lamotrigine concentrations and safety or efficacy endpoints were seen; therefore, the TI could not be calculated. This approach correctly determined the TI of phenytoin but was unable to determine the TI of lamotrigine due to a limited sample size."

According to the news editors, the research concluded: "The use of therapeutic drug monitoring and EHR data to aid in narrow TI drug classification is promising, but it requires an adequate sample size and accurate characterization of concentration-response relationships."

For more information on this research see: Use of Therapeutic Drug Monitoring, Electronic Health Record Data, and Pharmacokinetic Modeling to Determine the Therapeutic Index of Phenytoin and Lamotrigine. *Therapeutic Drug Monitoring*, 2016;38(6):728-737. *Therapeutic Drug Monitoring* can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. (Lippincott Williams and Wilkins - www.lww.com; Therapeutic Drug Monitoring - journals.lww.com/drug-monitoring/pages/default.aspx)

Oncology - Cancer Biomarkers

Investigators at East China University of Science and Technology Report New Data on Cancer Biomarkers (Near-Infrared Fluorogenic Probes with Polarity-Sensitive Emission for in Vivo Imaging of an Ovarian Cancer Biomarker)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Oncology - Cancer Biomarkers have been presented. According to news reporting originating in Shanghai, People's Republic of China, by NewsRx journalists, research stated, "Lysophosphatidic acid (LPA, cutoff values (>=) 1.5 mM) is an effective biomarker for early stage ovarian cancer. The development of selective probes for LPA detection is therefore critical for early clinical diagnosis."

Financial supporters for this research include State Administration of Foreign Experts Affairs, Ministry of Education of the People's Republic of China, Ministry of Science and Technology of the People's Republic of China, National Natural Science Foundation of China.

The news reporters obtained a quote from the research from the East China University of Science and Technology, "Although current methods have been developed for the detection of LPA in solution, they cannot be used for tracking LPA in vivo. Here, we report a near-infrared (NIR) fluorescent probe that can selectively respond to LPA based on polarity-sensitive emission at a very low detection limit of 0.5 mM in situ. This probe exhibits a marked increase of fluorescence at 720 nm upon binding to LPA, allowing the direct visualization of LPA in vitro and in vivo without interference from other biomolecules. Moreover, the probe containing two arginine-glycine-aspartic acid units can be efficiently taken up by cancer cells based on an avb3 integrin receptor targeting mechanism. It also exhibits excellent biocompatibility and high pH stability in live cells and in vivo. Confocal laser scanning microscopy and flow cytometric imaging of SKOV-3 cells have confirmed that our probe can be used to image LPA in live cells. In particular, its NIR turn-on fluorescence can be used to effectively monitor LPA imaging in a SKOV-3 tumor-bearing mouse model."

According to the news reporters, the research concluded: "Our probe may pave the way for the detection of cancer-related biomarkers and even for early stage cancer diagnosis."

Our news correspondents report that additional information may be obtained by contacting D. Yao, Key Laboratory for Advanced Materials & Institute of Fine Chemicals, East
Investigators at Eli Lilly Discuss Findings in Pharmacology
(Pharmacological interrogation of a rodent forced ambulation model:
leveraging gait impairment as a measure of pain behavior pre-clinically)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Pharmacology. According to news reporting out of Indianapolis, Indiana, by NewsRx editors, research stated, "The aim of this study was to investigate whether inflammogen-induced temporal and spatial gait changes in a rodent forced-ambulation paradigm were sensitive to pharmacological intervention with both clinically validated and novel analgesics. Using the GaitScan (CleverSys Inc., Reston, VA) treadmill system, we identified four functional endpoints inspired by clinical literature and sensitive to unilateral joint injury induced by intra-articular Complete Freund's Adjuvant (CFA)."

Our news journalists obtained a quote from the research from Eli Lilly, "These endpoints included: range of motion, normalized stance distance, stance/swing ratio, and paw print size as a measure of guarding; collectively, these measures are proposed to serve as a high fidelity index of joint pain. We then examined the ability of known analgesic mechanisms to attenuate gait impairment as measured by this index. Clinically efficacious opioids, Nonsteroidal anti-inflammatory drugs (NSAIDs), and the yet unapproved anti-NGF antibody dose-dependently attenuated the CFA)-induced gait deficits, while a TNF-alpha fusion protein blocker had no effect on gait, but did produce a reduction in swelling. As well, the time course for gait impairment in the model appears to be distinct from the traditional endpoint of tactile hypersensitivity, offering the potential to assess a novel functional pain phenotype. In response to the call for more functional pain measures, we submit this composite gait score as a novel endpoint to interrogate joint pain pre-clinically."

According to the news editors, the research concluded: "As the etiology of human osteoarthritis (OA) remains unclear, this model/endpoint cannot attempt to improve construct validity, but may provide an additional dimension to interrogate pain-induced gait deficits."

Our news journalists report that additional information may be obtained by
Investigators at Emory University Detail Findings in Leukemia (Modulation of Immune Checkpoints and Graft-versus-Leukemia in Allogeneic Transplants by Antagonizing Vasoactive Intestinal Peptide Signaling)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Leukemia are presented in a new report. According to news reporting originating from Atlanta, Georgia, by NewsRx correspondents, research stated, "The goal of allogeneic bone marrow transplantation (alloBMT) is elimination of leukemia cells through the graft-versus-leukemia (GvL) activity of donor cells, while limiting graft-versus-host disease (GvHD). Immune checkpoint pathways regulate GvL and GvHD activities, but blocking antibodies or genetic inactivation of these pathways can cause lethal GVHD."

Our news editors obtained a quote from the research from Emory University, "Vasoactive intestinal peptide (VIP) is an immunosuppressive neuropeptide that regulates co-inhibitory pathways; its role in allo-BMT has not been studied. We found VIP transiently expressed in donor NK, NK-T, dendritic cells, and T cells after allo transplant, as well as host leukocytes. A peptide antagonist of VIP signaling (VIPhyb) increased T-cell proliferation in vitro and reduced IL10 expression in donor T cells. Treatment of allo-BMT recipients with VIPhyb, or transplanting donor grafts lacking VIP (VIP-KO), activated donor T-cells in lymphoid organs, reduced T-cell homing to GvHD target organs, and enhanced GvL without increasing GvHD in multiple allo-BMT models. Genetic or ex vivo depletion of donor NK cells or CD8(+) T cells from allografts abrogated the VIPhyb-enhanced GvL activity. VIPhyb treatment led to down regulation of PD-1 and PD-L1 expression on donor immune cells, increased effector molecule expression, and expanded oligoclonal CD8(+) T cells that protected secondary allo transplant recipients from leukemia."

According to the news editors, the research concluded: "Blocking VIP signaling thus represents a novel pharmacologic approach to separate GvL from GvHD and enhance adaptive T-cell responses to leukemia-associated antigens in allo-BMT."

For more information on this research see: Modulation of Immune Checkpoints and Graft-versus-Leukemia in Allogeneic Transplants by Antagonizing Vasoactive Intestinal Peptide Signaling. *Cancer Research*, 2016;76(23):6802-6815. *Cancer Research* can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. (American Association for Cancer Research - www.aacr.com; Cancer Research - cancerres.aacrjournals.org/)
Investigators at Emory University Report Findings in Antigens (Genetic engineering of chimeric antigen receptors using lamprey derived variable lymphocyte receptors)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Immunology - Antigens have been published. According to news reporting from Atlanta, Georgia, by NewsRx journalists, research stated, "Chimeric antigen receptors (CARs) are used to redirect effector cell specificity to selected cell surface antigens. Using CARs, antitumor activity can be initiated in patients with no prior tumor specific immunity."

The news correspondents obtained a quote from the research from Emory University, "Although CARs have shown promising clinical results, the technology remains limited by the availability of specific cognate cell target antigens. To increase the repertoire of targetable tumor cell antigens we utilized the immune system of the sea lamprey to generate directed variable lymphocyte receptors (VLRs). VLRs serve as membrane bound and soluble immune effectors analogous but not homologous to immunoglobulins. They have a fundamentally different structure than immunoglobulin (Ig)-based antibodies while still demonstrating high degrees of specificity and affinity. To test the functionality of VLRs as the antigen recognition domain of CARs, two VLR-CARs were created. One contained a VLR specific for a murine B cell leukemia and the other contained a VLR specific for the human T cell surface antigen, CD5. The CAR design consisted of the VLR sequence, myc-epitope tag, CD28 transmembrane domain, and intracellular CD3. signaling domain. We demonstrate proof of concept, including gene transfer, biosynthesis, cell surface localization, and effector cell activation for multiple VLR-CAR designs."

According to the news reporters, the research concluded: "Therefore, VLRs provide an alternative means of CAR-based cancer recognition."

Stem Cell Research - Hematopoietic Stem Cells

Investigators at Erasmus University Medical Center Report Findings in Hematopoietic Stem Cells [Hematopoietic (stem) cell development - how divergent are the roads taken?]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Stem Cell Research - Hematopoietic Stem Cells have been published. According to news reporting originating from Rotterdam, Netherlands, by NewsRx correspondents, research stated, "The development of the hematopoietic system during early embryonic stages occurs in spatially and temporally distinct waves. Hematopoietic stem cells (HSC), the most potent and self-renewing cells of this system, are produced in the final 'definitive' wave of hematopoietic cell generation."

Funders for this research include Landsteiner Society for Bloodtransfusion Research, ZonMM - Netherlands Scientific Research Council - TOP, National Institutes of Health, Landsteiner Society for Blood Research.

Our news editors obtained a quote from the research from Erasmus University Medical Center, "In contrast to HSCs in the adult, which differentiate via intermediate progenitor populations to produce functional blood cells, the generation of hematopoietic cells in the embryo prior to HSC generation occurs in the early waves by producing blood cells without intermediate progenitors (such as the 'primitive' hematopoietic cells). The lineage relationship between the early hematopoietic cells and the cells giving rise to HSCs, the genetic networks controlling their emergence, and the precise temporal determination of HSC fate remain topics of intense research and debate."

According to the news editors, the research concluded: "This Review article discusses the current knowledge on the step-wise embryonic establishment of the adult hematopoietic system, examines the roles of pivotal intrinsic regulators in this process, and raises questions concerning the temporal onset of HSC fate determination."

For more information on this research see: Hematopoietic (stem) cell development - how divergent are the roads taken? FEBS Letters, 2016;590(22):3975-3986. FEBS Letters can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Elsevier - www.elsevier.com; FEBS Letters - www.journals.elsevier.com/febs-letters/)

The news editors report that additional information may be obtained by contacting E. Dzierzak, Erasmus MC, Erasmus MC Stem Cell Inst, Dept. of Cell Biol, Rotterdam, Netherlands. Additional authors for this research include C.S. Vink and E. Dzierzak.

Investigators at European Institute of Oncology Report Findings in Stem Cell Research (Molecular mechanisms of asymmetric divisions in mammary stem cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Stem Cell Research is the subject of a report. According to news reporting originating in Milan, Italy, by NewsRx journalists, research stated, "Stem cells have the remarkable ability to undergo proliferative symmetric divisions and self-renewing asymmetric divisions. Balancing of the two modes of division sustains tissue morphogenesis and homeostasis."

Financial supporters for this research include Associazione Italiana per la Ricerca sul Cancro, Ministero della Salute (Ministry of Health, Italy).

The news reporters obtained a quote from the research from the European Institute of Oncology, "Asymmetric divisions of Drosophila neuroblasts (NBs) and sensory organ precursor (SOP) cells served as prototypes to learn what we consider now principles of asymmetric mitoses. They also provide initial evidence supporting the notion that aberrant symmetric divisions of stem cells could correlate with malignancy. However, transferring the molecular knowledge of circuits underlying asymmetry from flies to mammals has proven more challenging than expected. Several experimental approaches have been used to define asymmetry in mammalian systems, based on daughter cell fate, unequal partitioning of determinants and niche contacts, or proliferative potential. In this review, we aim to provide a critical evaluation of the assays used to establish the stem cell mode of division, with a particular focus on the mammary gland system."

According to the news reporters, the research concluded: "In this context, we will discuss the genetic alterations that impinge on the modality of stem cell division and their role in breast cancer development."

For more information on this research see: Molecular mechanisms of asymmetric divisions in mammary stem cells. EMBO Reports, 2016;17(12):1700-1720. EMBO Reports can be contacted at: Wiley-Blackwell, 111 River St, Hoboken 07030-5774, NJ, USA. (Nature Publishing Group - www.nature.com/; EMBO Reports - www.nature.com/embor/)

Our news correspondents report that additional information may be obtained by contacting P.G. Pelicci, European Inst Oncol, Dept. of Expt Oncol, Milan, Italy. Additional authors for this research include T. Vlachou, M. Carminati, P.G. Pelicci and M. Mapelli.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.15252/embr.201643021. This DOI is a link to an online electronic document that is either free or for purchase.

Biotechnology - Cancer Gene Therapy

Investigators at Faculty of Pharmacy Zero in on Cancer Gene Therapy [Akt inhibitors in cancer treatment: The long journey from drug discovery to clinical use (Review)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Biotechnology - Cancer Gene Therapy is the subject of a report. According to news reporting from Bucharest, Romania, by NewsRx journalists, research stated, "Targeted cancer therapies are used to inhibit the growth, progression, and metastasis of the tumor by interfering with specific molecular targets and are currently the focus of anticancer drug development. Protein kinase B, also known as Akt, plays a central role in many types of cancer and has been validated as a therapeutic target nearly two decades ago."

The news correspondents obtained a quote from the research from the Faculty of Pharmacy, "This review summarizes the intracellular functions of Akt as a pivotal point of converging signaling pathways involved in cell growth, proliferation, apoptosis and neoangiogenesis, and focuses on the drug design strategies to develop potent anticancer agents targeting Akt. The discovery process of Akt inhibitors has evolved from adenosine triphosphate (ATP)-competitive agents to alternative approaches employing allosteric sites in order to overcome the high degree of structural similarity between Akt isoforms in the catalytic domain, and considerable structural analogy to the AGC kinase family. This process has led to the discovery of inhibitors with greater specificity, reduced side-effects and lower toxicity. A second generation of Akt has inhibitors emerged by incorporating a chemically reactive Michael acceptor template to target the nucleophile cysteines in the catalytic activation loop. The review outlines the development of several promising drug candidates emphasizing the importance of each chemical scaffold."

According to the news reporters, the research concluded: "We explore the pipeline of Akt inhibitors and their preclinical and clinical examination status, presenting the potential clinical application of these agents as a monotherapy or in combination with ionizing radiation, other targeted therapies, or chemotherapy."

Our news journalists report that additional information may be obtained by contacting G.M. Nitulescu, Faculty of Pharmacy, 'Carol Davila' University of Medicine and Pharmacy, Bucharest 020956, Romania. Additional authors for this research include D. Margina, P. Juzenas, Q. Peng, O.T. Olaru, E. Saloustros, C. Fenga, D.A. Spandidos, M. Libra and A.M. Tsatsakis.

Nutritional and Metabolic Diseases and Conditions -…

Investigators at Federal University Discuss Findings in Fabry Disease (Characterization and phosphoproteomic analysis of a human immortalized podocyte model of Fabry disease generated using CRISPR/Cas9 technology)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Nutritional and Metabolic Diseases and Conditions - Fabry Disease is the subject of a report. According to news reporting originating in Teresina, Brazil, by NewsRx journalists, research stated, "Fabry nephropathy is a major cause of morbidity and premature death in patients with Fabry disease (FD), a rare X-linked lysosomal storage disorder. Gb3, the main substrate of alpha-galactosidase A (alpha-Gal A), progressively accumulates within cells in a variety of tissues."

The news reporters obtained a quote from the research from Federal University, "Establishment of cell models has been useful as a tool for testing hypotheses of disease pathogenesis. We applied CRISPR/Cas9 genome editing technology to the GLA gene to develop human kidney cell models of FD in human immortalized podocytes, which are the main affected renal cell type. Our podocytes lack detectable alpha-Gal A activity and have increased levels of Gb3. To explore different pathways that could have distinct patterns of activation under conditions of alpha-gal A deficiency, we used a high-throughput antibody array to perform phosphorylation profiling of CRISPR/Cas9-edited and control podocytes. Changes in both total protein levels and in phosphorylation status per site were observed."

According to the news reporters, the research concluded: "Analysis of our candidate proteins suggests that multiple signaling pathways are impaired in FD."

Our news correspondents report that additional information may be obtained by contacting S. Monte, Univ Fed Piaui, Lab Immunogenet & Mol Biol, Teresina, Brazil. Additional authors for this research include A. Labilloy, M.L. Eshbach, A. Roy, A.R. Subramanya, S. Monte, G. Labilloy and O.A. Weisz.

Keywords for this news article include: Teresina, Brazil, South America, Nutritional and Metabolic Diseases and Conditions, Lysosomal Storage Diseases and Conditions, X-Linked Genetic Diseases and Conditions, Brain Diseases and Conditions, Lipid Metabolism Disorders, Sphingolipidoses, Fabry Disease, Technology, Podocytes, Neurology, Genetics, Federal University.

Heart Disorders and Diseases - Cardiomyopathies

Investigators at First Hospital of Jilin University Report New Data on Cardiomyopathies (Ginsenoside Rg1 ameliorates diabetic cardiomyopathy by inhibiting endoplasmic reticulum stress-induced apoptosis in a streptozotocin-induced diabetes rat ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Cardiomyopathies. According to news reporting out of Changchun, People's Republic of China, by NewsRx editors, research stated, "Ginsenoside Rg1 has been demonstrated to have cardiovascular protective effects. However, whether the cardioprotective effects of ginsenoside Rg1 are mediated by endoplasmic reticulum (ER) stress-induced apoptosis remain unclear."

Our news journalists obtained a quote from the research from the First Hospital of Jilin University, "In this study, among 80 male Wistar rats, 15 rats were randomly selected as controls; the remaining 65 rats received a diet rich in fat and sugar content for 4 weeks, followed by intraperitoneal injection of streptozotocin (STZ, 40 mg/kg) to establish a diabetes model. Seven days after STZ injection, 10 rats were randomly selected as diabetic model (DM) controls, 45 eligible diabetic rats were randomized to three treatment groups and administered ginsenoside Rg1 in a dosage of 10, 15 or 20 mg/kg/day, respectively. After 12 weeks of treatment, rats were killed and serum samples obtained to determine cardiac troponin (cTn)-I. Myocardial tissues were harvested for morphological analysis to detect myocardial cell apoptosis, and to Analyse protein expression of glucose-regulated protein 78 (GRP78), C/EBP homologous protein (CHOP), and Caspase-12. Treatment with ginsenoside Rg1 (10-20 mg/kg) significantly reduced serum cTnI levels compared with DM control group (all p<0.01). Ginsenoside Rg1 (15 and 20 mg/kg) significantly reduced the percentage of apoptotic myocardial cells and improved the parameters of cardiac function. Haematoxylin and eosin and Masson staining indicated that ginsenoside Rg1 could attenuate myocardial lesions and myocardial collagen volume fraction. Additionally, ginsenoside Rg1 significantly reduced GRP78, CHOP, and cleaved Caspase-12 protein expression in a dose-dependent manner."

According to the news editors, the research concluded: "These findings suggest that ginsenoside Rg1 appeared to ameliorate diabetic cardiomyopathy by inhibiting ER stress-induced apoptosis in diabetic rats."

Our news journalists report that additional information may be obtained by contacting H. Yu, Cardiology, The First Hospital of Jilin University, Changchun, Jilin, People's Republic of China. Additional authors for this research include J. Zhen, Y. Yang, J. Gu, S. Wu and Q. Liu.

**Urogenital Diseases and Conditions - Interstitial Cystitis**

**Investigators at Florida International University Report Findings in Interstitial Cystitis (Therapeutic Potential of Human Chorionic Gonadotropin Against Painful Bladder Syndrome/Interstitial Cystitis)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Urogenital Diseases and Conditions - Interstitial Cystitis is now available. According to news originating from Miami, Florida, by NewsRx editors, the research stated, "Painful bladder syndrome/interstitial cystitis is a debilitating chronic bladder disease that primarily affects women. The disease is due to a damage of urothelial cell lining."

Our news journalists obtained a quote from the research from Florida International University, "As a result, potassium particles and other toxic substances in urine can leak into bladder mucosa, causing the symptoms of lower abdominal/pelvic discomfort, pain, increased urination frequency, urgency, nocturia, and so on, all of which can substantially reduce the quality of daily life. There are multiple symptom relieving therapies. Among them, only pentosan polysulfate sodium, sold under the brand name of Elmiron, has been approved for oral use by US Food and Drug Administration. It provides the relief after several months of use."

According to the news editors, the research concluded: "Based on the scientific leads presented in this article, we propose that human chorionic gonadotropin has a therapeutic potential that is worth investigating for the treatment of this disease."

The correspondents report that additional information may be obtained from C.V. Rao, Florida International University, Herbert Wertheim Coll Med, Reprod & Dev Program, Dept. of Obstet & Gynecol, Miami, FL 33199, United States.

**Drugs and Therapies - Chemotherapy**

**Investigators at Guangxi Medical University Discuss Findings in Chemotherapy (Serum HE4 superior to CA125 in predicting poorer surgical outcome of epithelial ovarian cancer)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Drugs and Therapies - Chemotherapy have been presented. According to news reporting originating in Nanning, People's Republic of China, by NewsRx journalists, research stated, "Epithelial ovarian cancer (EOC) remains the deadliest form of gynecological cancers. Optimal tumor debulking, no matter the primary or the interval, is the most important prognostic factor for EOC, so there is an urgent demand for biomarkers to predict surgical outcome."

Financial support for this research came from Guilin research and technology development project.

The news reporters obtained a quote from the research from Guangxi Medical University, "The aim of this study was to investigate whether serum human epididymis protein 4 (HE4) and cancer antigen 125 (CA125) could predict surgical outcome of EOC. The levels of preoperative serum HE4 and CA125 were determined by electrochemiluminescence (ECLIA) in 82 EOC patients, comprising 39 subjected to primary debulking surgery (PDS) and 43 with extensive stage III or IV disease to neoadjuvant chemotherapy followed by interval debulking surgery (NACT-IDS). Among 39 patients subjected to primary debulking surgery, HE4 was superior to CA125 in predicting surgical outcome (area under curve [AUC] 0.758 vs. 0.633). At a cutoff of 353.22 pmol/L, HE4 reached 77.4% in sensitivity and 75% in specificity. The prediction of surgical outcome of interval debulking surgery based on preoperative HE4 and CA125 values was performed in 43 patients who received NACT-IDS. The difference of AUC between HE4 and CA125 (0.793 vs. 0.663) indicating that HE4 was the better biomarker to predict surgical outcome of IDS. A pre-IDS HE4 value of 154.3 pmol/L is the optimal cutoff to identify patients who would not benefit from IDS with a sensitivity of 92.9% and a specificity of 69%. The change (>70%) of HE4 before and after neoadjuvant chemotherapy could predict optimal interval debulking surgery. Serum HE4 was superior to CA125 in predicting surgical outcome of primary debulking surgery and interval debulking surgery."

According to the news reporters, the research concluded: "The change (absolute value or percentage) of HE4 in neoadjuvant chemotherapy could predict the outcome of interval debulking surgery."

Our news correspondents report that additional information may be obtained by contacting L. Li, Guangxi Med Univ, Affiliated Tumor Hosp, Dept. of Gynecol Oncol, Nanning 530021, The Guangxi Zhu, People's Republic of China.
The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1007/s13277-016-5335-0. This DOI is a link to an online electronic document that is either free or for purchase.

Enzymes and Coenzymes - Glycoside Hydrolases

Investigators at Gyeongsang National University Detail Findings in Glycoside Hydrolases (Potent bacterial neuraminidase inhibitors, anthraquinone glucosides from Polygonum cuspidatum and their inhibitory mechanism)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Enzymes and Coenzymes - Glycoside Hydrolases. According to news reporting out of Jinju, South Korea, by NewsRx editors, research stated, "Ethnopharmacological relevance: P. cuspidatum is a popular Chinese medicinal herb, having a long history of usage in traditional Chinese medicine for the treatment of several inflammatory diseases in the form of powders and decoctions. Similarly there are many reports that P. cuspidatum has antibacterial and anti-inflammatory effects, both of which are properties associated with compounds having activity against bacterial neuraminidase (BNA)."

Our news journalists obtained a quote from the research from Gyeongsang National University, "Aim of the study: We investigated whether P. cuspidatum's metabolites exhibited BNA inhibition. Consistent with our hypothesis, we found several inhibitors from the methanol extract of this plant, and then fully characterized their inhibitory mechanisms. Activity guided separation of methanol extract led to isolation of individual constituents, and subsequently their structures were elucidated by spectroscopic analysis. Detailed kinetic behaviors of BNA inhibitors were explored by showing the changes of K-m and V-max, the ratios of K-I/K-IS and K-ik/K-iv, and fluorescence quenching effect. This study attempted to isolate the responsible metabolites and elucidate the BNA inhibitory mechanism. The principal BNA inhibitory compounds (2-6) were identified as emodin (2), physcion-8-O-beta-D-glucopyranoside (3), emodin-8-O-beta-D-glucopyranoside (4), emodin-1-O-beta-D-glucopyranoside (5), and 2-methoxy-6-acetyl-7-methyljuglone (6). Unexpectedly, anthraquinone glucosides (3-5) were much more potent than their corresponding aglycones (1 and 2). For example, emodin (2) had an IC50=5.4 μM, whereas its glucosides (4 and 5) had IC50=0.85 μM and 0.43 μM respectively. A similar trend was observed with physcion (1, IC50 > 200 μM) and its glucoside (3, IC50=6.2 μM). The anthraquinone (2) was mixed type I inhibitor, whereas its glucosides (4 and 5) were noncompetitive. In addition, the fluorescence quenching study showed that the affinity constants (K-SV) of inhibitors increased in proportion to their inhibitory potencies. Furthermore, we quantified the major and minor metabolites through UPLC-PDA-Q-TOF/MS, and revealed that the most potent inhibitors were the major constituents."

According to the news editors, the research concluded: "This result contributes to our
understanding of *P. cuspidatum* utility as functional foodstuff and widely used herbal medicine."

Our news journalists report that additional information may be obtained by contacting Z. Uddin, Gyeongsang National University, Div Appl Life Sci Plus BK21, IALS, Jinju 660701, South Korea. Additional authors for this research include Y.H. Song, M.J. Curtis-Long, J.Y. Kim, H.J. Yuk and K.H. Park.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.jep.2016.08.026. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Jinju, South Korea, Asia, Enzymes and Coenzymes, Glycoside Hydrolases, Anthraquinones, Neuraminidase, Hydrocarbons, Anthracenes, Cascara, Emodin, Gyeongsang National University.

**Heart Disorders and Diseases - Heart Disease**

**Investigators at Hamilton Health Science Describe Findings in Heart Disease [A Risk Assessment Tool Incorporating New Biomarkers for Cardiovascular Events in Acute Coronary Syndromes: The Organization to Assess Strategies in Ischemic Syndromes ...]**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Disease have been published. According to news reporting originating from Hamilton, Canada, by NewsRx correspondents, research stated, "Several biomarkers have been shown to improve risk stratification in patients with non-ST-segment elevation acute coronary syndrome (NSTEACS); however, they have not been integrated into risk prediction tools. C-reactive-protein, N-terminal-proebrain natriuretic peptide (NT-proBNP), and haemoglobin A1C were measured in 6447 patients with NSTEACS who were enrolled in the Clopidogrel in Unstable Angina to Prevent Recurrent Events trial."

Our news editors obtained a quote from the research from Hamilton Health Science, "A risk score to predict cardiovascular (CV) death, myocardial infarction (MI), or stroke at 1 year was developed by incorporating biomarkers that were independently predictive of events with traditional variables, electrocardiogram, and troponin-T. Model discrimination was evaluated using c-statistic, integrated discrimination improvement, and net reclassification index, and validated using bootstrap methods. During 1 year of follow-up, 686 patients experienced a CV event. Each biomarker predicted CV death, MI, or stroke; however, only NT-proBNP and haemoglobin A1C improved model discrimination, increasing the c-statistic (0.66-0.71), integrated discrimination improvement to 3.4%, and net reclassification index to 17.5% (P < 0.0001 for all measures). A risk score ranging from 0 to 20 points including variables for
age, prior MI/stroke, sex, ST-segment deviation, troponin-T, NT-proBNP, and haemoglobin A1C classified individuals into low-, intermediate-, and high-risk groups with rates of CV death, MI, stroke of 3.7%, 9.1%, 17.8%, respectively. The absolute benefit of dual antiplatelet therapy vs aspirin alone was 1.0%, 4.7%, and 3.0% in low-, intermediate-, and high-risk groups, respectively."

According to the news editors, the research concluded: "The addition of NT-proBNP and haemoglobin A1C to 5 standard variables creates a 7-variable risk score that improves prediction of CV events at 1 year and aids in risk-based selection of patients with NSTEACS for dual antiplatelet therapy."

The news editors report that additional information may be obtained by contacting S.R. Mehta, Hamilton Hlth Sci, Hamilton, ON, Canada. Additional authors for this research include J.W. Eikelboom, P. Rao-Melacini, J.I. Weitz, S.S. Anand, G. Pare, A. Budaj, J. Pogue, K.A.A. Fox and S. Yusuf.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.cjca.2016.01.029. This DOI is a link to an online electronic document that is either free or for purchase.

Oncology - Lung Cancer

Investigators at Harvard School of Medicine Describe Findings in Lung Cancer (Programmed Cell Death Ligand 1 Expression in Resected Lung Adenocarcinomas: Association with Immune Microenvironment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Lung Cancer are presented in a new report. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "Programmed cell death ligand 1 (PD-L1) expression on tumor cells can be upregulated via activation of CD8(+) cytotoxic T lymphocytes (CTLs) or the T helper cell (Th1) pathway, counterbalancing the CTL/Th1 microenvironment. However, PD-L1 expression in association with subtypes of tumor-associated lymphocytes and molecular alterations has not been well characterized in lung adenocarcinomas."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "PD-L1 expression was evaluated in 261 resected lung adenocarcinomas using tissue
microarrays and various scoring systems, and was correlated with clinicopathologic/molecular features, including the extent/subtype of tumor associated lymphocytes (i.e., CD8, T-bet [Th1 transcription factor], and GATA3 [Th2 transcription factor]), and patient outcomes. PD-L1 expression was present in 129 (49%), 95 (36.5%), and 62 (24%) cases using cutoffs of >= 1%, > = 5%, and >= 50%, respectively, 98 (38%) by H score and 72 (28%) by immune score. PD-L1 expression was associated with abundant CD8(+) and/or T-bet(+) tumor-infiltrating lymphocytes and EGFR wild-type, significant smoking history, and aggressive pathologic features. In addition, concurrent PD-L1 expression and abundant CD8(+) tumor-associated lymphocytes were seen in 25% of KRAS mutants or cases with no alterations by clinical molecular testing as opposed to only 7.4% of EGFR mutants. PD-L1 expression was significantly associated with decreased progression-free and overall survival rates by univariate analysis, but not by multivariate analysis.”

According to the news editors, the research concluded: "PD-L1 expression in resected lung adenocarcinomas is frequently observed in the presence of CTL/Th1 microenvironment, in particular in those with KRAS mutations or no common molecular alterations, suggesting that blockade of the PD-1/PD-L1 axis may be a promising treatment strategy to reinstitute active immune response for at least a subset of such patient populations."

**Muscle Cells**

**Investigators at Harvard School of Medicine Describe Findings in Muscle Cells (Adventitial MSC-like Cells Are Progenitors of Vascular Smooth Muscle Cells and Drive Vascular Calcification in Chronic Kidney Disease)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Muscle Cells are discussed in a new report.
According to news originating from Boston, Massachusetts, by NewsRx correspondents, research stated, "Mesenchymal stem cell (MSC)-like cells reside in the vascular wall, but their role in vascular regeneration and disease is poorly understood. Here, we show that Gli1(+) cells located in the arterial adventitia are progenitors of vascular smooth muscle cells and contribute to neointima formation and repair after acute injury to the femoral artery."

Our news journalists obtained a quote from the research from the Harvard School of Medicine, "Genetic fate tracing indicates that adventitial Gli1(+) MSC-like cells migrate into the media and neointima during athero- and arteriosclerosis in ApoE(-/-) mice with chronic kidney disease. Our data indicate that Gli1(+) cells are a major source of osteoblast-like cells during calcification in the media and intima. Genetic ablation of Gli1(+) cells before induction of kidney injury dramatically reduced the severity of vascular calcification."

According to the news editors, the research concluded: "These findings implicate Gli1(+) cells as critical adventitial progenitors in vascular remodeling after acute and during chronic injury and suggest that they may be relevant therapeutic targets for mitigation of vascular calcification."

For more information on this research see: Adventitial MSC-like Cells Are Progenitors of Vascular Smooth Muscle Cells and Drive Vascular Calcification in Chronic Kidney Disease. Cell Stem Cell, 2016;19(5):628-642. Cell Stem Cell can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. Investigators at Harvard School of Medicine Describe Findings in Obesity (Associations of Parent Health Behaviors and Parenting Practices with Sleep Duration in Overweight and Obese Children)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Nutritional and Metabolic Diseases and Conditions - Obesity have been published. According to news reporting from Boston, Massachusetts, by NewsRx journalists, research stated, "To examine the extent to which parent health behaviors and parenting practices are associated with school-age children's sleep duration. We surveyed 790 parents of children, aged 6 to 12 y, who had a body mass index (BMI) &gt;= 90th percentile and were participating in a randomized controlled obesity trial."

The news correspondents obtained a quote from the Harvard
School of Medicine, "The main exposures were parent sleep duration, screen time and physical activity, parental limits placed on child TV viewing time and TV content, and parents' confidence regarding their ability to help their child get enough sleep. The primary outcome was child sleep duration. We used linear regression models to examine associations of parent behaviors and parenting practices with child sleep duration. On average, children slept 9.2 h per night, whereas parents slept 6.9 h. Parents reported having an average of 1.9 h of screen time per day and 0.6 h of physical activity. There were 57.3% of parents who reported feeling very/extremely confident that they could help their child get enough sleep. In adjusted multivariate analyses, child sleep duration was 0.09 h/day (95% confidence interval: 0.03, 0.15) longer for each 1-h increment in parent sleep duration. Additionally, children whose parents reported being very/extremely confident they could help their child get age-appropriate sleep duration slept 0.67 h/day longer (95% confidence interval: 0.54, 0.81) than those whose parents were not/somewhat confident."

According to the news reporters, the research concluded: "Educating parents about their own sleep health and enhancing parent confidence to help their children get enough sleep are potential areas of intervention to increase child sleep duration."

For more information on this research see: Associations of Parent Health Behaviors and Parenting Practices with Sleep Duration in Overweight and Obese Children. Journal of Clinical Sleep Medicine, 2016;12(11):1493-1498. Journal of Clinical Sleep Medicine can be contacted at: Amer Acad Sleep Medicine, 2510 N Frontage Rd, Darien, IL 60561, USA.

Oncology - Ovarian Cancer

Investigators at Harvard School of Medicine Detail Findings in Ovarian Cancer (The association between reproductive and hormonal factors and ovarian cancer by estrogen-alpha and progesterone receptor status)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Ovarian Cancer is the subject of a report. According to news reporting out of Boston, Massachusetts, by NewsRx editors, research stated, "We assessed the association between reproductive and hormonal factors and ovarian cancer incidence characterized by estrogen receptor-alpha (ER alpha) and progesterone receptor (PR) status. Tissue microarrays were used to assess ERa and PR expression among 197 Nurses' Health Study (NHS), 42 NHSII and 76 New England Case-Control Study (NECC) ovarian cancer cases."
Our news journalists obtained a quote from the research from the Harvard School of Medicine, "NHS/NHSII cases were matched to up to 4 controls (n = 954) on diagnosis date and birth year. NECC controls (n = 725) were frequency matched on age. Cases were considered receptor positive if of tumor cells stained positive. Associations by ER alpha and PR status were assessed using polytomous logistic regression. p-Value for heterogeneity was calculated using a likelihood ratio test. 45% of ovarian tumors were PR(+), 78% were ERa (+) and 45% were ER alpha(+)/PR(+), while 22% were ER alpha(-)/PR(-). Postmenopausal status was associated with an increased risk of PR(-) tumors (OR: 2.07; 95%CI: 1.15-3.75; p-heterogeneity = 0.01) and age at natural menopause was inversely associated with PR(-) tumors (OR, per 5 years: 0.77; 95% CI: 0.61-0.96; p-het = 0.01). Increasing duration of postmenopause was differentially associated by PR status (p-het = 0.0009). Number of children and tubal ligation were more strongly associated with ERa(-) versus ER alpha (+) tumors (p-het = 0.002 and 0.05, respectively). No differential associations were observed for oral contraceptive or hormone therapy use. Postmenopausal women have an increased risk of developing PR(-) ovarian tumors compared to premenopausal women."

According to the news editors, the research concluded: "The associations observed for ovarian cancer differ from those seen for breast cancer suggesting that the biology for tumor development through ERa and PR pathways may differ."

For more information on this research see: The association between reproductive and hormonal factors and ovarian cancer by estrogen-alpha and progesterone receptor status. Gynecologic Oncology, 2016;143(3):628-635. Gynecologic Oncology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. The news correspondents obtained a quote from the research from the Harvard School of Medicine, "Prolyl hydroxylase domain proteins hydroxylate substrate proline residues and have been linked to fuel switching. Here, we reveal that PHD3 rapidly triggers repression of FAO in response to nutrient abundance via hydroxylation of acetyl-coA carboxylase 2 (ACC2). We find that PHD3 expression is strongly decreased in subsets of cancer including acute myeloid leukemia (AML) and is linked to a reliance on fat catabolism regardless of external nutrient cues. Overexpressing PHD3 limits FAO via regulation of ACC2 and consequently impedes leukemia cell proliferation."

According to the news reporters, the research concluded: "Thus, loss of PHD3 enables greater utilization of fatty acids but may also serve as a metabolic and therapeutic liability by indicating cancer cell susceptibility to FAO inhibition."

For more information on this research see: PHD3 Loss in Cancer Enables Metabolic Reliance on Fatty Acid Oxidation via Deactivation of ACC2. *Molecular Cell*, 2016;63(6):1006-1020. *Molecular Cell* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. **Hematologic Diseases and Conditions --**

**Investigators at Harvard School of Medicine Discuss Findings in Thrombocytopenia (Low-level light treatment ameliorates immune thrombocytopenia)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Hematologic Diseases and Conditions - Thrombocytopenia have been published. According to news reporting originating in Boston, Massachusetts, by NewsRx journalists, research stated, "Immune thrombocytopenia (ITP) is an immune-mediated acquired bleeding disorder characterized by abnormally low platelet counts. We reported here the ability of low-level light treatment (LLLT) to alleviate ITP in mice."

The news reporters obtained a quote from the research from the Harvard School of Medicine, "The treatment is based on noninvasive whole body illumination 30 min a day for a few consecutive days by near infrared light (830 nm) transmitted by an array of light-emitting diodes (LEDs). LLLT significantly lifted the nadir of platelet counts and restored tail bleeding
time when applied to two passive ITP models induced by anti-CD41 antibody. The anti-platelet antibody hindered megakaryocyte differentiation from the progenitors, impaired proplatelet and platelet formation, and induced apoptosis of platelets. These adverse effects of anti-CD41 antibody were all mitigated by LLLT to varying degrees, owing to its ability to enhance mitochondrial biogenesis and activity in megakaryocytes and preserve mitochondrial functions in platelets in the presence of the antibody."

According to the news reporters, the research concluded: "The observations argue not only for contribution of mitochondrial stress to the pathology of ITP, but also clinical potentials of LLLT as a safe, simple, and cost-effective modality of ITP."

For more information on this research see: Low-level light treatment ameliorates immune thrombocytopenia. Scientific Reports, 2016;6():1-10. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Drugs and Therapies - Pharmacology

Investigators at Hebei University Discuss Findings in Pharmacology
[Selective activation of vascular K(v)7.4/K(v)7.5 K+ channels by fasudil contributes to its vasorelaxant effect]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Pharmacology are presented in a new report. According to news reporting out of Shijiazhuang, People's Republic of China, by NewsRx editors, research stated, "Background and PurposeK(v)7 (K(v)7.1-7.5) channels play an important role in the regulation of neuronal excitability and the cardiac action potential. Growing evidence suggests K(v)7.4/K(v)7.5 channels play a crucial role in regulating vascular smooth muscle contractility."

Our news journalists obtained a quote from the research from Hebei University, "Most of the reported K(v)7 openers have shown poor selectivity across these five subtypes. In this study, fasudil - a drug used for cerebral vasoconstriction - has been found to be a selective opener of K(v)7.4/K(v)7.5 channels. Experimental ApproachA perforated whole-cell patch technique was used to record the currents and membrane potential. Homology modelling and a docking technique were used to investigate the interaction between fasudil and the K(v)7.4 channel. An isometric tension recording technique was used to assess the vascular tension. Key ResultsFasudil selectively and potently enhanced K(v)7.4 and K(v)7.4/K(v)7.5 currents expressed in HEK293 cells, and shifted the voltage-dependent activation curve in a more
negative direction. Fasudil did not affect either K(v)7.2 and K(v)7.2/K(v)7.3 currents expressed in HEK293 cells, the native neuronal M-type K+ currents, or the resting membrane potential in small rat dorsal root ganglia neurons. The Val(248) in S5 and Ile(308) in S6 segment of K(v)7.4 were critical for this activating effect of fasudil. Fasudil relaxed precontracted rat small arteries in a concentration-dependent fashion; this effect was antagonized by the K(v)7 channel blocker XE991.

According to the news editors, the research concluded: "Conclusions and Implications These results suggest that fasudil is a selective K(v)7.4/K(v)7.5 channel opener and provide a new dimension for developing selective K(v)7 modulators and a new perspective for the use, action and mechanism of fasudil."

Liver Diseases and Conditions - Hepatitis B Virus

Investigators at Huazhong University of Science and Technology Detail Findings in Hepatitis B Virus (Hepatitis B virus upregulates host expression of alpha-1,2-mannosidases via the PPAR alpha pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Liver Diseases and Conditions - Hepatitis B Virus is now available. According to news reporting originating in Hubei, People's Republic of China, by NewsRx journalists, research stated, "To assess the effects of hepatitis B virus (HBV) on the expression of host alpha-1,2-mannosidases and determine the underlying mechanisms. We measured the expression levels of MAN1A1, MAN1A2, MAN1B1, and MAN1C1 in cell lines HepG2.2.15, HepN10, HepAD38 and HepG2 by Western blot."

The news reporters obtained a quote from the research from the Huazhong University of Science and Technology, "Viral antigens (HBsAg and HBeAg) in the culture medium were measured using the chemiluminescence method. HBV DNA quantification assays were performed using a commercial real-time PCR kit. Protein levels of human liver tissue alpha-1,2-mannosidases were also evaluated by Western blot. Plasmids containing seven individual viral genes of HBV (PTT22-HBx, PTT22-HBs, PTT22-preS2, PTT22-preS1, PTT22-HBe, PTT22-HBc, and PTT22-HBp) or control plasmids (PTT22-vector) were transfected into HepG2 cells. MK886 (PPAR alpha) and GW9662 (PPAR.) inhibitors were used to explore the effects of HBV on a-1,2-mannosidase expression after the PPARa and PPAR. pathways were
We showed that the expression of alpha-1,2-mannosidases was higher in stably transfected HBV cells than in controls. The expression levels of alpha-1,2-mannosidase were higher in AD38 cells than those in ND10 cells, which were in turn greater than those in G2.2.15 cells, and positively correlated with the expression of HBsAg in all the cell lines. Levels of alpha-1,2-mannosidase in non-tumorous liver tissues of HBV-related HCC patients were also higher than in the tissues from non-HBV-related HCC patients. Moreover, transfecting HepG2 cells with a component of the HBV viral envelope also increased the expression of alpha-1,2-mannosidases. However, this envelope protein component could not induce MAN1C1 expression in the presence of a PPAR alpha inhibitor, MK886. We also found that MK886 did not affect the expression of MAN1C1 in AD38 cells without tetracycline in the culture medium. This phenomenon was not observed in the case of GW9662."

According to the news reporters, the research concluded: "Our results indicate that HBV increases the expression of alpha-mannosidases both in vitro and in vivo via activation of the PPAR alpha pathway by its envelope protein."

Our news correspondents report that additional information may be obtained by contacting D.Y. Tian, Huazhong University of Science & Technology, Tongji Hosp, Tongji Med College, Wuhan 430030, Hubei, People's Republic of China. Additional authors for this research include L.B. Jiang, X.J. Zou, W. Yi and D.Y. Tian.

China, Fundamental Research Funds for the Central Universities, National High Technology Research and Development Program of China, Independent Innovation Foundation of Huazhong University of Science and Technology, Clinical Foundation of Tongji Hospital, National Science Foundation of China.

Our news journalists obtained a quote from the research from the Huazhong University of Science and Technology, "Most HCC overexpress GPC3, whereas little GPC3 can be detected in normal adult liver and benign liver lesions. Therefore, it is important to understand the function of GPC3 in HCC tumor development as the GPC3 ligand may facilitate detection of HCC. In this study, a 12-mer peptide with the sequence of DHLASLWWGTEL (denoted as TJ12P1) was identified by screening a phage display peptide library that demonstrated ideal GPC3 binding affinity. We used TJ12P1 conjugated with near-infrared fluorescent (NIFR) dye Cy5.5 for tumor imaging. After intravenous injection of the imaging agent, TJ12P1, xenografts of high GPC3 expressing hepatocellular carcinoma cell line, HepG2, demonstrated significantly higher tumor accumulation (tumor/muscle ratio: 3.98 ? 0.36) than those of low GPC3 expressing prostate cancer cell line, PC3 (tumor/muscle ratio: 2.03 ? 0.23). More importantly, GPC3 expression in tumor samples of patients could be visualized using TJ12P1, suggesting the potential use of this peptide as a probe for HCC detection."

According to the news editors, the research concluded: "Our study has successfully identified a promising GPC3-binding peptide ligand for detecting the GPC3 expression in HCC not only in vitro but also in vivo by its noninvasive imaging."

Our news journalists report that additional information may be obtained by contacting D. Zhu, Dept. of Nuclear Medicine and PET, Tongji Hospital, Tongji Medical College, Huazhong University of Science and Technology, Wuhan 430000, People's Republic of China. Chromaffin Cells

Investigators at Hunan University Report Findings in Chromaffin Cells (Bibenzyl compound 20c protects against endoplasmic reticulum stress in tunicamycin-treated PC12 cells in vitro)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Chromaffin Cells are discussed in a new report. According to news reporting out of Changsha, People's Republic of China, by NewsRx editors,
research stated, "Accumulation of alpha-synuclein (alpha-syn) in the brain is a characteristic of Parkinson's disease (PD). In this study, we investigated whether treatment with tunicamycin, an endoplasmic reticulum (ER) stress inducer, led to the accumulation of alpha-syn in PC12 cells, and where alpha-syn protein was accumulated, and finally, whether bibenzyl compound 20c, a novel compound isolated from Gastrodia elata (Tian ma), could alleviate the accumulation of alpha-syn and ER stress activation in tunicamycin-treated PC12 cells."

Our news journalists obtained a quote from the research from Hunan University, "PC12 cells were treated with tunicamycin for different time (6 h, 12 h, 24 h, 48 h). Cell viability was determined by a MTT assay. Subcellular fractions of ER and mitochondria were extracted with the Tissue Endoplasmic reticulum Isolation Kit. The levels of alpha-syn protein and ER-stress-associated downstream chaperones were detected using Western blots and immunofluorescence. Treatment of PC12 cells with tunicamycin (0.5-10 μg/mL) dose-dependently increased the accumulation of alpha-syn monomer (19 kDa) and oligomer (55 kDa), and decreased the cell viability. Accumulation of the two forms of alpha-syn was observed in both the ER and mitochondria with increasing treatment time. Co-treatment with 20c (10(-5) mol/L) significantly increased the viability of tunicamycin-treated cells, reduced the level of alpha-syn protein and suppressed ER stress activation in the cells, evidenced by the reductions in phosphorylation of eIF2 alpha and expression of spliced ATF6 and XBP1. Tunicamycin treatment caused accumulation of alpha-syn monomer and oligomer in PC12 cells."

According to the news editors, the research concluded: "Bibenzyl compound 20c reduces the accumulation of alpha-syn and inhibits the activation of ER stress, which protected PC12 cells against the toxicity induced by tunicamycin."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/aps.2016.75. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Antiretrovirals

Investigators at Indiana University School of Medicine Detail Findings in Antiretrovirals (Inhibition of Cytochrome P450 2B6 Activity by Voriconazole Profiled Using Efavirenz Disposition in Healthy Volunteers)
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Drugs and Therapies - Antiretrovirals are discussed in a new report. According to news reporting out of Indianapolis, Indiana, by NewsRx editors, research stated, "Cytochrome P450 2B6 (CYP2B6) metabolizes clinically important drugs and other compounds. Its expression and activity vary widely among individuals, but quantitative estimation is hampered by the lack of safe and selective in vivo probes of CYP2B6 activity."

Financial support for this research came from HHS | NIH | National Institute of General Medical Sciences (NIGMS).

Our news journalists obtained a quote from the research from the Indiana University School of Medicine, "Efavirenz, a nonnucleoside HIV-1 reverse transcriptase inhibitor, is mainly cleared by CYP2B6, an enzyme strongly inhibited in vitro by voriconazole. To test efavirenz metabolism as an in vivo probe of CYP2B6 activity, we quantified the inhibition of CYP2B6 activity by voriconazole in 61 healthy volunteers administered a single 100-mg oral dose of efavirenz with and without voriconazole administration. The kinetics of efavirenz metabolites demonstrated formation rate-limited elimination. Compared to control, voriconazole prolonged the elimination half-life ((t(1/2)) and increased both the maximum concentration of drug in serum (C-max) and the area under the concentration-time curve from 0 h to t (AUC(0-t)) of efavirenz (mean change of 51%, 36%, and 89%, respectively) (P < 0.0001) with marked intersubject variability (e.g., the percent change in efavirenz AUC(0-t) ranged from 0.4% to similar to 224%). Voriconazole decreased efavirenz 8-hydroxylation by greater than 60% (P < 0.0001), whereas its effect on 7-hydroxylation was marginal. The plasma concentration ratio of efavirenz to 8-hydroxyefavirenz, determined 1 to 6 h after dosing, was significantly increased by voriconazole and correlated with the efavirenz AUC(0-t) (Pearson r = 0.8; P< 0.0001)."

According to the news editors, the research concluded: "This study demonstrates the mechanisms of voriconazole-efavirenz interaction, establishes the use of a low dose of efavirenz as a safe and selective in vivo probe for phenotyping CYP2B6 activity, and identifies several easy-to-use indices that should enhance understanding of the mechanisms of CYP2B6 interindividual variability."

For more information on this research see: Inhibition of Cytochrome P450 2B6 Activity by Voriconazole Profiled Using Efavirenz Disposition in Healthy Volunteers. Antimicrobial Agents and Chemotherapy, 2016;60(11):6813-6822. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news journalists report that additional information may be obtained by contacting Z. Desta, Indiana Univ Sch Med, Dept. of Med, Div Clin Pharmacol, Indianapolis, IN 46202, United States. Additional authors for this research include I.F. Metzger, N. Thong, J.B.L. Lu, J.T. Callaghan, T.C. Skaar, D.A. Flockhart and R.E. Galinsky.

Organophosphorus Compounds

Investigators at Institute for Biology Research Report Findings in Organophosphorus Compounds (Propagation of damage in the rat brain following sarin exposure: Differential progression of early processes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Organophosphorus Compounds. According to news reporting from Ness Ziona, Israel, by NewsRx journalists, research stated, "Sarin is an irreversible organophosphate cholinesterase inhibitor and a highly toxic warfare agent. Following the overt, dose-dependent signs (e.g. tremor, hyper secretion, seizures, respiratory depression and eventually death), brain damage is often reported."

The news correspondents obtained a quote from the research from Institute for Biology Research, "The goal of the present study was to characterize the early histopathological and biochemical events leading to this damage. Rats were exposed to 1LD50 of sarin (80 μg/kg, i.m.). Brains were removed at 1, 2, 6, 24 and 48 h and processed for analysis. TSPO (translocator protein) mRNA increased at 6 h post exposure while TSPO receptor density increased only at 24 h. In all brain regions tested, bax mRNA decreased 1 h post exposure followed by an increase 24 h later, with only minor increase in bcl2 mRNA. At this time point a decrease was seen in both anti-apoptotic protein Bcl2 and pro-apoptotic Bax, followed by a time and region specific increase in Bax. An immediate elevation in ERK1/2 activity with no change in JNK may indicate an endogenous 'first response' mechanism used to attenuate the forthcoming apoptosis. The time dependent increase in the severity of brain damage included an early bi-phasic activation of astrocytes, a sharp decrease in intact neuronal cells, a time dependent reduction in MAP2 and up to 15% of apoptosis. Thus, neuronal death is mostly due to necrosis and severe astrocytosis. The data suggests that timing of possible treatments should be determined by early events following exposure."

According to the news reporters, the research concluded: "For example, the biphasic changes in astrocytes activity indicate a possible beneficial effects of delayed anti-inflammatory intervention."

Our news journalists report that additional information may be obtained by contacting E. Grauer, Israel Inst Biol Res, Dept. of PharmacoL, IL-74100 Ness Ziona, Israel. Additional authors for this research include I. Egoz, R. Brandeis, S. Chapman, E. Bloch-Shilderman and E. Grauer.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.taap.2016.09.008. This DOI is a link to an online electronic document that is either free or for purchase.

Investigators at Institute for Cancer Research and Treatment (IRCCS) Describe Findings in Clinical Trials and Studies [Prevalence of potential familial hypercholesteremia (FH) in 54,811 statin-treated patients in clinical practice]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Clinical Research - Clinical Trials and Studies are discussed in a new report. According to news originating from Milan, Italy, by NewsRx correspondents, research stated, "Familial hypercholesterolemia (FH) is a life-threatening disease, characterized by elevated LDL-C levels and a premature, increased risk of coronary heart disease (CHD) that is globally underdiagnosed. The percentage of patients with possible or probable FH in various countries was examined in the Dyslipidemia International Study (DYSIS)."

Our news journalists obtained a quote from the research from Institute for Cancer Research and Treatment (IRCCS), "DYSIS is a multinational, cross-sectional observational study of 54,811 adult outpatients treated with statin therapy. The percentages of patients with high levels of LDL-C, and with possible or probable FH, were assessed using the Dutch scoring method for FH across 29 countries, in age subgroups for the analysis population and among diabetes patients. Despite statin therapy, 16.1% (range 4.4-27.6%) of patients had LDL-C > 3.6 mmol/L (140 mg/dL) across countries and the prevalence of possible FH was 15.0% (range 5.5-27.8%) and 1.1% (range 0.0-5.4%) for probable FH. The highest percentages of probable FH occurred in Egypt (5.4%), the Baltic states (4.2%), Russia (3.2%), and Slovenia (3.1%), with the lowest rates in Israel (0.0%), Canada (0.2%), and Sweden (0.3%). Rates of FH were the highest in younger patients (45-54 years) for secondary prevention, regardless of the presence/absence of diabetes. Despite statin therapy, high LDL-C levels and rates of possible and probable FH were observed in some countries. The prevalence of FH was the highest in younger age patients, and > 60% of patients with probable FH displayed CHD."

According to the news editors, the research concluded: "Earlier diagnosis and treatment of patients with FH are needed to reduce CHD risk in these patients."

The news correspondents report that additional information may be obtained from A.L. Catapano, IRCCS Multimed, I-20133 Milan, Italy. Additional authors for this research include D. Lautsch, L. Investigators at Institute for Medical Genetics Report New Data on Medical Genetics (A homozygous HOXD13 missense mutation causes a severe form of synpolydactyly with metacarpal to carpal transformation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Genetics - Medical Genetics. According to news reporting from Berlin, Germany, by NewsRx journalists, research stated, "Synpolydactyly (SPD) is a rare congenital limb disorder characterized by syndactyly between the third and fourth fingers and an additional digit in the syndactylous web. In most cases SPD is caused by heterozygous mutations in HOXD13 resulting in the expansion of a N-terminal polyalanine tract."

Financial supporters for this research include Deutsche Forschungsgemeinschaft (DFG), Berlin-Brandenburg School for Regenerative Therapies (BSRT).

The news correspondents obtained a quote from the research from Institute for Medical Genetics, "If homozygous, the mutation results in severe shortening of all metacarpals and phalanges with a morphological transformation of metacarpals to carpals. Here, we describe a novel homozygous missense mutation in a family with unaffected consanguineous parents and severe brachydactyly and metacarpal-to-carpal transformation in the affected child. We performed whole exome sequencing on the index patient, followed by Sanger sequencing of parents and patient to investigate cosegregation. The DNA-binding ability of the mutant protein was tested with electrophoretic mobility shift assays. We demonstrate that the c.938C >G (p.313T >R) mutation in the DNA-binding domain of HOXD13 prevents binding to DNA in vitro. Our results show to our knowledge for the first time that a missense mutation in HOXD13 underlies severe brachydactyly with metacarpal-to-carpal transformation. The mutation is non-penetrant in heterozygous carriers."

According to the news reporters, the research concluded: "In conjunction with the literature we propose the possibility that the metacarpal-to-carpal transformation results from a homozygous loss of functional HOXD13 protein in humans in combination with an accumulation of non-functional HOXD13 that might be able to interact with other transcription factors in the developing limb."

Our news journalists report that additional information may be obtained by contacting D.M. Ibrahim, Institute for Medical Genetics and Human Genetics, Charite Universitatsmedizin Berlin, Berlin, Germany. Additional authors for this research include N. Tayebi, A. Knaus, A.C. Stiege, A. Sahebzamani, J. Hecht, S. Mundlos and M. Spielmann.

Investigators at Institute of Basic Medicine Zero in on Acute Promyelocytic Leukemia (A novel PAD4/SOX4/PU.1 signaling pathway is involved in the committed differentiation of acute promyelocytic leukemia cells into granulocytic cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Promyelocytic Leukemia. According to news reporting from Shandong, People's Republic of China, by NewsRx journalists, research stated, "All-trans retinoic acid (ATRA) treatment yields cure rates >80% through proteasomal degradation of the PML-RARa fusion protein that typically promotes acute promyelocytic leukemia (APL). However, recent evidence indicates that ATRA can also promote differentiation of leukemia cells that are PML-RARa negative, such as HL-60 cells."

The news correspondents obtained a quote from the research from the Institute of Basic Medicine, "Here, gene expression profiling of HL-60 cells was used to investigate the alternative mechanism of impaired differentiation in APL. The expression of peptidylarginine deiminase 4 (PADI4), encoding PAD4, a protein that post-translationally converts arginine into citrulline, was restored during ATRA-induced differentiation. We further identified that hypermethylation in the PADI4 promoter was associated with its transcriptional repression in HL-60 and NB4 (PML-RARa positive) cells. Functionally, PAD4 translocated into the nucleus upon ATRA exposure and promoted ATRA-mediated differentiation. Mechanistic studies using RNAi knockdown or electroporation-mediated delivery of PADI4, along with chromatin immunoprecipitation, helped identify PU.1 as an indirect target and SOX4 as a direct target of PAD4 regulation. Indeed, PAD4 regulates SOX4-mediated PU.1 expression, and thereby the differentiation process, in a SOX4-dependent manner."

According to the news reporters, the research concluded: "Taken together, our results highlight an association between PAD4 and DNA hypermethylation in APL and demonstrate that targeting PAD4 or regulating its downstream effectors may be a promising strategy to control differentiation in the clinic."

Our news journalists report that additional information may be obtained by contacting G. Song, Dept. of Hemato-Oncology, Institute of Basic Medicine, Shandong Academy of Medical Sciences, Key Medical Laboratory for Tumor Immunology and Traditional Chinese Medicine Immunology of Shandong, Jinan, Shandong, People's Republic of China. Additional authors for this research include L. Shi, Y. Guo, L. Yu, L. Wang, X. Zhang, L. Li, Y. Han, X. Ren, Q. Guo, K. Bi and G. Jiang.

Investigators at Institute of Biomedical Sciences Report New Data on Lung Cancer (Hedgehog pathway maintains cell survival under stress conditions, and drives drug resistance in lung adenocarcinoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Lung Cancer. According to news reporting from Taipei, Taiwan, by NewsRx journalists, research stated, "Hedgehog (HH) pathway plays an important role in embryonic development, but is largely inactive in adult except for tissue repair. Aberrant activation of HH pathway has been found in a variety of cancer types."  

The news correspondents obtained a quote from the research from the Institute of Biomedical Sciences, "In non-small cell lung cancer, however, the role and importance of HH pathway remain controversial. In the current study, we found that HH pathway was maintained in low activity in lung adenocarcinoma (LAC) cells under normal culture condition, but was highly induced in response to stress conditions. Activation of HH pathway promoted cell survival, growth, and invasion partially through HGF and MET signaling. Hedgehog-Interacting Protein (HHIP), a cell-surface negative regulator of HH pathway, was epigenetically silenced in LAC. Overexpression of HHIP blocked the activation of HH and HGF/MET pathways, and made cells significantly more susceptible to stress conditions. In LAC cells with acquired resistance to Epidermal Growth Factor Receptor Tyrosin Kinase Inhibitor (EGFR-TKI), we found that a part of tumor cells were much more sensitive to HH or HGF/MET inhibitors, suggesting an oncogenic addiction shift from EGFR to HH and HGF/MET pathways."

According to the news reporters, the research concluded: "This study showed that HH pathway is a survival signaling that drives LAC cell growth under stress conditions, and HHIP is a key regulator to block the induction of HH pathway. Targeting the HH pathway through inhibitors or HHIP thus holds promise to address EGFR-TKI resistance in LAC in clinic."

For more information on this research see: Hedgehog pathway maintains cell survival under stress conditions, and drives drug resistance in lung adenocarcinoma. 

Our news journalists report that additional information may be obtained by contacting E.H. Lin, Institute of Biomedical Sciences, Academia Sinica, Taipei, Taiwan. Additional authors for this research include Y.R. Kao, C.A. Lin, T.Y. Kuo, S.P. Yang, C.F. Hsu, T.Y. Chou, C.C. Ho and C.W Wu.

Investigators at Institute of Cell Biology and Neurobiology Release New Data on Estradiol Congeners (17beta-estradiol counteracts neuropathic pain: a behavioural, immunohistochemical, and proteomic investigation on sex-related differences in ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Hormones - Estradiol Congeners have been presented. According to news reporting originating from Rome, Italy, by NewsRx correspondents, research stated, "Sex differences play a role in pain sensitivity, efficacy of analgesic drugs and prevalence of neuropathic pain, even if the underlying mechanisms are far from being understood. We demonstrate that male and female mice react differently to structural and functional changes induced by sciatic nerve ligation, used as model of neuropathic pain."

Our news editors obtained a quote from the research from the Institute of Cell Biology and Neurobiology, "Male mice show a gradual decrease of allodynia and a complete recovery while, in females, allodynia and gliosis are still present four months after neuropathy induction. Administration of 17b-estradiol is able to significantly attenuate this difference, reducing allodynia and inducing a complete recovery also in female mice. Parallel to pain attenuation, 17b-estradiol treated-mice show a functional improvement of the injured limb, a faster regenerative process of the peripheral nerve and a decreased neuropathy-induced gliosis."

According to the news editors, the research concluded: "These results indicate beneficial effects of 17b-estradiol on neuropathic pain and neuronal regeneration and focuses on the importance of considering gonadal hormones also in clinical studies."

For more information on this research see: 17beta-estradiol counteracts neuropathic pain: a behavioural, immunohistochemical, and proteomic investigation on sex-related differences in mice. Scientific Reports, 2016;6():18980. (Nature Publishing Group - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting V. Vacca, CNR-National Research Council, Institute of Cell Biology and Neurobiology, 00143 Roma, Italy. Additional authors for this research include S. Marinelli, L. Pieroni, A. Urbani, S. Luvisetto and F. Pavone.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1038/srep18980. This DOI is a link to an online electronic document that is either free or for purchase.

Investigators at Institute of Gerontology Describe Findings in Muscular Dystrophy (The Muscular Dystrophy Gene TMEM5 Encodes a Ribitol beta 1,4-Xylosyltransferase Required for the Functional Glycosylation of Dystroglycan)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Musculoskeletal Diseases and Conditions - Muscular Dystrophy have been presented. According to news reporting originating in Tokyo, Japan, by NewsRx journalists, research stated, "A defect in O-mannosyl glycan is the cause of alpha-dystroglycanopathy, a group of congenital muscular dystrophies caused by aberrant alpha-DG glycosylation. Recently, the entire structure of O-mannosyl glycan, \[3\text{GlcA} \beta 1-3\text{Xyl} \alpha 1\]-(n)-3\text{GlcA} \beta 1-4\text{Xyl-Rbo5P-3GalNAc} \beta 1-3\text{GlcNAc} \beta 1-4(\text{phospho-6})\text{Man} \alpha 1-, which is required for the binding of alpha-DG to extracellular matrix ligands, has been proposed."

The news reporters obtained a quote from the research from the Institute of Gerontology, "However, the linkage of the first Xyl residue to ribitol 5-phosphate (Rbo5P) is not clear. TMEM5 is a gene product responsible for alpha-dystroglycanopathy and was reported as a potential enzyme involved in this linkage formation, although the experimental evidence is still incomplete. Here, we report that TMEM5 is a xylosyltransferase that forms the Xyl beta 1-4Rbo5P linkage on O-mannosyl glycan. The anomeric configuration and linkage position of the product (beta 1,4 linkage) was determined by NMR analysis. The introduction of two missense mutations in TMEM5 found in alpha-dystroglycanopathy patients impaired xylosyltransferase activity. Furthermore, the disruption of the TMEM5 gene by CRISPR/Cas9 abrogated the elongation of the (-3\text{GlcA} \beta 1-3\text{Xyl} \alpha 1-) unit on O-mannosyl glycan."

According to the news reporters, the research concluded: "Based on these results, we concluded that TMEM5 acts as a UDP-e-xylose:ribitol-5-phosphate beta 1,4-xylosyltransferase in the biosynthetic pathway of O-mannosyl glycan."

Our news correspondents report that additional information may be obtained by contacting T. Endo, Inst Gerontol, Tokyo 1730015, Japan. Additional authors for this research include Y. Yamaguchi, M. Investigators at Institute of Life Sciences Have Reported New Data on Developmental Biology (Nucleolar protein 4-like has a complex expression pattern in zebrafish embryos)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Life Science Research - Developmental Biology. According to news reporting originating from Bhubaneswar, India, by NewsRx correspondents, research stated, "The nucleolar protein 4-like (NOL4L) gene is present on chromosome 20 (20q11.21) in humans. Parts of this gene have been shown to fuse with RUNX1 and PAX5 in acute myeloid leukemia and acute lymphoblastic leukemia, respectively."

Our news editors obtained a quote from the research from the Institute of Life Sciences, "The normal function of NOL4L in humans and other organisms is not well understood. The expression patterns and functions of NOL4L homologs during vertebrate development have not been reported. We sought to address these questions by studying the expression pattern of zebrafish nol4l during embryogenesis. Our data show that Znol4l mRNA is expressed in multiple organs in zebrafish embryos."

According to the news editors, the research concluded: "The sites of expression include parts of the brain, spinal cord, pronephros, hematopoietic cells and gut."

For more information on this research see: Nucleolar protein 4-like has a complex expression pattern in zebrafish embryos. *The International Journal of Developmental Biology*, 2016;60(1-3):53-6.

The news editors report that additional information may be obtained by contacting S. Borah, Institute of Life Sciences, Nalco Square, Chandrasekhar Pur, Bhubaneswar, Odisha, India. Additional authors for this research include P. Barrodia and R.K Swain.

Investigators at Institute of Oncology Report New Data on Lymphoma (Checkpoint inhibitors in Hodgkin's lymphoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Lymphoma is the subject of a report. According to news reporting originating from Ljubljana, Slovenia, by NewsRx editors, the research stated, "Hodgkin's lymphoma is unusual among cancers in that it consists of a small number of malignant Hodgkin/Reed-Sternberg cells in a sea of immune system cells, including T cells. Most of these T cells are reversibly inactivated in different ways and their reactivation may induce a very strong immune response to cancer cells."
Our news editors obtained a quote from the research from the Institute of Oncology, "One way of reactivation of T cells is with antibodies blocking the CTLA-4 and especially with antibodies directed against PD-1 or the PD-L1 ligand thereby reversing the tumor-induced downregulation of T-cell function and augmenting antitumor immune activity at the priming (CTLA-4) or tissue effector (PD-1) phase. Immune checkpoint inhibitors have been evidenced as an additional treatment option with substantial effectiveness and acceptable toxicity in heavily pretreated patients with Hodgkin's lymphoma."

According to the news editors, the research concluded: "Particularly, PD-1 blockade with nivolumab and pembrolizumab has demonstrated significant single-agent activity in this select population."

The news editors report that additional information may be obtained by contacting B. Jezeršek Novakovic, Division of Medical Oncology, Institute of Oncology Ljubljana, Ljubljana, Slovenia.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ehj.12697. This DOI is a link to an online electronic document that is either free or for purchase.

Gram-Positive Bacteria - Staphylococcus aureus

Investigators at Institute of Surgery Research Discuss Findings in Staphylococcus aureus (Screening a Commercial Library of Pharmacologically Active Small Molecules against Staphylococcus aureus Biofilms)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Positive Bacteria - Staphylococcus aureus are presented in a new report. According to news reporting from Fort Sam Houston, Texas, by NewsRx journalists, research stated, "It is now well established that bacterial infections are often associated with biofilm phenotypes that demonstrate increased resistance to common antimicrobials. Further, due to the collective attrition of new antibiotic development programs by the pharmaceutical industries, drug repurposing is an attractive alternative."

Financial supporters for this research include DOE | LDRD | Oak Ridge Institute for Science and Education (ORISE), Naval Medical Research Center (NMRC).

The news correspondents obtained a quote from the research from the Institute of Surgery Research, "In this work, we screened 1,280 existing commercially available drugs in the Prestwick Chemical Library, some with previously unknown antimicrobial activity, against Staphylococcus aureus, one of the commonly encountered causative pathogens of burn and wound infections. From the primary screen of the entire Prestwick Chemical Library at a fixed
Concentration of 10 μM, 104 drugs were found to be effective against planktonic S. aureus strains, and not surprisingly, these were mostly antimicrobials and antiseptics. The activity of 18 selected repurposing candidates, that is, drugs that show antimicrobial activity that are not already considered antimicrobials, observed in the primary screen was confirmed in dose-response experiments. Finally, a subset of nine of these drug candidates was tested against preformed biofilms of S. aureus."

According to the news reporters, the research concluded: "We found that three of these drugs, niclosamide, carmofur, and auranofin, possessed antimicrobial activity against preformed biofilms, making them attractive candidates for repurposing as novel antibiofilm therapies."

For more information on this research see: Screening a Commercial Library of Pharmacologically Active Small Molecules against Staphylococcus aureus Biofilms. Antimicrobial Agents and Chemotherapy, 2016;60(10):5663-5672. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. Cardiovascular Diseases and Conditions - Hereditary...

Investigators at Jikei University Report Findings in Hereditary Hemorrhagic Telangiectasia (Open arterial reconstruction of multiple hepatic artery aneurysms in a patient with hereditary hemorrhagic telangiectasia A case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Cardiovascular Diseases and Conditions - Hereditary Hemorrhagic Telangiectasia have been presented. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "Hereditary hemorrhagic telangiectasia (HHT) is characterized by mucocutaneous telangiectasia and visceral vascular malformations (VMs). Liver involvement with VMs may lead to high-output cardiac failure, portal hypertension, and biliary disease."

Our news journalists obtained a quote from the research from Jikei University, "There is no curative treatment for the disease, and liver transplantation is indicated for life-threatening complications. Herein, we report a case of multiple hepatic artery aneurysms...
(HAAs) in a patient with HHT in which open arterial reconstruction was performed. There have only been a few case reports on HAA occurring with HHT. Thus, this case provides important information for the management of HHT-associated HAAs. Case summary: A 62-year-old female with known HHT was referred to our facility to seek further treatment for a giant HAA. She denied any symptoms except recurrent epistaxis. A computed tomography (CT) scan revealed a right HAA with a diameter of 72mm, in addition to 2 other minor HAAs. The CT scan also revealed the VMs that were scattered in the liver, and a continuously dilated and tortuous artery existing from the celiac trunk to the right and left hepatic arteries. We performed open arterial reconstruction of the HAAs. Her postoperative course was uneventful. When treating HAAs, there are a variety of options. However, hepatic VMs might affect HHT patients in various ways postprocedurally. Ligation and embolization of the hepatic artery may lead to complications, such as massive hepatic necrosis. Hepatectomy should be avoided if possible, because a postoperative hyperperfusion state in the remaining liver can cause adverse events."

According to the news editors, the research concluded: "We believe that arterial reconstruction of HHT-associated HAAs might reduce the risk of postprocedural complications with minimal hemodynamic changes in the liver, thus obviating the need for hepatectomy or liver transplantation."

For more information on this research see: Open arterial reconstruction of multiple hepatic artery aneurysms in a patient with hereditary hemorrhagic telangiectasia A case report. Medicine, 2016;95(46):370-373. Medicine can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Investigators at John Radcliffe Hospital Release New Data on Sclerosing Cholangitis (New Therapeutic Strategies for Primary Sclerosing Cholangitis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Digestive System Diseases and Conditions - Sclerosing Cholangitis have been published. According to news reporting originating in Oxford, United Kingdom, by NewsRx journalists, research stated, "Primary sclerosing cholangitis (PSC) is a chronic cholestatic liver disease, which in the majority of patients progresses to liver transplantation or death. To date, no medical treatment has been proven to be of benefit, although ursodeoxycholic acid is widely used."

The news reporters obtained a quote from the research from John Radcliffe Hospital, "The etiopathogenesis of PSC is unclear, although it is associated with inflammatory bowel disease. Various hypotheses have been suggested, which have led to different therapeutic
strategies. Recent studies have suggested that the microbiome may play a role in PSC, raising the possibility of efficacy of antibiotics and fecal microbiota transplantation. Gut-homing T cells may be important in the pathogenesis of PSC, and several agents are in development, targeting various receptors, integrins, and ligands on this pathway, including VAP-1, MAdCAM-1, α4β7, and CCR9. Nuclear receptor agonists such as obeticholic acid and fibrates hold promise, as do other therapies that alter bile acid composition such as norUDCA. Antifibrotic agents such as Loxi2 inhibitors are also being assessed.

According to the news reporters, the research concluded: "It is likely that an effective drug therapy for PSC will become available over the next decade."

For more information on this research see: New Therapeutic Strategies for Primary Sclerosing Cholangitis. Seminars In Liver Disease, 2016;36(1):5-14. (Thieme - www.thieme.com)

Our news correspondents report that additional information may be obtained by contacting K.D. Williamson, Translational Gastroenterology Unit, John Radcliffe Hospital, Oxford, UK.

Herpesvirus Diseases and Conditions -...

Investigators at Johns Hopkins University Describe Findings in Cytomegalovirus [Role of nucleotide-binding oligomerization domain 1 (NOD1) and its variants in human cytomegalovirus control in vitro and in vivo]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Herpesvirus Diseases and Conditions - Cytomegalovirus have been presented. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Induction of nucleotide-binding oligomerization domain 2 (NOD2) and downstream receptor-interacting serine/threonine-protein kinase 2 (RIPK2) by human cytomegalovirus (HCMV) is known to up-regulate antiviral responses and suppress virus replication. We investigated the role of nucleotide-binding oligomerization domain 1 (NOD1), which also signals through RIPK2, in HCMV control."

Financial support for this research came from The National Heart, Lung and Blood Institute.

Our news journalists obtained a quote from the research from Johns Hopkins University, "NOD1 activation by Tri-DAP (NOD1 agonist) suppressed HCMV and induced IFN-beta. Mouse CMV was also inhibited through NOD1 activation. NOD1 knockdown (KD) or inhibition of its activity with small molecule ML130 enhanced HCMV replication in vitro. NOD1 mutations displayed differential effects on HCMV replication and antiviral responses. In
cells overexpressing the E56K mutation in the caspase activation and recruitment domain, virus replication was enhanced, but in cells overexpressing the E266K mutation in the nucleotidebinding domain or the wild-type NOD1, HCMV was inhibited, changes that correlated with IFN-beta expression. The interaction of NOD1 and RIPK2 determined the outcome of virus replication, as evidenced by enhanced virus growth in NOD1 E56K mutant cells (which failed to interact with RIPK2). NOD1 activities were executed through IFN-beta, given that IFN-beta KD reduced the inhibitory effect of Tri-DAP on HCMV. Signaling through NOD1 resulting in HCMV suppression was IKK alpha-dependent and correlated with nuclear translocation and phosphorylation of IRF3. Finally, NOD1 polymorphisms were significantly associated with the risk of HCMV infection in women who were infected with HCMV during participation in a glycoprotein B vaccine trial.

According to the news editors, the research concluded: "Collectively, our data indicate a role for NOD1 in HCMV control via RIPK2-IKK alpha-IRF3 and suggest that its polymorphisms predict the risk of infection."

The news correspondents report that additional information may be obtained from R. Arav-Boger, Johns Hopkins University, Sch Med, Dept. of Pediat, Div Infect Dis, Baltimore, MD 21287, United States. Additional authors for this research include S. Roy, R. Mukhopadhyay, A. Kapoor, P. Duggal, G.L. Wojcik, R.F. Pass and R. Arav-Boger.

Our reports deliver fact-based news of research and discoveries from around the world. Copyright 2017, NewsRx LLC
NewsRx journalists, research stated, "Sickle cell disease (SCD) is an autosomal recessive hemoglobinopathy that causes significant morbidity and mortality related to chronic hemolytic anemia, vaso-occlusion, and resultant end-organ damage. Tobacco smoke exposure (TSE) through secondhand smoke exposure in people with SCD of all ages and through primary smoking in adolescents and adults is associated with significantly increased morbidity, with increased rates of emergency department visits and hospitalizations for painful vaso-occlusive crises and acute chest syndrome (ACS)."

The news correspondents obtained a quote from the research from Johns Hopkins University, "Secondhand smoke is also associated with pulmonary function abnormalities in children with SCD who are already at risk for pulmonary function abnormalities on the basis of SCD. TSE is emerging as one of the few modifiable risk factors of SCD."

According to the news reporters, the research concluded: "This review discusses the current state of the evidence with respect to TSE and SCD morbidity, discusses potential mechanisms, and highlights current gaps in the evidence and future research directions."

Our news journalists report that additional information may be obtained by contacting S.C. Sadreameli, Johns Hopkins Sch Med, Eudowood Div Pediat Resp Sci, Baltimore, MD 21287, United States. Additional authors for this research include B.T. Kopp, S.E. Creary, M.N. Eakin, S. McGrath-Morrow and J.J. Strouse.

Hematology - Blood Coagulation Factors

Investigators at Johns Hopkins University Report Findings in Blood Coagulation Factors (Immature endothelial cells initiate endothelin-mediated constriction of newborn arteries)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Hematology - Blood Coagulation Factors. According to news originating from Baltimore, Maryland, by NewsRx correspondents, research stated, "Endothelial cells lining fetal and newborn arteries have an unusual phenotype, including reduced NO activity, prominent actin stress fibres and poorly developed cellular junctions. Experiments were performed to determine whether the immature endothelium of newborn arteries also expresses and releases endothelin-1 (ET-1) and initiates endothelium-dependent constriction."

Our news journalists obtained a quote from the research from Johns Hopkins University, "Carotid arteries were isolated from newborn (postnatal day 1; P1), postnatal day 7 (P7) and postnatal day 21 (P21) mice and assessed in a pressure myograph system. Endothelial stimulation with A23187 or thrombin caused constriction in P1 arteries, no significant change in
diameter of P7 arteries, and dilatation in P21 arteries. In P1 arteries, constriction to thrombin or A23187 was inhibited by endothelial-denudation, by ET-1 receptor antagonists (BQ123 plus BQ788) or by inhibition of endothelin-converting enzyme (phosphoramidon or SM19712). ET-1 receptor antagonism did not affect responses to thrombin or A23187 in more mature arteries. Exogenous ET-1 caused similar concentration-dependent constrictions of P1, P7 and P21 arteries. Endothelial stimulation with thrombin rapidly increased the endothelial release of ET-1 from P1 but not P21 aortas. Endothelial expression of ET-1 peptides, as assessed by immunofluorescence analysis, was increased in P1 compared to P21 arteries. Therefore, newborn endothelial cells express high levels of ET-1 peptides, rapidly release ET-1 in response to endothelial stimulation, and initiate ET-1-mediated endothelium-dependent constriction. This activity is diminished as the endothelium matures in the immediate postnatal period."

According to the news editors, the research concluded: "Heightened activity of ET-1 in neonatal endothelium probably reflects an early developmental role of the peptide, although this might contribute to inappropriate responses of immature arteries to stress or injury."

The news correspondents report that additional information may be obtained from N.A. Flavahan, Johns Hopkins University, Dept. of Anesthesiol & Crit Care Med, Baltimore, MD, United States. Additional authors for this research include S. Flavahan and N.A. Flavahan.

**Intercellular Signaling Peptides and Proteins - TGF-…**

**Investigators at Kanazawa University Zero in on TGF-beta Superfamily Proteins (Novel oral transforming growth factor-b signaling inhibitor EW-7197 eradicates CML-initiating cells)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Intercellular Signaling Peptides and Proteins - TGF-beta Superfamily Proteins. According to news reporting originating in Kanazawa, Japan, by NewsRx journalists, research stated, "Recent strategies for treating CML patients have focused on investigating new combinations of tyrosine kinase inhibitors (TKIs) as well as identifying novel translational research agents that can eradicate CML leukemia-initiating cells (CML-LICs). However, little is known about the therapeutic benefits such CML-LIC targeting therapies might bring to CML patients."

The news reporters obtained a quote from the research from Kanazawa University,
"In this study, we investigated the therapeutic potential of EW-7197, an orally bioavailable transforming growth factor-b signaling inhibitor which has recently been approved as an Investigational New Drug (NIH, USA), to suppress CML-LICs in vivo. Compared to TKI treatment alone, administration of TKI plus EW-7197 to CML-affected mice significantly delayed disease relapse and prolonged survival. Notably, combined treatment with EW-7197 plus TKI was effective in eliminating CML-LICs even if they expressed the TKI-resistant T315I mutant BCR-ABL1 oncogene."

According to the news reporters, the research concluded: "Collectively, these results indicate that EW-7197 may be a promising candidate for a new therapeutic that can greatly benefit CML patients by working in combination with TKIs to eradicate CML-LICs."

Oncology - Breast Cancer

Investigators at Karolinska Institute Describe Findings in Breast Cancer (Sequencing-based breast cancer diagnostics as an alternative to routine biomarkers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Breast Cancer are presented in a new report. According to news reporting originating in Stockholm, Sweden, by NewsRx journalists, research stated, "Sequencing-based breast cancer diagnostics have the potential to replace routine biomarkers and provide molecular characterization that enable personalized precision medicine. Here we investigate the concordance between sequencing-based and routine diagnostic biomarkers and to what extent tumor sequencing contributes clinically actionable information."

The news reporters obtained a quote from the research from Karolinska Institute, "We applied DNA-and RNA-sequencing to characterize tumors from 307 breast cancer patients with replication in up to 739 patients. We developed models to predict status of routine biomarkers (ER, HER2, Ki-67, histological grade) from sequencing data. Non-routine
biomarkers, including mutations in BRCA1, BRCA2 and ERBB2(HER2), and additional clinically actionable somatic alterations were also investigated. Concordance with routine diagnostic biomarkers was high for ER status (AUC = 0.95; AUC(replication) = 0.97) and HER2 status (AUC = 0.97; AUC(replication) = 0.92). The transcriptomic grade model enabled classification of histological grade 1 and histological grade 3 tumors with high accuracy (AUC = 0.98; AUC(replication) = 0.94). Clinically actionable mutations in BRCA1, BRCA2 and ERBB2(HER2) were detected in 5.5% of patients, while 53% had genomic alterations matching ongoing or concluded breast cancer studies. Sequencing-based molecular profiling can be applied as an alternative to histopathology to determine ER and HER2 status, in addition to providing improved tumor grading and clinically actionable mutations and molecular subtypes."

According to the news reporters, the research concluded: "Our results suggest that sequencing-based breast cancer diagnostics in a near future can replace routine biomarkers."

For more information on this research see: Sequencing-based breast cancer diagnostics as an alternative to routine biomarkers. Scientific Reports, 2016;6():1-10. Cardiovascular Diseases and Conditions - Thrombosis

Investigators at Karolinska Institute Describe Findings in Thrombosis (Ageing, deep vein thrombosis and male gender predict poor outcome after acute Achilles tendon rupture)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Thrombosis. According to news reporting out of Stockholm, Sweden, by NewsRx editors, research stated, "Patients with an acute Achilles tendon rupture (ATR) take a long time to heal, have a high incidence of deep vein thrombosis (DVT) and widely variable functional outcomes. This variation in outcome may be explained by a lack of knowledge of adverse factors, and a subsequent shortage of appropriate interventions."

Our news journalists obtained a quote from the research from Karolinska Institute, "A total of 111 patients (95 men, 16 women; mean age 40.3, standard deviation 8.4) with an acute total ATR were prospectively assessed. At one year post-operatively a uniform outcome score, Achilles Combined Outcome Score (ACOS), was obtained by combining three validated, independent, outcome measures: Achilles tendon Total Rupture Score, heel rise height test, and limb symmetry heel-rise height. Predictors of ACOS included treatment; gender; age; smoking;
body mass index; time to surgery; physical activity level pre- and post-injury; symptoms; quality of life and incidence of DVT. There were three independent variables that correlated significantly with the dichotomised outcome score (ACOS), while there was no correlation with other factors. An age of less than 40 years old was the strongest independent predictor of a good outcome one year after ATR (odds ratio (OR) 0.20, 95% confidence interval (CI) 0.08 to 0.51), followed by female gender (OR) 4.18, 95% CI 1.01 to 17.24). Notably, patients who did not have a DVT while immobilised post-operatively had a better outcome (OR 0.31, 95% CI 0.12 to 0.80).

According to the news editors, the research concluded: "Over the age of 40 years, male gender and having a DVT while immobilised are independent negative predictors of outcome in patients with an acute ATR."

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1302/0301-620X.98B12.BJJ-2016-0008.R1. This DOI is a link to an online electronic document that is either free or for purchase.

Bispectral Index Score. Hypoxic and hypercapnic ventilatory responses were measured at rest, during sedation (OAA/S 2 to 4), and after recovery. Drug exposure was verified with concentration analysis in plasma. Ten subjects completed the study. The OAA/S at the sedation goal was 3 (3 to 4) (median [minimum to maximum]) for both drugs. Bispectral Index Score was 82 +/- 8 and 75 +/- 3, and the drug concentrations in plasma at the sedation target were 0.66 +/- 0.14 and 1.26 +/- 0.36 µg/ml for dexmedetomidine and propofol, respectively. Compared with baseline, sedation reduced hypoxic ventilation to 59 and 53% and the hypercapnic ventilation to 82 and 86% for dexmedetomidine and propofol, respectively. In addition, some volunteers displayed upper airway obstruction and episodes of apnea during sedation. Dexmedetomidine-induced sedation reduces ventilatory responses to hypoxia and hypercapnia to a similar extent as sedation with propofol."

According to the news editors, the research concluded: "This finding implies that sedation with dexmedetomidine interacts with both peripheral and central control of breathing."

For more information on this research see: Sedation with Dexmedetomidine or Propofol Impairs Hypoxic Control of Breathing in Healthy Male Volunteers A Nonblinded, Randomized Crossover Study. Anesthesiology, 2016;125(4):700-715. Anesthesiology can be contacted at: Lippincott Williams & Wilkins, Two Commerce Sq, 2001 Market St, Philadelphia, PA 19103, USA. Herpesvirus Diseases and Conditions -

Investigators at Kashan University of Medical Sciences Report New Data on Cytomegalovirus (ToRCH "co-infections" are associated with increased risk of abortion in pregnant women)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Herpesvirus Diseases and Conditions - Cytomegalovirus have been published. According to news originating from Kashan, Iran, by NewsRx correspondents, research stated, "ToRCH infections (toxoplasmosis, rubella, cytomegalovirus and Herpes simplex virus) have long been known to be associated with bad obstetric outcomes. However, little information is available about the impact of ToRCH co-infections on the outcome of pregnancy."

Financial support for this research came from Kashan University of Medical Sciences.

Our news journalists obtained a quote from the research from the Kashan University
of Medical Sciences, "Hence, we tested the IgG and IgM antibodies to *Toxoplasma gondii*, Rubella, Cytomegalovirus and Herpes Simplex Virus among 81 pregnant women with abortion (case group) and 98 pregnant women with normal delivery (control group). In the single-infection model, only CMV-IgM seropositivity was significantly increased in case than control group (25.9% in case and 12.2% in control, OR=2.5, p=0.019). In the co-infection model, 14 patterns were recognized, but two patterns were significantly increased in the case than the control group. Co-infection of *T. gondii* IgG + CMV IgM was 9.1-fold increased in the case than the control group (8.6% in the case and 1% in control, OR=9.1; p=0.024). Also, co-infection of *T. gondii* IgG + HSV IgG + CMV IgM was 7.7-fold increased in case than the control group (7.4% in case and 1% in control, OR=7.7; p=0.04). Although the OR of other co-infections was higher in the case than the control group, the difference was not statistically significant. These findings indicate that ToRCH co-infections are associated with increased risk of abortion than single infection."

According to the news editors, the research concluded: "Hence, the rates of co-infections should be considered in prenatal screening of ToRCH infections."

For more information on this research see: ToRCH "co-infections" are associated with increased risk of abortion in pregnant women. *Congenital Anomalies*, 2016;56(2):73-8. *Congenital Anomalies* can be contacted at: Blackwell Publishing Inc, 350 Main St, Malden, MA 02148, USA. **Oncology - Cancer Epidemiology**

**Investigators at Kent State University Describe Findings in Cancer Epidemiology (Current depression as a potential barrier to health care utilization in adult cancer survivors)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Cancer Epidemiology are presented in a new report. According to news originating from Kent, Ohio, by NewsRx correspondents, research stated, "Depression in cancer survivors is a major concern and is associated with poor health related quality of life (HRQOL). Delaying or forgoing care due to depression may further
Our news journalists obtained a quote from the research from Kent State University, "Although several studies have documented depression as a barrier to health care utilization in non-cancer populations, the impact of current depression on health care utilization among adult cancer survivors (ACS) has not been fully elucidated. The objective of this study was to examine the association between current depression and health care utilization among ACS. Data from the 2010 Behavioral Risk Factor Surveillance System involving ACS were used in this study. The Patient Health Questionnaire 8 (PHQ-8) item scale was used to measure current depression. Two indicators of health care utilization were examined as outcomes of interest: cost as a barrier to medical care and not having a routine care. Logistic regression models were used to examine the association between current depression and health care utilization. Overall, 13.0% of ACS reported symptoms of current depression. Despite no differences in having access to care, current depression in ACS was a significant barrier to health care utilization: cost as a barrier to medical care (AOR: 5.3 [95% CI: 3.1-9.1]), and not having a routine care (AOR: 2.0 [95% CI: 1.2-3.3]). Our findings have implications for future studies to further understand the association between depression and health care utilization among ACS, its impact on their overall wellbeing, and efforts to detect and treat depression in ACS."

According to the news editors, the research concluded: "Routine assessment of depression in ACS and effective treatment interventions may aid in seeking timely and appropriate medical care."

For more information on this research see: Current depression as a potential barrier to health care utilization in adult cancer survivors. *Cancer Epidemiology*, 2016;44():132-137. *Cancer Epidemiology* can be contacted at: Elsevier Sci Ltd, The Boulevard, Langford Lane, Kidlington, Oxford OX5 1GB, Oxon, England. **Developmental Diseases and Conditions - Autism…**

**Investigators at King Saud University Discuss Findings in Autism Spectrum Disorders (High-resolution Snp Genotyping Platform Identified Recurrent And Novel Cnvs In Autism Multiplex Families)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Developmental Diseases and Conditions - Autism Spectrum Disorders is now available. According to news reporting from Riyadh, Saudi Arabia, by NewsRx journalists, research stated, "Single nucleotide polymorphisms (SNPs)-based
genotyping using microarray platform is now frequently used to detect copy number variants (CNVs) in the human genome. Here, we report CNVs identified using Illumina Human Omni 2.5 M oligonucleotide microarrays in 11 multiplex families with autism spectrum disorder (ASD) referred to Autism Research and Treatment Center (ART) and Madinah Maternity and Children Hospital (MMCH).

The news correspondents obtained a quote from the research from King Saud University, "Of the 11 families, 22 patients with ASD (all males) and their parents, were recruited for the present study. In total, 43 individuals were genotyped with high-resolution array. Abnormal microarray results were seen in all 22 patients with ASD. A total of 17 shared CNVs were selected for further analysis. Out of these 17 CNVs, we discovered one novel CNV, previously not described, and 16 recurrent CNVs that overlap with the genomic imbalances defined in the autism database, autism chromosome rearrangement database and database of genomic variants. Recurrent CNVs include 11 common and 5 rare CNVs. All rare CNVs are duplications except a 16-kb deletion on chr2q36.3. Rare gain of copy numbers includes a 2-kb duplication on chr9q21.13, overlapping duplications of 107 kb and 181 kb on chrXp22.33 in 2 different families and a 10-kb duplication on chr18q21.13. A novel loss of copy number on chr3q23 was found in four ASD cases. results in deletion of intron 2 of calsyntenin 2 (CLSTN2) encoding synaptic protein calsyntenin 2. CLSTN2 is expressed exclusively in the brain, with high levels occurring in cortical gamma-aminobutyric acid (GABA)ergic interneurons and in medial temporal lobe regions."

According to the news reporters, the research concluded: "These results verify the diagnostic relevance of genome-wide small common and rare CNVs and provide further evidence of the high diagnostic yield of microarray for genetic testing in children with ASD."

Our news journalists report that additional information may be obtained by contacting L.Y. Alayadhi, King Saud Univ, Fac Med, Dept. of Physiol, KSU Autism Res & Treatment CenterAL Amodi Autism Re, Riyadh, Saudi Arabia. Additional authors for this research include J.A. Hashmi, M. Iqbal, A.M. Albalawi, M.I. Samman, N.E. Elamin, S. Bashir and S. Basit.

Investigators at King's College Report New Data on Immunology (T-bet as a key regulator of mucosal immunity)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Immunology is the subject of a report. According to news reporting from London, United Kingdom, by NewsRx journalists, research stated, "Initially understood to be a key regulator of interferon-g-producing helper T cells, our knowledge of T-bet's functional roles has expanded to encompass a growing range of cellular lineages. In addition to regulating other interferon-g-producing adaptive immune cells, it is now clear that T-bet plays a fundamental role in the regulation of innate immune responses across mucosal surfaces."

Funders for this research include Wellcome Trust, Medical Research Council, National Institute for Health Research.

The news correspondents obtained a quote from the research from King's College, "This homeostatic role is demonstrated by the spontaneous colitis that occurs when T-bet is deleted from innate immune cells in RAG(-/-) mice. Using this model as a focal point, we review our understanding of T-bet's regulation of adaptive and innate immune systems, focusing particularly on mucosal populations including innate lymphoid cells, dendritic cells and intraepithelial lymphocytes. With the increasingly diverse effects of T-bet on different lineages, the classical binding-centric paradigm of T-bet's molecular functionality has increasingly struggled to account for the versatility of T-bet's biological effects. Recent recognition of the synergistic interactions between T-bet and other canonical transcription factors has led to a co-operative paradigm that has provided greater explanatory power."

According to the news reporters, the research concluded: "Synthesizing insights from ChIP-seq and comparative biology, we expand the co-operative paradigm further and suggest a network approach as a powerful way to understand and model T-bet's diverse functionality."

Our news journalists report that additional information may be obtained by contacting R. Mohamed, Division of Transplantation Immunology and Mucosal Biology, Dept. of Experimental Immunobiology, King's College London, London, UK.

Investigators at King's College Zero in on Medical Genetics
(Comparative mRNA analysis of behavioral and genetic mouse models of aggression)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Genetics - Medical Genetics have been presented. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Mouse models of aggression have traditionally compared strains, most notably BALB/cJ and C57BL/6. However, these strains were not designed to study aggression despite differences in aggression-related traits and distinct reactivity to stress."

Funders for this research include Medical Research Council, National Institutes of Health.

Our news journalists obtained a quote from the research from King's College, "This study evaluated expression of genes differentially regulated in a stress (behavioral) mouse model of aggression with those from a recent genetic mouse model aggression. The study used a discovery-replication design using two independent mRNA studies from mouse brain tissue. The discovery study identified strain (BALB/cJ and C57BL/6J) vs stress (chronic mild stress or control) interactions. Probe sets differentially regulated in the discovery set were intersected with those uncovered in the replication study, which evaluated differences between high and low aggressive animals from three strains specifically bred to study aggression. Network analysis was conducted on overlapping genes uncovered across both studies. A significant overlap was found with the genetic mouse study sharing 1,916 probe sets with the stress model. Fifty-one probe sets were found to be strongly dysregulated across both studies mapping to 50 known genes. Network analysis revealed two plausible pathways including one centered on the UBC gene hub which encodes ubiquitin, a protein well-known for protein degradation, and another on P38 MAPK. Findings from this study support the stress model of aggression, which showed remarkable molecular overlap with a genetic model. The study uncovered a set of candidate genes including the Erg2 gene, which has previously been implicated in different psychopathologies."

According to the news editors, the research concluded: "The gene networks uncovered points at a Redox pathway as potentially being implicated in aggressive related behaviors."

Our news journalists report that additional information may be obtained by contacting K. Malki, King's College London, MRC Social, Genetic and Developmental Psychiatry Centre, Institute of Psychiatry, London, UK. Additional authors for this research include M.G. Tosto, O. Pain, F. Sluyter, Y.S. Meunier, W.E. Crusio, S. de Boer, K.N. Sandnabba, J. Kesserwani, E. Robinson, L.C. Schalkwyk and P. Asherson.

Investigators at Kinki University Discuss Findings in Cell Motility (Different Induction of LPA Receptors by Chemical Liver Carcinogens Regulates Cellular Functions of Liver Epithelial WB-F344 Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cell Motility have been published. According to news reporting originating in Higashiosaka, Japan, by NewsRx journalists, research stated, "Lysophosphatidic acid (LPA) signaling via LPA receptors (LPA1 to LPA6) mediates a variety of cellular functions, including cell motility. In the present study, we investigated the effects of LPA receptors on cell motile activity during multi-stage hepatocarcinogenesis in rat liver epithelial WB-F344 cells treated with chemical liver carcinogens."

The news reporters obtained a quote from the research from Kinki University, "Cells were treated with an initiator (N-nitrosodiethylamine (DEN)) and three promoters (phenobarbital (PB), okadaic acid (OA) and clofibrate) every 24 h for 2 days. Cell motile activity was elevated by DEN, correlating with Lpar3 expression. PB, OA, and clofibrate elevated Lpar1 expression and inhibited cell motile activity. To evaluate the effects of long-term treatment on cell motility, cells were treated with DEN and/or PB for at least 6 months. Lpar3 expression and cell motile activity were significantly elevated by the long-term DEN treatment with or without further PB treatment. In contrast, long-term PB treatment with or without further DEN elevated Lpar1 expression and inhibited cell motility. When the synthesis of extracellular LPA was blocked by a potent ATX inhibitor S32826 before cell motility assay, the cell motility induced by DEN and PB was markedly suppressed."

According to the news reporters, the research concluded: "These results suggest that activation of the different LPA receptors may regulate the biological functions of cells treated with chemical carcinogens."

Our news correspondents report that additional information may be obtained by contacting T. Tsujiuchi, Kinki University, Fac Sci & Engn, Dept. of Life Sci, Div Mol Oncol, Higashiosaka, Osaka 5778502, Japan. Additional authors for this research include S. Ishii, A. Tomimatsu, K. Fukushima, K. Takahashi, N. Fukushima, K. Honoki and T. Tsujiuchi.

Investigators at Kirby Institute Discuss Findings in Antiretrovirals (The impact of ribavirin plasma concentration on the efficacy of the interferon-sparing regimen, sofosbuvir and ribavirin)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antiretrovirals have been published. According to news reporting originating from Sydney, Australia, by NewsRx correspondents, research stated, "Ribavirin augments sustained virological response when administered with pegylated interferon for the treatment of chronic HCV infection. The impact of ribavirin plasma concentration on outcome in individuals receiving interferon-free regimens has not been evaluated."

Our news editors obtained a quote from the research from Kirby Institute, "Stored plasma samples were retrieved for 47 treatment-naive subjects who received sofosbuvir and weight-based ribavirin for 12-24 weeks in the Phase IIb QUANTUM study. Week 1, 4 and 8 ribavirin plasma concentrations (mg/l) were quantified using high-performance liquid chromatography with UV detection. Sustained virological response at 12 weeks post treatment was observed in 55% with all treatment failures due to relapse. The median ribavirin plasma concentration increased from week 1 (1.58 mg/l, IQR 1.44-2.24) to week 4 (2.23 mg/l, IQR 1.69-2.87) and week 8 (2.67 mg/l, IQR 2.10-3.26) with wide variability at steady state. Median week 4 ribavirin plasma concentration was 2.25 mg/l (IQR 1.63-3.05) in those with a sustained virological response as compared to 2.07 mg/l (IQR 1.79-2.86) in those with treatment failure (OR 1.35; 95% CI 0.76, 2.39; P=0.3). No significant association between ribavirin plasma concentration and treatment response was noted at weeks 1 or 8. We found no evidence of an association between ribavirin plasma concentrations and relapse suggesting that, as opposed to interferon-based therapy, suboptimal ribavirin plasma concentrations did not explain the high rate of virological failure with this regimen."

According to the news editors, the research concluded: "Our findings suggest that in interferon-free ribavirin-containing regimens, concerns over ribavirin dosing to achieve previously determined target plasma concentrations are unnecessary."

The news editors report that additional information may be obtained by contacting M. Martinello, UNSW, Kirby Inst, Sydney, NSW, Australia. Additional authors for this research include A. Schteinman, M. Alavi, K. Williams, G.J. Dore, R. Day and G.V. Matthews.

Investigators at Korea Advanced Institute of Science and Technology (KAIST) Discuss Findings in Breast Cancer (GALNT14 promotes lung-specific breast cancer metastasis by modulating self-renewal and interaction with the lung microenvironment)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Breast Cancer is the subject of a report. According to news reporting originating in Taejon, South Korea, by NewsRx journalists, research stated, "Some polypeptide N-acetyl-galactosaminyltransferases (GALNTs) are associated with cancer, but their function in organ-specific metastasis remains unclear. Here, we report that GALNT14 promotes breast cancer metastasis to the lung by enhancing the initiation of metastatic colonies as well as their subsequent growth into overt metastases."

The news reporters obtained a quote from the research from the Korea Advanced Institute of Science and Technology (KAIST), "Our results suggest that GALNT14 augments the self-renewal properties of breast cancer cells (BCCs). Furthermore, GALNT14 overcomes the inhibitory effect of lung-derived bone morphogenetic proteins (BMPs) on self-renewal and therefore facilitates metastasis initiation within the lung microenvironment. In addition, GALNT14 supports continuous growth of BCCs in the lung by not only inducing macrophage infiltration but also exploiting macrophage-derived fibroblast growth factors (FGFs). Finally, we identify KRAS-PI3K-c-JUN signalling as an upstream pathway that accounts for the elevated expression of GALNT14 in lung-metastatic BCCs."

According to the news reporters, the research concluded: "Collectively, our findings uncover an unprecedented role for GALNT14 in the pulmonary metastasis of breast cancer and elucidate the underlying molecular mechanisms."

Our news correspondents report that additional information may be obtained by contacting M.Y. Kim, Korea Adv Inst Sci & Technol, Inst BioCentury, Canc Metastasis Control Center, Taejon 305701, South Korea. Additional authors for this research include M.S. Park, T.S. Nandu, S. Gadad, S.C. Kim and M.Y. Kim.

Investigators at Korea Institute of Toxicology Report Findings in Pathology (A subchronic toxicity study of Radix Dipsaci water extract by oral administration in F344 rats)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pathology have been presented. According to news reporting out of Daejeon, South Korea, by NewsRx editors, research stated, "Radix Dipsaci, the dried root of Dipsacus asperoides C.Y. Cheng & T.M.Ai, has therapeutic effects on various disorders, and in particular, bone and joint disease."

Financial support for this research came from Ministry of Food and Drug Safety.

Our news journalists obtained a quote from the research from the Korea Institute of Toxicology, "Despite such ethnomedicinal benefits, there is very little information regarding its in vivo toxicity or adverse effects. This study was conducted to evaluate the potential toxicity of the Radix Dipsaci water Extract (RD-wE) by using F344 rats. The RD-wE was administered orally to rats at doses of 0, 125, 250, 500,1000, and 2000 mg/kg body weight (bw)/day for 13 weeks. During the treatment period there were no mortalities attributed to RD-wE. Moreover, no toxic effects were observed with regard to body weight, clinical pathology (hematology, clinical biochemistry, and urinalysis), and anatomic pathology (gross findings, organ weight, and microscopic examination). The changes related to the treatment were excessive salivation at the mouth and soft feces, observed in male and female rats at 1000 or 2000 mg/kg bw/day, but these were not accompanied by any microscopic correlate or other pathophysiological changes."

According to the news editors, the research concluded: "Based on these results, the oral no-observed adverse-effect level of the RD-wE was considered to be 2000 mg/kg bw/day in both genders, although the target organs were not determined under the current experimental conditions."

For more information on this research see: A subchronic toxicity study of Radix Dipsaci water extract by oral administration in F344 rats. *Regulatory Toxicology and Pharmacology*, 2016;81():136-145. Investigators at Kyung Hee University Detail Findings in Breast Cancer (Synergistic Effect of SH003 and Doxorubicin in Triple-negative Breast Cancer)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Oncology - Breast Cancer have been published. According to news originating from Seoul, South Korea, by NewsRx correspondents, research stated, "Triple-negative breast cancer (TNBC) is highly aggressive, resulting in poor prognosis. Chemotherapy of TNBC relies on anti-cancer agents with strong cytotoxicity, but it causes several side effects with recurrence."

Our news journalists obtained a quote from the research from Kyung Hee University, "While combinational approaches of chemotherapeutics have been highlighted as a new treatment strategy for TNBC to reduce side effects, combinations of anti-cancer agents with herbal medicines have not been reported. We recently reported that newly modified traditional Chinese medicine named SH003 inhibited TNBC growth. Considering a combinational strategy for TNBC treatment, we further studied synergistic effects of SH003 with various anti-cancer drugs in TNBC treatment. Here, we demonstrate that SH003 shows a synergistic effect with doxorubicin on TNBC treatment. Our in vitro cell viability assays revealed that SH003 and doxorubicin showed a synergistic effect in the well-defined TNBC cell line, MDA-MB-231. Moreover, we found that the combinational treatment caused Caspase-dependent apoptotic cell death. Our in vivo mouse xenograft tumor growth assays confirmed that combinational treatment of SH003 with doxorubicin repressed MDA-MB-231 tumor growth with no weight loss."

According to the news editors, the research concluded: "Therefore, we conclude that the combinational treatment of SH003 with doxorubicin shows the synergism in TNBC treatment, and suggest that SH003 can be used together with conventional anticancer drugs in chemotherapeutic approaches."

The news correspondents report that additional information may be obtained from S.G. Ko, Kyung Hee Univ, Coll Korean Med, Dept. of Prevent Med, Seoul 02447, South Korea. Additional authors for this research include A.J. Kim, Y.K. Choi, Y.C. Shin, S.G.C. Seong- and S.G. Ko.

Investigators at Laval University Discuss Findings in Endocarditis (Management of Loeffler's Endocarditis With Bivalvular Involvement and a FIP1L1/PDGFRA-Negative Mutation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Heart Disorders and Diseases - Endocarditis. According to news originating from Quebec City, Canada, by NewsRx correspondents, research stated, "Hypereosinophilic syndromes (HESs) are a group of disorders characterized by end-organ damage caused by eosinophilic infiltration."

Our news journalists obtained a quote from the research from Laval University, "We present a patient with idiopathic HES with severe tricuspid and mitral regurgitation secondary to Loeffler's endocarditis. In addition to prednisone, imatinib therapy initially helped control the eosinophil count."

According to the news editors, the research concluded: "However, successful long-term remission was achieved with hydroxyurea therapy."

The news correspondents report that additional information may be obtained from M. Senechal, Laval University, Dept. of Cardiol, Inst Univ Cardiol & Pneumol Quebec, Quebec City, PQ, Canada. Additional authors for this research include P.L. Bernard, S. Cloutier, M.H. Leblanc, E. Larose, A. Cinq-Mars and M. Dubois.

Investigators at Lung and Blood Institute Have Reported New Data on Acute Leukemia [Novel immunotherapeutic approaches for the treatment of acute leukemia (myeloid and lymphoblastic)]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Acute Leukemia. According to news reporting originating from Bethesda, Maryland, by NewsRx correspondents, research stated, "There have been major advances in our understanding of the multiple interactions between malignant cells and the innate and adaptive immune system. While the attention of immunologists has hitherto focused on solid tumors, the specific immunobiology of acute leukemias is now becoming defined."
Our news editors obtained a quote from the research from Lung and Blood Institute, "These discoveries have pointed the way to immune interventions building on the established graft-versus-leukemia (GVL) effect from hematopoietic stem-cell transplant (HSCT) and extending immunotherapy beyond HSCT to individuals with acute leukemia with a diversity of immune manipulations early in the course of the leukemia. At present, clinical results are in their infancy."

According to the news editors, the research concluded: "In the coming years larger studies will better define the place of immunotherapy in the management of acute leukemias and lead to treatment approaches that combine conventional chemotherapy, immunotherapy and HSCT to achieve durable cures."

For more information on this research see: Novel immunotherapeutic approaches for the treatment of acute leukemia (myeloid and lymphoblastic). Therapeutic Advances In Hematology, 2016;7(1):17-39. (Sage Publications - www.sagepub.com; Therapeutic Advances In Hematology - tah.sagepub.com)

Musculoskeletal Diseases and Conditions - Bone…

Investigators at Mahidol University Report New Data on Bone Resorption (Expression of osteoclastogenic factor transcripts in osteoblast-like UMR-106 cells after exposure to FGF-23 or FGF-23 combined with parathyroid hormone)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Musculoskeletal Diseases and Conditions - Bone Resorption. According to news reporting out of Bangkok, Thailand, by NewsRx editors, research stated, "As a bone-derived hormone, fibroblast growth factor-23 (FGF-23) negatively regulates phosphate and calcium metabolism, while retaining growth-promoting action for mesenchymal cell differentiation. Elevated FGF-23 levels, together with hyperparathyroidism, are often observed in chronic kidney disease, which is associated with impaired bone mineralization and enhanced bone resorption."

Financial supporters for this research include TRF Senior Research Scholar Grant, Faculty of Allied Health Sciences, Burapha University, TRF Research Career Development Grant, Research and Development Fund Burapha University, Faculty of Allied Health Sciences, Burapha University Research Grant of Fiscal Year 2015, Higher Education Research Promotion and National Research University Project of Thailand, Office of the Higher Education Commission, Mahidol University, National Center for Genetic Engineering and Biotechnology
Our news journalists obtained a quote from the research from Mahidol University, "Although overexpression of osteoblast-derived osteoclastogenic cytokines might contribute to this metabolic bone disease, whether FGF-23 alone and FGF-23 plus parathyroid hormone (PTH) directly modulated the expression of osteoblast-derived osteoclastogenic genes remained elusive. Herein, we demonstrated the direct effects of FGF-23 on proliferation and mRNA expression of osteoblast-specific differentiation and osteoclastogenic markers in rat osteoblast-like UMR-106 cells in the presence or absence of PTH. FGF-23 was found to suppress UMR-106 cell proliferation, while increasing FGF-23 expression, the latter of which suggested the presence of positive feedback regulation of FGF-23 expression in osteoblasts. FGF-23 also upregulated the mRNA expression of osteoblast differentiation markers (e.g., Runx2, osterix, AJ18, Dlx5, alkaline phosphatase, and osteopontin), osteoclastogenic factors (e.g., MCSF, MCP-1, IL-6, and TNF-a), and bone resorption regulators (RANKL and osteoprotegerin). However, combined PTH and FGF-23 exposure did not alter the levels of FGF-23-induced transcripts, suggesting that both hormones had no additive effect."

According to the news editors, the research concluded: "FGF-23 directly suppressed osteoblast proliferation, while inducing osteoclastogenic gene expression in UMR-106 cells, and the FGF-23-induced transcripts were not altered by long-standing PTH exposure."

Our news journalists report that additional information may be obtained by contacting J. Teerapornpuntakit, Center of Calcium and Bone Research (COCAB), Faculty of Science, Mahidol University, Bangkok, Thailand. Additional authors for this research include K. Wongdee, N. Krishnamra and N. Charoenphandhu.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1002/cbin.10573. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Human Serum Albumin Therapy

Investigators at Maria Curie-Sklodowska University Detail Findings in Human Serum Albumin Therapy (Determination of binding properties of ampicillin in drug-human serum albumin standard solution using N-vinylpyrrolidone copolymer combined with ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Drugs and Therapies - Human Serum Albumin Therapy are presented in a new report. According to news reporting originating in Lublin, Poland, by
NewsRx journalists, research stated, "It is well-known that only the unbound (free) drug fraction can achieve a pharmacological effect. Therefore the determination of free drug concentration is a very important issue in the field of pharmacology."

The news reporters obtained a quote from the research from Maria Curie-Sklodowska University, "In this study poly-1-vinyl-2-pyrrolidone (VP) crosslinked with divinylbenzene (DVB) compared with the micellar liquid chromatography (MLC) with and without pre-made drug adsorption was used for quantitative analysis of free ampicillin concentration in the standard solution of drug-human serum albumin owing to its ability to block protein adsorption. The commonly recognized adsorption method based on drug adsorption on VP-DVB has been compared to the entirely new application of MLC with direct sample injection (DSI) not requiring pre-made adsorption. Micellar aggregates are able to solubilize various compounds therefore micellar environment can be used for direct determination of free drug concentration. The obtained results show that the free drug concentration values obtained in the micellar systems based on cetyltrimethylammonium bromide (CTAB) (93.98 μg L⁻¹, 78.3%) as well as on polyoxyethylene (23) lauril ether (Brij35) (91.15 μg L⁻¹, 75.9%) are similar to those obtained after the drug adsorption on VP-DVB using both RP-HPLC (95.85 μg mL⁻¹, 79.9%) and spectrophotometry (96.47 μg mL⁻¹, 80.4%). However, only %PPB (% plasma protein binding) value calculated on the basis of Brij35 retention factor is similar to the literature data. The obtained results are within the analytical range of % of free drug concentration. Therefore N-vinylpyrrolidone copolymer as well as micellar system based on the non-ionic surfactant can be successfully applied for determination of free drug concentration."

According to the news reporters, the research concluded: "Moreover, the new application of MLC with DSI can be recognized as a promising, fast and simple method for quantitative determination of free drug concentration."

For more information on this research see: Determination of binding properties of ampicillin in drug-human serum albumin standard solution using N-vinylpyrrolidone copolymer combined with the micellar systems. Talanta, 2017;162():241-248. Talanta can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. (Elsevier - www.elsevier.com; Talanta - www.journals.elsevier.com/talanta/)

Investigators at Mashhad University of Medical Sciences Report Findings in Pharmacology (Berberis Vulgaris and Berberine: An Update Review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Pharmacology have been presented. According to news reporting originating in Mashhad, Iran, by NewsRx journalists, research stated, "Berberine is an isoquinoline alkaloid present in several plants, including Coptis sp. and Berberis sp. Berberine is a customary component in Chinese medicine, and is characterized by a diversity of pharmacological effects."

The news reporters obtained a quote from the research from the Mashhad University of Medical Sciences, "An extensive search in electronic databases (PubMed, Scopus, Ovid, Wiley, ProQuest, ISI, and Science Direct) were used to identify the pharmacological and clinical studies on Berberis vulgaris and berberine, during 2008 to 2015, using 'berberine' and 'Berberis vulgaris' as search words. We found more than 1200 new article studying the properties and clinical uses of berberine and B. vulgaris, for treating tumor, diabetes, cardiovascular disease, hyperlipidemia, inflammation, bacterial and viral infections, cerebral ischemia trauma, mental disease, Alzheimer disease, osteoporosis, and so on."

According to the news reporters, the research concluded: "In this article, we have updated the pharmacological effects of B. vulgaris and its active constituent, berberine."

Our news correspondents report that additional information may be obtained by contacting H. Hosseinzadeh, Mashhad Univ Med Sci, Sch Pharm, Dept. of Pharmacodynam & Toxicol, Mashhad, Iran.

Cardiovascular Diseases and Conditions - Thrombosis

Investigators at Mayo Clinic Detail Findings in Thrombosis [Non-infectious thrombosis of the melody(R) valve: A tale of two cities]

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Cardiovascular Diseases and Conditions - Thrombosis have been published. According to news reporting originating in Rochester, Minnesota, by NewsRx journalists, research stated, "Bioprosthetic valve thrombosis is an uncommon complication. We report two young women with prior uncomplicated percutaneous pulmonary valve replacement (Melody®, Medtronic, Inc.)"

The news reporters obtained a quote from the research from Mayo Clinic,
"Minneapolis, MN) who later developed symptomatic pulmonary emboli and pulmonary valve dysfunction without evidence of infection. Thrombophilia risk factors included oral contraceptive use and mild thrombophilia. Both experienced recovery of valve function following anticoagulation."

According to the news reporters, the research concluded: "Acute changes in Melody (®) valve function should prompt a thorough investigation for and treatment of potential thrombotic causes."

Our news correspondents report that additional information may be obtained by contacting A.K. Cabalka, Mayo Clinic, Div Cardiovasc Dis, Dept. of Med, Rochester, MN, United States. Additional authors for this research include J.W. Delaney and A.K. Cabalka.

Surgery - Patellectomy

Investigators at Mayo Clinic Discuss Findings in Patellectomy (Increased Risk of Postoperative Complications After Total Knee Arthroplasty in Patients With Previous Patellectomy)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Surgery - Patellectomy have been presented. According to news reporting from Rochester, Minnesota, by NewsRx journalists, research stated, "Few studies have reported the results of total knee arthroplasty (TKA) in patients with previous patellectomy. The purpose of this study was to assess the risk of complications and survivorship of primary TKA in patients who previously had a patellectomy in comparison to those undergoing TKA with patellar resurfacing."

The news correspondents obtained a quote from the research from Mayo Clinic, "This was a historical cohort study and comprised 134 knees with previous patellectomy in a cohort of 17,946 primary TKA procedures at a single institution between 1985 and 2010. Multivariable Cox regression analyses were used to estimate the risk of complications and revisions in patients with previous patellectomy. When compared to TKA with patellar resurfacing, the risk of complications (hazards ratio: 1.38, 95% confidence interval: 1.05, 1.81) was significantly higher in post-patellectomy knees, but there was no difference in the risk of revisions (hazards ratio: 1.32, 95% confidence interval: 0.80, 2.18). There was no significant difference between the posterior-stabilized and cruciate-retaining designs in terms of both complications and revisions (P > .05). The most common complications in post-patellectomy knees were instability, delayed healing, and infection."
According to the news reporters, the research concluded: "TKA patients with previous patellectomy have a higher risk of complications but not a higher risk of revisions."

Our news journalists report that additional information may be obtained by contacting R.J. Sierra, Mayo Clinic, Dept. of Orthoped Surg, Rochester, MN 55905, United States. Additional authors for this research include H.M. Kremers, W.K. Kremers, D.J. Berry, D.G. Lewallen, R.T. Trousdale and R.J. Sierra.

**Proteins - Neuropeptides**

**Investigators at Mayo Clinic Zero in on Neuropeptides (A neurotensin analog blocks cocaine-conditioned place preference and reinstatement)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Proteins - Neuropeptides have been published. According to news reporting out of Jacksonville, Florida, by NewsRx editors, research stated, "Neurotensin (NT) is a neuropeptide that acts as a neurotransmitter and neuromodulator in the central nervous system. Several studies suggest a therapeutic role for NT analogs in nicotine and other psychostimulant addictions."

Our news journalists obtained a quote from the research from Mayo Clinic, "We studied the effects of the nonselective NT receptor agonist NT69L, which has equal affinity for the two major NT receptors, NTS1 and NTS2, on the expression of cocaine-conditioned place preference (cocaine-CPP) and reinstatement after extinction. Robust cocaine-CPP was obtained after 5 days of conditioning. Extinction was induced using eight repeated daily injections of saline. Reinstatement was prompted by priming with one injection of cocaine (12 mg/kg intraperitoneally). On the test day, NT69L (1 mg/kg intraperitoneally) was administered 30 min before assessing cocaine-CPP. Extinction led to the loss of cocaine-CPP. One injection of cocaine (12 mg/kg intraperitoneally) for cocaine priming reinstated cocaine-CPP. NT69L blocked cocaine-CPP reinstatement in cocaine-primed animals. In addition, NT69L blocked cocaine-CPP reinstatement when administered before priming with cocaine. Thus, the NT agonist NT69L blocked both cocaine-CPP and reinstatement to cocaine preference. NT69L may exert this action by modulating the mesocorticolimbic dopamine and glutamatergic pathways involved in addiction and relapse processes."

According to the news editors, the research concluded: "Therefore, NT agonists may represent a novel therapy for the treatment of addiction to cocaine and possibly to other substances."
psychostimulants."

For more information on this research see: A neuropeptide analog blocks cocaine-conditioned place preference and reinstatement. *Behavioural Pharmacology*, 2016;27(2-3 Spec I):236-9. **Investigators at McGill University Release New Data on Asthma (Local genotype influences DNA methylation at two asthma-associated regions, 5q31 and 17q21, in a founder effect population)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Lung Diseases and Conditions - Asthma. According to news reporting from Montreal, Canada, by NewsRx journalists, research stated, "Two asthma-associated regions 17q12-q21 and 5q31.1 harbour genes that show strong effect of genotype on expression levels. DNA methylation has an important role in gene regulation; therefore, we examined DNA methylation at promoters of 12 genes from 5q31 and 17q12-q21 regions."

The news correspondents obtained a quote from the research from McGill University, "Our goal was to determine whether DNA methylation was associated with predisposition to asthma and whether such a relationship was independent from genetic association. Using sodium bisulfite sequencing and pyrosequencing methylation assays, we examined the effect of genotype on DNA methylation in peripheral blood cells from individuals from the Saguenay-Lac-Saint-Jean asthma familial collection and lymphoblastoid cell lines. The local genotype influenced methylation levels of solute carrier family 22 (organic cation/carnitine transporter) member 5 (SLC22A5), zona pellucida binding protein 2 (ZPBP2) and gasdermin A (GSDMA) promoter regions. The genotype had a dominant effect on ZPBP2 and GSDMA methylation with lower methylation levels in individuals that carry the asthma-predisposing alleles. Males also had lower methylation at the ZPBP2 promoter than females. We did not observe an effect of asthma status that would be independent of the genotype and the sex effects in the GSDMA, ZPBP2 and SLC22A5 regions; however, GSDMA and ZPBP2 data were suggestive of interaction between asthma and methylation levels in females and SLC22A5 in males. The local genotype influences methylation levels at SLC22A5 and ZPBP2 promoters independently of the asthma status."

According to the news reporters, the research concluded: "Further studies are
necessary to confirm the relationship between GSDMA-ZPB2 and SLC22A5 methylation and asthma in females and males separately."

For more information on this research see: Local genotype influences DNA methylation at two asthma-associated regions, 5q31 and 17q21, in a founder effect population. *Journal of Medical Genetics*, 2015;53(4):232-41. **Drugs and Therapies - Genistein Therapy**

**Investigators at Midwestern University Detail Findings in Genistein Therapy (Dietary Genistein Rescues Reduced Basal Chloride Secretion in Diabetic Jejunum via Sex-Dependent Mechanisms)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Drugs and Therapies - Genistein Therapy is the subject of a report. According to news reporting from Glendale, Arizona, by NewsRx journalists, research stated, "The goal of this study was to determine the effect of dietary genistein (naturally occurring phytoestrogen) on jejunal secretory function in a clinically relevant model of diabetes and obesity, the leptin-deficient ob/ob mouse. We measured transepithelial short circuit current (I-SC), across freshly isolated segments of jejunum from 12-week old male and female ob/ob and lean C57Bl/6J mice fed a genistein diet (600 mg genistein/kg diet) for 4-weeks."

The news correspondents obtained a quote from the research from Midwestern University, "Separate segments of jejunum were frozen for western blot determination of key proteins involved in secretory transport. Basal I_, was significantly decreased (by 33%, P<0.05) in ob/ob females versus leans, and genistein-diet reversed this. Similarly, in males, basal I_, was decreased (by 47%, P<0.05) in ob/ob mice versus leans, and genistein-diet reversed this. Inhibition with either clotrimazole (100 μM, bilateral) or ouabain (100 μM, basolateral) was significantly reduced in ob/ob mice compared to leans (P <0.05), and genistein-diet reversed clotrimazole-sensitive inhibition in ob/ob females, and reversed the ouabain-sensitive inhibition in males (indicating sex-dependent mechanisms). Our data suggested that PDE3 levels were dysregulated in ob/ob females and genistein reversed this. Expression of total CFTR (normalized to actin) was significantly decreased similar to 80% (P <0.05) in all ob/ob mice compared to leans, and genistein-diet was without effect. Expression of total NKCC1 (normalized to actin) was significantly decreased 80% (P <0.05) in ob/ob male mice versus
leans, and genistein-diet reversed this. Our data suggests that the reduced basal jejunal Is, in ob/ob female mice is a consequence of reduced CFTR expression, decreased activities of the basolateral K-Ca channel and Na+/K+-ATPase, and in male mice reduced basal jejunal Is, is a consequence of reduced CFTR and NKCC1 expression, along with decreased activities of the basolateral K-Ca channel and Na+/K+-ATPase. Genistein-diet has beneficial effects on basal Is, mediated by sex-dependent mechanisms in diabetic mice: in females via increased K-Ca-sensitive I-SC, and in males via increased Na+/K+-ATPase activity and increased NKCC1 expression."

According to the news reporters, the research concluded: "Improved understanding of intestinal dysfunctions in the ob/ob jejunum, may allow for the development of novel drug targets to treat obesity and diabetes, and may also be of benefit in CF-related diabetes."

Our news journalists report that additional information may be obtained by contacting L. Al-Nakkash, Midwestern Univ, Arizona Coll Osteopath Med, Dept. of Physiol, Glendale, AZ, United States. **Oncology - Carcinomas**

**Investigators at Milton S. Hershey Medical Center Zero in on Carcinomas (Molecular genetics and targeted therapeutics in biliary tract carcinoma)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Carcinomas is the subject of a report. According to news originating from Hershey, Pennsylvania, by NewsRx correspondents, research stated, "The primary malignancies of the biliary tract, cholangiocarcinoma and gallbladder cancer, often present at an advanced stage and are marginally sensitive to radiation and chemotherapy. Accumulating evidence indicates that molecularly targeted agents may provide new hope for improving treatment response in biliary tract carcinoma (BTC)."

Our news journalists obtained a quote from the research from Milton S. Hershey Medical Center, "In this article, we provide a critical review of the pathogenesis and genetic abnormalities of biliary tract neoplasms, in addition to discussing the current and emerging targeted therapeutics in BTC. Genetic studies of biliary tumors have identified the growth
factors and receptors as well as their downstream signaling pathways that control the growth and survival of biliary epithelia. Target-specific monoclonal antibodies and small molecules inhibitors directed against the signaling pathways that drive BTC growth and invasion have been developed. Numerous clinical trials designed to test these agents as either monotherapy or in combination with conventional chemotherapy have been completed or are currently underway. Research focusing on understanding the molecular basis of biliary tumorigenesis will continue to identify for targeted therapy the key mutations that drive growth and invasion of biliary neoplasms. Additional strategies that have emerged for treating this malignant disease include targeting the epigenetic alterations of BTC and immunotherapy."

According to the news editors, the research concluded: "By integrating targeted therapy with molecular profiles of biliary tumor, we hope to provide precision treatment for patients with malignant diseases of the biliary tract."

The news correspondents report that additional information may be obtained from E.I. Marks, Eric I Marks, Dept. of Medicine, Penn State Milton S Hershey Medical Center, Hershey, PA 17033, United States.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.3748/wjg.v22.i4.1335. This DOI is a link to an online electronic document that is either free or for purchase.

Viral RNA

Investigators at Monsanto Report Findings in Viral RNA (Corn rootworm-active RNA DvSnf7: Repeat dose oral toxicology assessment in support of human and mammalian safety)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Viral RNA are presented in a new report. According to news reporting out of Creve Coeur, Missouri, by NewsRx editors, research stated, "Genetically modified (GM) crops have been developed and commercialized that utilize double stranded RNAs (dsRNA) to suppress a target gene(s), producing virus resistance, nutritional and quality traits. MON 87411 is a GM maize variety that leverages dsRNAs to selectively control corn rootworm through production of a 240 base pair (bp) dsRNA fragment targeting for suppression the western corn rootworm (Diabrotica virgifera virgifera) Snf7 gene (DvSnf7)."

Our news journalists obtained a quote from the research from Monsanto, "A bioinformatics assessment found that endogenous corn small RNAs matched similar to 450 to 2300 unique RNA transcripts that likely code for proteins in rat, mouse, and human, demonstrating safe dsRNA consumption by mammals. Mice were administered DvSnf7 RNA (968 nucleotides, including the 240 bp DvSnf7 dsRNA) at 1, 10, or 100 mg/kg by oral gavage in a 28-day repeat dose toxicity study. No treatment-related effects were observed in body weights,
food consumption, clinical observations, clinical chemistry, hematology, gross pathology, or histopathology endpoints. Therefore, the No Observed Adverse Effect Level (NOAEL) for DvSnf7 RNA was 100 mg/kg, the highest dose tested."

According to the news editors, the research concluded: "These results demonstrate that dsRNA for insect control does not produce adverse health effects in mammals at oral doses millions to billions of times higher than anticipated human exposures and therefore poses negligible risk to mammals."

For more information on this research see: Corn rootworm-active RNA DvSnf7: Repeat dose oral toxicology assessment in support of human and mammalian safety. Regulatory Toxicology and Pharmacology, 2016;81():57-68. Regulatory Toxicology and Pharmacology can be contacted at: Academic Press Inc Elsevier Science, 525 B St, Ste 1900, San Diego, CA 92101-4495, USA. (Elsevier - www.elsevier.com; Regulatory Toxicology and Pharmacology - www.journals.elsevier.com/regulatory-toxicology-and-pharmacology/)

Our news journalists report that additional information may be obtained by contacting J.S. Petrick, Monsanto Co, Creve Coeur, MO 63167, United States. Additional authors for this research include G.E. Frierdich, S.M. Carleton, C.R. Kessenich, A. Silvanovich, Y.J. Zhang and M.S. Koch.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.yrtph.2016.07.009. This DOI is a link to an online electronic document that is either free or for purchase.

Drugs and Therapies - Hesperetin Therapy

Investigators at Nanchang University Detail Findings in Hesperetin Therapy (Inhibitory Effect of Hesperetin and Naringenin on Human UDP-Glucuronosyltransferase Enzymes: Implications for Herb-Drug Interactions)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Hesperetin Therapy. According to news reporting originating in Nanchang, People's Republic of China, by NewsRx journalists, research stated, "Hesperetin (HET) and naringenin (NGR) are flavanones found in citrus (oranges and grapefruit) and Aurantii Fructus Innnaturus. The present study aims to investigate the inhibition potential of HET and NGR derivatives towards one of the most important phase II drug-metabolizing enzymes-uridine diphosphate (UDP)-glucuronosyltransferases (UGTs)."

The news reporters obtained a quote from the research from Nanchang University, "We used trifluoperazine as a probe substrate to test UGT1A4 activity, and recombinant UGT-catalyzed 4-methylumbelliferone glucuronidation was used as a probe reaction for other UGT isoforms. Data show that HET and NGR displayed broad-spectrum inhibition against human UGTs. Besides, HET exhibited strong inhibitory effects on UGT1A1, 1A3 and 1A9 (both IC50 and K-i values lower than 10 mu M), and the inhibitory effects of NGR against three major UGTs, including UGT1A1, 1A3 and 2B7. In a combination of inhibition parameters (Ki) and in
vivo concentration of HET and NGR, the potential in vivo inhibition magnitude was predicted. Based on the reported maximum plasma concentration of HET and NGR in vivo, these findings indicate the potential herb drug interactions (HDI) between HET or NGR and the drugs mainly undergoing UGT1A3 or UGT2B7 catalyzed metabolic elimination.

According to the news reporters, the research concluded: "Considering the variety of citrus that contains HET and NGR, so caution should be applied when taking drugs that utilize UGTs for metabolism and clearance with citrus fruits."

Our news correspondents report that additional information may be obtained by contacting C.H. Xia, Nanchang University, Clin Pharmacol Inst, Nanchang 330006, People's Republic of China. Additional authors for this research include J. Wu, H.B. Xie, M.Y. Liu, I. Takau, H. Zhang, Y.Q. Xiong and C.H. Xia.

Keywords for this news article include: Nanchang, People's Republic of China, Asia, Glucuronosyltransferase, Enzymes and Coenzymes, Drugs and Therapies, Hesperetin Therapy, Anticholesteremic, Nanchang University.

Central Nervous System Diseases and Conditions -…

Investigators at Nanjing Medical University Describe Findings in Intracranial Vasospasm (Sulforaphane activates the cerebral vascular Nrf2 ARE pathway and suppresses inflammation to attenuate cerebral vasospasm in rat with subarachnoid ...)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Central Nervous System Diseases and Conditions - Intracranial Vasospasm. According to news reporting out of Jiangsu, People's Republic of China, by NewsRx editors, research stated, "Nrf2 ARE pathway reportedly plays a protective role in several central nervous system diseases. No study has explored the role of the Nrf2 ARE pathway in cerebral vasospasm(CVS) after subarachnoid hemorrhage(SAH)."

Our news journalists obtained a quote from the research from Nanjing Medical University, "The purpose of the present study was to investigate the activation of the cerebral vascular Nrf2 ARE pathway and to determine the potential role of this pathway in the development of CVS following SAH. We investigated whether the administration of sulforaphane (SFN, a specific Nrf2 activator) modulated vascular caliber, Nrf2ARE pathway activity, proinflammatory cytokine expression, and clinical behavior in a rat model of SAH. A two hemorrhage protocol was used to generate an animal model of SAH in male Sprague-Dawley rats. Administration of SFN to these rats following SAH enhanced the activity of the Nrf2-ARE pathway and suppressed the release of proinflammatory cytokines. Vasospasm was markedly attenuated in the basilar arteries after SFN therapy. Additionally, SFN administration significantly ameliorated two behavioral functions disrupted by SAH."

According to the news editors, the research concluded: "These results suggest that
SFN has a therapeutic benefit in post-SAH, and this may be due to elevated Nrf2-ARE pathway activity and inhibition of cerebral vascular proinflammatory cytokine expression."

For more information on this research see: Sulforaphane activates the cerebral vascular Nrf2 ARE pathway and suppresses inflammation to attenuate cerebral vasospasm in rat with subarachnoid hemorrhage. *Brain Research*, 2016;1653():1-7. *Brain Research* can be contacted at: Elsevier Science Bv, PO Box 211, 1000 Ae Amsterdam, Netherlands. **Central Nervous System Diseases and Conditions -…**

**Investigators at Nantong University Detail Findings in Spinal Cord Injury (PRDM5 Expression and Essential Role After Acute Spinal Cord Injury in Adult Rat)***

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Central Nervous System Diseases and Conditions - Spinal Cord Injury is the subject of a report. According to news originating from Jiangsu, People's Republic of China, by NewsRx correspondents, research stated, "PR (PRDI-BF1 and RIZ) domain proteins (PRDM) are a subfamily of the kruppel-like zinc finger gene products that modulate cellular processes such as differentiation, cell growth and apoptosis. PRDM5 is a recently identified family member that functions as a transcriptional repressor and behaves as a putative tumor suppressor in different types of cancer."

Financial support for this research came from Nantong University Innovation Project.

Our news journalists obtained a quote from the research from Nantong University, "However, the expression and function of PRDM5 in spinal cord injury (SCI) are still unknown. In the present study, we have performed an acute SCI model in adult rats and investigated the dynamic changes of PRDM5 expression in the spinal cord. We found that PRDM5 protein levels gradually increased, reaching a peak at day 5 and then gradually declined to a normal level at day 14 after SCI with Western blot analysis. Double immunofluorescence staining showed that PRDM5 immunoreactivity was found in neurons, astrocytes and microglia. However, the expression of PRDM5 was increased predominantly in neurons. Additionally, colocalization of PRDM5/active caspase-3 was been respectively detected in neurons. In vitro, we found that depletion of PRDM5 by short interfering RNA, obviously decreases neuronal apoptosis. In summary, this is the first description of PRDM5 expression in SCI."

According to the news editors, the research concluded: "Our results suggested that
PRDM5 might play crucial roles in CNS pathophysiology after SCI and this research will provide new drug targets for clinical treatment of SCI."

The news correspondents report that additional information may be obtained from F. Zhang, Nantong University, Dept. of Orthopaed, Ailiated Hosp, Nantong 226001, Jiangsu, People's Republic of China. Additional authors for this research include W.J. Wu, J. Hao, M.C. Yu, J. Liu, X.L. Chen, R. Qian and F. Zhang.

**Oncology - Brain Cancer**

**Investigators at National Cancer Institute Have Reported New Data on Brain Cancer (Brain tumors in patients with myotonic dystrophy: a population-based study)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Oncology - Brain Cancer are presented in a new report. According to news reporting from Bethesda, Maryland, by NewsRx journalists, research stated, "Patients with myotonic dystrophy (DM) are at high risk of brain cancer. This study describes the spectrum of brain neoplasms in DM patients."

Funders for this research include Cancerfonden, Stockholms Lans Landsting, Karolinska Institutet Foundations, Intramural Research Program of the National Cancer Institute, USA.

The news correspondents obtained a quote from the research from National Cancer Institute, "Data from 1119 DM patients identified from the National Swedish Patient Register between 1987 and 2007 were linked to the National Cancer and the Cause of Death Registers. Standardized incidence ratios (SIRs) and cumulative incidence to quantify the relative and absolute risks of brain neoplasms were calculated and the Kaplan-Meier estimator was used for survival analysis. Patient follow-up started at birth or the age at the start of Swedish cancer registration (1 January 1958) and ended at the age of brain neoplasm diagnosis, death or on 31 December 2007. Twenty patients developed brain neoplasm during follow-up median age 53, range 2-76 years, accounting for a five-fold excess risk of brain tumors during the patient lifetime [SIR=5.4, 95% confidence interval (CI) 3.4-8.1, p=1 ? 10(-5) ]. Astrocytoma was the most common histological subtype (n=16, 80%), and almost all cases (n=19) developed after age 20. No statistically significant differences in gender-specific risks (SIR in men 6.3 and in women 3.8, P-heterogeneity 0.46) were observed. After accounting for competing mortality..."
related to DM, the cumulative incidence of brain neoplasms reached 2.9% (95% CI 1.8%-4.7%) by age 70. Five-year survival after brain tumor diagnosis was 52% (95%CI 29%-75%) overall (number at risk 8) and 34% (95% CI 26%-47%) for malignant neoplasms (number at risk 5). Despite the high relative risk of DM-related brain tumors, the absolute risk is modest."

According to the news reporters, the research concluded: "Nonetheless, careful evaluation of DM patients with new central nervous system symptoms is warranted."

Our news journalists report that additional information may be obtained by contacting S.M. Gadalla, Clinical Genetics Branch, Division of Cancer Epidemiology and Genetics, National Cancer Institute, National Institutes of Health, Bethesda, MD, United States. Additional authors for this research include R.M. Pfeiffer, S.Y. Kristinsson, M. Bjorkholm, O. Landgren and M.H Greene.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1111/ene.12886. This DOI is a link to an online electronic document that is either free or for purchase.

Keywords for this news article include: Bethesda, Maryland, Oncology, Brain Cancer, United States, Brain Neoplasms, Myotonic Disorders, Myotonic Dystrophy, Risk and Prevention, Muscular Dystrophies, North and Central America, Brain Diseases and Conditions, Central Nervous System Neoplasms, Neuromuscular Diseases and Conditions.

Mosquito-Borne Diseases - Malaria

Investigators at National Institutes of Health Discuss Findings in Malaria (Cross-Regulation of Two Type I Interferon Signaling Pathways in Plasmacytoid Dendritic Cells Controls Anti-malaria Immunity and Host Mortality)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mosquito-Borne Diseases - Malaria. According to news reporting originating in Bethesda, Maryland, by NewsRx journalists, research stated, "Type I interferon (IFN) is critical for controlling pathogen infection; however, its regulatory mechanisms in plasmacytoid cells (pDCs) still remain unclear. Here, we have shown that nucleic acid sensors cGAS-, STING-, MDA5-, MAVS-, or transcription factor IRF3-deficient mice produced high amounts of type I IFN-alpha and IFN-beta (IFN-a/b) in the serum and were resistant to lethal plasmodium yoelii YM infection."

The news reporters obtained a quote from the research from the National Institutes of Health, "Robust IFN-alpha/beta production was abolished when gene encoding nucleic acid sensor TLR7, signaling adaptor MyD88, or transcription factor IRF7 was ablated or pDCs were depleted. Further, we identified SOCS1 as a key negative regulator to inhibit MyD88-dependent type I IFN signaling in pDCs. Finally, we have demonstrated that pDCs, cDCs, and macrophages were required for generating IFN-alpha/beta-induced subsequent protective immunity."
According to the news reporters, the research concluded: "Thus, our findings have identified a critical regulatory mechanism of type I IFN signaling in pDCs and stage-specific function of immune cells in generating potent immunity against lethal YM infection."

For more information on this research see: Cross-Regulation of Two Type I Interferon Signaling Pathways in Plasmacytoid Dendritic Cells Controls Anti-malaria Immunity and Host Mortality. *Immunity*, 2016;45(5):1093-1107. *Immunity* can be contacted at: Cell Press, 600 Technology Square, 5TH Floor, Cambridge, MA 02139, USA. (Elsevier - www.elsevier.com; Immunity - www.journals.elsevier.com/immunity/)

Our news correspondents report that additional information may be obtained by contacting X.Z. Su, NIAID, Lab Malaria & Vector Res, National Institutes of Health, Bethesda, MD 20892, United States. **Oncology - Breast Cancer**

**Investigators at National University Health System Report New Data on Breast Cancer (High-Throughput Mutation Profiling Changes before and 3 Weeks after Chemotherapy in Newly Diagnosed Breast Cancer Patients)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting out of Singapore, Singapore, by NewsRx editors, research stated, "Changes in tumor DNA mutation status during chemotherapy can provide insights into tumor biology and drug resistance. The purpose of this study is to analyse the presence or absence of mutations in cancer-related genes using baseline breast tumor samples and those obtained after exposure to one cycle of chemotherapy to determine if any differences exist, and to correlate these differences with clinical and pathological features."

Our news journalists obtained a quote from the research from National University Health System, "Paired breast tumor core biopsies obtained pre-and post-first cycle doxorubicin (n=18) or docetaxel (n=22) in treatment-na?ve breast cancer patients were analysed for 238 mutations in 19 cancer-related genes by the Sequenom Oncocarta assay. Median age of patients was 48 years (range 32-64); 55% had estrogen receptor-positive tumors, and 60% had tumor reduction (>=25%) after cycle 1. Mutations were detected in 10/40 (25%) pre-treatment and 11/40 (28%) post-treatment samples. Four mutation pattern categories were identified based on tumor mutation status pre-→ post-treatment: wildtype (WT)→WT, n=24; mutant (MT) &rarr;MT, n=5; MT&rarr;WT, n=5; WT&rarr;MT, n=6. Overall, the majority of tumors were WT at baseline (30/40, 75%), of which 6/30 (20%) acquired new mutations after chemotherapy.
Pre-treatment mutations were predominantly in PIK3CA (8/10, 80%), while post-treatment mutations were distributed in PIK3CA, EGFR, PDGFRA, ABL1 and MET. All 6 WT->MT cases were treated with docetaxel. Higher mutant allele frequency in baseline MT tumors (n=10; PIK3CA mutations n=8) correlated with less tumor reduction after cycle 1 chemotherapy (R=-0.667, p=0.035). No other associations were observed between mutation pattern category with treatment, clinicopathological features, and tumor response or survival. Tumor mutational profiles can change as quickly as after one cycle of chemotherapy in breast cancer."

According to the news editors, the research concluded: "Understanding of these changes can provide insights on potential therapeutic options in residual resistant tumors."

Our news journalists report that additional information may be obtained by contacting S.H. Tan, Dept. of Haematology-Oncology, National University Cancer Institute Singapore, National University Health System, Singapore, Singapore. Additional authors for this research include N.S. Sapari, H. Miao, M. Hartman, M. Loh, W.J. Chng, P. Iau, S.A. Buhari, R. Soong and S.C Lee.

**Anesthesia**

**Investigators at National University Report New Data on Anesthesia (The patients' understanding on the status and role of anaesthesiologists)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Anesthesia have been presented. According to news reporting out of Kuala Lumpur, Malaysia, by NewsRx editors, research stated, "To evaluate patients' understanding on the status and role of anaesthesiologists. This was a prospective, questionnaire-based cross-sectional study."

Our news journalists obtained a quote from the research from National University, "The interview had three segments which questioned on (i) patients' knowledge of the qualification, training and role of anaesthesiologists, (ii) attitude of patients towards anaesthesia and anaesthesiologists and (iii) the demographic data of patients. Of 384 patients interviewed, 59.4% had prior anaesthesia experience. Most patients (95.6%) knew that anaesthesiologists were medical doctors, but only 27.1% knew the duration of training required to attain this specialist qualification. Patients' awareness of the various anaesthetic responsibilities was 12.2% in managing labour pain, 25.5% in intensive care units, 49.2% in chronic pain and 99.5% in postoperative pain management. During surgery, 73.7% of patients knew that anaesthesiologists were monitoring their vital signs, but only 42.2% thought anaesthesiologists also treated medical
problems intraoperatively. Most patients (95.1%) would like to meet their anaesthesiologists prior to the operation and 97.7% want them to inform all possible anaesthesia complications. Our patients' understanding and awareness of the status and roles of anaesthesiologists are still limited and variable."

According to the news editors, the research concluded: "This can be further improved with patient interaction and public education."

For more information on this research see: The patients' understanding on the status and role of anaesthesiologists. La Clinica Terapeutica, 2015;166(6):227-35.

Our news journalists report that additional information may be obtained by contacting M. Budiman, Dept. of Anaesthesiology & Intensive Care, Universiti Kebangsaan Malaysia Medical Centre, Kuala Lumpur, Malaysia. Additional authors for this research include A. Izaham, N. Abdul Manap, K. Zainudin, E. Kamaruzaman, A. Masdar and A. Dan.

Keywords for this news article include: Asia, Malaysia, Anesthesia, Kuala Lumpur, Pain Medicine.

**Oncology - Acute Lymphoblastic Leukemia**

**Investigators at Nihon University Report Findings in Acute Lymphoblastic Leukemia (Adult acute lymphoblastic leukemia with a rare b3a3 type BCR/ABL1 fusion transcript)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology - Acute Lymphoblastic Leukemia is the subject of a report. According to news reporting out of Tokyo, Japan, by NewsRx editors, research stated, "The Philadelphia chromosome (Ph) is the most frequent chromosomal abnormality detected in adult acute lymphoblastic leukemia (ALL). This chromosome forms the BCR/ABL1 fusion gene; thus, ABL1 exon a2 is generally used as a primer-binding region for the detection of the fusion transcript via reverse transcription polymerase chain reaction (RT-PCR)."

Our news journalists obtained a quote from the research from Nihon University, "We observed a rare case of adult Ph-positive (Ph+) ALL, in which the BCR/ABL1 fusion transcript was not detected using the ABL1 exon a2 region primer. However, we were able to isolate a PCR product by RT-PCR with the BCR exon 13 (b2) and ABL1 exon a3 primers. Analysis of the sequence of the RT-PCR product revealed that the fusion point was between BCR exon 14 (b3) and ABL1 exon a3, and that the transcript lacked ABL1 exon a2. The patient achieved cytogenetic remission through combination chemotherapies, but relapse occurred before hematopoietic stem cell transplantation and the patient died 11 months after the initialization of chemotherapies."

According to the news editors, the research concluded: "If the BCR/ABL1 fusion transcript is undetected with the ABL1 exon a2 region primer in Ph+ ALL cases, an RT-PCR analysis that can detect the b3a3 type BCR/ABL1 fusion transcript should be considered to improve diagnosis."

For more information on this research see: Adult acute lymphoblastic leukemia with a rare b3a3 type BCR/ABL1 fusion transcript. Cancer Genetics, 2016;209(4):161-165. Drugs and Therapies - Antimicrobials

Investigators at Northwest University Report Findings in Antimicrobials (Antimicrobial mechanism of theaflavins: They target 1-deoxy-D-xylulose 5-phosphate reductoisomerase, the key enzyme of the MEP terpenoid biosynthetic pathway)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Drugs and Therapies - Antimicrobials have been published. According to news reporting from Shaanxi, People's Republic of China, by NewsRx journalists, research stated, "1-Deoxy-D-xylulose 5-phosphate reductoisomerase (DXR) is the first committed enzyme in the 2-methyl-D-erythritol 4-phosphate (MEP) terpenoid biosynthetic pathway and is also a validated antimicrobial target. Theaflavins, which are polyphenolic compounds isolated from fermented tea, possess a wide range of pharmacological activities, especially an antibacterial effect, but little has been reported on their modes of antimicrobial action."

The news correspondents obtained a quote from the research from Northwest University, "To uncover the antibacterial mechanism of theaflavins and to seek new DXR inhibitors from natural sources, the DXR inhibitory activity of theaflavins were investigated in this study. The results show that all four theaflavin compounds could specifically suppress the activity of DXR, with theaflavin displaying the lowest effect against DXR (IC50 162.1 µM) and theaflavin-3,3'-digallate exhibiting the highest (IC50 14.9 µM). Moreover, determination of inhibition kinetics of the theaflavins demonstrates that they are non-competitive inhibitors of DXR against 1-deoxy-D-xylulose 5-phosphate (DXP) and un-competitive inhibitors with respect to NADPH."

According to the news reporters, the research concluded: "The possible interactions between DXR and the theaflavins were simulated via docking experiments."

For more information on this research see: Antimicrobial mechanism of theaflavins: They target 1-deoxy-D-xylulose 5-phosphate reductoisomerase, the key enzyme of the MEP terpenoid biosynthetic pathway. Scientific Reports, 2016;6():1-8. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London N1 9XW, England. Histopathology

Investigators at Novartis Institute for Biomedical Research Detail Findings in Histopathology (Graphical display of histopathology data from toxicology studies for drug discovery and development: An industry perspective)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Histopathology is the subject of a report. According to news reporting originating in Cambridge, Massachusetts, by NewsRx journalists, research stated, "Histopathology data comprise a critical component of pharmaceutical toxicology studies and are typically presented as finding incidence counts and severity scores per organ, and tabulated on multiple pages which can be challenging for review and aggregation of results. However, the SEND (Standard for Exchange of Nonclinical Data) standard provides a means for collecting and managing histopathology data in a uniform fashion which can allow informatics systems to archive, display and analyze data in novel ways."

The news reporters obtained a quote from the research from Novartis Institute for Biomedical Research, "Various software applications have become available to convert histopathology data into graphical displays for analyses. A subgroup of the FDA-PhUSE Nonclinical Working Group conducted intra-industry surveys regarding the use of graphical displays of histopathology data. Visual cues, use cases, the value of cross-domain and cross-study visualizations, and limitations were topics for discussion in the context of the surveys. The subgroup came to the following conclusions. Graphical displays appear advantageous as a communication tool to both pathologists and non-pathologists, and provide an efficient means for communicating pathology findings to project teams. Graphics can support hypothesis-generation which could include cross-domain interactive visualizations and/or aggregating large datasets from multiple studies to observe and/or display patterns and trends."

According to the news reporters, the research concluded: "Incorporation of the SEND standard will provide a platform by which visualization tools will be able to aggregate, select and display information from complex and disparate datasets."

For more information on this research see: Graphical display of histopathology data from toxicology studies for drug discovery and development: An industry perspective. Regulatory Toxicology and Pharmacology, 2016;82():167-172. Investigating at Novartis Institute for Biomedical Research Report Findings in Colon Cancer (High-Order Drug Combinations Are Required to Effectively Kill Colorectal Cancer Cells)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Colon Cancer. According to news reporting originating in Cambridge, Massachusetts, by NewsRx journalists, research stated, "Like classical chemotherapy regimens used to treat cancer, targeted therapies will also rely upon polypharmacology, but tools are still lacking to predict which combinations of molecularly targeted drugs may be most efficacious. In this study, we used image-based proliferation and apoptosis assays in colorectal cancer cell lines to systematically investigate the efficacy of combinations of two to six drugs that target critical oncogenic pathways."

The news reporters obtained a quote from the research from Novartis Institute for Biomedical Research, "Drug pairs targeting key signaling pathways resulted in synergies across a broad spectrum of genetic backgrounds but often yielded only cytostatic responses. Enhanced cytotoxicity was observed when additional processes including apoptosis and cell cycle were targeted as part of the combination. In some cases, where cell lines were resistant to paired and tripled drugs, increased expression of antiapoptotic proteins was observed, requiring a fourth-order combination to induce cytotoxicity."

According to the news reporters, the research concluded: "Our results illustrate how high-order drug combinations are needed to kill drug-resistant cancer cells, and they also show how systematic drug combination screening together with a molecular understanding of drug responses may help define optimal cocktails to overcome aggressive cancers."

For more information on this research see: High-Order Drug Combinations Are Required to Effectively Kill Colorectal Cancer Cells. Cancer Research, 2016;76(23):6950-6963. Cancer Research can be contacted at: Amer Assoc Cancer Research, 615 Chestnut St, 17TH Floor, Philadelphia, PA 19106-4404, USA. (American Association for Cancer Research - www.aacr.com; Cancer Research - cancerres.aacrjournals.org/)

Investigators at Novosibirsk State University Report Findings in Follicular Lymphoma (Activation induced deaminase mutational signature overlaps with CpG methylation sites in follicular lymphoma and other cancers)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Follicular Lymphoma. According to news reporting originating from Novosibirsk, Russia, by NewsRx correspondents, research stated, "Follicular lymphoma (FL) is an incurable cancer characterized by progressive severity of relapses. We analyzed sequence context specificity of mutations in the B cells from a large cohort of FL patients."

Our news editors obtained a quote from the research from Novosibirsk State University, "We revealed substantial excess of mutations within a novel hybrid nucleotide motif: the signature of somatic hypermutation (SHM) enzyme, Activation Induced Deaminase (AID), which overlaps the CpG methylation site. This finding implies that in FL the SHM machinery acts at genomic sites containing methylated cytosine."

According to the news editors, the research concluded: "We identified the prevalence of this hybrid mutational signature in many other types of human cancer, suggesting that AID-mediated, CpG-methylation dependent mutagenesis is a common feature of tumorigenesis."

For more information on this research see: Activation induced deaminase mutational signature overlaps with CpG methylation sites in follicular lymphoma and other cancers. Scientific Reports, 2016;6():1-9. Scientific Reports can be contacted at: Nature Publishing Group, Macmillan Building, 4 Crinan St, London NI 9XW, England. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

The news editors report that additional information may be obtained by contacting I.B. Rogozin, Novosibirsk State Univ, Novosibirsk, Russia. Additional authors for this research include A.G. Lada, A. Goncearenco, M.R. Green, S. De, G. Nudelman, A.R. Panchenko, E.V. Koonin and Y.I. Pavlov.

Our reports deliver fact-based news of research and discoveries from around the
2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Dental Diseases and Conditions - Pulpitis have been published. According to news reporting out of Columbus, Ohio, by NewsRx editors, research stated, "In the treatment of patients With symptomatic irreversible pulpitis, endodontic debridement is a predictable method to relieve pain. However, there are clinical situations in which emergency care cannot be provided immediately."

Our news journalists obtained a quote from the research from Ohio State University, "An unexplored treatment option in these cases may be the use of a long-acting anesthetic to reduce pain in untreated irreversible pulpitis. Some medical studies have shown potential for infusions of liposomal bupivacaine (Exparel; Pacira Pharmaceuticals, San Diego, CA) to prolong pain relief and reduce opioid use postoperatively. The Food and Drug Administration has approved Exparel only for infusions; therefore, the purpose of this study was to compare an infiltration of liposomal bupivacaine versus bupivacaine for pain control in untreated, symptomatic irreversible pulpitis. Ninety-five emergency patients received 2% lidocaine with 1:100,000 epinephrine via infiltration or an inferior alveolar nerve block to relieve their initial presenting pain. Patients then randomly received either 4 mL liposomal bupivacaine (13.3 mg/mL) or 4 mL 0.5% bupivacaine with 1:200,000 epinephrine by infiltration. Patients received a diary for the day of the appointment and 3 days post injection to record soft tissue numbness, pain levels, and analgesic (non-narcotic and narcotic) use. No significant differences (P < .05) were found between the 2 anesthetic formulations for pain or the use of pain medications. A statistically higher level of soft tissue numbness was found on days 1 to 3 for the liposomal bupivacaine group."

According to the news editors, the research concluded: "Although liposomal bupivacaine had some effect on soft tissue anesthesia, it did not reduce pain to manageable clinical levels in patients presenting with untreated, symptomatic irreversible pulpitis."

Our news journalists report that additional information may be obtained by contacting A. Reader, Ohio State University, Div Endodont, Columbus, OH 43210, United States. Additional authors for this research include S. Fowler, M. Drum, A. Reader, J. Nusstein and M. Beck.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.joen.2016.08.018. This DOI is a link to an online electronic document that is either free or for purchase.

Inflammation

Investigators at Ondokuz Mayis University Discuss Findings in Inflammation (Can subphysiological cold application be utilized in excessive dermal scarring prophylaxis and treatment?: A promising hypothetical perspective)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Inflammation. According to news reporting originating from Samsun, Turkey, by NewsRx correspondents, research stated, "Excessive dermal scarring (EDS) is a wound healing complication, characterized by protruded erythematous and inelastic 'proliferative scar tissue' which is associated with increased and prolonged inflammation process within the wound microenvironment."

Our news editors obtained a quote from the research from Ondokuz Mayis University, "As inflammation plays a key role in this process, methods to contain or attenuate excessive inflammation hold promise in treatment and prophylaxis of EDS conditions. While cold exposure is notorious as the causative agent a wide array of morbidities and fatalities, its tempered use is exploited in medicine for ablative and therapeutic applications. 'Subphysiological cold' has been administered for its antiinflammatory effects which act via decreasing vascular permeability and downregulating proliferation of cells in the wound environment; this knowledge supports our hypothesis that 'subphysiological cold application' can also be utilized in human EDS prophylaxis and treatment."

According to the news editors, the research concluded: "In this study, we are reviewing the mechanisms of its both deleterious and therapeutic actions and suggesting another possible application for prevention and/or treatment of human EDS conditions."

For more information on this research see: Can subphysiological cold application be utilized in excessive dermal scarring prophylaxis and treatment?: A promising hypothetical perspective. Medical Hypotheses, 2016;97():4-6. Medical Hypotheses can be contacted at: Churchill Livingstone, Journal Production Dept, Robert Stevenson House, 1-3 Baxters Place, Leith Walk, Edinburgh EH1 3AF, Midlothian, Scotland. **Cardiology**

**Investigators at Ondokuz Mayis University Report Findings in Cardiology (Pentraxin 3, ischemia-modified albumin, and myeloperoxidase in predicting a cardiac damage in acute carbon monoxide poisoning)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Cardiology is now available. According to news originating from Kurupelit, Turkey, by NewsRx correspondents, research stated, "Carbon monoxide (CO) poisoning is associated with cardiac injuries or manifestations, frequently attributing to direct hypoxic damage at cellular level. For this, the aims were to evaluate the role of serum pentraxin 3 (PTX 3), ischemia-modified albumin (IMA), and myeloperoxidase (MPO) as an early biomarker for cardiac damage when compared to cardiac troponin I (cTnI) and creatine kinase-MB fraction (CK-MB) in adult patients with acute CO poisoning."

Our news journalists obtained a quote from the research from Ondokuz Mayis University, "Forty patients with acute CO poisoning admitted to the emergency department. The patients were divided into 2 main groups as follows: cardiac injury (group I, n = 19) and nonsuspected cardiac injury (group II, n = 21). Pentraxin 3, IMA, MPO, cTnI, CK-MB, and the other assays in the circulation were measured on admission. Upon measuring the serum PTX 3, IMA, MPO, cTnI, and CK-MB levels as well as large electrocardiography and echocardiography abnormalities of patients with cardiac injury on admission, no statistical difference for PTX 3, IMA, and MPO was found between the groups (P > .05). However, cTnI, CK-MB, and leukocyte count (white blood cell) were higher determined in patients of group I compared to group II (P < .05). Receiver operating characteristic curve was also performed to evaluate the diagnostic performance of these tests in patients with cardiac injury."

According to the news editors, the research concluded: "Our results suggest that PTX, IMA, and MPO assays are not superior to cTnI and CK-MB in predicting a cardiac damage in patients with acute CO intoxication."

The news correspondents report that additional information may be obtained from A. Baydin, Ondokuz Mayis University, Dept. of Emergency Med, Fac Med, TR-55139 Kurupelit, Samsun, Turkey. Additional authors for this research include R. Amanvermez, H.E. Celebi, O.K. Tuncel and S. Demircan.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1016/j.ajem.2016.05.043. This DOI is a link to an online electronic document that is either free or for purchase.

**Drugs and Therapies - Pharmacology**

**Investigators at Osmania University Discuss Findings in Pharmacology**

**(beta-N-oxalyl-L-alpha, beta-diaminopropionic acid induces HRE expression by inhibiting HIF-prolyl hydroxylase-2 in normoxic conditions)**

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Drugs and Therapies - Pharmacology. According to news reporting originating from Hyderabad, India, by NewsRx correspondents, research stated, "Hypoxia inducible factor (HIF)-1 alpha, a subunit of HIF transcription factor, regulates cellular response to hypoxia. In normoxic conditions, it is hydroxylated by prolyl hydroxylase (PHD)-2 and targeted for proteosomal degradation."

Our news editors obtained a quote from the research from Osmania University, "Drugs which inhibit PHD-2 have implications in conditions arising from insufficient blood supply. beta-ODAP (beta-N-oxalyl-L-alpha, beta-diaminopropionic acid), a non-protein excitatory amino acid present in Lathyrus sativus, is an alpha-amino-3-hydroxy-5-methyl-4-isoxazole propionic acid receptor agonist known to activate conventional protein kinase C and stabilize HIF-1 alpha under normoxic conditions. However, the mechanism of HIF-1 alpha stabilization by this compound is unknown. In silica approach was used to understand the mechanism of stabilization of HIF-1 alpha which revealed beta-ODAP interacts with key amino acid residues and Fe2+ at the catalytic site of PHD-2. These results were further corroborated with luciferase HRE (hypoxia response element) reporter system in HeLa cells. Different chemical modulators of PHD-2 activity and HIF-1 alpha levels were included in the study for comparison."

According to the news editors, the research concluded: "Results obtained indicate that beta-ODAP inhibits PHD-2 and facilitates HIF dependent HRE expression and hence, might be helpful in conditions arising from hypoxia."

The news editors report that additional information may be obtained by contacting R.K. Eslavath, Osmania Univ, Univ Coll Sci, Dept. of Biochem, Hyderabad 500007, Telangana State, India. Additional authors for this research include D. Sharma, N.A.M. Bin Omar, R. Chikati, M.K. Teli, G.K. Rajanikant and S.S. Singh.

Keywords for this news article include: Hyderabad, India, Asia, Pharmacology, Drugs and Therapies, Enzymes and Coenzymes, Hydroxylase, Osmania University.

Investigators at Palo Alto Medical Foundation Research Institute Report Findings in Breast Cancer (Mapping the Decision-Making Process for Adjuvant Endocrine Therapy for Breast Cancer: The Role of Decisional Resolve)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting from Palo Alto, California, by NewsRx journalists, research stated, "Studies show adjuvant endocrine therapy increases survival and decreases risk of breast cancer recurrence for hormone receptor-positive tumors. Yet studies also suggest that adherence rates among women taking this therapy may be as low as 50% owing largely to adverse side effects."

The news correspondents obtained a quote from the research from Palo Alto Medical Foundation Research Institute, "Despite these rates, research on longitudinal patient decision making regarding this therapy is scant. We sought to map the decision-making process for women considering and initiating adjuvant endocrine therapy, paying particular attention to patterns of uncertainty and decisional change over time. A longitudinal series of semistructured interviews conducted at a multispecialty health care organization in Northern California with 35 newly diagnosed patients eligible for adjuvant endocrine therapy were analyzed. Analysis led to the identification and indexing of 3 new decision-making constructs- decisional phase, decisional direction, and decisional resolve-which were then organized using a visual matrix and examined for patterns characterizing the decision-making process. Our data reveal that most patients do not make a single, discrete decision to take or not take hormone therapy but rather traverse multiple decisional states, characterized by 1) phase, 2) direction, and 3) strength of resolve. Our analysis tracks these decisional states longitudinally using a grayscale-coded matrix. Our data show that decisional resolve wavers not just when considering therapy, as the existing concept of decisional conflict suggests, but even after initiating it, which may signal future decisions to forgo therapy. Adjuvant endocrine therapy, like other chronic care decisions, has a longer decision-making process and implementation period."

According to the news reporters, the research concluded: "Thus, theoretical, empirical, and clinical approaches should consider further exploring the new concept and measurement of decisional resolve, as it may help to improve subsequent medication adherence."

Our news journalists report that additional information may be obtained by contacting L.L. Beryl, Palo Alto Med Fdn Res Inst, Palo Alto, CA 94301, United States. Investigators at Peking Union Medical College Hospital Zero in on Atherosclerosis (Intestinal Microbiota Metabolism and Atherosclerosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Atherosclerosis. According to news originating from Beijing, People's Republic of China, by NewsRx correspondents, research stated, "This review aimed to summarize the relationship between intestinal microbiota metabolism and cardiovascular disease (CVD) and to propose a novel CVD therapeutic target. This study was based on data obtained from PubMed and EMBASE up to June 30, 2015."

Our news journalists obtained a quote from the research from Peking Union Medical College Hospital, "Articles were selected using the following search terms: 'Intestinal microbiota', 'trimethylamine N-oxide (TMAO)', 'trimethylamine (TMA)', 'cardiovascular', and 'atherosclerosis'. Studies were eligible if they present information on intestinal microbiota metabolism and atherosclerosis. Studies on TMA-containing nutrients were also included. A new CVD risk factor, TMAO, was recently identified. It has been observed that several TMA-containing compounds may be catabolized by specific intestinal microbiota, resulting in TMA release. TMA is subsequently converted to TMAO in the liver. Several preliminary studies have linked TMAO to CVD, particularly atherosclerosis; however, the details of this relationship remain unclear."

According to the news editors, the research concluded: "Intestinal microbiota metabolism is associated with atherosclerosis and may represent a promising therapeutic target with respect to CVD management."

The news correspondents report that additional information may be obtained from S.Y. Zhang, Dept. of Cardiology, Peking Union Medical College Hospital, Chinese Academy of Medical Sciences and Peking Union Medical College, Beijing 100730, People's Republic of China. Additional authors for this research include H.T. Niu and S.Y Zhang.

Investigators at Policinico University Describe Findings in Heart Failure (The Renal Arterial Resistance Index Predicts Worsening Renal Function in Chronic Heart Failure Patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Heart Disorders and Diseases - Heart Failure have been published. According to news reporting originating from Bari, Italy, by NewsRx correspondents, research stated, "The renal arterial resistance index (RRI) is a Doppler measure, which reflects abnormalities in the renal blood flow. The aim of this study was to verify the value of RRI as a predictor of worsening renal function (WRF) in a group of chronic heart failure (CHF) outpatients."

Our news editors obtained a quote from the research from Policinico University, "We enrolled 266 patients in stable clinical conditions and on conventional therapy. Peak systolic velocity and end diastolic velocity of a segmental renal artery were obtained by pulsed Doppler flow, and RRI was calculated. Creatinine serum levels were evaluated at baseline and at 1 year, and the changes were used to assess WRF occurrence. During follow-up, 34 (13%) patients showed WRF. RRI was associated with WRF at univariate (OR: 1.13; 95% CI: 1.07-1.20) as well as at a forward stepwise multivariate logistic regression analysis (OR: 1.09; 95% CI: 1.03-1.16; p = 0.005) including the other univariate predictors. Quantification of arterial renal perfusion provides a new parameter that independently predicts the WRF in CHF outpatients."

According to the news editors, the research concluded: "Its possible role in current clinical practice to better define the risk of cardiorenal syndrome progression is strengthened."

The news editors report that additional information may be obtained by contacting M. Iacoviello, Policinico Univ Hosp, Cardiothorac Department, Cardiol Unit, IT-70124 Bari, Italy. Additional authors for this research include F. Monitillo, M. Leone, G. Citarelli, A. Doronzo, V. Antonecchi, A. Puzzovivo, C. Rizzo, M.S. Lattarulo, F. Massari, P. Caldarola and M.M. Ciccone.

Investigators at Prince Songkla University Report Findings in Tuberculosis (Evaluation of Proinflammatory Cytokines and Adverse Events in Healthy Volunteers upon Inhalation of Antituberculosis Drugs)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Mycobacterium Infections - Tuberculosis. According to news reporting out of Songkhla, Thailand, by NewsRx editors, research stated, "Inhalation therapy is a promising drug delivery approach for tuberculosis treatment. However, there is always concern about the safety of the dosage form by inhalation as it may induce inflammation."

Our news journalists obtained a quote from the research from Prince Songkla University, "Developing a new dosage form for inhalation must include tests for its safety especially for the tumor necrosis factor (TNF)-alpha and interleukine (IL)-1 beta. The safety of four anti-tuberculosis (anti-TB) drugs administered via inhalation was assessed in healthy volunteers. Four anti-TB drugs; isoniazid, rifampicin, pyrazinamide and levofloxacin were prepared as dry powder and evaluated for uniformity of delivered dose and in vitro drug deposition. These four anti-TB dry powder formulations for inhalation met the criteria of uniformity of delivered dose and exhibited suitable size for lung delivery. Forty healthy volunteers were recruited and each was sequentially challenged with isoniazid, rifampicin, pyrazinamide and levofloxacin in different orders. Safety was monitored by measuring the pro-inflammatory cytokines in their sputum, lung function test, blood chemistry and adverse events."

According to the news editors, the research concluded: "This study proves that all four anti-TB dry powders did not provoke inflammatory cytokines and are safe to healthy volunteers."

Our news journalists report that additional information may be obtained by contacting T. Srichana, Prince Songkla University, Fac Pharmaceut Sci, Dept. of Pharmaceut Technol, Hat Yai 90112, Songkhla, Thailand. Additional authors for this research include C. Ratanajamit, S. Juthong, T. Suwandecha, N. Laohapojanart, P. Pungrassami and A.R. Padmavathi.

Gram-Positive Bacteria - Staphylococcus aureus

Investigators at Pusan National University Hospital Report Findings in Staphylococcus aureus (Association between Type A blaZ Gene Polymorphism and Cefazolin Inoculum Effect in Methicillin-Susceptible Staphylococcus aureus)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Gram-Positive Bacteria - Staphylococcus aureus are presented in a new report. According to news reporting originating in Busan, South Korea, by NewsRx journalists, research stated, "Some proportion of type A blaZ gene-positive methicillin-susceptible Staphylococcus aureus strains exhibit the cefazolin inoculum effect (CIE)."

Financial support for this research came from National Research Foundation of Korea (NRF).

The news reporters obtained a quote from the research from Pusan National University Hospital, "The type A blaZ gene was divided into two groups by single nucleotide polymorphisms (SNPs) at Ser226Pro and Cys229Tyr. The median cefazolin MICs at a high inoculum concentration were 5.69 μg/ml for the Ser-Cys group and 40.32 μg/ml for the Pro-Tyr group (P = 0.01)."

According to the news reporters, the research concluded: "The SNPs at codons 226 and 229 in the amino acid sequence encoded by the blaZ gene were closely associated with the CIE."

For more information on this research see: Association between Type A blaZ Gene Polymorphism and Cefazolin Inoculum Effect in Methicillin-Susceptible Staphylococcus aureus. Antimicrobial Agents and Chemotherapy, 2016;60(11):6928-6932. Antimicrobial Agents and Chemotherapy can be contacted at: Amer Soc Microbiology, 1752 N St NW, Washington, DC 20036-2904, USA. (American Society for Microbiology - www.asm.org; Antimicrobial Agents and Chemotherapy - aac.asm.org)

Our news correspondents report that additional information may be obtained by contacting S. Lee, Pusan Natl Univ Hosp, Medical Res Inst, Busan, South Korea. Additional authors for this research include W.B. Park, S. Lee, S. Park, S.W. Kim, J.M. Lee, H.H. Chang, K.T. Kwon, P.G. Choe, N.J. Kim, H. Bin Kim and M.D. Oh.

Investigators at Queen Elizabeth Hospital Detail Findings in Aneurysm (Left gastric artery aneurysm rupture: a rare cause of retroperitoneal bleeding: a case report)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Cardiovascular Diseases and Conditions - Aneurysm. According to news originating from Gateshead, United Kingdom, by NewsRx correspondents, research stated, "Visceral artery aneurysms are very rare. Patients usually present as emergency secondary to the sudden rupture of the aneurysm or as an incidental finding on ultrasound, MRI or abdominal computed tomography."

Our news journalists obtained a quote from the research from Queen Elizabeth Hospital, "Among these, splenic artery aneurysms are the most common ones accounting for 60% of all splanchnic aneurysms and gastric and gastroepiploic aneurysms account for only about 4%. Case presentation: We present a 61-year-old Caucasian male previously fit and well, presenting with sudden onset epigastric pain due to retroperitoneal haemorrhage secondary to ruptured left gastric artery aneurysm. Apart from a tender epigastrium, there were no other obvious signs elicited on abdominal examination. He had persistent tachycardia and haemoglobin drop from 10 g/dl to 6.7 g/dl. He underwent a contrast computed tomography which identified the ruptured left gastric artery. The aneurysm was controlled successfully with coil embolisation of the left gastric artery aneurysm. At three-month follow-up, there was no evidence of the aneurysm. Clinical presentations that do not correlate with examination finding should prompt immediate extensive investigation."

According to the news editors, the research concluded: "The aid of contrast computed tomography and minimally invasive radiological interventional is the key to a fruitful outcome for this very rare entity."

The news correspondents report that additional information may be obtained from C.E. Ng, Queen Elizabeth Hospital, Dept. of Surg, Gateshead NE9 6SX, United Kingdom. Additional authors for this research include H. Khout, R. Farrell and T. Fasih.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1177/0036933015598122. This DOI is a link to an online electronic document that is either free or for purchase.

Liver Diseases and Conditions - Hepatitis C Virus

Investigators at Queen Mary University Target Hepatitis C Virus (Impact of Safety-Related Dose Reductions or Discontinuations on Sustained Virologic Response in HCV-Infected Patients: Results from the GUARD-C Cohort)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Liver Diseases and Conditions - Hepatitis C Virus. According to news reporting out of London, United Kingdom, by NewsRx editors, research stated, "Despite the introduction of direct-acting antiviral agents for chronic hepatitis C virus (HCV) infection, peginterferon alfa/ribavirin remains relevant in many resource-constrained settings. The non-randomized GUARD-C cohort investigated baseline predictors of safety-related dose reductions or discontinuations (sr-RD) and their impact on sustained virologic response (SVR) in patients receiving peginterferon alfa/ribavirin in routine practice."

Our news journalists obtained a quote from the research from Queen Mary University, "A total of 3181 HCV-mono-infected treatment-naive patients were assigned to 24 or 48 weeks of peginterferon alfa/ribavirin by their physician. Patients were categorized by time-to-first sr-RD (Week 4/12). Detailed analyses of the impact of sr-RD on SVR24 (HCV RNA <50 IU/mL) were conducted in 951 Caucasian, noncirrhotic genotype (G)1 patients assigned to peginterferon alfa-2a/ribavirin for 48 weeks. The probability of SVR24 was identified by a baseline scoring system (range: 0-9 points) on which scores of 5 to 9 and <5 represent high and low probability of SVR24, respectively. SVR24 rates were 46.1% (754/1634), 77.1% (279/362), 68.0% (514/756), and 51.3% (203/396), respectively, in G1, 2, 3, and 4 patients. Overall, 16.9% and 21.8% patients experienced (>=)1 sr-RD for peginterferon alfa and ribavirin, respectively. Among Caucasian noncirrhotic G1 patients: female sex, lower body mass index, pre-existing cardiovascular/pulmonary disease, and low hematological indices were prognostic factors of sr-RD; SVR24 was lower in patients with (>=)1 vs. no sr-RD by Week 4 (37.9% vs. 54.4%; p=0.0046) and Week 12 (41.7% vs. 55.3%; p=0.0016); sr-RD by Week 4/12 significantly reduced SVR24 in patients with scores <5 but not (>=)5. In conclusion, sr-RD to peginterferon alfa-2a/ribavirin significantly impacts on SVR24 rates in treatment-naive G1 noncirrhotic Caucasian patients."

According to the news editors, the research concluded: "Baseline characteristics can help select patients with a high probability of SVR24 and a low probability of sr-RD with peginterferon alfa-2a/ribavirin."

For more information on this research see: Impact of Safety-Related Dose Reductions or Discontinuations on Sustained Virologic Response in HCV-Infected Patients: Results from the GUARD-C Cohort. Plos One, 2016;11(3):e0151703. (Public Library of Science - www.plos.org; Plos One - www.plosone.org)

Our news journalists report that additional information may be obtained by contacting G.R. Foster, Institute of Cellular and Molecular Sciences, Queen Mary University of London, London, UK. Additional authors for this research include C. Coppola, M. Derbala, P. Ferenci, A. Orlandini, K.R. Reddy, L. Tallarico, M.L. Shiffman, S. Ahlers, G. Bakalos and T. Hassanein.

Investigators at RENORBIO Report Findings in Breast Cancer (Clinical and epidemiological profile of women with breast cancer managed in a public referral hospital in northeastern Brazil)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Oncology - Breast Cancer. According to news reporting originating from Recife, Brazil, by NewsRx correspondents, research stated, "To evaluate the clinical and epidemiological profile of women with breast cancer, managed in the Breast Service at Hospital Getalio Vargas (HGV). A descriptive, observational cross-sectional study, involving 174 breast cancer patients, managed at the Breast Service at HGV in Teresina, in the northeast of Brazil, from May 2011 to June 2014."

Our news editors obtained a quote from the research from RENORBIO, "Epidemiological variables included age group, age at menarche, age at first childbirth, and menopause. The tumor characteristics studied were histological type, TNM classification, and staging. The results were organized in distribution tables. Breast carcinoma was more common in patients aged 60 and over, in multiparous women, and in women who were menopausal before age 55. The most common histological type was ductal invasive carcinoma T2N1M0 (Stage J1B) in 83 (48%) women."

According to the news editors, the research concluded: "The current study shows that the majority of carcinomas were Stage II or advanced tumors, with clinically positive axillary lymph node status and weak correlation with reproductive risk factors."

For more information on this research see: Clinical and epidemiological profile of women with breast cancer managed in a public referral hospital in northeastern Brazil. European Journal of Gynaecological Oncology, 2016;37(6):814-816. European Journal of Gynaecological Oncology can be contacted at: I R O G Canada, Inc, 4900 Cote St-Luc, Apt# 212, Montreal, Quebec H3W 2H3, Canada.

The news editors report that additional information may be obtained by contacting B.B. da Silva, Northeast Network Biotechnol RENORBIO, Postagrad Program, Recife, PE, Brazil. Additional authors for this research include F.C. Sousa-Esteves, R.S. Martins, C.P. Salha, B.N. Paiva-Melo, C.S. Moura and F.A. Alves-Ribeiro.

Gram-Positive Bacteria - Lactobacillus

Investigators at Research Center Target LactoBacillius (Development and Validation of a Highly Accurate Quantitative Real-Time PCR Assay for Diagnosis of Bacterial Vaginosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Research findings on Gram-Positive Bacteria - LactoBacillus are discussed in a new report. According to news reporting originating from Hamilton, New Jersey, by NewsRx correspondents, research stated, "Bacterial vaginosis (BV) is the most common gynecological infection in the United States. Diagnosis based on Amsel's criteria can be challenging and can be aided by laboratory-based testing."

Our news editors obtained a quote from the research from Research Center, "A standard method for diagnosis in research studies is enumeration of bacterial morphotypes of a Gram-stained vaginal smear (i.e., Nugent scoring). However, this technique is subjective, requires specialized training, and is not widely available. Therefore, a highly accurate molecular assay for the diagnosis of BV would be of great utility. We analyzed 385 vaginal specimens collected prospectively from subjects who were evaluated for BV by clinical signs and Nugent scoring. We analyzed quantitative real-time PCR (qPCR) assays on DNA extracted from these specimens to quantify nine organisms associated with vaginal health or disease: Gardnerella vaginalis, Atopobium vaginae, BV-associated bacteria 2 (BVAB2, an uncultured member of the order Clostridiales), Megasphaera phyloytype 1 or 2, Lactobacillus iners, Lactobacillus crispatus, Lactobacillus gasseri, and Lactobacillus jensenii. We generated a logistic regression model that identified G. vaginalis, A. vaginae, and Megasphaera phyloytypes 1 and 2 as the organisms for which quantification provided the most accurate diagnosis of symptomatic BV, as defined by Amsel's criteria and Nugent scoring, with 92% sensitivity, 95% specificity, 94% positive predictive value, and 94% negative predictive value. The inclusion of Lactobacillusspp. did not contribute sufficiently to the quantitative model for symptomatic BV detection."

According to the news editors, the research concluded: "This molecular assay is a highly accurate laboratory tool to assist in the diagnosis of symptomatic BV."

The news editors report that additional information may be obtained by contacting D.W. Hilbert, Femeris Women's Health Research Center, Medical Diagnostic Laboratories, a member of Genesis Biotechnology group, Hamilton, New Jersey, United States. Additional authors for this research include W.L. Smith, S.G. Chadwick, G. Toner, E. Mordechai, M.E. Adelson, T.J. Aguin, J.D. Sobel and S.E Gygax.

The direct object identifier (DOI) for that additional information is: http://dx.doi.org/10.1128/JCM.03104-15. This DOI is a link to an online electronic document that is either free or for purchase.

Investigators at Rockefeller University Detail Findings in HIV/AIDS
(Paired quantitative and qualitative assessment of the replication-
competent HIV-1 reservoir and comparison with integrated proviral
DNA)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness
& Wellness Week -- Research findings on Immune System Diseases and Conditions -
HIV/AIDS are discussed in a new report. According to news reporting out of New York City,
New York, by NewsRx editors, research stated, "HIV-1-infected individuals harbor a latent
reservoir of infected CD4(+) T cells that is not eradicated by antiretroviral therapy (ART). This
reservoir presents the greatest barrier to an HIV-1 cure and has remained difficult to
characterize, in part, because the vast majority of integrated sequences are defective and
incapable of reactivation."

Financial supporters for this research include HHS | NIH | National Center for
Advancing Translational Sciences (NCATS), HHS | NIH | National Institute of Allergy and
Infectious Diseases (NIAID).

Our news journalists obtained a quote from the research from Rockefeller University,
"To characterize the replication-competent reservoir, we have combined two techniques,
quantitative viral outgrowth and qualitative sequence analysis of clonal outgrowth viruses.
Leukapheresis samples from four fully ART-suppressed, chronically infected individuals were
assayed at two time points separated by a 4-to 6-mo interval. Overall, 54% of the viruses
emerging from the latent reservoir showed gp160 env sequences that were identical to at least
one other virus. Moreover, 43% of the env sequences from viruses emerging from the reservoir
were part of identical groups at the two time points. Groups of identical expanded sequences
made up 54% of proviral DNA, and, as might be expected, the sequences of replication-
competent viruses in the active reservoir showed limited overlap with integrated proviral DNA,
most of which is known to represent defective viruses."

According to the news editors, the research concluded: "Finally, there was an inverse
correlation between proviral DNA clone size and the probability of reactivation, suggesting that
replication-competent viruses are less likely to be found among highly expanded provirus-
containing cell clones."

For more information on this research see: Paired quantitative and qualitative
assessment of the replication-competent HIV-1 reservoir and comparison with integrated
proviral DNA. Proceedings of the National Academy of Sciences of the United States of
America, 2016;113(49):E7908-E7916. Proceedings of the National Academy of Sciences of the
United States of America can be contacted at: Natl Acad Sciences, 2101 Constitution Ave NW,
Washington, DC 20418, USA. (National Academy of Sciences - www.nasonline.org/;
Proceedings of the National Academy of Sciences of the United States of America -
www.nasonline.org/publications/pnas/)

Investigators at Roswell Park Cancer Institute Zero in on Nephrology
(An RNA interference screen identifies new avenues for nephroprotection)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Fresh data on Nephrology are presented in a new report. According to news reporting from Buffalo, New York, by NewsRx journalists, research stated, "Acute kidney injury is a major public health problem, which is commonly caused by renal ischemia and is associated with a high risk of mortality and long-term disability. Efforts to develop a treatment for this condition have met with very limited success."

The news correspondents obtained a quote from the research from Roswell Park Cancer Institute, "We used an RNA interference screen to identify genes (BCL2L14, BLOC1S2, C2orf42, CPT1A, FBP1, GCNT3, RHOB, SCIN, TACR1, and TNFAIP6) whose suppression improves survival of kidney epithelial cells in in vitro models of oxygen and glucose deprivation. Some of the genes also modulate the toxicity of cisplatin, an anticancer agent whose use is currently limited by nephrotoxicity. Furthermore, pharmacological inhibition of TACR1 product NK1R was protective in a model of mouse renal ischemia, attesting to the in vivo relevance of our findings."

According to the news reporters, the research concluded: "These data shed new light on the mechanisms of stress response in mammalian cells, and open new avenues to reduce the morbidity and mortality associated with renal injury."

Our news journalists report that additional information may be obtained by contacting E.R. Zynda, Dept. of Cell Stress Biology, Roswell Park Cancer Institute, Elm and Carlton Streets, Buffalo, NY 14263, United States. Additional authors for this research include B. Schott, S. Gruener, E. Wernher, G.D. Nguyen, M. Ebeling and E.S Kandel.

Investigators at Royal College of Surgeons in Ireland Release New Data on Apoptosis (Endoplasmic reticulum stress-mediated upregulation of miR-29a enhances sensitivity to neuronal apoptosis)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Apoptosis have been published. According to news originating from Dublin, Ireland, by NewsRx correspondents, research stated, "Disturbance of homeostasis within the endoplasmic reticulum (ER) lumen leads to the accumulation of unfolded and misfolded proteins. This results in the activation of an evolutionary conserved stress response termed ER stress that, if unresolved, induces apoptosis."

Financial supporters for this research include Science Foundation Ireland, Health Research Board.

Our news journalists obtained a quote from the research from the Royal College of Surgeons in Ireland, "Previously the Bcl-2 homology domain 3-Only Protein Puma was identified as a mediator of ER stress-induced apoptosis in neurons. In the search of alternative contributors to ER stress-induced apoptosis, a downregulation of the anti-apoptotic Bcl-2 family protein Mcl-1 was noted during ER stress in both mouse cortical neurons and human SH-SY5Y neuroblastoma cells. Downregulation of Mcl-1 was associated with an upregulation of microRNA-29a (miR-29a) expression, and subsequent experiments showed that miR-29a targeted the 3'-untranslated region of the anti-apoptotic Bcl-2 family protein, Mcl-1. Inhibition of miR-29a expression using sequence-specific antagonirs or the overexpression of Mcl-1 decreased cell death following tunicamycin treatment, while gene silencing of Mcl-1 increased cell death. miR-29a did not alter the signalling branches of the ER stress response, rather its expression was controlled by the ER stress-induced transcription factor activating-transcription-factor-4 (ATF4)."

According to the news editors, the research concluded: "The current data demonstrate that the ATF4-mediated upregulation of miR-29a enhances the sensitivity of neurons to ER stress-induced apoptosis."

The news correspondents report that additional information may be obtained from K. Nolan, Centre for the Study of Neurological Disorders and Dept. of Physiology and Medical Physics, Royal College of Surgeons in Ireland, 123 St Stephens Green, Dublin, 2, Ireland. Additional authors for this research include F. Walter, L.P. Tuffy, S. Poeschel, R. Gallagher, S. Haunsberger, I. Bray, R.L. Stallings, C.G. Concannon and J.H Prehn.

Skin Diseases and Conditions - Urticaria

Investigators at Royal Melbourne Hospital Report Findings in Urticaria
(An unusual urticarial eruption: Familial cold autoinflammatory syndrome)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Skin Diseases and Conditions - Urticaria. According to news reporting originating from Melbourne, Australia, by NewsRx correspondents, research stated, "This is a case of a 26-year-old Caucasian woman with a lifelong history of an episodic urticaria associated with arthralgia, precipitated by exposure to cold. She had no other significant past medical history."

Our news editors obtained a quote from the research from Royal Melbourne Hospital, "She reported several family members with a history of very similar episodic eruptions without definitive diagnoses. An examination showed an urticarial eruption over her limbs with no other systemic findings. A baseline full blood examination, serology and autoimmune screen were normal. A skin biopsy was consistent with urticaria, with dermal oedema and a perivascular infiltrate. Following genetic testing, she was found to be heterozygous for a mutation, p.Ala439Val in the NLRP3 gene, known to cause familial cold autoinflammatory syndrome (FCAS), which typically presents with urticaria, conjunctivitis and arthralgia, as described in this patient. FCAS is one subtype of a group of conditions known as cryopyrin-associated periodic syndromes (CAPS)."

According to the news editors, the research concluded: "CAPS are rare, autosomal dominant inherited conditions with a spectrum of phenotypes, characterised by increased interleukin-1 beta release with subsequent local and systemic proinflammatory and pyrogenic effects."

The news editors report that additional information may be obtained by contacting R. Nguyen, Royal Melbourne Hospital, Melbourne, Vic, Australia. Additional authors for this research include A. Robinson, K. Nicholls, G. Varigos and C. Dolianitis.

Keywords for this news article include: Melbourne, Australia, Australia and New Zealand, Musculoskeletal Diseases and Conditions, Vascular Skin Diseases and Conditions, Joint Diseases and Conditions, Dermatology, Arthralgia, Urticaria, Genetics, Royal Melbourne Hospital.

Investigators at Rush University Report Findings in Syphilis (Risk behaviours of an interrelated syphilis-infected sexual network of men who have sex with men)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Data detailed on Sexually Transmitted Diseases and Conditions (STDs) - Syphilis have been presented. According to news reporting out of Chicago, Illinois, by NewsRx editors, research stated, "Aims and objectives. We examined the risk behaviours in an interrelated sexual network of 33 syphilis-infected men who have sex with men on the use of condoms, substances and websites to meet sexual partners."

Our news journalists obtained a quote from the research from Rush University, "Our study used a descriptive exploratory design to investigate co-occurring high-risk behaviours in this interrelated sexual network to inform future health interventions and research directions. Although the risk behaviours for human immunodeficiency virus transmission in men who have sex with men have been studied, few have studied the high-risk population of men who already have syphilis, and even fewer have studied the risk behaviours in sexual networks of syphilis-infected men who have sex with men who were identified using contact tracing. The data were collected from semi-structured, individual interviews at a not-for-profit lesbian, gay, bisexual and transgender health centre in a large city in the Midwestern USA. Inconsistent condom use was substantial during both insertive (92%) and receptive (88%) anal intercourse. Most participants (97%) reported using one or more substances prior to or during anal intercourse, and Internet websites were the most common place to meet sexual partners (88%). High-risk behaviours were significant within this syphilis-infected sexual network of men who have sex with men. The majority of our 33 participants were non-Hispanic Whites (n = 27, 82%), possessed a baccalaureate degree or higher (n = 23, 70%), and actively sought out unprotected anal intercourse [21 participants (64%) used BareBackRT.com, a website to seek out unprotected anal intercourse]. Relevance to clinical practice. Nurses should be more informed about the risk factors of a high-risk sexual network of syphilis-infected men who have sex with men."

According to the news editors, the research concluded: "Interrelated sexual networks have high levels of similarity among participants' high-risk behaviours; contact tracing may be used to identify individual participants for relevant risk-reduction interventions."

Our news journalists report that additional information may be obtained by contacting M. Shattell, Rush University, Dept. of Community Syst & Mental Hlth Nursing, Chicago, IL 60612, United States. Additional authors for this research include J.P. Brady and M. Shattell.

Oncology

Investigators at SWOG Statistical Center Report New Data on Oncology (Stepwise development of a cancer care delivery research study to evaluate the prevalence of virus infections in cancer patients)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Oncology is the subject of a report. According to news reporting originating in Seattle, Washington, by NewsRx journalists, research stated, "SWOG initiated a cancer care delivery research study of virus infection rates among newly diagnosed cancer patients. This study will inform viral screening guidelines in oncology clinics."

The news reporters obtained a quote from the research from SWOG Statistical Center, "In a first step 'vanguard' phase, we evaluated the feasibility of multiple study procedures. Site investigators were surveyed to obtain feedback on study implementation. Much higher enrollment occurred at sites where all physicians participated and viral testing was performed as routine practice. These procedures will be required going forward. Additional protocol changes based on site investigator input were implemented."

According to the news reporters, the research concluded: "This multistep protocol design process illustrates how cancer care delivery research studies can adapt to real-world strategies and procedures that exist at community clinics where the predominance of cancer patients are treated."

For more information on this research see: Stepwise development of a cancer care delivery research study to evaluate the prevalence of virus infections in cancer patients. Future Oncology, 2016;12(10):1219-31.

Our news correspondents report that additional information may be obtained by contacting J.M. Unger, SWOG Statistical Center, Fred Hutchinson Cancer Research Center, Seattle, WA, United States. Investigators at San Bortolo Hospital Have Reported New Data on Open-Angle Glaucoma (Brinzolamide 1%/timolol versus dorzolamide 2%/timolol in the treatment of open-angle glaucoma or ocular hypertension: prospective randomized patient-preference study.)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- New research on Eye Diseases and Conditions - Open-Angle Glaucoma is the subject of a report. According to news reporting originating from Vicenza, Italy, by NewsRx correspondents, research stated, "The objective of this study was to assess preference for fixed-combination brinzolamide 1%/timolol 0.5% (BTFC) versus fixed-combination dorzolamide 2%/timolol 0.5% (DTFC) in patients with open-angle glaucoma or ocular hypertension. In this prospective, single-masked crossover study, patients were randomized 1:1 to BTFC-DTFC or DTFC-BTFC treatment sequences."

Our news editors obtained a quote from the research from San Bortolo Hospital, "Patients self-administered each medication for 7 days, with a 48-hour washout period between treatments, and rated ocular discomfort after each treatment period. Medication preferences based on ocular comfort (primary endpoint) and anticipated adherence were assessed. Safety outcomes included adverse events and intraocular pressure. Between-group differences in treatment preference and ocular discomfort scores were analyzed using chi-square and Wilcoxon-Mann-Whitney tests, respectively. Adherence, intraocular pressure, and adverse events were summarized descriptively. In total, 112 patients were enrolled (mean ± SD age, 66 ± 11 years), and 109 patients completed the study. Numerically, more patients in the intent-to-treat dataset preferred BTFC versus DTFC (59.3% versus 40.7%); however, this result was not statistically significant (treatment difference, 18.6%; p=0.0670). Mean ocular discomfort scores (range, 0-9) were statistically significantly lower with BTFC versus DTFC (2.6 versus 3.7; p=0.0002, Wilcoxon-Mann-Whitney test). More patients who preferred BTFC over DTFC were confident that they would adhere to their preferred medication. Treatment-related adverse events included blurred vision with BTFC and eye irritation or eye pain with DTFC. BTFC and DTFC were preferred by approximately 60% and 40% of patients, respectively, and BTFC was associated with less patient-reported ocular discomfort."

According to the news editors, the research concluded: "Greater ocular comfort of glaucoma medications may improve treatment adherence."

For more information on this research see: Brinzolamide 1%/timolol versus dorzolamide 2%/timolol in the treatment of open-angle glaucoma or ocular hypertension: prospective randomized patient-preference study. Clinical Ophthalmology, 2015;9():2263-70.

Investigators at Sansom Institute for Health Research Report Findings in Chemotherapy (2016 Updated MASCC/ESMO Consensus Recommendations: Controlling nausea and vomiting with chemotherapy of low or minimal emetic potential)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Drugs and Therapies - Chemotherapy. According to news reporting originating from Adelaide, Australia, by NewsRx correspondents, research stated, "The purpose of this review is to update the MASCC (Multinational Association of Supportive Care in Cancer) guidelines for controlling nausea and vomiting with chemotherapy of low or minimal emetic potential. The antiemetic study group of MASCC met in Copenhagen in 2015 to review the MASCC antiemetic guidelines."

Our news editors obtained a quote from the research from Sansom Institute for Health Research, "A subgroup performed a systematic literature review on antiemetics for low emetogenic chemotherapy (LEC) and chemotherapy of minimal emetic potential and the chair presented the update recommendation to the whole group for discussion. They then voted with an aim of achieving 67% or greater consensus. For patients receiving low emetogenic chemotherapy, a single antiemetic such as dexamethasone, a 5HT3 receptor antagonist, or a dopamine receptor antagonist may be considered for prophylaxis of acute emesis. For patients receiving chemotherapy of minimal emetogenicity, no antiemetic should be routinely administered. If patients vomit, they should be treated as for chemotherapy of low emetic potential. No antiemetic should be administered for prevention of delayed nausea and vomiting induced by low or minimally emetogenic chemotherapy. More research is needed to determine the incidence of emesis, particularly delayed emesis, in the LEC group. Prospective studies are required to evaluate antiemetic strategies. The risk of emesis within LEC may be more accurately determined by adding the patient risk factors for emesis to those of the chemotherapy drugs."

According to the news editors, the research concluded: "Improved strategies for promoting adherence to guidelines are required."

For more information on this research see: 2016 Updated MASCC/ESMO Consensus Recommendations: Controlling nausea and vomiting with chemotherapy of low or minimal emetic potential. Supportive Care in Cancer, 2017;25(1):297-301. Supportive Care in Cancer can be contacted at: Springer, 233 Spring St, New York, NY 10013, USA. Investigators at Sapienza-University Detail Findings in Calcinosis (ASIA syndrome, calcinosis cutis and chronic kidney disease following silicone injections. A case-based review)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- A new study on Nutritional and Metabolic Diseases and Conditions - Calcinosis is now available. According to news originating from Rome, Italy, by NewsRx correspondents, research stated, "An immunologic adjuvant is a substance that enhances the antigen-specific immune response preferably without triggering one on its own. Silicone, a synthetic polymer used for reconstructive and cosmetic purposes, can cause, once injected, local and/or systemic reactions and trigger manifestations of autoimmunity, occasionally leading to an overt autoimmune disease."

Our news journalists obtained a quote from the research from Sapienza-University, "Siliconosis, calcinosis cutis with hypercalcemia and chronic kidney disease have all been reported in association with silicone injection. Here, we describe a case of autoimmune/auto-inflammatory syndrome induced by adjuvants, calcinosis cutis and chronic kidney disease after liquid silicone multiple injections in a young man who underwent a sex reassignment surgery, followed by a review of the literature. To our knowledge, this is the first report describing the concomitance of the three clinical conditions in the same patients."

According to the news editors, the research concluded: "The link between silicone and the immune system is not completely understood yet and requires further reports and investigations with long-term data, in order to identify the main individual and genetical risk factors predisposing to the wide spectrum of the adjuvant-induced responses."

For more information on this research see: ASIA syndrome, calcinosis cutis and chronic kidney disease following silicone injections. A case-based review. Immunologic Research, 2016;64(5-6):1142-1149. Immunologic Research can be contacted at: Humana Press Inc, 999 Riverview Drive Suite 208, Totowa, NJ 07512, USA. Investigators at School of Life Sciences Target Melanoma (TLR-3 stimulation improves anti-tumor immunity elicited by dendritic cell exosome-based vaccines in a murine model of melanoma)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Researchers detail new data in Oncology - Melanoma. According to news originating from Lausanne, Switzerland, by NewsRx correspondents, research stated, "Dendritic cell (DC)-derived exosomes (Dexo) contain the machinery necessary to activate potent antigen-specific immune responses. As promising cell-free immunogens, Dexo have been tested in previous clinical trials for cancer vaccine immunotherapy, yet resulted in limited therapeutic benefit."

Our news journalists obtained a quote from the research from the School of Life Sciences, "Here, we explore a novel Dexo vaccine formulation composed of Dexo purified from DCs loaded with antigens and matured with either the TLR-3 ligand poly(I:C), the TLR-4 ligand LPS or the TLR-9 ligand CpG-B. When poly(I:C) was used to produce exosomes together with ovalbumin (OVA), the resulting Dexo vaccine strongly stimulated OVA-specific CD8(+) and CD4(+) T cells to proliferate and acquire effector functions. When a B16F10 melanoma cell lysate was used to load DCs with tumor antigens during exosome production together with poly (I:C), we obtained a Dexo vaccine capable of inducing robust activation of melanoma-specific CD8(+) T cells and the recruitment of cytotoxic CD8(+) T cells, NK and NK-T cells to the tumor site, resulting in significantly reduced tumor growth and enhanced survival as compared to a Dexo vaccine formulation similar to the one previously tested on human patients."

According to the news editors, the research concluded: "Our results indicate that poly (I:C) is a particularly favorable TLR agonist for DC maturation during antigen loading and exosome production for cancer immunotherapy."

For more information on this research see: TLR-3 stimulation improves anti-tumor immunity elicited by dendritic cell exosome-based vaccines in a murine model of melanoma. Scientific Reports, 2015;5():17622. (Nature Publishing Group - www.nature.com/; Scientific Reports - www.nature.com/srep/)

Investigators at School of Medicine Detail Findings in Myelodysplastic Syndromes (Establishing a murine xenograft-model for long-term analysis of factors inducing chromosomal instability in myelodysplastic syndrome: Pitfalls and successes)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators publish new report on Hematologic Diseases and Conditions - Myelodysplastic Syndromes. According to news reporting from Hannover, Germany, by NewsRx journalists, research stated, "Myelodysplastic syndromes (MDS) are difficult to culture long-term showing the need of a model to study the fate of cells with MDS-abnormalities associated with chromosomal instability (CIN). This approach to establish a xenograft model transplanting human hematopoietic stem cells (HSC) with different independent lentivirally-mediated MDS-related modifications into immunodeficient mice is a long-lasting and tedious experiment with many parameters and every positive as well as non-functioning intermediate step will help the research community."

Financial support for this research came from Deutsche Forschungsgemeinschaft.

The news correspondents obtained a quote from the research from the School of Medicine, "As the establishment of appropriate xenograft models is increasing worldwide we aim to share our experiences to contribute toward minimizing loss of mice and following the 'right' approach. Here, modified HSCs were intrafemorally transplanted into NSG and/or NSGS mice: (1) RPS14-haploinsufficiency, (2) TP53-deficiency, (3) TP53 hotspot mutations (R248W, R175H, R273H, R249S). Engraftment was achieved and cytogenetic analyses showed human cells with normal karyo-types. However, in all experiments with NSG mice, mainly control cells or GFP-negative cells were engrafted, not allowing observation of modified HSCs. In NSGS mice, engraftment rate was higher, but mice developed graft-versus-host disease. In summary, engraftment of HSCs is promising and could be used to analyze the induction of CIN."

According to the news reporters, the research concluded: "However, the analysis of modified HSCs is limited and further experiments are required to improve this model."

Our news journalists report that additional information may be obtained by contacting G. Gohring, Hannover Med Sch, Inst Human Genet, D-30625 Hannover, Germany. Additional authors for this research include K. Thomay, K. Himmler, B. Vajen, A. Schienke, M. Hagedorn, J. Ebersold, H.H. Kreipe, A. Krueger, A. Schambach, B. Schlegelberger and G. Gohring.

Investigators at School of Medicine Discuss Findings in Hyperaldosteronism (Prevalence Of Primary Aldosteronism In An Urban Hypertensive Population)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Adrenal Gland Diseases and Conditions - Hyperaldosteronism have been published. According to news reporting from New York City, New York, by NewsRx journalists, research stated, "To determine the prevalence of primary aldosteronism (PA) in hypertensive patients presenting to the primary care clinic at The Mount Sinai Hospital, regardless of the degree of hypertension and to identify clinical criteria that should prompt screening for PA. An aldosterone:renin ratio (ARR, cutoff >= 20, with plasma aldosterone concentration [PAC] >= 10 and suppressed renin) was used to prospectively screen 296 hypertensive patients (blood pressure >= 140/90) over the age of 18 from August 2012 through May 2013."

The news correspondents obtained a quote from the research from the School of Medicine, "Subjects who screened positive then underwent confirmatory oral salt load testing (OSLT). Of the 296 patients, 14 screened positive for PA, an overall prevalence of 4.7%. Six of the 14 cases underwent confirmatory OSLT, upon which 2 were confirmed positive, for a prevalence of 0.7%. Overall, patients with confirmed PA were more likely to have resistant hypertension (42.9% vs. 18.1% (P = .0334)) and require more anti hypertensive agents (2.8 +/- 1.2 agents vs. 2.1 +/- 1.1 agents, P = .0213). There was a trend toward lower potassium values in the cases. The prevalence of PA in our clinic is much lower than in reports from certain 'at-risk' populations."

According to the news reporters, the research concluded: "PA screening is indicated in patients with resistant hypertension, regardless of serum potassium levels."

For more information on this research see: Prevalence Of Primary Aldosteronism In An Urban Hypertensive Population. Endocrine Practice, 2016;22(11):1296-1302. Endocrine Practice can be contacted at: Amer Assoc Clinical Endocrinologists, 245 Riverside Avenue, Ste 200, Jacksonville, FL 32202, USA.

Investigators at Science Institute Describe Findings in Clinical Trials and Studies (General practice patients treated for substance use problems: a cross-national observational study in Belgium)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Investigators discuss new findings in Clinical Research - Clinical Trials and Studies. According to news reporting originating in Brussels, Belgium, by NewsRx journalists, research stated, "General Practitioners (GPs) are well placed to care for patients with (chronic) substance use problems. This pilot was carried out to study the feasibility and usefulness of a continuous surveillance of substance use problems among general practice patients."

The news reporters obtained a quote from the research from Science Institute, "The objectives were (i) to describe variables with missing values exceeding 1% and whether patients were reported without substance-related problems; (ii) the profile and the magnitude of the patient population that is treated for substance use problems. Observational study by the Belgian Network of Sentinel General Practices (SGP) in 2013. Baseline (at the first encounter) and 7-month follow-up data were reported of all patients treated for substance use problems. Two main measurements were type of substance use and patient status at follow-up. Multiple logistic regression analysis was used to examine patient status at follow-up. Of 479 patients, 47.2% had problems with alcohol alone, 20.3% with prescription drugs, 16.7% with illicit drugs other than heroin or methadone and 15.9% with heroin or methadone. Problems with alcohol alone were more prevalent in Flanders (53.0%; 95% confidence interval (CI) 46.8-59.1%) than in Wallonia-Brussels (39.8%; 95% CI 33.1-46.8%), while problems with heroin or methadone were more prevalent in Wallonia-Brussels (27.0%; 95% CI 21.1-33.5%) than in Flanders (7.1%; 95% CI 4.3-10.9%). At follow-up, 32.8% of the patients had dropped out, 29.0% had discontinued GP treatment and 38.2% had continued GP treatment. Overall, 32.4% of 479 patients had continued GP treatment for substance use problems during the study period. In Wallonia-Brussels, this proportion was higher (42.7%; 95% CI 35.9-49.6%) than in Flanders (24.3%; 95% CI 19.2-29.8%). A continuous surveillance of the general practice population treated for substance use problems seems to be feasible and useful. The latter is suggested by the specific profile and the relative magnitude of the population."

According to the news reporters, the research concluded: "Inter-regional health system differences should be taken into account to estimate the epidemiology of substance use problems among general practice patients."

Our news correspondents report that additional information may be obtained by contacting N. Boffin, Sci Inst Public Hlth, OD Public Hlth & Surveillance, Brussels, Belgium. Additional authors for this research include J. Antoine, S. Moreels, S. Wanyama, K. De Ridder, L. Peremans, M. Vanmeerbeek and V. Van Casteren.

Essential Amino Acids

Investigators at Scripps Research Institute Target Essential Amino Acids (Protein Arginine Methylation and Citrullination in Epigenetic Regulation)

2017 JAN 14 (NewsRx) -- By a News Reporter-Staff News Editor at Obesity, Fitness & Wellness Week -- Current study results on Essential Amino Acids have been published. According to news reporting from Jupiter, Florida, by NewsRx journalists, research stated, "The post-translational modification of arginine residues represents a key mechanism for the epigenetic control of gene expression. Aberrant levels of histone arginine modifications have been linked to the development of several diseases including cancer."

Funders for this research include National Cancer Institute, National Institute of General Medical Sciences.

The news correspondents obtained a quote from the research from Scripps Research Institute, "In recent years, great progress has been made in understanding the physiological role of individual arginine modifications and their effects on chromatin function. The present review aims to summarize the structural and functional aspects of histone arginine modifying enzymes and their impact on gene transcription."

According to the news reporters, the research concluded: "We will discuss the potential for targeting these proteins with small molecules in a variety of disease states."

For more information on this research see: Protein Arginine Methylation and Citrullination in Epigenetic Regulation. Acs Chemical Biology, 2015;11(3):654-68. (American Chemical Society - www.acs.org; Acs Chemical Biology - www.pubs.acs.org/journal/acbcct)
